Analytical Method Life Cycle

- What is the final aim of quantitative analytical methods ?
 - Start with the end !
 - Objective: provide results used to make decisions
 - Release of a batch
 - Stability/Shelf life
 - Patient health
 - PK/PD studies, ...
- What matters are **the results** produced by the method.

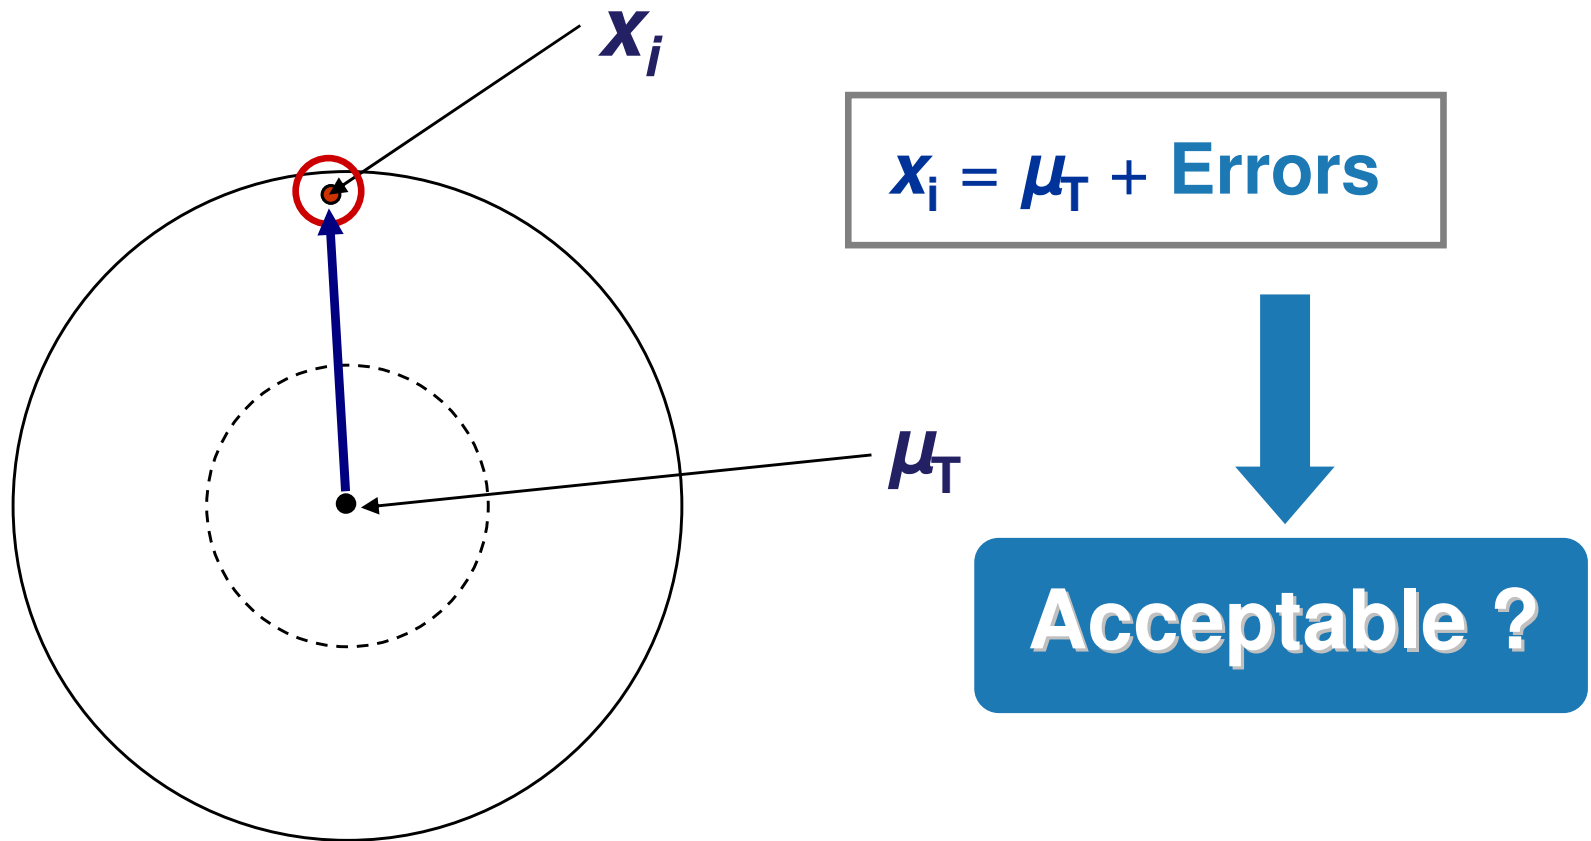

Analytical Method Life Cycle

Result in routine

X_i = observed result

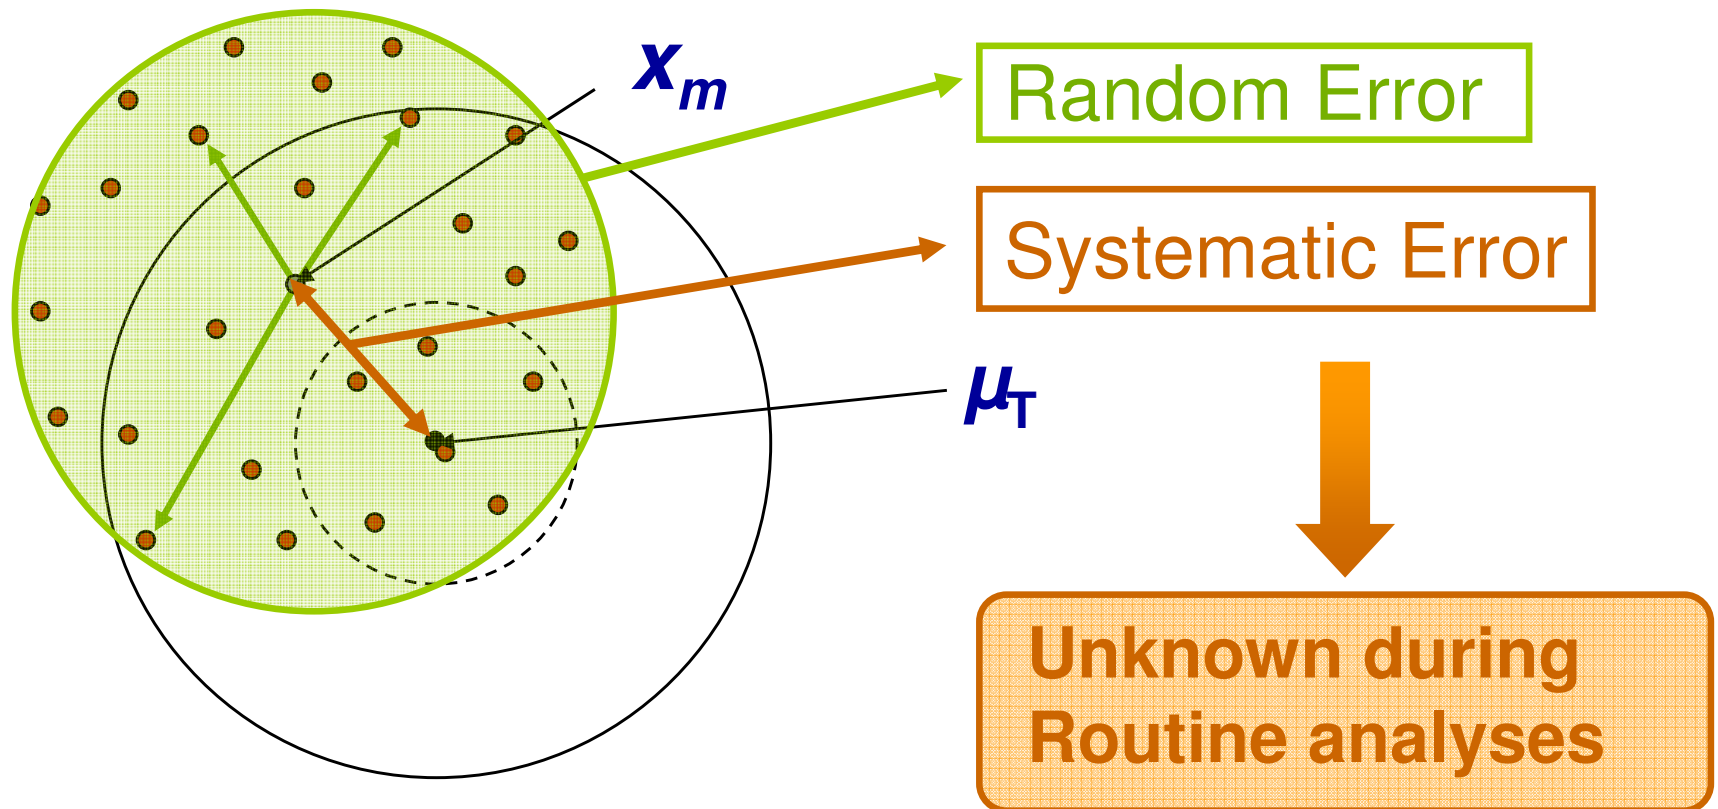

μ_T = True unknown value

Analytical Errors

\bar{X}_m = mean of observed results

μ_T = unknown true value

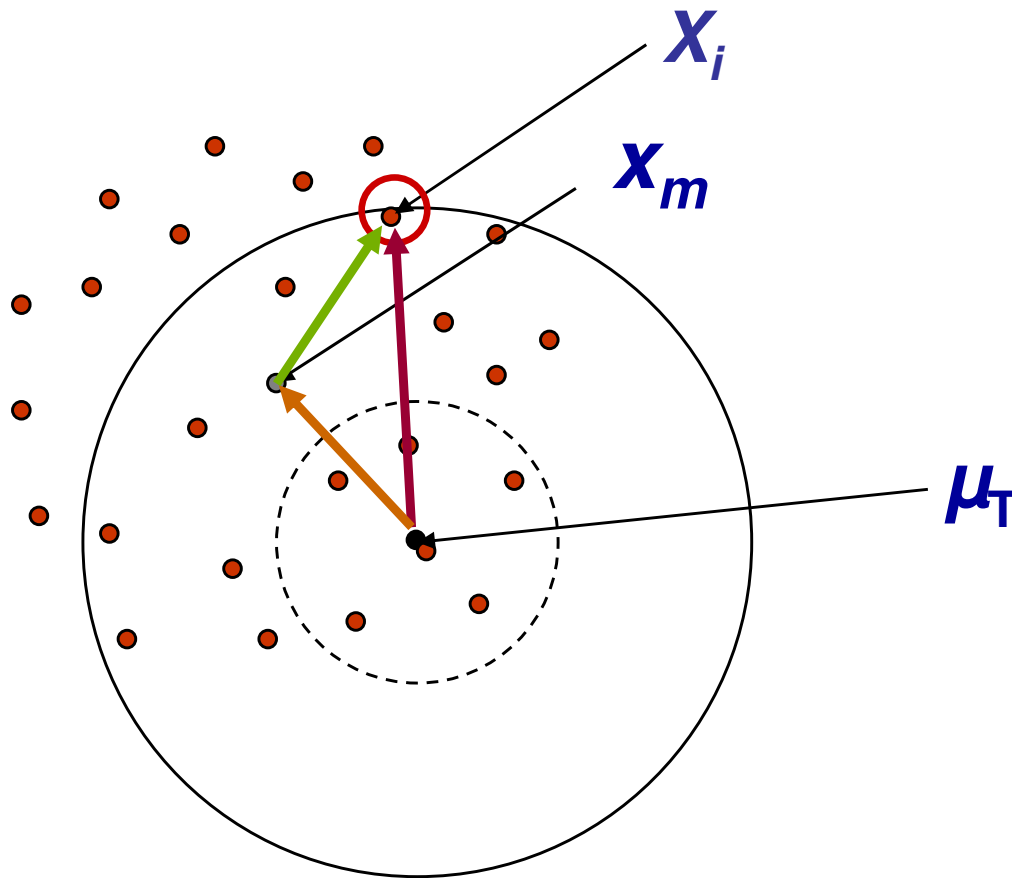

Analytical Errors

\bar{X}_m = mean of observed results

μ_T = unknown true value

X_i = observed result

$$X_i = \mu_T + \text{Errors}$$

Total Error

↓
Systematic Error

↓
Random Error

Total Error

Accuracy (ICH Q2R1 – ISO 5725 – SFSTP)

The accuracy of an analytical procedure expresses the closeness of agreement between the value which is accepted either as a conventional true value or an accepted reference value and the value found.

- **Total error** is directly linked to the definition of **accuracy**.
- **Total error** is the **adequate decision criterion** to accept the **validity** or the **transfer** of an analytical method before its routine application.

D. Kringle et al., Pharma.Research, 24, (2007) 1157

Analytical Method Life Cycle

- Need to demonstrate/guarantee that the analytical method will provide, in its future routine use, quality results
- This is the key aim of Analytical Method Validation !

How ?

1. Aim of Analytical Method Validation
2. Traditional Analytical Method Validation
3. Rewarding Analytical Method Validation
4. Analytical Method Validation Design
5. Is my Method Valid ?
6. Applicability ?
7. Is this enough ?
8. Conclusions

- Traditional vision:
 - The Validation Criteria Check List:

- Selectivity
- Trueness/Mean Accuracy
- Precision
- Linearity
- Range
- Limit of Quantification (LOQ)

Method Valid !

Analytical Method Validation

- Traditional vision:
 - Is a valid method providing reliable results ?

Analytical Method

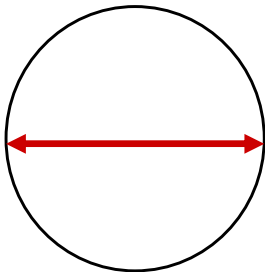

Bias

% Bias < 3%

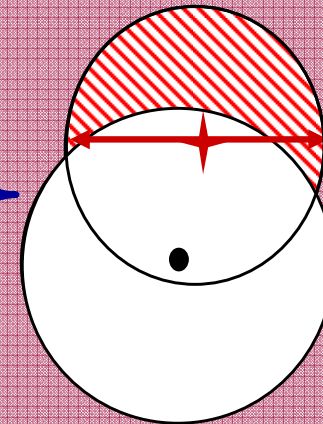

Precision

% CV < 2%

Analytical Results

Are you ready to take
this risk?

Analytical Method Validation

- Traditional vision:
 - Preliminary Conclusion:
- “**Good**” Methods do **NOT** necessarily provide
“**good**” Results !

8. Conclusions

Analytical Method Validation

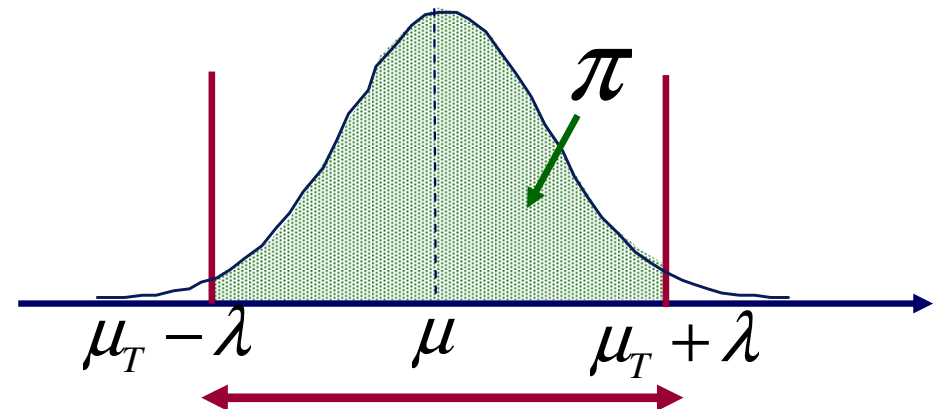

Aim of validation

Is to give to laboratories as well as to regulatory agencies the **guaranties** that each result that will be obtained in routine will be **close enough** to the unknown true value of the analyte in the sample.

$$\pi = P \left[|X_i - \mu_T| < \lambda \right] \geq \pi_{\min}$$

λ = predefined acceptance limits

π_{\min} = minimum probability that a result will be included inside $\pm \lambda$

E. Rozet et al., J. Chromatogr.A, 1158 (2007) 126

Aim of Analytical Method Validation

The aim of **validation** is evaluating whether the probability that each future result will be included within predefined acceptance limits is acceptable.

→ Based on the estimations of method's bias and precision.

$$E_{\hat{\delta}, \hat{\sigma}} \left\{ P \left[|X_i - \mu_T| < \lambda \right] \middle| \hat{\delta}, \hat{\sigma} \right\} \geq \pi_{\min}$$

Aim of Analytical Method Validation

The aim of **validation** is evaluating whether the **probability that each future result** will be included within the acceptance limits.

→ Based on the estimations of bias and precision.

$$E_{\hat{\delta}, \hat{\sigma}} \left\{ P \left[|X_i - \mu_T| < \lambda \right] \middle| \hat{\delta}, \hat{\sigma} \right\} \geq \pi_{\min}$$

Accuracy (total error)
required of each future
result

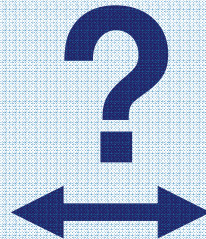

Aim of Analytical Method Validation

The aim of **validation** is evaluating whether the **probability that each future result** will be included within the acceptance limits.

→ Based on the **estimation of bias and precision**.

$$E_{\hat{\delta}, \hat{\sigma}} \left\{ P[|X_i - \mu_T| < \lambda] \right\}_{\hat{\delta}, \hat{\sigma}} \geq \pi_{\min}$$

Accuracy (total error)
required of each
future result

Missing Link

Estimators of the **method**
performances obtained during
the **validation** phase

Summary of the aims

Aims

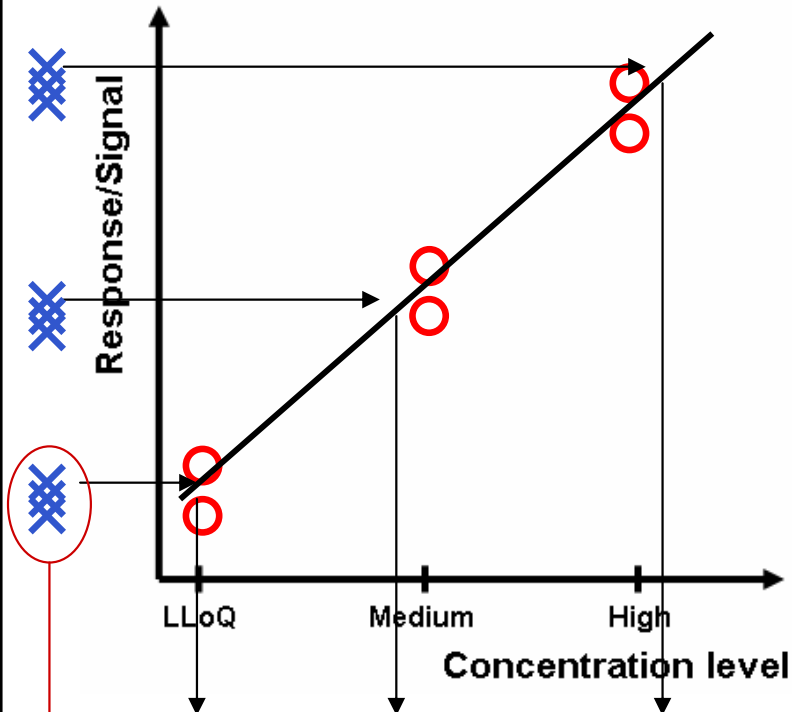

- Each single future result / not the past results.
- Futur results / not the method performances.
- The past performances of the method are useless to take a decision even if they provide information about the method.
- **Important to clarify the way the decision will be taken based on the results available.**

8. Conclusions

- How to decide about methods' validity ?
 - Do we need statistics ?
 - If yes, what statistical methodology ?
- ➔ Let's illustrate this through an example:

Example

- Validation of HPLC-UV method for the quantification of codeine and paracetamol in a drug product
- Design:
 - 3 series,
 - 3 repetitions per series for the validation standards
 - 3 concentration levels for the validation standards

How to decide ?

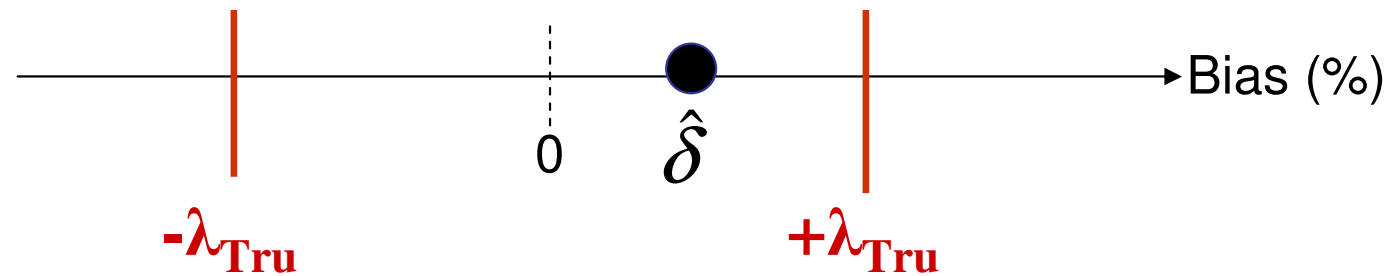

Traditional Approaches:

Separate evaluation of methods **Trueness** and **Precision** and comparison to predefined acceptance limits (λ).

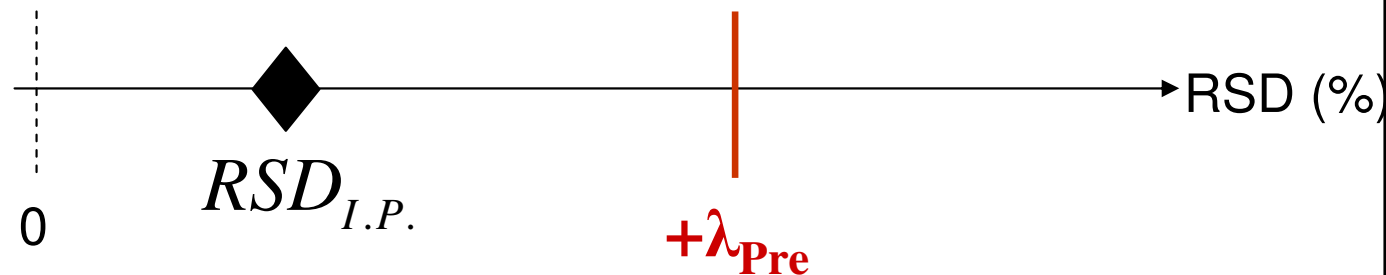

- Descriptive:
 - **trueness**: only based on estimation of method *bias*;
 - **precision**: only based on estimation of method $RSD_{I.P.}$.
- Difference:
 - **trueness**: based on bilateral Student t-test for *bias* significance.
- Equivalence:
 - **trueness**: based on confidence interval of the *bias* ($=TOST$);
 - **precision**: based on confidence interval of the intermediate precision variance.

Descriptive Approach

Trueness:

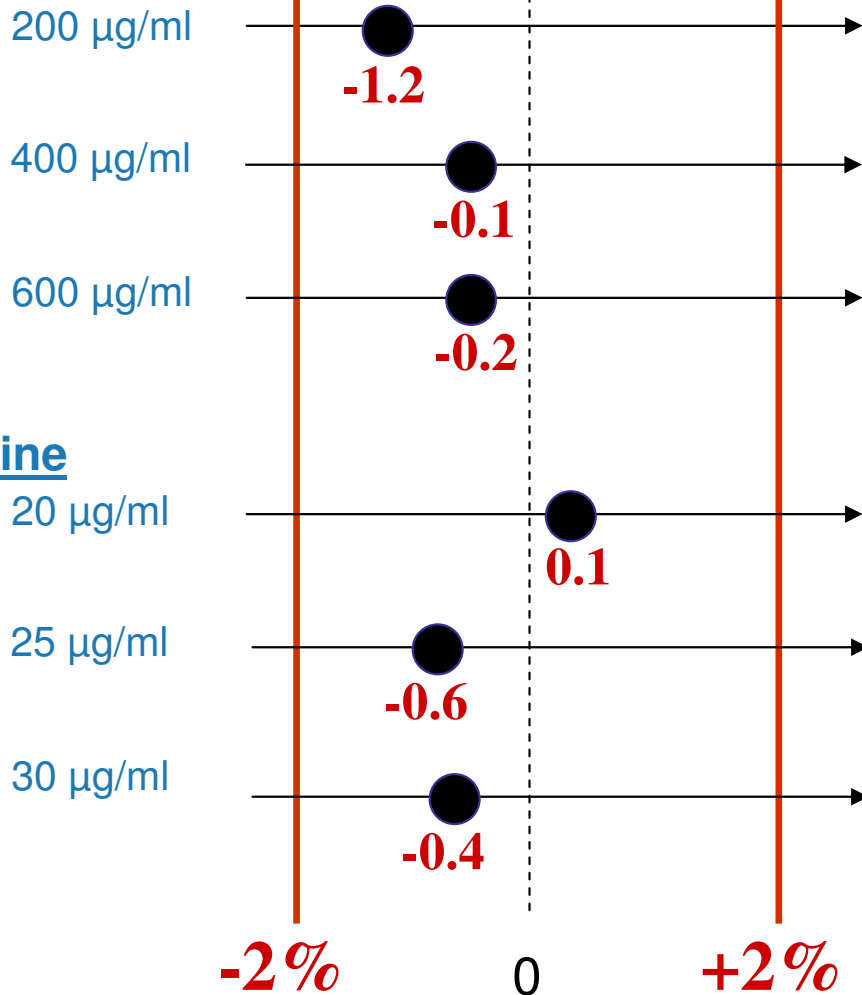

Precision:

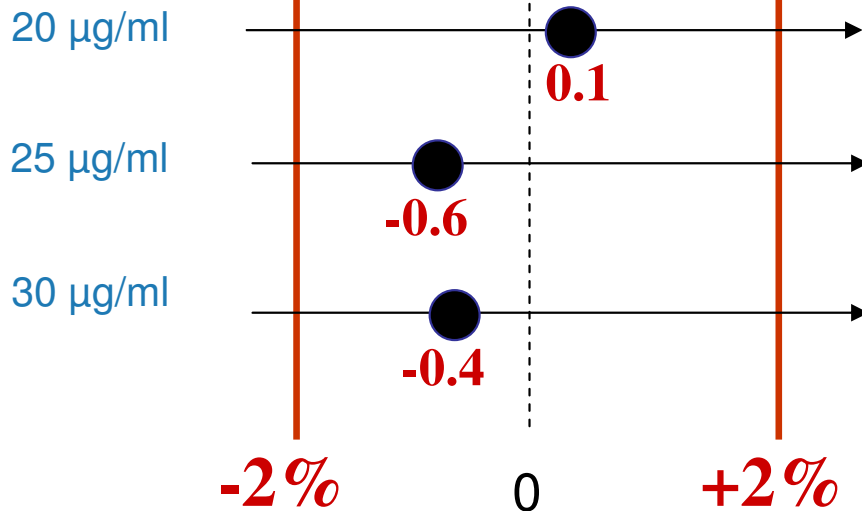

Example

Trueness

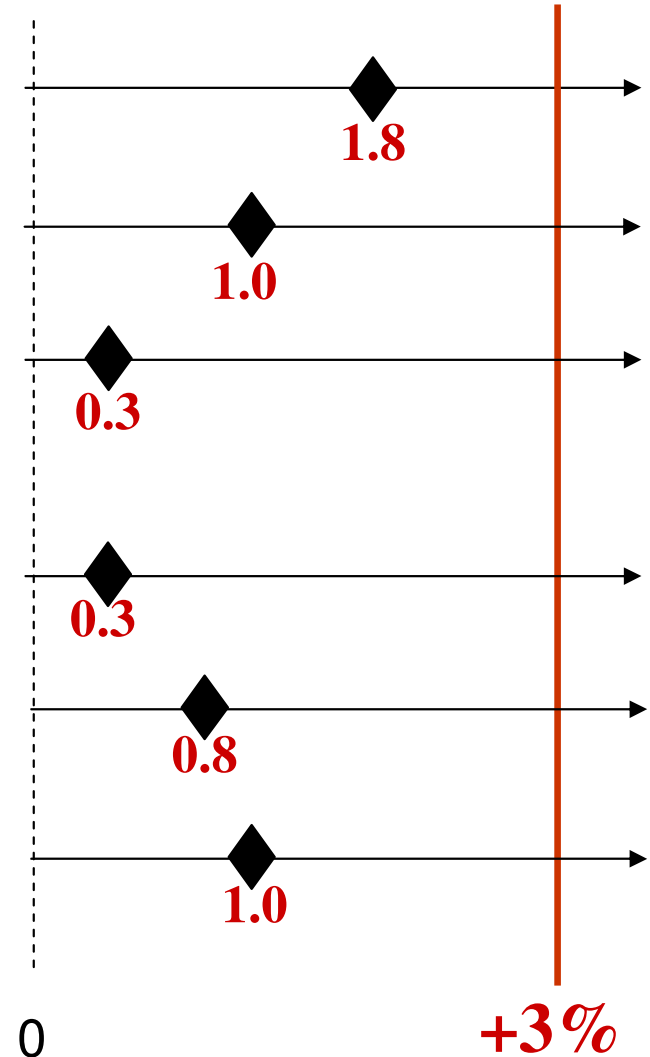

Paracetamol

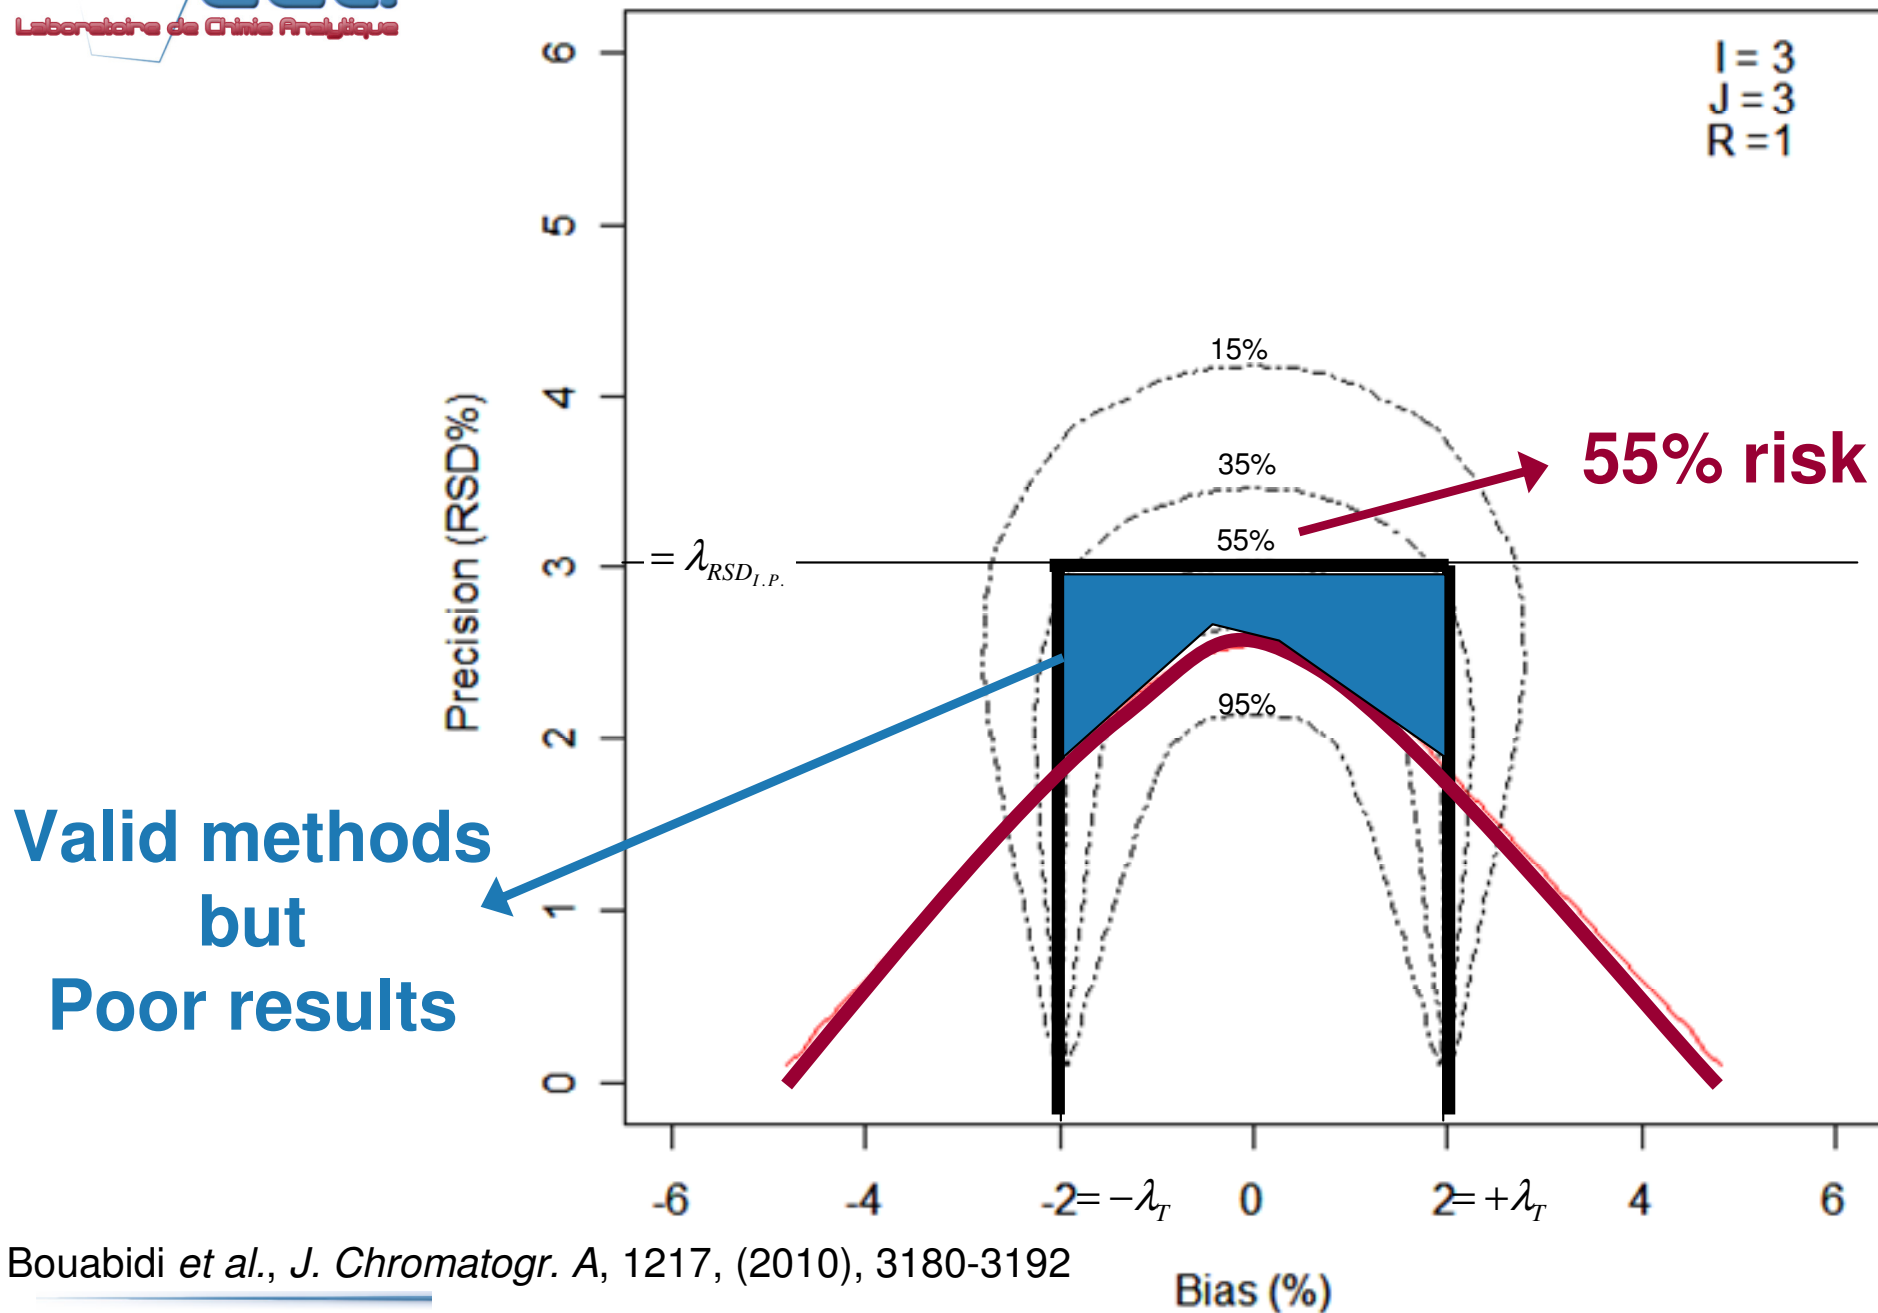

Codeine

Precision

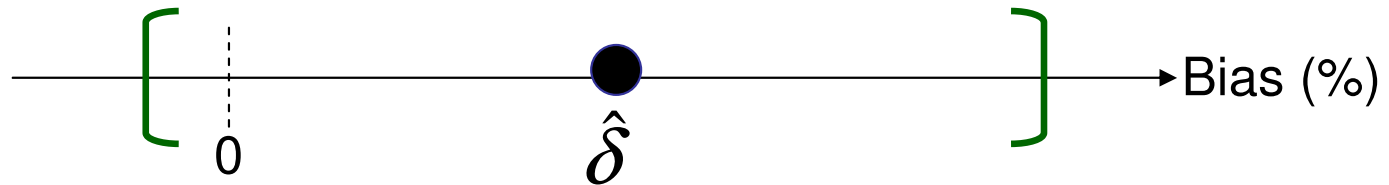

Descriptive: performance

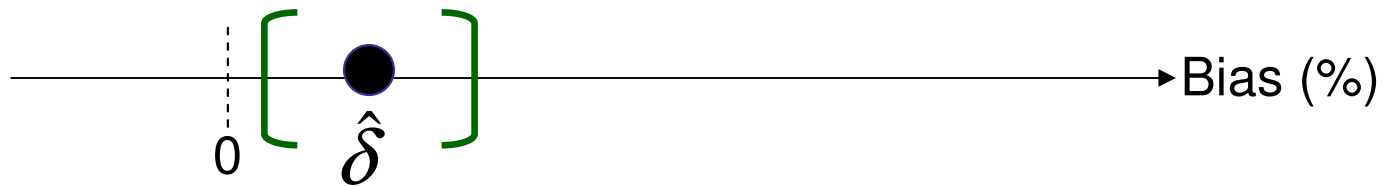

Difference Approach

$$H_0 : \delta = 0$$

$$H_1 : \delta \neq 0$$

No rejection of $H_0 \rightarrow$ Method **valid** !?

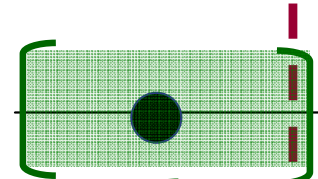

Rejection of $H_0 \rightarrow$ Method **not valid** !?

Example

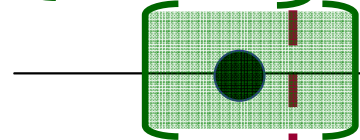

Trueness

Paracetamol

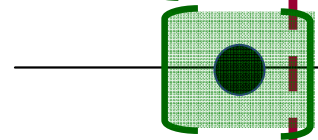

200 µg/ml

400 µg/ml

600 µg/ml

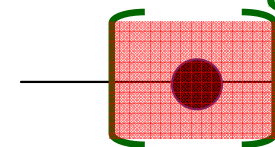

Codeine

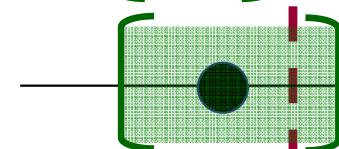

20 µg/ml

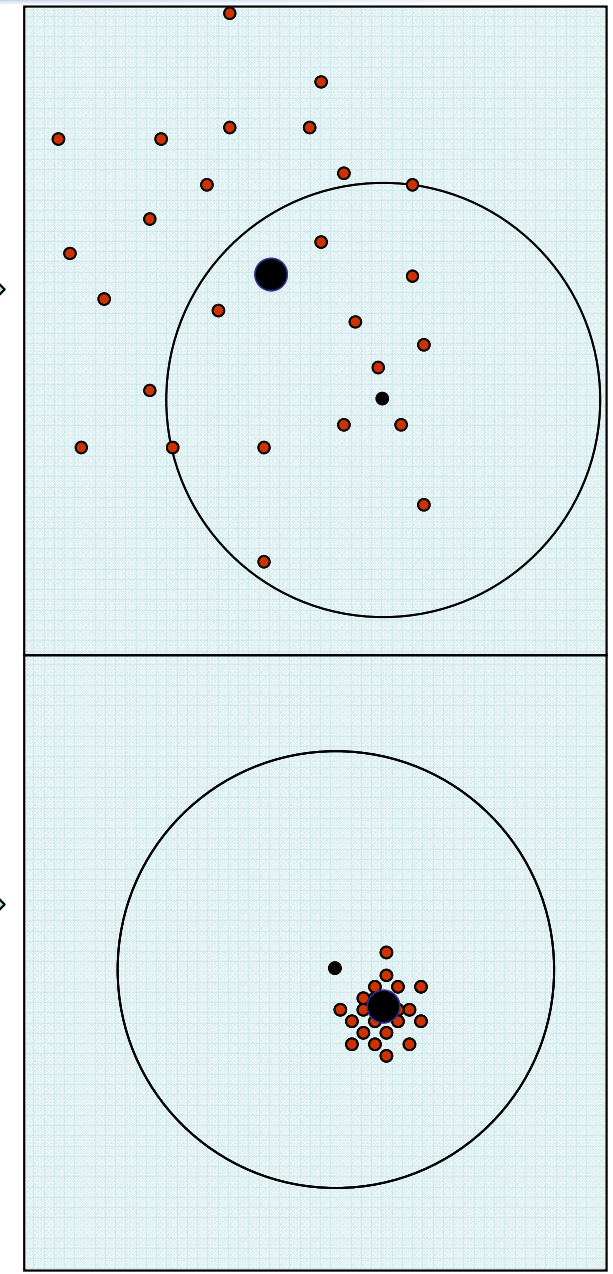

25 µg/ml

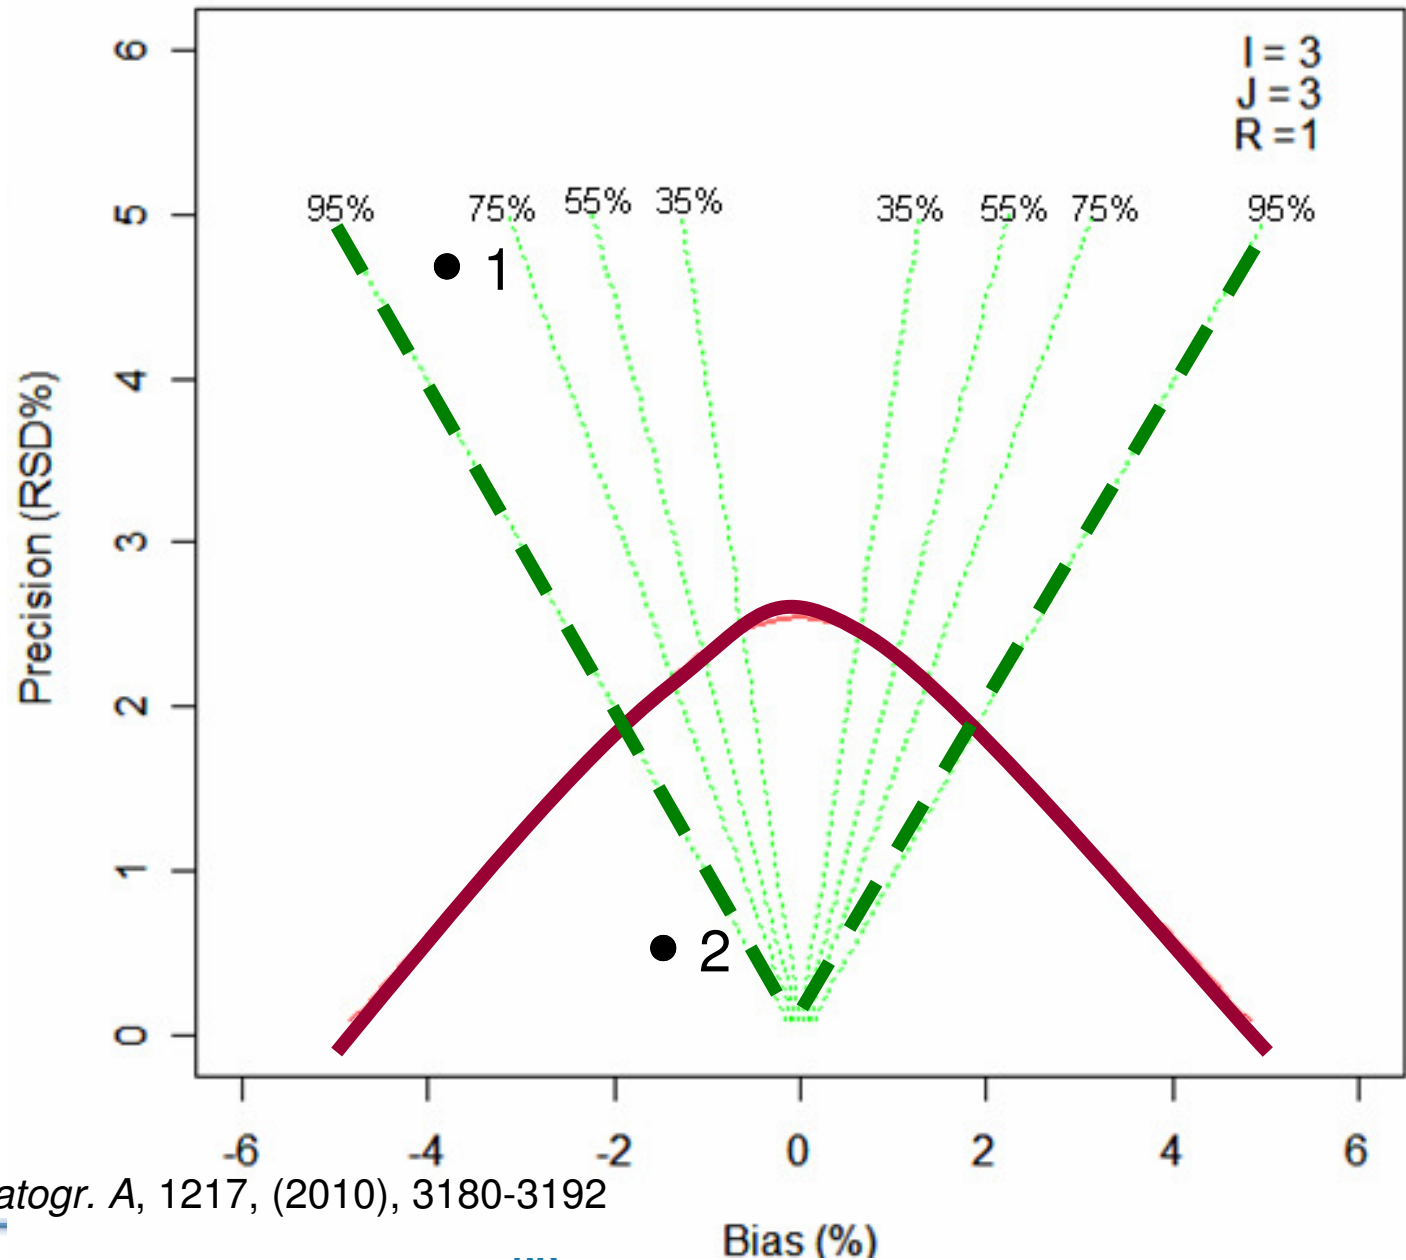

30 µg/ml

0%

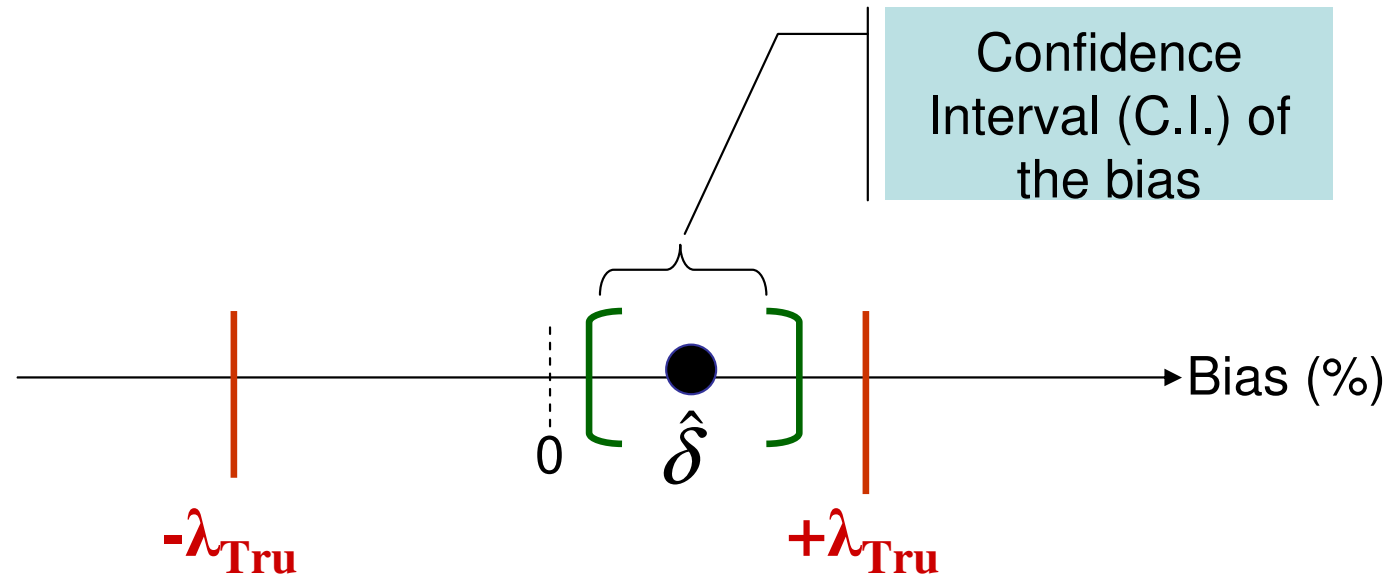

Difference: performance

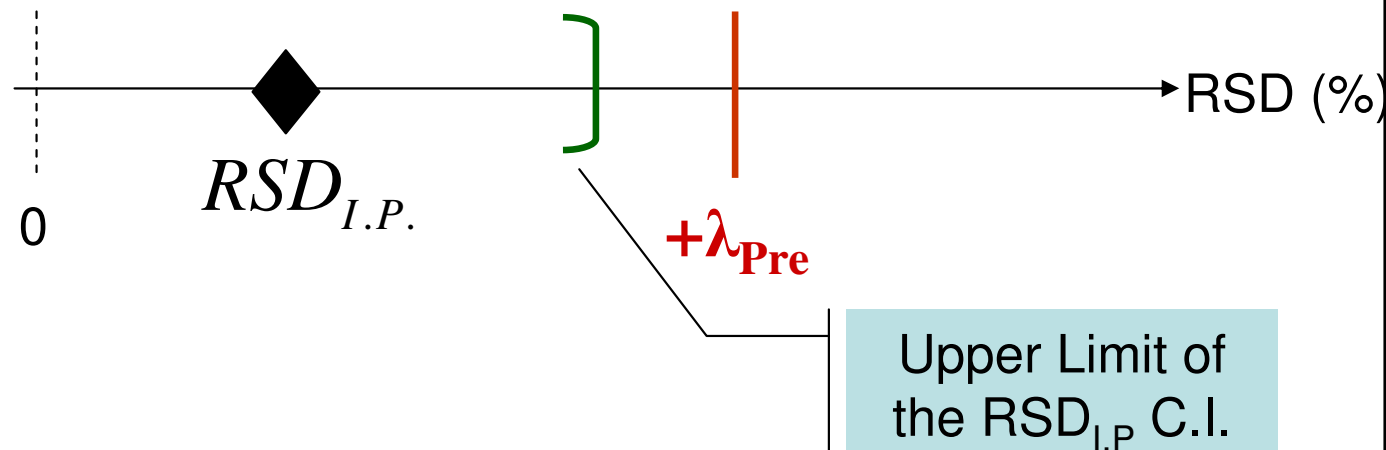

Equivalence Approach

Trueness:

Precision:

Example

Trueness

Paracetamol

200 µg/ml

400 µg/ml

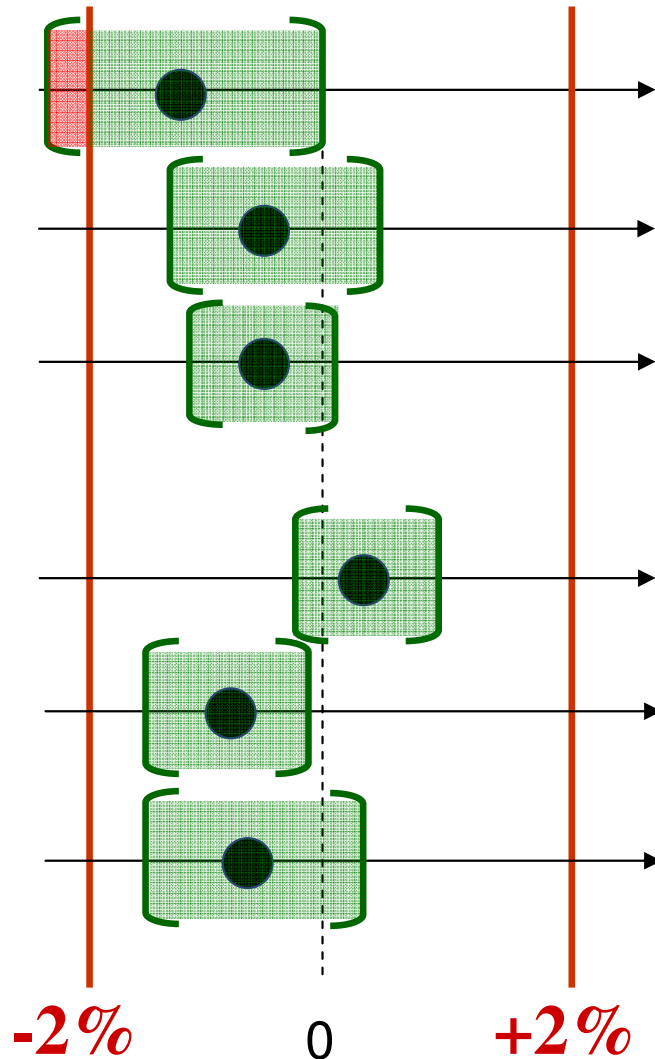

600 µg/ml

Codeine

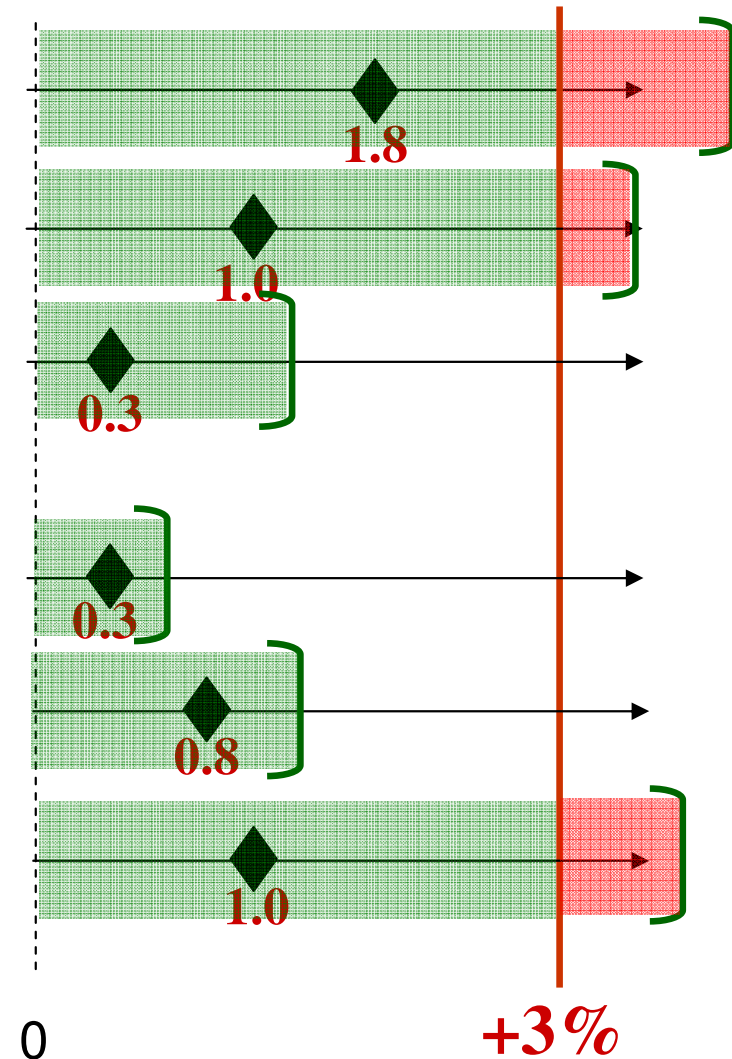

20 µg/ml

25 µg/ml

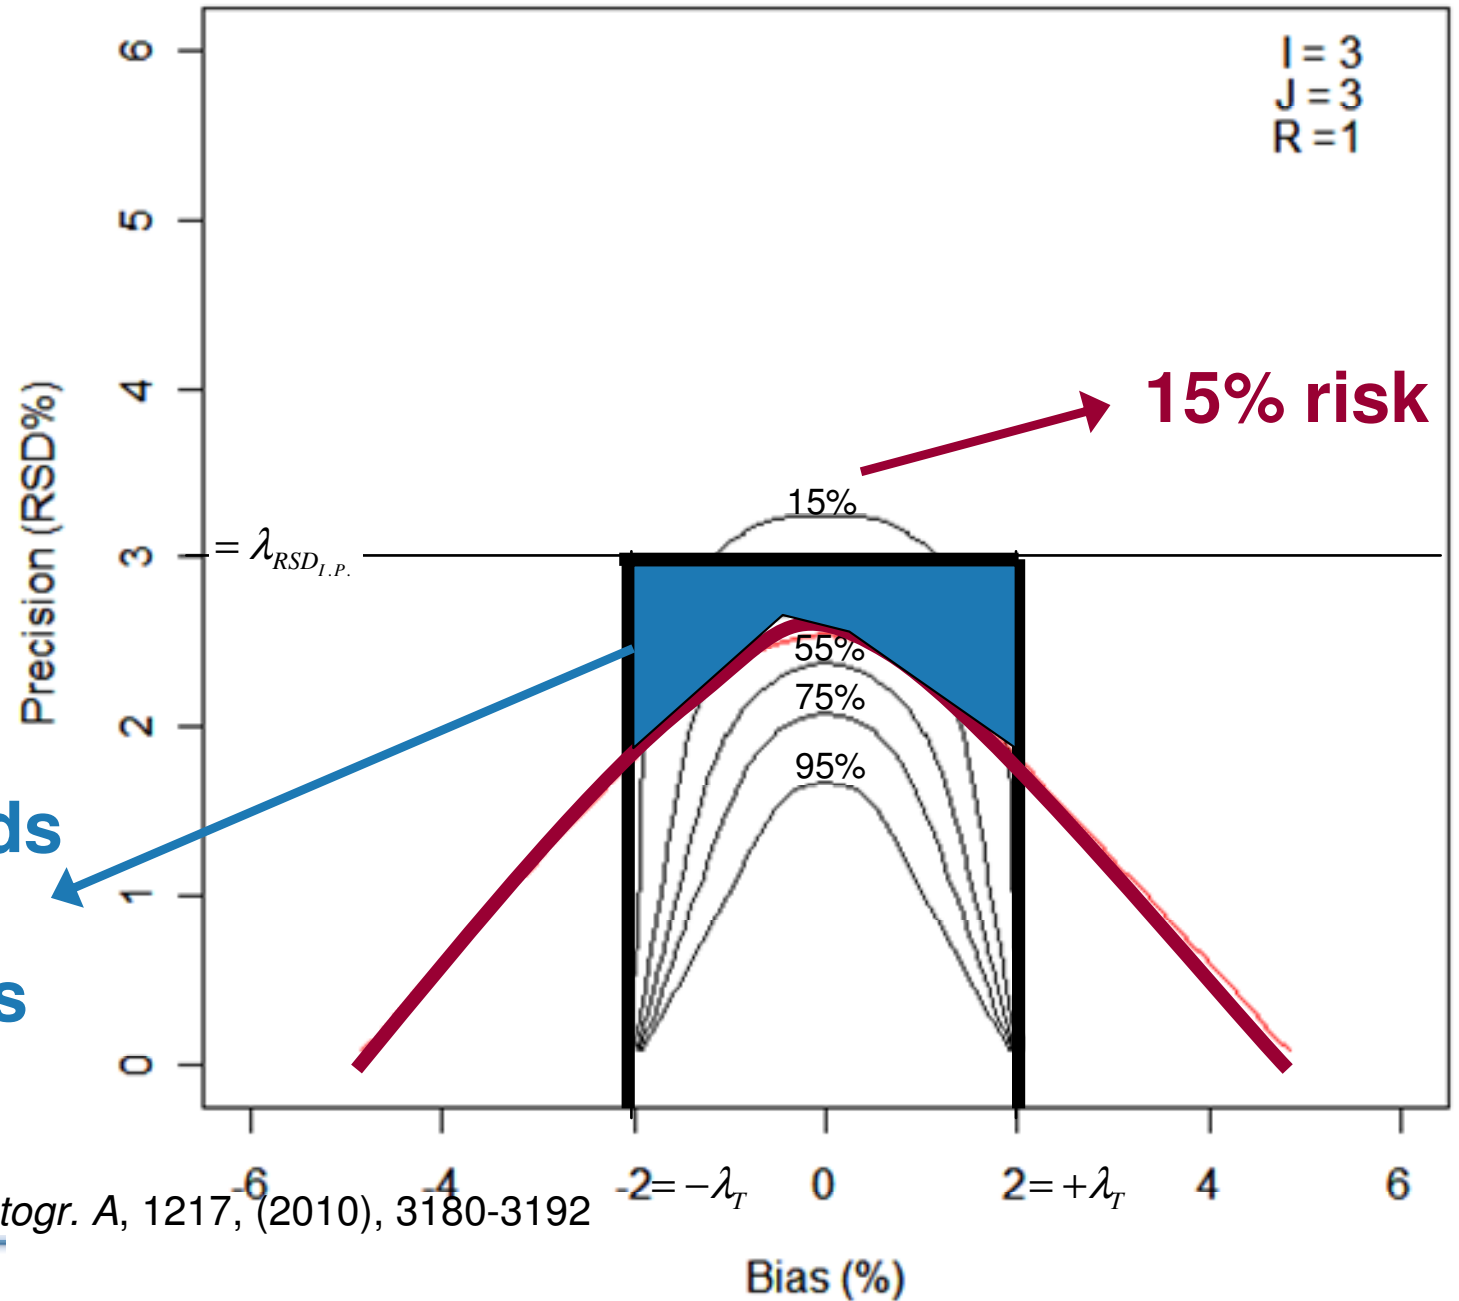

30 µg/ml

Precision

Equivalence: performance

- **Descriptive approach:**
 - no risk management
 - Up to 50% risk to take wrong decision
- **Difference approach:**
 - Useless for Method Validation purpose: Avoid it !
- **Equivalence approach**
 - Patient risk controlled
 - Nonetheless do not fully answer method validation aim: the method is “good” but not necessarily the results !

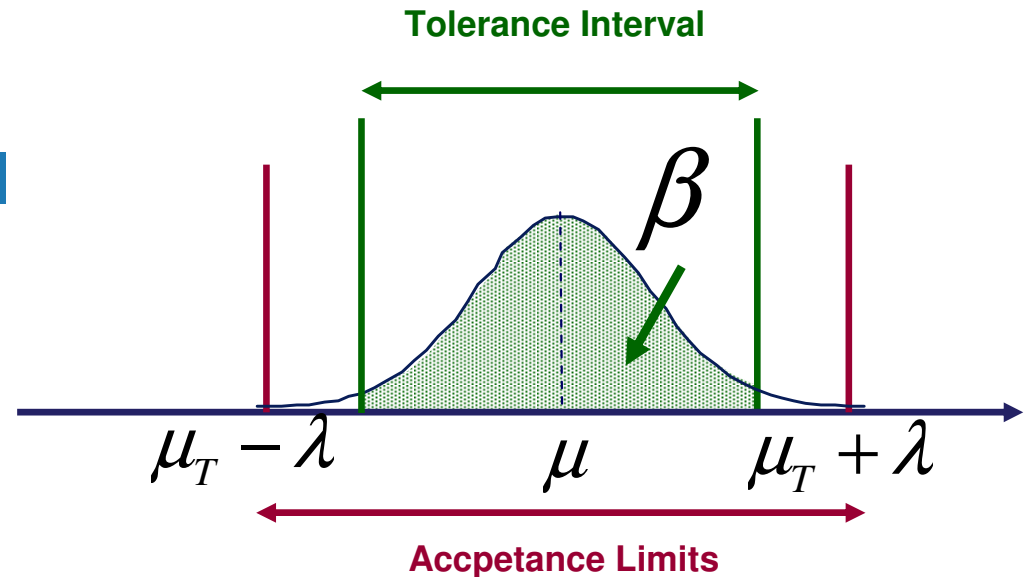

- Is there any better decision methodology ?

Tolerance Intervals

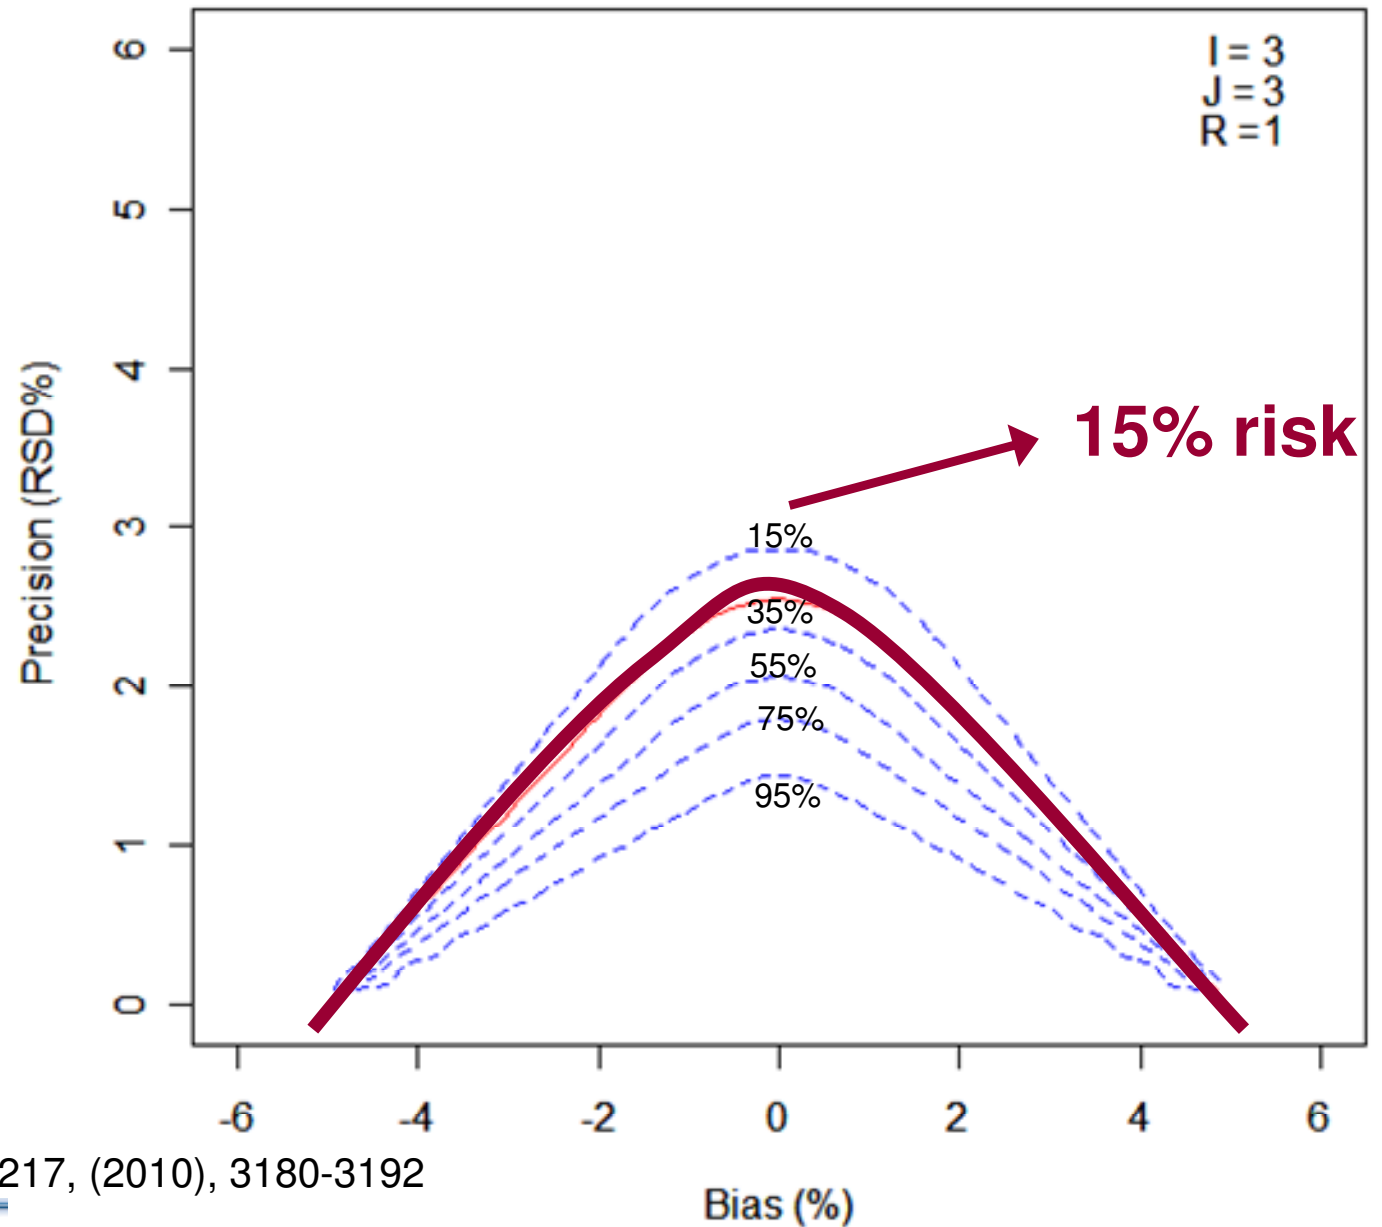

β -Expectation Tolerance Interval (β TI)

Allows to predict where each future result will fall (*Wald, 1942*).

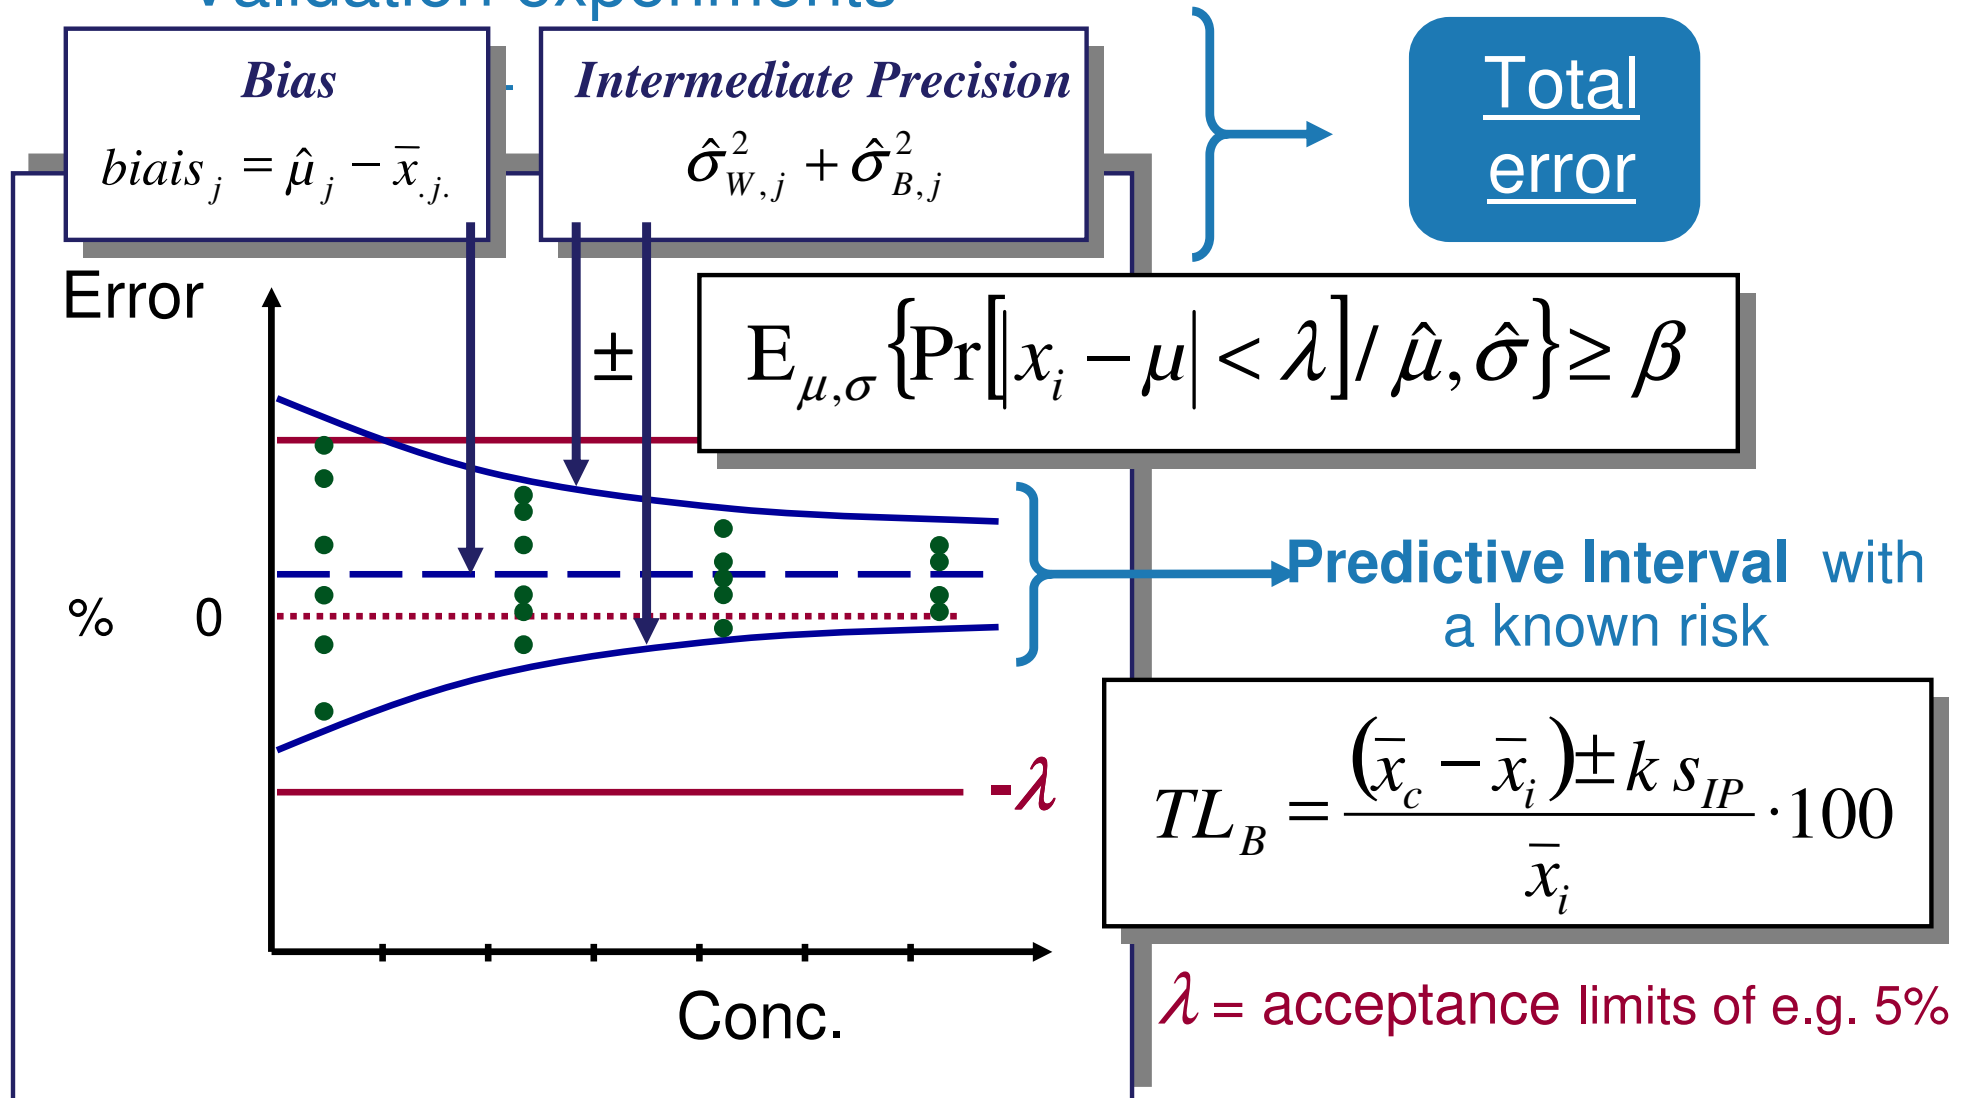

→ If the β -expectation tolerance interval is included inside the acceptance limits, then the **probability that each future result will be within the acceptance limits is at least β** (ex. 80%).

β TI : performance

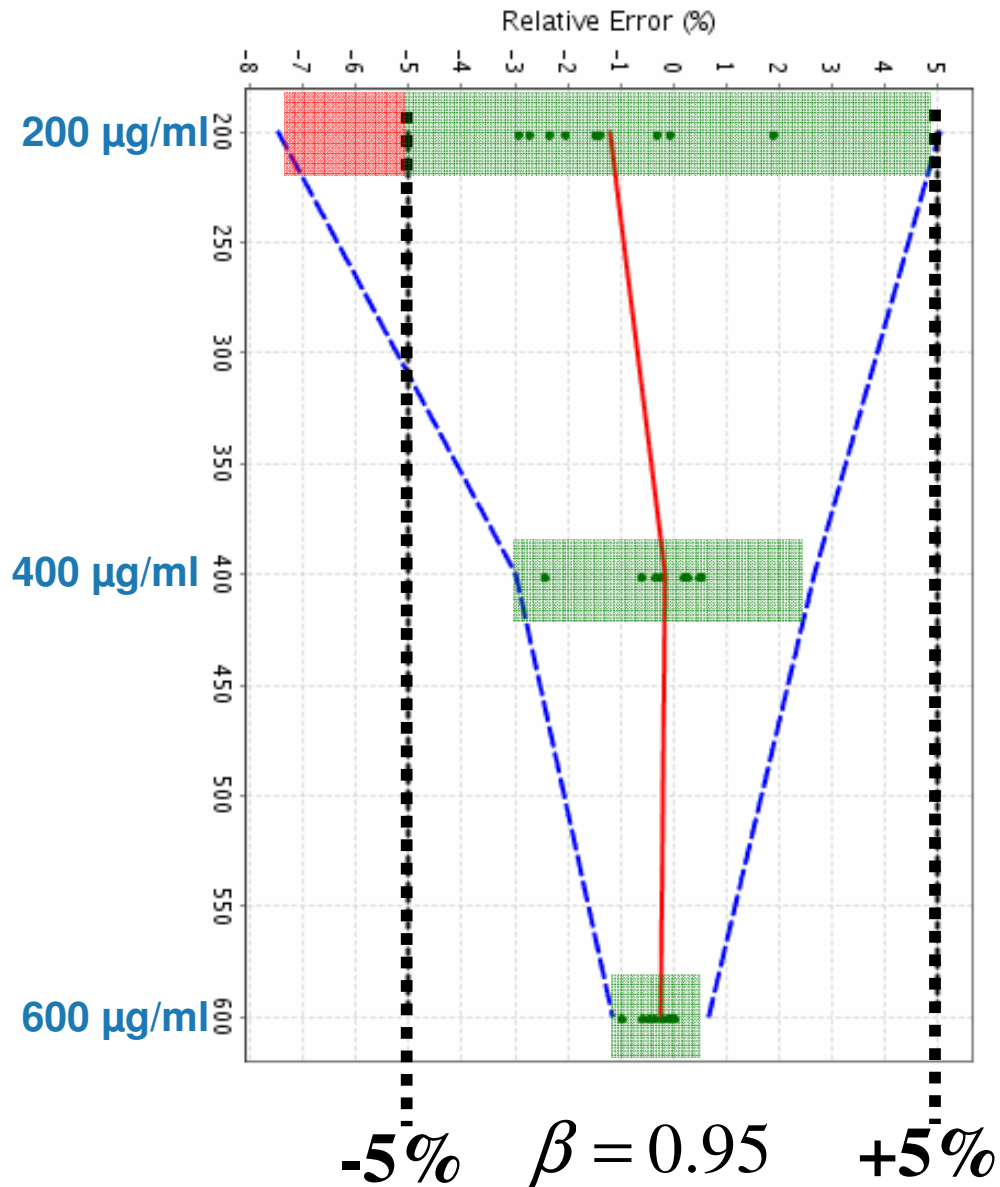

Accuracy Profile

Validation experiments

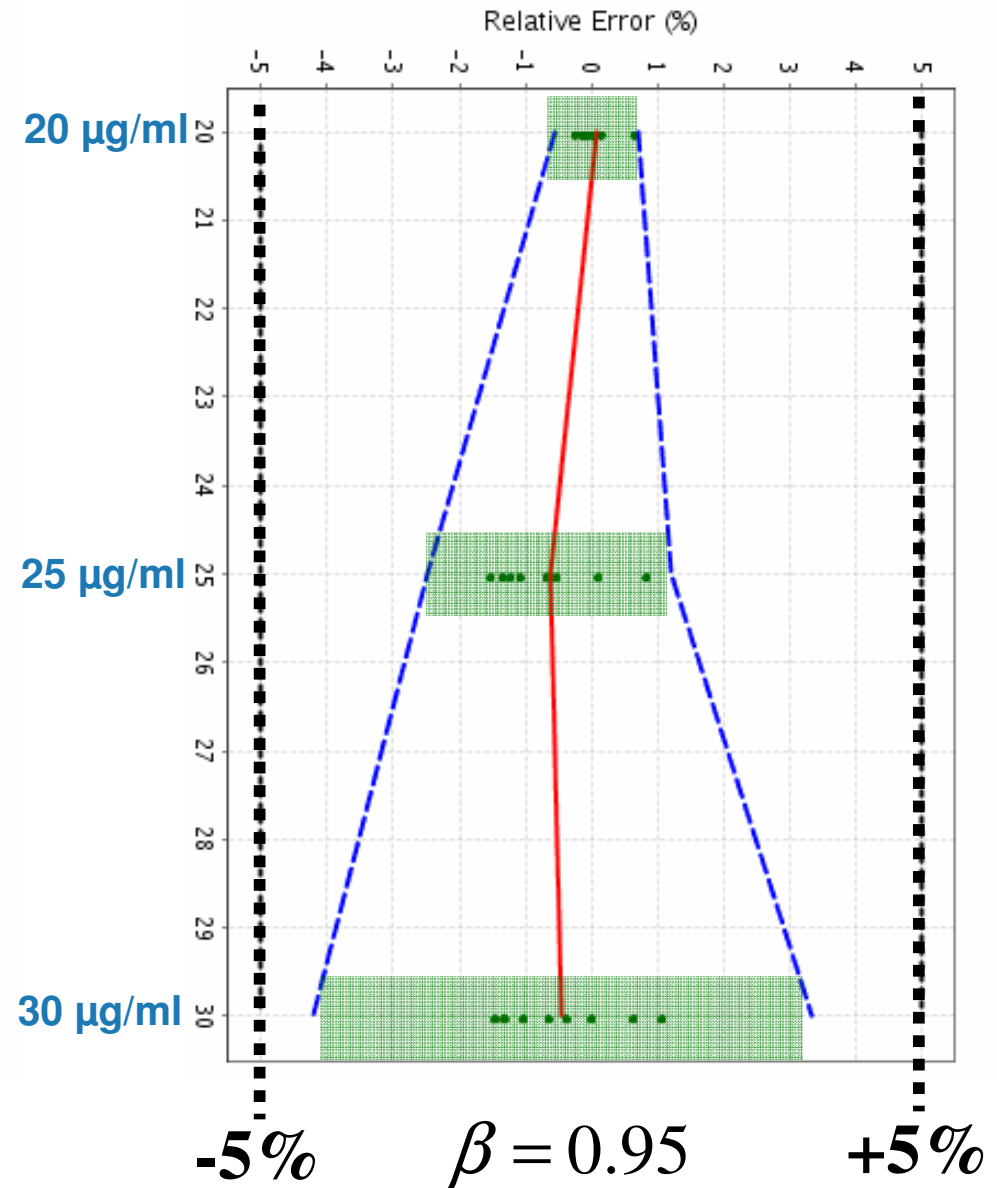

Example

Paracetamol

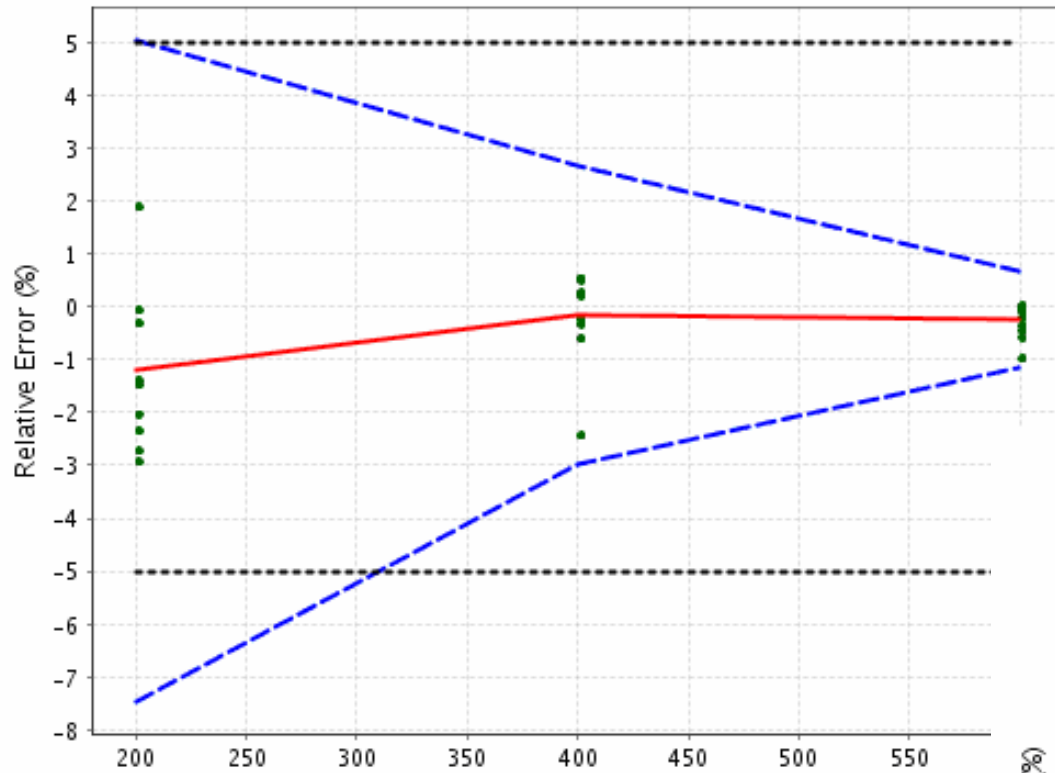

Codéine

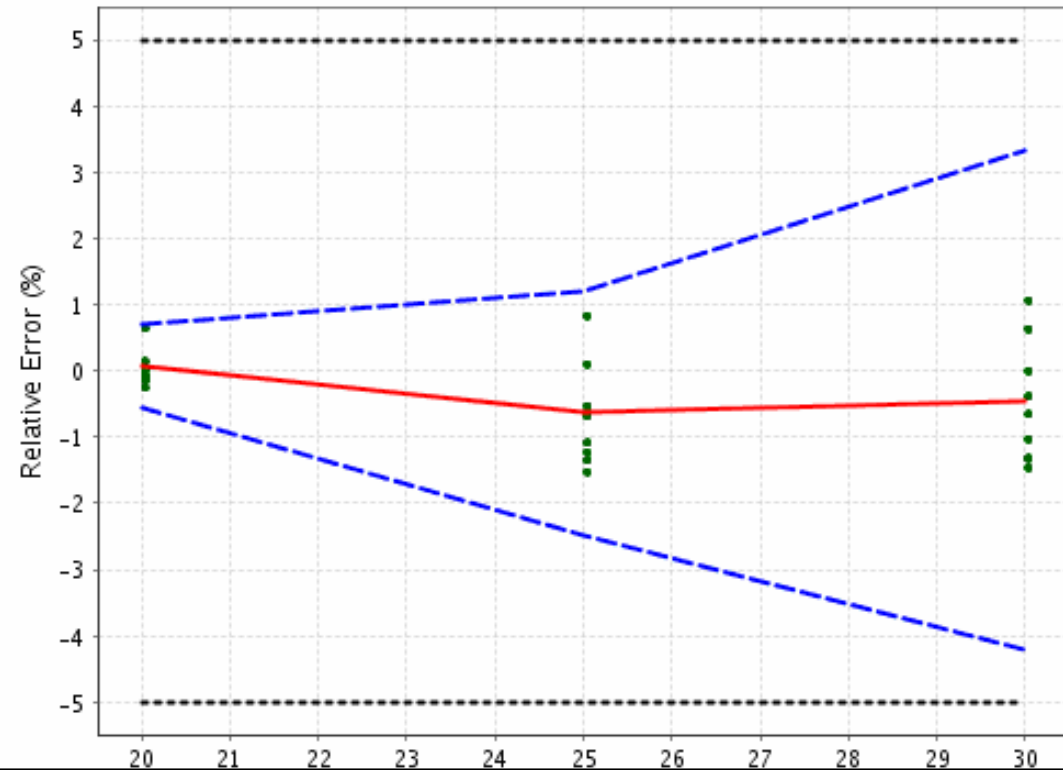

Example

Codéine

Analytical Method Validation

Analytical Results

Analytical Method

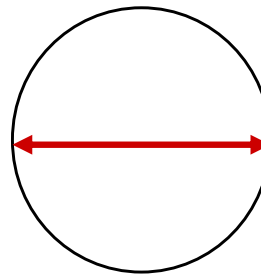

Bias

% Bias < 3%

Precision

% RSD < 2%

- Accuracy Profile Approach:

- Preliminary Conclusion:

“**Good**” Results can only be obtained by
“**good**” Methods !

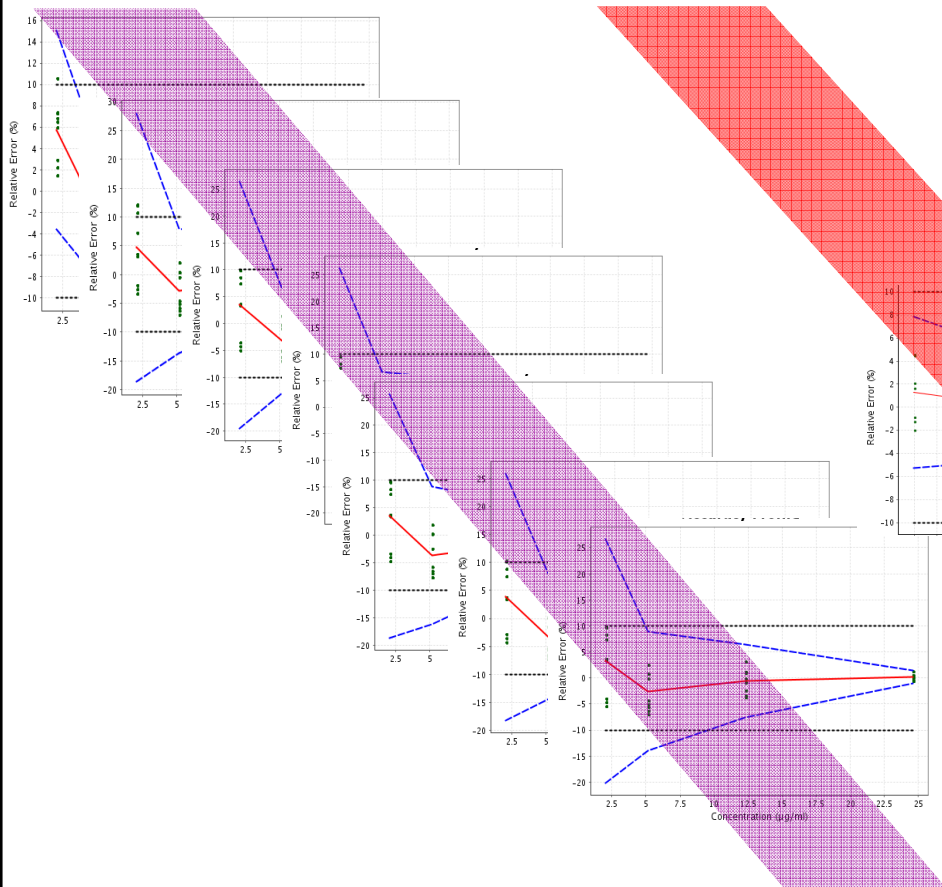

- Make a **decision on the results**, the very reason of an analytical quantitative method.
 - This way, it will guarantee your method is valid

5. Is my Method Valid ?
6. Applicability ?
7. Is this enough ?
8. Conclusions

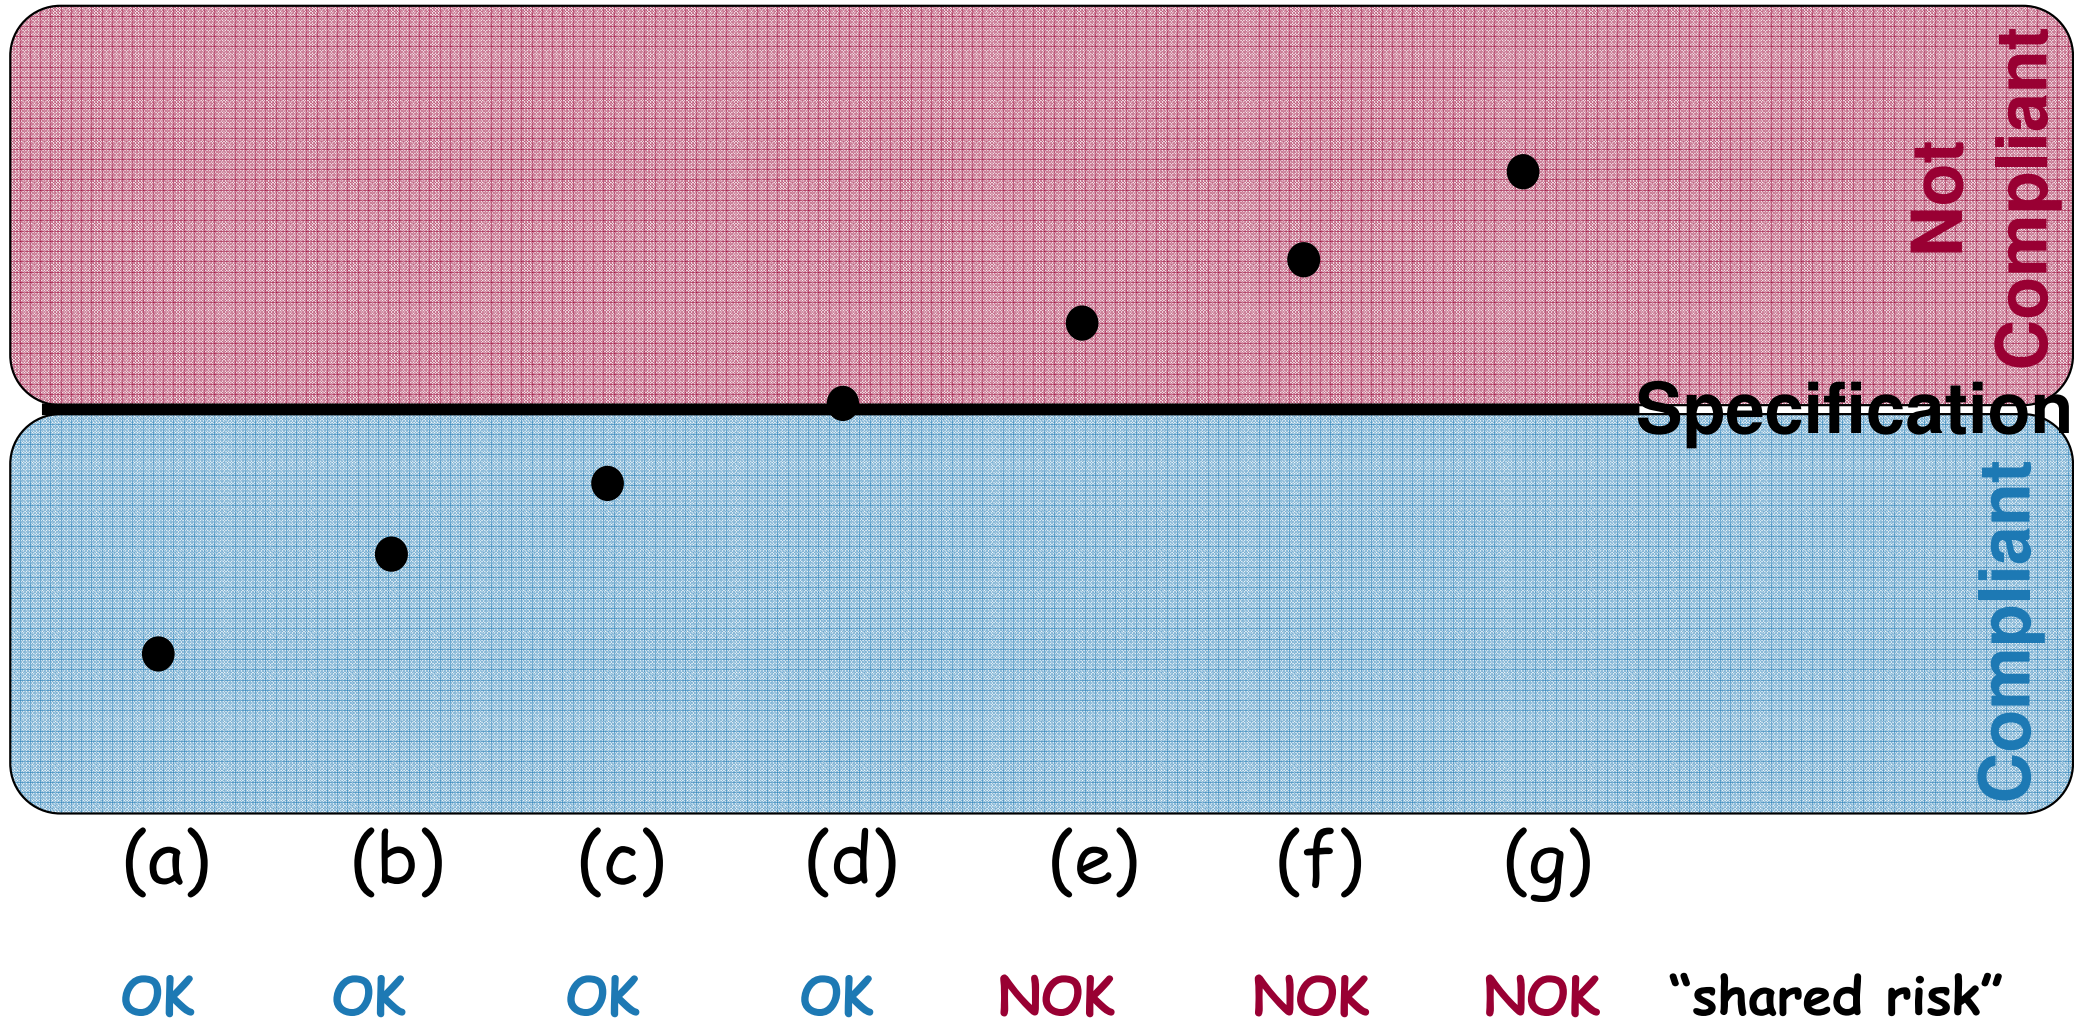

Measurement uncertainty

- The method is valid, is this enough ?
- Need measurement uncertainty:

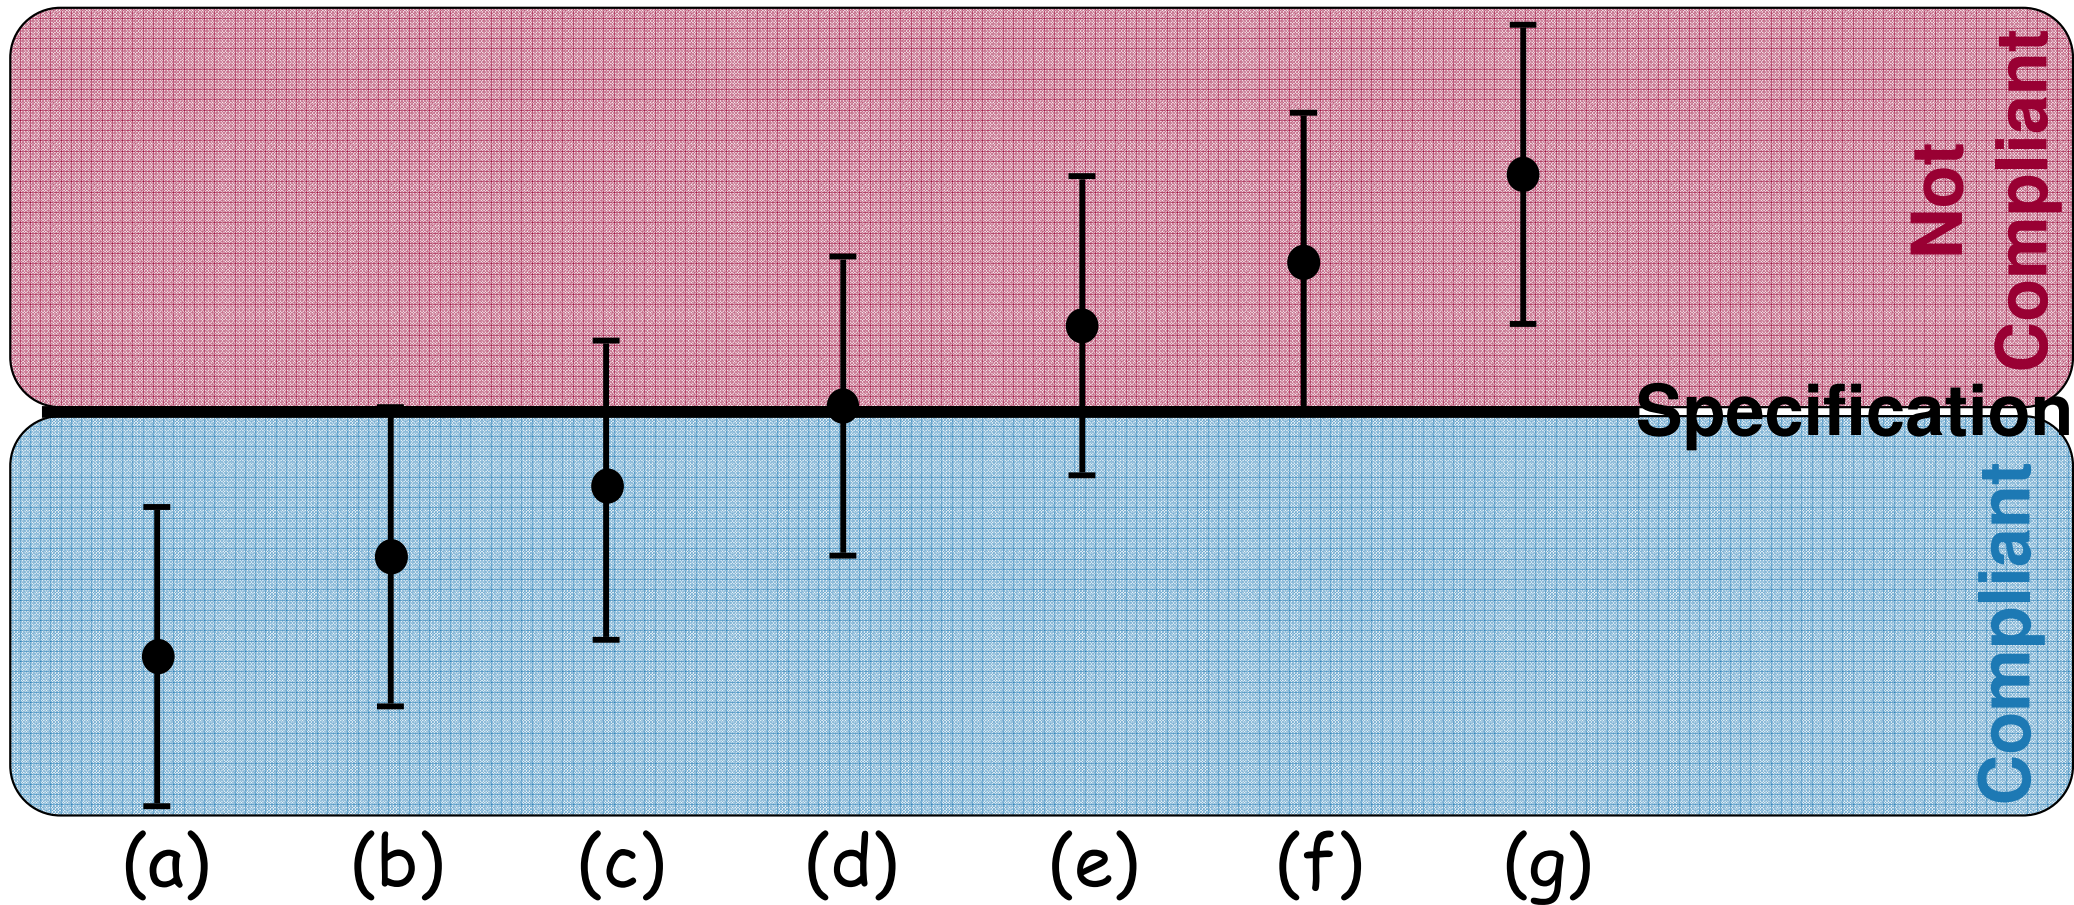

Results $\pm U$

- to:
 - **Interpret** adequately results
 - **Compare** results between them

Measurement uncertainty

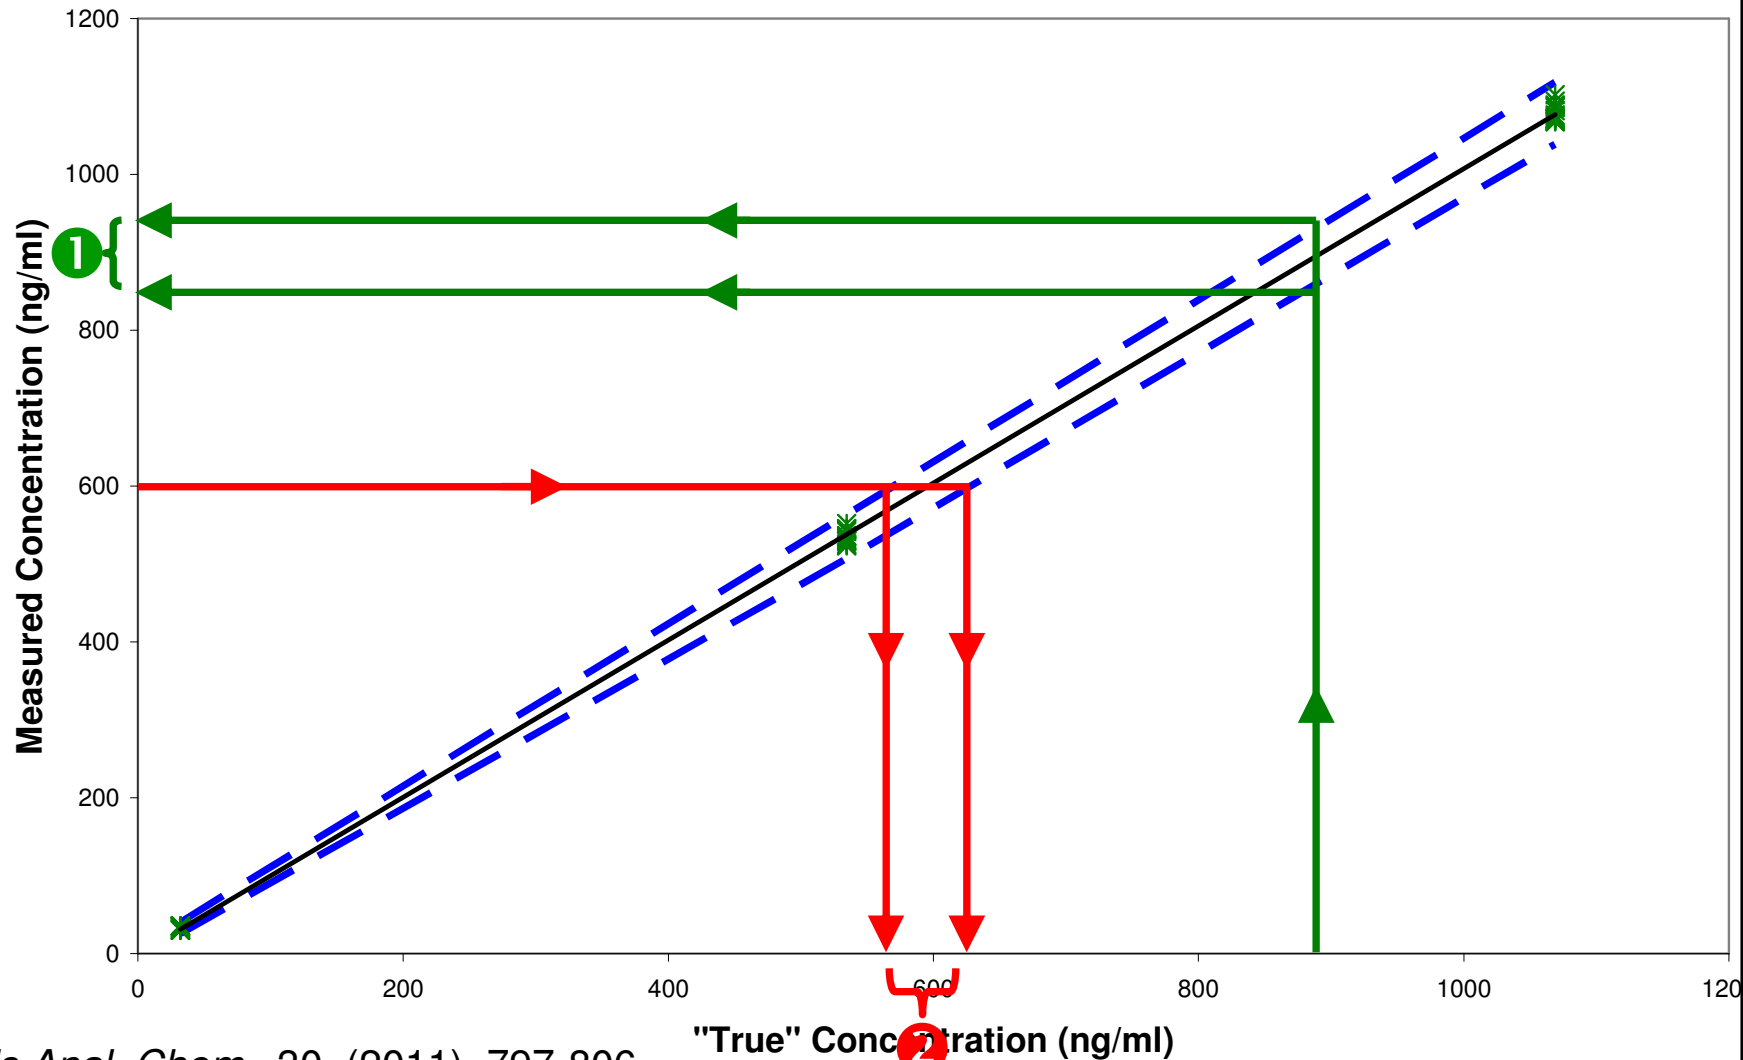

Measurement uncertainty

+U OK NOK NOK NOK NOK NOK "full risk"

Measurement uncertainty

- Use Method Validation Data:

Rozet et al., Trends Anal. Chem., 30, (2011), 797-806

Content

1. Aim of Analytical Method Validation
2. Traditional Analytical Method Validation
3. Rewarding Analytical Method Validation
4. Analytical Method Validation Design
5. Is my Method Valid ?
6. Applicability ?
7. Is this enough ?
8. **Conclusions**

Conclusions

- **Switch** from the traditional check list validation to a rewarding, useful and predictive method validation
- The **quality of future results** ($\approx \pi$) must be the objective and not the past performances of the method.
- The **β -expectation tolerance interval/Accuracy profile** fulfils this objective.
- In such a way, the **risks** are known at the end of the validation.

Conclusions

- Use method validation to obtain estimates of **measurement uncertainty** for routine real/incurred samples.
- **Universal** methodology applicable to **any** quantitative assay.
