¹Sizes based on *A. halleri* BAC sequences (Genbank accession numbers: EU382073.1, EU382072.1) [8], and on *A. thaliana* genome sequence (Genbank accession numbers: AC005724 and AC005917) for amplicons S1 and S13. Note that primers designed for amplicons S5, S7 and S10 non-specifically cross-amplified sequences from all three of these target gene copies in *A. halleri*; assignment to copies was then done based on S8 and according to Materials and Methods.

²TAIR 10 (<http://www.arabidopsis.org>).

³No PCR products were obtained for the given individuals despite attempts using a range of alternative primer pairs and PCR conditions.

⁴Amplicons were sequenced after cloning, using vector-specific primers M13f (CGCCAGGGTTTCCAGTCACGAC) and M13r (TCACACAGGAAACAGCTATGAC). When necessary, sequencing was completed using additional gene-specific primers.

⁵All *HMA4* gene copies correspond to At2g19110. *p*: promoter region.

⁶There is only a single complete *HMA4* gene in the *A. lyrata* genome, which corresponds to *AhHMA4-1* (S4, S5). See also Figure S1.

⁷For S8, only the 3'-end of the amplicon encompassing 492 bp (209 bp coding and 283 bp non-coding¹) was used as segment S8 in all analyses (see Figure S5A). The 5'-end of amplicon S8 (819 bp¹) was designed to overlap with S7 and used to identify S7 sequences (see Materials and Methods; Figure S5A).

Red fonts: segments comprising repeated sequence stretches present in several, almost identical copies in the *HMA4* genomic region.

Table S2. Summary of statistics of nucleotide sequence diversity as shown in Figure 1.

Values for BAC and *A. lyrata* are based on public data [8,39]. Genotypes for which only a single consensus sequence was obtained were concluded to be homozygous, and the second allele was inferred. Assignment to *HMA4* gene copy of S5, S7 and S10 was done by inference upon the assignment to S7 through anchoring *via* overlapping S8 sequences according to Materials and Methods (marked “/”; ⁺: ambiguous assignment to S5 or S10). Grey shade: amplicons in triplicated region (*HMA4* and two downstream genes, see Figure 1). Red fonts: segments comprising repeated sequence stretches present in several, almost identical copies in the *HMA4* genomic region. n.a.: not applicable; sequences did not evolve independently because of ectopic gene conversion, thus precluding tests of molecular population genetics. [§]: $P < 0.05$. -: no PCR product obtained. x: not present in the genome. *: Primer pairs designed to obtain S6 and S9 (see Table S1) both yielded the same set of four highly similar sequences (see Figure S1). ¹Parameters for the *A. halleri* ssp. *gemmifera* and *A. lyrata* ssp. *lyrata* individuals are only shown for comparison; their sequences were not included in the analyses presented above and in Figure 1.

Table S3. Identification within amplicons of repeated sequence stretches present in several copies in the *HMA4* genomic region.**A.** Sequence similarities between amplified segments and sequences within BAC contig of the *A. halleri* genomic *HMA4* region.

¹Sequence identities and hit lengths are given for the top-scoring non-self hits running amplicon sequences (predicted based on BAC contig) as queries against the *HMA4* BAC contig in BLASTN with default settings at NCBI (Genbank accession numbers EU382073.1 and EU382072.1; contig length 289,768 bp [8]).

²All three genes (At2g19010/S2, At2g19050 and At2g19060) encode putative GDSL-motif lipase/hydrolase family proteins.

Note that sequences corresponding to S1 and S13 are not present in the *HMA4* BAC contig. Red fonts: segments comprising repeated sequence stretches present in several, almost identical copies in the genomic *HMA4* region. r.c.: reverse complement. -: no significant hit.

B. Sequence similarities between amplified segments of *A. halleri* and sequences in the *A. thaliana* and *A. lyrata* ssp. *lyrata* genomes.

¹Sequence identities and hit lengths are given for the two top-scoring hits from BLASTN with default settings using amplicon sequences as queries against all *A. thaliana* and *A. lyrata* ssp. *lyrata* sequences at NCBI.

²*AtHMA4*.

³Truncated pseudogene copy of *HMA4* present only in *A. lyrata* and corresponding to the 3'-end of *HMA4* (see Figure S1).

⁴Part of the At2g19010/At19020 intergenic region of the *A. halleri* S2 sequences contains repeats found at multiple sites on multiple chromosomes of *A. thaliana*.

Red fonts: segments comprising repeated sequence stretches present in several, almost identical copies in the *HMA4* genomic region of *A. halleri*. r.c.: reverse complement.-: no significant hit.

Table S4. Robustness of π estimation.**A.** Estimation of error in π resulting from uncertainties in the assignment of sequences to *HMA4* gene copy (for S5, S7 and S10).

Locus	Genotypes								
	All <i>A. halleri</i> ssp. <i>halleri</i>			Harz Mountains			Thuringian Forest		
	<i>N</i>	No. of sites	π	<i>N</i>	No. of sites	π	<i>N</i>	No. of sites	π
S5 only (<i>HMA4-1</i>)	35	1320	0.0042	22	1320	0.0042	11	1336	0.0025
S5 + ambiguous S5/S10	40	1320	0.0043	25	1320	0.0042	13	1336	0.0033
S7 anchored based on S8	34	1327	0.0032	22	1327	0.0032	10	1327	0.0020
S7 only (<i>HMA4-2</i>)	37	1327	0.0031	23	1327	0.0033	12	1327	0.0019
S7 + ambiguous S7/S10	39	1327	0.0032	25	1327	0.0033	12	1327	0.0019
S10 only (<i>HMA4-3</i>)	34	1336	0.0035	21	1336	0.0039	11	1349	0.0035
S10 + ambiguous S5/S10	41	1320	0.0036	26	1320	0.0039	13	1349	0.0036

No. of sites are numbers of informative sites, excluding those with gaps. Sequences that could not be assigned to a single *HMA4* gene copy are named ambiguous (see Figure 4, Figure S4).

B. Dependence of π on variation in sampling.

Genotypes	Segment												
	S1	S2	S3	S4	S5	S6	S7	S8	S9	S10	S11	S12	S13
All <i>A. halleri</i> ssp. <i>halleri</i>	0.0049	0.0059	0.0021	0.0018	0.0042	0.0010	0.0032	0.0052	0.0001	0.0035	0.0008	0.0069	0.0091

	Reverse	CGTTTCGGAGAATCCTCGC	CGTTTCGGAGAATCCTCGC	CGTTTCGGAGAATCCTCGC	

All primer sequences are given in 5'- to 3'-direction. The *HMA4* and S13 primers for *A. halleri* were designed based on an alignment of all S5/S7/S10 and S13 consensus sequences (see Figure 1, Table S1), respectively, in order to ensure the absence of polymorphisms within primer binding sites. The *FRD3* primers for *A. halleri* were designed based on available sequences from the Lan3.1 individual of the Langelshheim population [12]. The *A. thaliana* and *A. lyrata* ssp. *lyrata* primers were designed based on available genome sequences [39,73].

[†]: arithmetic mean ± s. e. m., *n* equals the number of replicate PCR reactions per amplicon.
