

# Generalized pointwise Hölder spaces

D. Kreit & S. Nicolay

Nord-Pas de Calais/Belgium congress of Mathematics

October 28–31 2013

A function  $f \in L_{\text{loc}}^{\infty}(\mathbb{R}^d)$  belongs to  $\Lambda^s(x_0)$  if there exists a polynomial of degree at most  $s$  s.t.

$$\sup_{|h| \leq 2^{-j}} |f(x_0 + h) - P(h)| \leq C2^{-js},$$

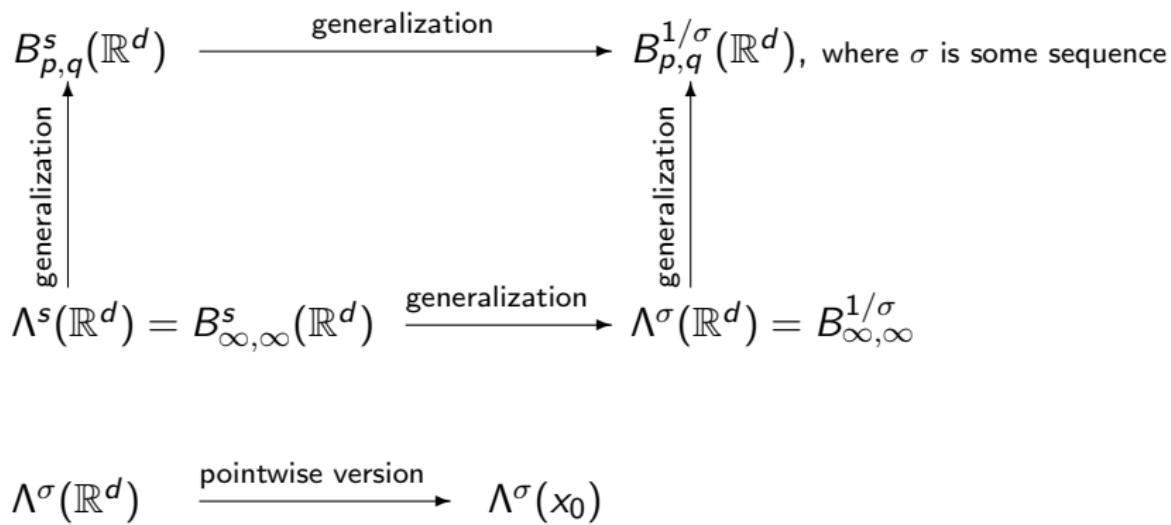

for  $j$  sufficiently large.

Is it possible to be sharper and replace the sequence  $(2^{-js})_j$  with a more general sequence  $\sigma = (\sigma_j)_j$  :

$f \in L_{\text{loc}}^{\infty}(\mathbb{R}^d)$  belongs to  $\Lambda^{\sigma, M}(x_0)$  if there exists a polynomial of degree at most  $M$  s.t.

$$\sup_{|h| \leq 2^{-j}} |f(x_0 + h) - P(h)| \leq C\sigma_j,$$

for  $j$  sufficiently large.

A sequence of real positive numbers is called admissible if

$$\frac{\sigma_{j+1}}{\sigma_j}$$

is bounded.

For such a sequence, we set

$$\underline{s}(\sigma) = \lim_j \frac{\log_2(\inf_{k \in \mathbb{N}} \frac{\sigma_{j+k}}{\sigma_j})}{j}$$

and

$$\overline{s}(\sigma) = \lim_j \frac{\log_2(\sup_{k \in \mathbb{N}} \frac{\sigma_{j+k}}{\sigma_j})}{j}.$$

- the open unit ball centered at the origin is denoted  $B$ ,
- the set of polynomials of degree at most  $n$  is denoted  $\mathbf{P}[n]$ ,
- $[s] = \sup\{n \in \mathbb{Z} : n \leq s\}$ ,
- if  $f$  is defined on  $\mathbb{R}^d$ ,

$$\Delta_h^1 f(x) = f(x + h) - f(x)$$

and

$$\Delta_h^{n+1} f(x) = \Delta_h^1 \Delta_h^n f(x),$$

for any  $x, h \in \mathbb{R}^d$

## Definition

Les  $s > 0$  and  $\sigma$  an admissible sequence ; a function  $f \in L^\infty(\mathbb{R}^d)$  belongs to  $\Lambda^{\sigma,M}(\mathbb{R}^d)$  iff there exists  $C > 0$  s.t.

$$\sup_{|h| \leq 2^{-j}} \|\Delta_h^{[M]+1} f\|_\infty \leq C\sigma_j$$

## Proposition

Les  $s > 0$  and  $\sigma$  an admissible sequence ; a function  $f \in L^\infty(\mathbb{R}^d)$  belongs to  $\Lambda^{\sigma,s}(\mathbb{R}^d)$  iff there exists  $C > 0$  s.t.

$$\inf_{P \in \mathbf{P}^{[M]}} \|f - P\|_{L^\infty(2^{-j}B+x_0)} \leq C\sigma_j,$$

for any  $x_0 \in \mathbb{R}^d$  and any  $j \in \mathbb{N}$ .

## Definition

A function  $f \in L_{\text{loc}}^{\infty}(\mathbb{R}^d)$  belongs to  $\Lambda^{\sigma, M}(x_0)$  iff there exists  $C > 0$  and  $J \in \mathbb{N}$  s.t.

$$\inf_{P \in \mathbf{P}[M]} \|f - P\|_{L^{\infty}(2^{-j}B + x_0)} \leq C\sigma_j,$$

for any  $j \geq J$ .

## Definition

A function  $f \in L_{\text{loc}}^{\infty}(\mathbb{R}^d)$  belongs to  $\Lambda^{\sigma, M}(x_0)$  iff there exists  $C > 0$  and  $J \in \mathbb{N}$  s.t. for any  $j \geq J$ , there exists  $P_j \in \mathbf{P}[M]$  for which

$$\sup_{|h| < 2^{-j}} |f(x_0 + h) - P_j(x_0 + h)| \leq C\sigma_j.$$

What about the classical case

A function  $f \in L_{\text{loc}}^{\infty}(\mathbb{R}^d)$  belongs to  $\Lambda^s(x_0)$  ( $s \in \mathbb{R}$ ) iff there exists  $C > 0$ , a polynomial  $P$  of degree less than  $s$  and  $J \in \mathbb{N}$  s.t. for any  $j \geq J$ ,

$$\sup_{|h| < 2^{-j}} |f(x_0 + h) - P(x_0 + h)| \leq C2^{-js}.$$

There is one polynomial, independant from the scale.

## Lemma

If  $M < \underline{s}(\sigma^{-1})$ , the sequence of polynomials occurring in the definition of  $\Lambda^{\sigma, M}(x_0)$  satisfies

$$\|D^\beta P_k - D^\beta P_j\|_{L^\infty(x_0 + 2^{-k}B)} \leq C 2^{j|\beta|} \sigma_j,$$

for any multi-index  $\beta$  s.t.  $|\beta| \leq M$  and  $k \geq j \geq J$ .

In particular,  $(D^\beta P(x_0))_j$  is a Cauchy sequence.

## Lemma

If  $M < \underline{s}(\sigma^{-1})$ , and  $(P_j)_j$  is a sequence of polynomials in the definition of  $\Lambda^{\sigma,M}(x_0)$ , for any multi-index  $\beta$  s.t.  $|\beta| \leq M$ , the limit

$$f_\beta(x_0) = \lim_j D^\beta P_j(x_0)$$

is independant of the chosen sequence  $(P_j)_j$ .

$f_\beta(x_0)$  is the Peano derivative of order  $\beta$  of  $f$  at  $x_0$ .

There can be only one

## Theorem

If  $M < \underline{s}(\sigma^{-1})$ , then  $f \in \Lambda^{\sigma, M}(x_0)$  iff there exist  $C > 0$  and a polynomial  $P \in \mathbf{P}[M]$  s.t.

$$\|f - P\|_{L^\infty(x_0 + 2^{-j}B)} \leq C\sigma_j,$$

for  $j$  sufficiently large. The polynomial is unique.

One has

$$P(x) = \sum_{|\beta| \leq M} f_\beta(x_0) \frac{(x - x_0)^\beta}{|\beta|!}.$$

For  $s \in (0, \infty)$ , let

- $\sigma_j = 2^{-js}$
- $M = [\underline{s}(\sigma^{-1})] = [s]$  if  $s \notin \mathbb{N}$
- $M = s - 1$  if  $s \in \mathbb{N}$

We have

$$\Lambda^s(x_0) = \Lambda^{\sigma, M}(x_0).$$

### Corollary

If  $M < \underline{s}(\sigma^{-1})$ , one has

$$\Lambda^{\sigma, M}(x_0) \subset \Lambda^M(x_0).$$

Let

$$B_h^M(x_0, j) = \{x : [x, x + (M + 1)h] \subset x_0 + 2^{-j}B\}.$$

### Proposition

Let  $f \in L^\infty_{\text{loc}}(\mathbb{R}^d)$ ; one has  $f \in \Lambda^{\sigma, M}(x_0)$  iff there exist  $C, J > 0$  s.t.

$$\sup_{h \in B_j} \|\Delta_h^{M+1} f\|_{L^\infty(B_h^M(x_0, j))} \leq C\sigma_j,$$

for any  $j \geq J$ .

Let  $\rho$  a radial function s.t.  $\rho \in C_c^\infty(B)$ ,  $\rho(B) \subset [0, 1]$  and  $\|\rho\|_1 = 1$ .

One sets, for any  $j \in \mathbb{N}_0$ ,

$$\rho_j = 2^{-jd} \rho(\cdot/2^j).$$

## Lemma

Let  $N \in \mathbb{N}_0$ ; if  $f \in L^1_{\text{loc}}(\mathbb{R}^d)$  satisfies

$$\sup_{k \geq j} \|f * \rho_k - f\|_{L^\infty(x_0 + 2^{-j}B)} \leq C\sigma_j,$$

for  $j \geq J$ , then, for any multi-index  $\beta$  s.t.  $|\beta| \leq N$ , one has

$$\|D^\beta(f * \rho_j - f * \rho_{j-1})\|_{L^\infty(x_0 + 2^{-j}B)} \leq C2^{jN}\sigma_j,$$

for any  $j \geq J$ .

## Proposition

If  $f \in \Lambda^{\sigma, M}(x_0)$ , then there exists  $\Phi \in C_c^\infty(\mathbb{R}^d)$  s.t.

$$\sup_{k \geq j} \|f - f * \Phi_k\|_{L^\infty(x_0 + 2^{-j}B)} \leq C\sigma_j,$$

for  $j$  sufficiently large.

Conversely, if  $\sigma \rightarrow 0$ ,  $f \in \Lambda^\epsilon(\mathbb{R}^d)$  for some  $\epsilon > 0$  and  $f$  satisfies the previous relation for some function  $\Phi \in C_c^\infty(\mathbb{R}^d)$ , then  $f \in \Lambda^{\sigma, M}(x_0)$  for any  $M$  s.t.  $M + 1 > \bar{s}(\sigma^{-1})$ .

Under some general conditions, there exist a function  $\phi$  and  $2^d - 1$  functions  $\psi^{(i)}$  called wavelets s.t.

$$\{\phi(\cdot - k) : k \in \mathbb{Z}^d\} \bigcup \{\psi^{(i)}(2^j \cdot - k) : k \in \mathbb{Z}^d, j \in \mathbb{N}_0\}$$

forms an orthogonal basis of  $L^2(\mathbb{R}^d)$ .

Any function  $f \in L^2(\mathbb{R}^d)$  can be decomposed as follows,

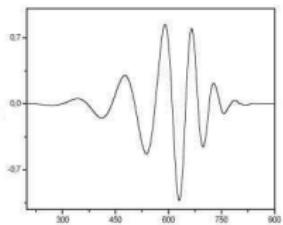

$$f(x) = \sum_{k \in \mathbb{Z}^d} C_k \phi(x - k) + \sum_{j \geq 0, k \in \mathbb{Z}^d, 1 \leq i < 2^d} c_{j,k}^{(i)} \psi^{(i)}(2^j x - k),$$

with

$$C_k = \int f(x) \phi(x - k) dx, \quad c_{j,k}^{(i)} = 2^{dj} \int f(x) \psi^{(i)}(2^j x - k) dx.$$

We assume

- $\phi, \psi^{(i)} \in C^n(\mathbb{R}^d)$  with  $n > M$ ,
- $D^\beta \phi, D^\beta \psi^{(i)}$  ( $|\beta| \leq n$ ) have fast decay,
- $\text{supp}(\psi^{(i)}) \subset 2^{-j_0} B$  for some  $j_0$ .

We set

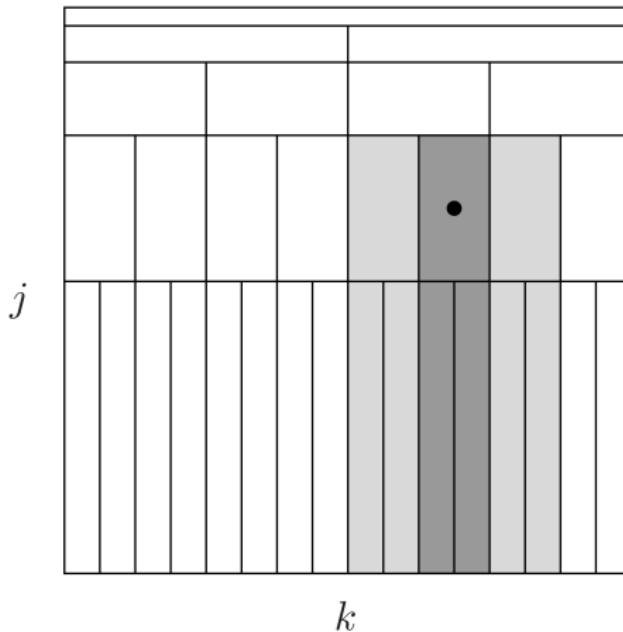

- $\lambda = \lambda(i, j, k) = \frac{k}{2^j} + \frac{i}{2^{j+1}} + [0, \frac{1}{2^{j+1}})^d$
- $c_\lambda = c_{j,k}^{(i)}$
- $\psi_\lambda = \psi^{(i)}(2^j \cdot - k).$

The wavelet leaders are defined by

$$d_\lambda = \sup_{\lambda' \subset \lambda} |c_{\lambda'}|$$

If  $3\lambda$  denotes the  $3^d$  dyadic cubes adjacent to  $\lambda$  and  $\lambda_j(x_0)$  the dyadic cube of length  $2^{-j}$  containing  $x_0$ , one sets

$$d_j(x_0) = \sup_{\lambda \subset 3\lambda_j(x_0)} d_\lambda$$

## Theorem

If  $f \in \Lambda^{\sigma, M}(x_0)$ , then there exists  $C > 0$  s.t.

$$d_j(x_0) \leq C\sigma_j,$$

for  $j$  sufficiently large.

Conversely, if  $\sigma \rightarrow 0$ ,  $f \in \Lambda^\epsilon(\mathbb{R}^d)$  for some  $\epsilon > 0$  and  $f$  satisfies the previous relation, then  $f \in \Lambda^{\tau, M}(x_0)$ , where

- $\tau$  is the sequence defined by  $\tau_j = \sigma_j |\log_2 \sigma_j|$ ,
- $M$  is any number satisfying  $M + 1 > \bar{s}(\sigma^{-1})$ .

If, for any  $s > 0$ ,  $\sigma^{(s)}$  is an admissible sequence, the application

$$\sigma^{(\cdot)} : s > 0 \mapsto \sigma^{(s)}$$

is called a family of admissible sequences.

A family of admissible sequences is decreasing for  $x_0$  if

$$s < t \Rightarrow \Lambda^{\sigma^{(t)}, [t]}(x_0) \subset \Lambda^{\sigma^{(s)}, [s]}(x_0).$$

Let  $\sigma^{(\cdot)}$  a family of decreasing sequences for  $x_0$  and  $f \in L_{\text{loc}}^{\infty}(\mathbb{R}^d)$  ;  
the Hölder exponent of  $f$  at  $x_0$  for  $\sigma^{(\cdot)}$  is

$$h_f^{\sigma^{(\cdot)}}(x_0) = \sup\{s > 0 : f \in \Lambda^{\sigma^{(s)}, [s]}(x_0)\}.$$

How to check if a family of admissible sequences is decreasing ?

Let

$$\overline{\Theta}^{(m)} = \sup_{k \in \mathbb{N}} \frac{\sigma_{k+1}^{(m)}}{\sigma_k^{(m)}}, \quad \underline{\Theta}^{(m)} = \inf_{k \in \mathbb{N}} \frac{\sigma_{k+1}^{(m)}}{\sigma_k^{(m)}},$$

## Proposition

A family of admissible sequences is decreasing for  $x_0$  if it satisfies the following conditions :

- if  $m \leq s < t < m + 1$  with  $m \in \mathbb{N}_0$ ,  $\sigma_j^{(t)} \leq C\sigma_j^{(s)}$  for  $j$  sufficiently large
- for any  $m \in \mathbb{N}$ , at least one of the following conditions is satisfied : there exists  $\epsilon_0 > 0$  s.t. for any  $\epsilon \in (0, \epsilon_0)$ ,

$$\left. \begin{array}{l} \sigma_j^{(m)} \leq C\sigma_j^{(m-\epsilon)} \\ \text{if } 1 < 2^m \overline{\Theta}^{(m)} : (\overline{\Theta}^{(m)})^j \leq C\sigma_j^{(m-\epsilon)} \\ \text{if } 1 > 2^m \overline{\Theta}^{(m)} : 2^{-jm} \leq C\sigma_j^{(m-\epsilon)} \\ \text{if } 1 = 2^m \overline{\Theta}^{(m)} : j2^{-jm} \leq C\sigma_j^{(m-\epsilon)} \end{array} \right| \begin{array}{l} 2^{-jm} \leq C\sigma_j^{(m-\epsilon)} \\ \text{if } 1 < 2^m \underline{\Theta}^{(m)} : \sigma_j^{(m)} \leq C\sigma_j^{(m-\epsilon)} \\ \text{if } 1 > 2^m \underline{\Theta}^{(m)} : \sigma_j^{(m)}(2^m \underline{\Theta}^{(m)})^{-j} \leq C\sigma_j^{(m-\epsilon)} \\ \text{if } 1 = 2^m \underline{\Theta}^{(m)} : j\sigma_j^{(m)} \leq C\sigma_j^{(m-\epsilon)} \end{array}$$
