

Multi-scale methods with strain-softening: damage-enhanced MFH for composite materials and computational homogenization for cellular materials with micro-buckling

L. Noels, G. Becker, V.-D. Nguyen,
L. Wu , L. Adam (x-Stream), I. Doghri (UCL)

Non-local damage mean-field-homogenization

FE2
homogenization of
cellular structures

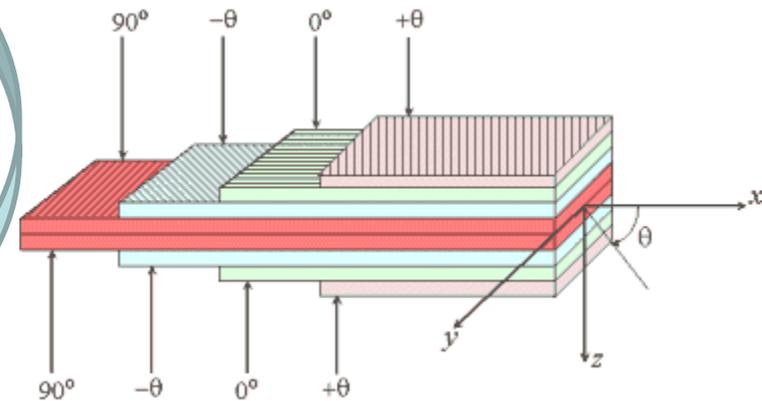

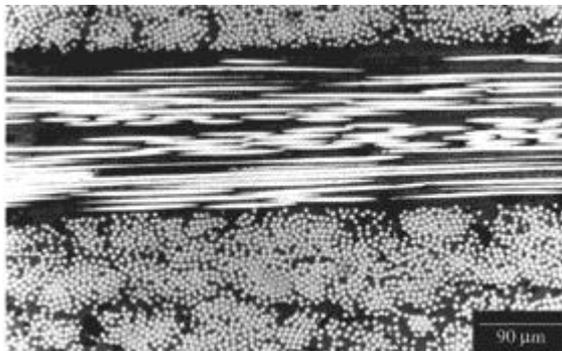

Multi-scale modelling: Why?

- Materials in aeronautics

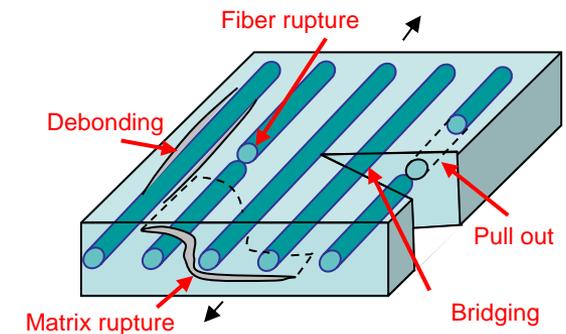

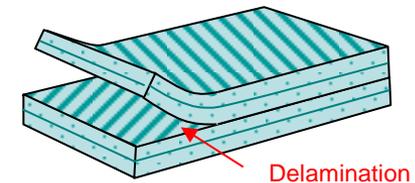

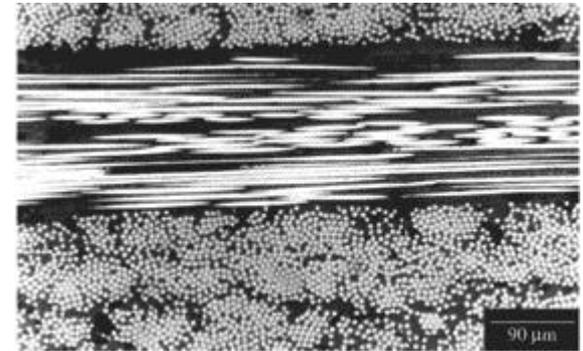

- More and more engineered
- Multi-scale in nature

A350 wing lower cover

- Limitations of one-scale models
 - Physics at the micro-scale is too complex to be modelled by a simple material law at the macro-scale
 - Engineered materials
 - Multi-physics/scale problems
 -
 - See next slides
 - Lack of information of the micro-scale state during macro-scale deformations
 - Required to predict failure
 -
 - Effect of the micro-structure on the macro-structure response
 - Fibres distribution ...
 - ...
- Solution: multi-scale models

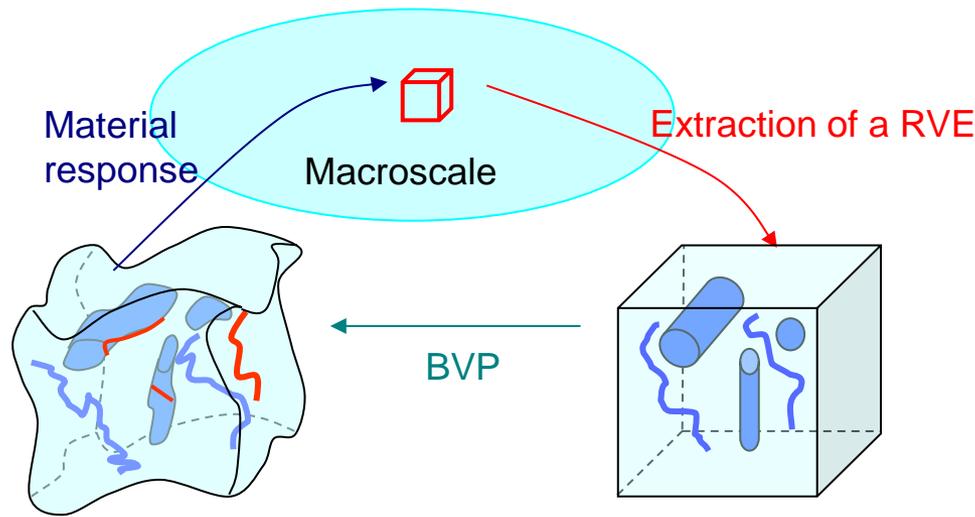

- Introduction
 - Multi-scale modelling: How?
 - Strain softening issues
- Non-local damage-enhanced mean-field-homogenization
- Computational homogenization for cellular materials
- Other researches
 - DG-based fracture mechanics: blast, fragmentation, ...
- Conclusions

Multi-scale modelling: How?

- Principle

- 2 problems are solved concurrently
 - The macro-scale problem
 - The micro-scale problem (Representative Volume Element)
- Scale transitions coupling the two scales
 - Downscaling: transfer of macro-scale quantities (e.g. strain) to the micro-scale to determine the equilibrium state of the Boundary Value Problem
 - Upscaling: constitutive law (e.g. stress) for the macro-scale problem is determined from the micro-scale problem resolution

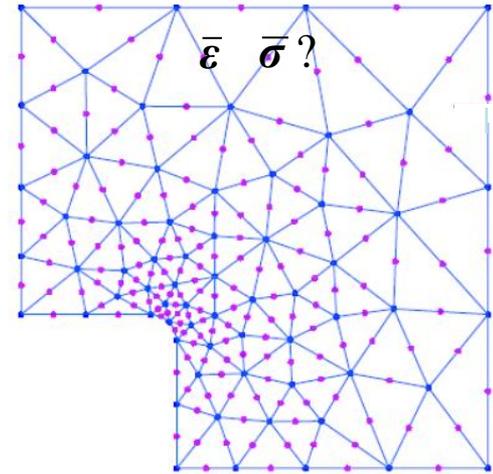

Assumptions:

$$L_{\text{macro}} \gg L_{\text{RVE}} \gg L_{\text{micro}}$$

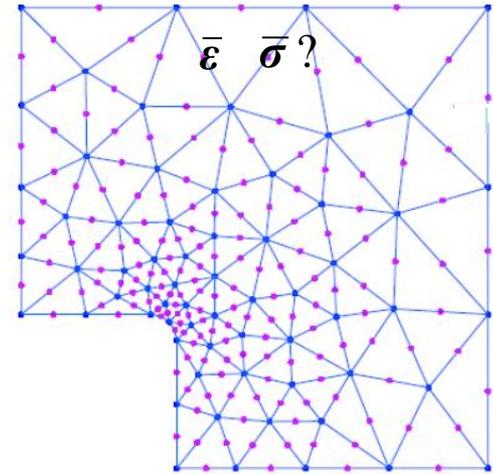

Multi-scale modelling: How?

- Computational technique: FE²
 - Macro-scale
 - FE model
 - At one integration point $\bar{\epsilon}$ is know, $\bar{\sigma}$ is sought

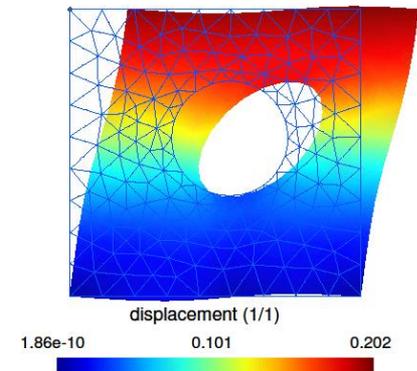

Multi-scale modelling: How?

Strain softening of the microscopic response

- Finite element solutions for strain softening problems suffer from:
 - The loss the uniqueness and strain localization
 - Mesh dependence

The numerical results change with the size of mesh and direction of mesh

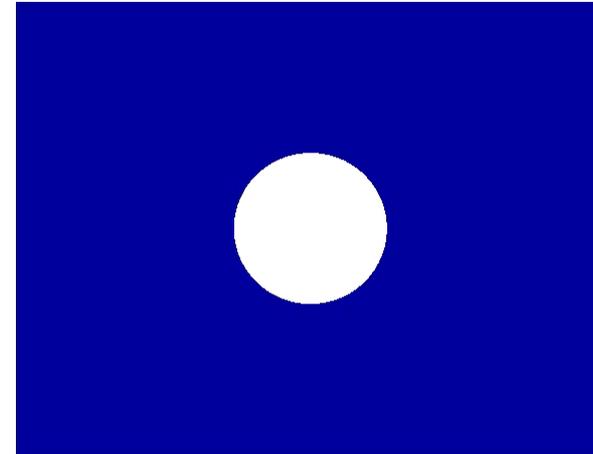

The numerical results change without convergence

- Requires a non-local formulation of the macro-scale problem

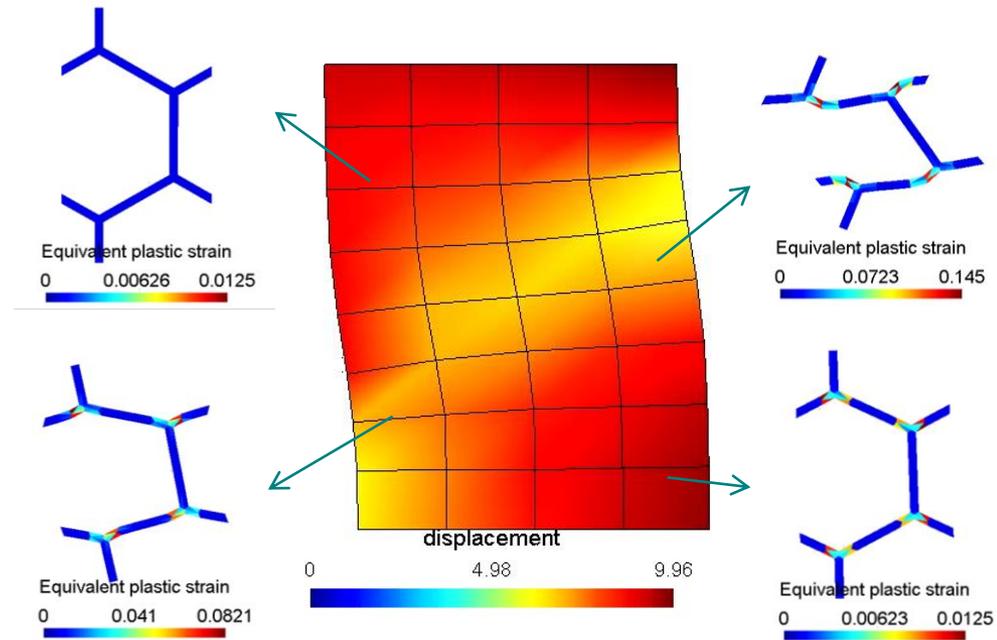

Multi-scale simulations with strain softening

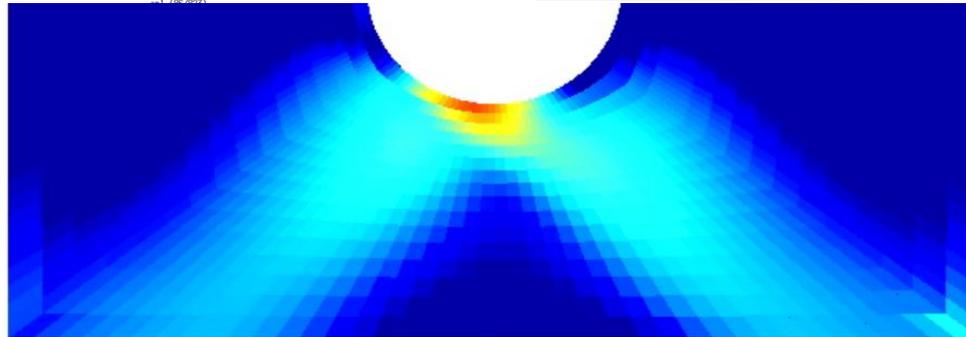

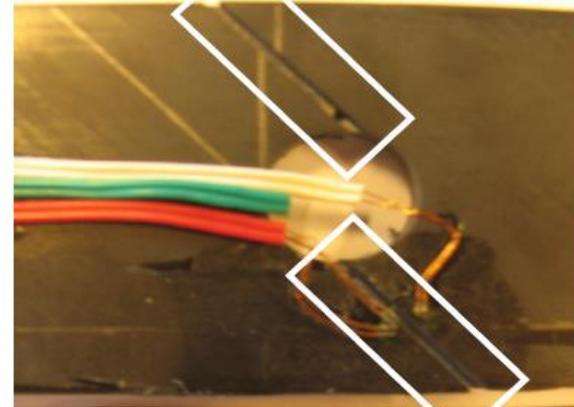

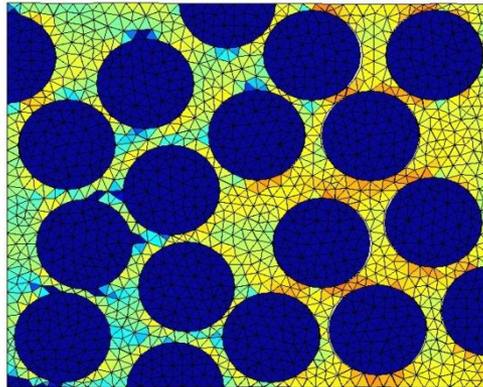

- Two cases considered
 - Composite materials
 - Mean-field homogenization
 - Non-local damage formulation

y
z

- Honeycomb structures
 - Computational homogenization
 - Second-order FE2
 - Micro-buckling

Non-local damage-enhanced mean-field-homogenization

L. Wu (ULg), L. Noels (ULg), L. Adam (e-Xstream), I. Doghri (UCL)

SIMUCOMP The research has been funded by the Walloon Region under the agreement no 1017232 (CT-EUC 2010-10-12) in the context of the ERA-NET +, Matera + framework.

Non-local damage-enhanced mean-field-homogenization

- Semi analytical Mean-Field Homogenization

- Based on the averaging of the fields

$$\langle a \rangle = \frac{1}{V} \int_V a(\mathbf{X}) dV$$

- Meso-response

- From the volume ratios ($v_0 + v_I = 1$)

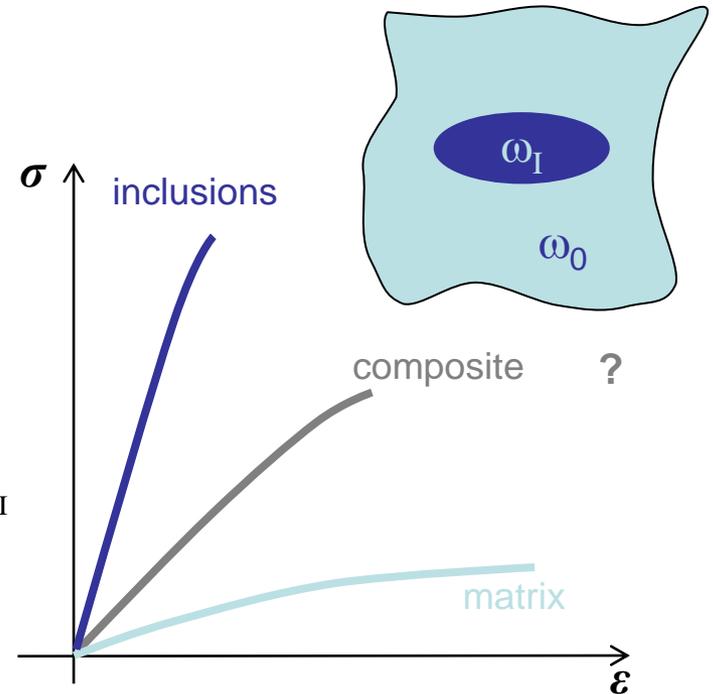

$$\begin{cases} \bar{\sigma} = \langle \sigma \rangle = v_0 \langle \sigma \rangle_{\omega_0} + v_I \langle \sigma \rangle_{\omega_I} = v_0 \sigma_0 + v_I \sigma_I \\ \bar{\varepsilon} = \langle \varepsilon \rangle = v_0 \langle \varepsilon \rangle_{\omega_0} + v_I \langle \varepsilon \rangle_{\omega_I} = v_0 \varepsilon_0 + v_I \varepsilon_I \end{cases}$$

- One more equation required

$$\varepsilon_I = \mathbf{B}^\varepsilon : \varepsilon_0$$

- Difficulty: find the adequate relations

$$\begin{cases} \sigma_I = f(\varepsilon_I) \\ \sigma_0 = f(\varepsilon_0) \\ \varepsilon_I = \mathbf{B}^\varepsilon : \varepsilon_0 \end{cases} \quad \mathbf{B}^\varepsilon ?$$

Non-local damage-enhanced mean-field-homogenization

- Mean-Field Homogenization for different materials

- Linear materials

- Materials behaviours

$$\begin{cases} \sigma_I = \bar{C}_I : \varepsilon_I \\ \sigma_0 = \bar{C}_0 : \varepsilon_0 \end{cases}$$

- Mori-Tanaka assumption $\varepsilon^\infty = \varepsilon_0$

- Use Eshelby tensor

$$\varepsilon_I = \mathbf{B}^\varepsilon(\mathbf{I}, \bar{C}_0, \bar{C}_I) : \varepsilon_0$$

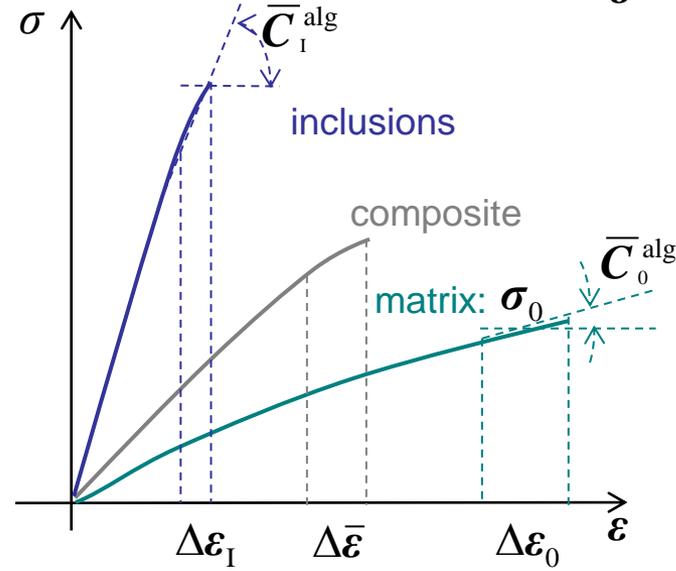

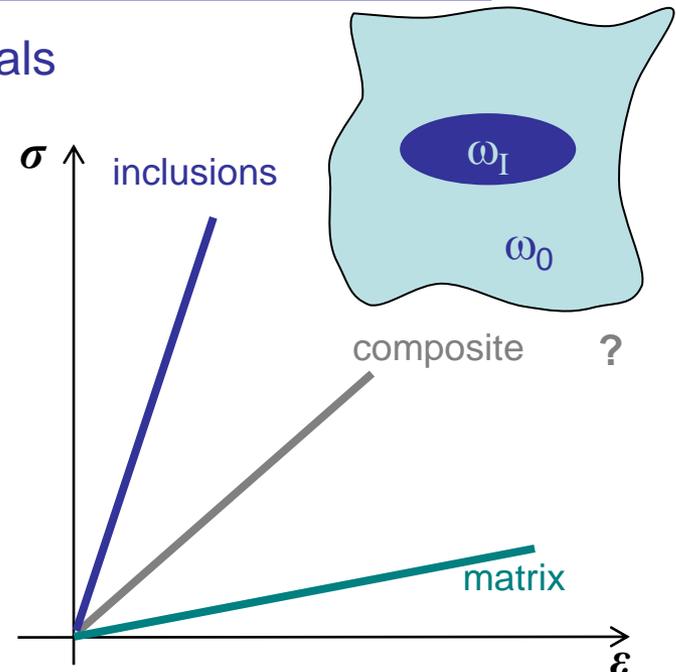

$$\text{with } \mathbf{B}^\varepsilon = [\mathbf{I} + \mathbf{S} : \bar{C}_0^{-1} : (\bar{C}_I - \bar{C}_0)]^{-1}$$

- Non-linear materials

- Define a Linear Comparison Composite

- Common approach: incremental tangent

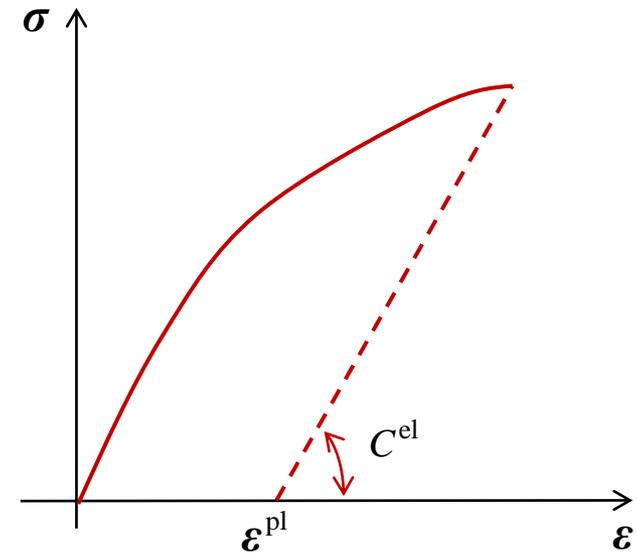

$$\Delta \varepsilon_I = \mathbf{B}^\varepsilon(\mathbf{I}, \bar{C}_0^{\text{alg}}, \bar{C}_I^{\text{alg}}) : \Delta \varepsilon_0$$

- Material models

- Elasto-plastic material

- Stress tensor $\boldsymbol{\sigma} = \mathbf{C}^{\text{el}} : (\boldsymbol{\varepsilon} - \boldsymbol{\varepsilon}^{\text{pl}})$
 - Yield surface $f(\boldsymbol{\sigma}, p) = \boldsymbol{\sigma}^{\text{eq}} - \sigma^Y - R(p) \leq 0$
 - Plastic flow $\Delta \boldsymbol{\varepsilon}^{\text{pl}} = \Delta p \mathbf{N} \quad \& \quad \mathbf{N} = \frac{\partial f}{\partial \boldsymbol{\sigma}}$
 - Linearization $\delta \boldsymbol{\sigma} = \mathbf{C}^{\text{alg}} : \delta \boldsymbol{\varepsilon}$

Non-local damage-enhanced mean-field-homogenization

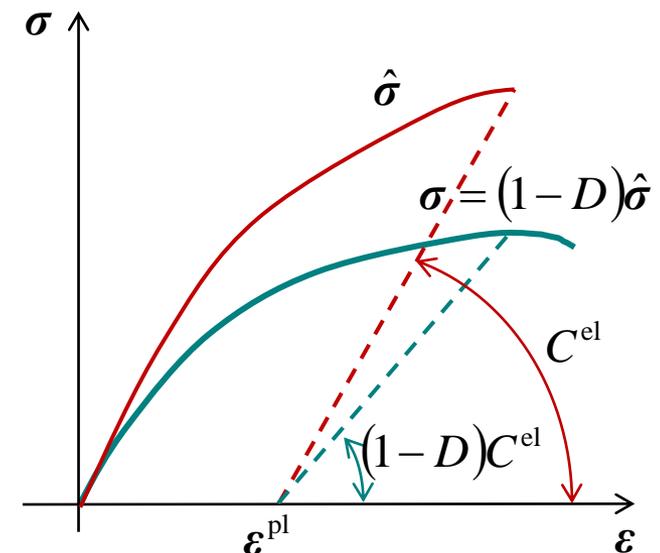

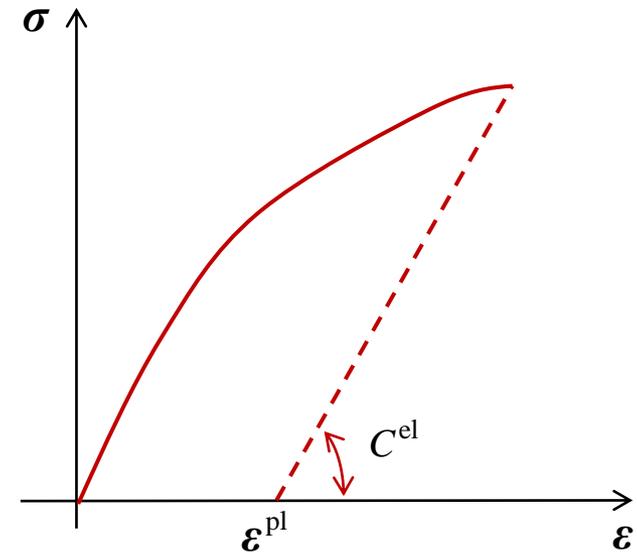

- Material models

- Elasto-plastic material

- Stress tensor $\boldsymbol{\sigma} = \mathbf{C}^{\text{el}} : (\boldsymbol{\varepsilon} - \boldsymbol{\varepsilon}^{\text{pl}})$
 - Yield surface $f(\boldsymbol{\sigma}, p) = \boldsymbol{\sigma}^{\text{eq}} - \boldsymbol{\sigma}^Y - R(p) \leq 0$
 - Plastic flow $\Delta \boldsymbol{\varepsilon}^{\text{pl}} = \Delta p \mathbf{N}$ & $\mathbf{N} = \frac{\partial f}{\partial \boldsymbol{\sigma}}$
 - Linearization $\delta \boldsymbol{\sigma} = \mathbf{C}^{\text{alg}} : \delta \boldsymbol{\varepsilon}$

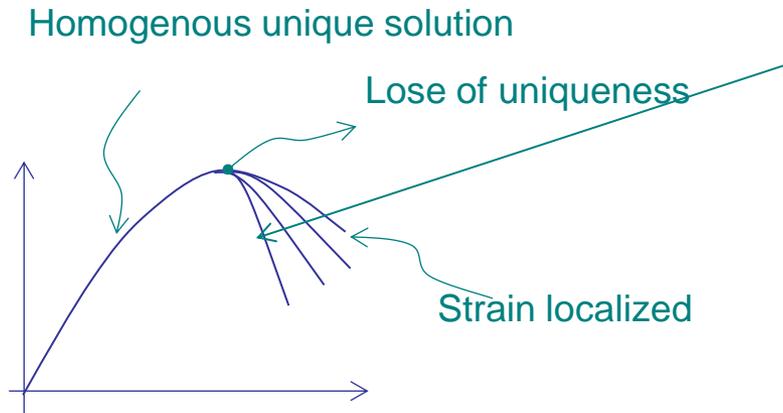

- Local damage model

- Apparent-effective stress tensors $\boldsymbol{\sigma} = (1 - D) \hat{\boldsymbol{\sigma}}$
 - Plastic flow in the effective stress space
 - Damage evolution $\Delta D = F_D(\boldsymbol{\varepsilon}, \Delta p)$

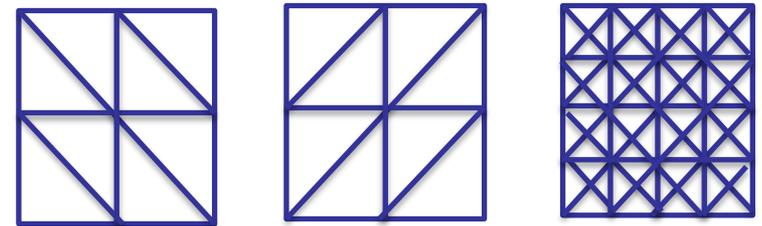

Non-local damage-enhanced mean-field-homogenization

- Finite element solutions for strain softening problems suffer from:
 - The loss the uniqueness and strain localization
 - Mesh dependence

The numerical results change with the size of mesh and direction of mesh

The numerical results change without convergence

- **Implicit non-local approach** [Peerlings et al 96, Geers et al 97, ...]
 - A state variable is replaced by a non-local value reflecting the interaction between neighboring material points

$$\tilde{a}(\mathbf{x}) = \frac{1}{V_C} \int_{V_C} a(\mathbf{y}) w(\mathbf{y}; \mathbf{x}) dV$$

- Use Green functions as weight $w(\mathbf{y}; \mathbf{x})$

$$\Rightarrow \tilde{a} - c \nabla^2 \tilde{a} = a \Rightarrow \text{New degrees of freedom}$$

Non-local damage-enhanced mean-field-homogenization

Material models

– Elasto-plastic material

- Stress tensor $\boldsymbol{\sigma} = \mathbf{C}^{\text{el}} : (\boldsymbol{\varepsilon} - \boldsymbol{\varepsilon}^{\text{pl}})$
- Yield surface $f(\boldsymbol{\sigma}, p) = \boldsymbol{\sigma}^{\text{eq}} - \boldsymbol{\sigma}^Y - R(p) \leq 0$
- Plastic flow $\Delta \boldsymbol{\varepsilon}^{\text{pl}} = \Delta p \mathbf{N} \quad \& \quad \mathbf{N} = \frac{\partial f}{\partial \boldsymbol{\sigma}}$
- Linearization $\delta \boldsymbol{\sigma} = \mathbf{C}^{\text{alg}} : \delta \boldsymbol{\varepsilon}$

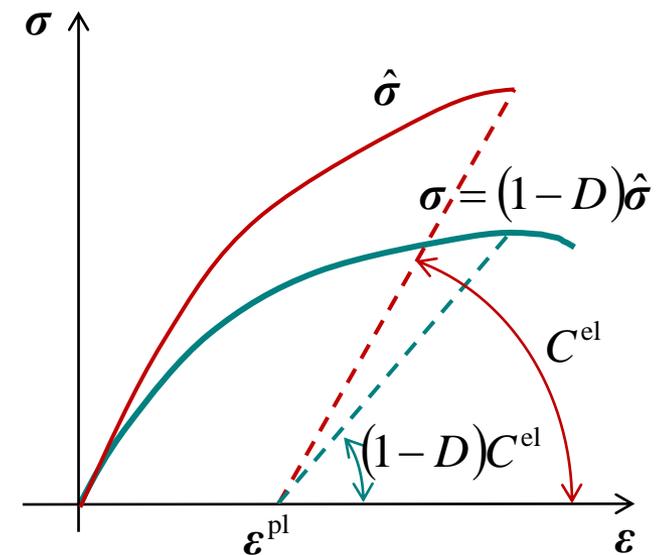

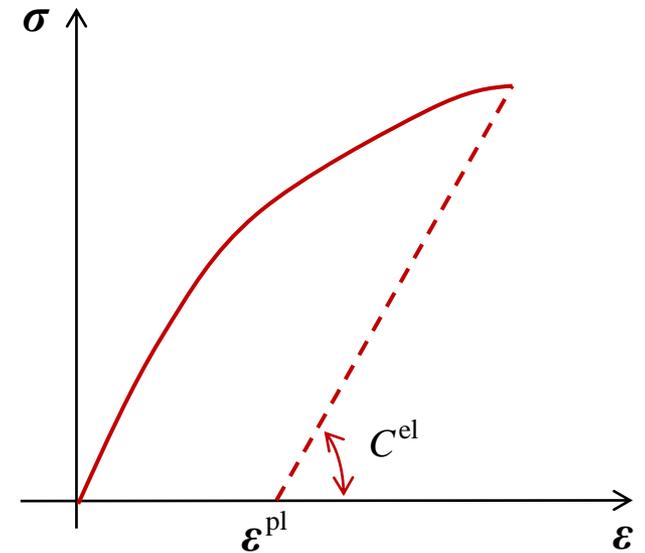

– Local damage model

- Apparent-effective stress tensors $\boldsymbol{\sigma} = (1 - D) \hat{\boldsymbol{\sigma}}$
- Plastic flow in the effective stress space
- Damage evolution $\Delta D = F_D(\boldsymbol{\varepsilon}, \Delta p)$

– Non-Local damage model

- Damage evolution $\Delta D = F_D(\boldsymbol{\varepsilon}, \Delta \tilde{p})$
- Anisotropic governing equation $\tilde{p} - \nabla \cdot (\mathbf{c}_g \cdot \nabla \tilde{p}) = p$
- Linearization

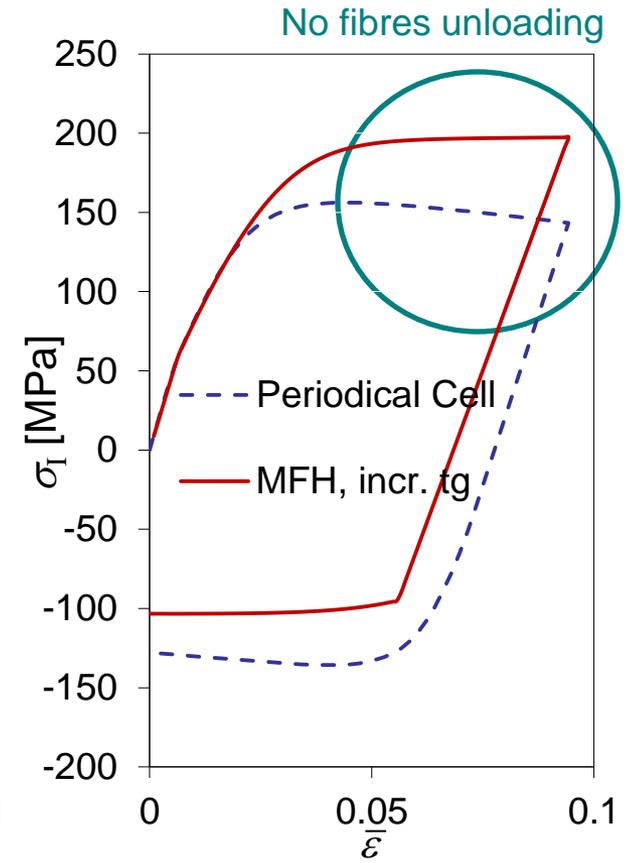

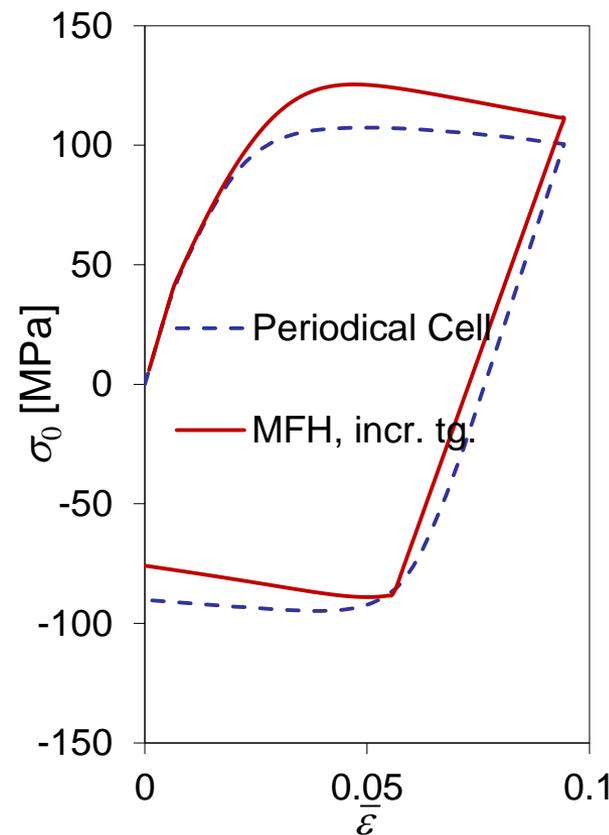

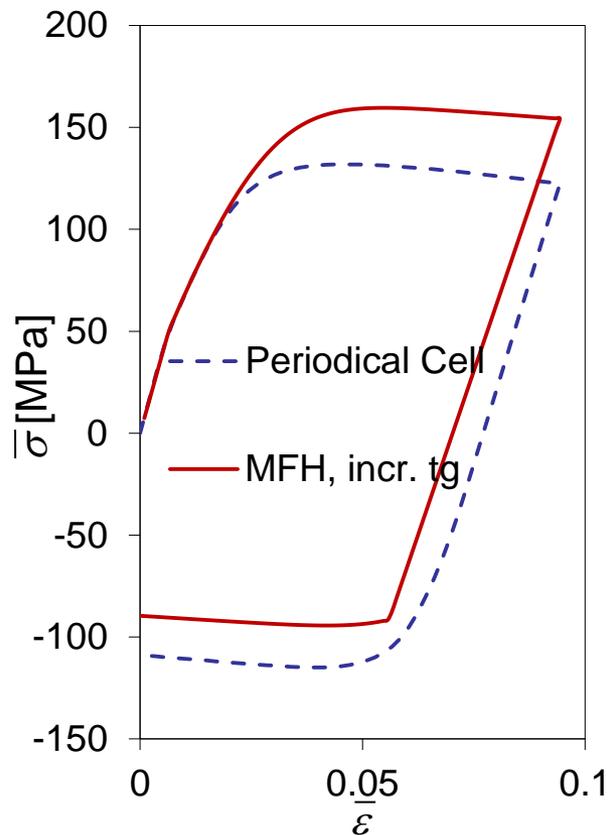

$$\delta \boldsymbol{\sigma} = \left[(1 - D) \mathbf{C}^{\text{alg}} - \hat{\boldsymbol{\sigma}} \otimes \frac{\partial F_D}{\partial \boldsymbol{\varepsilon}} \right] : \delta \boldsymbol{\varepsilon} - \hat{\boldsymbol{\sigma}} \frac{\partial F_D}{\partial \tilde{p}} \delta \tilde{p}$$

Non-local damage-enhanced mean-field-homogenization

- Limitation of the incremental tangent method

- Fictitious composite
 - 50%-UD fibres
 - Elasto-plastic matrix with damage
- Due to the incremental formalism, stress in fibres cannot decrease during loading

Non-local damage-enhanced mean-field-homogenization

- Problem

- We want the fibres to get unloaded during the matrix damaging process

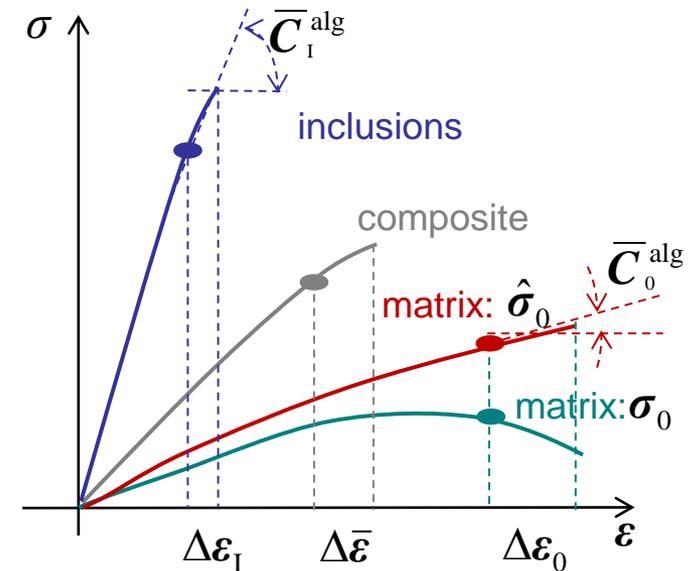

- For the incremental-tangent approach

$$\Delta \boldsymbol{\varepsilon}_I = \mathbf{B}^\varepsilon \left(\mathbf{I}, (1-D) \bar{\mathbf{C}}_0^{\text{alg}}, \bar{\mathbf{C}}_I^{\text{alg}} \right) : \Delta \boldsymbol{\varepsilon}_0$$

- To unload the fibres ($\boldsymbol{\varepsilon}_I < 0$) with such approach would require $\bar{\mathbf{C}}_I^{\text{alg}} < 0$

- We cannot use the incremental tangent MFH

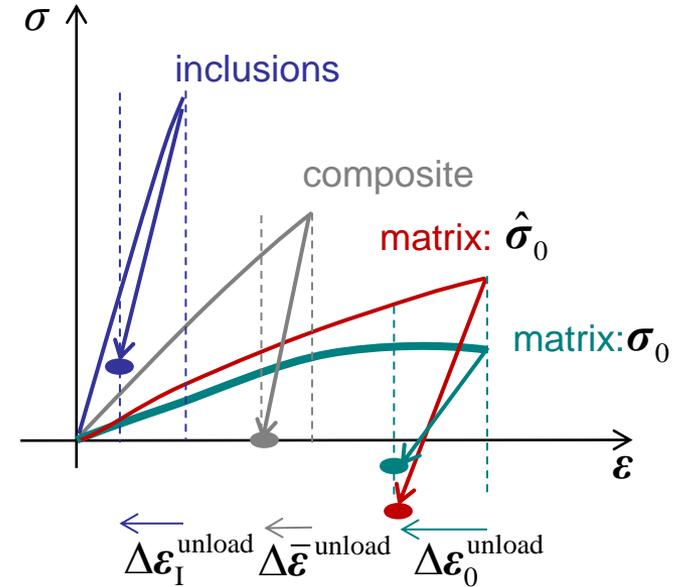

- We need to define the LCC from another stress state

Non-local damage-enhanced mean-field-homogenization

- Idea

- New incremental-secant approach
 - Perform a virtual elastic unloading from previous solution
 - Composite material unloaded to reach the stress-free state
 - Residual stress in components

Non-local damage-enhanced mean-field-homogenization

- Idea

- New incremental-secant approach
 - Perform a virtual elastic unloading from previous solution
 - Composite material unloaded to reach the stress-free state
 - Residual stress in components

- Apply MFH from unloaded state
 - New strain increments (>0)

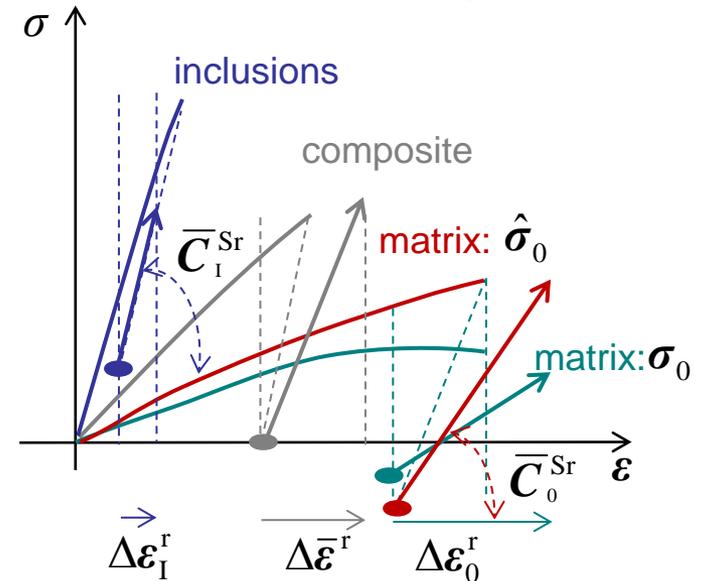

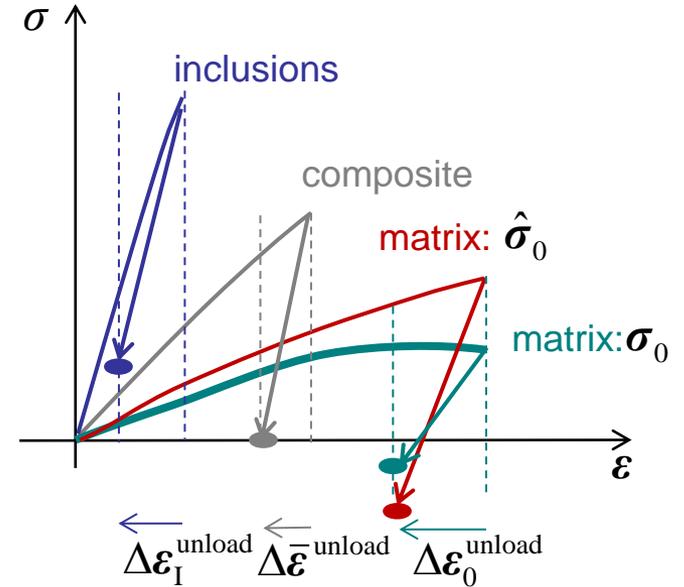

$$\Delta \boldsymbol{\varepsilon}_{I/0}^r = \Delta \boldsymbol{\varepsilon}_{I/0} + \Delta \boldsymbol{\varepsilon}_{I/0}^{\text{unload}}$$

- Use of secant operators

$$\Delta \boldsymbol{\varepsilon}_I^r = \mathbf{B}^\varepsilon \left(\mathbf{I}, (1-D)\bar{\mathbf{C}}_0^{\text{Sr}}, \bar{\mathbf{C}}_I^{\text{Sr}} \right) : \Delta \boldsymbol{\varepsilon}_0^r$$

- Possibility of have unloading

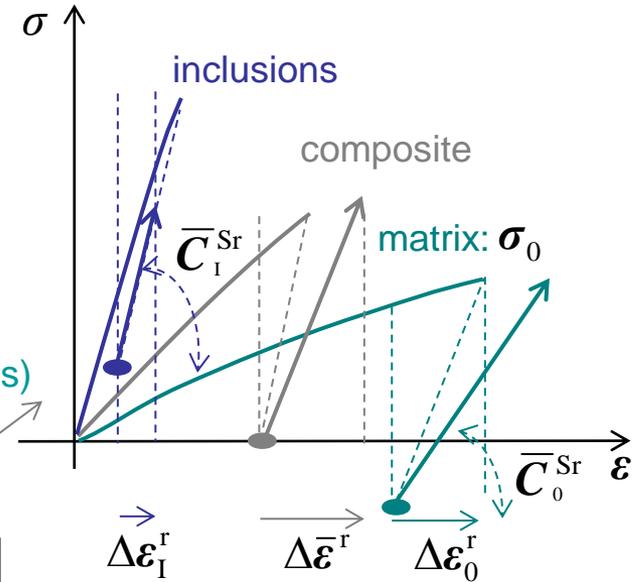

$$\begin{cases} \Delta \boldsymbol{\varepsilon}_I^r > 0 \\ \Delta \boldsymbol{\varepsilon}_I < 0 \end{cases}$$

Non-local damage-enhanced mean-field-homogenization

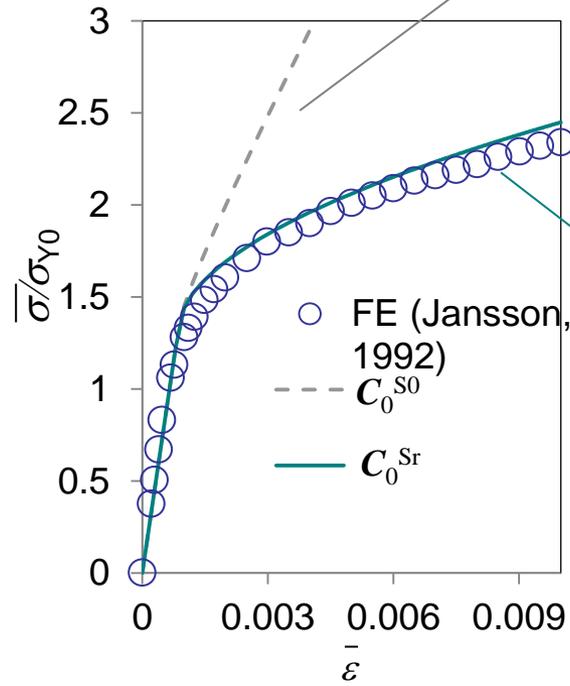

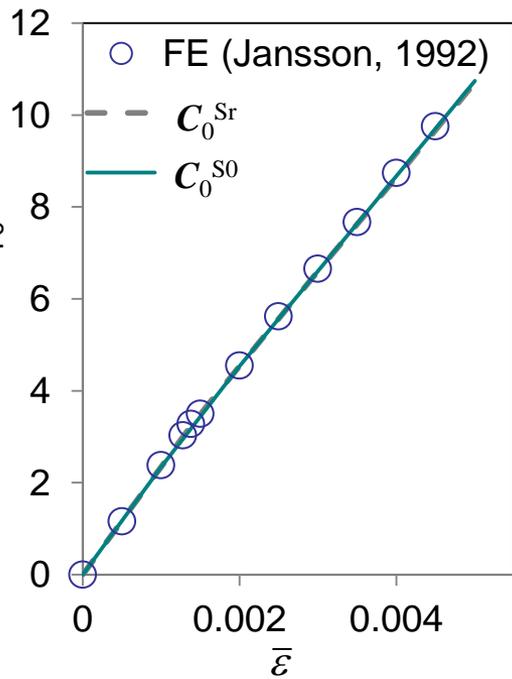

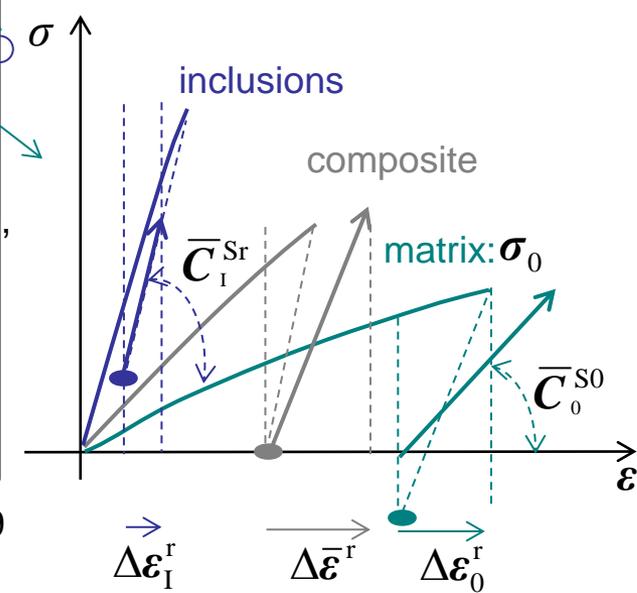

- Zero-incremental-secant method (2)

- Continuous fibres
 - 55 % volume fraction
 - Elastic
- Elasto-plastic matrix (no damage)**
- Secant model in the matrix
 - Modified if stiffer inclusions (negative residual stress)

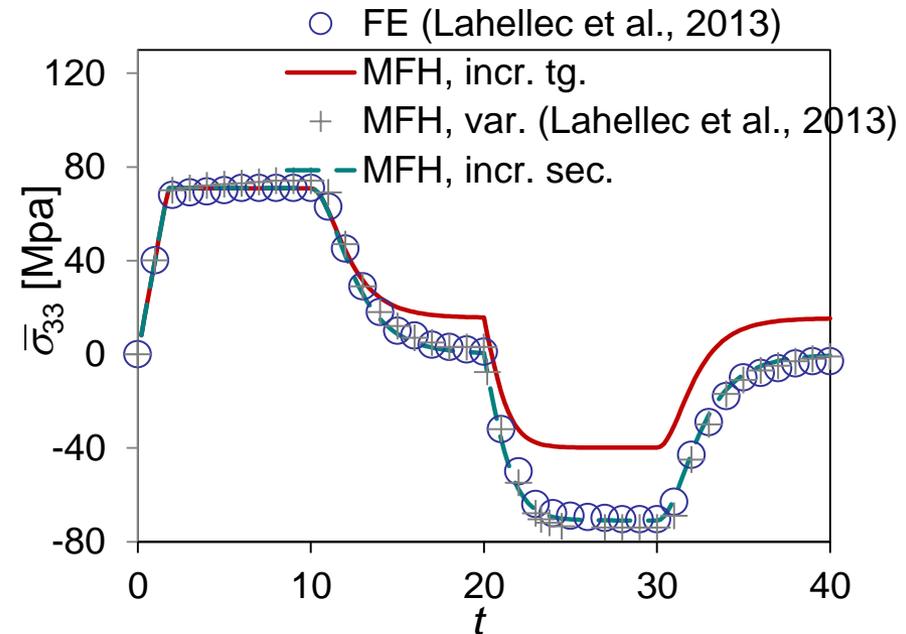

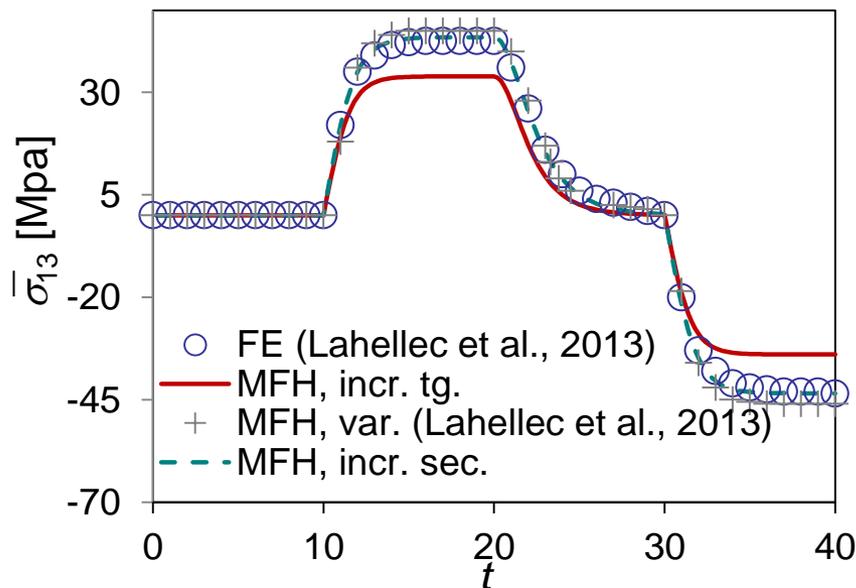

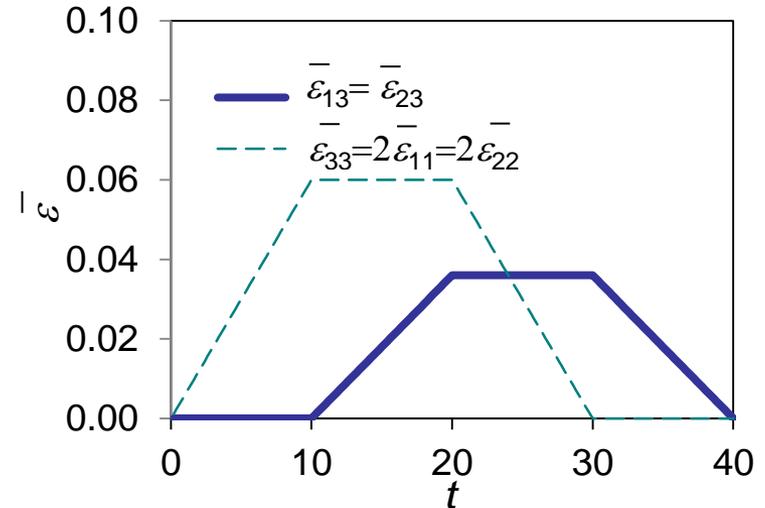

Longitudinal tension

Transverse loading

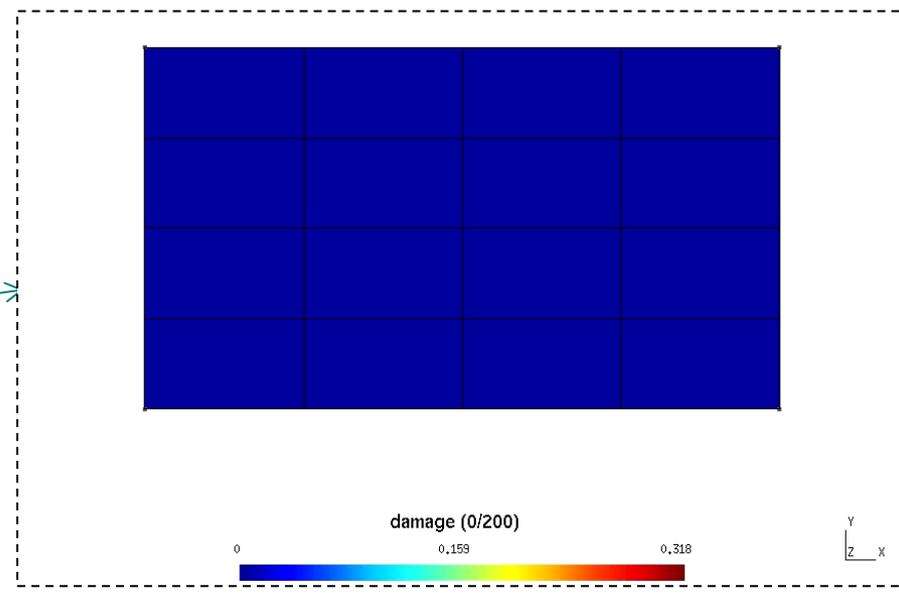

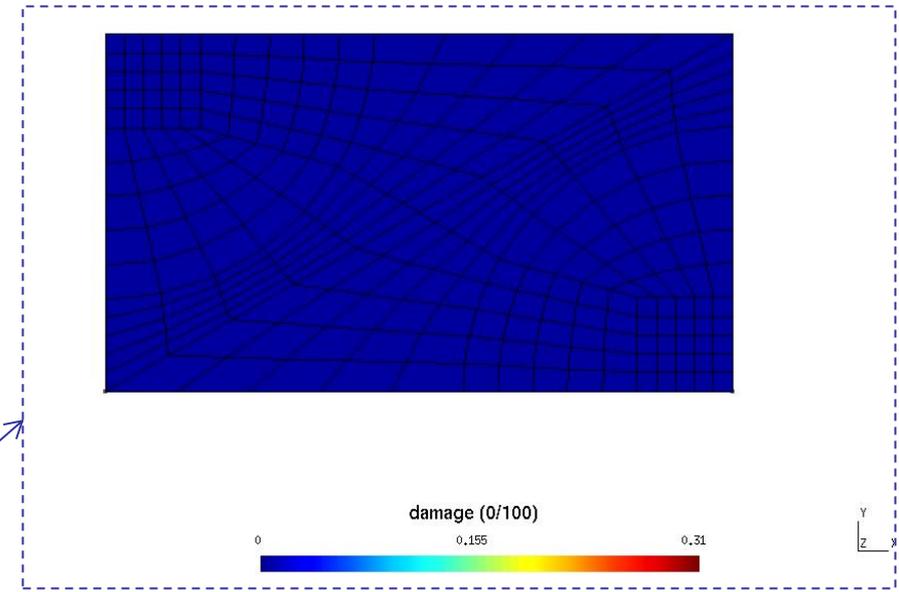

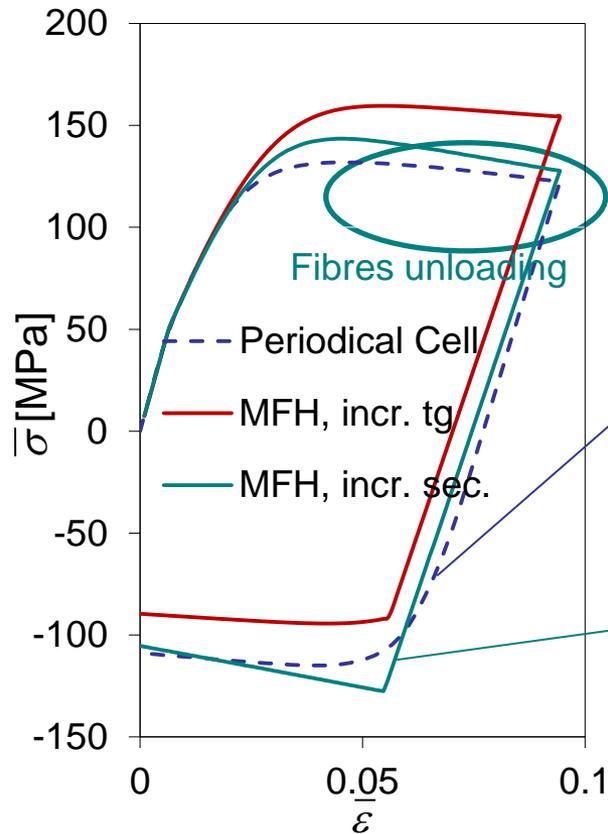

Non-local damage-enhanced mean-field-homogenization

- Verification of the method
 - Spherical inclusions
 - 17 % volume fraction
 - Elastic
 - Elastic-perfectly-plastic matrix (no damage)
 - Non-radial loading

Non-local damage-enhanced mean-field-homogenization

- New results for damage
 - Fictitious composite
 - 50%-UD fibres
 - Elasto-plastic matrix with damage

- Weak formulation

- Strong form

$$\left\{ \begin{array}{l} \nabla \cdot \bar{\boldsymbol{\sigma}}^T + \mathbf{f} = \mathbf{0} \quad \text{for the homogenized composite material} \\ \tilde{p} - \nabla \cdot (\mathbf{c}_g \cdot \nabla \tilde{p}) = p \quad \text{for the matrix phase} \end{array} \right.$$

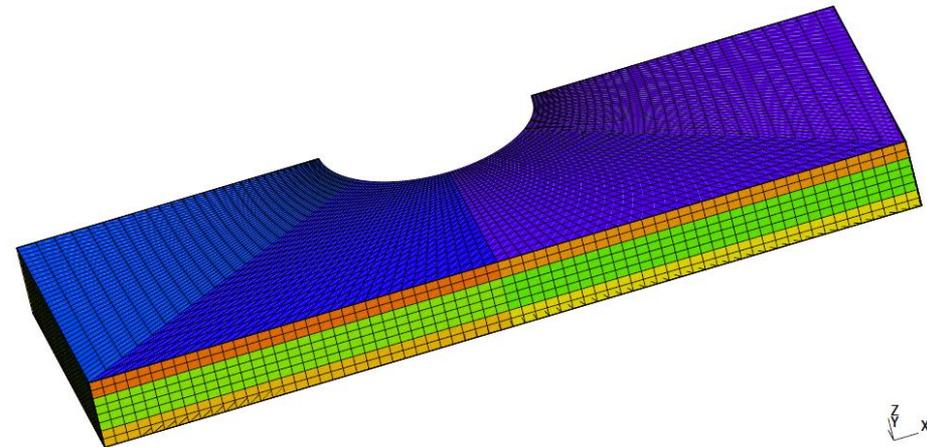

- Boundary conditions

$$\left\{ \begin{array}{l} \boldsymbol{\sigma} \cdot \mathbf{n} = \mathbf{T} \\ \mathbf{n} \cdot (\mathbf{c}_g \cdot \nabla \tilde{p}) = 0 \end{array} \right.$$

- Finite-element discretization

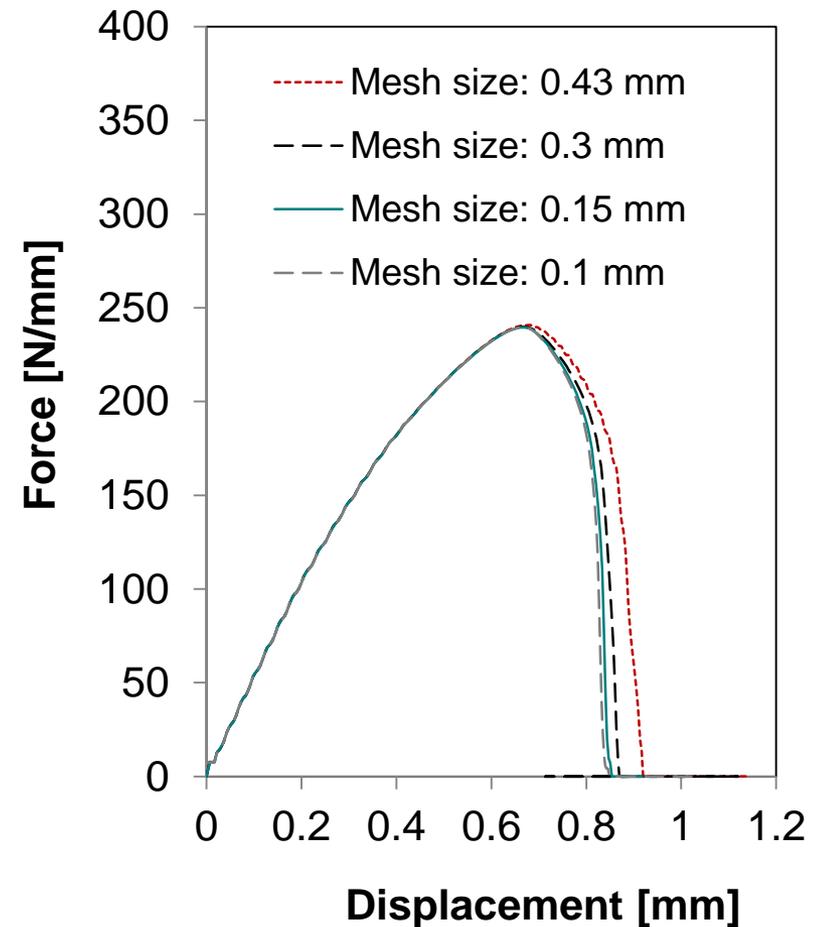

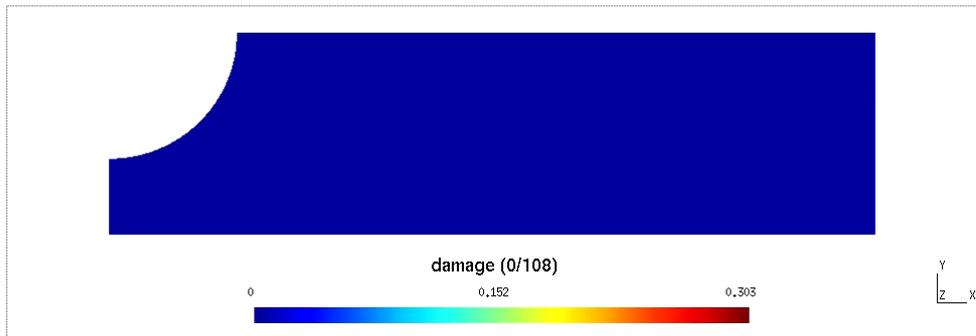

$$\left\{ \begin{array}{l} \tilde{p} = N_{\tilde{p}}^a \tilde{p}^a \\ \mathbf{u} = N_u^a \mathbf{u}^a \end{array} \right.$$

$$\rightarrow \begin{bmatrix} \mathbf{K}_{uu} & \mathbf{K}_{u\tilde{p}} \\ \mathbf{K}_{\tilde{p}u} & \mathbf{K}_{\tilde{p}\tilde{p}} \end{bmatrix} \begin{bmatrix} d\mathbf{u} \\ d\tilde{p} \end{bmatrix} = \begin{bmatrix} \mathbf{F}_{\text{ext}} - \mathbf{F}_{\text{int}} \\ \mathbf{F}_p - \mathbf{F}_{\tilde{p}} \end{bmatrix}$$

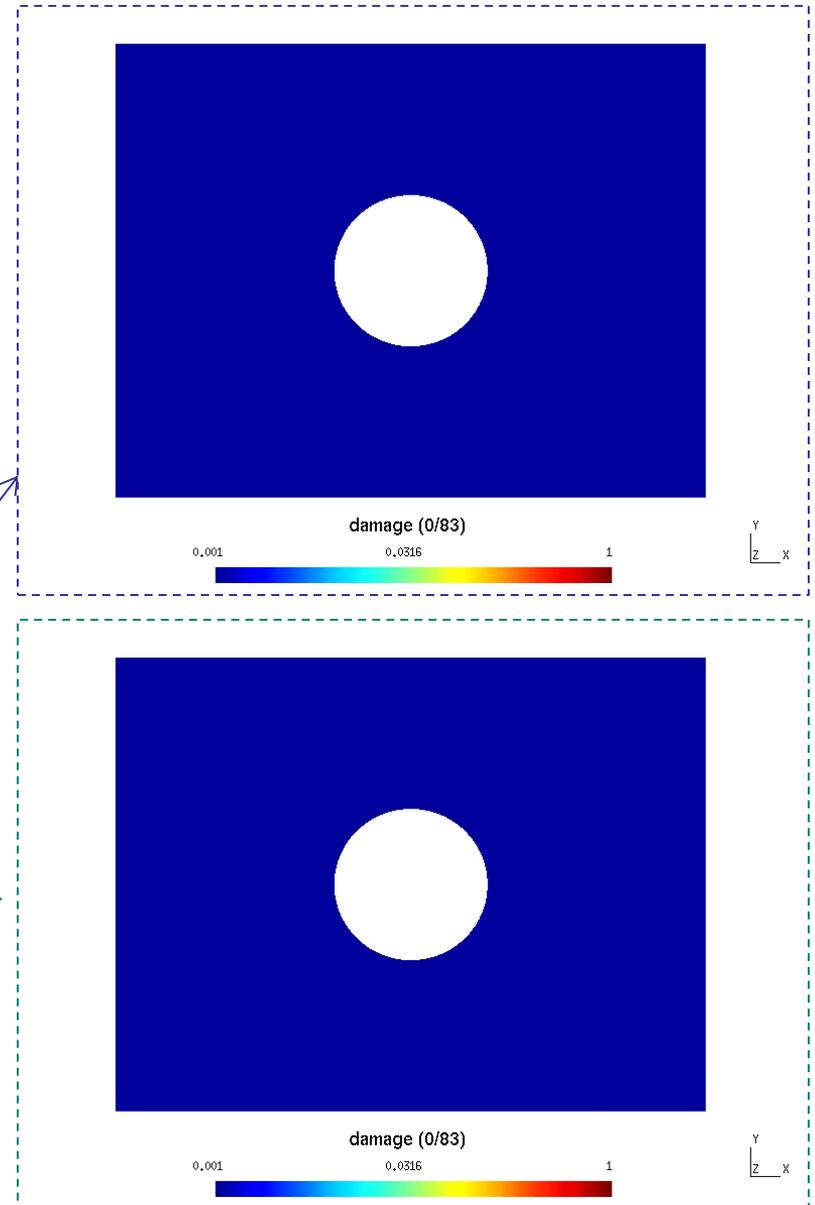

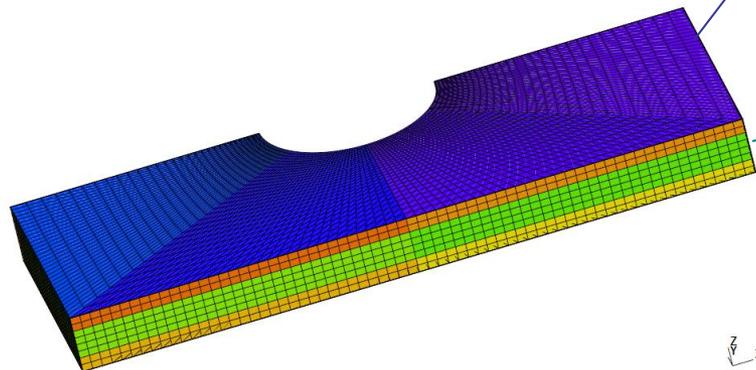

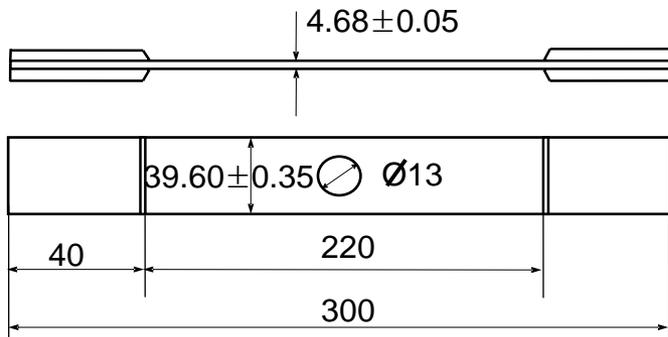

Non-local damage-enhanced mean-field-homogenization

- Mesh-size effect
 - Fictitious composite
 - 30%-UD fibres
 - Elasto-plastic matrix with damage
 - Notched ply

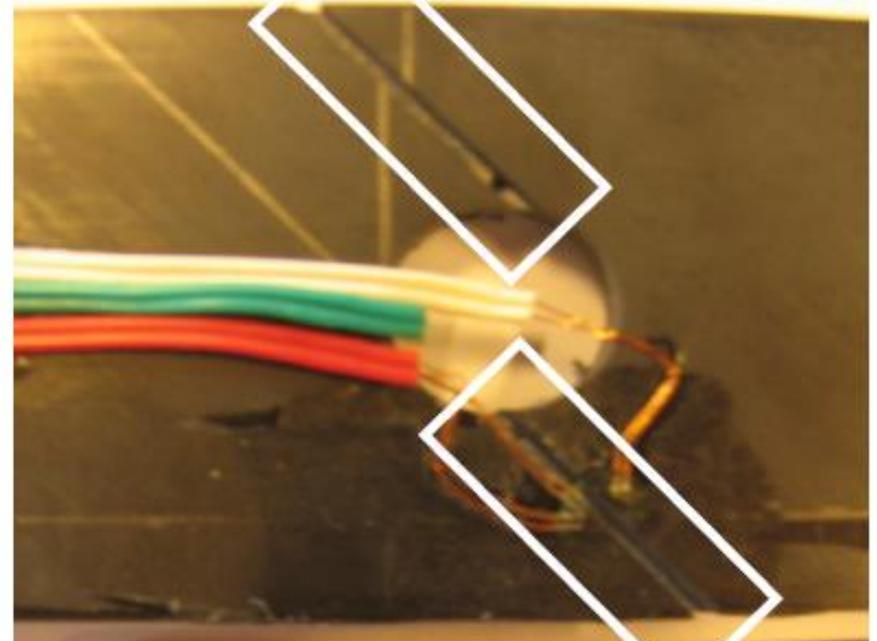

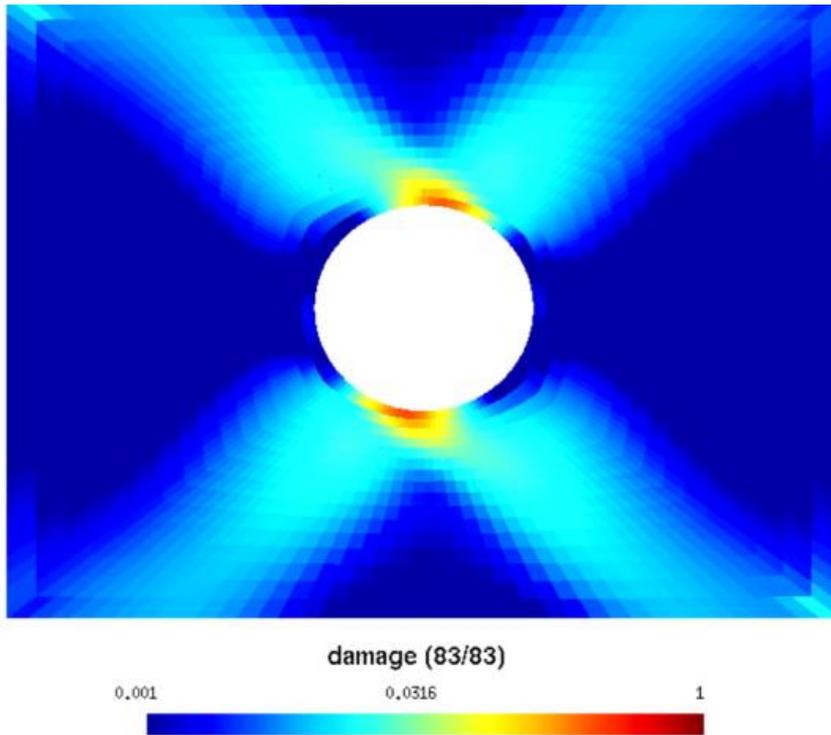

Non-local damage-enhanced mean-field-homogenization

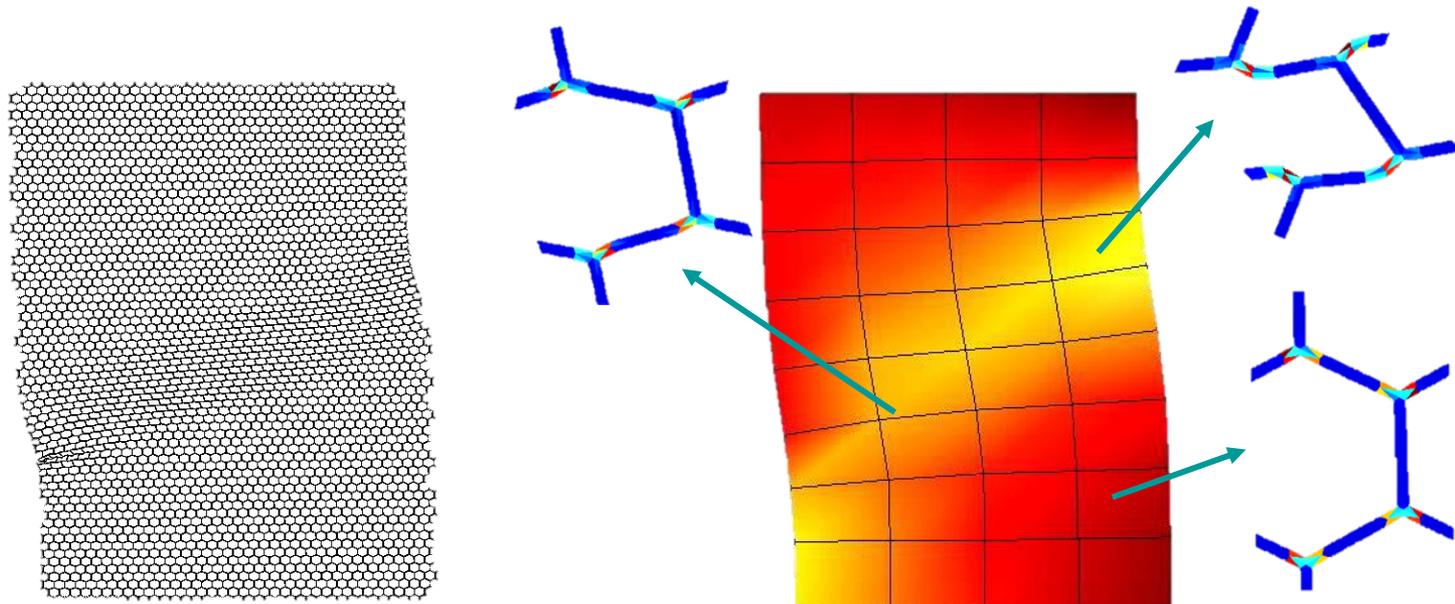

- Laminate plate with hole
 - Carbon-fibres reinforced epoxy
 - 60%-UD fibres
 - Elasto-plastic matrix with damage
 - $[-45_2/45_2]_S$ stacking sequence

Non-local damage-enhanced mean-field-homogenization

- Laminate plate with hole (2)
 - Carbon-fibres reinforced epoxy
 - 60%-UD fibres
 - Elasto-plastic matrix with damage
 - $[-45_2/45_2]_S$ stacking sequence

➡ How to constrain the periodic boundary conditions?

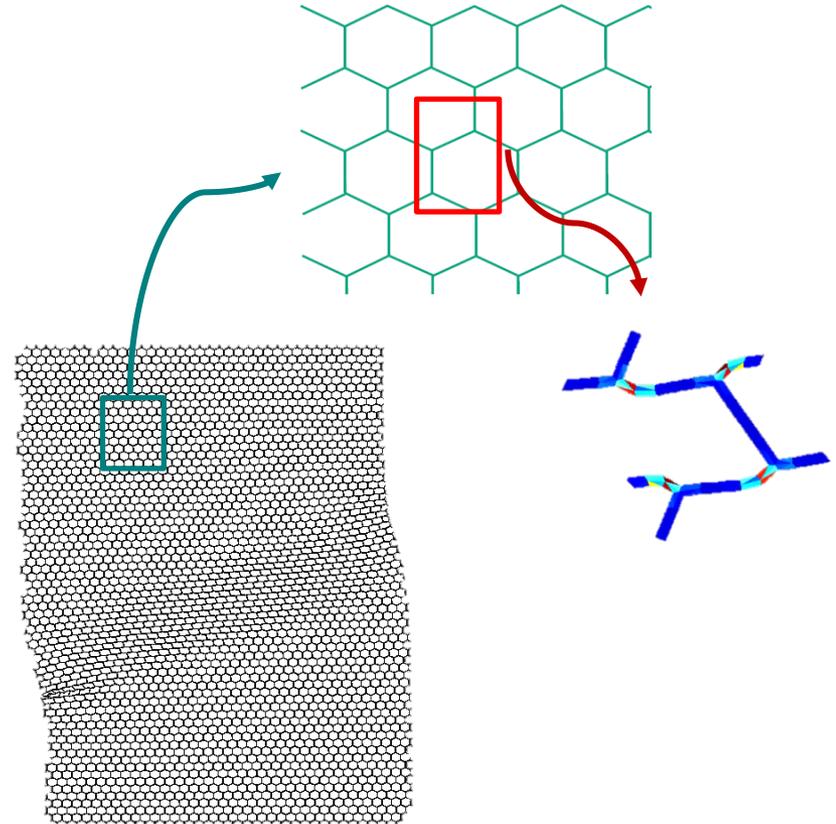

- Thin components
 - Experiences micro-buckling

➡ How to capture the instability?

- Transition

- Homogenized tangent not always elliptic
 - Localization bands

➡ How can we recover the solution unicity at the macro-scale?

Computational homogenization for foamed materials

- Challenges

- Micro-structure

- Not perfect with non periodic mesh

➡ How to constrain the periodic boundary conditions?

- Thin components
 - Experiences micro-buckling

➡ How to capture the instability?

- Transition

- Homogenized tangent not always elliptic
 - Localization bands

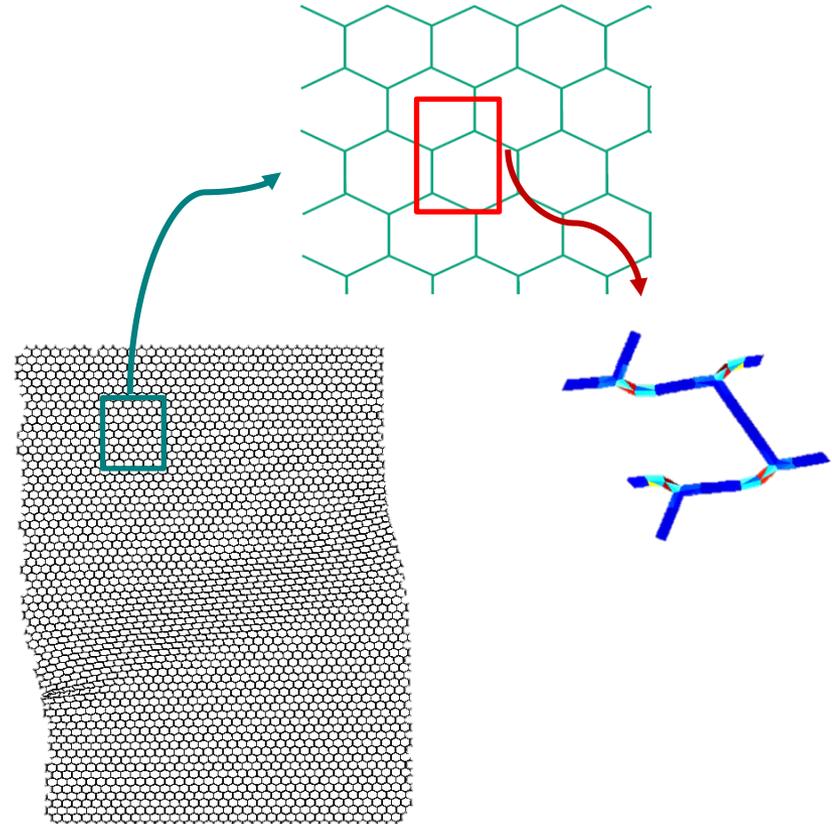

➡ How can we recover the solution unicity at the macro-scale?

- Macro-scale

- Localization bands

➡ How to remain computationally efficient

➡ How to capture the instability?

Computational homogenization for foamed materials

- Recover solution unicity: second-order FE²

- Macro-scale

- High-order Strain-Gradient formulation

$$\bar{\mathbf{P}}(\bar{\mathbf{X}}) \cdot \nabla_0 - \bar{\mathbf{Q}}(\bar{\mathbf{X}}): (\nabla_0 \otimes \nabla_0) = 0$$

- Partitioned mesh (//)

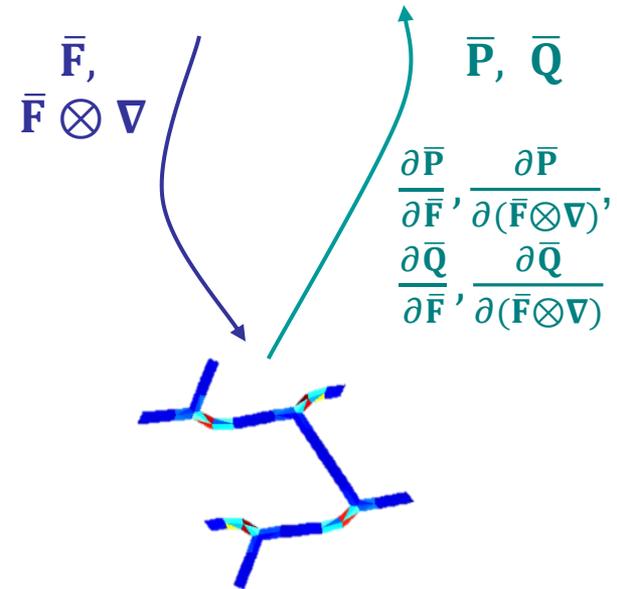

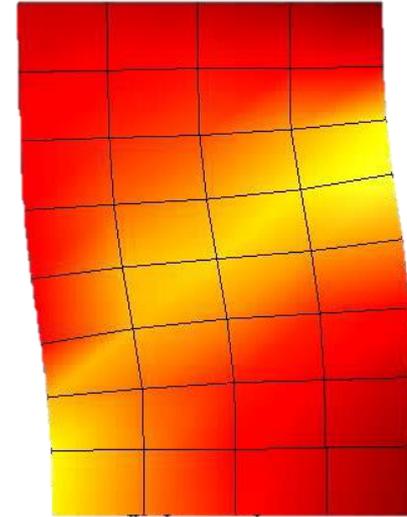

- Transition

- Gauss points on different processors
 - Each Gauss point is associated to one mesh and one solver

- Micro-scale

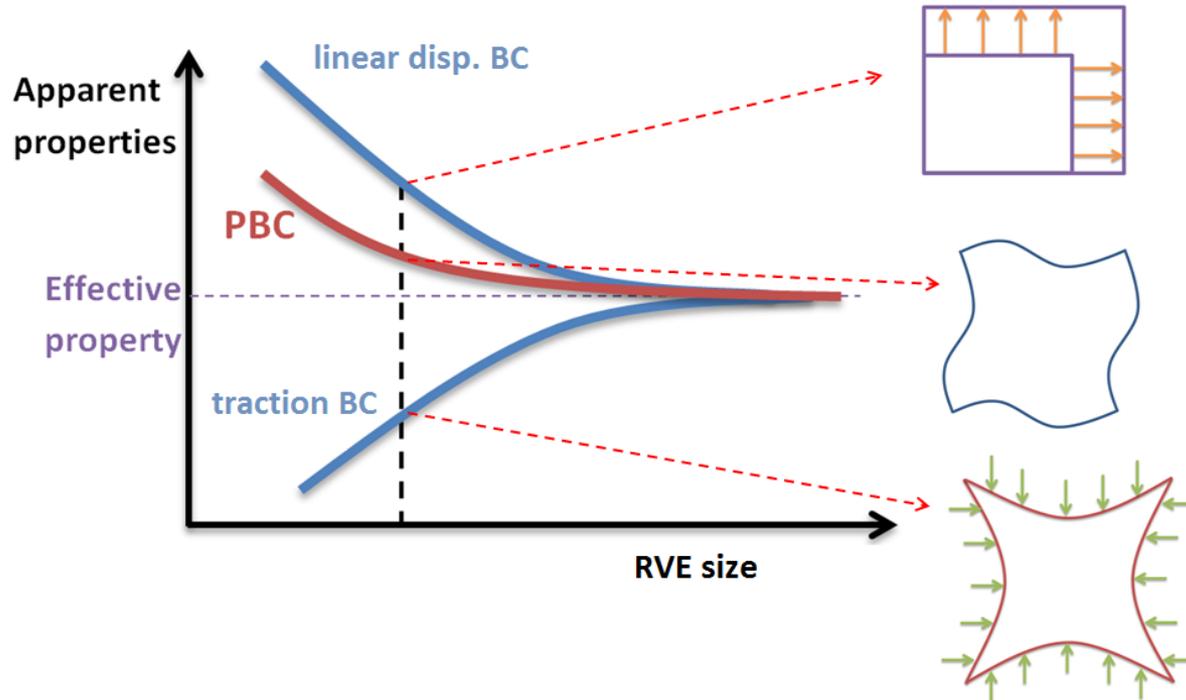

- Usual continuum

$$\mathbf{P}(\mathbf{X}) \cdot \nabla_0 = 0$$

Computational homogenization for foamed materials

- Micro-scale periodic boundary conditions
 - Convergence in terms of RVE size

- Periodic boundary conditions is the optimum choice for periodic structures
- Periodic boundary conditions remain the optimum choice for non-periodic structures

Computational homogenization for foamed materials

- Micro-scale periodic boundary conditions (2)

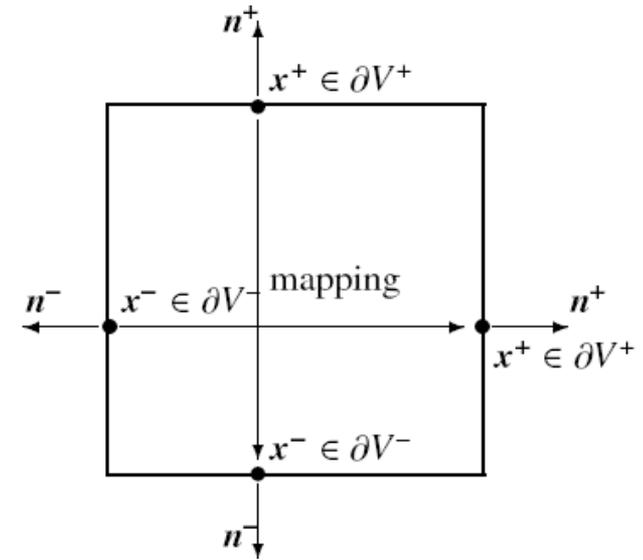

- Defined from the fluctuation field

$$\mathbf{w} = \mathbf{u} - (\bar{\mathbf{F}} - \mathbf{I}) \cdot \mathbf{X} + \frac{1}{2} (\bar{\mathbf{F}} \otimes \nabla_0) : (\mathbf{X} \otimes \mathbf{X})$$

- Stated on opposite RVE sizes

$$\begin{cases} \mathbf{w}(\mathbf{X}^+) = \mathbf{w}(\mathbf{X}^-) \\ \int_{\partial V^-} \mathbf{w}(\mathbf{X}) d\partial V = \mathbf{0} \end{cases}$$

- Can be achieved by constraining opposite nodes

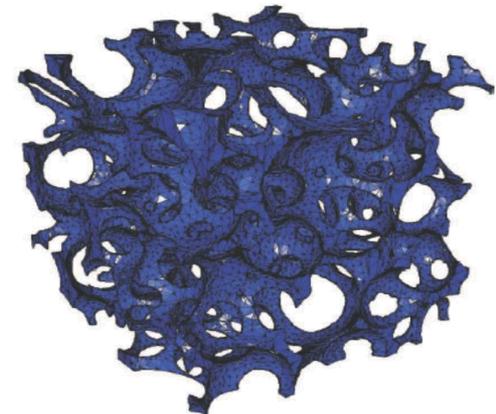

- Foamed materials

- Usually random meshes
- Important voids on the boundaries

- Honeycomb structures

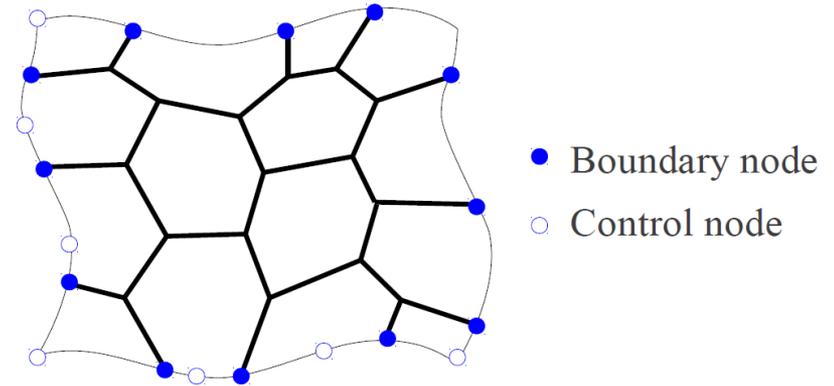

- Not periodic due to the imperfections

- Micro-scale periodic boundary conditions (2)

- New interpolant method

$$\left\{ \begin{array}{l} \mathbf{w}(\mathbf{X}^-) = \sum_k \mathbf{N}(\mathbf{X}) \mathbf{w}^k \\ \mathbf{w}(\mathbf{X}^+) = \sum_k \mathbf{N}(\mathbf{X}) \mathbf{w}^k \\ \int_{\partial V^-} \left(\sum_k \mathbf{N}(\mathbf{X}) \mathbf{w}^k \right) d\partial V = \mathbf{0} \end{array} \right.$$

- Use of Lagrange, cubic spline .. interpolations
- Fits for
 - Arbitrary meshes
 - Important voids on the RVE sides
- Results in new constraints in terms of the boundary and control nodes displacements

$$\tilde{\mathcal{C}} \tilde{\mathbf{u}}_b - \mathbf{g}(\bar{\mathbf{F}}, \bar{\mathbf{F}} \otimes \nabla_0) = 0$$

Computational homogenization for foamed materials

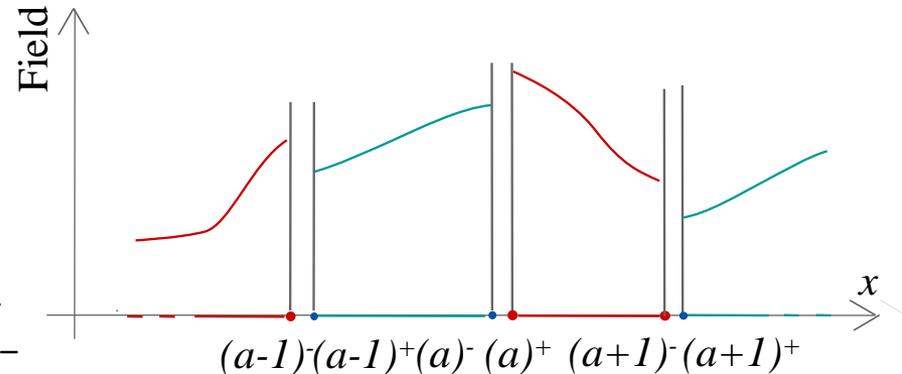

- Discontinuous Galerkin (DG) implementation of the second order continuum

- Finite-element discretization
- Same **discontinuous** polynomial approximations for the

- **Test** functions φ_h and
- **Trial** functions $\delta\varphi$

- Definition of operators on the interface trace:

- **Jump operator:** $[[\cdot]] = \begin{matrix} \cdot^+ & - & \cdot^- \\ \cdot^+ & + & \cdot^- \end{matrix}$
- **Mean operator:** $\langle \cdot \rangle = \frac{\cdot^+ + \cdot^-}{2}$

- Continuity is weakly enforced, such that the method
 - Is consistent
 - Is stable
 - Has the optimal convergence rate
- Can be used to weakly enforce higher discontinuities

- Second-order FE2 method
 - Macro-scale second order continuum

$$\bar{\mathbf{P}}(\bar{\mathbf{X}}) \cdot \nabla_0 - \bar{\mathbf{Q}}(\bar{\mathbf{X}}): (\nabla_0 \otimes \nabla_0) = 0$$

- Requires \mathcal{C}^1 shape functions on the mesh
- The \mathcal{C}^1 can be weakly enforced using the DG method

$$a(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = a^{\text{bulk}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) + a^{\text{PI}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) + a^{\text{QI}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = b(\delta\bar{\mathbf{u}})$$

- Second-order FE2 method
 - Macro-scale second order continuum

$$\bar{\mathbf{P}}(\bar{\mathbf{X}}) \cdot \nabla_0 - \bar{\mathbf{Q}}(\bar{\mathbf{X}}) : (\nabla_0 \otimes \nabla_0) = 0$$

- Requires \mathcal{C}^1 shape functions on the mesh
- The \mathcal{C}^1 can be weakly enforced using the DG method

$$a(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = a^{\text{bulk}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) + a^{\text{PI}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) + a^{\text{QI}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = b(\delta\bar{\mathbf{u}})$$

- Usual volume terms

$$a^{\text{bulk}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = \int_{\bar{V}} [\bar{\mathbf{P}}(\bar{\mathbf{u}}) : (\delta\bar{\mathbf{u}} \otimes \nabla_0) + \bar{\mathbf{Q}}(\bar{\mathbf{X}}) : (\delta\bar{\mathbf{u}} \otimes \nabla_0 \otimes \nabla_0)] dV$$

- Second-order FE2 method

- Macro-scale second order continuum

$$\bar{\mathbf{P}}(\bar{\mathbf{X}}) \cdot \nabla_0 - \bar{\mathbf{Q}}(\bar{\mathbf{X}}): (\nabla_0 \otimes \nabla_0) = 0$$

- Requires \mathcal{C}^1 shape functions on the mesh
- The \mathcal{C}^1 can be weakly enforced using the DG method

$$a(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = a^{\text{bulk}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) + a^{\text{PI}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) + a^{\text{QI}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = b(\delta\bar{\mathbf{u}})$$

- Weak enforcement of the \mathcal{C}^0

- Continuity
- Consistency
- Stability

between the finite elements

$$a^{\text{PI}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = \int_{\partial_I \bar{V}} \left[\begin{aligned} & [[\delta\bar{\mathbf{u}}]] \cdot \langle \bar{\mathbf{P}} - \bar{\mathbf{Q}} \cdot \nabla_0 \rangle \cdot \bar{\mathbf{N}} + [[\bar{\mathbf{u}}]] \cdot \langle \bar{\mathbf{P}}(\delta\bar{\mathbf{u}}) - \bar{\mathbf{Q}}(\delta\bar{\mathbf{u}}) \cdot \nabla_0 \rangle \cdot \bar{\mathbf{N}} + \\ & [[\bar{\mathbf{u}}]] \otimes \bar{\mathbf{N}}: \langle \frac{\beta_P}{h_s} \mathbf{C}^0 \rangle: [[\delta\bar{\mathbf{u}}]] \otimes \bar{\mathbf{N}} \end{aligned} \right] dV$$

- Allows efficient parallelization as elements are disjoint

- Second-order FE2 method

- Macro-scale second order continuum

$$\bar{\mathbf{P}}(\bar{\mathbf{X}}) \cdot \nabla_0 - \bar{\mathbf{Q}}(\bar{\mathbf{X}}): (\nabla_0 \otimes \nabla_0) = 0$$

- Requires \mathcal{C}^1 shape functions on the mesh
- The \mathcal{C}^1 can be weakly enforced using the DG method

$$a(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = a^{\text{bulk}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) + a^{\text{PI}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) + a^{\text{QI}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = b(\delta\bar{\mathbf{u}})$$

- Weak enforcement of the \mathcal{C}^1

- Continuity
- Consistency
- Stability

between the finite elements

$$a^{\text{QI}}(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = \int_{\partial_I \bar{V}} \left[\begin{aligned} & [[\delta\bar{\mathbf{u}} \otimes \nabla_0]] \cdot \langle \bar{\mathbf{Q}} \rangle \cdot \bar{\mathbf{N}} + [[\bar{\mathbf{u}} \otimes \nabla_0]] \cdot \langle \bar{\mathbf{Q}}(\delta\bar{\mathbf{u}}) \rangle \cdot \bar{\mathbf{N}} + \\ & [[\bar{\mathbf{u}} \otimes \nabla_0]] \otimes \bar{\mathbf{N}}: \langle \frac{\beta_P}{h_S} \mathbf{J}^0 \rangle: [[\delta\bar{\mathbf{u}} \otimes \nabla_0]] \otimes \bar{\mathbf{N}} \end{aligned} \right] dV$$

- Allows efficient parallelization as elements are disjoint

- Capturing instabilities

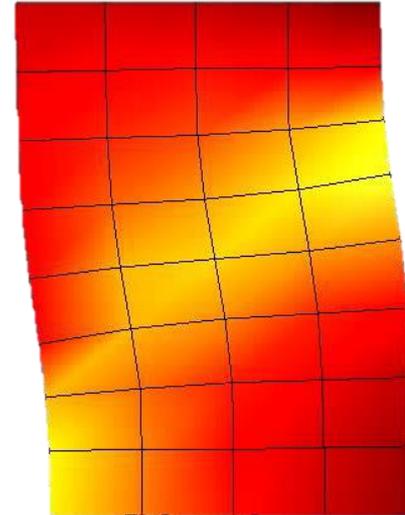

- Macro-scale: localization bands

- Path following method on the applied loading

$$a(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = \bar{\mu} b(\delta\bar{\mathbf{u}})$$

- Arc-length constraint on the load increment

$$\bar{h}(\Delta\bar{\mathbf{u}}, \Delta\bar{\mu}) = \frac{\Delta\bar{\mathbf{u}} \cdot \Delta\bar{\mathbf{u}}}{\bar{X}_0^2} + \Delta\bar{\mu}^2 - \Delta L^2 = 0$$

Computational homogenization for foamed materials

- Capturing instabilities

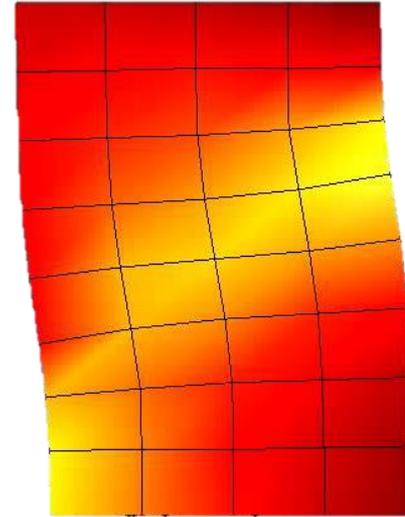

- Macro-scale: localization bands

- Path following method on the applied loading

$$a(\bar{\mathbf{u}}, \delta\bar{\mathbf{u}}) = \bar{\mu} b(\delta\bar{\mathbf{u}})$$

- Arc-length constraint on the load increment

$$\bar{h}(\Delta\bar{\mathbf{u}}, \Delta\bar{\mu}) = \frac{\Delta\bar{\mathbf{u}} \cdot \Delta\bar{\mathbf{u}}}{\bar{X}_0^2} + \Delta\bar{\mu}^2 - \Delta L^2 = 0$$

- Micro-scale

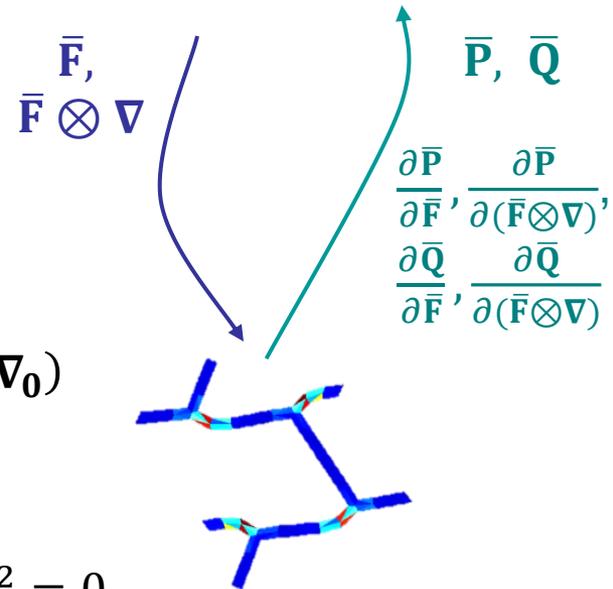

- Path following method on the applied boundary conditions

$$\tilde{\mathcal{C}} \tilde{\mathbf{u}}_b - \mathbf{g}(\bar{\mathbf{F}}, \bar{\mathbf{F}} \otimes \nabla_0) = 0$$

$$\begin{cases} \bar{\mathbf{F}} = \bar{\mathbf{F}}_0 + \mu \Delta\bar{\mathbf{F}} \\ \bar{\mathbf{F}} \otimes \nabla_0 = (\bar{\mathbf{F}} \otimes \nabla_0)_0 + \mu \Delta(\bar{\mathbf{F}} \otimes \nabla_0) \end{cases}$$

- Arc-length constraint on the load increment

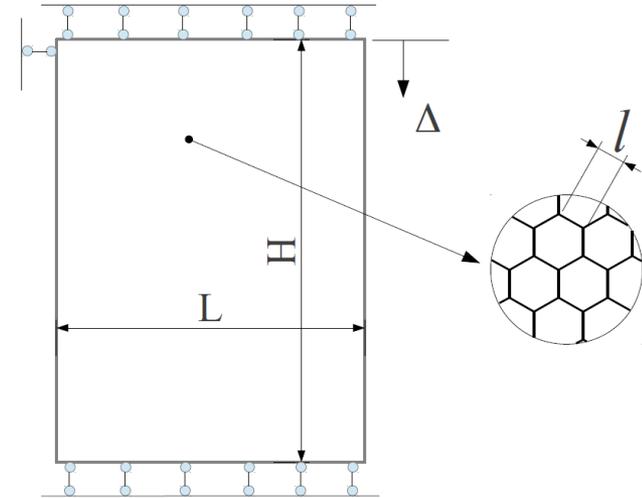

$$h(\Delta\mathbf{u}, \Delta\mu) = \frac{\Delta\mathbf{u} \cdot \Delta\mathbf{u}}{X_0^2} + \Delta\mu^2 - \Delta l^2 = 0$$

$$\frac{\partial \bar{\mathbf{P}}}{\partial \bar{\mathbf{F}}}, \frac{\partial \bar{\mathbf{P}}}{\partial (\bar{\mathbf{F}} \otimes \nabla)}, \frac{\partial \bar{\mathbf{Q}}}{\partial \bar{\mathbf{F}}}, \frac{\partial \bar{\mathbf{Q}}}{\partial (\bar{\mathbf{F}} \otimes \nabla)}$$

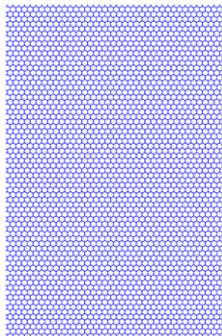

Computational homogenization for foamed materials

- Compression of an hexagonal honeycomb
 - Elasto-plastic material

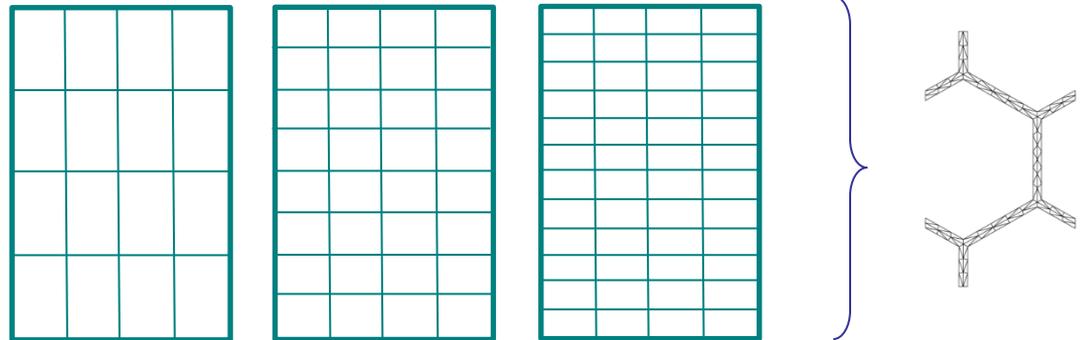

- Comparison of different solutions

Full direct simulation

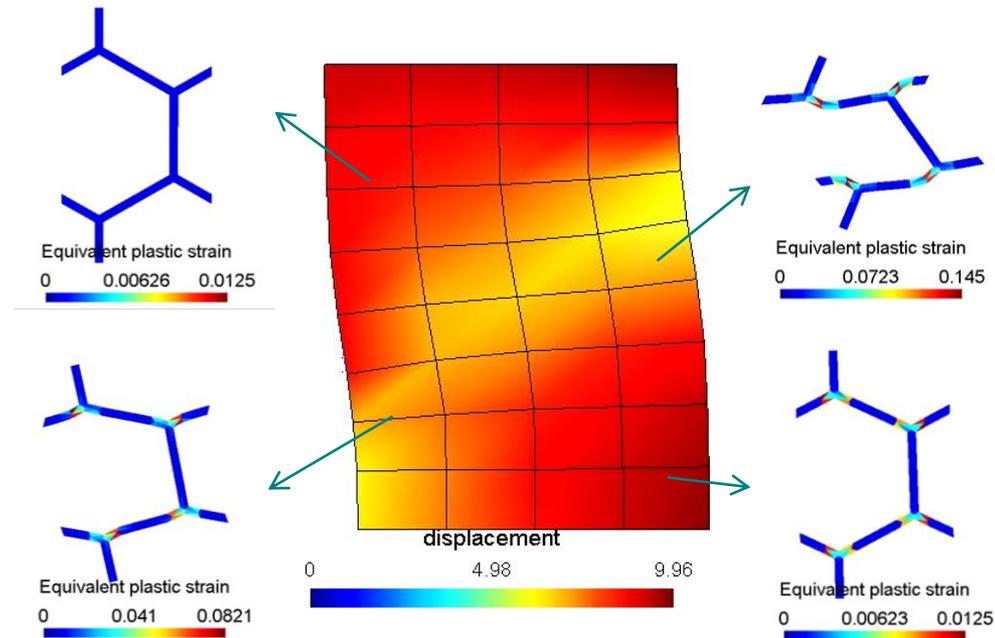

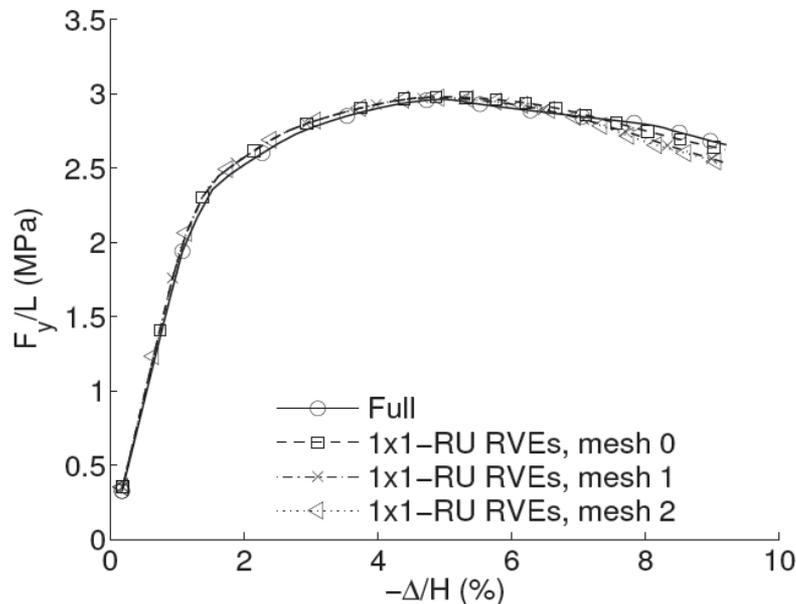

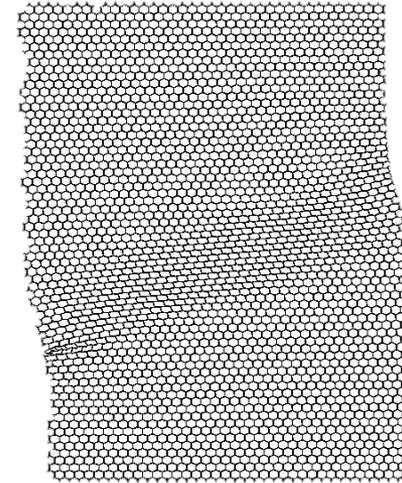

Multiscale with different macro-meshes

Computational homogenization for foamed materials

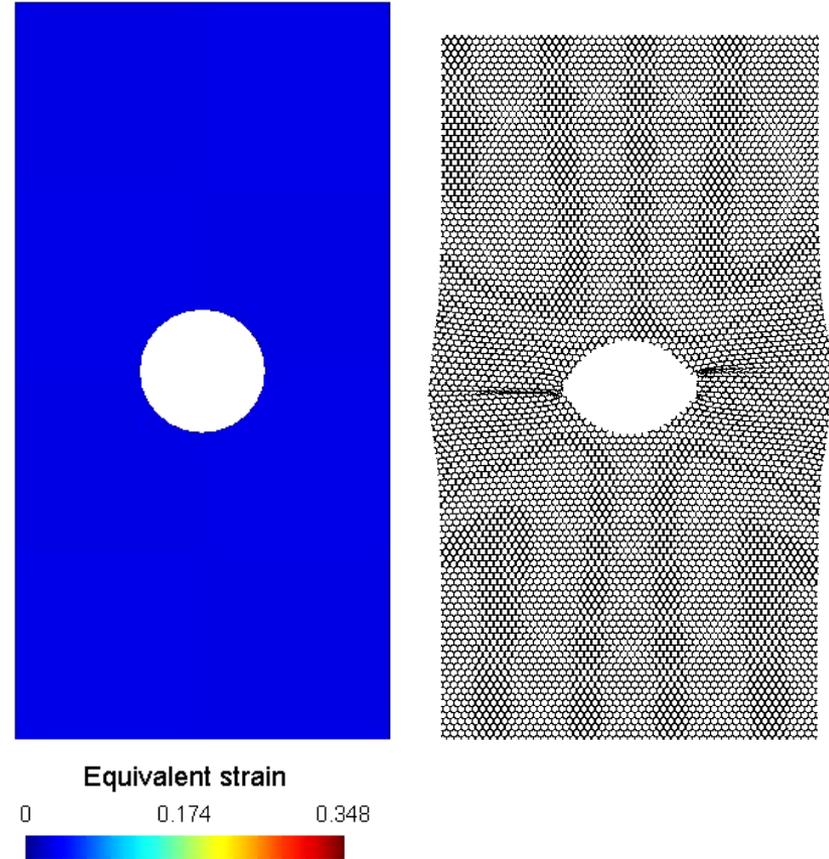

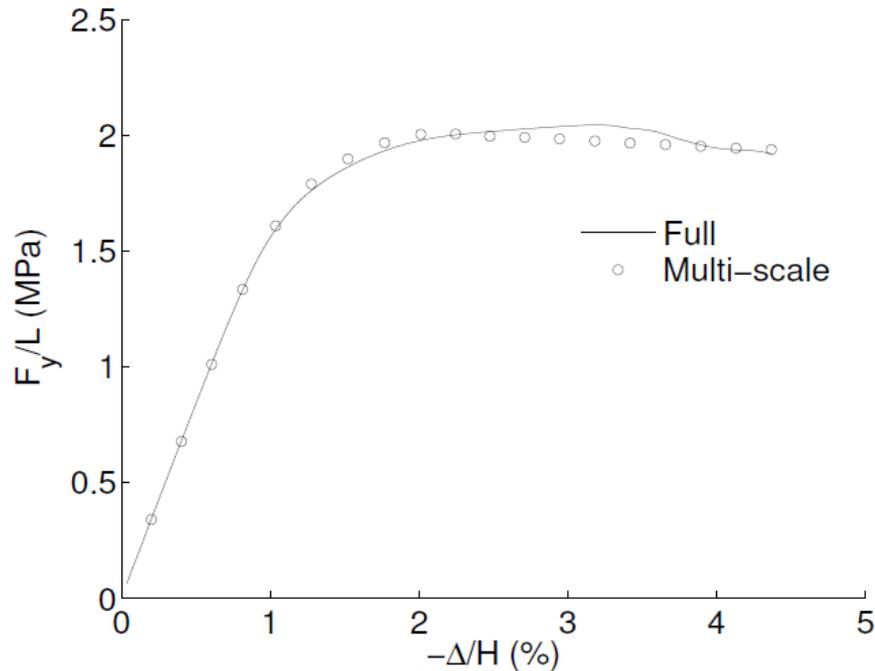

• Compression of an hexagonal honeycomb (2)

- Captures of the softening onset
- Captures the softening response
- No macro-mesh size effect

Computational homogenization for foamed materials

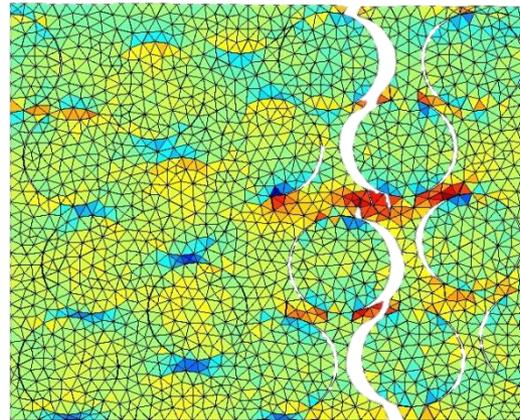

- Compression of a hexagonal honeycomb plate with a centered hole
 - Results given by full and multi-scale models are comparable

- Non-local damage-enhanced mean-field-homogenization
 - MFH with damage model for the matrix material
 - Non-local implicit formulation
 - Can capture the strain softening
