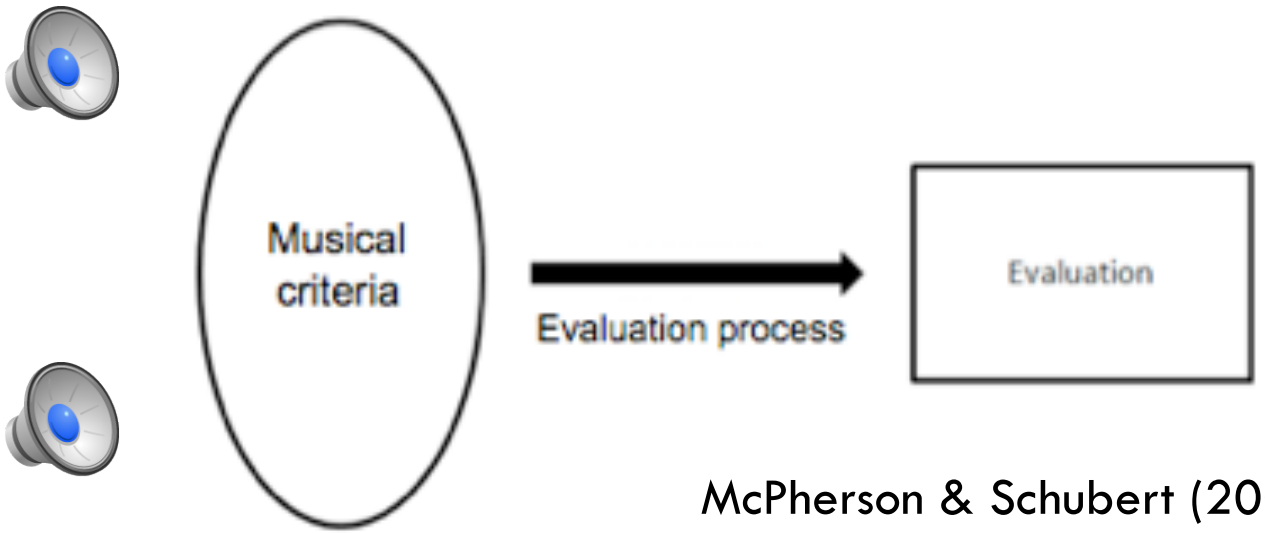
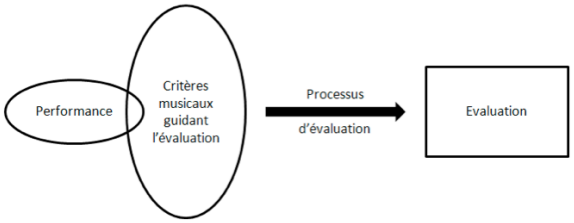
Is it in tune?



McPherson & Schubert (2004)



Is it in tune?

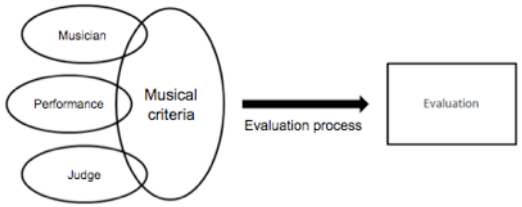
- Judges

  (e.g. Alcock, Passingham, Watkins, & Vargha-Khadem, 2000a; Alcock, Wade, Anslow, & Passingham, 2000b; Hébert, Racette, Gagnon, & Peretz, 2003; Kinsella, Prior, & Murray, 1988; Lévêque, Giovanni, & Schön, 2012; Prior, Kinsella, & Giese, 1990; Racette, Bard, & Peretz, 2006; Schön, Lorber, Spacal, & Semenza, 2004; Wise & Sloboda, 2008)

- But factors influencing the judges

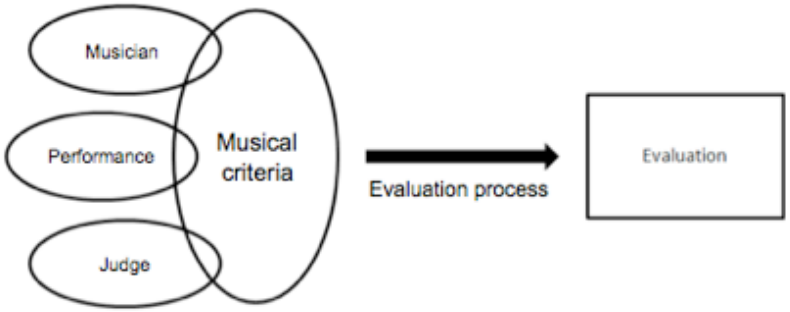
  (Godlovitch, 1998; Landy & Farr,1980; McPherson & Thompson, 1998)

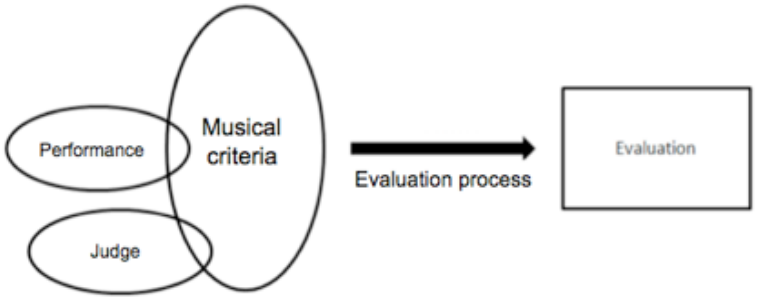
  - Musician (Behne & Wöllner, 2011; Davidson & Edgar, 2003; Elliott, 1996)
  - Behavior on stage (Howard, 2012; Juchniewicz, 2008; Kurosawa & Davidson, 2005; Wapnick et al., 1998, 2000)
  - Facial expressions (Livingstone, Thompson, & Russo, 2009)
  - Appearance / attractiveness (Ryan & Costa-Giomi, 2004; Wapnick, Darrow, Kovacs, & Dalrymple, 1997; Wapnick et al., 1998, 2000)
  - Attire (Griffiths, 2008, 2010; Wapnick et al., 2000)

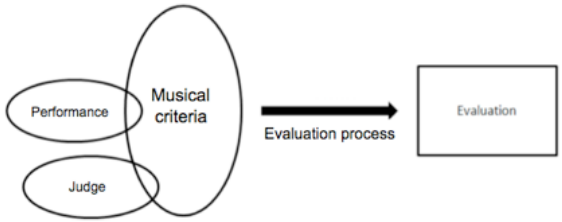


Is it in tune?

- Presentation of the music performance (i.e. visual and/or auditory) (Connell, Gay, & Holler, 2013, Howard, 2012; Thompson, Graham, & Russo, 2005; Thompson & Russo, 2007; Tsay, 2013)
- Context of the evaluation (Hash, 2013; Larrouy-Maestri & Morsomme, 2013; Sheldon, 1994)



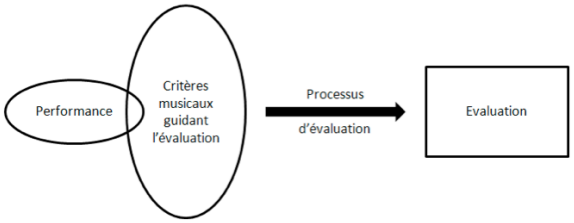




Is it in tune?

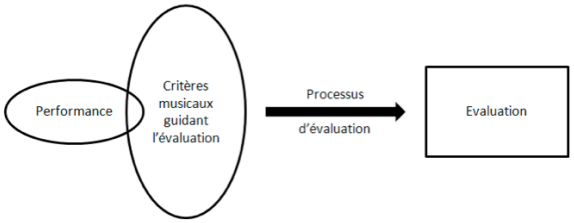
- If recordings
  - Gender of the judge (Wapnick et al., 1997)
  - Musical preferences (Glejser & Heyndel, 2001)
  - Familiarity (Kinney, 2009)
  - Judges' expectations (Cavitt, 1997; Duerksen, 1972; Larrouy-Maestri & Morsomme, 2013)
  - Expertise (e.g. Hutchins, Roquet, & Peretz, 2012; Larrouy-Maestri, Roig-Sanchis, & Morsomme, 2013)
  - Tempo and length (Wapnick, Ryan Campbell, Deek, Lemire, & Darrow, 2005)
  - Size of intervals (Russo & Thompson, 2005; Vurma & Ross, 2006)
  - Timbre (Hutchins et al., 2012)

➔ **Computer-assisted method**



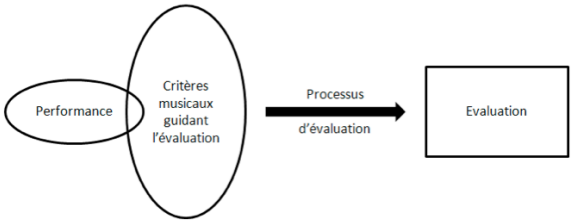
Is it in tune?

- Computer-assisted method
  - Not new
    - Singing Assessment and Development (SINGAD) (Howard & Welch, 1989)
    - Elmer and Elmer's method (2000)
  - Seems preferred (Dalla Bella, Berkowska, & Sowinski, 2011)
- Objectives
  - Possible causes of "poor pitch singing" (for reviews, see Hutchins & Peretz, 2012; Pfordresher et al., 2007)
  - Singing proficiency in the general population or singers profile (Dalla Bella & Berkowska, 2009; Dalla Bella, Giguère, & Peretz, 2007; Pfordresher & Brown, 2007; Pfordresher, Brown, Meier, Belyk, & Liotti, 2010)



Is it in tune?

- Tasks
  - Pitch-matching
    - Complex tones (Amir, Amir, & Kishon-Rabin, 2003; Hutchins & Peretz, 2012; Moore, Keaton, & Watts, 2007; Nikjeh, Lister, & Frisch, 2009; Pfordresher & Brown, 2007, 2009; Pfordresher et al., 2010)
    - Voice of the participant (Hutchins & Peretz, 2012; Hutchins, Larrouy-Maestri, & Peretz, in press; Moore et al., 2008; Pfordresher & Mantell, 2014)
  - Melodic sequences (Granot et al., 2013; Pfordresher & Brown, 2007, 2009; Pfordresher et al., 2010)
  - Full melodies (Dalla Bella et al., 2007, 2009; Hutchins et al., in press; Larrouy-Maestri et al., 2013a, 2014; Pfordresher et al., 2010)
- Procedure (manual or automatic)
- Tools
  - Praat
  - Yin (+ matlab)
  - Melodyne
  - Ircam's tools (Paris, France)



Is it in tune?

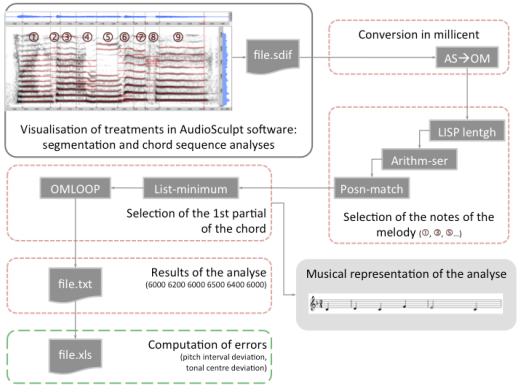
- If pitch-matching
  - Tone performed compared to the target tone: absolute pitch
  - Deviation calculated relatively to equal temperament
- If melodic sequences
  - Like for the pitch-matching task
  - Intervals performed compared to intervals expected: relative pitch
  - Both (Berkowska & Dalla Bella, 2013; Dalla Bella et al., 2007; Granot et al., 2013; Pfordresher et al., 2010)
- If full melodies
  - Like for pitch-matching and melodic sequences
  - Pitch stability (Dalla Bella et al., 2007)
  - Tonal deviation (Larrouy-Maestri & Morsomme, 2013, 2014)
  - Number of modulations (Larrouy-Maestri et al., 2013)

Three steps

Three steps

Manual segmentation

AudioSculpt (Ircam)



F0 information

AudioSculpt and OpenMusic (Ircam)

Quantification of errors

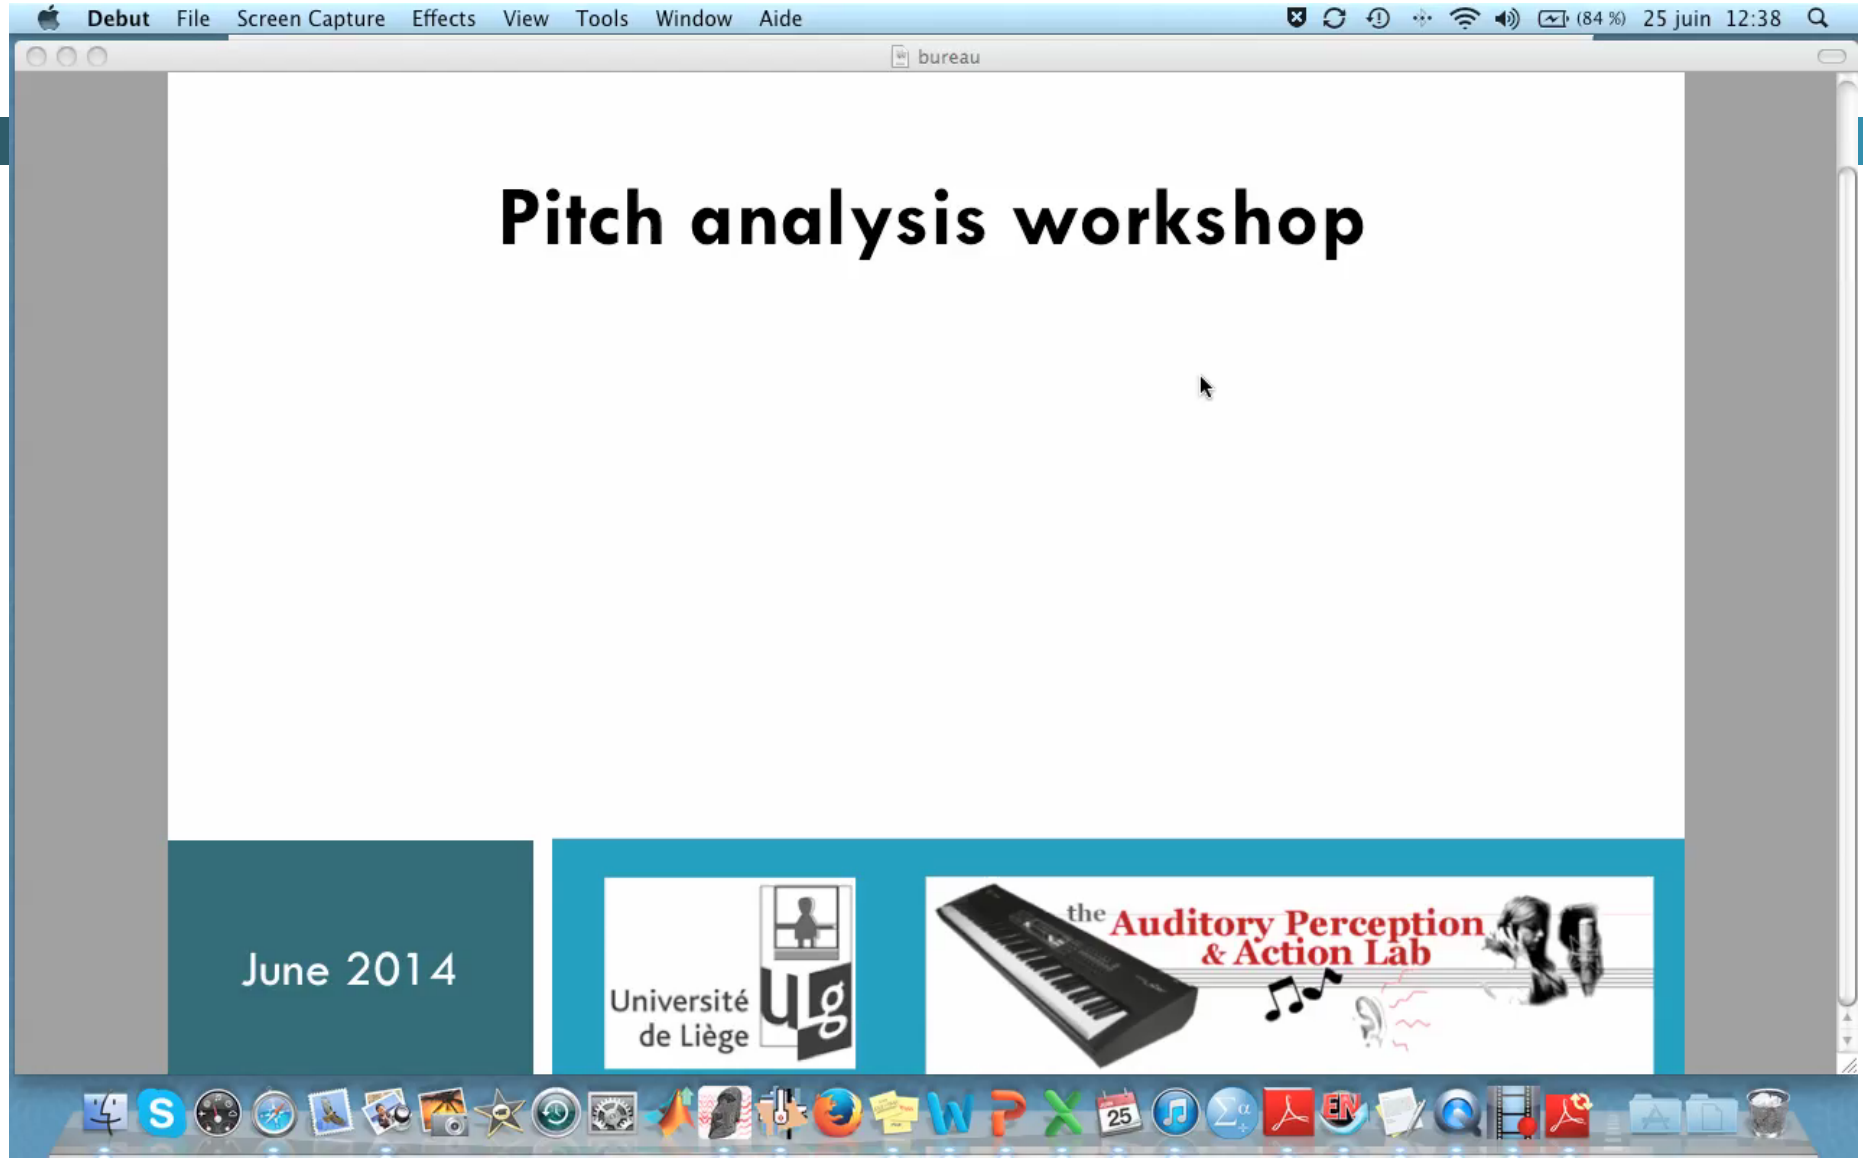
Excel (Microsoft)

Larrouy-Maestri, P., & Morsomme, D. (2014). Criteria and tools for objectively analysing the vocal accuracy of a popular song. *Logopedics Phoniatrics Vocology*.

Step 1 – Segmentation + analysis

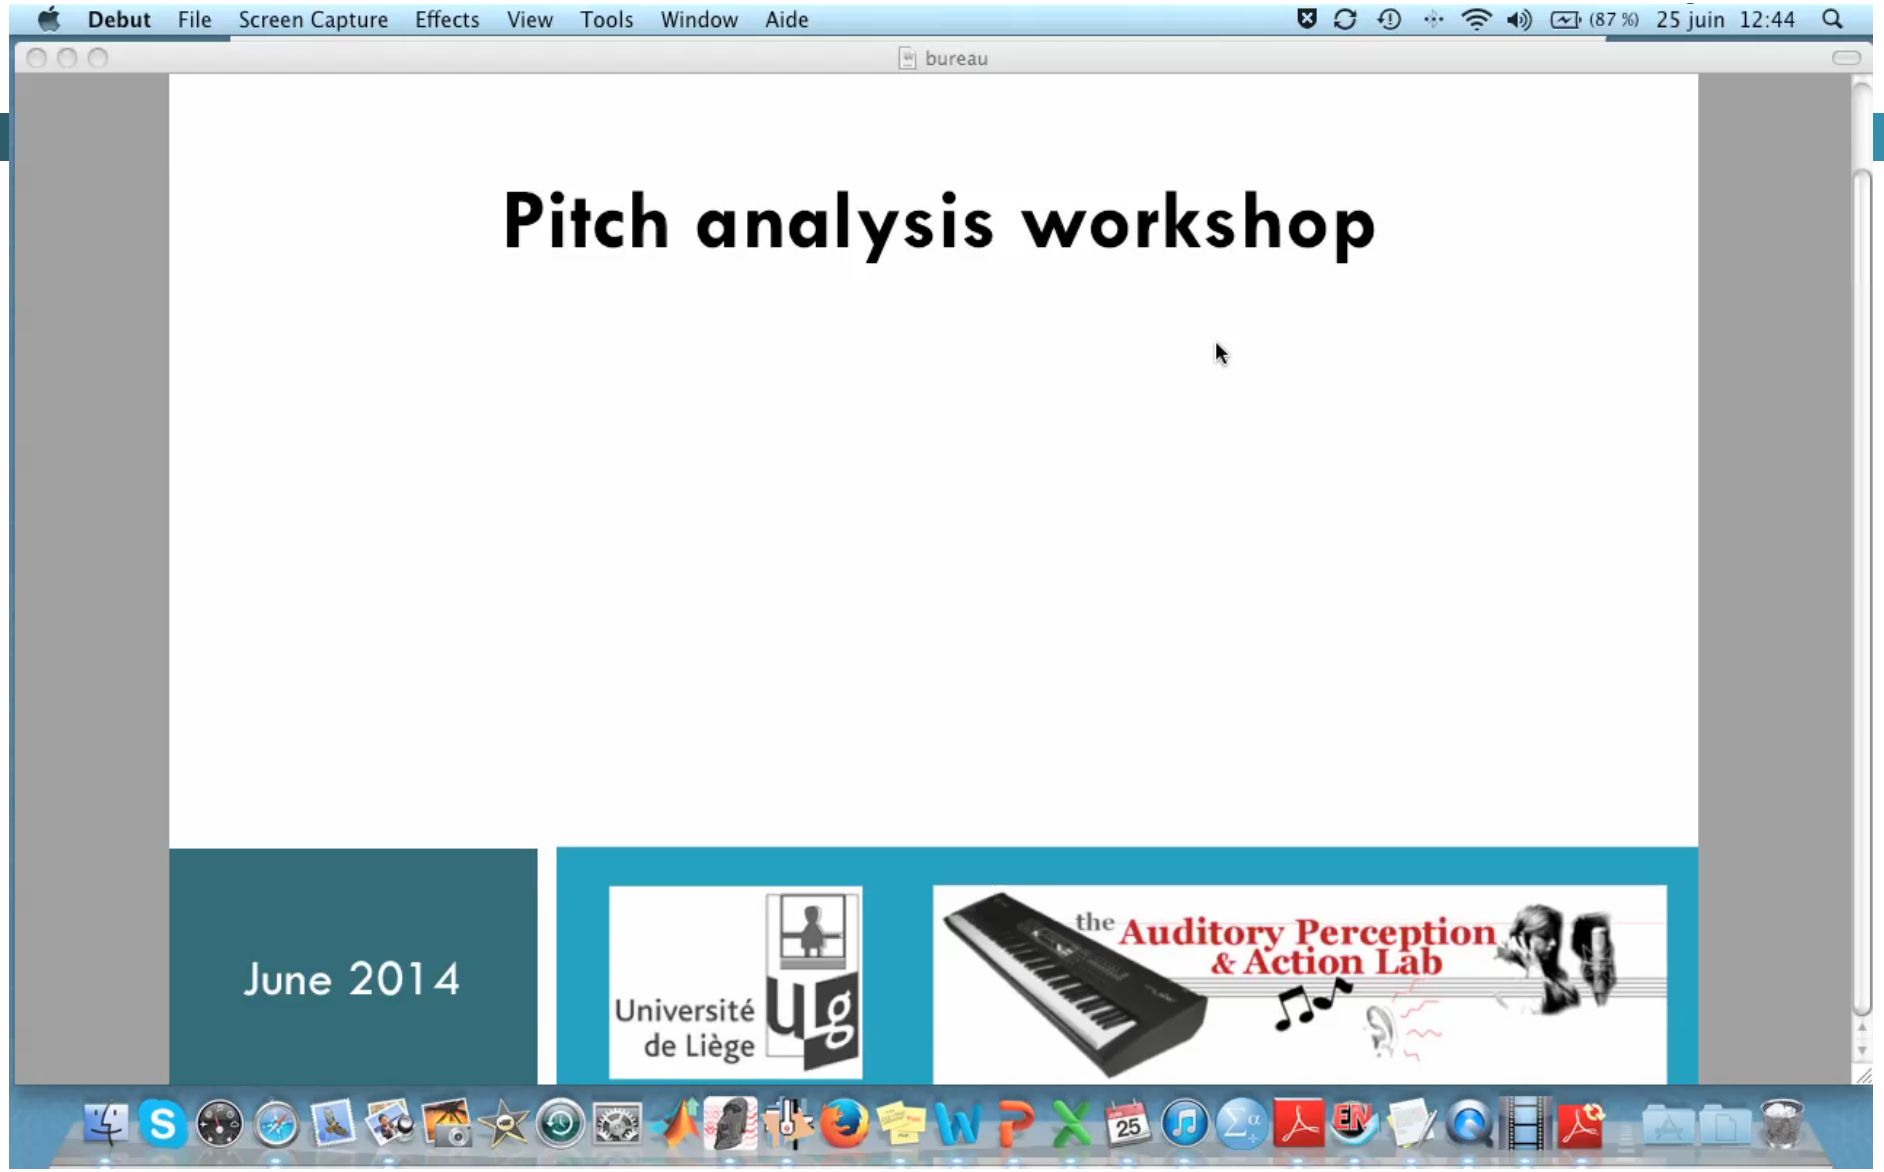
AudioSculpt (Ircam, Paris, France)

Step 1



Debut File Screen Capture Effects View Tools Window Aide
(84 %) 25 juin 12:38
bureau
Pitch analysis workshop
June 2014
Université de Liège
the Auditory Perception & Action Lab

Step 1



Debut File Screen Capture Effects View Tools Window Aide
(87 %) 25 juin 12:44
bureau
Pitch analysis workshop
June 2014
Université de Liège
the Auditory Perception & Action Lab

Step 1
Procedure

- Open file
- Sonogram + F0 (FFT)
- Markers to select each note (visual and audio cues)
  - Vowels
    - essential acoustic information about the pitch
    - mark the beginning of a musical sound

      (Sundberg & Bauer-Huppmann, 2007)
  - Comparison analyzes with different segmentation strategies (with or without attacks and links between notes) (Pfordresher & Brown, 2007)
    - strong correlation (r> .99)
- Chord sequence analysis
- Save analysis

Step 1
Discussion

- Advantages
  - Masking noise if necessary
  - Adaptation of analysis parameters
  - Whatever the instrument and the piece
- Why not automatically?
  - Automation requires a good quality of the signal
    - Presence of silence or alteration of the sound within tones can lead to a segmentation of the signal
    - A tone with unstable F0 could be considered as two separate elements
  - Complicated for melodic context
    - No silence between the tones
    - Not always a consonant
  - Not so time consuming and avoids segmentation errors

Step 1
Alternatives

- Several possibilities to extract F0

  (for reviews, see Gomez, Klapuri, & Meudic, 2003)

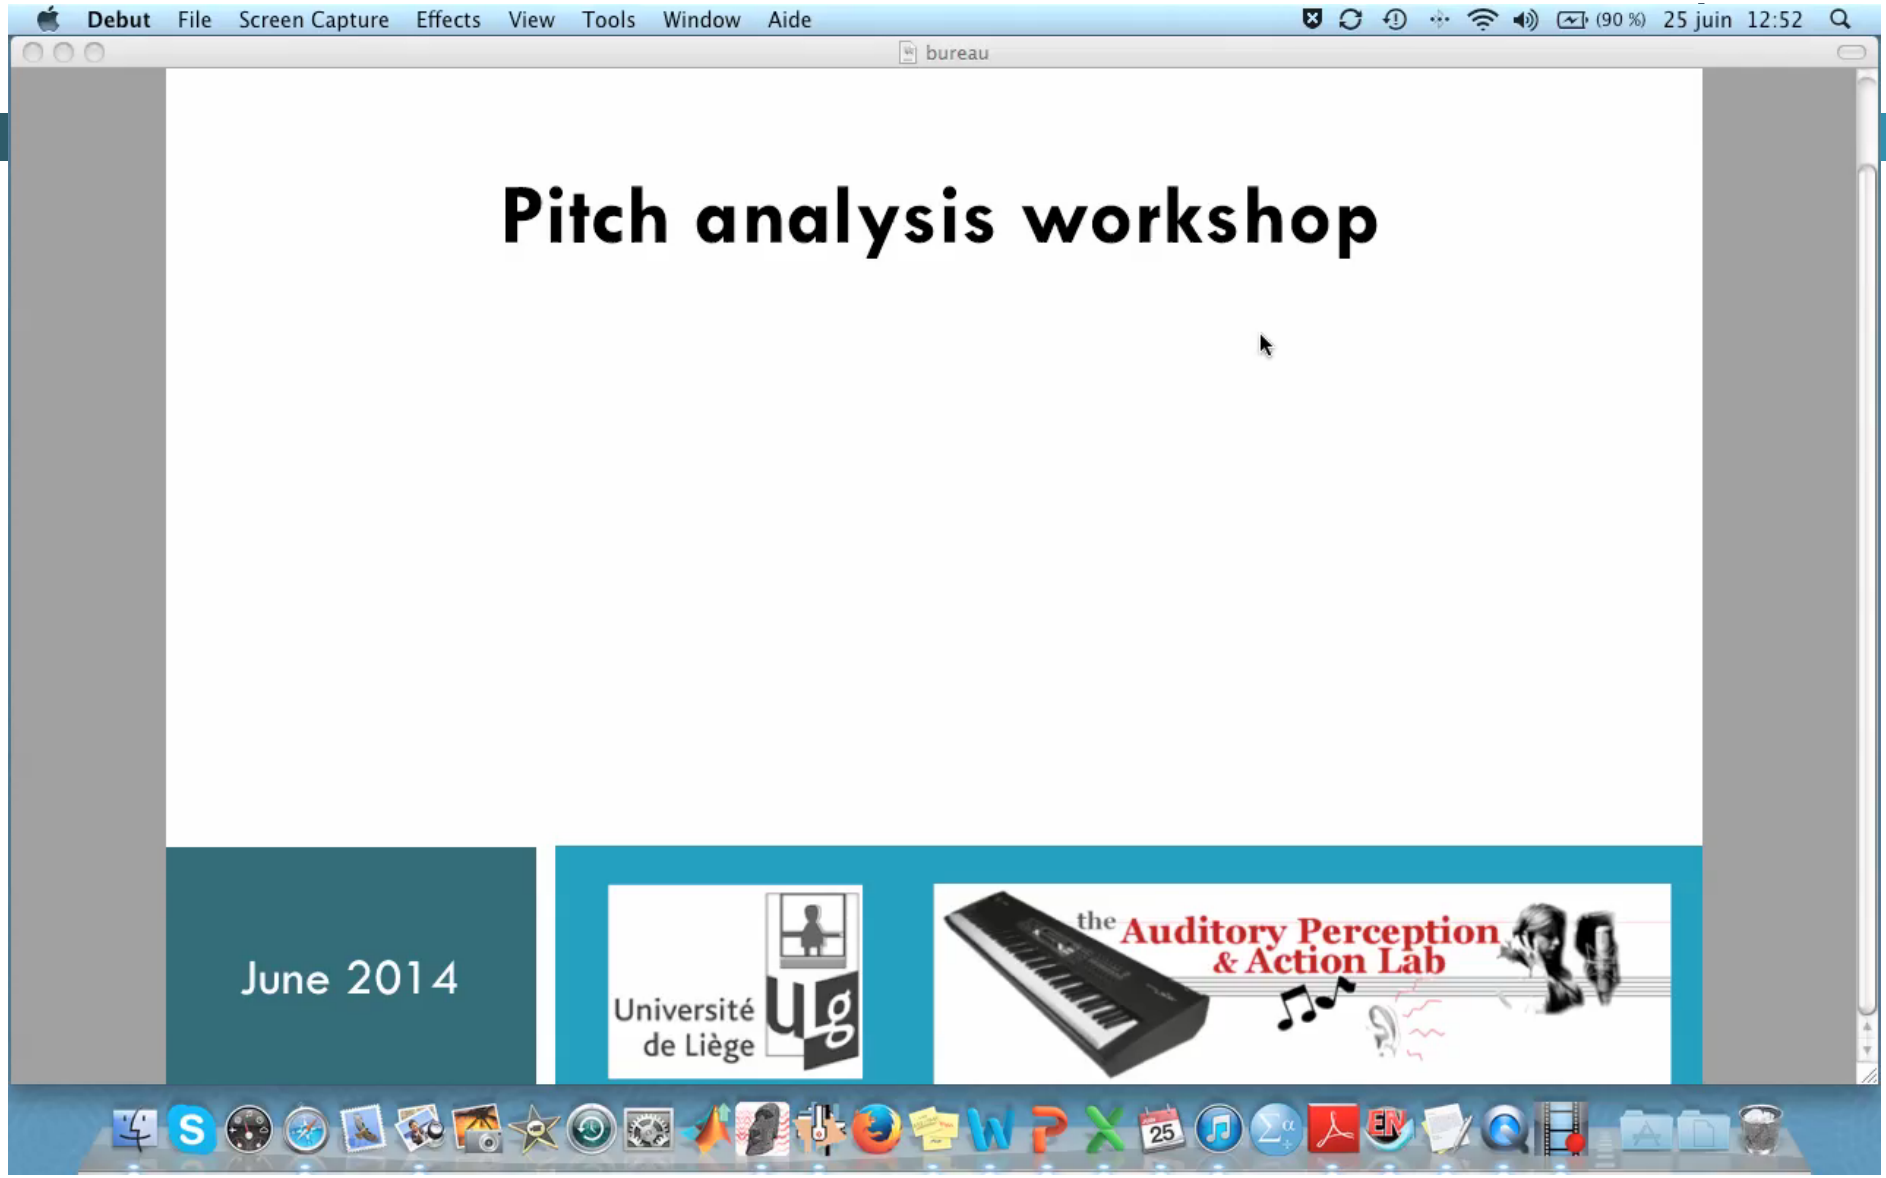
  - Three main groups of algorithms (workshop Bing-Yi)
  - Favor the time information, the spectral information, or both

- Analytical tools
  - Melodyne
    - Can choose “melodic”, “percussive” or “polyphonic”
    - Quid of the difference
  - Praat
    - Autocorrelation method seems preferable for vocal analysis (Boersma, 1993)
    - Mostly used but many octave errors
  - Yin algorithm
    - Improved version of the autocorrelation method (De Cheveigné & Kamahara, 2002)
    - Used by Hutchins & Peretz (2012), Hutchins, Larrouy-Maestri, & Peretz (in press)
  - Recent comparison of Praat and Yin
    - Perhaps a preference for Yin (less octave errors)

Step 2 – Treatment

OpenMusic (Ircam, Paris, France)

Step 2



Debut File Screen Capture Effects View Tools Window Aide

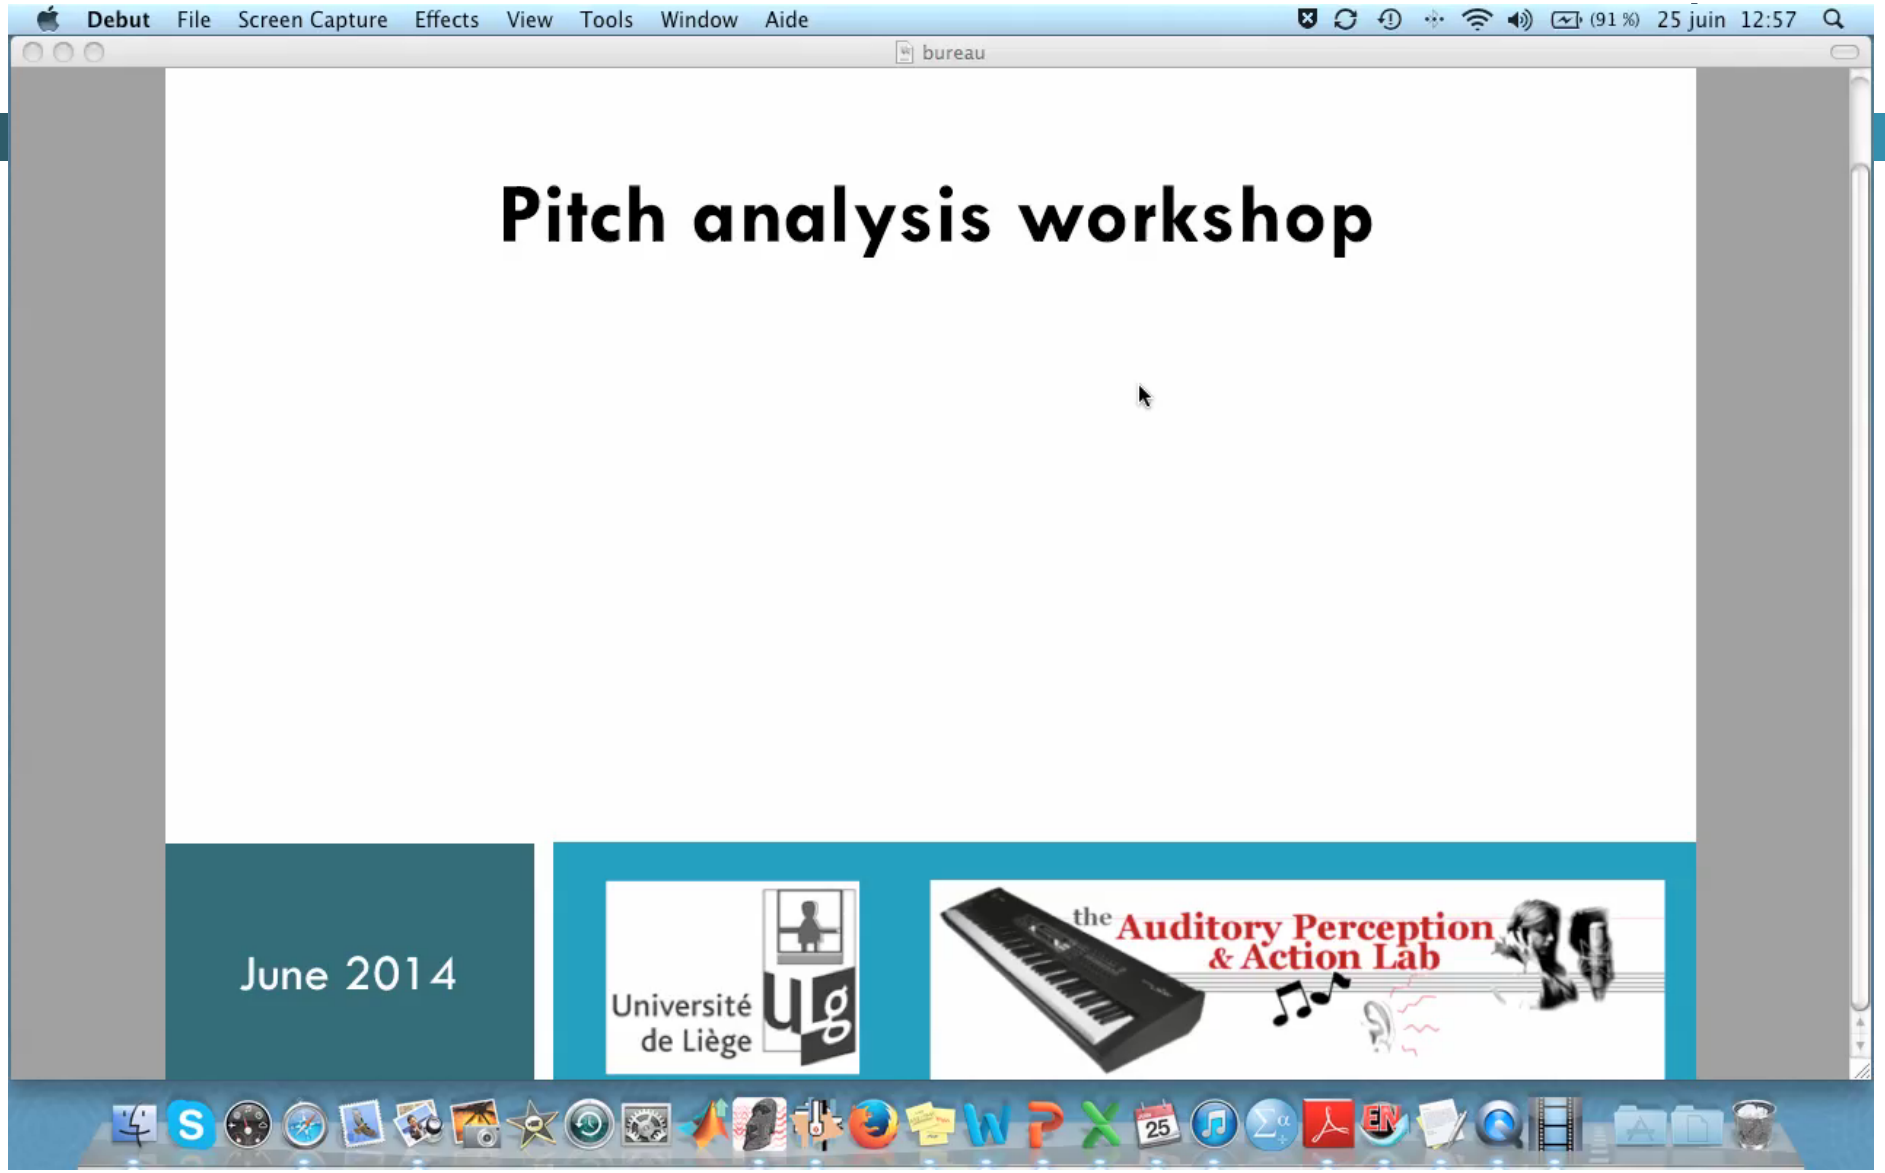
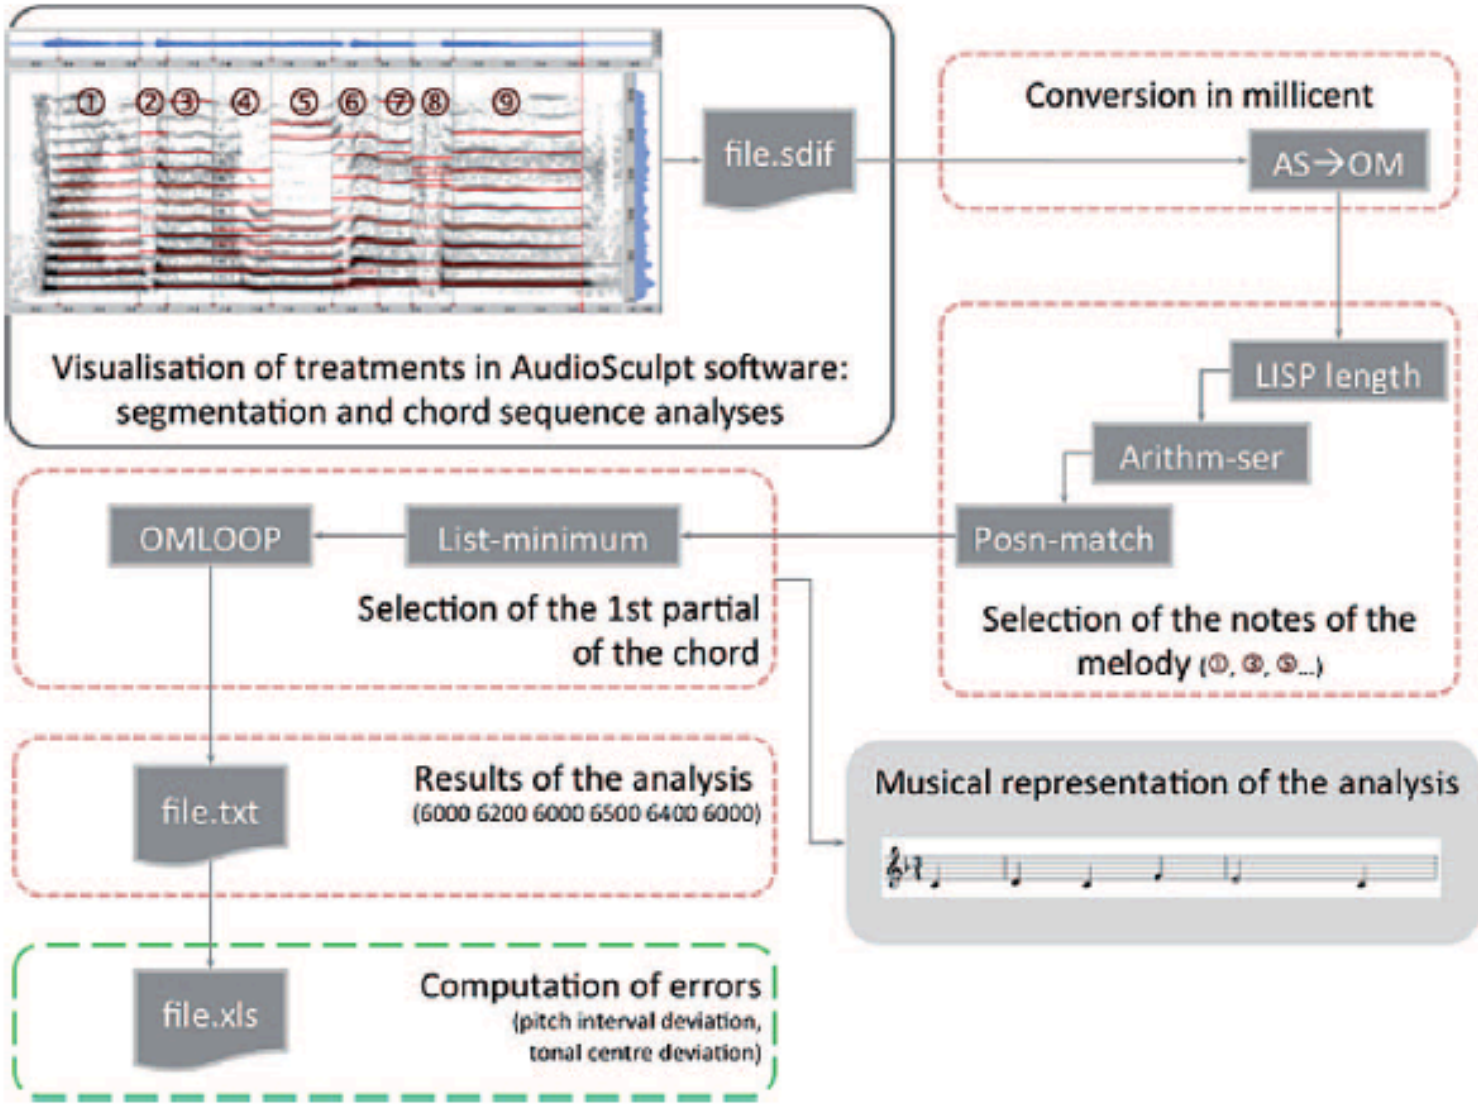
Step 2



Debut File Screen Capture Effects View Tools Window Aide
(91 %) 25 juin 12:57
bureau
Pitch analysis workshop
June 2014
Université de Liège
the Auditory Perception & Action Lab

Step 2
Procedure



Step 2
Discussion

- Advantages
  - Adaptative
  - Automatic
  - Whatever the instrument and the piece
  - Possibility to visualize the results as text.file or on a musical score
- But
  - Experimental end sensitive material
  - Not free
  - Only on macintosh
  - Necessity of programing skills

Step 3 – Computation of errors

Excel (Microsoft)

Step 3

Step 3
Musical criteria

Contour error

Interval deviation

Modulation

Step 3
Procedure

- Insert reference in cents for each note
- Import text file
- Computation of errors
  - Contour error
    - Detect wrong direction of an interval
  - Interval precision
    - Compute the average difference between expected/performed intervals
  - Respect of tonal center
    - Same but intervals between « important » tones
  - Number of modulations
    - Interval deviation of more than a semitone (100 cents)
    - Not compensated

Step 3
Example

- Example of « important » tones

		0	0	-700	-700	0	0	0
Nom	Gpe	|5-1|	|12-9|	|20-15|	|26-21|	|29-27|	|32-30|	|32-1|
man		70	64	104	164	64	60	364
woman		10	6	28	36	22	10	30

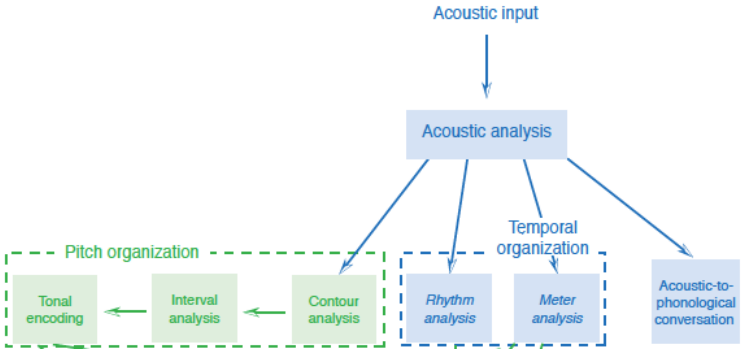
- Average of the tonal center deviations
  - Man = 100.5 cents
  - Woman = 20 cents

Choice of the musical errors

Choice of the musical errors

- Young age
  - Categorisation of contour errors:10 months (Ferland & Mendelson, 1989)
  - Discrimination of tonality and intervals (Hannon & Trainor, 2007; Gooding & Stanley, 2001; Plantinga & Trainor, 2005; Stalinski et al., 2008)
- Errors perceived by adults

  (Dowling & Fujitani, 1970; Edworthy, 1985; Stalinski et al., 2008; Trainor & Trehub, 1992)



Peretz & Cortheart (2003)

- Particularly by musicians

  (Hutchins & Peretz, 2012; Hutchins et al., 2012; Micheyl et al., 2006; Russo & Thompson, 2005; Terviniami et al., 2005)

Choice of the musical errors

166 sung performances

http://sldr.org/sldr000774/en

Acoustic analyses

18 Musicians

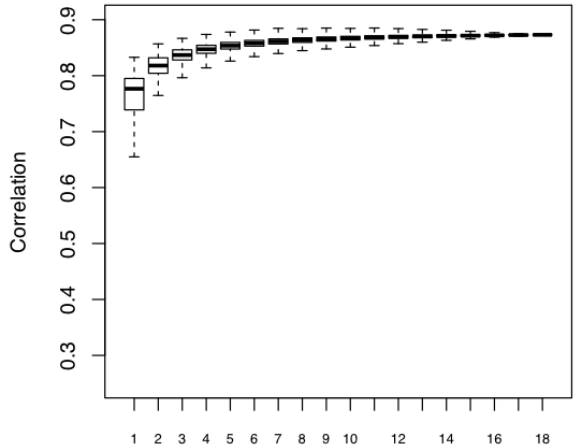
1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9

Out of tune — In tune

Choice of the musical errors

- 81% of the variance explained
  - $F(3,165) = 231.51$; $p < .01$
  - Pitch interval deviation: $\beta = 0.51$; $p < .001$
  - Respect of the tonality: $\beta = 0.45$; $p < .001$
- Precise definition among the expert judges
  - Mean judges' correlation:

    $r = .77$, $p < .01$



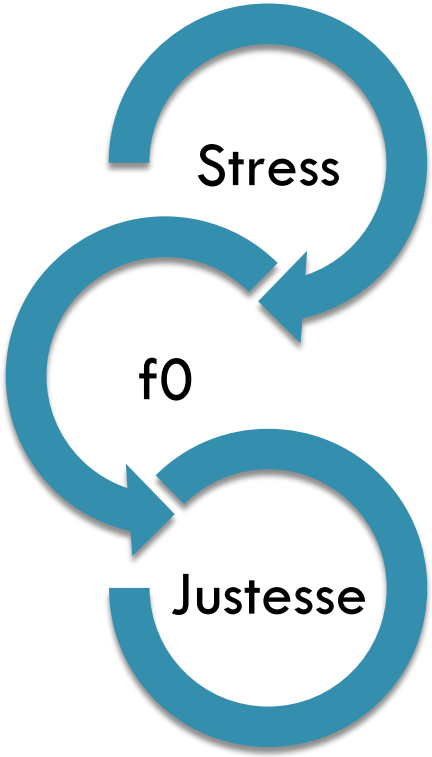
➔ **Perception of pitch accuracy based on two criteria**

Larrouy-Maestri, P., Lévêque, Y., Schön, D., Giovanni, A., & Morsomme, D. (2013). The evaluation of singing voice accuracy: A comparison between subjective and objective methods. *Journal of Voice*.

Choice of the musical errors

Effects of stress on interval deviation and tonality?

Bermudez et al. (2012)
Giddens et al. (2013)
Scherer et al. (1977)

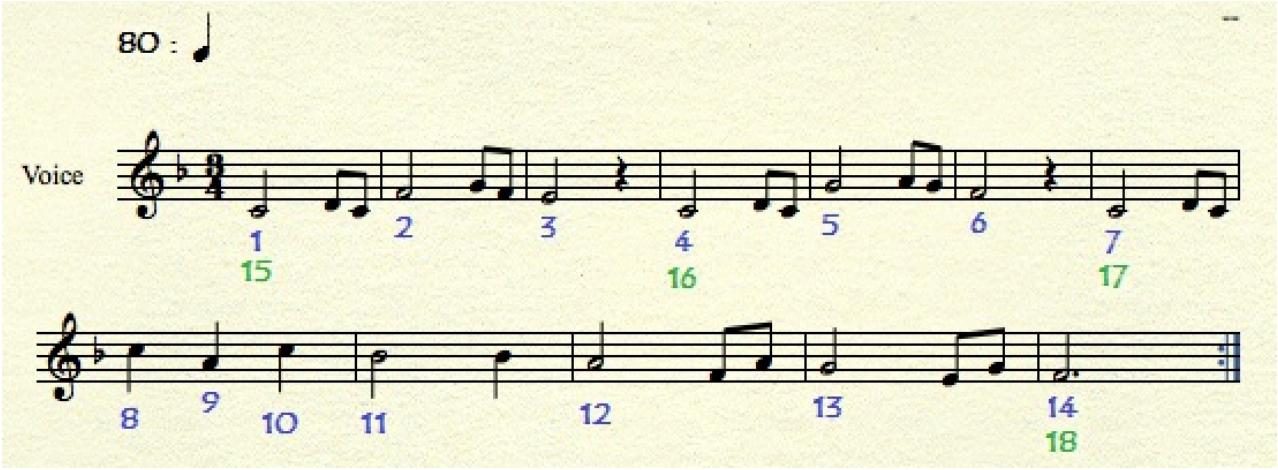


Craske & Craig (1984)
Hamann & Sobaje (1983)
Kenny (2011)
Yoshie et al. (2008, 2009)

?

Choice of the musical errors

- 31 students of conservatory
  - 2 levels
    - 1st year: 18 students
    - 2nd year: 13 students



Learning | Trial | Examination | Quiet situation

Choice of the musical errors

- Stress measurement
  - Heart rate
  - Competitive State Anxiety Inventory – 2 Revised (CSAI-2R) (Cox et al., 2003; Martinent et al., 2010)
    - Intensity of somatic and cognitive symptoms
    - Direction of symptoms (positive or debilitative)
- Singing voice evaluation
  - Interval deviation
  - Respect of tonal center

Choice of the musical errors

- Higher stress level for everybody
- Same increasement of stress
  - Except for the direction of somatic symptoms (much more negative for the 2nd year students)
- Contracted effects of stress on vocal accuracy

	1st level	2nd level
Interval precision	+	ns
Respect of tonal center	ns	-

➔ **Different evolution of the musical errors**

Larrouy-Maestri, P, & Morsomme, D. (2014). The effects of stress on singing voice accuracy. *Journal of Voice*.

Why not (only) pitch matching?

Why not (only) pitch matching?

Pitch-matching

(Amir et al., 2003 ; Granot et al., in press ; Hutchins & Peretz, 2012 ; Moore et al., 2007, 2008 ; Nikjeh et al., 2009 ; Pfordresher & Brown, 2007, 2009 ; Pfordresher et al., 2010 ; Watts et al., 2005)

Most used

Melodie

(Dalla Bella & Berkowska, 2009 ; Dalla Bella et al., 2007 ; Larrouy-Maestri et al., 2013, 2014; Wise & Sloboda, 2008)

Ecological but time consuming

Same information ?

Why not (only) pitch matching?

- 22 non musicians
- Recording of five different tones for each participant
- Three tasks
  - Full melody
    - Happy Birthday
    - Analysed according to Larrouy-Maestri & Morsomme (2014)
  - Vocal pitch-matching
  - Instrumental pitch-maching

Why not (only) pitch matching?

- Comparison slider and full melody
  - Interval deviation and tonal center: ns
- Comparison vocal pitch-matching and full melody
  - Interval deviation: $r(20) = .48$, $p = .02$
  - Tonal center: ns

➔ **Vocal pitch-matching provides indication**

➔ **But should not replace full melodic performance**

Hutchins, S., Larrouy-Maestri, P., & Peretz, I. (in press). Singing ability is rooted in vocal-motor control of pitch. *Attention, Perception & Psychophysics.*

Between in tune and out of tune

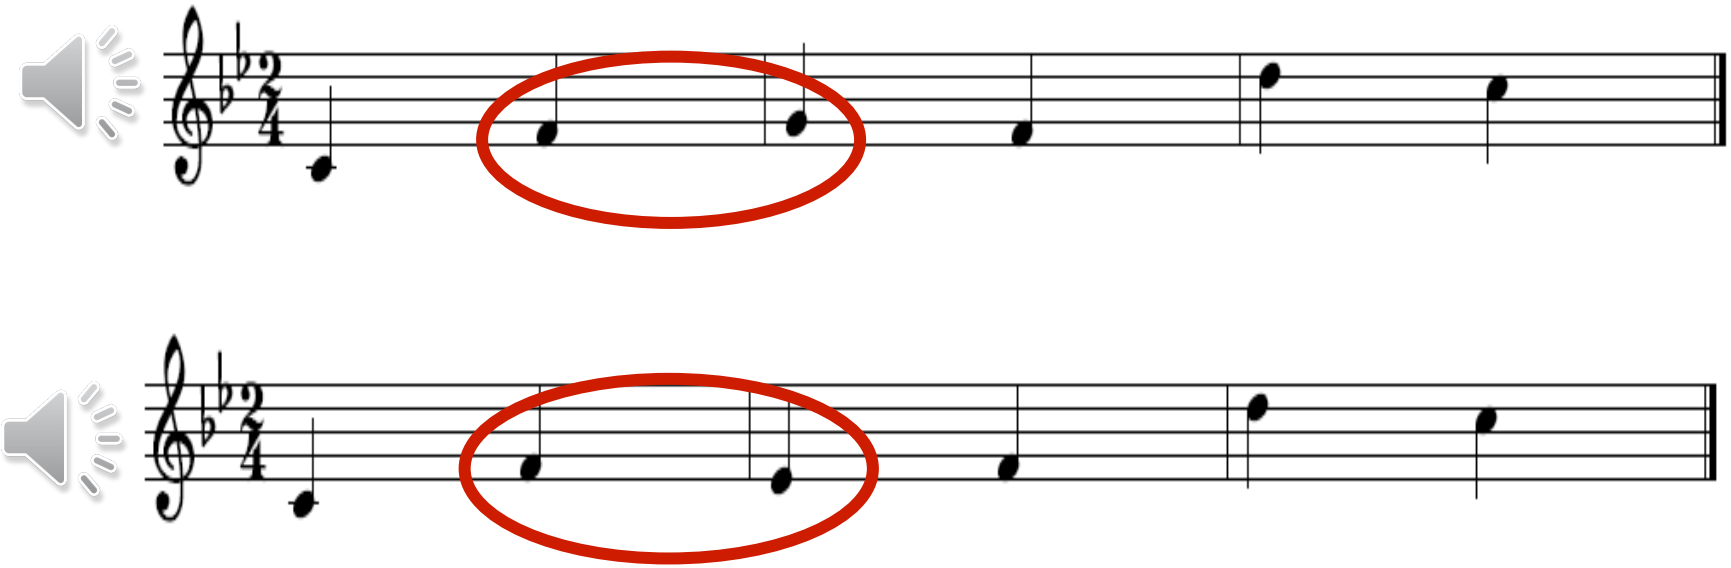
For now

- Pitch discrimination
  - http://www.musicianbrain.com/pitchtest/
  - http://tonometric.com/adaptivepitch/
- In a melodic context
  - Semitone (100 cents) (Berkowska & Dalla Bella, 2009 ; Dalla Bella et al., 2007, 2009a, 2009b ; Pfordresher & al., 2007, 2009, 2010)
  - Quartertone (50 cents) (Hutchins & Peretz; 2012 ; Hutchins, Roquet, & Peretz, 2012 ; Pfordresher & Mantell, 2014)

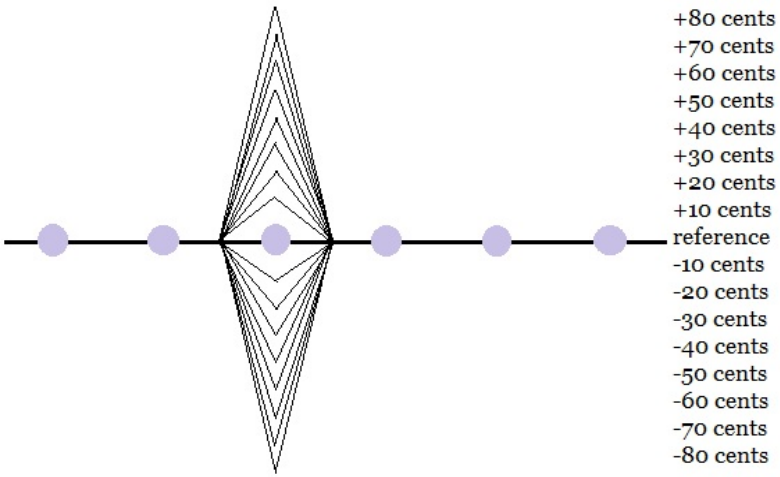
➔ **Which threshold in a melodic context?**

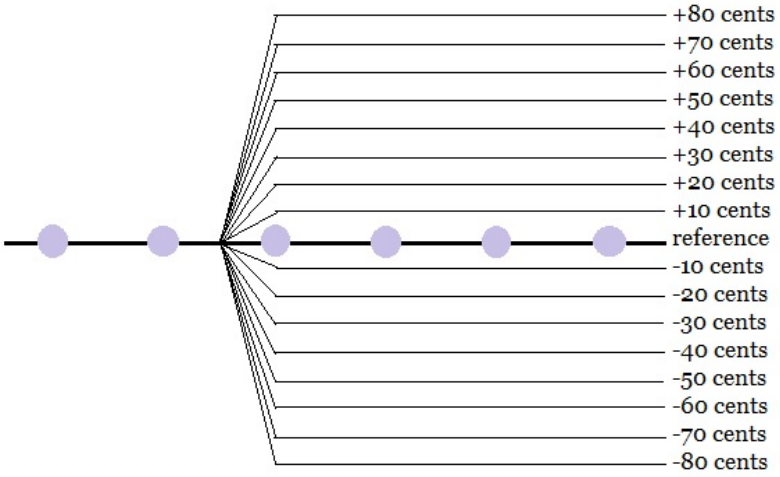
➔ **Is it stable?**

- Melodic contour: ascending or descending

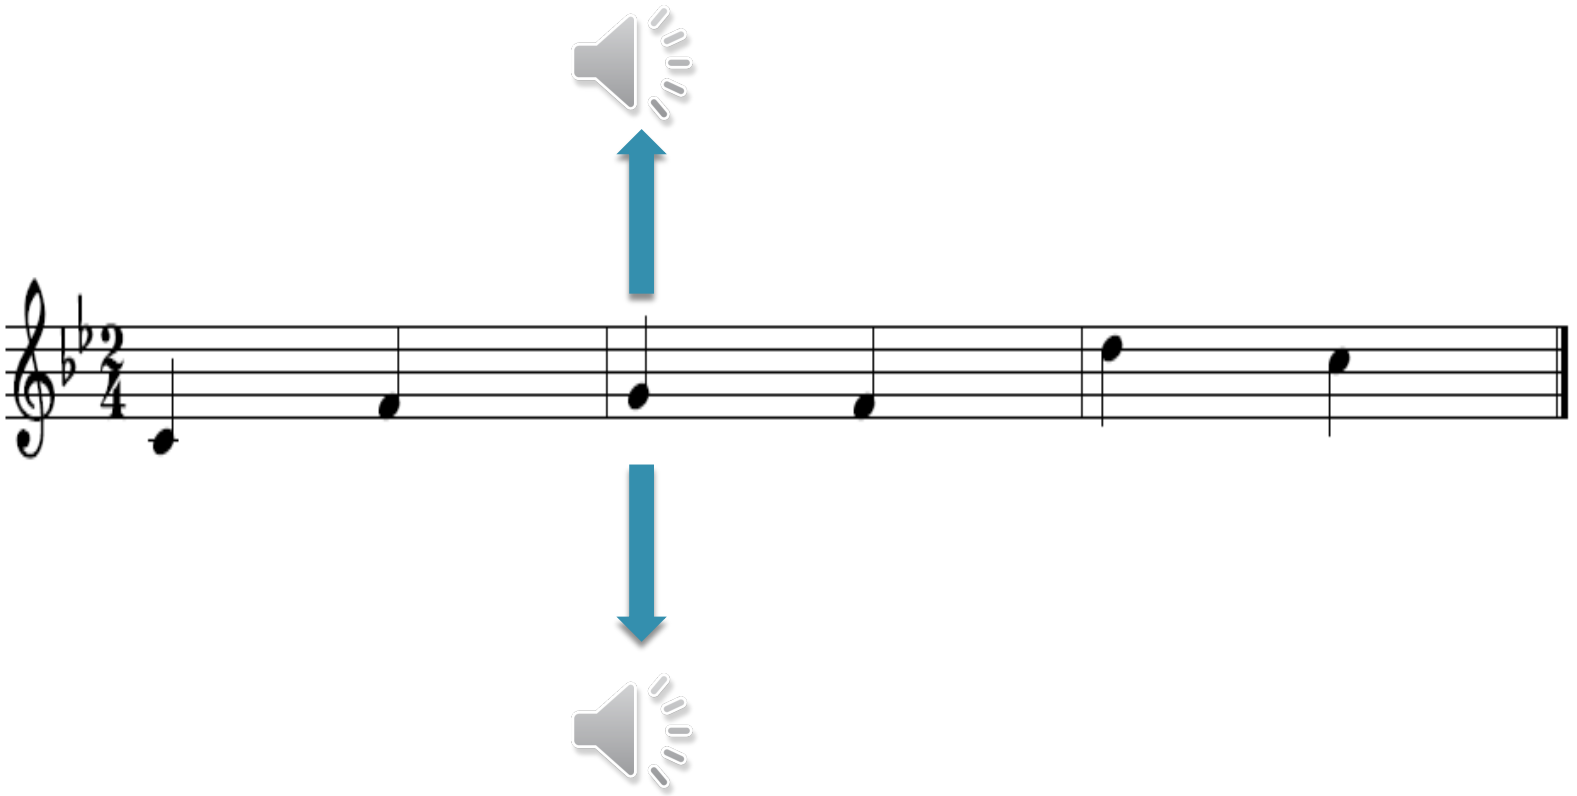


- Musical criteria





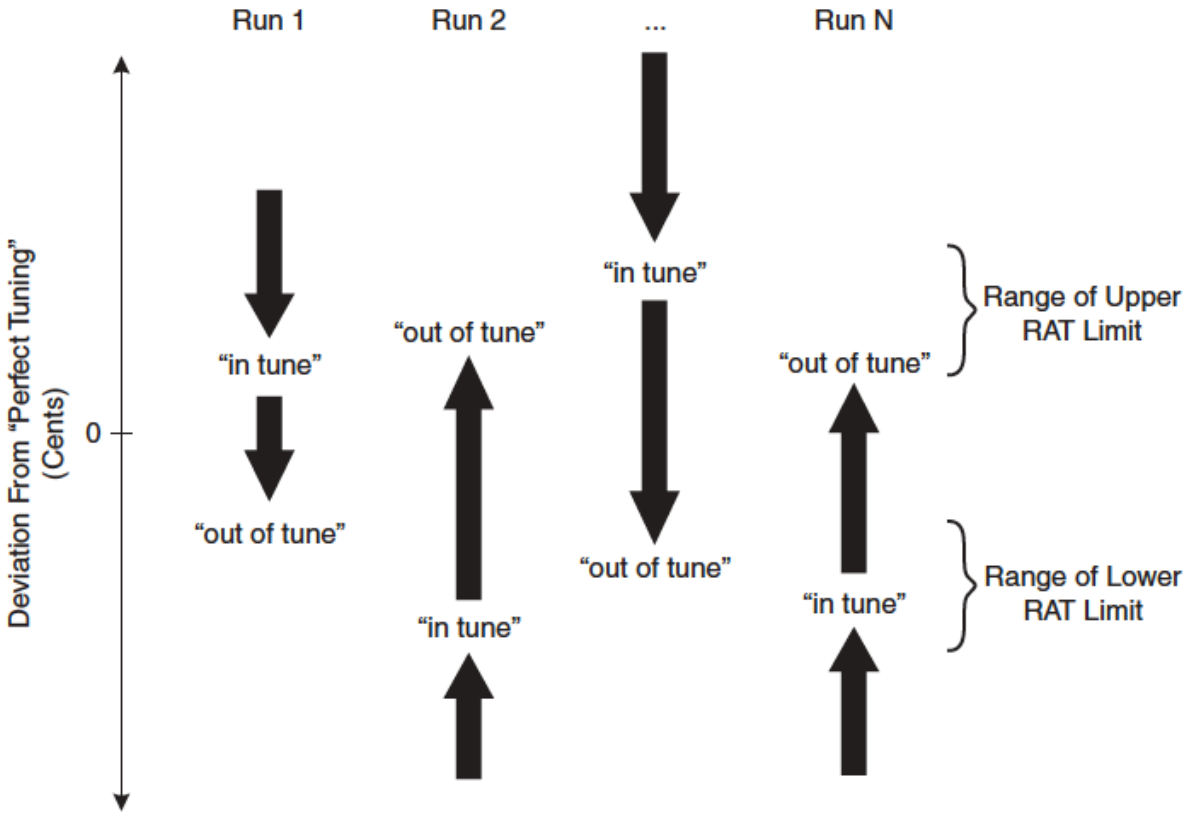
- Error type: enlargement or compression



Method

- Design 2x2x2
  - Melodic direction
  - Musical criteria
  - Error type
- Participants
  - 30 non musicians (M = 23.33; SD = 3.53)
  - Audio, MBEA, questionnaires
- Test-retest
  - 7 to 16 days
- Methods of limits (Van Besouw et al., 2008)

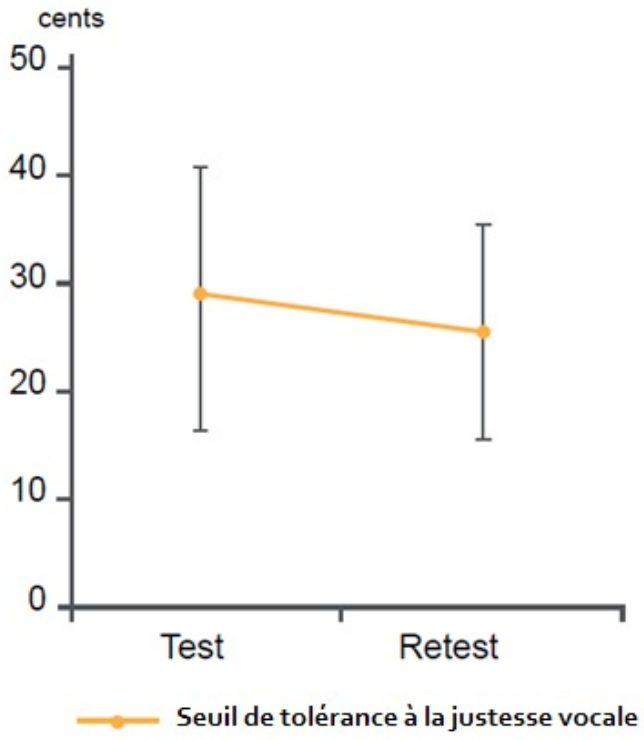
Method



Run 1
Run 2
...
Run N
Deviation From "Perfect Tuning" (Cents)
0
"in tune"
"out of tune"
"out of tune"
"in tune"
"in tune"
"out of tune"
"out of tune"
"in tune"
Range of Upper RAT Limit
Range of Lower RAT Limit

Results

- Correlation test-retest
  - $r(120) = 0.46$, $p < .001$
- Lower threshold for the retest
  - $t(120) = 3.64$, $p < .001$



➔ **Threshold: *M* =27.45 cents (*SD* = 10.45)**

Results

Conditions	F	p
Melodic contour	1.09	0.30
Musical criteria	2.00	0.16
Error type	0.62	0.43
Melodic contour*Criteria	0.01	0.94
Melodic contour*Error type	0.19	0.66
Criteria*Error type	0.14	0.71
Melodic contour*Criteria*Error type	0.00	0.95

➔ **No effect of the condition on threshold**

Discussion

➔ Precise and stable melodic representations

- 27 cents
- Much smaller than 100 or 50 cents (Berkowska & Dalla Bella, 2009; Hutchins & Peretz; 2012 ; Hutchins, Roquet, & Peretz, 2012 Dalla Bella et al., 2007, 2009a, 2009b ; Pfordresher & al., 2007, 2009, 2010, 2014)

- Effect of training … to confirm
- Effect of familiarity ?
  - Same method applied to a familiar/non familiar melodies
    - Last sentence of "Happy birthday" and similar melody
  - Online questionnaire
    - 399 participants from 13 to 70 years old ($M = 29.81$)
    - $t(398) = 20.92$, $p < .001$

Discussion

➔ **Same "tolerance" for familiar/non familiar melodies**

➔ **Pertinent limit between in tune and out of tune**

- Next step: interval size, place of the error, cumulative errors
- To include in objective tools

Conclusion

- Preference for computer-assisted method
- Preference for full melodies
- Ircam's tools seem adequate
- Alternatives
- Two musical criteria
- Small threshold (around 30 cents)

Conclusion

	Interval precision	Respect of tonal center	Modulations
Man 	75.74	100.5	4
Woman 	22.26	20	0
