Vehicle assignment

To maximize profit : select loads to be transported by trucks (FTL-PDP) References : W.B. Powell

Multi-period

Confirmed and projected loads provided over some periods
Repetitive decision process period per period over an horizon

Stochastic load availability

Projected loads realize or vanish

Conclusions

- **Multi-period information and decision framework**
- **The Deterministic Vehicle Assignment Problem**
- **Bounds**
- **Algorithms**
- **Instances and Results**
- **Robustness Analysis**
- **Conclusions**

Multi-period : Rolling horizon

Decision : in t and $t = 1, 2, \dots, T - H \Rightarrow$ **Policy**

Parts : **decision**, **deterministic**, **stochastic**

- 1 Rolling horizon $H = 4P = 4$ days
- 2 **Deterministic** $RH = 1P$, **Stochastic** $3P$

Dynamism of the system :

- 1 Decision and actions in t (info out)
- 2 Roll-over 1 period, updates (info in) $t \rightarrow t + 1$
 - 1 stochastic gets **deterministic** $t + RH + 1 \rightarrow t' + RH$
 - 2 new **stochastic** info in $t + H + 1 \rightarrow t' + H$
- 3 Go to 1 with $t \rightarrow t + 1$

Vehicle Assignment Problem : Description

Vehicle
Assignment

Bounds

Algorithms

Instances and
results

Robustness

Conclusions

Full truckload selection

Data : Cities, Distances, Periods, Loads, Trucks

Actions : **Carry**, **Wait**, **Move unladen**

Objective function : maximize Profit (Gains-Costs)

Constraints : Space, Time, Max 1 Load per Truck

Stochastic data : Stochastic Load Availability in one period

Discrete and finite Bernoulli distribution for load L_j

$$P(q_j = x) = \begin{cases} p_j & \text{if } x = 1 \\ 1 - p_j & \text{if } x = 0 \end{cases}$$

Single scenario model

VEROLOG
2014

Th. Pironet
HEC-ULg
QuantOM

Deterministic formulation : Network flow structure

Polynomially solvable

Feasible links : time and space aggregated

Specific Scenarios \Rightarrow Bounds

VEROLOG
2014

Th. Pironet
HEC-ULg
QuantOM

Bounds : fully revealed information scenarios

- 1 Myopic or a-priori policy over RH : O_{RH}^*
- 2 Oracle or a-posteriori policy over H : O_H^*
- 3 Oracle or a-posteriori solution over T : O_T^*

Stochastic problem

Expected Value Scenario \Rightarrow Expected Value 'Solution' EVS

Optimal policy for the stochastic problem : E^*

Maximization : $O_T^* \geq O_H^* \geq E^* \geq EVS \geq O_{RH}^*$

Value of information :

VPI : Value of the Perfect Information $O_T^* - E^* \geq 0$

Robustness

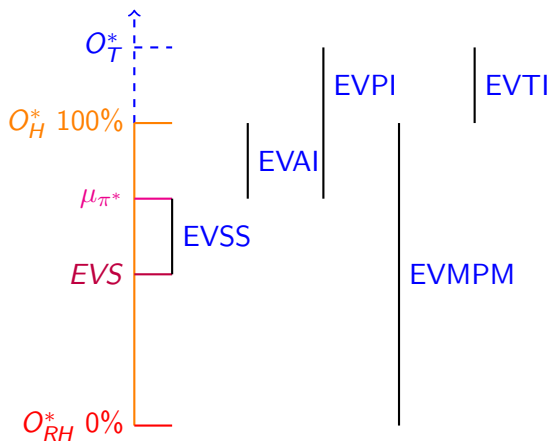

Conclusions

Bounds : Fully revealed information

O^* , O_H^* (UB=100%), O_{RH}^* (LB=0%)

Mono scenario approximation

EVS expected reward, Modal and **Optimist** (all loads)

Multiple scenario approaches : 10 to 30 scenarios

- **Consensus** : Aggregate per action in t and per city
=> Allocate action per truck decreasingly
- **Restricted Expectation** : Cross-evaluation of decisions in t inserted in other scenarios, highest cumulated gain
- **Subtree** : Non-anticipativity constraints in t , Tractable

Instances and Results

Instances : 10 Trucks, 10-15-20-25 Cities, 150-200 Loads, 20 P
Probability of availability (p_j) linked to distance or city sizes

Robustness

Conclusions

Observations :

- High value of **EVMPM**
- Graphs or distributions do not seem to influence the results
- **EVTI**, **EVPI** are high on average (e.g. 78.4%, 110.7%)
- **ST** is mostly μ_{π^*} rarely Cs or **EVS**
- **ST** never under-performs and closes 2/3 of the gap
 $O_{RH}^* - O_H^*$
- **EVS** performs "well" (e.g **EVSS**=+/-11%)

Robustness analysis

Robustness :

forecast availabilities based on a probability p in algorithm ST^p compared with real availabilities p'

Reality/Forecast	EVS	Low	Medium	High
Alg.	EVS^{50}	ST^{30}	ST^{50}	ST^{70}
Reality Low 20%	23.8	55.0	48.1	20.1
Reality High 80%	60.4	67.0	84.9	87.6
Alg.	EVS^{50}	ST^{20}	ST^{50}	ST^{80}
Reality Medium 50%	36.4	31.9	55.1	30.2

Aim :

to be independent from distribution

Robustness

Conclusions

Conclusions

- 1 Importance of stochastic multi-period models
- 2 VPI, VMPPM, VSS are relevant information values
- 3 *ST* is the best algo and others under-perform
- 4 *ST*⁵⁰ (calibrated with a 50% availability) is robust
- 5 *ST* solvable by a LP solver
- 6 e.g Independent of graph shape, size or distribution laws

Perspectives :

- 1 Repositioning strategy
- 2 Investigate the VTI
