

## Application of stable isotopes in trophic ecology:

Importance of TEF and seasonal baseline for robust interpretations

Why using stable isotopes in trophic ecology?

➔ Mixing Law in trophic ecology:

“You are what you eat,  
plus a few permil...” (DeNiro &  
Epstein 1976)

### QUESTION :

Can we calculate the contribution of each potential food source of an animal diet from the isotopic compositions?

**Yes !! → Using Mixing Models**

For  $n$  sources the mixing equation is :

$$\delta_m = (fa\delta_a + fb\delta_b + fc\delta_c + \dots)$$

$$fa\delta_a + fb\delta_b + fc\delta_c + \dots = 1$$

Complex Bayesian Mixing models : SIAR, MixSIAR, FRUITS...

See : Parnell *et al.* 2010; Fernandes *et al.* 2014...

**Case study 1 : TEF determination for the amphipod

## Experimental design

3 different treatments :

- Freshwater amphipod powder
- Green algae powder
- Dead *P. oceanica* powder

(1-2 mm powder)

Different carbon isotopic compositions

Different quality (C/N)

All potentially ingestible by *G. aequicauda*

## Experimental design

## Results

### Trophic Enrichment Factors : TEFs or $\Delta$

|                                  | 1                  | 2               | 3                |
|----------------------------------|--------------------|-----------------|------------------|
|                                  | Amphipod treatment | Algae treatment | Litter treatment |
| $\Delta^{13}\text{C} (\text{‰})$ | $0.81 \pm 0.39$    | /               | $1.19 \pm 0.13$  |
| $\Delta^{15}\text{N} (\text{‰})$ | $2.91 \pm 0.56$    | $0.53 \pm 0.44$ | $0.96 \pm 0.42$  |

Treatment 1 → typical of predator

Treatments 2 & 3 → typical of primary detritic-feeder

SIAR new run with custom TEF → better !!

TEF = major parameter

## Case study 2 - Isotopic composition modifications: baseline variations vs. real diet shift?

## Litter patches are dynamic places!

31/10/12 – 16:00h

01/11/12- 10:00h

Mean thickness: 53,4 cm  
Cover : 100%

Mean thickness: 1,8 cm  
Cover : < 5%

➔ Potential effect on food availability/type !!

## Sampling design

- 4 seasons
- 2 sites
- Litter, macrofauna AND potential food sources

**Summary**

1. The use of stable isotope community metrics to estimate isotopic niche widths among and within communities has become increasingly common. However, the metrics used to estimate isotopic niche widths are often based on different assumptions and can be difficult to compare. We present a new metric, SIBER (Stable Isotope Bayesian Ellipses), which is based on the Bayesian standard ellipse method. SIBER provides a robust estimate of isotopic niche width that is comparable across different studies and communities. We demonstrate the use of SIBER using data from a study of the isotopic niches of the Exported Litter Community. SIBER is implemented in the R package 'SIBER'.

## Results

Also true for their predator...

**Question :** are these clear variations due to actual diet modifications or only to a baseline shift of the food sources?

**How to answer that question?**

Time to remember an old friend :

**SIAR**

**Why?**

**➔ It uses food sources compositions**

## Results

Use of the custom TEF  
from Case study 1 !!

*Gammarus aequicauda*, summer, site 1

*Gammarus aequicauda*, autumn, site 1

**Real diet change independently of food sources isotopic composition!**

## Results

*Palaemon xiphias*, summer, site 1

*Palaemon xiphias*, autumn, site 1

**For *P. xiphias* → looks more like a baseline shift  
BUT : warning...**

## SIBER+SIAR

- ➔ Variations of “isotopic niche”
- ➔ Potential origin of the changes

## BUT...

Need to sample sources  
Specific level data analysis when possible  
TEF are a major parameter

## Acknowledgment

The authors warmly thank the STARESO field station staff for their support during the sampling campaign.

The first author acknowledges a PhD F.R.I.A. grant (Fund for Research training in Industry and in Agriculture) of the Belgian National Fund for Scientific Research (FRS-FNRS).

**Thank you for your attention !**
