

# Carbon monoxide retrieved from ground based FTIR remote sensing in the mid- and near infrared spectral region

**Christof Petri**  
**Thomas Blumenstock**  
**Frank Hase**  
**Martine De Mazière**  
**Bavo Langerock**  
**Emmanuel Mahieu**  
**Bruno Franco**  
**Justus Notholt**

# CO data assessment

- Task: find a recommendation regarding data in the NDACC-TCCON overlapping region e.g. for satellite validation.
- Assessment of overall comparability of the different instruments and retrieval strategies of the FTIR measurement networks NDACC and TCCON.

Site	Network	Lat	Lon	Height
Bremen	NDACC & TCCON	53.10 ° N	8.85 ° E	27 m
Izana (Tenerife)	NDACC & TCCON	28.30 ° N	16.48 ° W	2367 m
St. Denis (La Réunion)	NDACC & TCCON	20.90 ° S	55.49 ° E	87 m
Jungfraujoch	NDACC	46.55 ° N	7.98 ° E	3580 m

# Overview

- Comparison between TCCON and NDACC regarding CO:
- NDACC FTIR stations
  - Bruker 120M instruments or better
  - 3 narrow retrieval windows in the mid infrared
  - **Profile retrieval algorithm**
- TCCON FTIR stations
  - Bruker 125HR instruments
  - 2 wide retrieval windows in the near infrared
  - **Profile scaling algorithm**

# Retrieval windows

- NDACC:

Window [wavenumbers]	Width [wavenumbers]	Interfering gases
2057.70 - 2058.00	0.30	O <sub>3</sub> , CO <sub>2</sub> , OCS
2069.56 - 2069.76	0.20	O <sub>3</sub> , CO <sub>2</sub> , OCS
2157.50 – 2159.15	1.65	O <sub>3</sub> , CO <sub>2</sub> , OCS, N <sub>2</sub> O, H <sub>2</sub> O

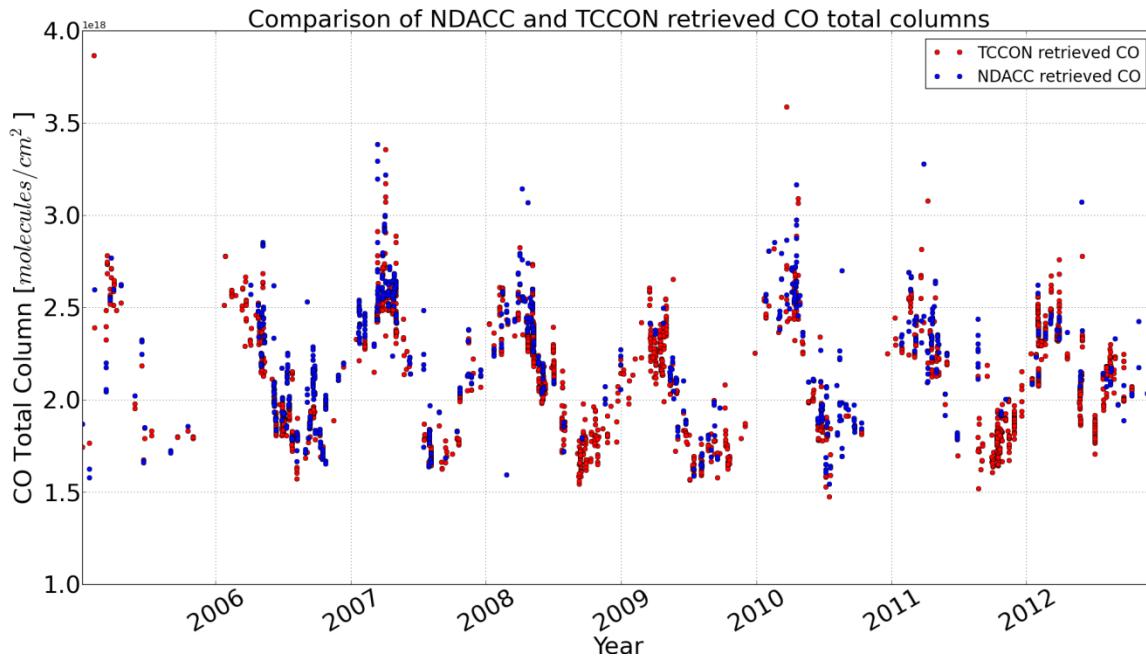

- TCCON:

Window [wavenumbers]	Width [wavenumbers]	Interfering gases
4233.00	48.60	CH <sub>4</sub> , H <sub>2</sub> O, HDO
4290.40	56.80	CH <sub>4</sub> , H <sub>2</sub> O, HDO

# Timeseries at Bremen station

- Very good agreement in seasonal variations.
- Mean NDACC value is ~5% higher than TCCON.

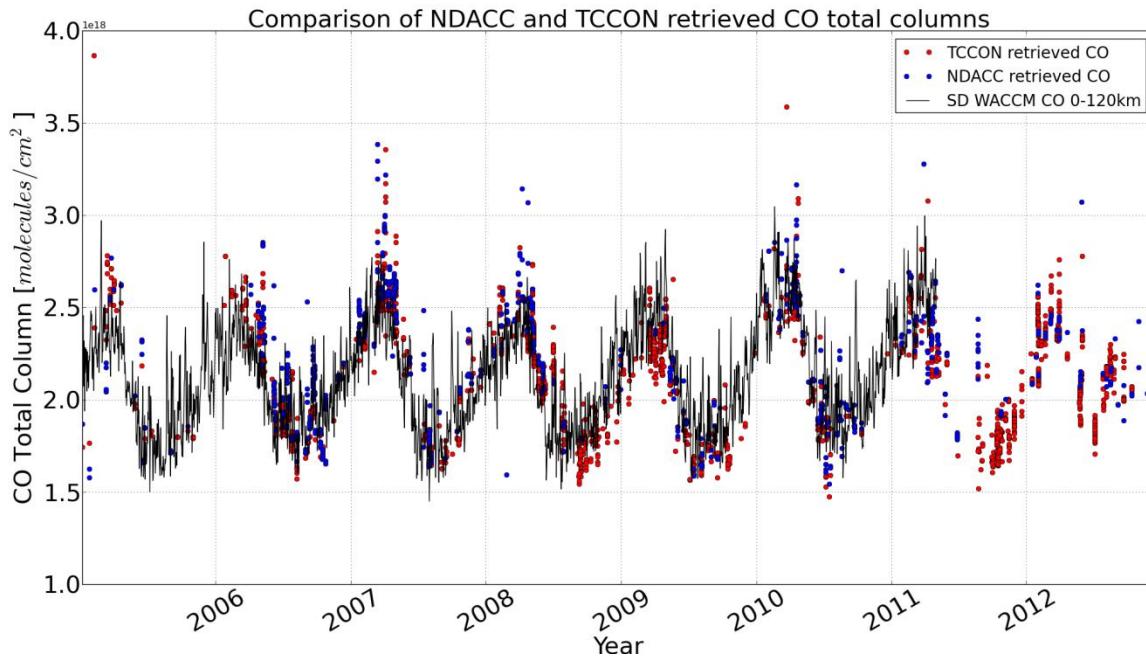

- Postcorrections for the official data products are not taken into account.

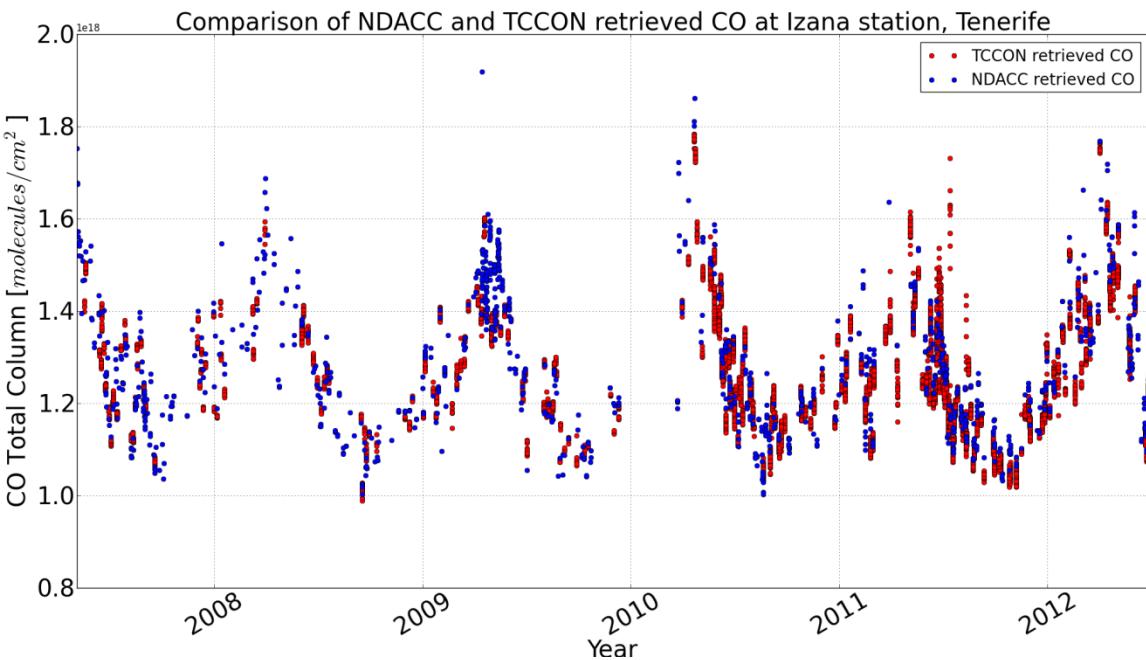

# SD-WACCM comparison

- Model comparison also shows a very good agreement.
- SD-WACCM data by the Douglas Kinnision group, UCAR, Boulder.

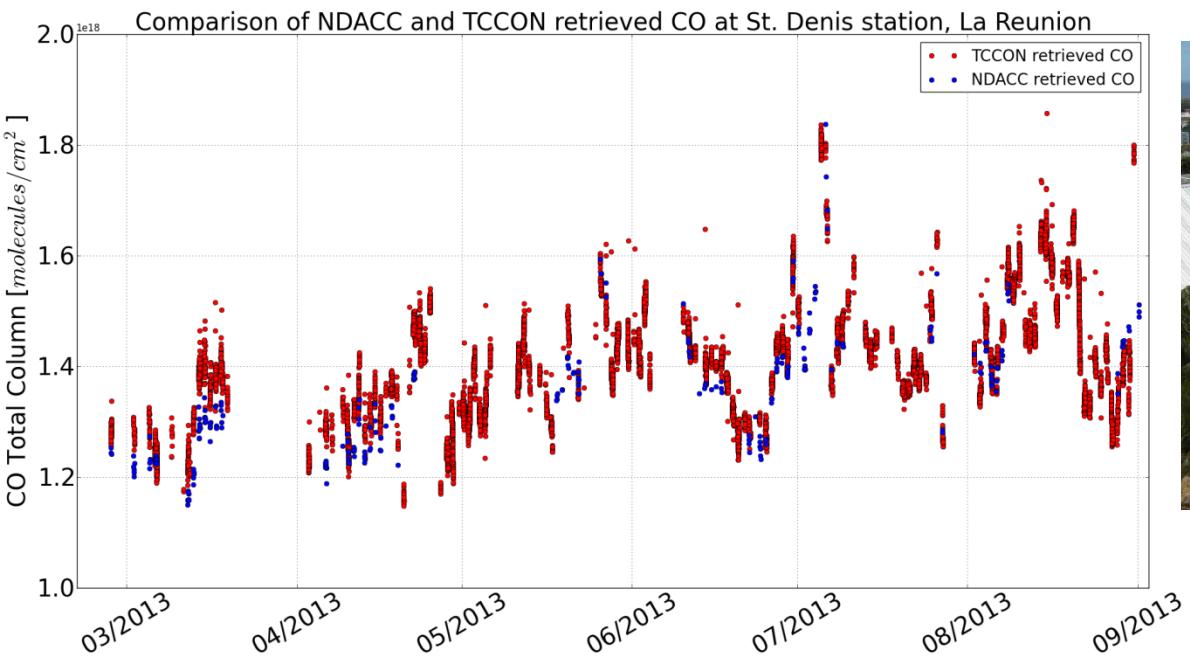

# CO time series at Izana station

- Slightly different windows for NDACC are used (C. Rinsland).
- Lower values are in close agreement.
- For higher values NDACC is more sensitive.

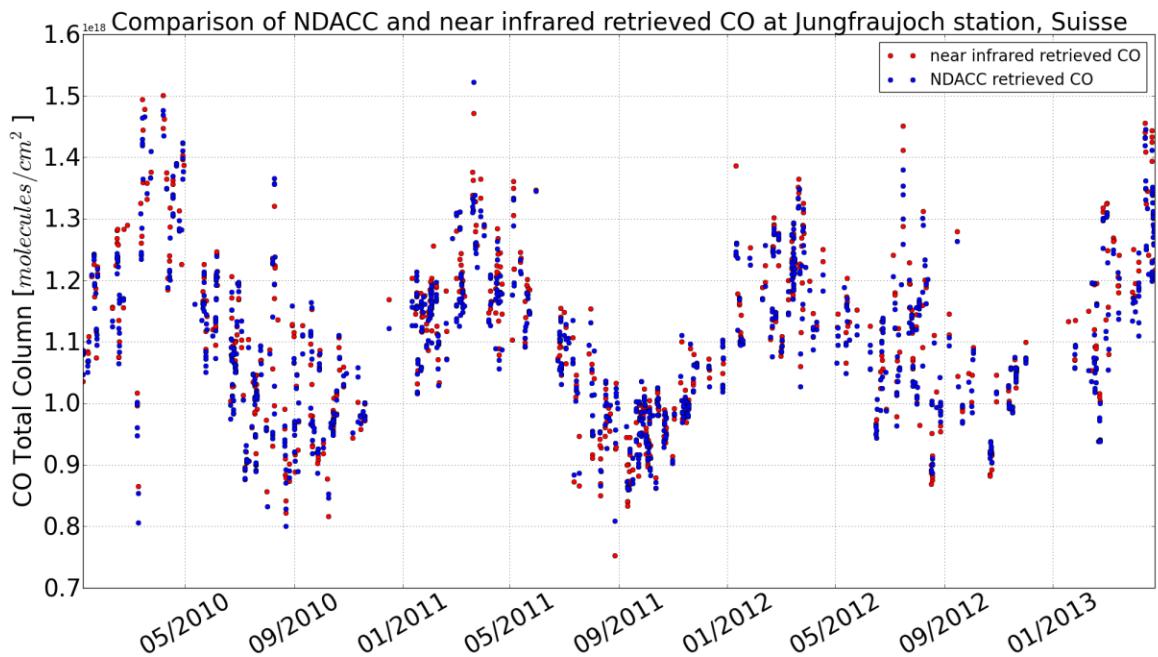

# CO time series at St. Denis

- NDACC is  $\sim 2.5\%$  lower than TCCON.
- Southern hemisphere  $\rightarrow$  seasonal cycle vice versa.

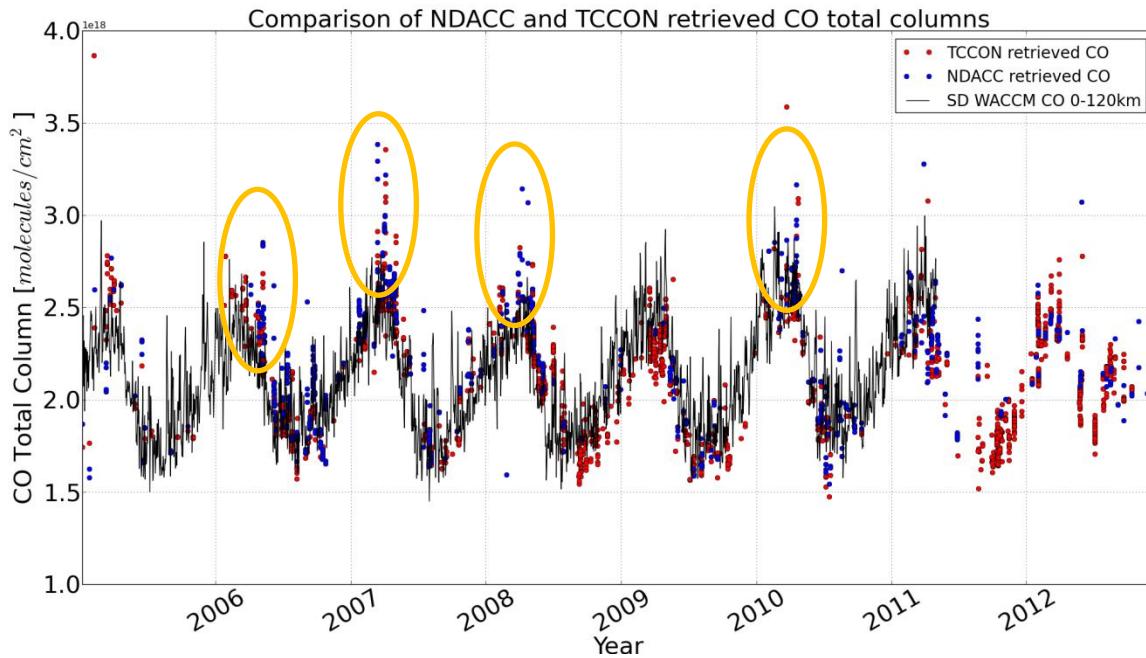

# CO time series at Jungfraujoch

- Retrieval of both wavenumber areas with profile retrieval.
- Better agreement,  $4200\text{ cm}^{-1}$  area has higher DOF's and less residual.

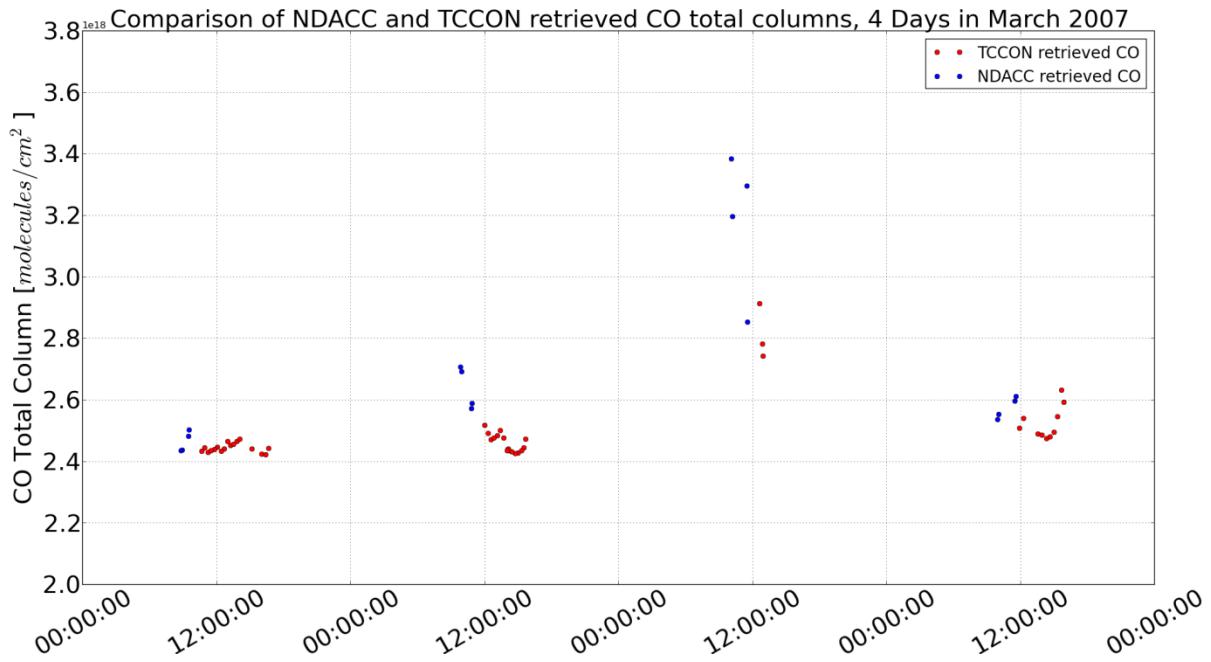

# SD-WACCM comparison

- Model comparison also shows a very good agreement.
- SD-WACCM data by the Douglas Kinnision group, UCAR, Boulder.

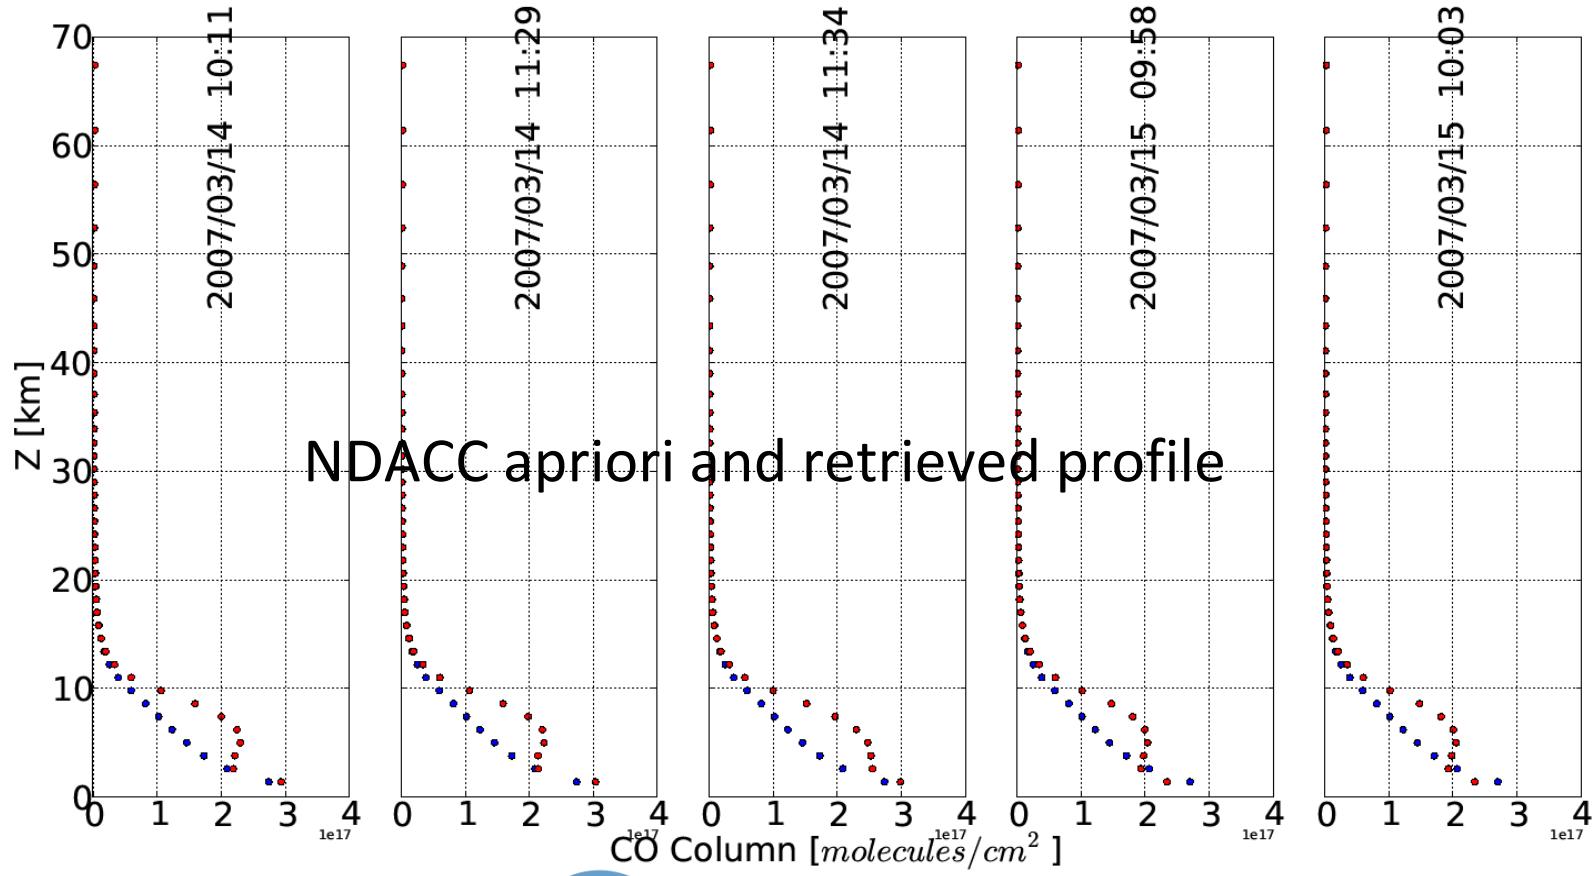

# Lokal events

- Local events show a different sensitivity for NDACC and TCCON.
- Trajectories coming directly from industrial zone in germany.

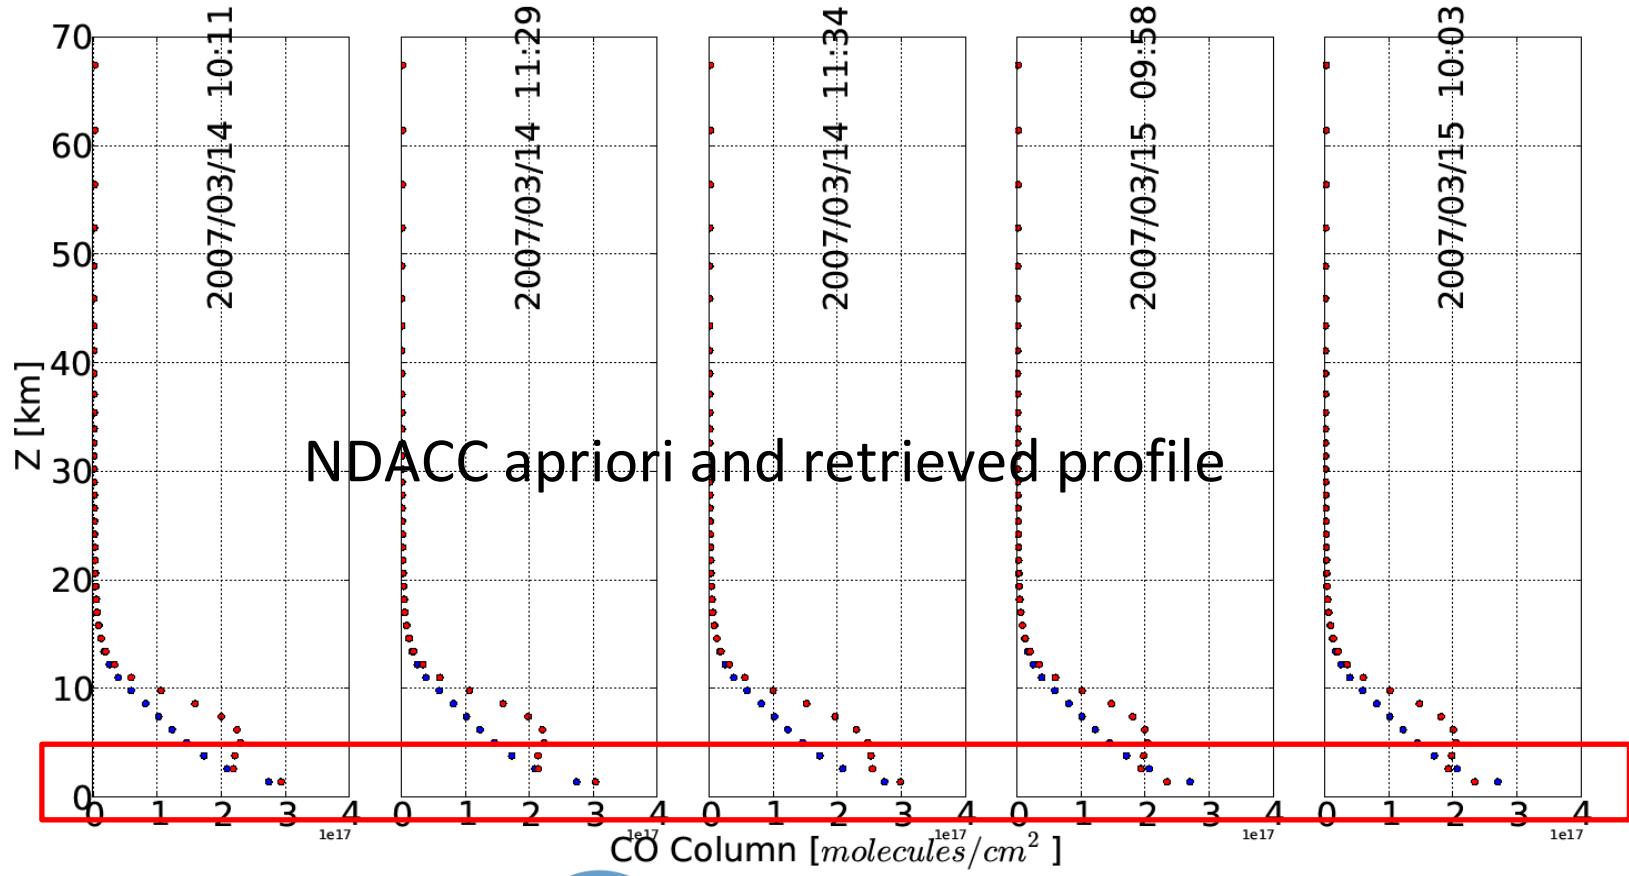

# Lokal events

- Only the lowest point changes significant.

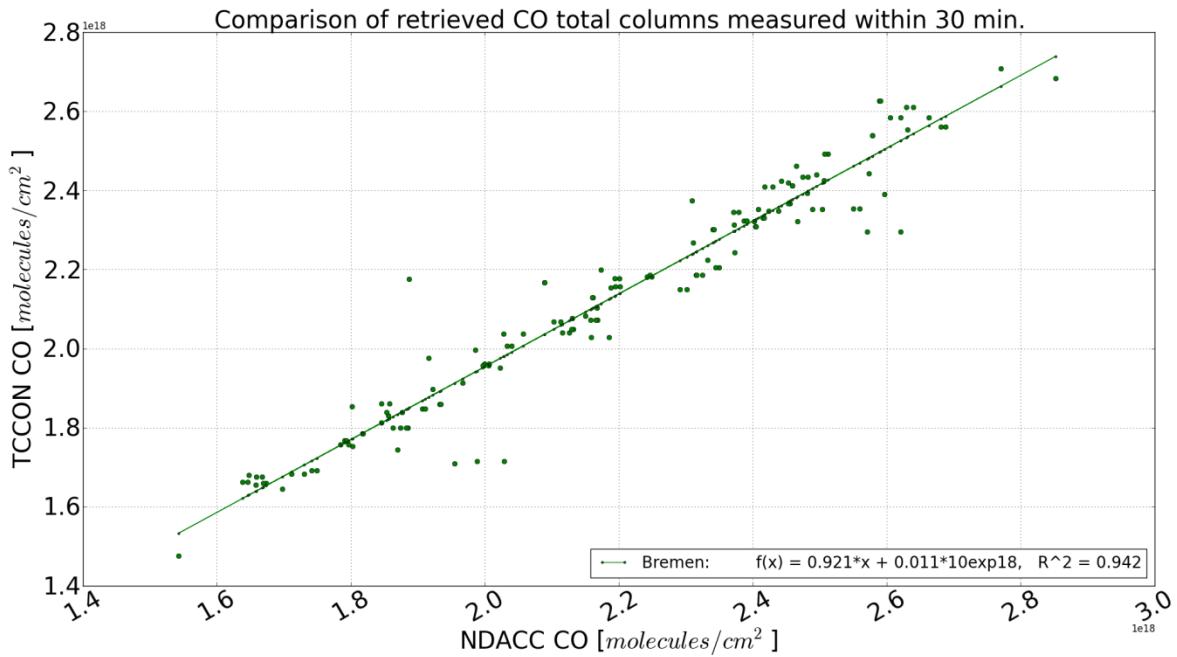

# Lokal events

- Only the lowest point changes significant.

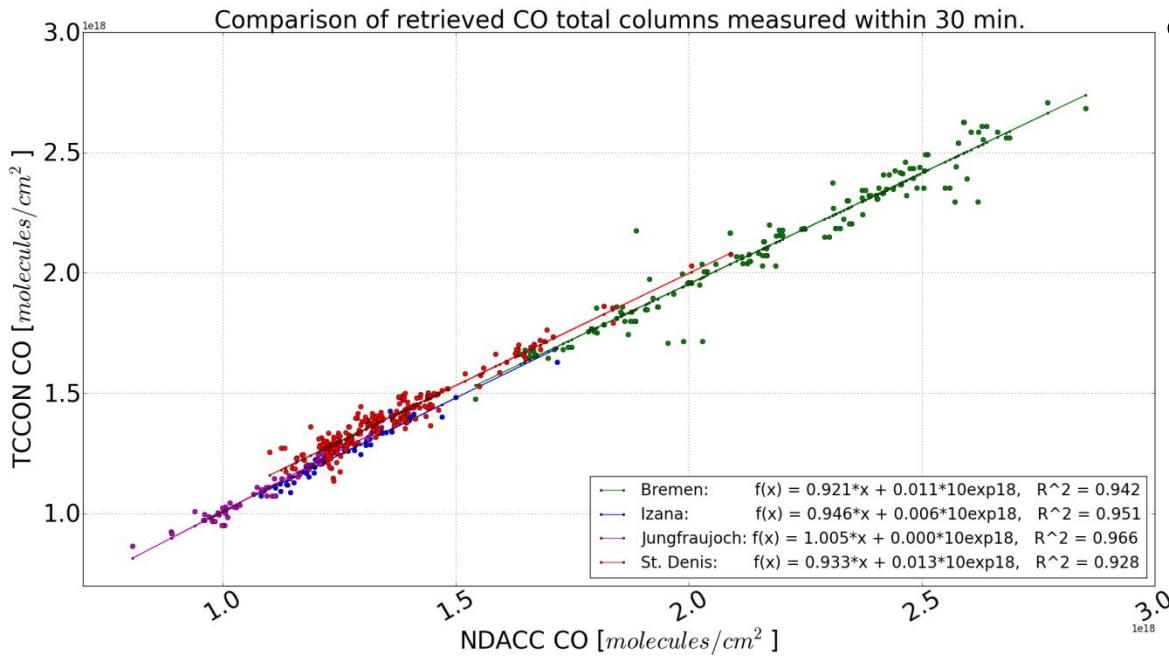

# Contemporary measurements

- Lower values are in close agreement.
- For higher values NDACC is more sensitive than TCCON.

# Contemporary measurements

- Lower values are in close agreement.
- For higher values NDACC is more sensitive than TCCON.
- Similar slope for all NDACC/TCCON sites

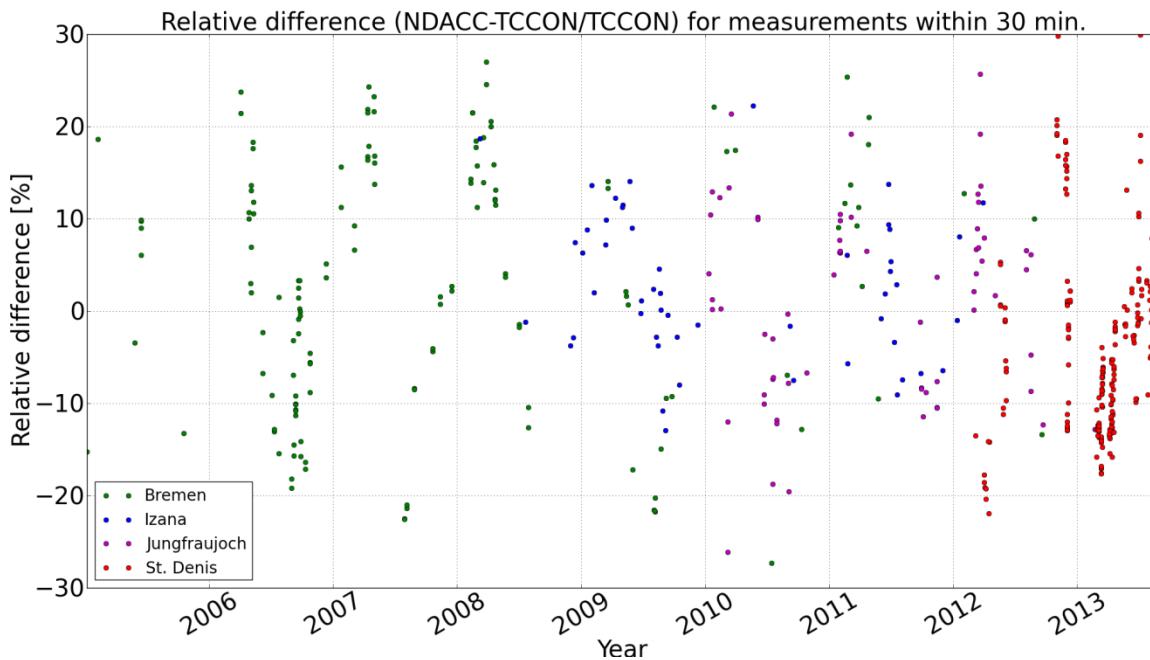

- Jungfraujoch has a slope of ~1.

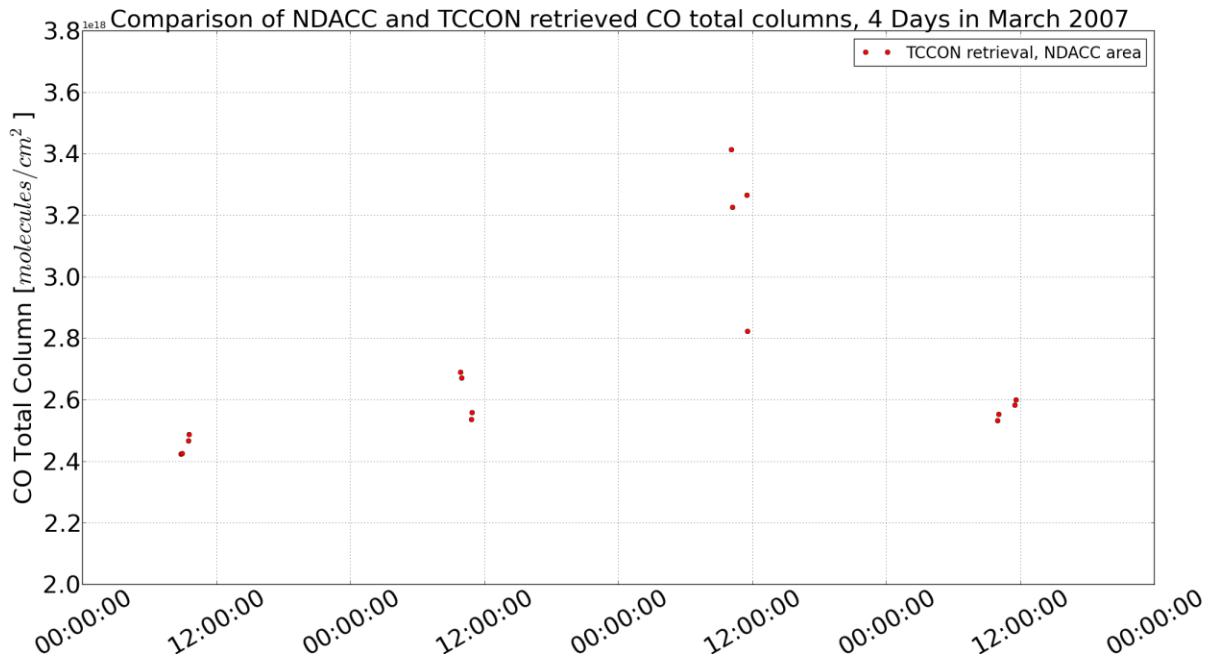

# Contemporary measurements

- Relative difference with a clear seasonal cycle cause of higher values in spring.
- Vice versa for St. Denis

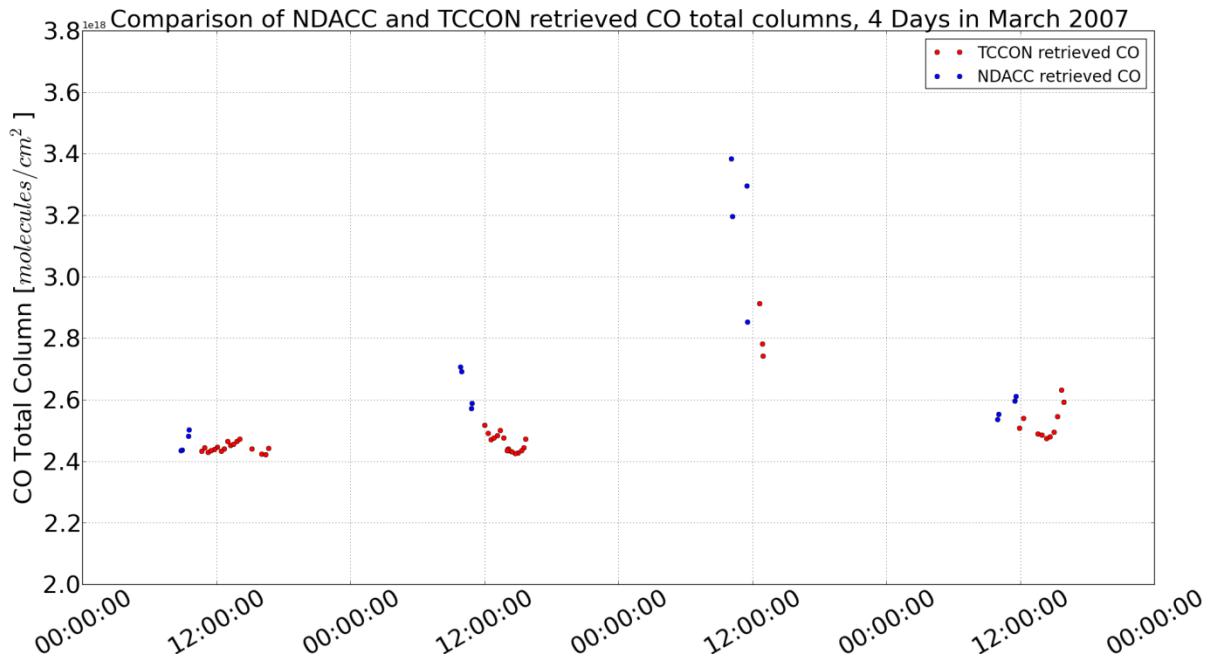

# Cross retrieval

- GFIT retrieval in mid infrared gives same results as SFIT for total columns

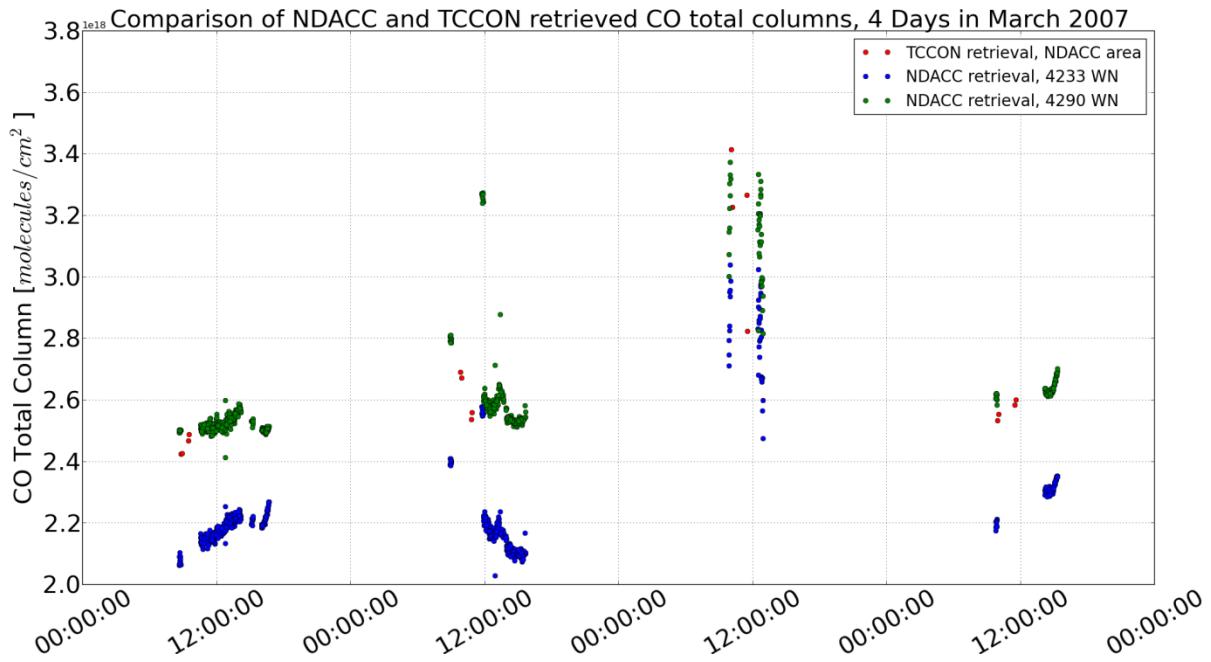

# Lokal events

- Local events show a different sensitivity for NDACC and TCCON.
- Trajectories coming directly from industrial zone in germany.

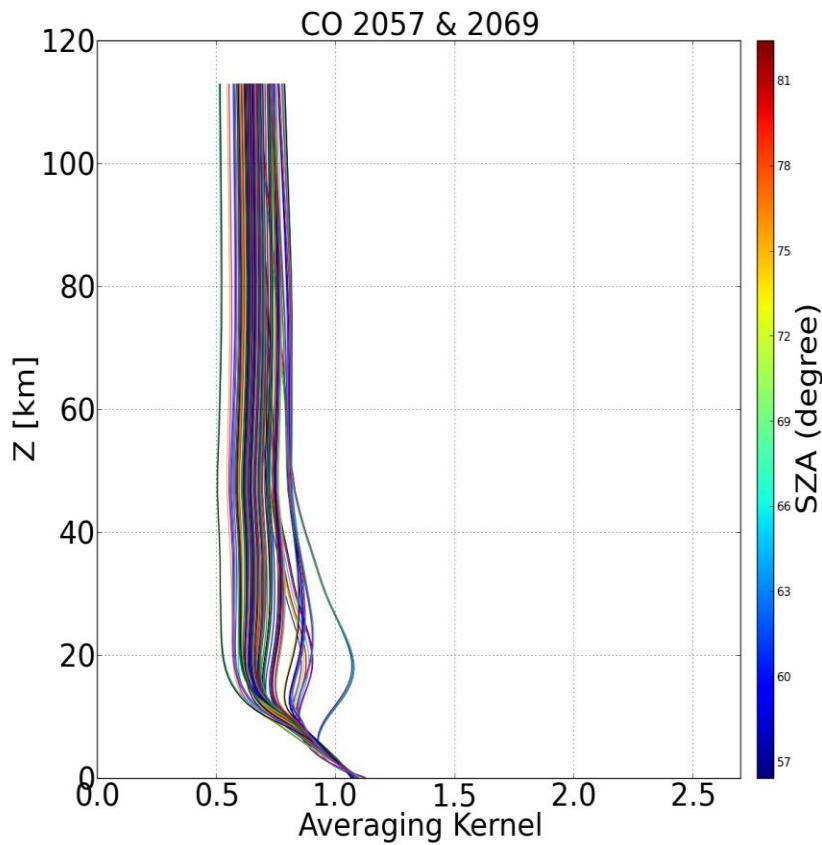

# Cross retrieval

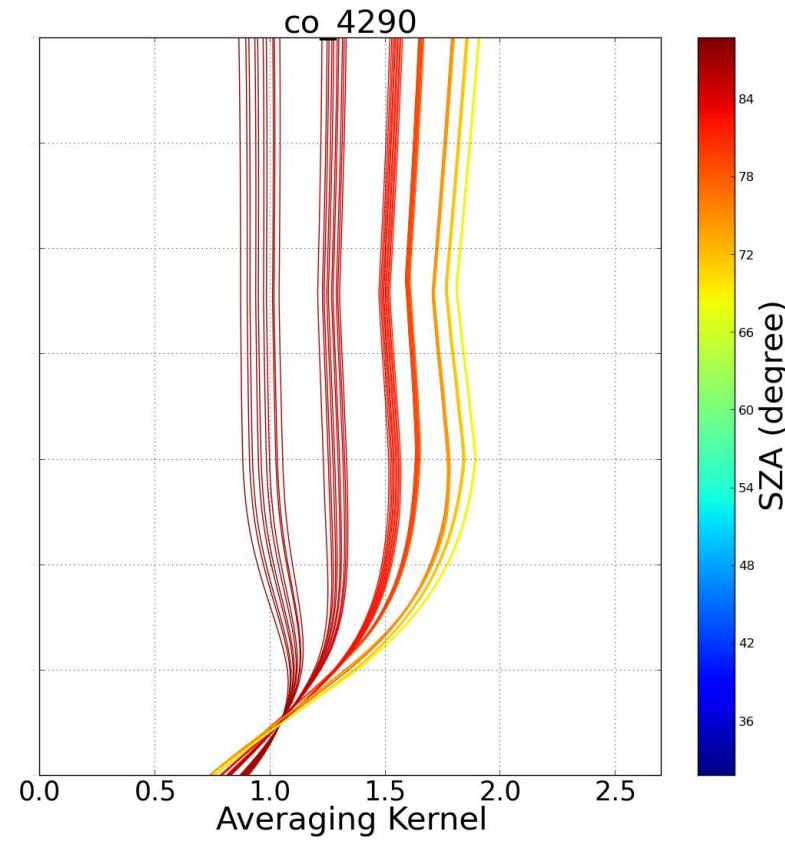

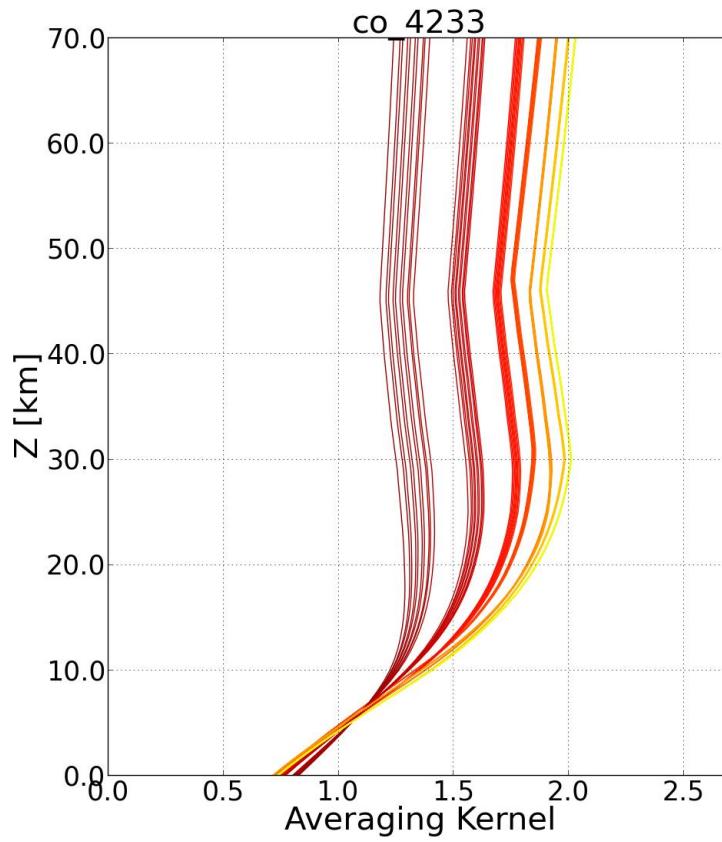

- SFIT retrieval in near infrared gives lower results as GFIT for total columns

# SFIT averaging kernels

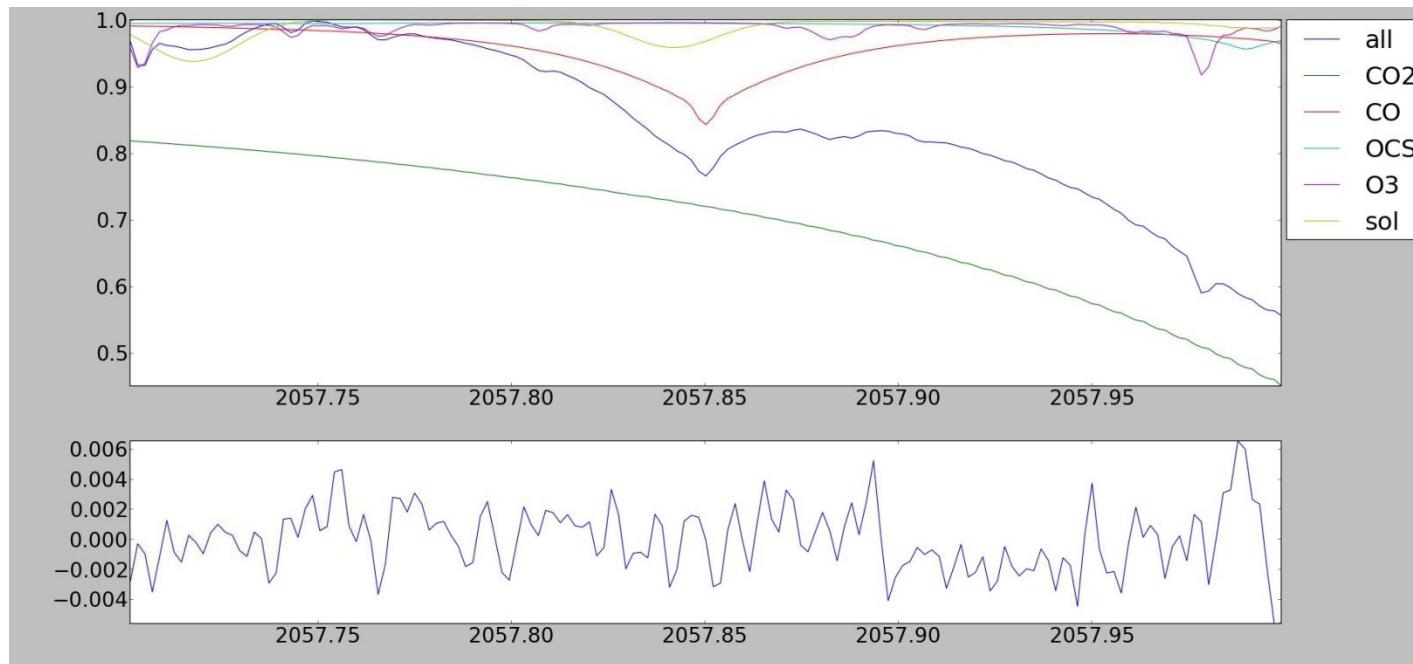

# GFIT averaging kernels

# Residuals for NDACC MW's

- Using the recommended HITRAN 2008 database, residuals indicate non perfect spectroscopic data of  $O_3$ .

# Summary and Outlook

- Satisfying agreement of both retrieval strategies.
- Mid infrared aera reacts more sensitive to lokal events:
  - Different sensitivity of the wavenumber aeras.
- Spectroscopic issues.
- Using both networks for satellite validation could be a benefit due to the increased number of sites.
- Including aircraft campaigns.
- Rerun SFIT retrievals using new linelist (Toon).

# Thank you for your attention !
