2016
Prague

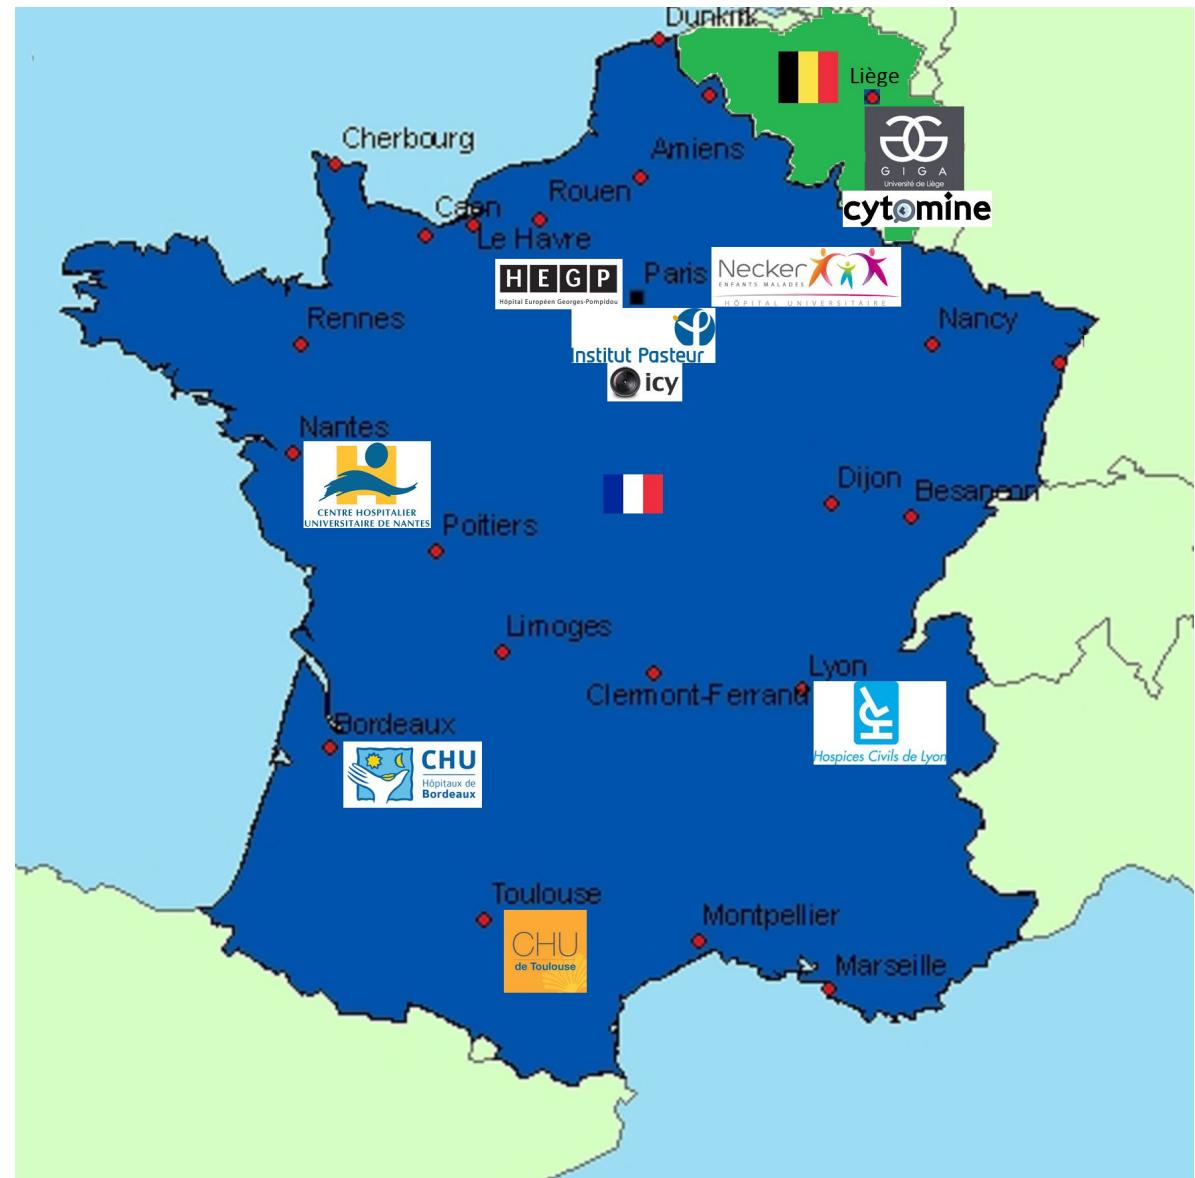

Large biomedical studies have to be multicentric

Benefits :

- Large number of participants
- Wider range of population groups (<> genetic, environmental, demographic factors)

→ Increase the generalizability of the study

Challenges of *multisite* studies in digital pathology

Big data management

- High-resolution images (100 K x 100 K)
- Large number of whole-slide images (hundreds...thousands...)
- Very large number of « objects » (e.g. cells,...) to detect, quantify, and store
- Distributed and poorly structured

Image variabilities require robust pattern recognition

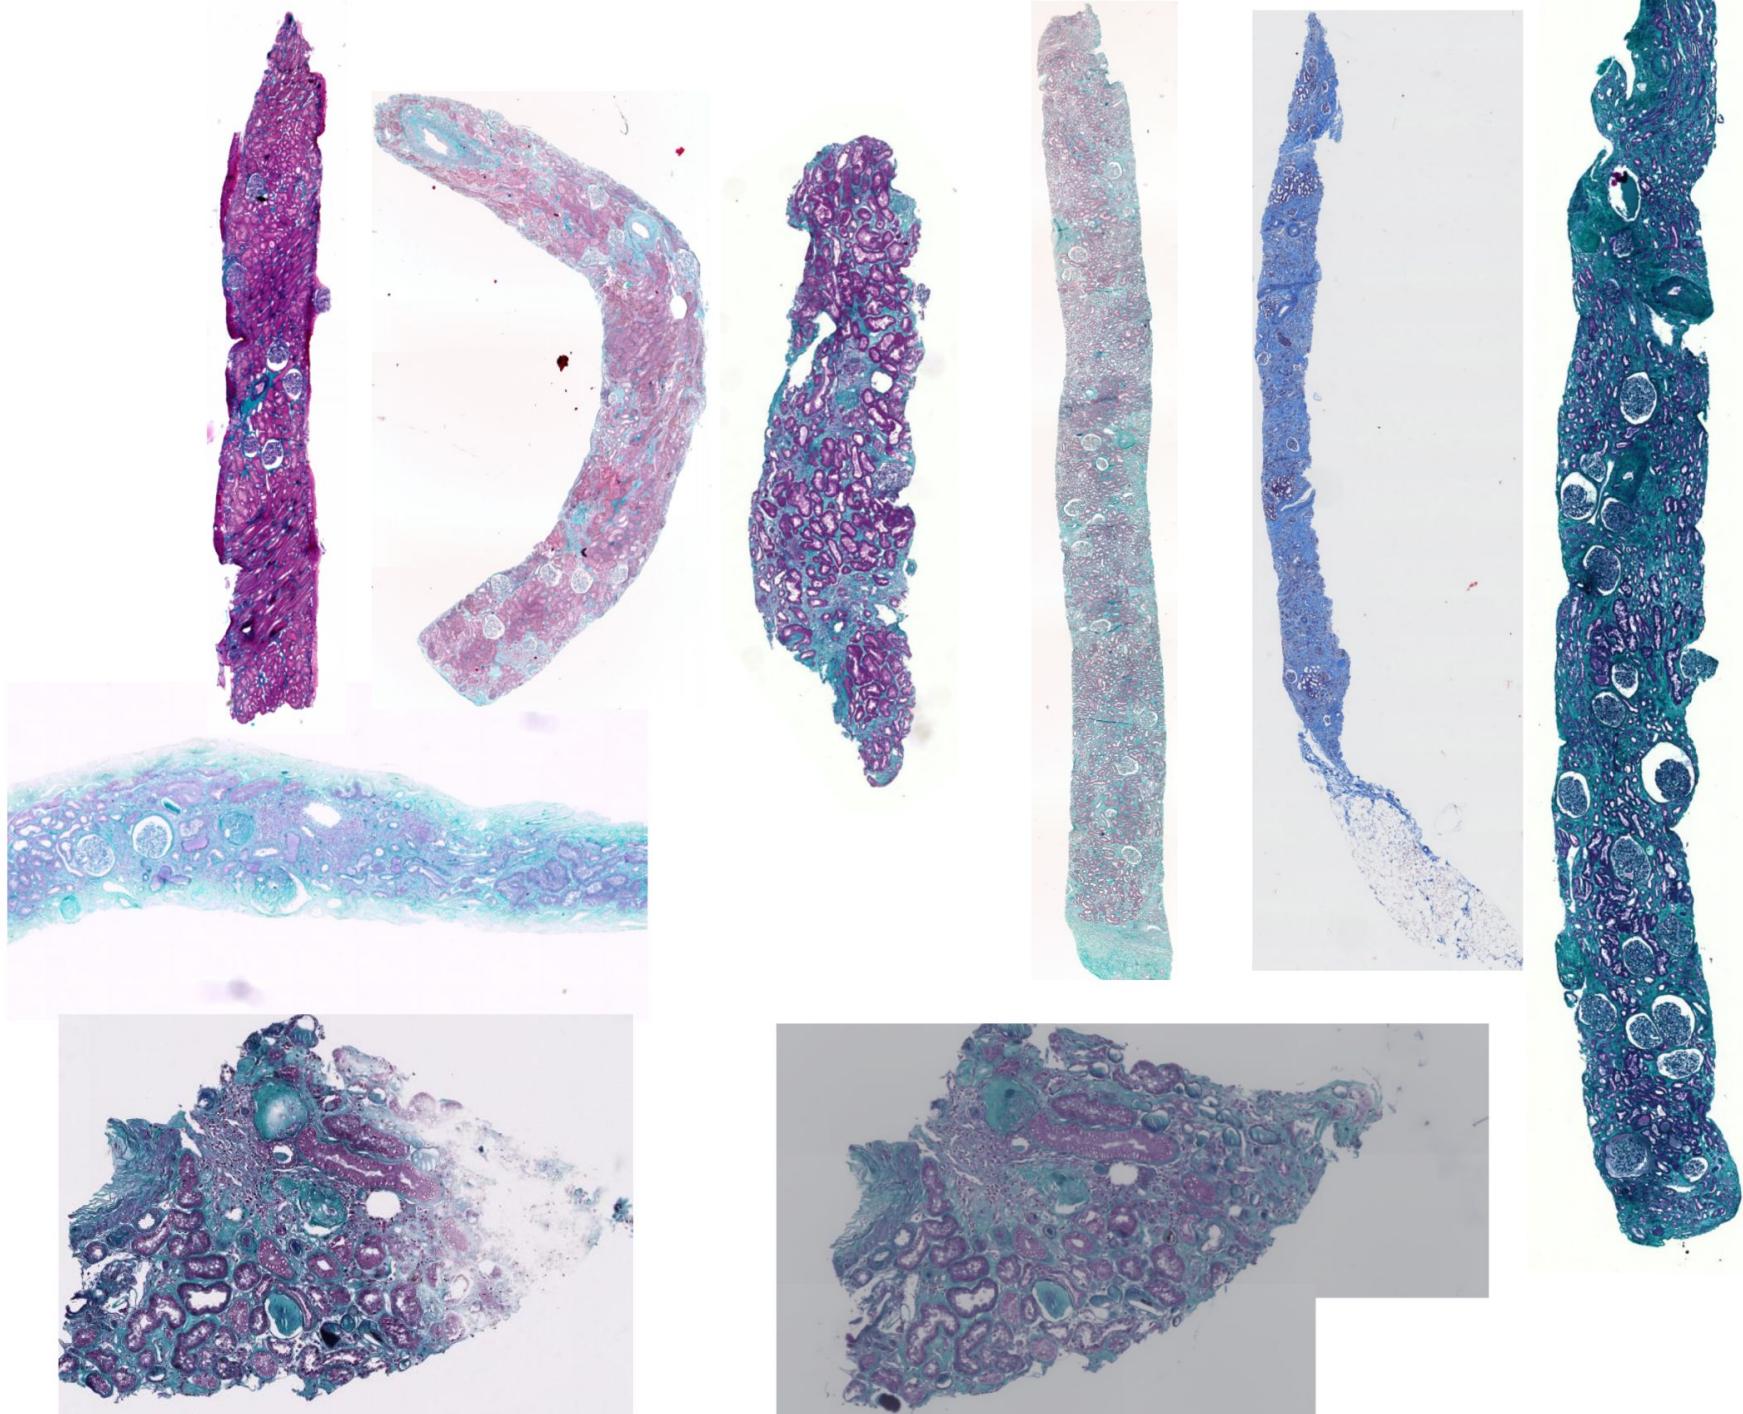

- Tissue (healthy or not, age, ...)
- Preparation protocols (staining, ...)
- Acquisition setups (slide scanners, ...)

Collaborative software platforms:

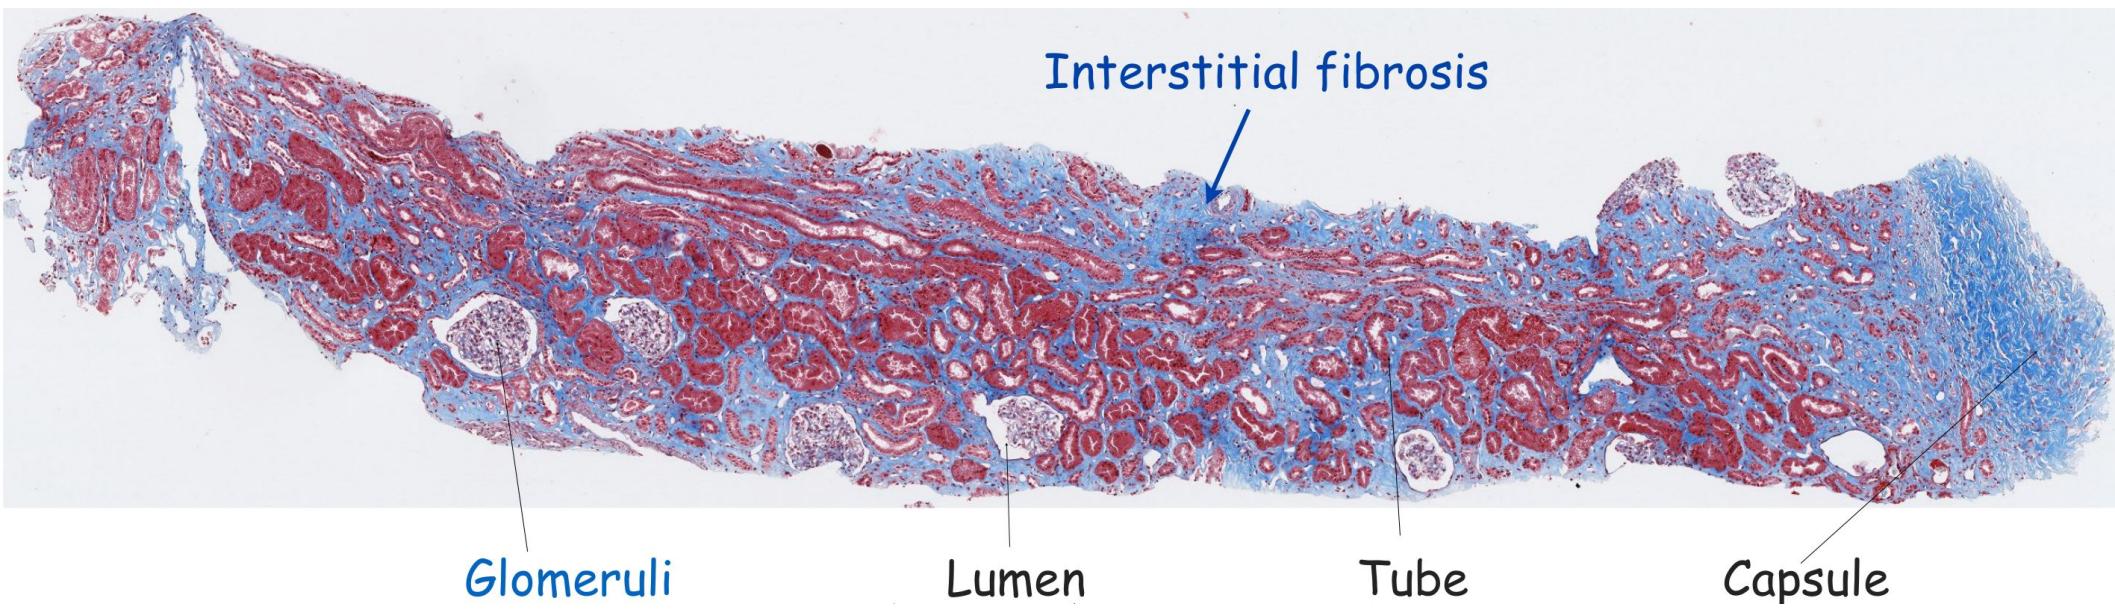

- Groups of pathologists
 - Ground-truth creation
 - Validation of algorithms
- Groups of image analysts
 - Image processing/analysis
 - Machine learning

...

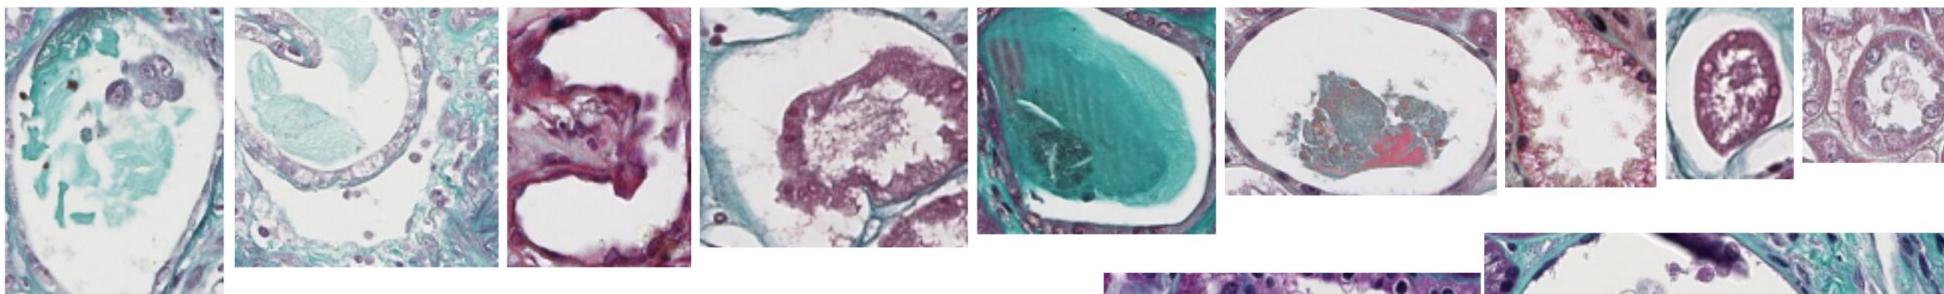

Challenges of glomeruli detection (1/2)

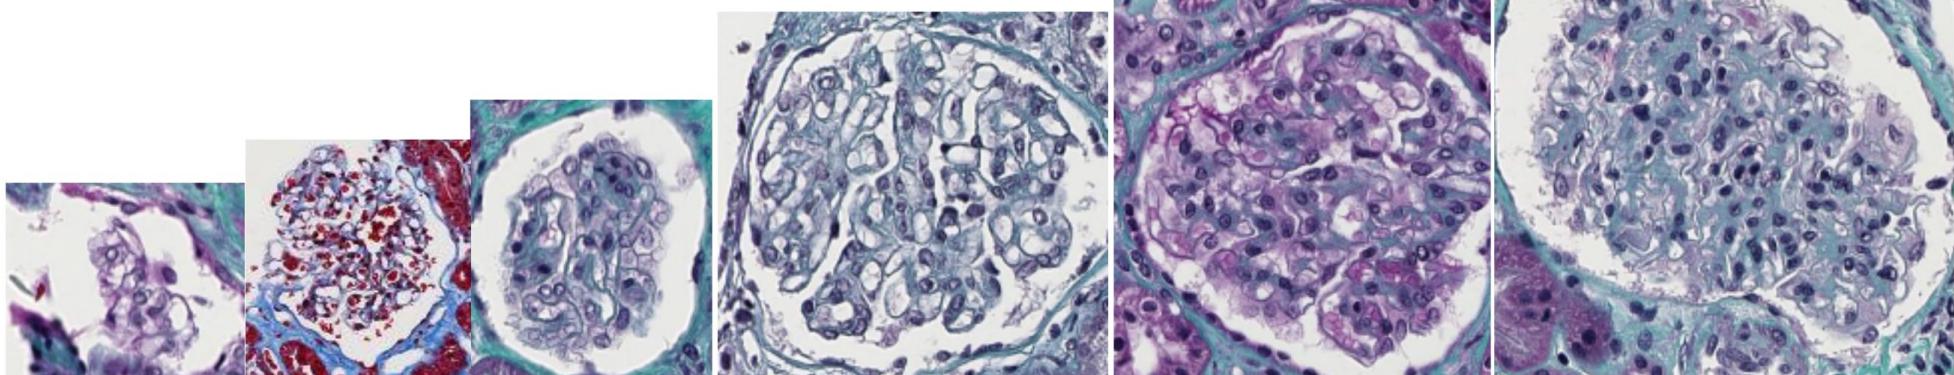

Challenges of glomeruli detection (2/2)

Glom

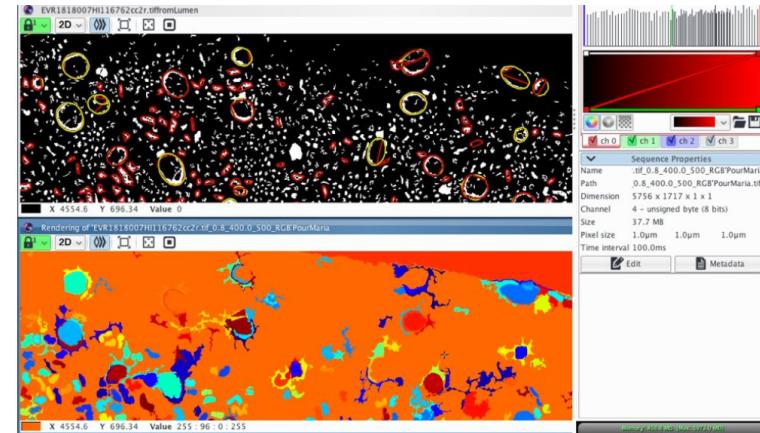

Our approach overview

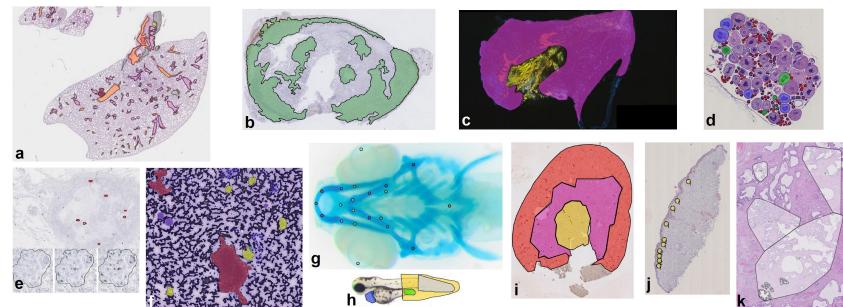

(icy.bioimageanalysis.org ; Nature Methods, 2012) :

- Image analysis
 - Glomeruli candidate detection (Transplantation, 2011)
 - Color normalization/transfer

(www.cytomine.be ; Bioinformatics, 2016) :

- Database to organize whole-slide images (various formats) and semantic annotations
- A rich internet application : data sharing and collaborative modes (proofreading)
- Supervised machine learning algorithms for object recognition
- Open API and software templating mechanisms to add algorithms

open source

Proposed approach :

1. Segmentation of candidates within whole slides using image analysis

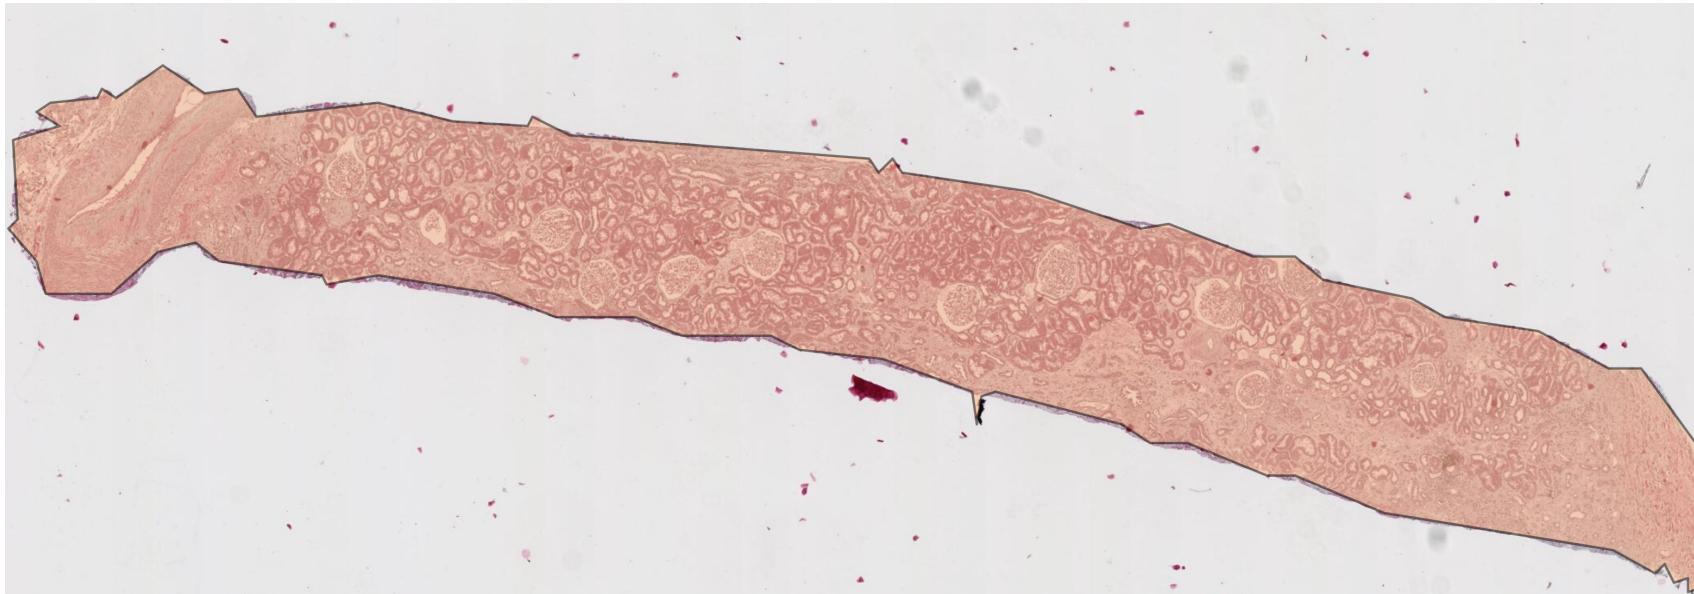

Section detection : Otsu thresholding

Proposed approach :

1. Segmentation of candidates within whole slides using image analysis

Section detection : Otsu thresholding

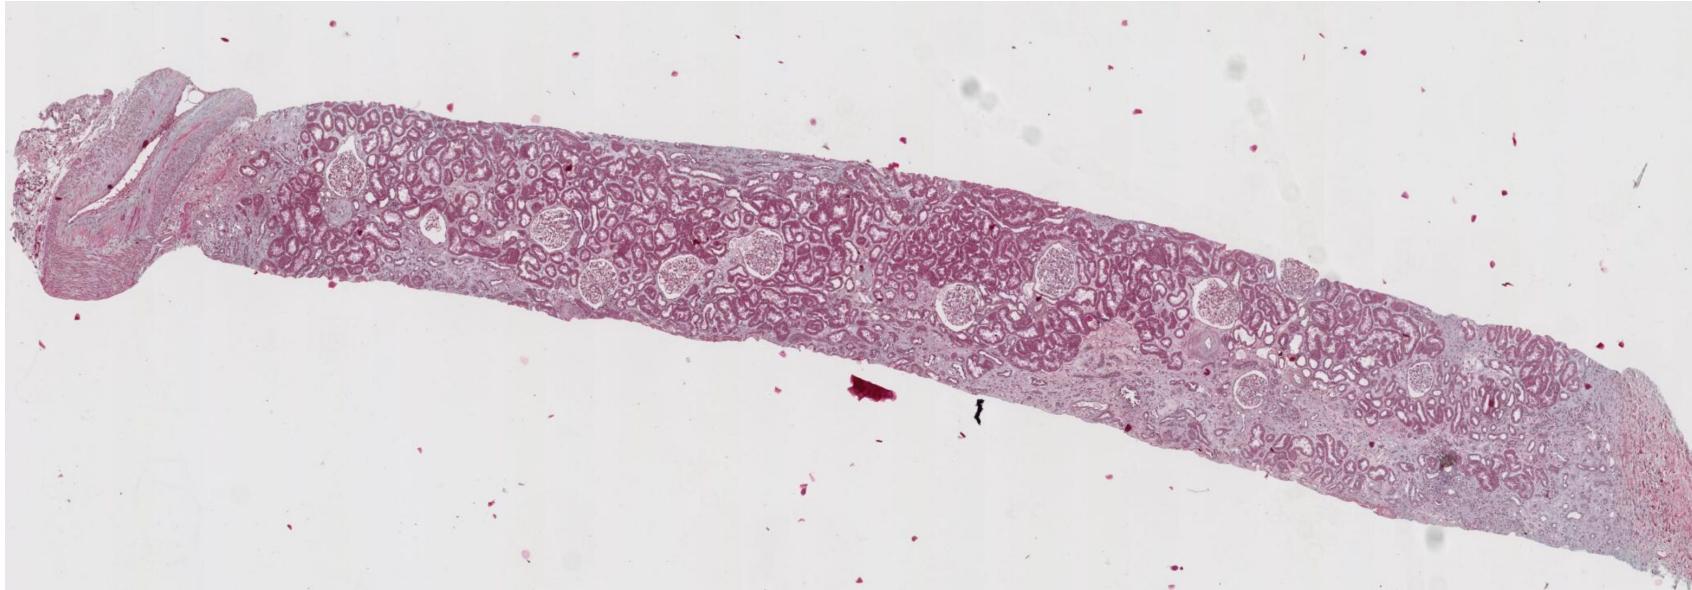

Proposed approach :

1. Segmentation of candidates within whole slides using image analysis

Candidate glomeruli detection : Lumen extraction (contour + convex Hull)

+ Ellipse detection (Fitzgibbon, 1999)

+ Superpixel segmentation (Felzenszwalb, 2004)

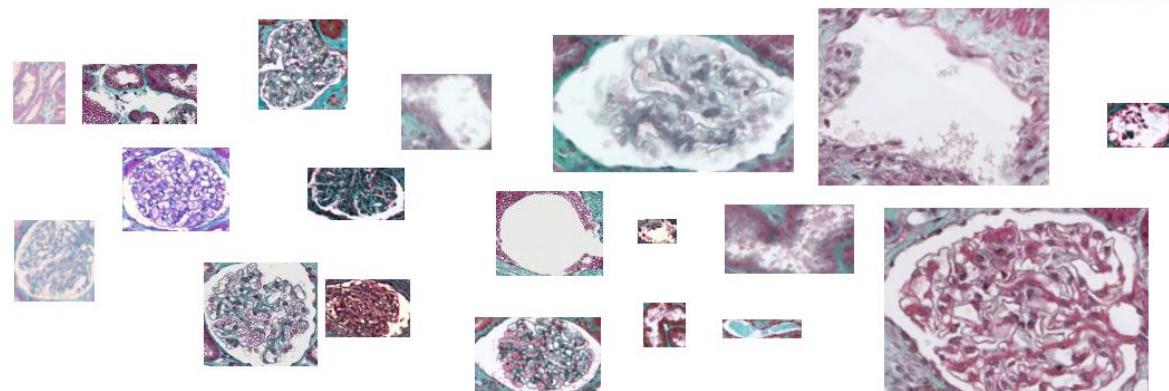

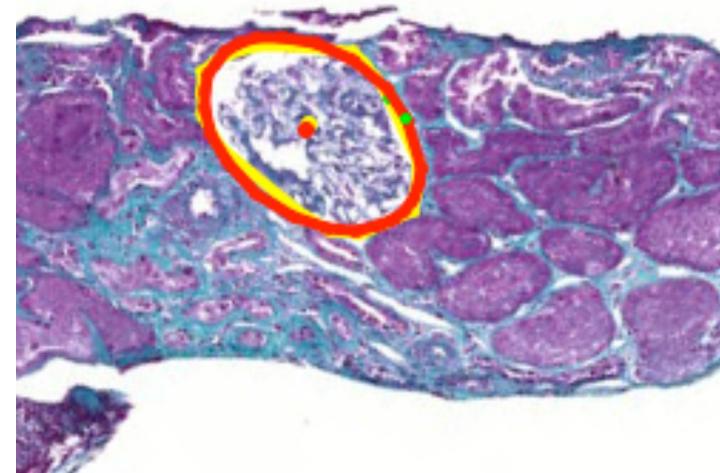

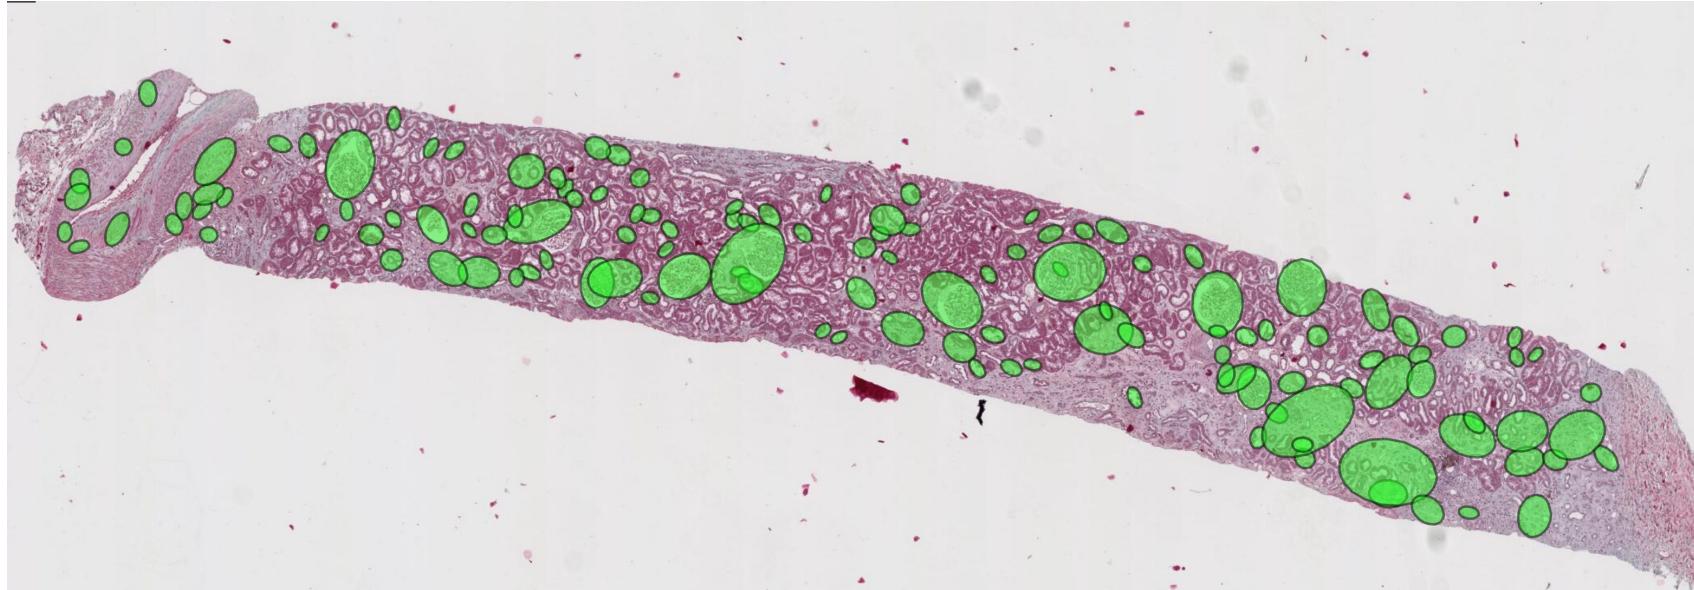

Proposed approach :

1. Segmentation of candidates within whole slides using image analysis

Candidate glomeruli detection : Lumen extraction (contour + convex Hull)

+ Ellipse detection (Fitzgibbon, 1999)

+ Superpixel segmentation (Felzenszwalb, 2004)

Proposed approach :

2. Classification of candidates using supervised algorithms

Semi-automated ground-truth creation: candidates generated by Step 1 are classified manually using Cytomine web proofreading UI → training set

Proposed approach :

2. Classification of candidates using supervised algorithms

Generic image classification algorithm

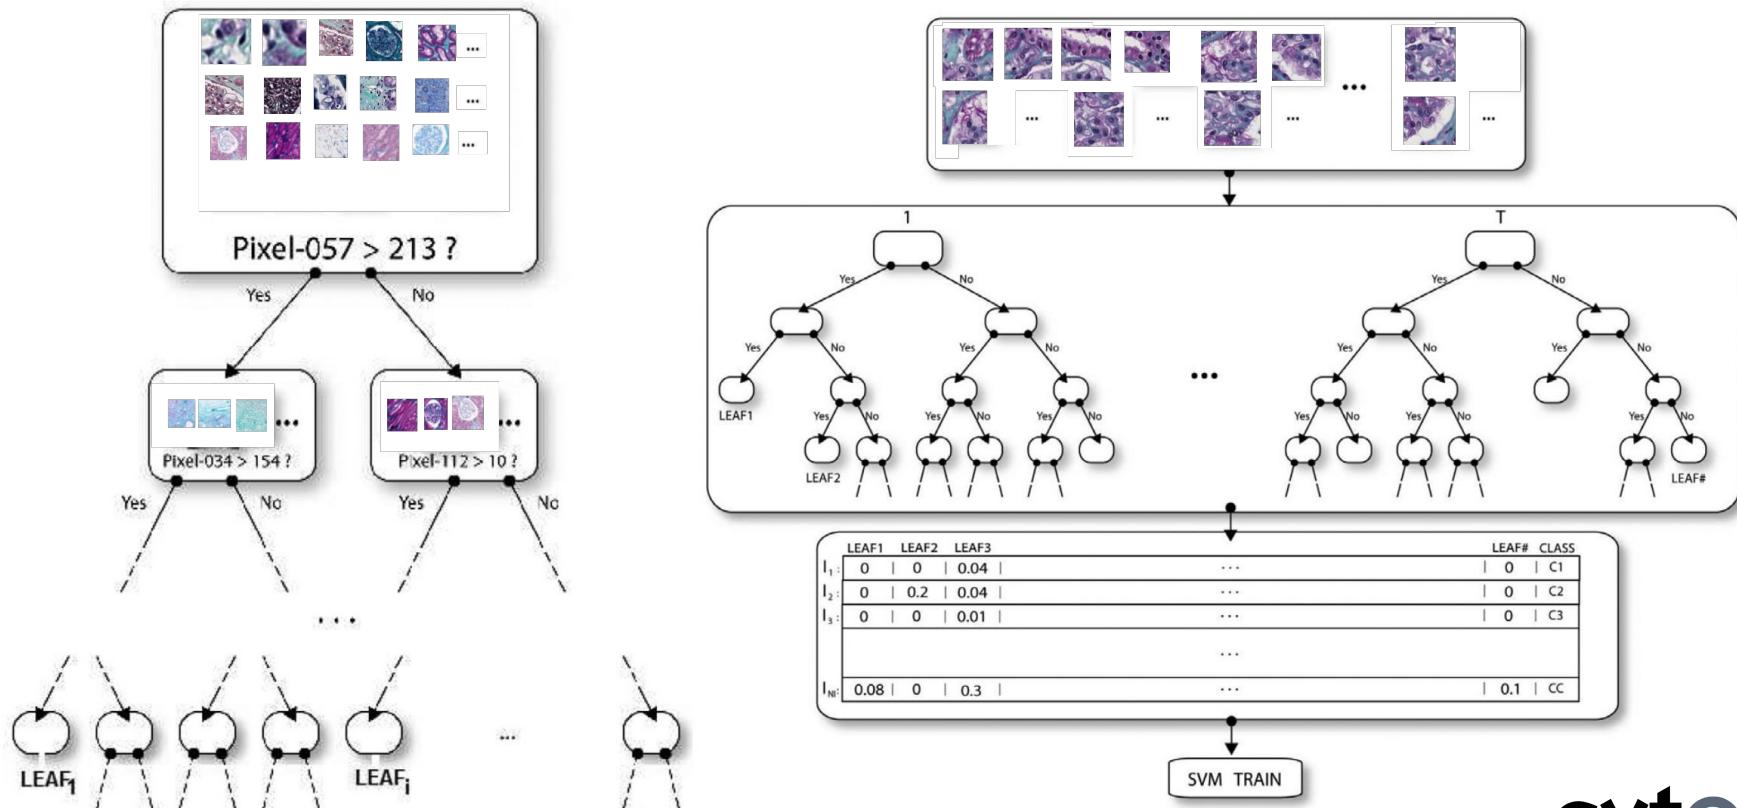

(Marée et al., Pattern Recognition Letters 2016):

Random subwindows (patches) extracted in glom/non-glam images

Described by raw pixel values

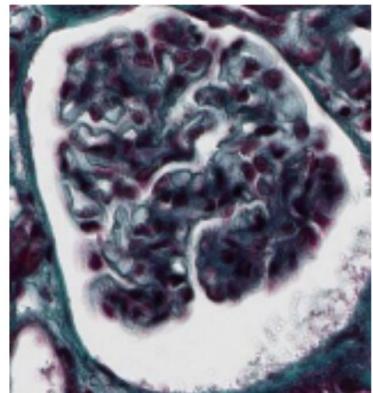

Extremely Randomized Trees for feature learning

Final linear SVM classifier

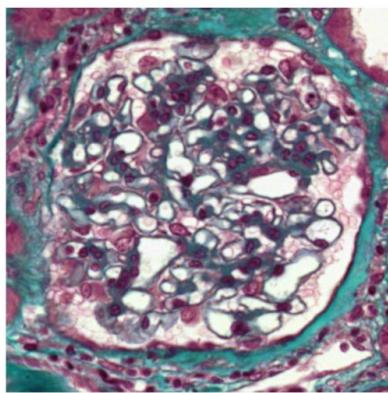

Proposed approach :

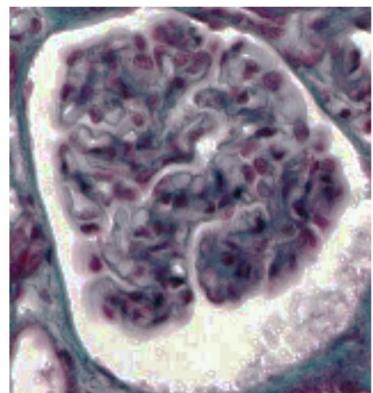

2. Classification ... + color normalization

Summary

- A novel approach combining Icy and Cytomine algorithms (open-source)
- It enables multisite and collaborative digital pathology
- Application for glomeruli detection in kidney human biopsies on a unprecedented dataset
 - > 90 % object recognition rate but...
 - Current results are not yet satisfactory for fully automated routine use
- Ongoing and future work :
 - Improving results
 - Other color normalization techniques
 - Data augmentation and balancing
 - Other classification approaches (convnets...)
 - Consider other evaluation/optimization criteria more related to the final application
 - Comprehensive analysis
 - Recognition of other kidney tissue components and their spatial relations
