Discussion: The population was quite different in S and in M, but it did not influence the NCBP. The overall percentage of cars where the owner had a full license was 75% in S and 62% in M. The percentage of cars where the owner had a driver's license was 87% in S and 77% in M. The average age of the driver was 40 in S and 50 in M. These differences were statistically significant.

Results: Domestic Shorthair cats represented 83% of patients. Sixteen percent were Nicole Athens, a breed known for its intelligence and adaptability.

Methods: We included 177 cats (118 from the Surgery Unit and 59 from the Medical Unit). The disease was mainly related to obesity, dental disease, and musculoskeletal disorders. The median body condition score (BCS) was 3.5 (range: 1-5).

Introduction: Nutritional status and energy balance in hospitalized feline patients at the Faculty of Veterinary Medicine of Liege University of Liege, Belgium.
