

Journées Luxembourgeoises de la Géodynamique

November 6 – 8, 2017 - Luxembourg

Development of an Interferometric Mass Processing Chain for Multitemporal Ground Deformation Measurements

L. Libert¹, D. Derauw¹, N. d'Oreye^{2,3}

¹*Centre Spatial de Liège, Université de Liège, Belgium*

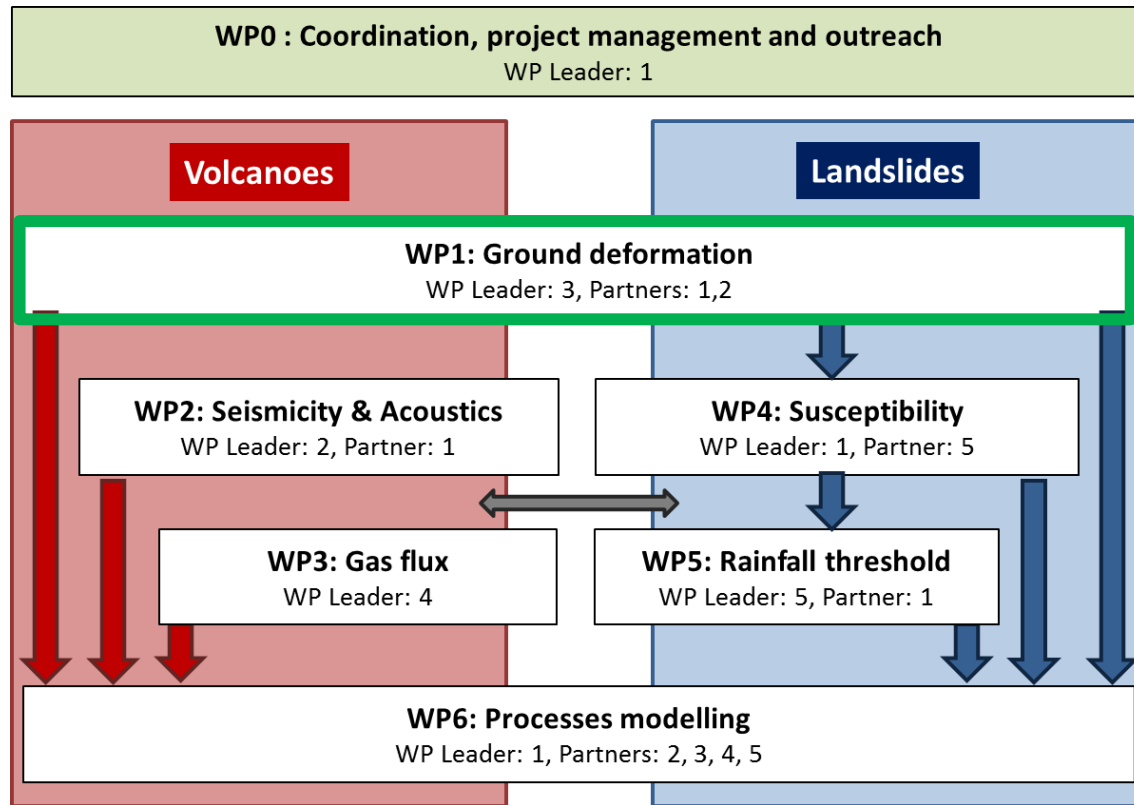

²*European Center for Geodynamics and Seismology, Luxembourg*

³*National Museum of Natural History, Luxembourg*

RESIST : the big picture

The main goal of RESIST is to understand the mechanisms driving **volcanic eruptions** and **landslides** in the Kivu region.

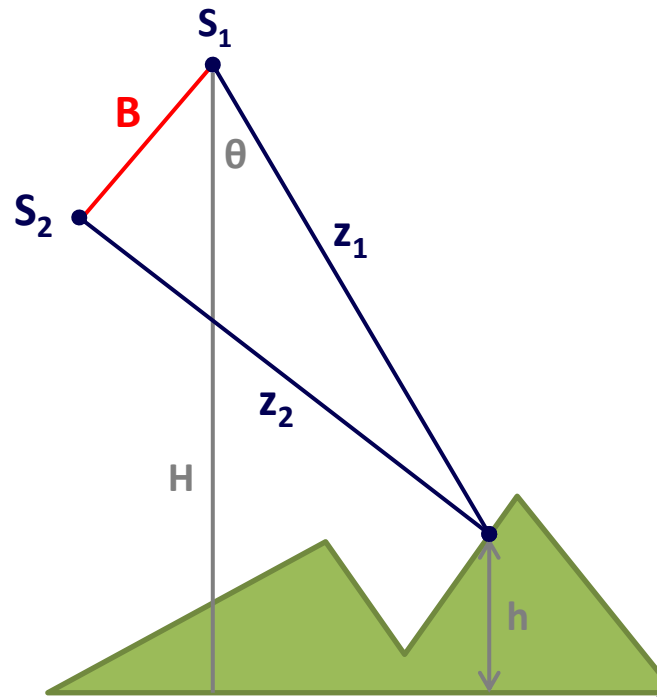

Partner 1: RMCA; Partner 2: MNHN/ECGS; Partner 3: CSL; Partner 4: BIRA-IASB; Partner 5: NASA

The Differential SAR Interferometry Approach

Interferometry measures the optical path difference related to two coherent wavefronts.

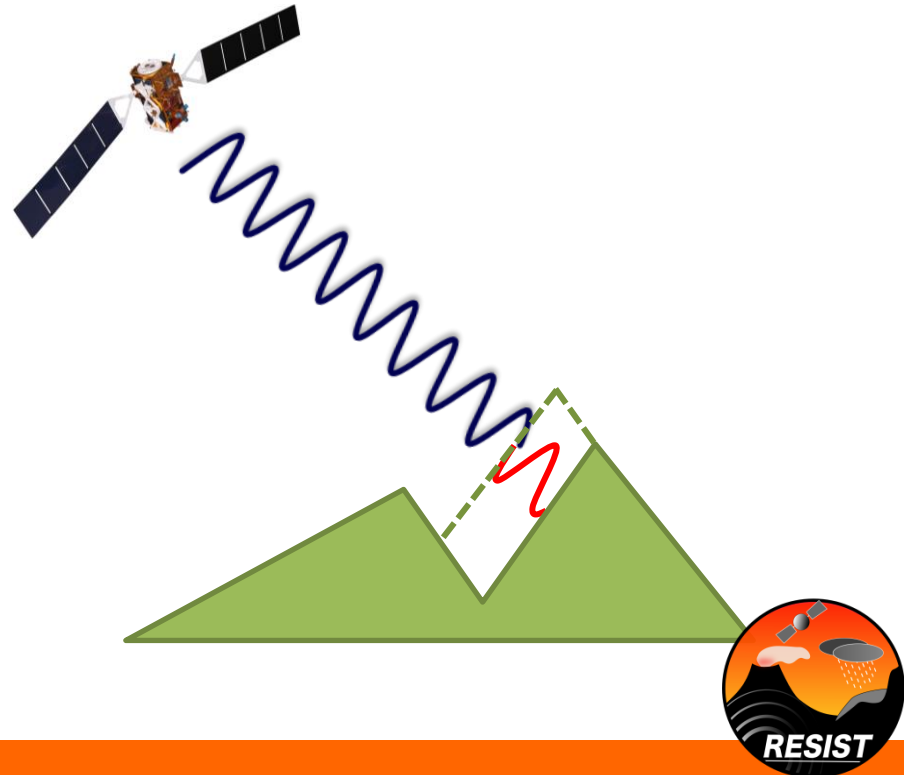

The Synthetic Aperture Radar (SAR) interferometry is used to map the **topography** and **ground deformations**.

The Differential SAR Interferometry Approach

Interferometry measures the optical path difference related to two coherent wavefronts.

The Synthetic Aperture Radar (SAR) interferometry is used to map the **topography** and **ground deformations**.

The Differential SAR Interferometry Approach

Differential SAR Interferometry offers **large spatial coverage** and temporal sampling of the order of **one to several days**.

Contrary to PSI, MSBAS considers **distributed scatterers** and computes deformations along **two axes**.

<http://www.e-geos.it>

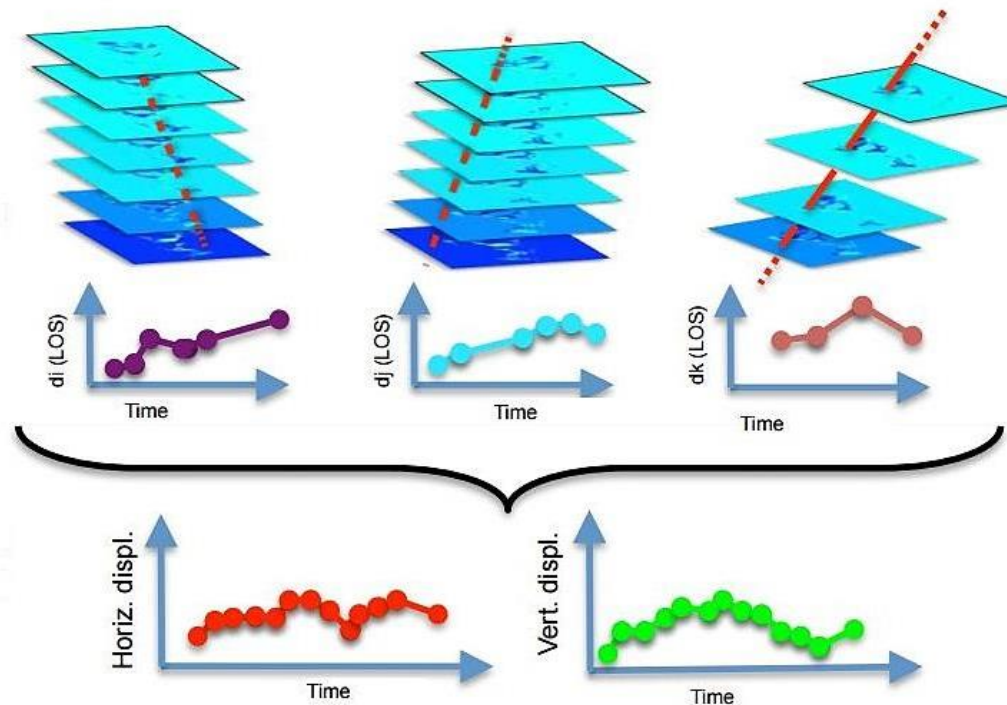

Multidimensional Small BAseline Subset (MSBAS)

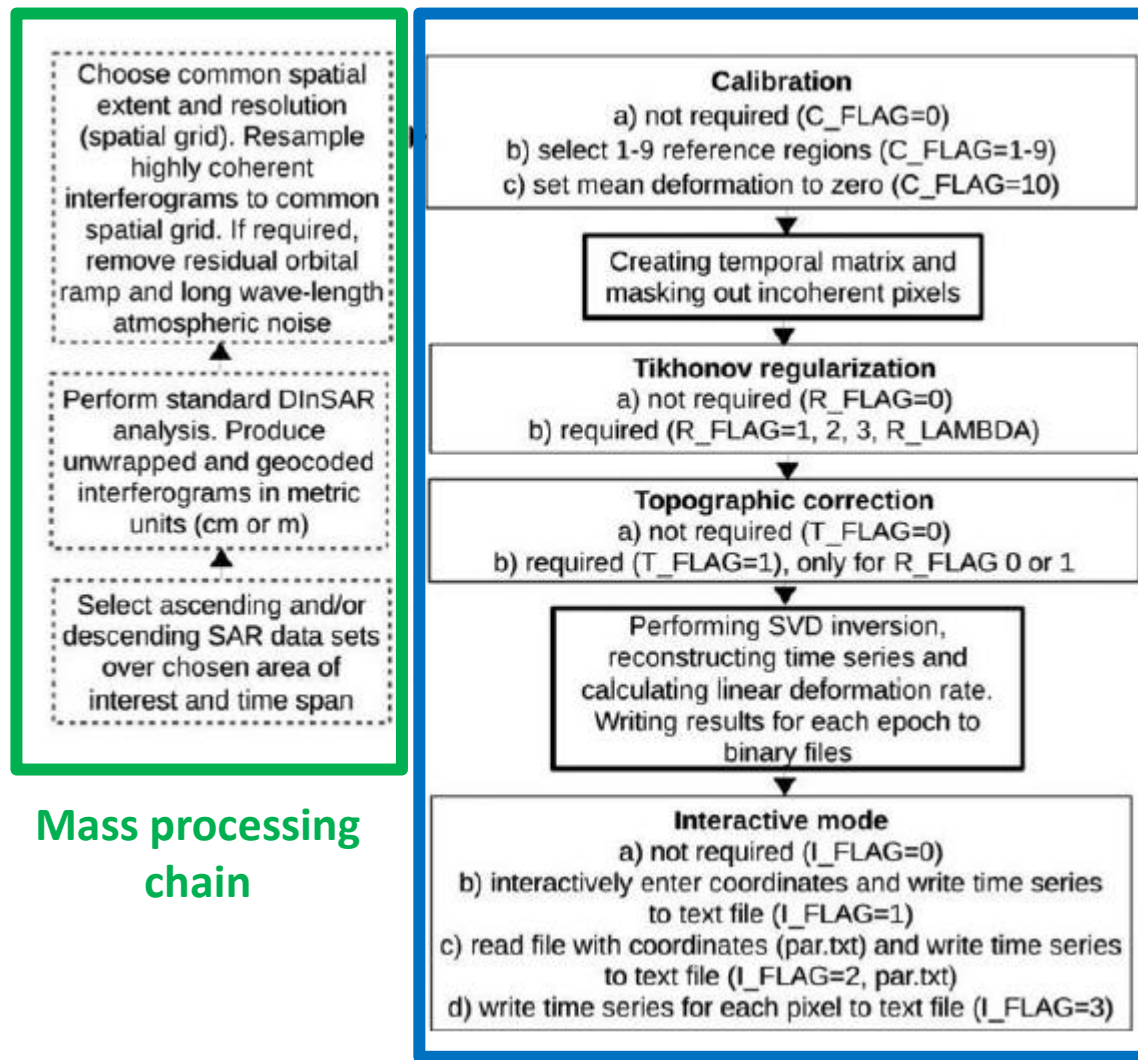

Integration of DInSAR data sets

- From different sensors
- With different spatial and temporal sampling and resolution
- With different incidence angles, wavelengths, pass directions, etc.

Computation of 2D time series of ground deformations, along :

- The East-West direction
- The vertical direction

Mass Processing Chain

Interferometric Mass Processing Chain

A three-step approach:

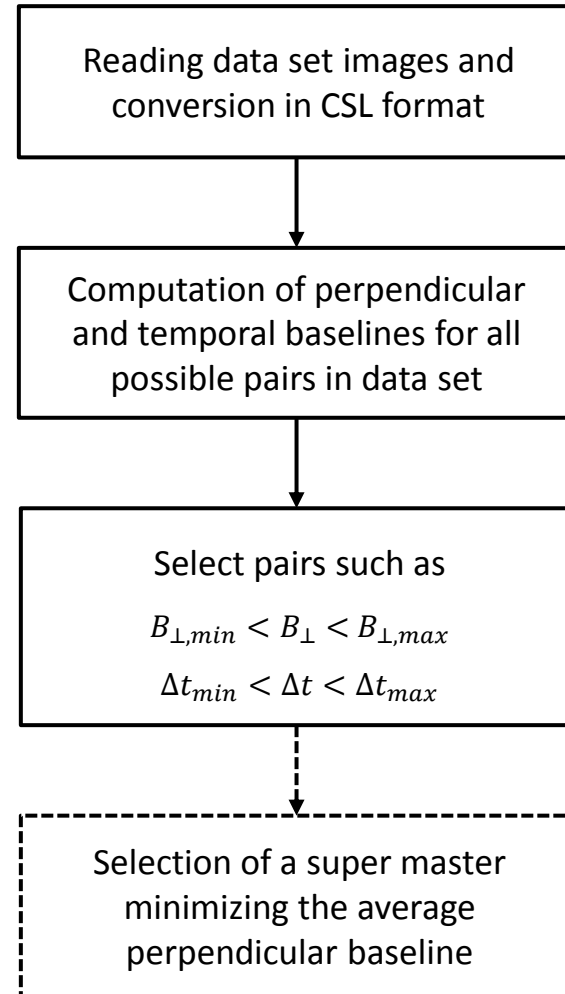

Integration of the *CSL InSAR Suite* (CIS) routines by a shell script for an automatic processing of the selected interferometric pairs

Interferometric Mass Processing Chain

Interferometric pairs selection

- Small perpendicular baselines to prevent geometric decorrelation
- Small temporal baselines to prevent temporal decorrelation

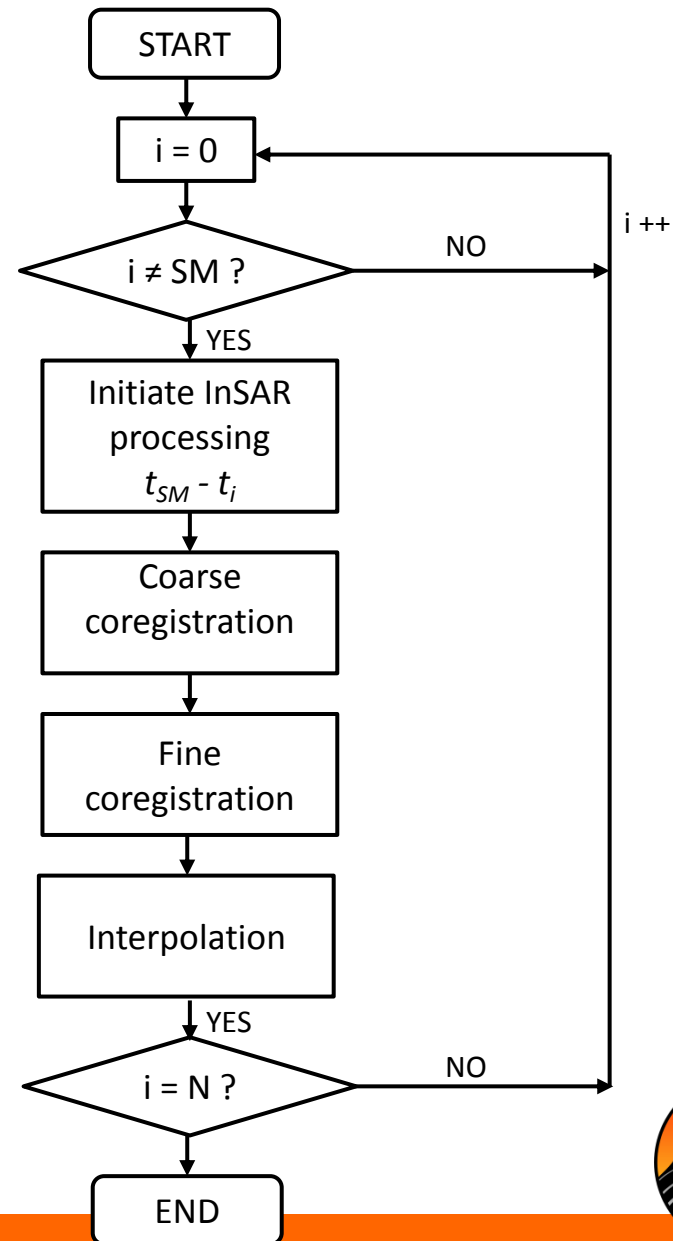

Interferometric Mass Processing Chain

Coregistration on super master

Let us consider a data set composed of $N + 1$ SAR images acquired at times t_0, t_1, \dots, t_N .

Super master image is acquired at time t_{SM} .

Interferometric Mass Processing Chain

What is the CIS added-value ?

- Fully adaptable and flexible
- A user/developer co-construction
- Saving memory and time in the long-term

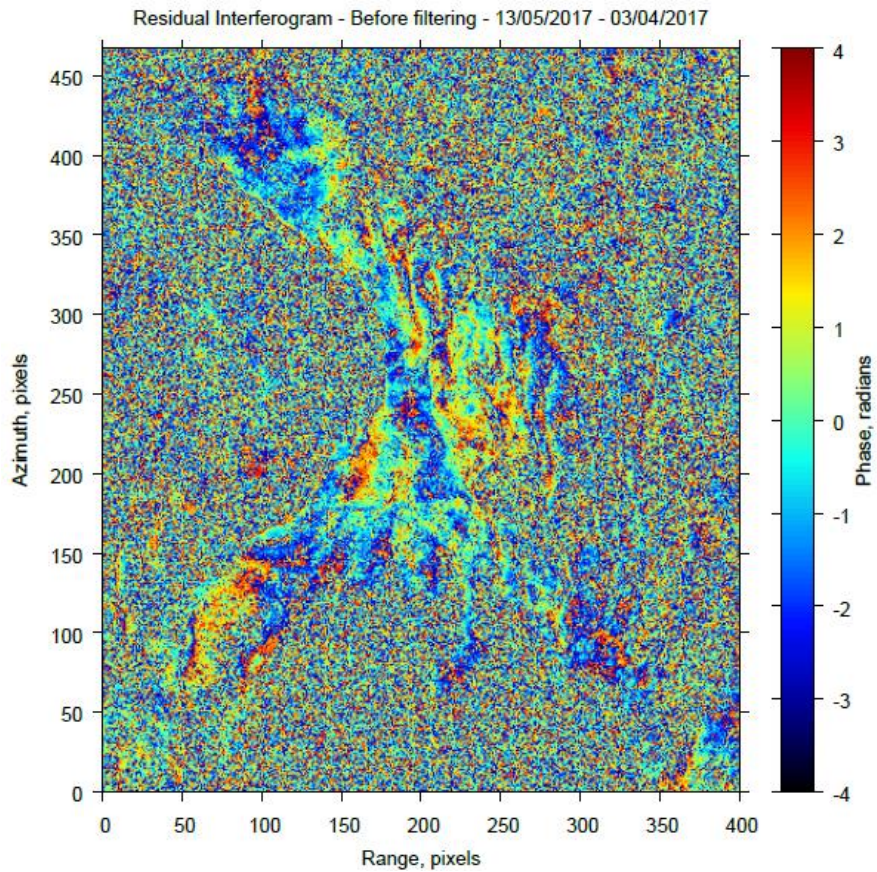

What is now possible with CIS ?

- Supporting ERS, Envisat, Radarsat, TerraSAR-X/TanDEM-X, ALOS, Cosmo-SkyMed and Sentinel-1 data
- Adaptive filtering
- Phase unwrapping: branch-cut or snaphu
- Image/data set interpolation
- Sentinel-1 interferometry

What is now possible with CIS ?

Adaptive filtering

What is now possible with CIS ?

Phase unwrapping : snaphu or branch-cut algorithm

What is now possible with CIS ?

Interpolation

1st CASE

2nd CASE

3rd CASE

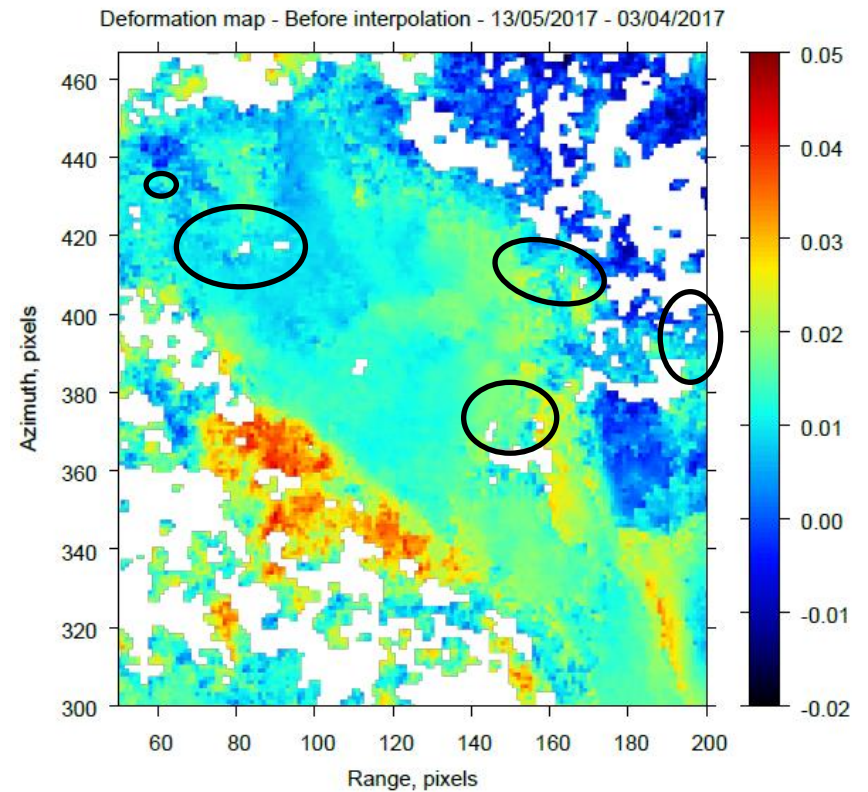

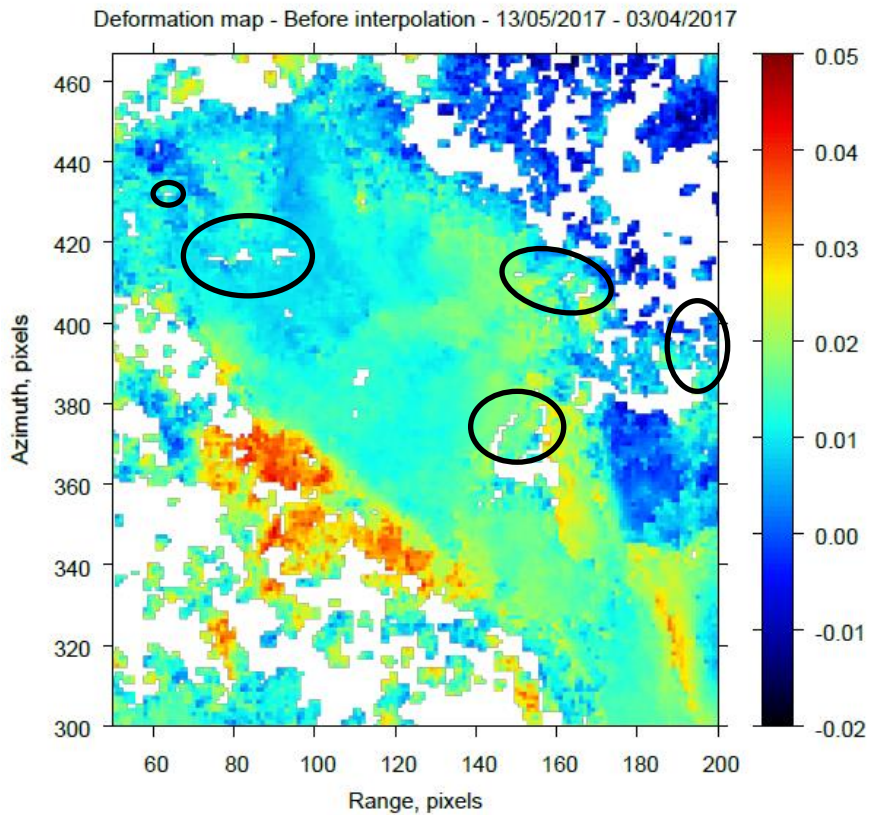

Image interpolation based on a simple bilinear/linear interpolation of nearest neighbours value

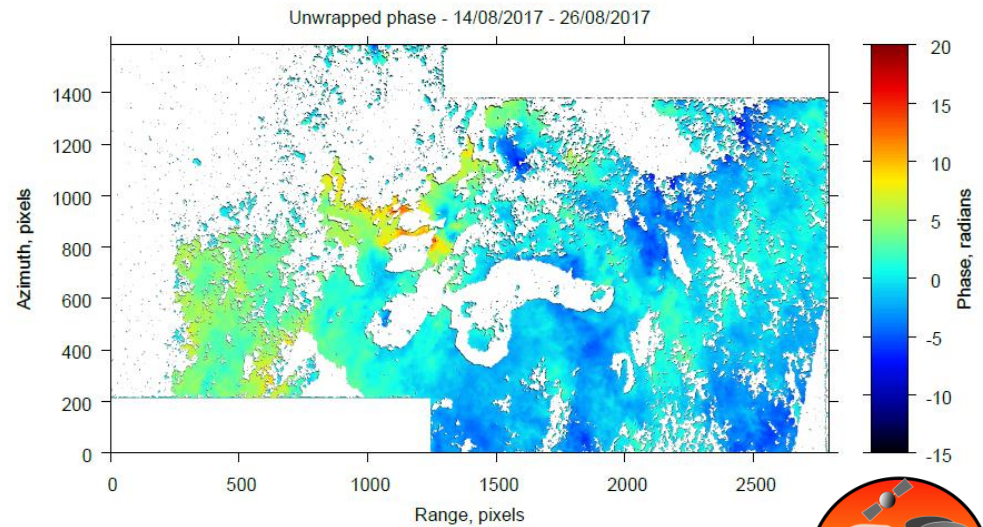

What is now possible with CIS ?

Interpolation

What is now possible with CIS ?

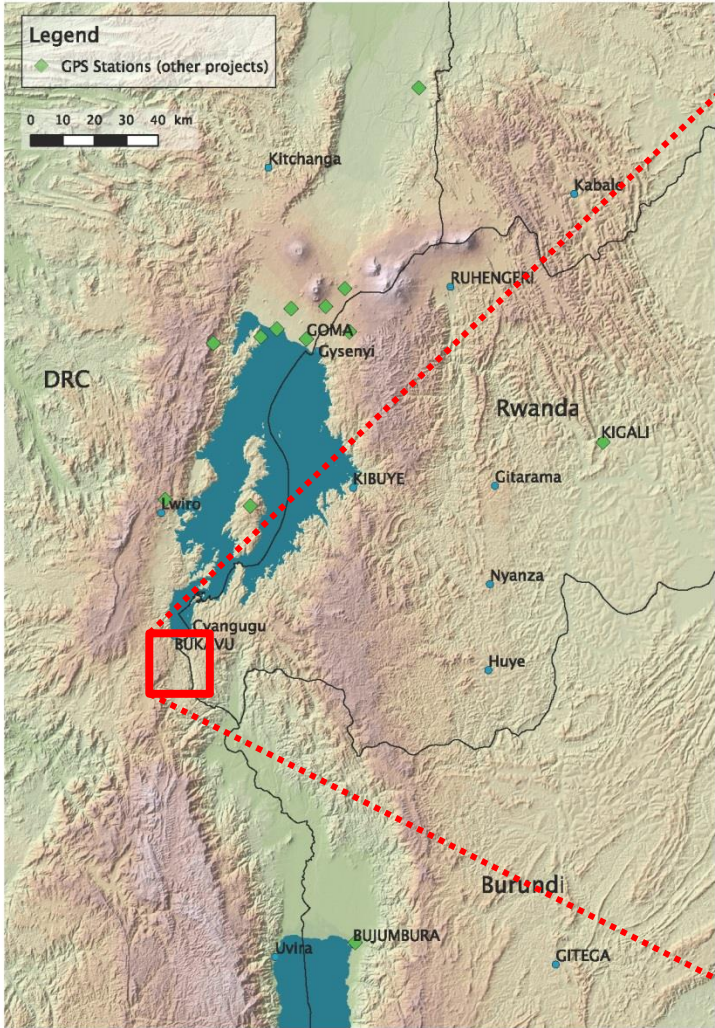

Sentinel-1 interferometry

MSBAS preliminary results on Bukavu

Test site : Funu landslide, Bukavu

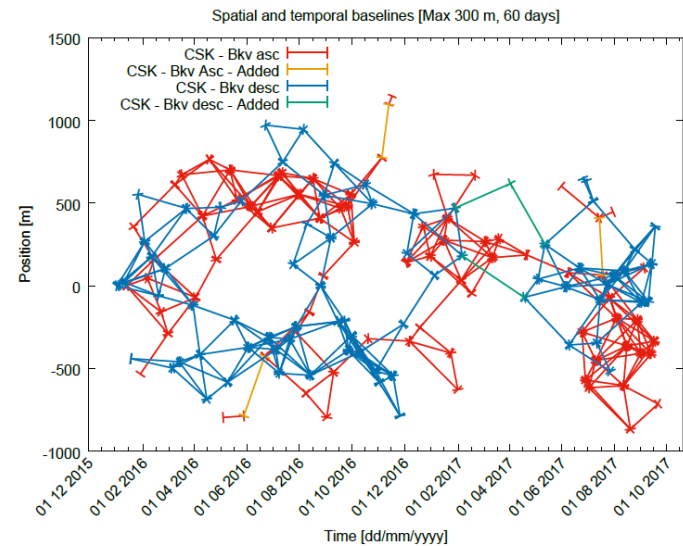

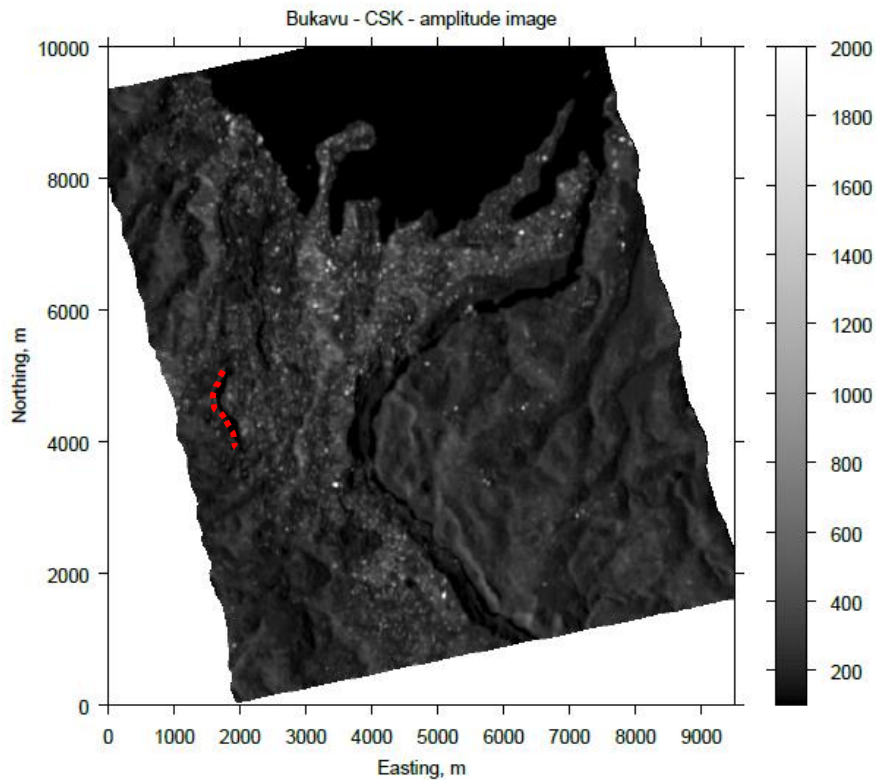

Test site : Funu landslide, Bukavu

Funu landslide : data sets

Two data sets spanning 2016 - 2017:

- Cosmo-SkyMed ascending pass : 77 acquisitions / 188 interferograms $B_{\perp} < 300 \text{ m}$
- Cosmo-SkyMed descending pass : 75 acquisitions / 193 interferograms $\Delta t < 56 \text{ days}$

Funu landslide : data sets

Two data sets spanning 2016 - 2017:

- Cosmo-SkyMed ascending pass : 77 acquisitions / 188 interferograms
- Cosmo-SkyMed descending pass : 75 acquisitions / 193 interferograms

Computing performances ?

Crop centered on Bukavu + ML 10x10
Adaptive filtering
Snaphu + mask

Coregistration on super master :

~ 1h40 (two processes in parallel)

14 Go + 16 Go

Interferometric processing and geoprojection :

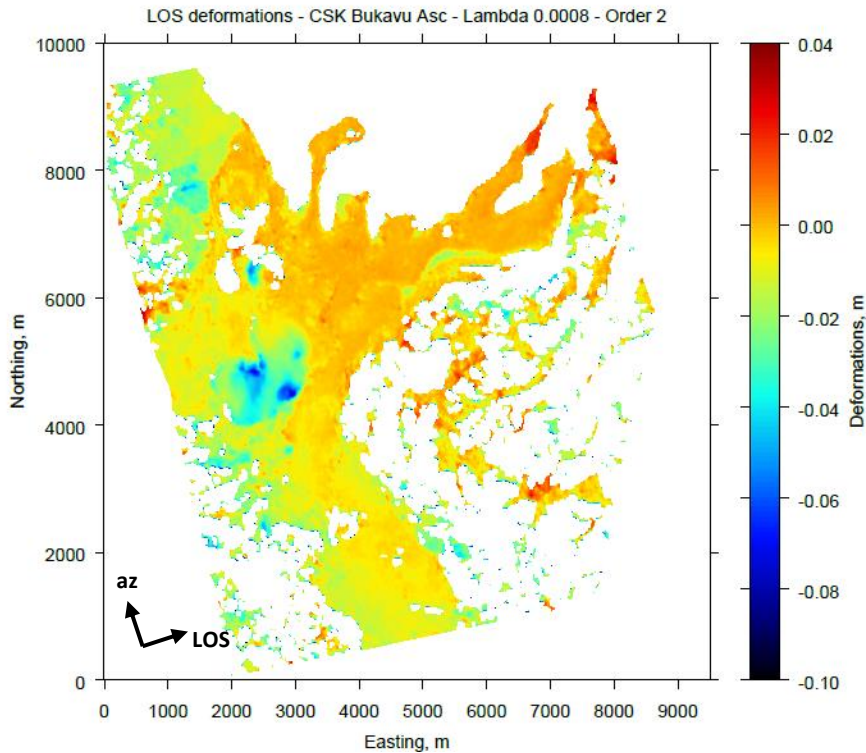

~ 6h40 (two processes in parallel)

60 Go + 66 Go

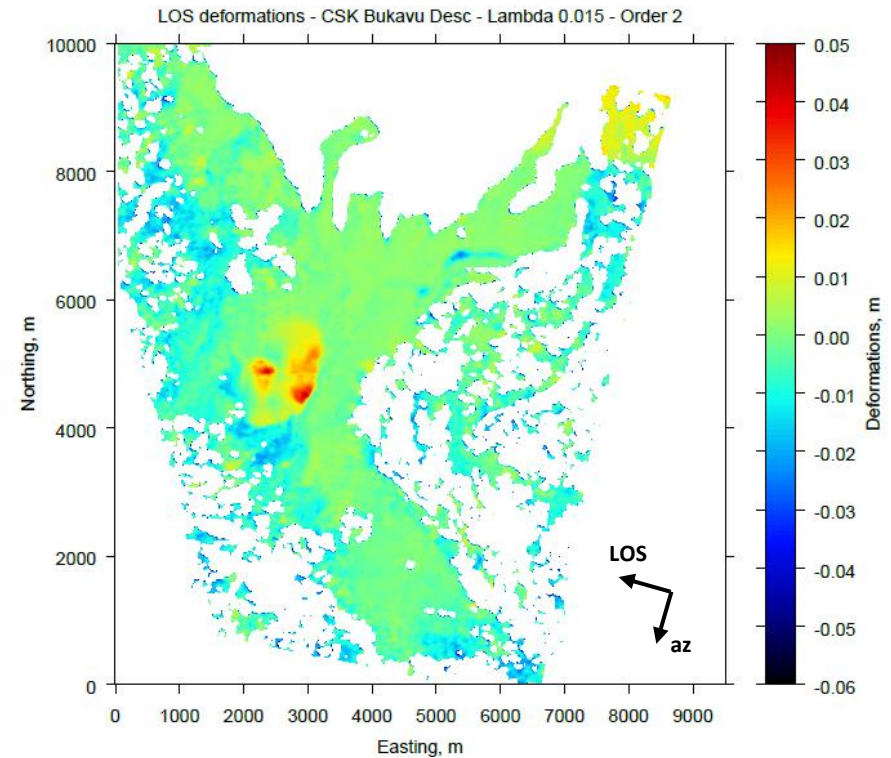

Funu landslide : SBAS

Cosmo-SkyMed – Ascending pass

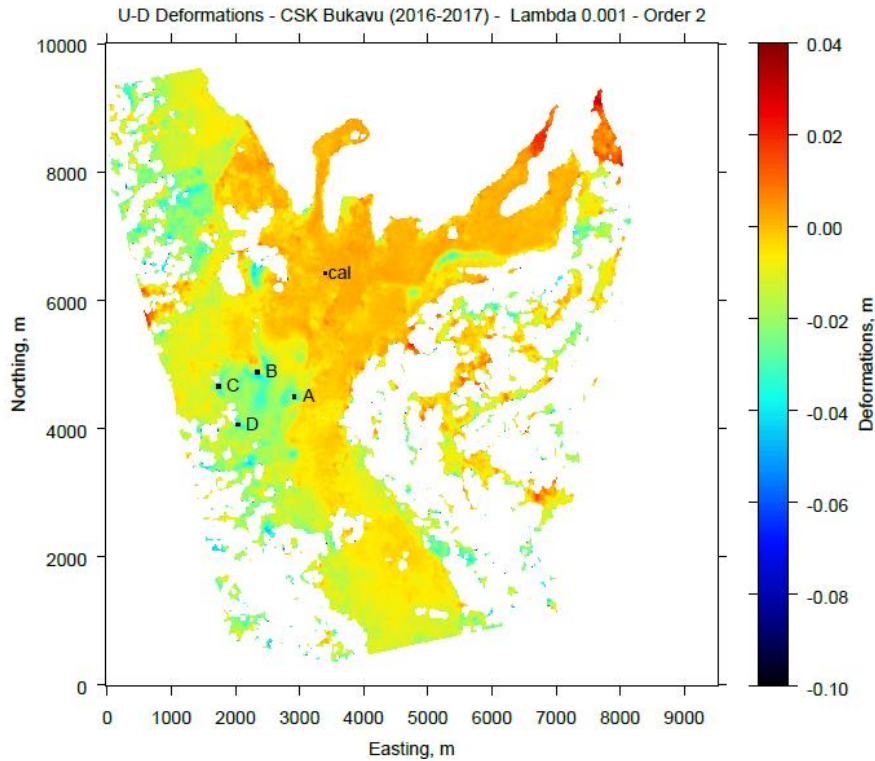

Cosmo-SkyMed – Descending pass

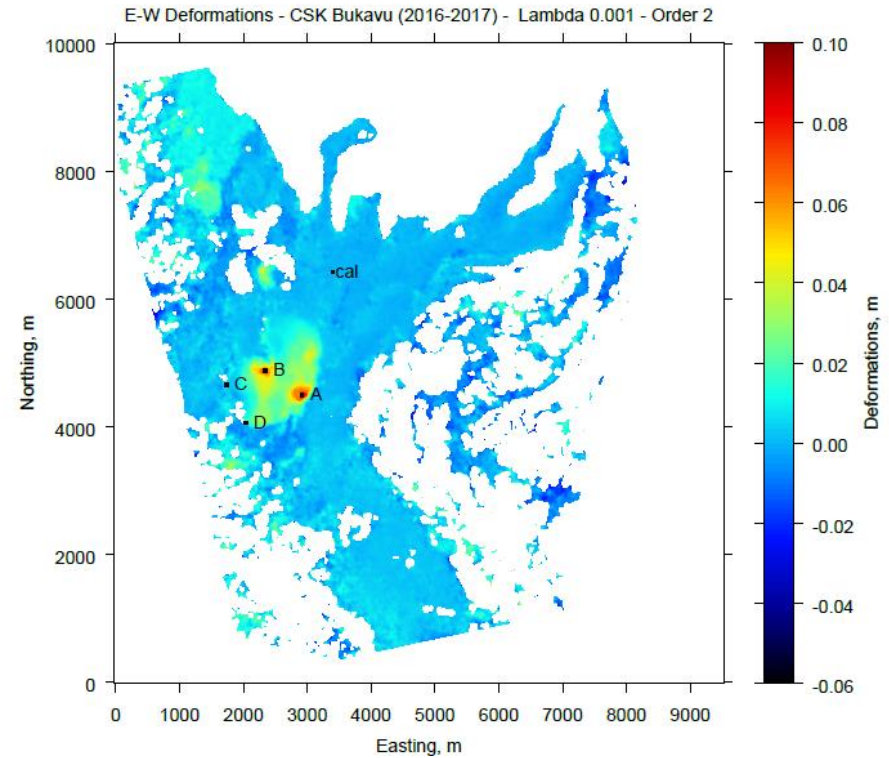

Funu landslide : MSBAS

Vertical deformation Linear rate

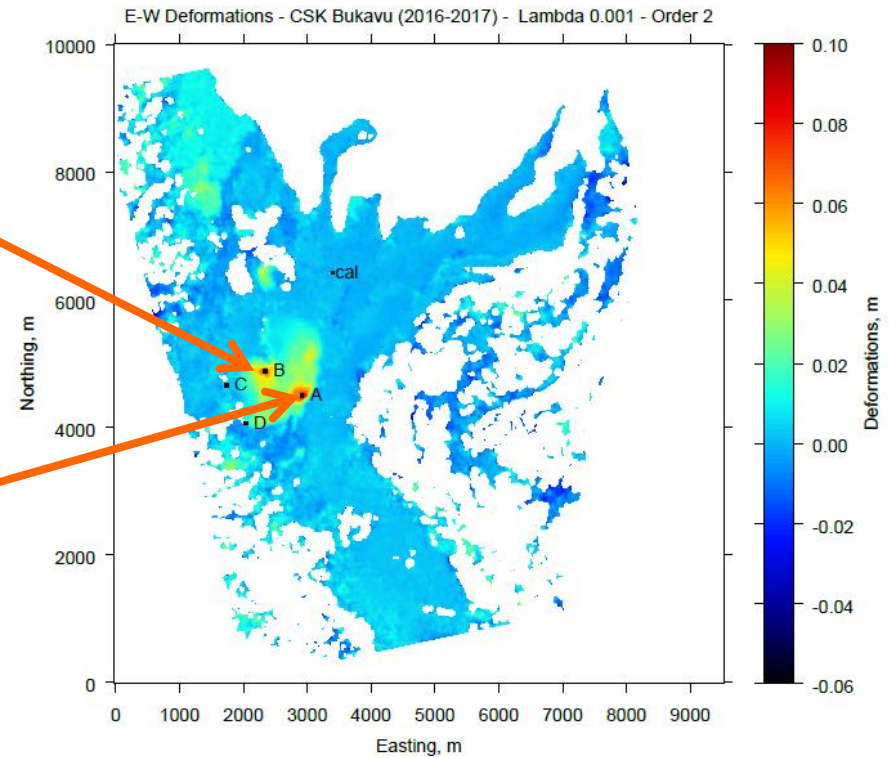

West-East deformation Linear rate

Funu landslide : MSBAS

Funu landslide : MSBAS

Funu landslide : MSBAS

Comparison of deformations for regularization orders 1 and 2

Conclusions

- Numerous improvements made and options integrated in CIS
- An end-to-end working interferometric processing chain
- Preliminary results on Bukavu, for the 2016 – 2017 period, consistent with previous analysis

Thank you for your attention
