Abstract

This chapter presents a description of Harakmbut, an Amazonian language spoken in southeast Peru, based on existing work as well as original fieldwork. It focuses on its most vital dialect, Arakmbut (Amarakaeri). The discussion of its phonology and phonetics highlights nasality as an important—yet not fully understood—phenomenon. The chapter also presents morphological templates for both (pro)nominal heads and finite verb forms. The description of the noun phrase revolves around the distinction between obligatorily bound nouns and potentially free ones, which leads to distinct morphosyntactic behaviour in noun modification, noun incorporation, and word formation. Contra earlier work, I argue that just a limited number of bound nouns (rather than the whole class) should be analyzed as classifiers. The discussion of the verb phrase homes in on the lack of referential transparency in person marking, as well as the abundance of inflectional and derivational morphology, including markers of associated motion and temporal adverbial markers. In the system of argument marking on dependents, the three argument roles (S, A, and O) show differential and/or optional marking. At the level of clause-linking, nominalization plays an important role in the expression of relative, complement, and adverbial relations.

1 Classification, demographics, and sociolinguistic background

Harakmbut is a Peruvian Amazonian language spoken in the regions of Cusco and Madre de Dios. The name of the language is an autonym and means 'person, people'. The Harakmbut people still live in their traditional homeland, which covers the area drained by the Madre de Dios River and all its tributaries from its headwaters down until the mouth of the Inambari River. As can be seen in Figure 1 [map to be included], the southern border is formed by the Andes. The speakers live in a number of sometimes ethnically mixed *comunidades nativas* 'native communities', which are protected by national law. These communities border on the Amarakaeri Communal Reserve, also a protected area, which lies in the center of the Harakmbut homeland.

The Harakmbut are divided into several groups that settled into different areas of the homeland, have some different cultural practices, and speak different varieties of the language (see Gray 1996: 4–16). Table 1 presents data on their current locations and numbers.

Table 1: Dialects of the Harakmbut language

Detailed studies on the dialectal differences are lacking, but the dialects are reported to be mutually intelligible. Solís Fonseca (2003: 158) and Helberg (in prep.) divide them into two main groups: Watipaeri and Toyoeri are phonetically and lexically somewhat different from Amarakaeri/Arakmbut, Arasaeri, and Sapiteri. The data from Aza (1936) and Peck (1979 [1958]), however, suggest that the Arakmbut variety is different from the other four mentioned, which are in turn similar to each other (See Section 2). Of the last five dialects in Table 1 only a handful of fluent speakers, if any, are left.

The Harakmbut are traditionally farmers (slash-and-burn agriculture) and hunter-gatherers, but they started working gold in the 1970s (e.g., Aikman 2009). For a detailed ethnography, the reader is referred to Gray (1996, 1997a, 1997b). The sociolinguistic situation points to a rather low degree of vitality, as I have found many young parents reluctant to pass on the language to their children, so as to protect them from stigmatization as an indigenous person. Children are mainly brought up in Spanish and only acquire a passive competence in Harakmbut. However, efforts are being made to develop didactic materials in Harakmbut, and to implement a programme of Bilingual Intercultural Education funded by the national government. In addition, a number of speakers are trying to boost the communities' self-esteem by publishing on Harakmbut oral tradition and documenting cultural practices. In

¹ It should be noted that the speakers of the Amarakaeri variety regard the label *Amarakaeri* as a derogatory term; it is adapted from *wa-mba-arak-a-eri* (NMLZ-V.PL-kill-TRNS-AN), a deverbal nominalization meaning '(fierce) killer/murderer' (cf. Helberg 1996: 18, in prep.), which goes back to an ancient story about the origin of the different ethnolinguistic groups of the Harakmbut people. They prefer to call their variety 'Arakmbut', as distinct from the Watipaeri variety, towards whose speakers they generally entertain feelings of hostility rather than brotherhood. The etymology of the other ethnonyms is as follows: *wa-tipa-eri* (NMLZ-dig.out.step-AN) 'people from the steps dug into the hillside'; *arãsã-eri* (Arasa-AN) 'people living on the Arasa River' (i.e., the Marcatapa, a tributary of the Inambari); *pukiri-eri* (Pukiri-AN) 'people living on the Pukiri River'; *toyo(dn)-eri* (downriver-AN) 'people living downriver' (cf. Helberg 1996: 18). The etymology of *kisambaeri* and *sapiteri* is unknown; the latter is certainly different from *kapiteri* (*kapite-eri* (Kapite-AN) 'people living on Mount Kapite'), who are part of the Arakmbut group (*pace* Helberg, in prep).

² Numbers cited by INEI (Instituto Nacional de Estadística e Informática) in 2007 (courtesy of Yesica Patiachi Tayori). The locations of the ethnic groups without any NC in Table 1 is the pre-contact location assumed in Gray (1996: 6).

general, young adults and speakers up to the age of fifty are bilingual in Harakmbut and Spanish, while speakers older than fifty are mainly monolingual in Harakmbut. In some communities there is language contact across different Harakmbut varieties, and with Matsigenka, Yine (both Arawakan), and Ese Ejja (Takanan).

The genetic classification of Harakmbut, sometimes also termed 'Harakmbet', 'Hate'³ or (mistakenly) 'Mashco', has been a matter of dispute. McQuown (1955: 530) and Matteson (1972) classified it as an Arawakan or Maipuran language. Similarly, Greenberg (1960) and Voegelin and Voegelin (1977) placed it in the Andean-Equatorial phylum, specifically the Arawak subbranch of the Equatorial branch (see Payne 1987: 23–24). However, Payne (1991: 365–369) convincingly refuted this classification; since the 1960s, consensus has emerged that Harakmbut is an isolate (Tovar 1961; Loukotka 1968; Lyon 1975; Helberg 1984; Wise 1999: 307). Recently, Adelaar (2000, 2007) proposed that it is genetically related to the Brazilian Katukina family, which may be further linked to Macro-Jê. This proposal is mainly based on lexical evidence and awaits further corroboration. From an areal perspective, Harakmbut exhibits a number of Western Amazonian grammatical features, as well as features characteristic of the nearby Guaporé-Mamoré linguistic area in southwest Brazil and eastern Bolivia (Crevels & van der Voort 2008).

The present chapter is based on previous work as well as my own fieldwork on the Harakmbut language, both of which focus on the Amarakaeri/Arakmbut dialect, which has the highest number of speakers. Earlier work includes studies by Hart (1963), Helberg (1984, 1990) and Tripp (1976a, 1976b, 1976c, 1995). My own data were collected through audio recording during three field trips in 2010, 2011 and 2016 (about five months in total), in the native communities of Puerto Luz, San José del Karene, and Shintuya. The data used in this chapter come mainly from elicitation sessions with bilingual speakers; if taken from spontaneous speech, this has been indicated in the example.

2 Phonology and phonetics

The phonological analysis presented in this section largely follows Helberg's (1984: 13–178, in prep.) description. Tables 2 and 3 present the consonant and vowel phonemes of the Amarakaeri or 'Arakmbut' variety; the corresponding orthographic symbols are given in angled brackets. The practical orthography, designed by the author and indicated in brackets where relevant, is IPA-based, and different from the community spelling. Based on written sources, the segmental inventories of the other varieties seem to differ only with respect to the phonemic status of the glottal fricative [h] <h> and the bilabial approximant [w] <w>.

| MANNER, PLACE | BILABIAL | ALVEOLAR | VELAR |
|---------------|-------------------|--------------------------|-----------|
| STOP | р | t | k |
| NASAL | m <m, mb=""></m,> | n <n, dn,="" nd=""></n,> | ŋ <ŋ, gŋ> |
| TAP | | r <r></r> | |
| FRICATIVE | | S | |
| APPROXIMANT | W | | |

³ The term *hate* (*ate* in Arakmbut) originates in the sequence *Harakmbut-ha-te* (people-say-LOC) 'in the language of the people, in the Harakmbut language', in which the deverbal nominalization is attached to the preceding modifier noun (*hate* itself is not an independent form in the language). An alternative construal to this sequence, in the Arakmbut variety, is given in (37b).

Table 3: Vowel phonemes of Amarakaeri/Arakmbut

| | FRONT | CENTRAL | BACK |
|------|--|---------|------------|
| HIGH | i, ĩ | | u, ũ |
| MID | $\epsilon <\!\!e\!\!>, \tilde{\epsilon} <\!\!\tilde{e}\!\!>$ | | ο<0>, δ<õ> |
| LOW | | a, ã | |

Both consonant and vowel phonemes underlie a fairly wide range of speech sounds. The plosives /p/, /t/, /k/ generally show a voiceless realization, unless they occur in intervocalic position, in which they tend to become voiced ([b], [d], [g]), as in (3)—cf. Helberg (1984, in prep.).⁴ They are unreleased in syllable-final position, as with [k'] in (1). Alveolar /t/, /n/, and /s/ are often palatalized to [\mathfrak{g}], [\mathfrak{n}] and [\mathfrak{f}] when followed by high front vowels (older speakers do not always palatalize them); for the [nd] allophone of /n/ (see below) this results in [ndʒ]. In case the high front vowels are in turn followed by a different vowel, the former tend to be unpronounced (but need to be posited for morphological reasons), as with the second syllable in (1).⁵ Palatalization of /s/ is also triggered by ensuing high back vowels.

| (1) | e-ti-a?-pak | /ɛ.tia?.pak/ | [ɛ.ˈʧa?.pak]] | V.CVV?.CVC | 'to narrate' |
|-----|--------------|--------------|-------------------|-----------------------|--------------|
| | NMLZ-SPAT:up | o-say-VBZ | (syllables are se | eparated by a dot sym | nbol) |

All three nasal consonants show allophonic variation with pre- and/or post-stopped variants. In the case of preceding oral vowels, /n/ and /ŋ/ are realized as pre-stopped [dn] and [gŋ] respectively; in the case of preceding nasal vowels, they are realized as [n] and [ŋ]. In the case of following oral vowels, /n/ and /m/ are realized as post-stopped [nd] and [mb] respectively; in the case of following nasal vowels, they are realized as [n] and [m] (cf. Helberg 1984, in prep.). The same allophonic distribution has been noted for Toyoeri and Sapiteri by Peck (1979 [1958]: 18–21), and for Watipaeri and Arasaeri in a schoolbook drawn up by a multi-dialect author team (Manqueriapa Vitente et al. 2012). However, there is also some free variation within and across speakers of Arakmbut, e.g., *wa-mba2-neŋ* (NMLZ-hand-amount) 'five' is attested as both [wa'ma2nɛ̃ŋ] and [wa'mba2nɛ̃ŋ]. In addition, there is a nasal harmony system (2), in which the nasal root elements are in bold, and there are degrees of nasality in vowels. All these aspects of nasality await further analysis. In the practical orthography used here, only strong (phonemic) nasality in vowels is indicated with a tilde; weak nasality (through co-articulation) is not indicated, for example in the proper name *Morimõ*. The consonant nasal allophones are spelled according to their realization.

(2) $w\underline{\tilde{a}}$ - $t\tilde{o}$ - \tilde{e} $m\tilde{e}$ - $t\underline{\tilde{a}}$ - \tilde{e} - $n\tilde{e}$ NMLZ-CAUS.SOC-be 3SG>1/2SG.IND-APPL-be-IND'This is my husband.'

The phonetic realization of the vowel phonemes is very close to that of the corresponding cardinal vowels, apart from the mid vowels, which have a more raised pronunciation than the open-mid cardinal vowels. Allophonic variation is most noticeable when two vowel segments are adjacent. When adjacent to low central vowels, for instance, mid front vowels tend to be raised considerably, often even to palatal semi-vowel realizations; for example, the verb form in (2) is often pronounced as [mɛ̃'tãjnɛ̃]. Raising also takes place when mid front vowels

⁴ In Toyoeri and Sapiteri, lenition in intervocalic position has only been described for /k/ (Peck 1979 [1958]: 17). ⁵ In Toyoeri and Sapiteri, palatalization is only reported for /t/ when followed by high front vowels, which also go unpronounced when they are themselves followed by a different vowel (Peck 1979 [1958]: 23–25).

precede low central vowels, which may in turn lead to palatalization of the preceding consonant (3).

(3) k<u>a</u>te-apo [1] Raising of /ε/ adjacent to /a/: ['ka.tia.bɔ] what-REAS [2] Palatalization of /t/: ['ka.tʃa.bɔ] 'why?'

Similarly, mid back vowels tend to be raised and realized as [w] when they precede low central or mid front vowels in a single consonant-initial syllable (4). Helberg (1984; in prep.) only notes the [w] allophone of the mid back vowels in syllable-initial position and does not attribute phonemic status to the bilabial approximant. More detailed study is in order here. In general, vowels are spelled phonemically, for example $/\varepsilon/ \ll$ in (3), except for /i, \tilde{i} , which are spelled \ll, \tilde{y} when realized as [j] adjacent to vowels in a single syllable, as with the final syllable in (4). Vowels in stressed syllables are slightly longer than those in unstressed syllables. Syllable-final vowels of unstressed syllables are often elided (5b), especially in rapid speech.

The canonical syllable structure is (C)(V)V(V)(C), with the optional vowel segments restricted to the back and high front vowels phonetically realized as a semi-vowels (4), or "swallowed" after inducing palatalization of the preceding consonant (1). Table 4 presents the segmental restrictions on syllable onsets and codas for the consonant system (however, /c/ is excluded in word-initial position); syllables that contain nuclear vowels only do not have any segmental restrictions.

| (4) | ĩ-nõ-põ-ẽ-ỹ | /ĩ.nゔ.pゔĩí/ | [ĩ.ˈnɔ̃.pwɛ̃j̃] |

|--------------------|------------------------------|---------------------------------------|---------------------------------------|
| Consonant phonemes | /t/, /k/, /n/, /s/ | /p/, /m/, /ɾ/, /w/ | /ŋ/ |

Two speech sounds have not been discussed so far; they are the glottal stop [?] < ?> and fricative [h] <h>, which show dialectal variation. Helberg (1984: 22, in prep.) argues that the glottal stop has phonemic status in Arakmbut, but my data do not contain conclusive evidence in support of this analysis. Rather, I believe it has the same suprasegmental function Helberg (1984: 143–148, in prep.) describes for [h], which is to optionally demarcate syllable boundaries when these lack consonantal onsets or codas. Its non-phonemic status is corroborated by the observation that its production varies within and across speakers of Arakmbut. In addition, Peck (1979 [1958]) does not report it for Toyoeri and Sapiteri. While Helberg (1984: 143–148, in prep.) analyzes [h] as a suprasegmental element in Arakmbut, Peck (1979 [1958]: 2) posits phonemic status for it in Toyoeri and Sapiteri. A preliminary comparison of 35 lexical items based on Peck (1979 [1958]), Manqueriapa Vitente et al. (2012), and my own data shows that (in writing) in Watipaeri/Toyoeri/Sapiteri, <h> before <i> corresponds to [w] in Arakmbut, while in these same varieties <h> before <e> corresponds to [w], [?], or Ø in identical phonetic environments in Arakmbut. Before <a>, <o> and <u> (nasal or oral), is either retained in Arakmbut, or pronounced [?], or left unpronounced (Ø). In syllable-final position, Watipaeri/Toyoeri/Sapiteri <h> tends to be retained in Arakmbut. More research is needed on this dialectal variation.

The domain of stress assignment in a phonological word differs according to word class. For nouns, the stress domain is the root plus derivational affixes; the main stress falls on the penultimate syllable. In examples (1)–(5), word stress has been indicated through the stress symbol ['] or underlined syllable nuclei. As shown in (3) and (5c), inflectional suffixes like case endings do not bear on stress assignment. By contrast, derivational suffixes attaching to nouns typically affect stress placement (5).

| (5) | a. | <i>wã-wẽ</i> NMLZ-liquid 'liquid, river' | [ˈwã.wɛ̃] | b. | <i>wã-wẽ-ẽrĩ</i> NMLZ-liquid-AN 'river spirit' | [wã.ˈwɛ̃.rĩ] |
|-----|----|--|------------------------------------|----|--|--------------|
| 1 | | <i>wã-wẽ-ẽrĩ-tã</i> NMLZ-liquid-AN-ACC 'river spirit' (direct ob | [wã.'wɛ̃.rĩ.tã] oject function) | | | |

Verb forms also show stress on the penultimate syllable, but they have a different stress domain, as not all derivational suffixes are included (e.g., the transitivizer -a in (6) does not influence stress placement). This topic also needs further research.

3 Morphological profile and basic word classes

In terms of phonological fusion, grammatical markers in Harakmbut are phonologically bound, and are thus concatenative in nature (see Bickel & Nichols 2007: 181). For example, all case and TAME markers attach to their respective host words and form a single phonological word together with their host, as with the complex words in (6). Harakmbut has no isolating or nonlinear formatives.

(6) *Nãŋ oʔ-tay-a wa-siʔ-po-ta* mother 3SG.IND-sleep-TRNS NMLZ-peel-CLF:round-ACC 'The mother puts the child to bed.'

With respect to exponence, that is, the degree to which categories cumulate into single formatives (Bickel & Nichols 2007: 188), case markers generally are monoexponential (see Sections 4.1 and 6.2), whereas TAME markers are polyexponential (see Sections 5.1 and 5.2). In terms of flexivity, Harakmbut has nonflexive formatives; allomorphy is never lexically determined (item-based), but phonologically conditioned. Harakmbut formatives are thus generally agglutinative in the sense of concatenative-nonflexive.

Harakmbut grammatically distinguishes the open parts-of-speech classes of nouns, verbs, adjectives, and adverbs, as well as the closed classes of pronouns, quantifiers, auxiliaries, interjections, polar-question particles, ideophones (Helberg 1984: 241–242), and clitics. In addition, a small number of words are flexible: *sik*, for instance, can function as a verb root ('become dark') as well as a noun, for example, when marked for locative case in the temporal expression *sik-yo* (black-LOC) 'at night'.

4 The noun phrase

4.1 Morphological template of the head

Within the Harakmbut noun phrase, a number of categories are marked on the head element. Table 5 presents the morphological template of the head of a noun phrase, with a linear order of base-collective-case-focus₁-focus₂ (note the two distinct focus slots). The first slot is filled by the head element of the NP, which can be of four types, namely common and proper

nouns, as with *apetpet* and *Luis* in (7), respectively; pronouns, as with *ndo?* and *opudn* (9); or filler words such as $\tilde{a}n\tilde{i}$ in (8).⁶

(7) *Luis-?a-nda o?-arak-me apetpet-ta* Luis-NOM-FOC 3SG.IND-kill-REC.PST jaguar-ACC 'Luis himself killed the jaguar.'

| 1 | | | | i i | | i i | |

| BASE | COLLECTIVE | CASE | | FOCUS ₁ | | FOCUS | |
| common noun | -(o)mey COL ^H , | -?a~-a | NOM ^{H, T} | -yo | REST ^{H, T} | -nda | FOC ^H |
| proper noun | Т | | INS ^{H, T} | -nãỹõ | COND | | |
| pronoun | | -ere | COM ^{H, T} | | | | |
| filler word | | | INS T | | | | |
| | | -ta(h) | ACC ^{H, T} | | | | |
| | | -en~-edn~- | GEN ^{H, T} | | | | |
| | | wedn~-?edn | | | | | |
| | | -tewapa | BEN^T | | | | |
| | | -(o)niŋ | SIM | | | | |
| | | -apo | REAS | | | | |
| | | -mbayo | PRIV | | | | |
| | | -yo; -ya; - | LOC ^{H, T} | | | | |
| | | ta?; -te; - | | | | | |
| | | yon; -pen | | | | | |
| | | | | | | | |

Table 5: Morphological template of the head of an NP⁷

(8) *o?-wa-me-ne sabado-ta? ãnĩ-ỹõ wẽ-ũk-yo* 1PL.INCL-go-REC.PST-IND Saturday(Sp)-LOC FILLER-LOC river-hot-LOC 'We went to, um, Aguas Calientes on Saturday.' (spontaneous speech: anecdote)

The second slot is devoted to collective marking (see Section 4.6), which is only available to nouns and plural personal pronouns, like *opudn* in (9).

(9) ndo-a opudn-omey-tah on-to-mba-pe-apet
 1SG-NOM 2PL-COLL-ACC 1
 'I am going to invite you (PL) to eat.' (Tripp 1995: 191; my segmentations & glosses)

The third slot hosts case suffixes. Case is monoexponential in Harakmbut, and it is inert: it is marked only once for the NP it has in its scope. In addition, its marking is symmetrical across nominal and pronominal systems; compare (7) with (9). To date, there is no evidence of case spreading or stacking.⁸ The syntax of case will be discussed in Section 6.2.

Harakmbut has a rather extensive set of case markers, two of which show syncretism, or rather polysemy, that is, the first two case suffixes listed in Table 5. The suffix -a marks nominative (7) or instrumental case (28). The marker -ere can be used to signal an instrument (like -a) (10), but additionally expresses accompaniment, or a comitative relationship.

⁶ Note that *ãnĩ* does not have any lexical content; it only marks a pause or hesitation in speech.

⁷ H = Helberg 1984: 436–444; T = Tripp 1995: 194–200.

 $^{^8}$ There are cases that superficially show case stacking of the pattern N_1 -GEN N_2 -GEN-COM N_3 , which means 'the N_3 of (both) N_1 and N_2 '. In such structures, however, the comitative marker functions as a coordinative linker,

(10) *kumeh-ere-yo-nda on-mba?-wek-me* bow-INS-REST-FOC 3PL.IND-V.PL-wound.with.arrow-REC.PST 'They pierced it with an arrow only.'

The accusative suffix *-ta* is used to code primary objects (see Section 6.2), and genitive marking is used to signal the syntactic relation of attributive possession (see Section 4.5). The case ending used to signal the semantic role of beneficiary is rather long, *-tewapa*, and is illustrated in (25). The case ending coding similative adjuncts is *-niŋ*; adjuncts of reason feature the case ending *-apo*, as in (3) and (41). Harakmbut also has a privative case marker, *-mbayo*, which expresses the lack or absence of the referent of the head it is marked on (11).

(11) $pag\eta$ -mbayo $\tilde{\iota}$ - \tilde{e} - \tilde{y} father-PRIV 1SG-be-1.IND 'I have no parents; I am without parents'

For adjuncts indicating locations or directions, Harakmbut has a number of locative case markers (Tripp 1995: 196), for example, -yo (8) and -ya (42), occurring on the same nouns. Two markers are used for temporal location also, for example, $-ta^2$ (8) and -te. In spatial contexts, -te involves contact between figure and ground (12).

| (12) | ken | ãnĩ | on-ma-ndeh-po | muneyo-si?po | bisikleta -te =kon |
|--|-----|--------|-----------------------|--------------|---------------------------|
| | 3 | FILLER | 3PL.IND-V.PL-meet-DEP | girl-DIM | bicycle(Sp)-LOC=ADD |
| 'Then, um, they cross one another; the little girl is also on a bike.' (spontaneou | | | | | |
| speech: Pear story) | | | | | |

Finally, the fourth and fifth slots are occupied by focus markers. The fifth includes just the focus marker *-nda*, as in (7) and (10). It is also found in adjectival constructions (see Section 4.7). Other focus markers can precede it in the fourth slot, for example, the restrictive focus marker *-yo* 'only' (10). Clitics, like the additive focus marker *=kon* in (12) above, have not been included in the template of the head of an NP, as they can attach to other word classes.

4.2 Pronouns and demonstratives

The Harakmbut paradigm of independent personal pronouns formally distinguishes between first, second, and third persons, and for the first two, it also distinguishes between singular and plural number (Table 6).

| | SINGULAR | PLURAL |
|---|----------|--------|
| 1 | ndo? | oro? |
| 2 | on | opudn |
| 3 | ke | en |

The third person pronoun *ken* (Table 6) also functions as a distal demonstrative modifier. As detailed in Table 7, the demonstratives distinguish between distal/remote (47) and proximal values (13), and also between pronoun and adjective/modifier function.

| | | | MODIFIER (DEPENDENT) | | INDEPENDENT PRONOUN |
|----------------------------|----------------------|--------------|----------------------|-----------------|------------------------------|
| PROXIMAL | | | in | | ine |
| DISTAL | | | ken | | kene |
| (13) <i>i</i> | ine | õ?-ẽ-tã | ine | ine | |
| F | PROX 3SG.IND-be-INFR | | PROX | PROX | |
| 'It must be this one, (thi | | | one, this one) | .' (spontaneous | speech: Family problems, San |
| I | Roque | et al. 2012) | | | |

Table 7: Demonstratives in Harakmbut

Table 8 presents the interrogative pronouns and modifiers, which form the basis of a number of indefinite pronouns. Here the main distinction is a semantic one, that is, human versus non-human referents. The pronouns can be inflected for any case, as with *kate-apo* in (3).

| | MODIFIER (DEPENDENT) | INDEPENDENT PRONOUN |
|-----------|----------------------|---------------------|
| HUMAN | <i>mbe?</i> 'which' | mbe? 'who' |
| NON-HUMAN | men/kate | kate 'what' |

Two forms have been found for adnominal question words targeting non-human referents. Judging from (14) and (15), it may be hypothesized that *men* is used to ask for identification of one or more members of a set ('which?'), while *kate* is used to ask for type specification ('what type/sort of?') (but see [18] in Section 4.3).

- (14) *men kõsõ ya-po?-sak-on?* which pot 3SG.DUB-CLF:round-break-PFV.NVOL 'Which pot broke?'
- (15) *kate aypo i?-pak-ika-Ø?* what food 2SG-want-HAB-DUB 'What sort of food do you (SG) like?'

The interrogative forms in Table 8 also serve as indefinite ones, as in (16) and (20). Table 9 details that free-choice indefinites host the clitic =pi? INDETERMINATE, which attaches only after possible case endings (16). Realis indefinites, by contrast, do not (*pace* Tripp 1995: 200).

Table 9: Indefinites in Harakmbut (N = nominal head)

| | | MODIFIER (DEPENDENT) | INDEPENDENT PRONOUN |
|-------------|-----------|--|------------------------------|
| REALIS | HUMAN | <i>men, mbe?</i> 'some' | <i>mbe?</i> 'somebody' |
| | NON-HUMAN | men 'some' | kate 'something' |
| FREE CHOICE | HUMAN | <i>mbe</i> ? N= <i>pi</i> ? 'whichever N' | <i>mbe?=pi?</i> 'who(m)ever' |
| | NON-HUMAN | <i>moning</i> N= <i>pi</i> ? 'whichever N' | kate=pi? 'whatever' |

(16) *mboerek o-mba-yok-me tare? mbe?-ta=pi?* man 3SG.IND-V.PL-give-REC.PST manioc somebody-ACC=INDET 'The man gave manioc to whom(so)ever.' Furthermore, the interrogative pronouns also serve as negative indefinite pronouns (human *mbe?*; non-human *kate*) when they occur with the negative particle or predicate negation. Finally, Harakmbut also has a third person reflexive pronoun (50b), and it lacks relative pronouns. (Relative clauses are discussed in Section 7.1.)

4.3 Common nouns

Harakmbut common nouns can be divided into two classes on the basis of their morphological status, that is, potentially free nouns versus obligatorily bound nouns. This distinction is relevant to noun modification, noun incorporation, and word formation. While potentially free nouns can stand on their own as a word, obligatorily bound ones require a prefix to obtain independent nominal status. The two prefixes used, wa(2)- and e(2)-, are analyzed as semantically empty nominalizers that derive independent nouns from bound ones;⁹ they also serve in deverbal nominalization (see Sections 4.8 and 7). The bound root -*mba2*, for example, gives rise to two distinct independent nouns whose referents show a similarity in shape and form an upper extremity of a living body, cf. (17).

| (17) | a. | wa-mba? | b. | e-mba? |
|------|----|----------------------------|----|----------------------------|
| | | NMLZ-hand | | NMLZ-hand |
| | | 'hand' (Helberg 1984: 437) | | 'leaf' (Helberg 1984: 437) |

Differences between free and bound nouns also show up in the noun phrase. When combined with adnominal modifiers that obligatorily precede the nominal head in continuous noun phrases,¹⁰ free nouns show a single construction type, while bound nouns show two: (i) one in which they attach to a nominalizing prefix and follow the modifier like free nouns (18a), and (ii) one in which they fuse with their modifier (18b). In (18a) the (interrogative) modifier-head structure is like that in (15) with the free noun *aypo* 'food'.

| (18) | a. | kate | wa-ndik | ĩ?-ẽ-Ø? |
|------|----|--------------|------------|------------|
| | | what | NMLZ-name | 2sg-be-dub |
| | | 'What is you | ır name?' | |
| | b. | kate-ndik | ĩ?-ẽ-Ø? | |
| | | what-name | 2sg-be-dub | |
| | | 'What is you | ır name?' | |

Similarly to (18b), bound nouns also attach to genitive-marked (pro)nouns (Section 4.5) and to quantifiers (Section 4.6). Information included in lexical entries in Tripp (1995: 266a, s.v. dia 'day') suggests that they attach to demonstrative modifiers and deictic adjectives like *noŋ* 'other' as well. Another difference between the two noun types is that only bound nouns are incorporable into the verb (Section 5.9).

Semantically, the set of free nouns is fairly heterogeneous, whereas the set of obligatorily bound nouns shows more homogeneity. The latter refer to inalienably possessed entities, such

⁹ The finding that the two nominalizers lead to two different lexical items when attached to the same noun root (17) might challenge the claim that they are semantically empty. However, noun roots that combine with both nominalizers are few; I am aware of one other pair: e^2 - pu^2 'bamboo' vs. wa- pu^2 'tube'. Like in (17), the two lexical items are similar in shape. Note that the cases of - mba^2 and - pu^2 defy the generalization that wa(2)- is linked exclusively with the expression of inherent possession by an animate entity.

¹⁰ Harakmbut also features discontinuous noun phrases, characterized by the presence of quantifiers or descriptive modifiers (see Section 4.7).

as body parts, plant parts, and landscape parts (cf. the class of *e*-nouns in Cavineña as described by Guillaume 2008: 409–416), as well as kinship terms and basic shapes or qualities of entities. This set (excluding kin terms) has been identified as "shape morphemes" by Hart (1963), and analyzed as classifiers by Payne (1987). However, I will argue that only a subset of the bound nouns also function as classifiers, that is, the nouns that show classificatory noun incorporation (see Section 5.9). Not a single bound noun functions as a classifier in possessive, numeral, attributive, locative, or demonstrative nominal constructions. Example (19) with head noun *kuwa* 'dog', a free noun root, illustrates that Harakmbut does not use classifiers in possessive, demonstrative, and adjectival modifier environments, nor does it feature a noun classifier, in the sense of classifier from Aikhenvald (2000: 204–207).

(19) mbe?-edn ỹã-tã-ẽ in kuwa uru-nda?
 who-GEN 3SG.DUB-APPL-be PROX dog beautiful-NDA
 'Whose is this beautiful dog?'

4.4 Modification by demonstratives and indefinites

Harakmbut lacks articles which would express definiteness or specificity but does have demonstrative and indefinite modifiers (cf. Section 4.2). These invariably precede their nominal head and do not show any type of agreement with it. Demonstrative modifiers typically realize definite reference, for example, the proximal modifier in (19). In (20), indefinite modifier *mbe?* (see Table 9) realizes indefinite, non-specific reference.

| (20) | mbe? | wettone | o?-tiak-me | ta?mba-yo |
|------|-------|---------|----------------------|-------------|
| | some | woman | 3SG.IND-come-REC.PST | swidden-LOC |
| | 'Some | | | |

4.5 Attributive possession

In Harakmbut, the syntactic relation of attributive possession is reflected by dependent marking: (pro)nouns denoting the possessor are marked for genitive case; the possessum is unmarked (21). The order is that of possessor-possessum (Tripp 1995: 195).

(21) *nd<u>o</u>?-edn n<u>a</u>ŋ* 1SG-GEN mother 'my mother'

Free and bound nouns show distinct morphosyntactic behaviour. Free possessed nouns, like $n\tilde{a}\eta$ in (21), use the pattern in which the possessor and possessum form two distinct phonological words; stressed syllable nuclei are underlined. Bound possessed nouns have two patterns at their disposal: (i) the default pattern shared with free nouns (22), and (ii) a pattern exclusively available to bound nouns (23a). Like in (18b), this pattern is characterized by the absence of a nominalizing prefix and by the (possessive) modifier and head noun forming a single phonological word; compare (23a) with (23b) and (23c).

(22) *nd<u>o</u>?-edn wa-nd<u>a</u>-po <u>õ</u>-mẽ?-a? 1SG-GEN NMLZ-CLF:fruit-CLF:round 3SG.IND-liver-say 'My belly is making noise.' (lit. 'liver-says')*

| (23) | a. | <i>arakmbut-<u>e</u>dn-ndik</i> people-GEN-name | b. | <i>ar<u>a</u>kmbut</i> people;person | c. | w <u>a</u> -ndik NMLZ-name |
|------|----|--|----|---|----|-------------------------------|
| | | <pre>'native word' ('name of the people')</pre> | | 'people' | | 'name' |

4.6 Nominal number and quantification

Harakmbut does not require number marking on nouns in any context (cf. Tripp 1995: 194). Strategies to express overtly that more than one referent is involved include collective marking, modification by numerals, and indefinite quantifiers, as well as verbal plural marking (see Section 5.6). This section focuses on the first two strategies, confined to the noun phrase.

Harakmbut is noted to have two collective suffixes, -(*o*)*mey* and -*kupo*, which attach to nouns and plural personal pronouns (Tripp 1995: 194, 198). No uses of -*kupo* as a collective suffix have been found so far (as a bound noun it means 'buttocks'), and only few uses of -(*o*)*mey*, on nouns with human referents engaged in a joint activity (cf. Corbett 2000: 199), cf. (24).

| (24) | wettone?- mey | <i>mba-tiaway-we</i> | <i>õn-mã-ẽ-mẽ-tẽ</i> | | | | |
|------|--|----------------------|---------------------------------|--|--|--|--|
| | woman-COLL | V.PL-see-NEG | 3pl.ind-v.pl-be-rec.pst-nfirsth | | | | |
| | <i>wa-mationka-eri-ta</i> NMLZ-hunt-AN-ACC 'The (group of) women didn't find the hunters.' | | | | | | |

The second strategy involves modification by numerals and indefinite quantifiers. Harakmbut has a restricted numeral system. Most speakers can only count up to five (Table 10). However, I also recorded numeral expressions up to twenty from a very skilled speaker, who used elaborate periphrastic constructions referring to fingers, hands, toes, and feet. These expressions are generally accepted to form the original system.

Table 10: Cardinal numbers in Harakmbut

| 1 | noŋ-ti-nda | other-SPAT:up-NDA |
|---|-----------------|-------------------|
| 2 | mbotta? | two |
| 3 | mbapa? | three |
| 4 | mbotta?-mbotta? | two-two |
| 5 | wa-mba?-neŋ | NMLZ-hand-amount |

Harakmbut also has a set of indefinite quantifiers, namely absolute quantifiers *suwing* '(a) few/little' and *wakka* 'many/much', and universal quantifier *aya* 'all' (cf. Helberg 1984: 257); there are no counterparts of *no*, *most*, and *each/every*.

Quantifying modifiers obligatorily precede the nominal head in continuous noun phrases. Example (25) illustrates the construction type shared by free and bound nouns for indefinite quantifiers, in which *wakka* is suffixed with *-nda*; (26) shows the shared construction type for cardinal quantifiers, in which the numeral lacks *-nda*.

| (25) | õn-mã-wẽỹã-mẽ | wakka-nda | ауро | aya-tewapa-nda |
|------|----------------------------|---------------|------|----------------|
| | 3PL.IND-V.PL-cook-REC.PST | much-NDA | food | all-ben-nda |
| | 'They cooked enough food f | or everyone.' | | |

(26) *Ih-yok-i* **mbotta**? **kuwa** *Luis-ta* 1SG-give-1.IND two dog Luis-ACC 'I give two dogs to Luis.'

Bound nouns stand out in allowing for an additional construction type involving phonological fusion (27). Example (27a) instantiates the same type as (25), while (27b) shows fusion of the quantifying modifier and the noun root into one phonological word, having a single stress. Numeral modifiers fuse with bound nouns analogously (but do not show *-nda*).

| (27) | a. | <i>ĩh-tõ-ẽ-ỹ</i> 1SG-CAUS. SOC-be-1.IND 'I have all my teeth.' | <u>a</u> ya-nda w <u>a</u> -?idn all-NDA NMLZ-tooth | | |
|------|----|--|--|--|--|
| | b. | ĩ <i>h-tõ-ẽ-ỹ</i> 1sg-caus.soc-be-1.ind | <i>wakk<u>a</u>-?idn-a-n</i> many-tooth-EP.V | | |

In addition to continuous noun phrases, indefinite quantifiers are also attested in discontinuous noun phrases, which have not been found with numeral modifiers. In such cases, the indefinite quantifier does not carry the suffix *-nda*. Numerals and indefinite quantifiers can also be used independently, in which case both types take the suffix *-nda*, as in (25) with the indefinite quantifier 'all'.

4.7 Descriptive modification

'I have many teeth.'

In Harakmbut, "semantic adjectives" (Dryer 2007: 168) form a distinct word class (see also Helberg 1984: 241; Tripp 1995: 197–198), showing specific morpho-syntactic characteristics that are not yet well understood. Adjectives modifying nouns do not show any agreement with their head (see also Tripp 1995: 197). They appear in both continuous and discontinuous noun phrases. In the first type, they occur in prenominal and postnominal position. The noun phrase type and position of adjectives seem to be determined by the referential properties of the noun phrase they are part of. Free and bound head nouns do not behave differently, which is in line with the generalization in Section 4.3.

Continuous noun phrases in which the adjective immediately follows the head realize different types of reference, and their more specific formal features seem to differ accordingly. Generic noun phrases, like the one in boldface in (28), feature adjectives that are prefixed by wa(2)- and carry no suffix. Specific NPs, either definite or indefinite (29), by contrast, require the *-nda* suffix on the adjective, which typically does not carry the prefix wa(2)-. This pattern is attested for both free head nouns (19) and wa(2)-prefixed bound nouns (29). In discontinuous NPs, the adjective also follows its head noun, but comes only after the finite verb. Such NPs realize indefinite reference, and the adjectives do not carry wa(2)-, but do take the suffix *-nda*, just like in the continuous noun phrase in (29).

- (28) mba-e-a-ndik $\tilde{o}^2-\tilde{e}$ mbi?igy wa-mboro? kumo-a V.PL-get-TRNS-POT 3SG.IND-be fish NMLZ-big barbasco-INS 'One can catch big fish with barbasco.' or 'Big fish can be caught with barbasco.'
- (29) *ĩh-tõ-ẽ-ỹ w<u>a</u>-?<i>i mb<u>o</u>ro?-nda* 1sG-CAUS.SOC-be-1.IND NMLZ-foot big-NDA 'I have big feet.'

Continuous noun phrases with prenominal adjectives are also restricted in terms of the type of reference they realize, and again their formal features differ accordingly. In non-referential noun phrases, for example, those serving as predicative nominals (30), adjectives carry the prefix wa(2)- and often also the suffix -*nda*. Specific definite (referential) noun phrases show a different pattern (31), without prefix wa(2)- and with -*nda* not suffixed to the adjective, but to the head noun. The noun phrase in (31) also shows phonological fusion (the stressed syllable nucleus is underlined), but in similar polysyllabic structures stress patterns are less clearly indicative of a single phonological word; more investigation is needed.

- (30) *ken õn?-ẽ wa-ndak-nda wa-mationka-eri* 3 3PL.IND-be NMLZ-good-NDA NMLZ-hunt-AN 'They are good hunters.'
- (31) *a*?-yok-i sal **uru-wettone-ta-nda** 1SG.IMP-give-1.IMP salt(Sp) beautiful-woman-ACC-NDA 'I (should) give salt to the beautiful woman.'

So far, the analysis of adjective constructions has been imprecise about the functions of prefix wa(2)- and suffix -*nda*. While the function of wa(2)- is clear in endocentric and deverbal exocentric nominalizations (see Sections 4.3 and 4.8), its function in adjective constructions is less well understood. It is also glossed as nominalizing prefix for lack of a better alternative.

The analysis of the suffix *-nda* remains equally unclear. When attached to a case/focus₁-marked noun or pronoun, it functions as a focus marker (7). In adjective constructions, by contrast, it does not signal information focus or increased degree (*pace* Tripp 1995: 197). In view of its occurrence on several types of adnominal modifiers and also adverbs, as well as on nominalized verb forms coding the adverbial relation of simultaneity (66), its function might be that of producing a general modifier.

4.8 Word formation

A number of bound noun roots, sometimes analyzed as classifiers, have been noted to attach to other nouns or noun roots (cf. Hart 1963: 1–2; Helberg 1984: 247–249; Payne 1987: 36–37; Tripp 1995: 193), yielding morphologically complex nouns that can function as nominal heads. This section will discuss noun-based as well as verb-based word formation processes.

Compounding is illustrated in (32), which consists of two morphologically free nouns.

(32) *ndumba-kuwa* forest-dog
'bush dog' [*Speothos venaticus*, AVL] (Helberg 1984: 252; Tripp 1995: 194)

In the examples in (33), the final elements are all bound nouns directly attached to the preceding element.¹¹ Examples (33a) and (33b) are analyzed as modifier-head structures resulting from compounding (e.g., a manioc leaf is a type of leaf). In (33c), by contrast, the first element denotes a type of material, and the second element a type of shape, which

¹¹ Note that in (33b) the first bound root -*mba*? does attach to the prefix wa[?]- to attain independent nominal status.

together denote a type of material having a particular shape. (33c) is therefore analyzed as a classifier-derived noun (cf. Payne 1987; see Rose & Van linden 2022).

| (33) | a. | tare?-mba? | b. | wa-mba?-ku | c. | pera?-po |
|------|----|---------------|----|----------------|----|---------------------------------------|
| | | manioc-hand | | NMLZ-hand-head | | rubber-CLF:round |
| | | 'manioc leaf' | | 'fingernail' | | '[e.g., plastic] ball' (Hart 1963: 5) |

Bound morphemes denoting shape are also used in the formation of complex body part nouns. These terms often contain what has been called 'linkers' by Hart (1963: 6), that is, bound morphemes that link shape-denoting morphemes to bound noun roots, specifying their spatial configuration, for example, $-ta^2$ - 'base, against, towards' in (34a), and -ti- 'up, on top of' in (34b), and which may also occur in pre-root slots in verb forms (see Sections 5.7 and 5.8).

| (34) | a. | wa-mba-ta?-meh-po | b. | wa-kpo-ku-ti-mba? |
|------|----|------------------------------------|----|--------------------------------|
| | | NMLZ-hand-SPAT:base-hump-CLF:round | | NMLZ-eye-head-SPAT:up-CLF:hand |
| | | 'wrist' | | 'eyelid' |

In addition, Harakmbut has a number of clearly derivational suffixes that attach equally to both free nouns and bound nouns prefixed by a nominalizer. Nominal bases suffixed by *-eri* come to refer to animate entities living in or coming from the place denoted by the nominal base, which can be a common noun (6b) or a proper noun (35). The derived nouns are often true demonyms or gentilics (35). The same suffix is used in deverbal nouns with animate referents.

(35) Porto-lus-eri
 Puerto-Luz-AN
 'people living in/coming from Puerto Luz'

Finally, common and proper nouns can also be suffixed by derivational morphemes that characterize the referent of the nominal base in terms of age and/or size, that is, *-tone?* (adult, old, big) (36) and *-si?po* (young, age of a child, small) (cf. Tripp 1995: 193), analyzed as a diminutive suffix in (12).

(36) *i-wa-y* widn-tone? õ-mã-ẽ-nĩŋ kẽỹõn 1SG-go-1.IND stone-big 3SG.IND-V.PL-be-REL thither 'I am going to where there are big stones'

Turning to verb-based derivation, Harakmbut is found to use the same affixes as in nounbased derivation. The two nominalizing prefixes also derive inanimate nouns from lexical verbs (see Van linden 2019). Prefixation of wa(2)- is used for instrument (37a) and object nominalizations (37b) (cf. Comrie & Thompson 2007: 338–342), but prefixation of e(2)- only for the latter type (37c).

| (37) | a. | wa-wedn | b. | arakmbut-edn | wa?-a?-te |
|------|----|---------------------------|----|-----------------------|---------------------|
| | | NMLZ-lie | | people-GEN | NMLZ-say-LOC |
| | | 'bed' (= something | | 'in the language of t | he people', 'in the |
| | | for the purpose of lying) | | Harakmbut languag | e' |

| c. | ndak-we | $\tilde{\iota}^{2-}(\tilde{e})$ - $\tilde{u}n$ - $m\tilde{e}$ - \tilde{y} | e?-wi-a |
|----|-------------|---|---------------|
| | good-NEG | 1sg-be-pfv.nvol-rec.pst-1.ind | NMLZ-rain-INS |
| | 'I became i | Il because of the rain.' | |

Deverbal nouns referring to animate entities are produced by prefixation of wa(?)- and suffixation of -*eri* in a process of agentive nominalization, for example, *wa-mationka-eri* 'hunter' in (30).

5 The verb phrase

The verb phrase constitutes the most complex phrase in Harakmbut. The morphological template of the finite verb form is presented in Tables 11 (prefixes) and 12 (suffixes). In Table 11, five prefix slots are fixed, while the verbal plural marker (V.PL) and a set of adverbial prefixes are positionally flexible, entering into scopal relations with fixed-position prefixes. The tables also indicate in which sections (§) the respective affixes will be discussed.

| | §5.4 | §5.7 | §5.4-5.5 | §5.3 | §5.4 | §5.3 | §5.1-5.3 |

5.1 Mood

Harakmbut distinguishes between three mood types—indicative, dubitative, and imperative mood—each of which has a distinct set of verbal argument markers (cf. Helberg 1984, 1990; Tripp 1995: 206–215). These sets of markers will be presented in Section 5.2.

The mood types are not completely identical to sentential mood types. The indicative mood is used in declarative sentences, including those with future-tense marked verbs, and the dubitative mood is found in interrogative sentences (cf. Tripp 1995: 206–215). Mood marking in declarative modalized clauses depends on the degree of likelihood associated with the propositional content. The suffix marking inferential evidentiality (*-ta*) requires indicative mood (13), while the epistemic marker *-et* denoting possibility requires dubitative mood, as in (38), in which it is fused with the recent past marker *-me*. (See [9] for the future tense marker *-apo* fused with *-et*.)

| (38) | i-wek-met=pi? | wa-ku-ti-po-te |
|------|--|------------------------------|
| | 1SG.DUB-wound.with.arrow- | NMLZ-head-SPAT:up-CLF:round- |
| | REC.PST.EPIST=INDET | LOC |
| | 'Maybe I pierced it in the upper leg.' | |

The imperative mood is used in independent directive clauses expressing orders and requests, as well as in a set of dependent clauses, for example in purposive clauses (Section 7.3). Prohibitive forms show different marking (Section 6.3).

Mood marking not only interacts with argument marking in the form of mood+agreement coexponence. There is also some interplay with evidential marking in the sense that the mood+agreement suffix is in complementary distribution with indirect evidential suffixes in Sf7, like *-te* in (39). In (39), *-te* precludes the use of the indicative mood suffix *-ne*, which distinguishes between indicative and interrogative mood for second person singular (Table 13).

(39)on-ai-ma-niŋ-to-wa-me-te(*-ne)wa-kndaken-tewapa2SG-NOM2SG-V.PL-BEN-CAUS.SOC-go-REC.PST-NFIRSTHNMLZ-egg3-BEN'You (SG) took along eggs for them.'

5.2 Argument marking

Marking of grammatical relations is realized in Harakmbut by both head and dependent marking. Finite verb forms obligatorily carry cross-reference markers, while the overt expression of external nominal arguments is optional (see Section 6.2). Inanimate plural subjects trigger singular agreement, as in (36) and (51), and so do nouns referring to animals (28); plural agreement is restricted to human participants (46). This section focuses on the paradigms of cross-reference markers, which at the same time also code the verbal category of mood (Section 5.1), and aims to show that the system is far from referentially transparent.

The verbal argument markers, which form a two-slot system (Pf-4 and Sf7), are presented in Tables 13 and 14; allomorphs are phonologically conditioned. The system involves hierarchical indexation resulting in a scenario-based split (without direction marking), based on the position of the O-participant on the person hierarchy 1/2 > 3. Third person Oparticipants are never indexed: for example, the verb forms in transitive (40a) and intransitive (42) show the same person prefix o(?)-. In contrast, speech act participant (SAP) Oparticipants trigger distinct relational prefixes, that is, portmanteau prefixes indexing both A and O (40b).

| (40) | a. | wa-mationka-eri | o?-wek-me | keme-ta |
|------|----|--------------------|----------------------------------|-------------|
| | | NMLZ-hunt-AN | 3SG.IND-wound.with.arrow-REC.PST | tapir-ACC |
| | | 'The hunter pierce | d the tapir.' | |
| | b. | wa-mationka-eri | mbe?-wek-ay-me-ne | |
| | | NMLZ-hunt-AN | 3SG>1/2SG-wound.with.arrow-AVRT- | REC.PST-IND |
| | | 'The hunter almos | t pierced me.' | |

SAP O-participants are indexed in a primary object system: while it is the O-participant that is cross-referenced in monotransitive contexts (40b), it is the goal/recipient participant that is cross-referenced in ditransitive contexts, as in (60) and (63) (cf. Tripp 1995: 206). More generally, the scenario-based split amounts to accusative alignment in non-local and direct scenarios (A>3-markers = S-markers); for a non-local scenario, compare again (40a) and (42).

Table 13 indicates that there are few distinctions between indicative and dubitative mood marking; non-local scenarios show distinctive prefixes, but all other scenarios merely show presence versus absence of a suffix in Sf7. Across the three mood types, in both local and inverse scenarios a number of strategies are at work that reduce referential transparency (cf. Heath 1998), like the neutralization of person marking (e.g., of first and second person in 3SG>1/2SG scenarios) and number marking (e.g., of first person in local scenarios in Table 13), and, most noticeably, the use of unanalyzable portmanteaus that index both A and O. Many of these are ambiguous, for example, merely two forms are used to code eight different local combinations (41). Two portmanteau forms also occur as simple markers, that is, o(?)-indexing first person plural inclusive (41), and mbo(?)/mo(?)- indexing second person plural A/S in the imperative mood.

(41) kate-apo o?-pak-Ø?
what-REAS 1<<>2SG-want-DUB or 1PL-want-DUB
'Why do I love you (SG)?'
'Why do we love you (SG)?'
'Why do you (SG) love me?'
'Why do you (SG) love us?'
'Why do we love (it/him/her/them)?'

5.3 Tense, evidentiality and modality

Harakmbut distinguishes between present (zero-marked), future (-*apo*), recent past (-*me*) and distant past tense (-*uy*) on finite verb forms in Sf6 (cf. Tripp 1976a, 1995: 221–222; *pace* Helberg 1984: 277). Past forms are also obligatorily marked for evidentiality, that is, direct, which is zero-marked (8), versus indirect, or non-firsthand, evidential, marked by -(*a*)*te* suffixed to past tense markers -*me* (39) and -*uy* (42), or by portmanteau -*tuy* (44) (Tripp 1976a, 1995: 222; Helberg 1984: 277–279). Indirect evidential markers compete with the mood+agreement suffixes for Sf7 (39).

(42) *hak-?udn-ya o-ti-kot-uy-ate wẽy-pa?-a* house-upper.back-LOC 3SG.IND-SPAT:up-fall-REM.PST-NFIRSTH tree-CLF:rod-NOM 'A branch fell on the roof long ago.' (speaker did not see it happen)

In addition to direct versus indirect evidentiality, signalling whether the speaker witnessed the described event or not (see Van linden 2020), Harakmbut also marks inferential evidentiality, with *-ta* (13), and epistemic modality, with *-et*, as in (9) and (38), in Sf7 (Section 5.1). Predictions carry indicative mood and future tense markers; future-oriented possibility is expressed by dubitative-marked verb forms suffixed by *-ipot*.

Expressions of root modality (except participant-inherent subtypes, see Section 7.2) feature periphrastic constructions with a non-finite form suffixed by potential *-ndik* immediately followed by auxiliary \tilde{e}/\tilde{e} 'be'. These can be used to express the speaker's assessment of a state of affairs as (un)desirable or (un)acceptable (deontic modality), or to indicate (im)possibilities or necessities inherent in situations (dynamic modality), as in (28) and (49b). The non-finite verb forms can carry verbal plural, valency-changing, and negation morphology, but no nominalizing prefix. TAME and argument marking occur on the auxiliary. The language also has an apprehensive suffix, *-apey* (Helberg Chávez 1990: 240; Tripp 1995: 222), found with all person subjects, but more research is needed on the set of person markers it combines with. Lastly, although not strictly modal, the suffix *-ay* (Sf4) also deserves mention—(40b) above—which signals that an action was narrowly averted (cf. Tripp 1995: 220).

5.4 Aspect

Harakmbut verbs are found with an extended set of markers that code pluractionality, aspect, and specific temporal adverbial meanings. All of these have been noted in earlier work, but sometimes analyzed differently (Helberg 1984: 284–286; Tripp 1995: 220–221).

Pluractionality marking includes the habitual suffix -ika (Sf5), as in (15) and (47), and iterative -e (Sf1), as in (43) and (48).

(43) si?noŋ pa ya-wa?-e-nde?
baby Q 3SG.DUB-go-ITER-ALREADY
'Does the baby walk already?'

Grammatical aspect seems to be limited to perfective aspect (Sf3). The perfective suffixes are special in that they also code (non-)volitionality, that is, whether the A/S-participant is intentionally involved in the action referred to or not. They naturally occur on telic events (44). Volitional events are marked with *-an~-adn*, for example, the breaking event in (44). In (14), the same verb combines with *-on~-odn~-un~-udn* in a non-volitional event, with a patientive S-argument. Perfective aspect is also marked on stative predicates, which get a change-of-state interpretation (37c).

| (44) | Fermin | o-n-a-tuy | Luis-ta | ya-sak-an |
|------|----------------------------|----------------------|----------|-----------------------|
| | Fermin | 3sg.IND-SPAT:on-say- | Luis-ACC | 2sg.IMP-break-PFV.VOL |
| | | REM.PST.NFIRSTH | | |
| | <i>mba?egg</i> drinking | | | |

'Fermin made Luis break the glass.' (lit. 'Fermin said to Luis: "Break the glass!"")

Finally, there are a number of markers that express temporal adverbial meanings. Two markers specify the duration of both telic and atelic predicates in Sf3, indicating that the action lasted for a short while, *-atu* (45), or for a long while, *-onwa*.

(45) *a-mã-tã?ke(a)-atu-y-a-po o?-wa* 1SG.IMP-V.PL-fish.with.hook-SHORT.TIME-1.IMP-QUOT-DEP 3SG.IND-go 'He goes/went to fish for a short while.'

The suffix *-nde* (Sf5) is best translated as the English adverbial *already* (43). A final set of suffixes indicate that the event was performed at a particular time of the day, namely *-awadn* 'all day', *-mbedn* 'all night' (46), and *-yak* 'at dawn' in Sf3.

| (46) | <i>lus</i> light(Sp) | <i>ẽ?-ẽ-tanda</i> NMLZ-be-CONC | <i>i</i> and(Sp) | <i>e-mba-uk-pak-tanda</i> NMLZ-V.PL-hot-VBZ-CONC | |

| <i>wa-si2-po on-mb</i> NMLZ-peel-CLF:round 3PL.IN 'In spite of the light and the he | | | p-ALL.NIGHT | <i>ndak-a</i> good-ADV slept well all night.' | |

5.5 Associated motion

Harakmbut non-motion verbs can carry suffixes in Sf3 that indicate that the action denoted by the verb is associated with spatial displacement (cf. Guillaume 2006, 2008). The system of associated motion (AM in Table 12) is small, with two members, *-ato* 'move and do' in (47) and *-ankadnyak* 'move while doing several times' (see Guillaume 2016: 142 ex. A30).

(47) *ken-ta? siŋ=pi? on-mba-kkay-ato-nde-po* DIST-LOC little=INDET 3PL.IND-V.PL-buy-AM:MOVE&DO-ALREADY-DEP

on-may-ika 3PL.IND-drink-HAB 'When they have come and bought a few things, then they usually drink.' (spontaneous speech: Family problems, San Roque et al. 2012)

5.6 Verbal plural

With nouns being unmarked for number, plurality of participants is marked by the verbal plural prefix *mba-~ma-~mã-* (V.PL). It operates on an ergative basis, indicating plural number of the S-argument in intransitive clauses (46), and of the (applied) O-argument in transitive clauses (48). In addition, it also signals plurality of the action denoted by the event. Together with two applicative prefixes, it forms a configurational string, in which the relative ordering of the formatives determines their relative scope. In (39), V.PL precedes the benefactive

applicative prefix *niŋ*- (Pf2), indicating that the A-participant took along eggs for more than one third person (scope over applied O). In (48), by contrast, V.PL follows that same applicative marker, indicating that A has to make more than one arrow (scope over direct O of imperative form; applied O is first person singular). The same scopal relations are observed to hold between V.PL and general applicative *ta*- (Section 5.7).

| (48) | Herman | o-n-a | Bernardo-ta | | |

| | 'Herman has Bernardo make arrows for him.' (lit. 'Herman says | | | | |

'Herman has Bernardo make arrows for him.' (lit. 'Herman says to Bernardo: "Make arrows for me!"")

5.7 Valency-changing mechanisms

Valency-changing mechanisms in Harakmbut (see Helberg 1984: 295–298, 388–389; Tripp 1995: 203–205, 218–220 for sometimes diverging analyses) include causativization, three types of which can be distinguished. Direct causation is coded by suffix *-a* (Tripp 1995: 204) in Sf2 (6), whose core function is that of transitivizer (61). Harakmbut also signals sociative causation (Shibatani & Pardeshi 2002: 147–153) through prefix *to-* in Pf5. The joint-action subtype was illustrated in (39) above; the assistive subtype is also attested. The causee of both *-a* and *to-* forms gets accusative marking only when it is human, as can be seen when comparing (6) with (56). Thirdly, indirect causation is expressed through a number of periphrastic constructions, with verbs like 'make' or 'say'; the latter are used for coercive (44) as well as benefactive causation (48).

A second valency-increasing mechanism involves applicatives (see Van linden 2022). Two applicative prefixes make up a configurational string with the verbal plural prefix (V.PL). See Section 5.6 for benefactive *niy*- (Pf2), whose applied objects are found with both accusative and beneficiary marking (39). The other prefix is the general applicative *ta*- (Pf3), which can be used to promote a possessor to object status, which is indexed on the verb in (2). In (57), *ta*- precedes V.PL, which scopes over the object (more than one pear) rather than the possessor indexed by *ta*- (the pear picker). Sometimes the possessor is additionally expressed by a genitive-marked (pro)noun (19). Other functions of *ta*- include promoting comitative or malefactive adjuncts to object status. Other prefixes that seem to function as applicatives but are not well understood yet include *wa*- (Tripp 1995: 204), *man*-, and spatial prefixes (see Section 5.8).

Valency-reducing mechanisms in Harakmbut comprise reflexive, reciprocal, and passive constructions. Reflexive constructions do not require any specific marking for first and second person subjects, except the verbal plural prefix for plural subjects (49a), which are formally identical to reciprocal constructions (49b). The modal construction in (49b) does not affect argument or valency-reduction marking. Third person subjects, however, require an extra marker to distinguish between reflexive and reciprocal constructions (50a), namely the reflexive pronoun wa^2 in (50b) (cf. Tripp 1995: 202).

| (49) | a. | oro? | o-mba-tiaway-me-ne | wẽ?ẽỹ-ỹõ |
|------|----|----------------------|------------------------------------|--------------|
| | | 1pl | 1PL.INCL-V.PL-see-REC.PST-IND | water-LOC |
| | | 'We saw ourselves in | the water.'; 'We saw each other in | n the water' |

| b. | mba-tiaway-ndik | õ?-ẽ-ne | men-ok=pi? |
|---|-----------------|-----------------|------------------|
| | V.PL-see-POT | 1PL.INCL-be-IND | any-period=INDET |
| 'We can see each other whenever/at any time.' | | | |

| (50) | a. | ken | on-mba-arak-me | b. | ken | on-mba-arak-me | wa?-ta |
|------|----|-------|---------------------------|----|-------|---------------------------|------------|
| | | 3 | 3PL.IND-V.PL-kill-REC.PST | | 3 | 3PL.IND-V.PL-kill-REC.PST | 3.REFL-ACC |
| | | 'They | y killed each other.' | | 'They | v killed themselves.' | |

Passive constructions, finally, consist of a finite form of $\tilde{e}?\tilde{e}$ 'be' and a nominalized verb form using prefix e(?)- (51). They are only available to third person subjects; SAP patients require transitive (inverse) constructions.

(51) *wenpu* õ?-ẽ-me *e-mba-sayuŋ-ka* string.bag 3SG.IND-be-REC.PST NMLZ-V.PL-wet-make 'The string bags were made wet.'

5.8 Spatial prefixes

Spatial prefixes specify locative or directional circumstances of (participants in) the event denoted by the verb. Examples include *ti*- in (42), which indicates location high up; *on*-*n*- in (44), which signals the relation of 'in', 'inside' or 'to' (Tripp 1976a: 8); and *ok*-*k*- in (52), which expresses separation (Tripp 1995: 219). They also serve to increase the valency of a verb (see Van linden 2022), as in (52): *ok*- promotes the person from whom the boys stole the manioc to a core argument registered on the verb.

(52) *wambo-ta i-mba-uk-i tare?* boy-ACC 1SG-V.PL-search-1.IND manioc

> *men-ok-mbere-me-niŋ-ta* 3PL>1SG-SPAT:separation-steal-REC.PST-REL-ACC 'I am looking for the boys that stole manioc from me.'

5.9 Noun incorporation

Harakmbut shows all four types of noun incorporation identified in Mithun (1984). Incorporated noun stems occupy Pf4. They are typically morphologically bound nouns; one exception is the free noun (h)ak 'house', as in (53) and (67), which is restricted to type I noun incorporation. I will argue that only elements that occur in type IV noun incorporation are true classifiers.

Type I noun incorporation or lexical compounding serves to create new lexemes for "name-worthy" activities (Mithun 1984: 848), and derives intransitive predicates from transitive ones. An example is given in (53): the transitive verb stem *-yoy* is combined with the free noun (h)ak 'house' to yield an intransitive verb that denotes a name-worthy activity of hunters, that is, the destruction of their waiting huts. The incorporated noun bears the semantic relationship of patient to its host verb. An example with a body part incorporated noun is given in (22).

(53) *wa-mationka-eri o-ak-yoŋ-me* NMLZ-hunt-AN 3SG.IND-house-destroy-REC.PST 'The hunter hut-destroyed.' Type II noun incorporation affects the valency structure of the whole clause in that it "advances an oblique argument into the case position vacated by the IN" (Mithun 1984: 856). It often features incorporated body parts (54) whose possessors are promoted to (applied) object status (cf. Mithun 1984: 857–858). Unlike in (53), the incorporated noun in (54) is identifiable; it is the head of the applied object (n.b., spatial *ti*-), here the speaker.

| (54) | mbe- ku -ti-kot-uy-ne | apoare?-a | ta?mba-ya |
|------|---|------------|-------------|
| | 3SG>1/2SG-head-SPAT:up-fall-REM.PST-IND | рарауа-NOM | swidden-LOC |
| | 'A papaya fell on my head in the swidden lo | | |

Type III noun incorporation serves to background known or incidental participants in discourse (Mithun 1984: 859). It is illustrated in (55). In the first clause, the pears are referred to with a full noun phrase; in the second one, anaphoric reference to the pears is realized by incorporated bound noun root *-nda* 'fruit'. Both noun and verb in (55) have fairly general lexical reference (Mithun 1984: 864).

| (55) | pera | o-n-ka | ãnĩ, | o-mbewik-po | eskalera-te, | ãnĩ |
|------|------------|----------------------|----------|----------------------------|----------------------|--------|

| | | SPAT:on-do | | | | |
| | 'He is pic | king pears, um, goin | ng up on | a ladder, eh.' (spontaneou | s speech: Pear story | y) |

| o-ma- nda -e-a, | o-ma- nda -e-a | ãnĩ, |
|-----------------------------|-----------------------------|--------|
| 3sg.ind-v.pl-fruit-get-trns | 3sg.IND-V.PL-fruit-get-TRNS | FILLER |

kanasta-yo [...] basket(Sp)-LOC 'He is taking/collecting them (the fruits), um, in a basket.' (spontaneous speech: Pear story)

Finally, Harakmbut also displays type IV noun incorporation, or classificatory noun incorporation. Example (14) above contains the verb *-sak* 'break' and a bound noun root specifying the shape of the S-argument. Similarly, in (57) the general noun stem *-nda* 'fruit' characterizes the O-argument in terms of shape, which is expressed by the external noun phrase *pera* (cf. Mithun 1984: 863). In these examples, the bound nouns function as verb classifiers, categorizing an external NP referent in terms of shape or substance. There are about 13 items that show type IV noun incorporation, out of a set of about 100 bound noun roots (Rose & Van linden 2022).

6 Simple clauses

6.1 Basic constituent order

Harakmbut clauses do not have a rigid constituent order. While Tripp (1995: 191) identifies the basic order as (not strictly) SOV, a consultant of mine indicated that the unmarked, neutral order in thetic sentences is OVS, as in (56). More research is needed here.

| (56) | wẽ?ẽỹ | o-to-tiak | wa-si?-po |
|------|---------|-------------------------------|---------------------------|
| | water | 3sg.ind-caus.soc-come | NMLZ-peel-CLF:round |
| | 'The ch | ild brings water.' (Yesica Pa | tiachi Tayori 15/05/2015) |

6.2 Alignment system

In the Harakmbut system of argument marking on dependents, the three argument roles (S, A, and O) show differential or optional marking. O-participants show animacy-based differential marking. Human and higher-order animate O-participants are accusative-marked with -ta(h), whereas inanimate and lower-order animate O-participants are left unmarked (see [52] for both types). Accusative case is marked on patient-like arguments in transitive clauses, as in (7) and (9), as well as recipient-like arguments in ditransitive clauses, as in (16), (26), and (31). This parallels the primary object system in head marking (Section 5.2). However, (applied) R-participants also take beneficiary case marking (39).

Differential A-marking is governed by both animacy and focus. Non-focal animate A-participants tend to go unmarked, as in (6), (24), and (56). Inanimate A-participants, by contrast, typically carry the case suffix *-a* analyzed as nominative in earlier work (54), and so do animate A-participants that are in argument focus (e.g., question-answer pairs), or in focus within the broader discourse context (cf. Fauconnier 2011), as in (57): the first clause features a boy as A-participant, just like the clause preceding (57), while the second clause shows a switch in A-participant, which gets marked with *-a*.

| (57) | <i>ãnĩ</i> FILLER | <i>pera</i> pear | | <i>o-ta-ma-nda-mb</i> 3sg.ind-Appl-v. | | <i>ãnĩ</i> FILLER | <i>pero</i> but(Sp) |
|------|---------------------------|---------------------|---------------------|--|--|---|------------------------|
| | <i>tiaway-</i> see-NEC | | <i>õ?-ê</i> 3sg. | IND-be | <i>mboerek-a</i> man- NOM | <i>no-kot-we</i> vital.center-fall-1 | NEG |
| | | | | | [i.e., the man's] pe | | |
| | see it; h | e [i.e. | , the | man] does not real | lize it.' (spontaneou | us speech: Pear sto | ory) |

S-participants typically go unmarked, whether they refer to human, as in (20) and (46), or inanimate participants, as in (36) and (51), and irrespective of their thematic role. Very rarely, overt marking with -a is used, for instance on an inanimate S (42), highlighting both the agentivity and the unexpectedness of the subject (McGregor 2007).

While earlier work maintains that the dependent marking system shows nominativeaccusative alignment (Helberg 1984; Tripp 1995), the discussion above suggests that it is better characterized as a tripartite system, featuring both differential and optional marking.¹² Turning to the head marking system, Section 5.2 showed that Harakmbut basically shows nominative-accusative alignment, with hierarchical effects interfering in local and inverse scenarios.

6.3 Negation

Standard negation is expressed by a periphrastic construction in which the lexical verb base is suffixed by *-we* and immediately followed by a finite form of auxiliary \tilde{e}/\tilde{e} 'be' (cf. Tripp 1995: 218). TAME and argument marking occur on the auxiliary, as in (24) and (57). Negative existentials contain the negative particle *ewe*, which also serves as the negative response item 'no', and a finite form of \tilde{e}/\tilde{e} 'be'. Negation with the privative suffix *-mbayo* was illustrated in (11) above.

¹² Accordingly, it might be better to gloss *-a* as ergative rather than nominative, also in view of (i) optionality being more common for ergative than nominative marking (McGregor 2010), (ii) the constraints on marking of S (McGregor 2007), and (iii) the polysemy of instrumental/ergative markers observed elsewhere (cf. Blake 1977: 51).

Negation in imperative/hortative sentences is quite different. Second person prohibitives are not formed with *-we*, and show distinct marking depending on the rank of O on the referential hierarchy (58). Third person prohibitives, by contrast, use the standard negation pattern with the auxiliary showing the imperative person affixes in Table 14, or use apprehensive forms.

| (58) | a. | o-arak-pete | b. | i-arak-kate |
|------|----|-----------------------|----|---------------------|
| | | 2>1-hit;kill-2>1.proн | | 2sg-hit;kill-2.proн |
| | | 'Don't hit me!' | | 'Don't hit him!' |

7 Clause-linking

7.1 Relative relations

Given that many of the properties of Harakmbut relative clauses vary in terms of the function of the relativized noun phrase (NP_{rel}), that is, the referent of the noun phrase whose reference is delimited (NP_{mat}) in the relative clause (S_{rel}), this section is organized in terms of these functions (terminology from Andrews 2007). When the relativized noun phrase functions as a subject, two formal strategies are available for the relative clause: suffixation of finite verb forms by the relativizing suffix *-niŋ* (52), and agentive deverbal nominalization with *wa*(?)- and *-eri*, as in (59) (see Section 4.8, and Van linden 2019).

| (59) | arakmbut-ta | i?-uk-i | wenpu | wa-mba-ka-eri-ta | |
|------|--|------------------|------------|-----------------------|--|
| | person-ACC | 1sg-search-1.IND | string.bag | NMLZ-V.PL-make-AN-ACC | |
| | 'I am looking for the person who makes string bags.' | | | | |

In both (52) and (59), the verb form carries case marking signalling the function of NP_{mat} , and S_{rel} appears outside of NP_{mat} , i.e., as a right-adjoined relative clause. There is also an alternative construal of (52) showing an external embedded relative clause. All strategies show omission of NP_{rel} .

Omission of NP_{rel} is also required when NP_{rel} functions as O (60), but S_{rel} only features suffixation of its verb form by *-niŋ*. Example (60) indicates that this strategy has verb-like internal syntax, with A marked for nominative case. It also suggests why A is expressed overtly at all: the *-niŋ* suffix competes with the mood+agreement suffixes for Sf7, so that in the absence of the overt pronoun, A can be understood to have a third person plural referent (Table 13).

(60) *i?-uk-i* siro opudn-a on-yok-me[*-ne]-niŋ 1SG-search-1.IND machete 2PL-NOM 1<>2PL-give-REC.PST-REL 'I am looking for the machete that you (PL) gave me'

Thirdly, when NP_{rel} functions as an oblique participant (locative or instrumental), NP_{mat} is immediately followed by the pronoun *ken*, which introduces S_{rel} (61) and can be analyzed as a resumptive pronoun. In addition, locative NPs_{rel} also use structures in which the deictic locative adverb $k\tilde{e}\tilde{y}\tilde{o}n$ 'thither' functions as a nominal domain following rather than preceding the relative clause (36); these involve omission of NP_{rel}. Instrumental NPs_{rel} have another strategy at their disposal as well, which involves instrumental deverbal nominalization through prefix *wa*(*2*)- (see Section 4.8) and omission of NP_{rel}, similarly to (59).

| (61) | mboerek | õ-ĩrĩŋ-ã-mẽ | widn | ken | toto-ta |
|------|---------|---------------------------|-------|--------|-----------------|
| | man | 3sg.IND-hide-trns-rec.pst | stone | 3/dist | evil.spirit-ACC |

o-arak-me-niŋ 3SG.IND-kill-REC.PST-REL 'The man hid the stone with which he killed the evil spirit.'

7.2 Complement relations

Harakmbut uses two main formal types of clauses to express a fairly wide range of complement relations. Table 15 indicates which semantic type of complement-taking predicates (CTPs) use which formal type (classification based on Noonan 2007), and includes reference to examples given. None of the CTPs uses overt complementizers.

Table 15: Formal types of complement clauses with their semantic types of CTP

| Sentence-like complement | Nominalization in $e(2)$ - | Other |
|-----------------------------------|----------------------------|--------------------------|
| – Utterance CTP (63), (64) | - Commentative CTP | – Predicates of fearing: |
| – Propositional attitude CTP (62) | (unmarked INF) | adverbial relation of |
| - Knowledge/acquisition of | – Acquired ability CTP | reason |
| knowledge (KAK) CTP | (unmarked INF) | – Immediate perception |
| - Desiderative CTP: hope-class | – Immediate perception | CTP: relative clause |
| – Manipulative CTP (44) | CTP (unmarked INF) | when emphasis on |
| – Immediate perception CTP: | - Desiderative CTP: want- | deliberate perception |
| only when $A(CTP) = O$ | class (65) | of how the perceived |
| (complement clause) = 1 SG | (INF marked for ACC case) | event proceeds |

Firstly, all sentence-like (S-like) complements involve a shift from the current speaker's deictic centre to that of the represented speaker, cognizer, or experiencer (62), unless the current speaker is involved in the complement clause, as S or O (63). This deictic shift is especially noticeable in contexts where the participants in main and complement clause are third persons relative to the current speaker and coreference obtains between A of the CTP and O of the complement clause, as in (62): the dependent verb form shows verbal argument marking specific to the 3SG>1/2SG inverse scenarios, rather than non-local forms (see Section 5.2).

(62) mbokerek õ-nõ-põ-ẽ-mẽ-tẽ

man 3SG.IND-vital.center-CLF:round-be-REC.PST-NFIRSTH

| mbe -arak-apo- ne -a | apetpet-a |
|------------------------------------|---|
| 3sg>1/2sg-kill-fut-ind-quot | jaguar-NOM |
| 'The man thought the jaguar was g | oing to kill him.' (lit. 'The man thought: "The |
| jaguar is going to kill me."") | |

Verb forms in complements of propositional attitude CTPs carry the quotative suffix -a (62), just like those of utterance predicates in contexts of indirect speech representation (63).¹³ Example (64) presents the direct speech counterpart of (63); such structures are never marked by quotative -a. Note that -a also is a verbal root, meaning 'say', as in (63) and (64), which is most probably its diachronic source.

¹³ Other CTP types with S-like complements use -a less consistently.

- (63) mboerek me-n-a-me-ne mbe-arak-apo-ne-a man 3SG>1/2SG-SPAT:on-say-REC.PST-IND
 ndumba-yo forest-LOC
 'The man told me he was going to kill me in the forest'
- (64) *mboerek o?-a-me o-arak-apo-ne ndumba-yo* man 3SG.IND-say-REC.PST 1<>2SG-kill-FUT-IND forest-LOC 'The man said: "I am going to kill you (SG) in the forest."'

In addition to S-like complements, complement relations are also expressed by nominalized verb forms prefixed by e(?)-. Complements of the *want*-class stand out in that the nominalizations invariably carry accusative marking (65) (cf. Tripp 1976b:3; 1995: 216; Helberg 1984: 451–452) in spite of being inanimate (Section 6.2). This indicates that their external syntax is noun-like (but special in terms of O-marking); their internal syntax, however, is verb-like; compare *opudnta* in (65). The notional subject of the nominalization in (65) is coreferential with the matrix subject, and has been equi-deleted (see Van linden 2019).

| (65) | mbuttinda | e-ma-n-a-ta | ih-pak-i | opudn-ta |
|------|--------------|---------------------------|----------------|----------|
| | truth | NMLZ-V.PL-SPAT:on-say-ACC | 1sg-want-1.IND | 2.PL-ACC |
| | 'I want to t | ell you (PL) the truth.' | | |

7.3 Adverbial relations

As for complement relations, Harakmbut also uses nominalization in e(2)- for the expression of adverbial relations, with suffixes specifying the semantic subtype (Van linden 2019). In addition, some adverbial relations use relative clauses with deictic adverbials, or clauses whose verb form signals dependency; see Table 16, which includes reference to examples given.

 Table 16: Formal types of adverbial clauses, with their semantic types of adverbial relations

| Nominalization in <i>e</i> (?)- | | Relativization | Dependent verb in | Dependent |
|---------------------------------|-----------------|--------------------------|-------------------|---------------------|
| suffix | relation | | - <i>po</i> | verb in <i>-nok</i> |
| -te | Time: different | – Reason: with deictic | – General | – Reason |
| (LOC) | subject | kente 'there' (same | adverbial | |
| -(a)nda | Time: same | subject) | (IND mood) (12), | |
| | subject (66) | – Manner: with deictic | (47), (55), (67) | |
| -tanda | Concession | <i>kenpa</i> 'like this' | – Purpose | |
| | (46) | – Location: with deictic | (IMP/PROH | |
| -nãỹõ | Condition | kẽỹõn 'thither' (36) | mood) (45), (68) | |

Like the nominalizations coding complement relations, those coding adverbial relations also combine noun-like external syntax with verb-like internal syntax. In (66), the notional participants of the nominalization are case-marked like main clause participants would be (see

Section 6.2). The suffix -(a)nda in (66) signals a temporal relation of simultaneity between events with shared subjects.

(66) on-a oro?-ta e?-uk-anda tiaway-we õ?-ẽ-ne
2SG-NOM 1PL-ACC NMLZ-search-SIMUL.SS see-NEG 1<>2SG-be-IND
'While you (SG) are looking for us, you (SG) don't find us.'

A second formal strategy involves relativization with deictic adverbials following the relative clause, as described for $k\tilde{e}\tilde{y}\tilde{o}n$ (36) in Section 7.1. Thirdly, person-marked verb forms can receive suffixes that indicate the dependent status of the clause. Suffixation by *-po* is very frequent, especially in narratives. The relationship it establishes can be interpreted in various ways (e.g., time, reason; Tripp 1976c). As shown in (67), *-po* occurs in Sf7 just like *-niŋ* REL: the *o*-prefix does not index a third person singular S-participant like in (55), but a first person plural S-participant (the distinctive agreement suffix is absent because of *-po*).

| (67) | <i>ken-ta?</i> DIST-LOC | <i>mbaysik</i> dusk | <i>o-tiak-po</i> 1PL-come-DEP | <i>hak-yo</i> house-LOC | <i>o-tiak-m</i> 1PL.INCI | | EC.PST-IND |
|------|----------------------------|------------------------|----------------------------------|----------------------------|-----------------------------|-----------|------------|
| | a_las_sinko-ta? | | õ-kỹẽ-mẽ-nẽ | | | in | hak-yo |
| | at.five(Sp)- | LOC | 1PL.INCL-arrive.fr | om.trip-REC.P | ST-IND | PROX | house-LOC |
| | 'Then we c | ame home | e at dusk, we came | at five o'cloc | k, we arri | ved in th | is house.' |
| | (spontaneo | us speech: | anecdote) | | | | |

Purposive relations stand out in that they use the imperative rather than indicative paradigm in *-po*-clauses, and same-subject purposives invariably index first person singular subjects (45) (cf. Tripp 1976c: 4). What is puzzling is that these verb forms retain the mood+agreement suffix (Sf7), with the quotative suffix *-a* still preceding *-po* (45), unless the imperative suffix is *-e2* in different-subject purposives (68). Similarly, negative purposives use verb forms with the apprehensive suffix *-apey*, followed in turn by quotative *-a* and *-po*.

| (68) | arakmbut-a | o-n-ka | kumo | kã-mã-õrõk-e-po |

| | - | do | | - |
| | | | | |

mbi?ignkuru-tefishsurface-LOC'The people use barbasco so that the fish come (out) at the (water) surface.'

8 Conclusion

This chapter has presented a grammatical description of Harakmbut, more specifically the variety known as Amarakaeri or Arakmbut (the preferred autonym). Most of the data are drawn from elicitation, so the description will benefit from future work on spontaneously produced narratives, for example on basic constituent order, alignment, information structure, and discourse. Lesser understood topics within phonetics and phonology include nasality and stress assignment. In addition, more research is needed on the other varieties of Harakmbut.

Typologically interesting features include the presence of two classes of common nouns, potentially free nouns and obligatorily bound ones, which show differences in terms of noun modification, noun incorporation and, word formation. When combined with adnominal modifiers that obligatorily precede the nominal head in continuous noun phrases, for example, free nouns show a single construction type, while bound nouns show two: (i) one in which

they attach to a nominalizing prefix and follow the modifier, just like free nouns do, and (ii) one in which they attach to their modifier and form one phonological word with it. The distinct morpho-syntactic behaviour of bound nouns is unlike what has been described for bound nouns in, for instance, the Arawakan language Mojeño Trinitario (Rose 2015). Taking into account data from noun incorporation as well, I have argued that only the set of bound nouns showing classificatory noun incorporation (type IV in Mithun 1984) should be analyzed as classifiers, which does not exhaust the whole class of bound nouns (*pace* Payne 1987).

Another interesting feature relates to argument marking. Head marking involves hierarchical indexation resulting in a scenario-based split (without direction marking), based on the position of the O-participant on the person hierarchy 1/2 > 3. In local scenarios, there is substantial referential opacity, with a number of pragmatic skewing strategies (Heath 1998) at work. In non-local and direct scenarios, the scenario-based split amounts to accusative alignment (A>3-markers = S-markers). Dependent marking had been analyzed as a nominative-accusative system in earlier work. However, the constraints on the marking of intransitive subjects suggest that it is better analyzed as a tripartite system, showing differential O-marking and both differential and optional A-marking.

Acknowledgments

The research reported on in this paper has been made possible by mobility grants and postdoctoral grants from the Research Foundation, Flanders (FWO) (2009–2014) and the Fund for Scientific Research, FNRS (2015–2016), as well as a research project grant from the research council of the University of Leuven (KU Leuven) (GOA/12/007). I thank both editors and an anonymous referee for helpful comments on earlier drafts, as well as Olga Krasnoukhova, Françoise Rose, and Leo Wetzels. Special thanks go to Lev Michael for his help on the phonology and phonetics section. Of course, any errors of fact or interpretation remain my own responsibility. Finally, my sincere thanks go to the Harakmbut people, who warmly welcomed me in their communities and patiently taught me their beautiful language.
