**Background:** Chronic inflammatory arthritis(CIA) is considered the leading cause of disability that places severe limits on daily activity and quality of life for over 100 million Chinese. Nurse-led CIA management reveals tremendous benefits for CIA patients. European League Against Rheumatism(EULAR) developed the recommendations for the role of the nurse in the management of CIA in 2011, however, whether or not the recommendations could be fully implemented in China is unknown.

**Objectives:** The aim was to test the EULAR recommendations among registered Chinese rheumatology nurses in terms of its agreement level, practicality, and adverse conditions to the implementation.

**Methods:** We conducted an anonymous online questionnaire among registered clinical nurses in the department of rheumatology and immunology nationwide based on convenience sampling. The agreement and feasibility of the recommendations were assessed by visual analogue scale(VAS 0=total disagreement/completely infeasible, VAS 1–4=partial disagreement/partially infeasible, VAS 5–9=partial agreement/partially feasible, VAS 10=complete agreement/completely feasible). The respondents needed to select the reasons they agreed or disagreed and if they thought the recommendations were feasible or not.

**Results:** 485 subjects were included, and 438 valid questionnaires were retrieved(valid recovery rate=90.3%). The subjects were from 49 national medical centers with the average age of 31.65±6.65. The average years of working experience were 6.41±5.438. With each and every piece of the recommendation, approximately 50% of the subjects completely agreed(VAS 10), about 40% partially agreed(VAS 5–9), under 10%(VAS 1–4) partially disagreed and around 1% (VAS 0) totally disagreed(shown in figure 1A). As for the feasibility, around 30% of the subjects thought the recommendations were fully feasible(VAS 10), about 50% considered partially feasible (VAS 5–9), 10% partially infeasible(VAS 1–4), and less than 1% totally infeasible(shown in figure 1B). Factors made the subjects disapprove of the recommendations include busy clinical loading(39.98%), lack of professional knowledge and nursing skills(25.7%), patients did not accept the extended role of nurses(17.35%). In the meantime, lack of working time(16.33%), shortage of professional nurses(12.74%), lack of training and education(10.59%), lack of professional knowledge(9.22%), attitude of patients toward nurses (8.28%), and lack of financial support(7.53%) were the reasons that made subjects think the recommendations infeasible in China.

**Figure 1** the agreement and feasibility analysis of the EULAR recommendations in China

**Conclusions:** The role and tasks of nurses should be clearly described in the framework in China. Professional training and educational nursing programs at both basic and advanced levels need to be well developed with the aim of providing better care and bringing added value to patients at a lower cost.

**Acknowledgements:** The authors are grateful to 49 national medical centers that participated in this study.

**Disclosure of Interest:** None declared

### HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative)

#### FRI0737-HPR | WOMEN'S EXPERIENCES OF COPING WITH CHRONIC WIDESPREAD PAIN – A QUALITATIVE STUDY

K. Aili<sup>1</sup>, S. Bergman<sup>2,3,4</sup>, A. Bremander<sup>2,5,6</sup>, E. Haglund<sup>2,5</sup>, I. Larsson<sup>2,3</sup>.

<sup>1</sup>Institute of Environmental Medicine, Karolinska Institutet, Stockholm, <sup>2</sup>FoU Spenshult, <sup>3</sup>School of Health and Welfare, Halmstad University, Halmstad,

<sup>4</sup>Institute of Medicine, The Sahlgrenska Academy, University of Gothenburg, Gothenburg, <sup>5</sup>School of Business, Engineering and Science, Halmstad University, Halmstad, <sup>6</sup>Department of Clinical Sciences, Section of Rheumatology, Lund University, Lund, Sweden

**Background:** Approximately ten percent of the population report chronic widespread pain (CWP), the condition is more common among women than men. For most people, the pain interferes with many aspects of every-day life and implies large consequences. However, the group reporting CWP is heterogeneous and there is a need for better understanding of the different strategies used for coping with pain in every-day life.

**Objectives:** The purpose of this study was to describe women's experiences of how to cope with CWP.

**Methods:** The study had a descriptive design with a qualitative content analysis approach. Individual interviews were conducted with 19 women, 31–66 of age, who had reported CWP in a survey 2016. CWP was defined according to the 1990 ACR criteria for fibromyalgia. To be considered chronic, the pain should have persisted for more than three months during the last 12 months. A manifest qualitative content analysis was used to analyze the main question "How do you cope with your chronic widespread pain?" The analysis resulted in four categories.

**Results:** Women described their coping with CWP in four different ways; to take control, to continue as usual, to follow instructions and to rest. *To take control* meant to make deliberate decisions to handle everyday day life. It also meant to take care of oneself, to think positive and to exercise at an adequate level. *To continue as usual* meant not to listen to body signals and either to ignore or accept the pain. *To follow instructions* meant listening to the health professionals and following advices, but without taking any part of the responsibility for the treatment outcome. *To rest* meant to perceive an unreasonable need for recovery, to resign and let the pain set the terms for the daily living.

**Conclusions:** Women expressed different ways of coping with CWP including both active and passive strategies. The coping strategies included two dimensions, where one ranged from *actively taking control over the pain*, to *passively following instructions* and the other from *actively continue as usual* by either accepting or ignoring the pain to *passively rest* and being mastered by pain.

### HPR Epidemiology and public health (including prevention)

#### FRI0738-HPR | NURSE-LED SCREENING: CHANGES IN CARDIOVASCULAR RISK PROFILE AND ASSOCIATION TO SOCIO-ECONOMIC STATUS IN OUTPATIENTS WITH INFLAMMATORY ARTHRITIS

J. Primdahl<sup>1,2</sup>, A. Kjeldgaard<sup>3</sup>, R.D. Christensen<sup>4</sup>, J. Søndergaard<sup>4</sup>, K. Hørslev-Petersen<sup>2</sup>, <sup>1</sup>Hospital of Southern Jutland, Aabenraa, <sup>2</sup>King Christian X's Hospital for Rheumatic Diseases, University of Southern Denmark, <sup>3</sup>King Christian X's Hospital for Rheumatic Diseases, Graasten, <sup>4</sup>Research Unit for General Practice, University of Southern Denmark, Odense, Denmark

**Background:** Persons with inflammatory arthritis have an increased risk for cardio-vascular (CV) disease and screening is therefore recommended (1)

**Objectives:** To investigate changes in the patient's risk for CV disease and whether risk reduction was associated with socio-economic status in a hospital population of outpatients with inflammatory arthritis (IA) (rheumatoid arthritis (RA), psoriatic arthritis (PsA) and ankylosing spondylitis (AS))

**Methods:** Outpatients with IA ≤85 years of age connected to King Christian X's Hospital for Rheumatic Diseases in Graasten, Denmark, who had participated in a 30-minute nurse-led screening consultation (SC) (2) based on the EULAR recommendations between July 2012 and July 2015 were included. During the SC the patients' risk for cardiovascular death was calculated according to the SCORE system (3). Elements of motivational interviewing were used. Data was entered in a national rheumatology quality database, DANBIO, and combined with national registers. Whether socio-economic status influenced changes in risk factors from first to second screening consultation was explored in simple logistic regression analyses for each risk factor including the socio-economic variables sex, age, marital status, education, and income separately one at a time

**Results:** A total of 1266 patients, 18–85 years of age, were included; 72.5% with RA and 27.5% with AS or PsA. 447 patients had high risk (≥5% risk) for CV death in 10 years and 819 had low to moderate risk (<5%). Number of patients achieving relevant changes from the first to the subsequent yearly or biannual screening consultation, are reported for high and low risk patients in table 1.

For all the patients, female gender significantly decreased the odds for increased exercise frequency (OR, [CI], p-value) (0.40[0.17; 0.92], 0.0320), being single decreased the odds of reduced BMI (0.57[0.32; 0.99, 0.0472] and age ≥65 years

increased the odds of a normalization of SBP (2.13[1.30; 3.50], 0.0027). In high risk patients, higher education (1.94[1.05; 3.57], 0.0338) and higher income (2.07 [1.00; 4.28], 0.0508) increased the odds of a normalization of SBP although not significant, we include this effect based on the confidence interval not including any values indicating a decreased odds

Table 1 Changes in CV risk profile from first to subsequent screening consultation for high and low risk patients

Risk factor	Patients with high risk (SCORE≥5%) Number with changes out of number affected (%)	Low to moderate risk (SCORE<5%) Number with changes out of number affected (%)
Changes in exercise habits: from < 5 times a week to ≥5 times a week	73/153 (48%)	27/136 (20%)
Smokers changed to non-smokers	12/60 (20%)	10/66 (15%)
Elevated blood sugar (fasting Blood sugar or HbA1C): changes to normal level	69/72 (96%)	94/95 (99%)
LDL-cholesterol: changes from elevated level to normal level (<3 mMol/Mol)	4/18 (22%)	0/0 (0%)
Systolic blood pressure ≥ 145: changes from elevated level to normal level (≤140 mmHg)	73/153 (48%)	0/0 (0%)
BMI≥30: reduction with at least 1	21/68 (31%)	36/90 (40%)

**Conclusions:** Clinically relevant reductions in CV risk factors were seen after SC for CV risk in both high and low risk patients. Surprisingly female patients improved their exercise habits less often than male patients did. Older age increased the odds to reach a normal SBP. In high-risk patients, education and income positively influenced the odds to reduce SBP to normal

## HPR Interventions (educational, physical, social and psychological)

### FRI0739-HPR EXPERT RECOMMENDATIONS ON PSYCHOLOGICAL NEEDS OF PATIENTS WITH RHEUMATOID ARTHRITIS

L. León<sup>1,2</sup>, M. Redondo<sup>2</sup>, A. Fernández-Nebro<sup>3</sup>, S. Gómez<sup>4</sup>, E. Loza<sup>5</sup>, M. Montoro<sup>4</sup>, R. García-Vicuña<sup>6</sup>, M. Galindo<sup>7</sup>. <sup>1</sup>Hospital Clínico San Carlos, <sup>2</sup>Ciencias de la Salud, Universidad Camilo José Cela, Madrid, <sup>3</sup>Unidad de Gestión Clínica de Reumatología, Instituto de Investigación Biomédica de Málaga (IBIMA), Hospital Regional Universitario de Málaga, Universidad de Málaga, Málaga, <sup>4</sup>Departamento Médico de Pfizer, Alcobendas, <sup>5</sup>Instituto de Salud Musculo-esquelética, <sup>6</sup>Servicio de Reumatología, Hospital Universitario de la Princesa, IIS-IP, <sup>7</sup>Servicio de Reumatología, Hospital Universitario 12 de Octubre, Madrid, Spain

**Objectives:** To generate recommendations in order to: 1) Optimize the management of psychological needs of RA patients, their family and caregivers; 2) Promote and improve communication and decision making with patients; 3) Establish referral criteria to mental health professionals.

**Methods:** A nominal group meeting of RA experts, rheumatologists and psychologists was held, in which the most important psychological and emotional needs and related aspects in RA were addressed. With an extensive review of the literature, a set of preliminary recommendations was generated that the experts discussed and modified. The definitive recommendations were voted in a Delphi which was extended to 20 more professionals. Participants voted from 1 (strongly disagree) to 10 (totally agree). Agreement was considered if at least 70% voted ≥7 (GA). Each recommendation was assigned a level of evidence (LE) and a grade of recommendation (GR) according to the Center for Evidence Based Medicine of Oxford.

**Results:** A total of 13 recommendations were generated (see table 1).

#	RECOMMENDATIONS	LE*	GR*	GA†
1	One of the objectives of the treatment of RA should be the psychological well-being of the patient	5	D	80%
2	The panel recommends to perform, along with the usual clinical actions, a psychological approach of patients with RA at the diagnosis and during the course of the disease	5	D	80%
3	It is recommended to analyze the impact that the information on the diagnosis of RA may cause in the patient	4	D	93%
4	It is recommended to adapt the information we give, to patient knowledge of their own illness, their concerns and characteristics, and to offer it sequentially, using all the available resources	5	D	100%
5	Information about RA should avoid medical technicalities as much as possible, as well as words and expressions that may negatively impact on the patient	5	D	87%
6	The panel recommends to use a constructive messages when we inform the patient about RA	5	D	100%
7	It is recommended to encourage and motivate the patient regarding to the treatment plan of the RA	2a	B	100%
8	During the course of the disease special attention must be paid to the psychological needs of the patient and their family and caregivers	4	D	100%
9	It is recommended to generate an atmosphere of trust, to share treatment decisions, and to avoid paternalistic attitudes or reprimands	5	D	87%
10	It is recommended to use open questions, an active listening, and to let the patients express themselves freely, as well as time for reflection	5	D	93%
11	Empathy should be practice in daily consultation, allowing discussion to seek consensus, and avoiding confrontation	5	D	100%
12	In patients with negative attitudes, it is recommended to promote self-efficacy, to promote the solution of problems and to offer other therapeutic options	5	D	87%
13	In patients with emotional lability, the panel recommends to use the HADS screening questions in order to detect depression	5	D	73%

**Conclusions:** These recommendations will help health professionals address psychological needs of the patient in daily practice, in order to manage them and improve patient's quality of life.

**Disclosure of Interest:** None declared

FRIDAY, 15 JUNE 2018

## HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative)

### FRI0740-HPR RESPONDING RESILIENTLY TO CHRONIC DISEASE: RHEUMATOID ARTHRITIS PATIENTS' DISCOURSE ON COPING STRATEGIES AND CHALLENGES

Y. Shaw<sup>1,\*</sup>, M. Bradley<sup>2</sup>, A. Dominique<sup>3</sup>, K. Michaud<sup>1</sup>, D. McDonald<sup>2</sup>, T.A. Simon<sup>3</sup>. <sup>1</sup>National Data Bank for Rheumatic Diseases, Wichita, <sup>2</sup>LIFT1428, Chattanooga, <sup>3</sup>Bristol-Myers Squibb, Princeton, United States

**Background:** Little is known about how rheumatoid arthritis (RA) patients build and maintain resilience, or their ability to recover from, and adapt successfully to, stressful situations.<sup>1</sup> As symptoms and limitations caused by RA are often beyond patients' control, it is important to understand how patients develop and maintain resilience throughout fluctuations in their condition.

**Objectives:** We qualitatively explored patient narratives of coping with RA to examine their strategies for building/maintaining resilience in the context of RA.

**Methods:** Semi-structured interviews were conducted with adult RA patients in the United States. Interviewees were asked to discuss their experiences with diagnosis, living with RA, coping with challenges, treatment, and healthcare providers. The interviews were audio-recorded and transcribed verbatim. Transcripts were analyzed to identify patients' strategies for building/maintaining resilience (including examples, patterns in how and when strategies were used, and changes in use as patients gained experience with RA). Patients were categorized as 'high resilience' and 'low resilience' based on how confidently they coped with symptoms, physical limitations, the prospect of future life with RA, taking treatments, and communicating with healthcare providers. The characteristics of the high-resilience and low-resilience groups were qualitatively described.

**Results:** Eighteen patients were interviewed, with ages of 27–80 years and RA durations of 4–40 years. Patients used 10 strategies to build/maintain resilience

(table 1): perseverance, avoiding threatening thoughts, social support connection, pursuing valued activities, positive reframing, maintaining a sense of control, acceptance, humor, equanimity, and flexibility. Nine patients were categorized as high-resilience and 9 patients as low-resilience cases. High-resilience patients tended to have more years' experience of living with RA compared with low-resilience patients. Although low-resilience patients sometimes struggled to cope, they made efforts to improve their capacity to face their personal challenges.

Table 1 Strategies described by RA patients for building/maintaining resilience

Strategy	Definition
<b>Perseverance</b>	Habitually enduring difficult situations
<b>Avoiding threatening thoughts</b>	Avoiding emotionally threatening thoughts and information
<b>Social support connection</b>	Receiving or giving emotional or instrumental social support
<b>Pursuing valued activities</b>	Deep engagement in valued activities
<b>Positive reframing</b>	Finding positive meaning in difficult experiences
<b>Maintaining a sense of control</b>	Adopting actions or thoughts to promote a sense of control over one's condition
<b>Acceptance</b>	Acknowledging the realities of living with RA
<b>Humor</b>	Joking about stressful situations due to RA
<b>Equanimity</b>	Staying calm in stressful situations
<b>Flexibility</b>	Adjusting to changes in physical limitations

**Conclusions:** Participants used a combination of behavioral and emotion management strategies to build and maintain resilience when facing challenges of living with RA. Awareness of these strategies may benefit patients, healthcare providers and researchers developing behavioral interventions and social support programs in the context of RA and other chronic diseases.

**FRI0741-HPR DISCUSSIONS OF LIFESTYLE HABITS AS AN INTEGRAL PART OF CARE MANAGEMENT IN PATIENTS WITH ESTABLISHED RHEUMATOID ARTHRITIS.**

K. Malm<sup>1,2</sup>, S. Bergman<sup>1,3</sup>, A. Bremander<sup>1,4</sup>, I. Larsson<sup>1,5</sup>, M.L. Andersson<sup>1,4</sup> on behalf of The BARFOT study group. <sup>1</sup>R&D-CENTRE, SPENSHULT, <sup>2</sup>Rheumatology, Capio Movement, Halmstad, <sup>3</sup>Primary Health Care Unit, Department of Public Health and Community Medicine, Institute of Medicine, The Sahlgrenska Academy, University of Gothenburg, Gothenburg, <sup>4</sup>Department of Clinical Sciences, Section of Rheumatology, Lund, <sup>5</sup>Halmstad University, School of Health and Welfare, Halmstad, Sweden

**Background:** Rheumatoid arthritis (RA) is associated with an increased risk of developing comorbidities which are known to be associated with lifestyle-related habits; such as having a sedentary lifestyle, having an unhealthy diet, smoking, and over-consumption of alcohol. In 2010, the European League Against Rheumatism (EULAR) published general guidelines on risk management in patients with RA, with an update 2017 (1,2) in which health professionals are encouraged to prioritize discussions with patients regarding their lifestyle and it is of interest to study the extent to which these discussions actually occur.

**Objectives:** To study if lifestyle habits; physical activity, diet, smoking and alcohol had been discussed with patients having RA during health care visits.

**Methods:** A cross-sectional postal survey in 2017 included 1542 eligible patients from the BARFOT (Better Anti-Rheumatic Pharmacotherapy) study. All patients received a questionnaire including lifestyle habits (physical activity, diet, smoking, and alcohol), and whether these habits had been discussed during health care visits. There was also a question regarding if they would have wanted such a discussion.

**Results:** 1,061 patients (68%) responded to the survey (mean age 67 years (SD 13); 73% women). Physical activity was discussed with 49% of the patients (figure 1A). Those who reported that they were active on a health-enhancing level were more likely to have discussed physical activity with health professionals. Diet had been discussed with 23% of the patients (figure 1B). Patients who reported a non-traditional mixed diet were more likely to have discussed diet. Smoking was discussed with 25% of the patients (figure 1C). Current smokers had more often

discussed smoking habits with healthcare professionals compared with never smokers (32% vs. 17%; p=0.000). Alcohol had been discussed with 17% of the patients (figure 1D). Of the patients with hazardous drinking habits, 77% had not had a discussion regarding alcohol.

Figure 1 Rate of patients reporting that they had a discussion regarding life-style-related habits and whether they had wanted to have a discussion. Panel A relates to physical activity, panel B relates to diet, panel C relates to smoking, and panel D relates to alcohol consumption.

**Conclusions:** Physical activity had been discussed at least once with every second patient with established RA. Diet, smoking, and drinking habits had been discussed with about a quarter of them. There is a need for improvement, since lifestyle habits are especially important in a long-standing disease such as RA. Discussions concerning lifestyle habits should be an integral part of care management and an interactive process.

**FRI0742-HPR EULAR RECOMMENDATIONS FOR THE ROLE OF THE NURSE IN THE MANAGEMENT OF CHRONIC INFLAMMATORY ARTHRITIS: 2018 UPDATE**

B. Bech<sup>1</sup>, J. Primdahl<sup>2</sup>, M. Scholte-Voshaar<sup>3</sup>, H.A. Zangi<sup>4</sup>, A. van Tubergen<sup>5</sup>, Y. van Eijk-Hustings<sup>5</sup>. <sup>1</sup>Center for Rheumatology and Spine Diseases, Centre for Head and Orthopaedics, Rigshospitalet – Glostrup, Copenhagen, <sup>2</sup>King Christian X's Hospital for Rheumatic Diseases, Graasten; Hospital of Southern Jutland, Aabenraa and University of Southern Denmark, Odense, Denmark, <sup>3</sup>Department of Psychology, Health and Technology, University of Twente, Netherlands, <sup>4</sup>Department of Rheumatology, National Resource Centre for Rehabilitation in Rheumatology, Diakonhjemmet Hospital, Oslo, Norway, <sup>5</sup>Department of Internal Medicine, Division of Rheumatology, Maastricht University Medical Centre, Netherlands

**Background:** During the past years an increasing number of papers regarding rheumatology nursing have been published, which may contribute to a higher level of evidence and increased insight into the nurses' roles.

**Objectives:** To update the EULAR recommendations for the role of the nurse in the management of chronic inflammatory arthritis (IA) (1).

**Methods:** The EULAR standardised operating procedures were followed to integrate available higher level of evidence and new insights of nursing care in the

treatment of patients with IA. The EULAR Task Force comprised 15 nurses, 2 patient research partners, 1 physiotherapist, 1 psychologist, 1 occupational therapist, 1 medical student and 2 rheumatologists of whom one was also methodologist. A total of 17 European countries were represented. The systematic literature review included available literature from 2010 until December 2017 and was performed in the databases Medline, EMBASE, Cochrane Central, CINAHL, PsycINFO and in the 2016/2017 ACR and EULAR conferences abstracts. The original search strategy was used with no limitations applied with regard to publication type, research type or language. Titles, abstracts and full texts were screened for eligibility independently by the fellow and the convenor. Results were shared with the task force to check for comprehensiveness. Subsequently, the steering committee prepared proposals for update and rewording of the ten recommendations. The proposals were discussed with the Task Force in a one day consensus meeting and final agreement was obtained by voting.

**Results:** A total of 51 studies was included. Some studies added to existing evidence with a higher level of evidence to nurses' contribution regarding patients' satisfaction with care, cost-effectiveness, and self-efficacy, and also for the benefit of nurses' extended roles to patient outcomes as well as structured training aiming at improving nurses' skills. Additional evidence was found for needs-based patient education and telemonitoring. Two recommendations remained unchanged, six were reworded, two were merged and one recommendation was deleted and reformulated as an overarching principle together with the formulation of two additional overarching principles (figure 1). The level of agreement from each Task Force member will be retrieved by email.

Overarching principles		
Rheumatology nurses are part of a healthcare team		
Rheumatology nurses provide evidence based care		
Rheumatology nursing is based on shared decision making with the patient		
Recommendations	Level of evidence*	Strength of recommendation*
1 Patients should have access to a nurse for needs-based education to improve knowledge of CIA and its management throughout the course of their disease	1B	A
2 Patients should have access to nurse consultations in order to enhance satisfaction with care	1A	A
3 Patients should have the opportunity of timely access to a nurse for needs-based support; this includes telehealth	1B	B
4 Nurses should participate in comprehensive disease management to control disease activity, reduce symptoms, and improve patient preferred outcomes; this leads to cost-effective care	1A	A
5 Nurses should address psychosocial issues to reduce patients' symptoms of anxiety and depression	1B	A
6 Nurses should support self-management skills to increase patients' self-efficacy	1A	A
7 Nurses should have access to and undertake continuous education in the speciality of rheumatology to improve and maintain knowledge and skills	2C	B
8 Nurses should be encouraged to undertake extended roles after specialized training and according to national regulations	1A	A

\*According to the Oxford Centre for Evidence-based Medicine, CEBM Levels of Evidence 1

**Figure 1** EULAR recommendations for the role of the nurse in the management of CIA: 2018 Update

**Conclusions:** A total of three overarching principles and eight evidence- and expert opinion-based recommendations have been formulated, that provide an up-to-date guidance of nursing care in rheumatology.

#### FRI0743-HPR NURSE-LED OUTPATIENT MANAGEMENT FOR IMPROVED TREATMENT OF GIANT CELL ARTERITIS (GCA) AND POLYMYALGIA RHEUMATIC (PMR) IN A RHEUMATOLOGY OUTPATIENT CLINIC

M.T. Poder<sup>1</sup>, B.A. Esbensen<sup>1</sup>, M.B.T. Pedersen<sup>1</sup>, N.G. Andersen<sup>1</sup>, J. J. Lykkegaard<sup>1</sup>, A.M. Johansen<sup>1</sup>, T. Lundbak<sup>1</sup>, B. Bech<sup>1</sup>. <sup>1</sup>Center for Rheumatology and Spine Diseases, Centre for Head and Orthopaedics, Rigshospitalet, Glostrup, Denmark

**Background:** GCA and PMR are challenges with regard to diagnosis and effective treatment because of varied and vague symptom presentations and overlapping pathologies that often require specialist for diagnostic investigations and specific treatment. Long-term glucocorticoids (GC) dependency is common, and

GC side effects occur in approximately 50% of patients emphasizing the need for continued monitoring and symptom control (1).

**Objectives:** To present the development and the implementation of a nurse-led, rheumatologist-supported model of care in the outpatient management of adults diagnosed with GCA or PMR.

**Methods:** Initially, available evidence about symptom regulated GC tapering in the treatment of GCA and PMR was identified. Subsequent, a fixed phase-out schedule for high dose GC therapy following either of three pathways (GCA with/without eye symptoms and PMR) was agreed on in a multidisciplinary working group. Furthermore, the group developed a nurse-managed protocol for nurse-led outpatient consultations to ensure systematic treatment and proper response to relapse. Prior to the implementation rheumatology nurses were taught and trained by rheumatologists in pertinent regulation of medication and identification of adverse signs and symptoms essential for providing appropriate support and patient education. Overall patient satisfaction was assessed on-site by an anonymous iPad questionnaire.

**Results:** An individual, initial GC dose are set by the rheumatologist based on clinician diagnosis, supported by currently available diagnostic and classification criteria. Subsequently, a nurse-led protocol reassures patient education and support during approximately one year of steroid therapy. The protocol includes close and continues observation and assessment by planned rheumatology nursing consultations followed by reassuring telephone calls. A rheumatologist can be consulted if doubt arises. Further, the rheumatology nurse is responsible for allocating final tapering (approximately 24 weeks) in the individualized PMR-management-plan for general practitioner. Patient overall self-reported satisfaction first nine month was high indicated by patients' experience of confidence, being heard and having questions resolved. Within the first 18 months, n=190 patients (GCA, n=82/PMR, n=108) with a mean aged of 73.2 (SD 8.4) years have been enrolled into nurse-led managed protocols for GC tapering.

**Conclusions:** A nurse-managed protocol for systematic and individualized GC tapering and patient support was developed as well as implemented successfully for individualized treatment of GCA and PMR. The extensive supportive patient education and involvement in symptom management secured by the rheumatology nurse provided high satisfaction. Also, the protocol executes rapid and direct access to advice for patients as recommended by EULAR for the management of PMR (2).

#### HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative)

#### FRI0744-HPR THE ASSOCIATION OF LOCAL DISEASE ACTIVITY AND FOREFOOT DEFORMITIES WITH PLANTAR PRESSURE IN PATIENTS WITH RHEUMATOID ARTHRITIS AND FOREFOOT SYMPTOMS: A CROSS-SECTIONAL STUDY IN THE AMSTERDAM FOOT COHORT

A. Konings-Pijnappels<sup>1</sup>, M. Tenten-Diepenmaat<sup>1</sup>, R. Dahmen<sup>1</sup>, J. Dekker<sup>2</sup>, J. Twisk<sup>3</sup>, L. Roorda<sup>1</sup>, M. van der Leeden<sup>1,2</sup>. <sup>1</sup>Amsterdam Rehabilitation Research Center, Reade, <sup>2</sup>Department of Rehabilitation Medicine, VU University Medical Center, <sup>3</sup>Department of Clinical Epidemiology and Biostatistics, VU University Medical Center and Institute of Health Science, Amsterdam, Netherlands

**Background:** In patients with rheumatoid arthritis (RA), both high and low forefoot plantar pressures have been reported in the literature (1-3). Understanding of contributing factors to forefoot pressure alterations can help to better formulate and specify goals for treatment with foot orthoses or therapeutic footwear.

**Objectives:** Investigate the association of local disease activity and forefoot deformity with plantar pressure in RA patients with forefoot symptoms.

**Methods:** A cross sectional study was conducted in the Amsterdam Foot (AMS-foot) cohort, using data of 172 consecutive patients with RA and forefoot symptoms. Peak pressure (PP) and pressure time integral (PTI) in the forefoot were measured with a pressure platform. Forefoot deformity was measured with the Platto score. Forefoot disease activity was defined as swelling and/or pain measured by palpation of the metatarsophalangeal (MTP) joints. The forefoot was

divided in a medial, central and lateral region, in which the following conditions could be present: 1) no abnormality, 2) disease activity, 3) deformity or 4) deformity and disease activity. A multilevel analysis was performed using condition per forefoot region as the independent variable and PP or PTI in the corresponding region as the dependent variable.

**Results:** Statistically significant higher PP and PTI were found in forefoot regions when deformities were present (RR 1.2, CI 1.1–1.3,  $P < 0.0001$ ), compared to forefoot regions without forefoot abnormalities. No significant differences in PP and PTI were found when solely local disease activity was present in forefoot regions (RR 1.0, CI 0.9–1.2,  $p = 0.749$  and RR 1.0, CI 0.8–1.2,  $p = 0.850$  respectively).

**Conclusions:** Deformities in the medial, central and lateral forefoot regions are related to higher plantar pressures measured in these regions. The absence of an association between local disease activity and plantar pressure might be explained by the low prevalence of MTP pain or swelling as detected by palpation. Future research with ultrasound measurements to detect disease activity is recommended to reveal the effect of forefoot disease activity on plantar pressure.

#### FRI0745-HPR IMPLICIT AND EXPLICIT ATTITUDES AND ASSOCIATIONS OF RHEUMATOID ARTHRITIS PATIENTS TOWARDS CONVENTIONAL DISEASE MODIFYING ANTI-RHEUMATIC DRUGS AS POSSIBLE TARGETS FOR IMPROVING MEDICATION ADHERENCE

M. Van Heuckelum<sup>1</sup>, E. van den Ende<sup>2</sup>, L. Vandenberg<sup>3</sup>, S. van Dulmen<sup>4</sup>, A. Linn<sup>3</sup>, B. van den Bemt<sup>1</sup>. <sup>1</sup>Rheumatology and Pharmacy, <sup>2</sup>Rheumatology, Sint Maartenskliniek, Nijmegen, <sup>3</sup>ASCOR, University of Amsterdam, Amsterdam, <sup>4</sup>Primary and community care, Radboudumc, Nijmegen, Netherlands

**Background:** Medication adherence to conventional disease modifying anti-rheumatic drugs (cDMARDs) is suboptimal in patients with rheumatoid arthritis (RA) with medication adherence rates ranging from 30 to 80% [1]. Since existing interventions are only partially effective, identifying (modifiable) factors associated with non-adherence might help to find targets for more effective adherence-improving interventions. There is growing evidence that not only explicit attitudes (conscious responses) are responsible for behaviour, but also implicit attitudes (unconscious responses) might be involved [2].

**Objectives:** The aim of this study is to examine implicit and explicit attitudes of RA patients towards cDMARDs, and their association with medication adherence.

**Methods:** A multicenter observational cohort study in two rheumatology specialized centres was initiated to examine implicit and explicit attitudes of 254 consecutive adult RA patients (ACR 2010 criteria) treated with at least one cDMARD for a minimum period of one year. Prior to their regular consultation, patient's implicit attitudes were measured with the Single Category Implicit Association Test and explicit attitudes were evaluated with a bipolar evaluative adjective scale and the validated Beliefs about Medicines Questionnaire (BMQ-specific). Primary outcome was self-reported medication adherence measured with the validated Compliance Questionnaire on Rheumatology.

**Results:** Implicitly, more patients displayed negative attitudes (49.0%) and sickness related associations (60.9%) than explicitly (21.3% and 23.5% respectively). Only significant correlations between explicit attitudes and associations of RA patients and beliefs about medicines were found. The lowest levels (48.8%) of self-reported adherence were found in patients who displayed congruent negative (implicit and explicit) attitudes. The highest levels (71.4%) of self-reported adherence were found in patients who displayed congruent (implicit and explicit) health (versus sickness) related associations.

**Conclusions:** Implicit attitudes and associations of RA patients were not always congruent with explicit attitudes and associations. Slightly higher adherence rates were found in patients who displayed positive explicit attitudes and associations.

However, implicit and explicit attitudes and associations of RA patients towards cDMARDs and their adherence should be further investigated with MEMS (medication event monitoring system) devices.

#### Public health, health services research and health economics

#### FRI0746 NURSING CONSULTATION VERSUS RHEUMATOLOGIST FOLLOW UP FOR PATIENTS WITH STABLE RHEUMATOID ARTHRITIS: A RANDOMIZED CONTROLLED TRIAL

G.S.K. Kwok<sup>1</sup>, T.T. Cheung<sup>2</sup>, M.L.M. Tang<sup>1</sup>, C.K.Y. Yuen<sup>1</sup>, H.Y. Chung<sup>2</sup>, W.C. S. Lau<sup>2</sup>. <sup>1</sup>Medicine, Queen Mary Hospital, <sup>2</sup>Medicine, The University of Hong Kong, Hong Kong, Hong Kong

**Background:** Conventionally, patients with RA have been managed by scheduled routine consultations by rheumatologists every 3 to 6 months. However, the burden of RA has been increasing globally. Although rheumatology nursing consultation was shown to be an effectiveness management strategy in western countries, its feasibility has not been evaluated in Chinese population. Therefore, we would like to compare the efficacy of rheumatology nursing consultation with usual rheumatologist follow-up in Hong Kong.

**Objectives:** To evaluate the efficacy of rheumatology nursing consultation in patients with stable RA over 1 year.

**Methods:** Study design and patient selection: This is a single centre, randomized controlled, non-inferiority trial conducted in Queen Mary Hospital. Patients with RA were recruited from the rheumatology clinic in Queen Mary Hospital. Subjects have to fulfill the 2010 ACR-EULAR classification criteria for RA, with DAS28-CRP  $\leq 3.2$  for at least 6 months with no increase in dose of conventional synthetic disease modifying anti-rheumatic drugs (csDMARDs). Subjects with systemic manifestation of RA, current malignancies or current use of biologic therapies were excluded.

**Intervention:** Subjects were randomized in a 1:1 ratio to the following treatment groups.

Usual rheumatologist follow-up (control): Subjects were followed up by rheumatologists or registrars every 4 months. The treatment target was to maintain the DAS28-CRP  $\leq 3.2$ .

Rheumatology nursing consultation: Subjects were followed up by the rheumatology nurses every 4 months. At 12 months, all subjects will be reviewed by a senior rheumatologist. The treatment target was to maintain the DAS28-CRP  $\leq 3.2$ .

**Outcomes:** The primary outcome was the difference in proportion of subjects who remained to have DAS28-CRP  $\leq 3.2$  at 12 months. Secondary outcomes included the difference in proportion of subjects with DAS28-CRP  $> 0.6$  at 12 months; the change in modified Sharp score, health assessment questionnaire (HAQ) score, patients' drug compliance from baseline and patients' satisfaction at 12 months.

**Statistical analysis:** SPSS v.22 was used to performed the statistical analyses according to intention to treat and per protocol analysis. The comparisons between 2 groups was performed by Student's t-test for continuous variables and chi-square test for categorical variables. A one-way repeated measures ANOVA was conducted to determine if there was a difference in DAS28-CRP between treatment groups during the study period.

**Results:** 276 subjects were randomized to receive rheumatology nurse consultation or usual rheumatologist follow-up. At 12 months, 95.5% and 90.5% of subjects in the nurse consultation and rheumatologist follow-up remained to have low disease activity respectively, with an adjusted treatment difference of 5.0% (CI -1.27–11.54) and showed non-inferiority with a pre-defined margin of -10%. However, more subjects in the rheumatologist follow-up experienced DAS28-CRP  $> 0.6$  at 12 months. One-way repeated measures ANOVA test showed significant difference in DAS28-CRP between 2 treatment group over time. No statistically significant differences were seen in other outcome measures.

**Conclusions:** Rheumatology nurse consultation is not inferior to regular rheumatologist follow-up for rheumatoid arthritis patients with low disease activity.

**Disclosure of Interest:** None declared

## HPR Measuring health (development and measurement properties of PROs, tests, devices)

### SAT0716-HPR PATIENTS PREFERENCE GOES TO METHOTREXATE AUTOINJECTORS OVER PREFILLED SYRINGES: RESULTS FROM A PHASE III TRIAL, SELFI

A. Saraux<sup>1</sup>, C. Hudry<sup>2,3</sup>, E. Zinovieva<sup>4</sup>, H. Herman-Demars<sup>4</sup> on behalf of All investigators of SELFI study. <sup>1</sup>Rheumatology Department, CHU Cavale Blanche, Brest; <sup>2</sup>Rheumatology Department, Cochin Hospital; <sup>3</sup>Institut de Rhumatologie Paris 8; <sup>4</sup>Medical Department, Nordic Pharma, Paris, France

**Background:** The offer of injectable MTX in Europe expanded during past few years with different types of enhanced devices such as prefilled syringes and autoinjector pens.

**Objectives:** SELFI trial intended to compare historical MTX prefilled syringes vs a new MTX autoinjector in terms of treatment adherence, functional capacity and patients' preference at 6 months in RA patients.

**Methods:** SELFI was a phase III, randomised open-label trial, conducted in France between Sept. 2015 and March 2017. It included RA patients, treated by oral or injectable MTX for  $\geq 3$  months (monotherapy or association). Patients were randomised in two arms: MTX in prefilled syringes (PS) or MTX in autoinjectors (AI) at the dosage decided by the investigator. Primary objectives of the trial were to prove the 4% non-inferiority of AI vs PS in terms of patients' adherence and functional capacity (HAQ-DI) at 6 months. Secondary objectives included the evaluation of satisfaction and patients' preference.

**Results:** Between Sept. 2015 and ,Sept. 2016 50 rheumatologists, mostly in private practice, included 271 patients, 197 of which composed the *per protocol* population. Patients baseline characteristics were [mean ( $\pm$ SD)]: age: 59.2 ( $\pm$ 12.3) yrs; BMI: 26.0 ( $\pm$ 4.9) kg/m<sup>2</sup>; RA duration: 5.35 ( $\pm$ 6.70) yrs; DAS28: 3.1 ( $\pm$ 1.2); HAQ-DI: 0.6 ( $\pm$ 0.6). All patients were treated by MTX (1/3 oral; 2/3 parenteral) at a mean dose of 15.4 ( $\pm$ 4.1) mg/wk. There were no significant differences at baseline between PS and AI arms. At 6 months, the treatment adherence was over 95% for both arms, and HAQ-DI was improved by a mean of 0.05 in both arms. The AI 4% non-inferiority as compared to PS was shown for both primary criteria.

Patients' reported satisfaction was very significantly higher ( $p \leq 0.001$ ) in AI arm vs PS for the following criteria: easy to use, pleasant, satisfying, willingness for further utilisation and significantly higher ( $p < 0.05$ ) for reassuring and not constraining. Of the 132 patients who experienced both devices (during the study or before it), 127 (96%;  $p < 0.001$ ) preferred the auto injector over the historical prefilled syringe. No unexpected safety issues were observed during this trial and injection point safety tolerance satisfaction was higher for AI vs PS.

**Conclusions:** SELFI trial showed that although the new MTX autoinjector is comparable to historical prefilled syringe in terms of treatment adherence and functional capacity improvement, it is significantly superior in terms of patients'

satisfaction. Over 95% of patients who have tried both devices report preferring the pen.

### SAT0717-HPR PSYCHOMETRIC TESTING OF A GERMAN VERSION OF THE EVALUATION OF DAILY ACTIVITY QUESTIONNAIRE IN RHEUMATOID ARTHRITIS

A. Hammond<sup>1</sup>, K. Niedermann<sup>2</sup>, S. Tyson<sup>3</sup>, A. Tennant<sup>4</sup>. <sup>1</sup>Centre for Health Sciences Research, University of Salford, Salford, UK; <sup>2</sup>Gesundheit, ZHAW, Winterthur, Switzerland; <sup>3</sup>Div. Nursing, Midwifery and Social Work, Manchester University, Manchester, UK; <sup>4</sup>ICF Network, Swiss Paraplegic Research, Nottwil, Switzerland

**Background:** The Evaluation of Daily Activity Questionnaire (EDAQ) is a patient reported outcome (PRO) of activity limitations. The English EDAQ is reliable, valid and a comprehensive measure of the commonest problems experienced by people with rheumatoid arthritis (RA) and musculoskeletal conditions.<sup>1,2</sup> It includes 138 items in 14 'domains' (Eating/Drinking; Personal Care; Dressing; Bathing; Cooking; Moving Indoors; House Cleaning; Laundry; Moving and Transfers; Moving Outdoors; Gardening/Household Maintenance; Caring; Leisure/Social Activities). All items are scored on a 0–3 scale (no difficulty to unable to do). There is no similar measure available in German. PROs must be tested in target languages and conditions, prior to use, to ensure validity and reliability.

**Objectives:** To linguistically validate a German EDAQ and test its reliability and validity in German-speaking people with RA.

**Methods:** The English EDAQ was forward-backward translated to German. Cognitive debriefing interviews were conducted and the German EDAQ developed. Participants from a Rheumatology clinic (Switzerland) and arthritis patient organisations (Switzerland, Germany, Austria) then completed postal questionnaires including: demographic questions, German EDAQ, Health Assessment Questionnaire (HAQ), SF36v2, RA Quality of Life scale (RAQOL), and a hand pain numeric rating scale (NRS). Three weeks later, the EDAQ was mailed again. Test-retest reliability of domain scores, and validity of the 14 German EDAQ domains against the other measures, were evaluated using nonparametric correlations. Internal consistency was tested using Cronbach's alpha.

**Results:** Six German-speaking people with RA were interviewed, recommended changes reviewed by the expert panel and the German EDAQ agreed. 163 people then completed questionnaires: 145 women and 18 men; mean age=52.84 (SD14.94) years; mean RA duration=15.73 years (SD12.12). 85 (45%) were employed; 21 had children<18 y at home. Median pain score=4 (IQR 2–6) and fatigue=5 (IQR 3–7).

107 (65%) completed a second questionnaire. Test-retest reliability of total domain scores was excellent for all domains ( $r_s = 0.80–0.93$ ). Internal consistency was high in all domains: Cronbach's alpha=0.84–0.96. All EDAQ domains (except Caring) correlated significantly ( $p < 0.001$ ) with: HAQ  $r_s = 0.73–0.87$ ; SF36v2 (Physical Function)  $r_s = -0.61$  to  $-0.84$ ; SF36v2 Bodily Pain  $r_s = -0.53$  to  $-0.65$ ; SF36v2 (Vitality)  $r_s = -0.27$  to  $0.31$ ; RAQOL  $r_s = 0.55–0.68$ ; and hand pain  $r_s = 0.43–0.52$ . Correlations were lower in the 'Caring' domain due to the smaller sample size ( $n=77$ ), although mostly still significant ( $p < 0.01$ ;  $r_s = 0.25$  to  $0.42$ ; except SF36v2 Vitality= $-0.10$  non-significant).

**Conclusions:** The German EDAQ is a valid and reliable measure of daily activity in people with RA. Either the whole EDAQ or individual domains can be used in clinical practice to identify clients' daily activity problems and help find solutions, or as an outcome measure in research and audit. A User Manual is available.<sup>3</sup>

**SAT0718-HPR ARE THERE SYMPTOMS DISTINGUISHING FIBROMYALGIA FROM CHRONIC PAIN THAT ARE MISSING FROM THE 2016 CRITERIA?**

A.W. St John<sup>1</sup>, K.D. Jones<sup>2</sup>, R. Friend<sup>3</sup>, R.M. Bennett<sup>4</sup>. <sup>1</sup>Department of Anesthesiology and Preoperative Medicine; <sup>2</sup>Schools of Nursing and Medicine, Oregon Health and Science University, Portland; <sup>3</sup>Department of Psychology, College of Arts and Sciences, Stony Brook University, Stony Brook; <sup>4</sup>School of Nursing, Oregon Health and Science University, Portland, USA

**Background:** Fibromyalgia (FM) patients have a wide range of symptoms. **Objectives:** Herein we analysed 20 common symptoms to determine those that best discriminate between FM patients and chronic pain patients without FM (Chronic Pain).

**Methods:** 352 patients (mean age 50+/16.3 years, 70% female) scheduled for a routine examination in two primary care practices were studied. 50 patients (14.2%) had FM (based on 1990 ACR) and 108 patients (30.7%) had Chronic Pain. All subjects completed a survey of 20 symptoms commonly found in FM patients – 10 were from the Symptom Impact Questionnaire (SIQR).

**Results:** Table 1 presents the 20 symptoms ranked by magnitude of Somers' D. This is a statistic that provides an estimate of predicting a diagnosis of fibromyalgia versus no fibromyalgia (OR: 1.87–8.00; p<0.001). The top 10 symptoms showed strong correlations with diagnosis (D=0.49 to 0.64) and large mean differences between the 2 groups (Means: 2.8–4.3). Notably, there was a 4.3 score difference in Persistent Deep Ache and only a 1.4 difference in SIQR Pain (p<0.001). Using a 4-point criterion as a clinical cut-off (0–10), symptoms best discriminating patients with FM from Chronic Pain were: Persistent Deep Aching (86% vs. 36%), Environmental Sensitivity (82% vs. 38%), Poor Balance (82% vs. 35%), Tenderness to Touch (84% vs. 39%) and Pain after exercise (96% vs. 54%). The symptoms of Pain, Unrefreshing Sleep, Muscle Stiffness and Low Energy were high in both groups, thus they are not good discriminators.

**Abstract SAT0718HPR – Table 1.** Twenty common fibromyalgia symptoms ranked by Somers' D. The top 10 symptoms are shaded. SIQR symptoms are italicised.

Symptom	Somers'D (rank)	FM Mean (%)	Chronic Pain Mean (%)	Mean difference
Persistent Deep Aching	.641 (1)	7.40 (86)	3.14 (36)	4.26
Intolerance to Noise	.592 (2)	6.98 (86)	3.27 (34)	3.71
Environmental Sensitivity	.574 (3)	6.82 (82)	3.04 (38)	3.78
Poor Balance	.552 (4)	6.26 (82)	3.06 (35)	3.20
Pain after Exercise	.534 (5)	8.08 (96)	4.07 (54)	4.01
Muscle Weakness	.524 (6)	6.92 (88)	3.77 (42)	3.15
Tenderness to Touch	.511 (7)	6.82 (84)	3.61 (39)	3.21
Muscle Stiffness	.505 (8)	7.68 (94)	4.86 (57)	2.82
Intolerance to Bright Lights	.492 (9)	6.58 (72)	3.41 (33)	3.17
Tender Muscles	.491 (10)	7.90 (94)	4.94 (56)	2.96
Non-refreshing Sleep	.452 (11)	7.54 (84)	4.60 (52)	2.94
Poor Memory	.421 (12)	5.66 (66)	3.03 (37)	2.63
Intolerance to Cold	.414 (13)	6.62 (74)	3.82 (40)	2.80
Irritable Bowel Symptoms	.412 (14)	5.68 (64)	3.05 (31)	2.63
Swollen Joints	.409 (15)	6.16 (76)	3.78 (41)	2.39
Depression	.398 (16)	5.44 (64)	3.17 (42)	2.27
Stiffness	.396 (17)	6.92 (88)	4.54 (53)	2.38
Chronic Headaches	.390 (18)	5.62 (66)	3.45 (38)	2.17
Low Energy	.349 (19)	6.82 (84)	4.92 (61)	1.90
Pain Level	.320 (20)	6.54 (94)	5.12 (69)	1.42

**Conclusions:** In this sample from 2 primary care practices, Persistent Deep Aching, Tenderness to Touch, Environmental Sensitivity, Poor Balance and Pain after Exercise were the best discriminators between FM patients and patients with Chronic Pain. Notably: Depression, Headaches, Poor Memory and Irritable Bowel symptoms were weak discriminators; in fact, none of the top 10 discriminators appear in the 2016 Fibromyalgia Diagnostic Criteria.

**SAT0719-HPR PERFORMANCE-BASED PHYSICAL FUNCTION MEASURE WAS MORE SENSITIVE TO DETECT RESPONDERS THAN SELF-REPORTED MEASURE AFTER A PHYSICAL THERAPY EXERCISE INTERVENTION IN PATIENTS WITH AXIAL SPONDYLOARTHRITIS**

C. Fongen<sup>1</sup>, S.H. Sveaas<sup>1</sup>, A. Bilberg<sup>2</sup>, E. Pedersen<sup>3</sup>, M.W. Johansen<sup>4</sup>, S. van Weely<sup>5</sup>, K.B. Hagen<sup>1</sup>, H. Dagfinrud<sup>1</sup>. <sup>1</sup>Diakonhjemmet Hospital, Oslo, Norway; <sup>2</sup>Sahlgrenska University Hospital, Gothenburg, Sweden; <sup>3</sup>University Hospital of North Norway, Tromsø; <sup>4</sup>Martina Hansen Hospital, Bærum, Norway; <sup>5</sup>Leiden University Medical Center, Leiden, Netherlands

**Background:** Physical function is regarded as an important outcome in axial spondyloarthritis (axSpA) and the self-reported questionnaire Bath Ankylosing Spondylitis Functional Index (BASFI) is recommended for the evaluation. However, it is shown that BASFI may not be sufficiently sensitive to detect changes after physical therapy. Based on BASFI a disease-specific performance-based measure has been developed; the Ankylosing Spondylitis Performance-based Improvement (ASPI).

**Objectives:** To compare the proportion of patients with axSpA considered as responders in the performance-based function measure ASPI and the self-reported BASFI after a physical therapy exercise intervention.

**Methods:** This study was part of the ESpa-study (Exercise for SpondyloArthritis) which examines the effect of 12 weeks, supervised high intensity exercise intervention. Patients with axSpA were included from 4 centres in Scandinavia. Physical function was assessed with ASPI and BASFI at baseline and after 3 months. The ASAS20 response criteria were used to categorise patients as intra-individual responders or non-responders. In BASFI, patients were classified as responders if they showed an improvement of ≥20% and ≥1 unit. In ASPI, patients were classified as responders if they showed an improvement of ≥20% on 1 or more subtest(s) and the absence of deterioration on the potential remaining test. Deterioration was defined as a worsening of ≥20% in 1 or more subtest(s). The proportion of patients categorised as intra-individual (non-) responders was examined with Chi square test.

**Results:** A total of 58 patients (intervention n=30, control n=28) with complete data on ASPI and BASFI were included in the analyses, 41% were male, mean age (SD) was 45 (10.7) years, 55% had radiographic axSpA and mean disease activity (ASDAS) (SD) was 2.6 (0.7). In BASFI, a score of <1 was present in 14% at baseline and in 22% at 3 months, indicating a ceiling effect (figure). The proportion of responders in the total group was 53% in ASPI and 36% in BASFI, p=0.13 (table 1). In the intervention group, 70% were responders in ASPI and 43% were responders in BASFI, p=0.02.

Table. Number of responders measured with performance-based function test (ASPI) and self-reported physical function (BASFI) according to study sub-group

	All patients (n=58)	Intervention (n=30)	Control (n=28)
ASPI Responder	31 (53%)	21 (70%)	10 (36%)
ASPI Non-responder	27 (47%)	9 (30%)	18 (64%)
BASFI Responder	21 (36%)	13 (43%)	8 (29%)
BASFI Non-responder	37 (64%)	17 (57%)	20 (71%)
p-value*	0.13	0.02	0.45

Values are number (percentages). \*Chi square test between (non-) responder in ASPI and BASFI within groups

**Abstract SAT0719HPR – Figure 1.** Distribution of BASFI scores and time in seconds in ASPI assessed at baseline and at 3 months follow-up (n=58). Lower values indicates better physical function in both measures

**Conclusions:** The performance-based physical function measure ASPI was more sensitive to detect responders than the self-reported measure BASFI according to the ASAS20 response criteria in patients with axSpA after a high intensity exercise intervention. Our findings suggest that the performance-based physical function (ASPI) measure is preferable when evaluating physical function after exercise interventions with physical therapy.

### SAT0720-HPR MORE PRECISE MEASUREMENTS OF SPINAL MOBILITY WHEN ASSESSED WITH A SENSOR IN PATIENTS WITH AXIAL SPONDYLOARTHRITIS

C. Fongen<sup>1</sup>, C.H. Franke<sup>2</sup>, D.M. Soldal<sup>2</sup>, V. Berre<sup>3</sup>, J.H. Relbe-Moe<sup>4</sup>, J. Hagfors<sup>4</sup>, A.T. Tveter<sup>1</sup>, N. Østerås<sup>1</sup>, K.B. Hagen<sup>1</sup>. <sup>1</sup>Diakonhjemmet Hospital, Oslo; <sup>2</sup>Hospital of Southern Norway, Kristiansand; <sup>3</sup>Apertus, Bærum; <sup>4</sup>Patient partners, Oslo, Norway

**Background:** Rotation of the spine is one of the principal movements of spinal motion. Cervical rotation (CR) is included in the assessment for monitoring axial spondyloarthritis (axSpA). Thoracolumbar rotation (TLR) is also known to be a valid measure for axSpA specific changes, but is seldom used due to lack of easy feasible measures. Goniometer or myrinometer (compass) is traditionally used to evaluate rotation. A sensor with excellent criterion validity and reliability for rotation in the range of motion from 10 to 120 degrees, that are able to detect changes of  $\leq 1$  degree, has recently been developed<sup>1</sup>.

**Objectives:** To examine the concurrent validity between the sensor and compass in CR and TLR and to evaluate the usability and satisfaction with the sensor.

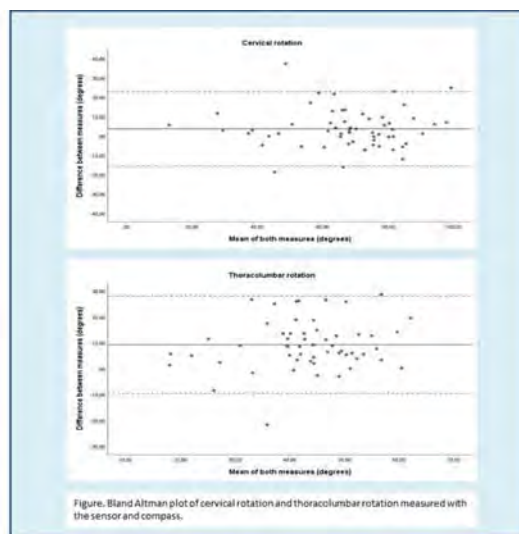

**Methods:** This study was part of the MOSKUS-study (Mobile mosculo Skeletal User Self-management). Patients with axSpA were included from two rheumatology outpatients' clinics and examined by experienced physiotherapists. CR and TLR were assessed three times with both the sensor and compass; mean score are used in the analyses. The measuring order was randomised. The sensor was considered gold standard. Group differences were assessed with paired sample t-test or Wilcoxon signed rank test, and agreement with Bland Altman plot. Time to conduct the test (instruction, conducting and note of results) was recorded for the 10 last included patients. Satisfaction was assessed both by the patients and assessors with numeric rating scale (NRS), (0–10, 10=highest satisfaction).

**Results:** A total of 60 patients with axial SpA and 2 assessors participated. Of the included patients 60% were male, median (min-max) age was 39<sup>20–73</sup> years and 77% had radiographic axSpA. There were statistically significant differences in measure of rotation between the sensor and the compass of 3.7° in CR,  $p=0.01$  and 9.2° in TLR,  $p<0.001$  (table 1). The Band Altman plots show that the compass systematically measured lower rotation than the sensor in both CR and TLR (figure). There was no difference in time used to conduct the measurements. Patients satisfaction in CR measured with the sensor was mean (SD) 7.8 (2.4) and compass 6.7 (2.6),  $p<0.001$  and in TLR 7.8 (2.4) and 7.3 (2.3),  $p=0.08$  respectively. Assessors satisfaction in CR measured with the sensor was 9.0 (1.2) and compass 5.6 (2.8)  $p<0.001$  and in TLR 8.1 (2.2) and 3.6 (2.2)  $p<0.001$ , respectively.

**Abstract SAT0720HPR – Table 1.** Characteristics of rotation measures, agreement and time to conduct measurements

Mobility	Measure	n	Mean (SD)	Mean difference (SD)	p-value	Time in sec, median (min-max), n=10	p-value
Cervical	Sensor	59	69.2 (18.2)			96 (44–216)	
	Compass	59	65.4 (18.2)	3.7 (10.0)	0.01	96 <sup>62–150</sup>	0.36
Thoraco-lumbar	Sensor	56	47.8 (11.8)			107 (36–200)	
	Compass	56	38.6 (10.3)	9.2 (9.5)	<0.001	86 <sup>46–158</sup>	0.92

**Conclusions:** Measure of CR and TLR were significantly lower when measured with a traditional compass compared to a digital sensor. There were no difference in time use and both patients and assessors were more satisfied with the sensor. The results suggest that the sensor gives more precise measurements of rotation and allow a feasible way to assess TLR in daily clinical practise.

**Abstract SAT0720HPR – Figure 1.** Bland Altman plot of cervical rotation and thoracolumbar rotation measured with the sensor and compass.

### SAT0721-HPR IMPROVEMENT IN CLINICAL RESULTS BY ENHANCING ADHERENCE TO A HEALTHCARE MODEL IN RHEUMATOID ARTHRITIS

D. Buitrago-García<sup>1</sup>, L. Villarreal<sup>2</sup>, F. Rodríguez<sup>2</sup>, I. Mendez<sup>2</sup>, P. Santos-Moreno<sup>3</sup>. <sup>1</sup>Epidemiology, SIIES; <sup>2</sup>Health services; <sup>3</sup>Rheumatology, Biomab, Center For Rheumatoid Arthritis, Bogota, Bogota, Colombia

**Background:** A Centre of Excellence (CoE) healthcare model aims to obtain a high quality results from the appropriate and minimal use of resources in rheumatoid arthritis (RA); Enhancing adherence of patients to healthcare model and treatment using a Treat to Target approach and patient education has demonstrated the improvement of patient conditions and clinical results.<sup>1</sup>

**Objectives:** To describe the adherence patterns to a centre of excellence model and clinical outcomes in patients with RA in a specialised centre. For this study researchers defined adherence as the attendance to an appointment with our healthcare team for more than three times during 12 months.

**Methods:** We reviewed the clinical records of patients with RA in a specialised centre during a 12 month period. We included socio demographic variables and the attendance to consultations to rheumatology, psychiatry, physical therapy, occupational therapy, nutrition, and psychology consultations. Descriptive epidemiology was done, percentages and averages were calculated We analysed bivariate association with Pearson's  $\chi^2$ .

**Results:** We included 5413 patients, where 83% were female and 17% were male; mean age was 59 years $\pm$ 12. Mean DAS28 of patients was 2.82 $\pm$ 0.84, where 46% of patients were on remission, 27% in low disease activity, 24% in moderate disease activity and 3% in severe disease activity. The specialty where the adherence was higher was in rheumatology 98%, followed by psychiatry 33%, psychology 29%, physical therapy 28%, occupational therapy 20% and nutrition 13%. In our study 47% of patients were considered as adherents; from all patients who were adherent 75% were in remission or low disease activity. When we compared disease activity with the attendance to all specialties there was statistical association between disease activity and the patients who attended to more than four visits.

**Conclusions:** Patients who attend satisfactory to a multidisciplinary healthcare approach team can achieve better results compared to those who doesn't attend to all medical specialties; thus it is relevant to implement patient education

processes in order to create awareness about the importance and value of each medical specialty, mainly in patients with moderate or severe disease activity.

#### **SAT0722-HPR** THE VALIDITY AND TEST-RETEST RELIABILITY OF THE TURKISH PATIENT SPECIFIC FUNCTIONAL SCALE IN CHRONIC NECK PAIN PATIENTS

G. Yalcinkaya<sup>1</sup>, B. Kara<sup>1</sup>, M.N. Arda<sup>2</sup>. <sup>1</sup>*School of Physical Therapy and Rehabilitation,* <sup>2</sup>*Department of Neurosurgery, Dokuz Eylül University, Izmir, Turkey*

**Background:** Current clinical guidelines recommend to use both clinical and self-reported measurements for evaluation of chronic neck pain. Among the self-reported outcomes, Neck Disability Index (NDI) and Patient Specific Functional Scale (PSFS) are the most widely used and recommended instruments.<sup>1</sup> Although, NDI was validated in Turkish language before, but no validation study related to the PSFS was detected in the literature.

**Objectives:** The purpose of our study was to determine the validity and reliability of PSFS which was not validated in Turkish language previously.

**Methods:** The PSFS has been translated into Turkish (PSFS-T) according to "translation-backward translation" method as recommended in the guidelines. Demographic data, PSFS-T, and NDI were recorded at the initial assessment. For the test-retest reliability analysis, the first 30 patients were called by phone. Intra-class correlation coefficient (ICC) was established for reliability analyses. The correlations between PSFS-T and NDI was examined for the validity analysis.

**Results:** The final form was completed by 110 chronic neck pain patients (F:77, M:33). The mean age of patients was 44±14 and the average duration of pain was 43±49 months. Test retest reliability of PSFS-T was found good level (ICC: 0.85). The relationship between PSFS-T and NDI was found moderate level ( $p < 0.05$ ,  $\rho = -0.578$ ). Furthermore, reading books/newspapers, cleaning and carrying heavy things were reported by Turkish neck patients as the first three activities which are the most problematic for their daily activities of life.

**Conclusions:** PSFS-T is a valid and reliable method of measuring outcome in patients with neck pain. Future studies should focus on the validity and reliability of PSFS-T in different populations.

#### **SAT0723-HPR** COMPARISON OF PHYSICAL ACTIVITY, FATIGUE, HEALTH-RELATED QUALITY OF LIFE, ANXIETY AND DEPRESSION BETWEEN ANKYLOSING SPONDYLITIS AND RHEUMATOID ARTHRITIS PATIENTS

G.I. Kinikli<sup>1</sup>, M.E. Yayla<sup>2</sup>, A. Ates<sup>2</sup>, M. Turgay<sup>2</sup>, G. Kinikli<sup>2</sup>. <sup>1</sup>*Department of Physiotherapy and Rehabilitation, Faculty of Health Sciences, Hacettepe University,* <sup>2</sup>*Department of Rheumatology, Ankara University, Faculty of Medicine, Ankara, Turkey*

**Background:** Rheumatoid arthritis (RA) and ankylosing spondylitis (AS) are chronic progressive inflammatory diseases, leading to joint damage and reducing the physical fitness of patients. They are among the most common rheumatic diseases. Physical inactivity, fatigue, low health-related quality of life (HRQoL), higher anxiety and depression levels are common problems reported in patients both ankylosing spondylitis (AS) and rheumatoid arthritis (RA) although the clinical manifestations differ in many ways. These low outcomes have been found to be associated with functional limitations in both AS and RA serves as mediators in the link between disease activity and functional limitations in spite of NSAIDs and DMARDs therapies. Although many studies have assessed the outcomes of a single disease state, either RA or AS, few studies have focused on a direct comparison between those both diagnostic groups.

**Objectives:** The aim of this study to assess and compare physical activity, fatigue, HRQoL, anxiety and depression levels between AS and RA patients.

**Methods:** Twenty-six RA patients and 18 patients with AS were recruited from the outpatient clinic. Physical activity was assessed using the International Physical Activity Questionnaire-Short Form (IPAQ-SF), a validated instrument comprising of four items that estimates the levels of vigorous activity, moderate activity, walking and time spent sitting during the previous 7 days. The Fatigue Severity Scale (FSS) was used to measure the severity of fatigue. Disease-specific instruments to measure (HRQoL) in patients with RA and AS (RAQoL and ASQoL) were used. The Hospital Anxiety and Depression Scale (HADS) were used to assess anxiety and depression. The patient groups were compared using the Kruskal-Wallis test and the Chi-square test.

**Results:** Disease durations were similar between RA (mean age=48.92±12.50 years, disease duration=10.81±7.68 years) and AS (mean age=43.44±12.36 years, disease duration=11.39±8.87 years) patients ( $p=0.867$ ). There was no statistically difference between FSS (RA=45.27±16.95; AS=41.00±12.95;  $p=0.173$ ), IPAQ-SF (RA=1289.65±839.75; AS=2110.06±1210.86;  $p=0.062$ ) and HADS scores (RA=18.31±2.93; AS=17.00±2.87;  $p=0.123$ ) in both patient groups.

**Conclusions:** Our results support that physical inactivity due to impaired mobility as well as fatigue, anxiety/depression and low (HRQoL) are common and similar features of both RA and AS. In conclusion, management of disease activity with drug therapies should be targeted not only to improve physical function for RA and AS but also to improve physical activity levels, restore fatigue, anxiety and depression levels and preserve HRQoL.

#### **SAT0724-HPR** TECHNOLOGICAL ASSISTED REHABILITATION FOLLOWING TOTAL KNEE JOINT REPLACEMENT. A RANDOMISED CONTROLLED NON-INFERIORITY TRIAL

H.H. Andersen. *University of Southern Denmark, Odense, Denmark*

**Background:** Supervised rehabilitation after total knee arthroplasty (TKA) has been suggested effective for quicker recovery. The effect of Technological Assisted Rehabilitation (TAR) in the participant's home compared to supervised rehabilitation has been investigated in trials and results suggest it being equal to supervised rehabilitation on short time follow-up (6 weeks to 4 months). No studies have been found that evaluate the effect of TAR on follow-ups longer than 4 months.

**Objectives:** The aim of this study was to evaluate the effect of TAR compared to supervised rehabilitation (usual care) on participants with TKA after 6 and 12 months.

**Methods:** This was a single-blinded, randomised controlled, non-inferiority study. 155 participants were randomised to either TAR (ICURA) or usual care. Intervention time was 6 weeks, follow-ups were after intervention, at 6 and 12 months. This study only concluded on 6 and 12 months. Primary outcome was 10 m walk test. Secondary outcomes were 2.45 m up and go, 30 s. Sit to Stand, active knee flexion and extension and the KOOS questionnaire. All outcomes were measured at all time points by a blinded assessor. Non-inferiority margin was no statistical significant- and less than 10% between group difference at 6 and 12 months, estimated by a repeated measurement analysis, adjusted for relevant baseline variables.

**Results:** Overall, the groups did not differ at baseline. No statistical between group difference was detected after 6 and 12 months for primary and secondary outcomes. A power analysis suggested severe lack of power to detect a statistical between group difference, due to high numbers of participants lost to follow-up after 6 and 12 months. The between group difference at 6 and 12 months was less than 10% for all outcomes except KOOS Quality of Life at 6 months, were a difference of 12.2% was detected, in favour of ICURA

**Conclusions:** The results show that the effect of ICURA is equal to usual care after 6 and 12 months. Because lack of power after 6 and 12 months, the statistical significance should be interpreted with caution, but overall between group difference after 6 and 12 months was less than 10% for primary and secondary outcomes.

**SAT0725-HPR** **COMPARATIVE ANALYSES OF RESPONSIVENESS BETWEEN THE RHEUMATOID ARTHRITIS IMPACT OF DISEASE (RAID) SCORE, OTHER PATIENT REPORTED OUTCOMES AND DISEASE ACTIVITY MEASURES: SECONDARY ANALYSES FROM THE ARCTIC STUDY**

K. Holten<sup>1,2</sup>, J. Sexton<sup>1</sup>, T.K. Kvien<sup>1,2</sup>, E.A. Haavardsholm<sup>1,2</sup>, A.-B. Aga<sup>1</sup>.

<sup>1</sup>Department of Rheumatology, Diakonhjemmet Hospital; <sup>2</sup>Faculty of Medicine, University of Oslo, Oslo, Norway

**Background:** The RAID score is a patient-derived patient reported outcome measure (PROM), developed by a EULAR task force, that assesses the impact of RA on seven important domains. Responsiveness of the RAID score was assessed in the preliminary validation,<sup>1</sup> but more data is needed on the sensitivity to change, especially compared to other PROMs and other conventional outcome measures.

**Objectives:** The objective of this study was to assess the changes in the RAID score in patients with early RA during the first six months of intensive DMARD treatment, and to evaluate the responsiveness of RAID after 3 months compared to other PROMs and conventional measures of disease activity.

**Methods:** RA patients with short disease duration were followed in the 24 month treat-to-target strategy ARCTIC trial.<sup>2</sup> The responsiveness of the RAID score was evaluated by calculating the Standardised Response Mean (SRM) followed by the Relative Efficiency (RE) with respect to the Ritchie Articular Index. SRMs and RE were also calculated for other PROMs and clinical outcome measures. An SRM with absolute value above 0.80 was considered high.

**Results:** 230 RA patients were included. The mean symptom duration was 7.09 ±5.40 (±SD) months, the baseline mean RAID score was 4.49±2.14. At the 3 month follow-up, the mean change score for RAID was -2.25±1.98 and the SRM was -1.13 (-1.33 to -0.96) (table 1).

Table Mean change±SD and standardised response mean (SRM) with 95% confidence intervals for patients reported outcomes and conventional disease activity measures at 3 and 6 months

	3 months		6 months	
	Change, mean±SD	SRM (95% CI)	Change, mean±SD	SRM (95% CI)
RAID	-2.25±1.98	-1.13 (-1.33 to -0.96)	-2.39±1.98	-1.21 (-1.38 to -1.06)
DAS	-1.71±1.04	-1.63 (-1.89 to -1.42)	-1.95±1.09	-1.80 (-2.04 to -1.60)
ESR	-10.9±15.0	-0.73 (-0.83 to -0.63)	-11.7±16.5	-0.71 (-0.84 to -0.59)
CRP	-9.68±18.4	-0.53 (-0.62 to -0.43)	-10.8±19.5	-0.55 (-0.63 to -0.48)
Swollen joint count	-8.86±6.89	-1.28 (-1.46 to -1.14)	-9.63±7.41	-1.30 (-1.46 to -1.17)
Ritchie Articular Index	-5.75±6.03	-0.95 (-1.12 to -0.80)	-6.33±6.30	-1.01 (-1.15 to -0.88)
Patient global assessment VAS	-28.3±24.2	-1.17 (-1.35 to -1.02)	-30.2±25.2	-1.20 (-1.38 to -1.05)
Physician global assessment VAS	-26.2±19.2	-1.37 (-1.54 to -1.22)	29.2±20.7	-1.41 (-1.58 to -1.27)
PROMIS physical function	14.8±13.7	1.08 (0.96 to 1.22)	15.5±14.0	1.11 (0.97 to 1.26)
Fatigue VAS	-13.3±29.3	-0.45 (-0.60 to -0.32)	-16.0±29.8	-0.54 (-0.68 to -0.40)
Joint pain VAS	-27.7±24.4	-1.14 (-1.31 to -0.98)	-29.5±25.2	-1.17 (-1.35 to -1.02)
SF-36 Physical component	8.99±9.02	1.00 (0.84 to 1.18)	9.19±9.47	0.97 (0.83 to 1.14)
SF-36 Mental component	3.89±10.6	0.37 (0.23 to 0.52)	3.02±10.8	0.28 (0.15 to 0.43)

The RAID score was more efficient in detecting change than the Ritchie Articular Index and also demonstrated relatively high efficiency in detecting change compared to other PROMs and clinical outcome measures (figure 1).

**Abstract SAT0725HPR – Figure 1.** Relative efficiency to tender joint count (Ritchie Articular Index) of the various outcomes reflecting disease activity at 3 months follow-up (Ritchie Articular Index = reference with a relative efficiency of 1.00).

**Conclusions:** The RAID score proved to be highly responsive to change in RA patients with short disease duration who followed a treat-to-target strategy. The RAID score was efficient in detecting change compared to other PROMs and conventional disease activity measures.

**SAT0726-HPR** **IMPROVEMENT OF HAND FUNCTION, PHYSICAL CAPACITY AND QUALITY OF LIFE OF SYSTEMIC SCLEROSIS PATIENTS AFTER AUTOLOGOUS HEMATOPOIETIC STEM CELL TRANSPLANTATION**

K.R. Costa Pereira<sup>1</sup>, J.B. Elias<sup>1</sup>, D.A. Moraes<sup>1</sup>, A.L.C. Guimaraes<sup>2</sup>, J.T. Garcia<sup>2</sup>, M. C. Oliveira<sup>3</sup>, V. Leopoldo<sup>3</sup>, A.F. Zombirilli<sup>3</sup>, T.M. Costa<sup>1</sup>, A.B.P. Stracieri<sup>1</sup>, B. P. Simoes<sup>4</sup>, M.C.C. Oliveira<sup>1</sup>. <sup>1</sup>Division of Clinical Immunology Ribeirao Preto Medical School; <sup>2</sup>Ribeirao Preto School of Philosophy, Sciences and Literature; <sup>3</sup>Ribeirao Preto School of Nursing; <sup>4</sup>Division of Hematology, Ribeirao Preto Medical School, University of Sao Paulo, Ribeirao Preto, Brazil

**Background:** Systemic sclerosis (SSc) is characterised by skin thickening and visceral involvement, leading to impairment of physical function, daily life activities and quality of life. Severe cases usually have poor prognosis, despite conventional immunosuppressive treatment. Autologous hematopoietic stem cell transplantation (AHST) has been investigated as treatment for patients with severe SSc and promotes reduction of skin thickening and at least stabilisation of visceral involvement. There are no reports in the literature addressing the influence of AHST on hand function and physical capacity of SSc patients.

**Objectives:** To evaluate the impact of AHST on skin involvement, hand function, physical capacity and quality of life (QoL) of SSc patients.

**Methods:** This is a prospective longitudinal study of a cohort of 27 SSc patients who underwent AHST at a University Hospital in the state of São Paulo, Brazil. Patients were evaluated before, and at 6, 12 and 24 months after transplant. The evaluations included modified Rodnan skin score (mRSS), hand function (hand-grip strength, finger-to-palm distance – FTP, range of motion measures, DASH and COCHIN questionnaires), mouth opening, six-minute walk test (6MWT) and quality of life questionnaire (SF-36). Results were subjected to statistical analyses and significance levels were established at p<0.05.

**Results:** Twenty-seven patients were evaluated before and at 6 months after transplant, 22 of which were additionally evaluated at 12 months, and 13 patients at 24 months post-transplant. At 12 months after AHST, patients presented significant improvement of mRSS (p<0.01), hand grip strength (p<0.01), range of motion of hands (p<0.01, except for 1 metacarpophalangeal joints of both hands), FTP distance (p<0.01), DASH (p<0.01), COCHIN (p<0.01), mouth opening (p<0.01), 6MWT distance (p=0.01), and physical (p<0.01) and mental (p=0.02) components of the SF-36, when compared to pre-transplant evaluations. Significant correlations were observed between skin involvement and range of motion measures (dominant hand: R=-0.65, p<0.01; non-dominant hand: R=-0.59,

p<0.01), and between the 6MWT distance and quality of life (R=0.62, p<0.01), and between DASH and quality of life (R=-0.48, p=0.03).

**Conclusions:** AHSCT enhances the functional status of SSc patients, significantly improving skin involvement, hand function, physical capacity and quality of life. These results can be interpreted as positive outcomes of AHSCT for SSc.

**SAT0727-HPR CRITERION VALIDITY AND RELIABILITY OF A SUBMAXIMAL TREADMILL TEST IN JUVENILE IDIOPATHIC ARTHRITIS PATIENTS**

K. Risum<sup>1</sup>, E. Edvardsen<sup>1</sup>, A.M. Selvaag<sup>1</sup>, Ø. Molberg<sup>1</sup>, H. Dagfinrud<sup>2</sup>, H. Sanner<sup>1</sup>.  
<sup>1</sup>Oslo University Hospital; <sup>2</sup>Diakonhjemmet Hospital, Oslo, Norway

**Background:** For both research purposes and daily clinical practice, a feasible exercise test with acceptable measurement properties is needed to measure exercise capacity in juvenile idiopathic arthritis (JIA) patients.

**Objectives:** To evaluate the criterion-validity, test-retest reliability and inter-rater reliability of an eight-minute submaximal treadmill test, which can be used to estimate VO<sub>2peak</sub><sup>1</sup>, in JIA patients.

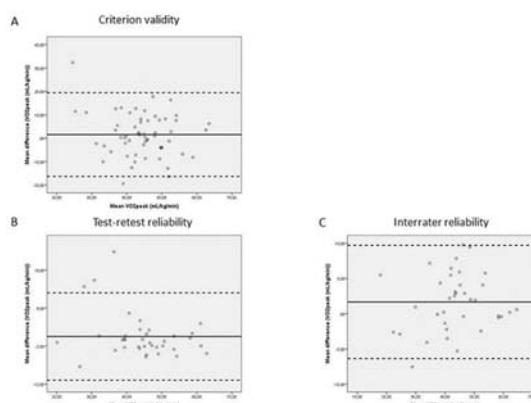

**Methods:** 59 patients with oligo- (n=30) and polyarticular (n=29) JIA (mean age (SD) 13.6 (2.2), 50 girls) participated in this study. They performed a maximal treadmill test until exhaustion to measure the VO<sub>2peak</sub> directly and the eight-minute submaximal treadmill test to estimate the VO<sub>2peak</sub>. A standardised formula was used to estimate the VO<sub>2peak</sub><sup>1</sup>. To evaluate the reliability, 37 patients also performed the submaximal treadmill test twice on the same day 1–4 weeks after the initial test. Paired t-tests were used to test potential differences between the tests. Criterion validity and reliability were evaluated with two ways mixed interclass correlation coefficient<sub>agreement</sub> (ICC). Limits of agreement (LoA) (Bland and Altman method), standard error of measurement (SEM<sub>agreement</sub>) and smallest detectable change (SDC<sub>95</sub>) were calculated to evaluate the measurement error of the submaximal treadmill test.

**Results:** No significant difference was found between the observed and estimated VO<sub>2peak</sub> (mL·kg<sup>-1</sup>·min<sup>-1</sup>), 44.8 (8.8) vs 43.2 (10.3) respectively, p=0.18. The single ICC (95% CI) value at individual level between the estimated and measured VO<sub>2peak</sub> was moderate; ICC 0.55 (0.34–0.70) while the ICC at group level was good; 0.71 (0.51–0.82). The measurement errors were large (SEM 6.5 and SDC<sub>95</sub> 18.0). The single ICC value for test-retest reliability and interrater reliability were good to excellent, 0.84 (0.71–0.91) and 0.92 (0.83–0.96), respectively. The ICC value at group level for test-retest reliability and interrater reliability were excellent, 0.91 (0.83–0.96) and 0.96 (0.91–0.98), respectively. There were no significant differences between estimated VO<sub>2peak</sub> (mL·kg<sup>-1</sup>·min<sup>-1</sup>) when comparing the results from the three performed submaximal treadmill tests. The measurement errors were moderate/large for both test-retest reliability and interrater reliability (table 1). The Bland Altman plots showed no systematic differences, but confirmed the large variability for both the validity and reliability (figure 1).

Table. Reliability and measurement error of the submaximal treadmill test

	Test*	Retest*	Difference*	SEM <sub>agreement</sub>	LoA	SDC <sub>95</sub>

	Tester 1*	Tester 2*	Difference*	SEM <sub>agreement</sub>	LoA	SDC <sub>95</sub>
Est VO <sub>2peak</sub> (mL·kg <sup>-1</sup> ·min <sup>-1</sup> )	44.3 (11.0)	42.7 (10.5)	1.6 (4.1)	3.1	-6.4–9.7	8.6

\*Values are mean (SD).

**Abstract SAT0727HPR – Figure 1.** Limits of agreement for VO<sub>2peak</sub> (mL/kg/min) for criterion validity (A), test-retest (B) and interrater reliability (C).

**Conclusions:** The submaximal treadmill test is valid for use in JIA patients on group level, but showed only moderate validity on an individual level. The test-retest and intra-rater reliability is good to excellent; however, the measurement errors are large. Our findings indicate that the submaximal treadmill test is not optimal for use in daily clinical practice to estimate VO<sub>2peak</sub> in individual patients and it is important to be aware of the large measurement errors.

**SAT0728-HPR EVALUATION OF THE EFFECTIVENESS OF AN EDUCATIONAL PROGRAM IN PATIENTS WITH OSTEOARTHRITIS OF THE KNEES**

L.Y. Miura, A. Jones, C. Brumini, J. Natour. UNIFESP, São Paulo, Brazil

**Background:** Osteoarthritis (OA) is the most common chronic joint disease, affecting about 50% of the population aged 65 or over, its incidence tends to increase according to the age.

Educational intervention is considered an important part of treatments for chronic diseases. However, in the literature, for OA there is still no standard of educational program to be followed.

**Objectives:** To evaluate the effectiveness of the educational intervention in patients with knee osteoarthritis regarding to pain, function, anxiety and quality of life

**Methods:** Sixty patients with knee OA, both genders and age between 40 to 80 years, were included. The patients were randomised into 2 groups: Experimental Group (EG) received an educational intervention, composed of 5 consecutive sessions held once a week, with a duration of 60 min each session. At the end of the last class, a booklet was given to each patient with all the content of the classes. In addition to the educational program, this EG also received a TENS (Transcutaneous Nerve Electrical Stimulation) treatment performed twice a week for 5 weeks for 40 min each session. Control group (CG) received the same TENS treatment as EG group.

The evaluations were performed at baseline, 4 and 12 weeks after baseline with the following instruments: numerical pain scale (NPS) for pain; WOMAC questionnaire and 6 min walk test for function; IDATE questionnaire for anxiety and SF-36 questionnaire for quality of life.

**Results:** Regarding the variables pain, function, anxiety and quality of life, no statistically significant difference was found between groups over time. (table 1)

The intragroup comparisons show no improvement in both groups between T0 and T4 and T0 and T12for: pain; function total and pain score of WOMAC and domains physical role functioning and social role functioning of SF-36 (table 1)

#### SAT0729-HPR FIRST EXPERIENCES WITH ONLINE REMOTE MONITORING IN PATIENTS WITH INFLAMMATORY RHEUMATIC DISEASES

L. Renskers<sup>1</sup>, S.A.A. Rongen<sup>1,2</sup>, A.M.P. Huis<sup>1</sup>, P. L. C. M. van Riel<sup>1,2</sup>. <sup>1</sup>IQ Healthcare, Radboud university medical center, Nijmegen; <sup>2</sup>Rheumatology, Bernhoven, Uden, Netherlands

**Background:** Inflammatory rheumatic diseases (IRDs) such as Rheumatoid Arthritis (RA) and Psoriatic Arthritis (PsA) are characterised by a fluctuating disease course. Because of these fluctuations, the disease activity in between outpatient visits can be different from the disease activity objectively measured at outpatient visits. In order to capture the in between disease activity and to encourage patients to take an active role in their disease management, iMonitor<sup>1</sup> was developed. This online self-monitoring tool allows patients to complete Patient-Reported Outcome Measures (PROMs) in order to get insight in their disease activity.

**Objectives:** To gather patient experiences regarding online remote monitoring in IRDs and to provide recommendations in order to efficiently arrange and optimise self-monitoring.

**Methods:** This mixed-method study was conducted at a teaching hospital (Bernhoven, Uden, the Netherlands) from April 2016 until August 2017. Adult patients with RA or PsA were eligible to participate and were recruited by means of purposive sampling. Four instruction classes were organised in which patients received instructions regarding how to use iMonitor. Patients indicated which PROM(s) they preferred to complete (HAQ, RAID, and/or RADAI-5) and at which frequency (one-, two-, four-, six-, or eight-weeks). The system generated an alert email accordingly, adherence was determined by checking whether the PROM was completed within the time interval. Level of congruence between DAS28-scores and PROM-values (very poor – very good) were independently determined by two researchers (LR and PvR). Facilitators and barriers with regard to using iMonitor were collected by means of a focus group discussion and four telephone interviews.

**Results:** Seven patients with PsA and 32 with RA participated in this study. Most were female (n=23, 59%). Mean (±SD) age was 56.6 (10.7) years. RAID was chosen most often (29 times). Most patients (n=25) chose a four-week PROM-frequency. Mean adherence was 52.9%, patients with a one-week frequency were most compliant (73.8%). Regarding the congruence between DAS28 and PROMs, RAID scored best. Overall, patients were positive about iMonitor. They felt more aware about their disease and its consequences, felt supported in

handling their disease, and gained more knowledge about their disease (activity). Based on our first experiences, recommendations for optimal self-monitoring are: 1) Patients need to be actively recruited 2) Tailored education (e.g. instruction class) is useful for some patients in order to get familiar with the program. 3) Patients need to get feedback from their healthcare provider regarding their outcomes. 4) Working with a stand-alone system such as iMonitor is not feasible, it should be integrated in an existing (hospital) system.

**Conclusions:** Self-monitoring is a first step towards personalised healthcare. Patients become more aware about their disease and gain more knowledge about their disease (activity), which can result in increased self-management. Future research should investigate the possibility of skipping outpatient visits for those patients with stable disease activity.

#### SAT0730-HPR DEVELOPMENT OF PSYCHOMETRICALLY EQUIVALENT SHORT FORMS TO MEASURE DISEASE AND TREATMENT ASSOCIATED KNOWLEDGE IN RHEUMATOID ARTHRITIS: APPLICATION OF ITEM RESPONSE THEORY (IRT)

M. Oude Voshaar<sup>1</sup>, M. de Jonge<sup>2</sup>, L. Renskers<sup>2</sup>, S. Rongen<sup>2,3</sup>, M. van de Laar<sup>1</sup>, A. Huis<sup>2</sup>, P. Van Riel<sup>2</sup>. <sup>1</sup>Psychology, Health and Technology and Arthritis center Twente, University of Twente, Enschede; <sup>2</sup>IQ Healthcare, Radboud Institute for Health Sciences, Radboud university medical center, Nijmegen; <sup>3</sup>Rheumatology, Bernhoven, Uden, Netherlands

**Background:** Patient education can be used to support and enable people with Rheumatoid Arthritis (RA) to optimise health and wellbeing. It has been recommended as an integral part in management of RA in order to undertake self-management activities or to adhere to treatments. Disease-specific knowledge can be measured with a Patient Knowledge Questionnaire (PKQ). Because PKQs in RA are outdated, de Jonge et al. developed the Disease and Treatment Associated Knowledge in Rheumatoid Arthritis (DataK-RA) item bank and provided preliminary evidence to support its construct validity. It was developed with input from patients and rheumatology experts. DataK-RA contains 42 multiple choice items with 2–4 response alternatives per item and was calibrated using the two parameter item response model for dichotomous responses. IRT scores are corrected for item characteristics, which allows scores to be compared between measures that include different items. IRT models also provide detailed information about the precision of scores at different levels of knowledge. Various methods are available that can help select optimal items to be administered to patients, given certain criteria.

**Objectives:** The objective of this study was to develop two DataK-RA short forms using linear optimal test design.

**Methods:** The open source excel add in “solver” was used to program a linear optimisation algorithm to develop two short forms. The algorithm was instructed to optimise precision (i.e. reliability) of the scores for both short forms, subject to the constraints that: 1) each item could only be included in one short form 2) each short form should include 15±1 items, 3) reliability for each short form should be >0.70 for all patients who are within 1 SD of the mean of knowledge scores, and 4) scores on each short form should be similarly precise, defined as maximum allowable difference in information of 0.15.

**Results:** Two short forms were derived from the DataK-RA item bank that satisfied all content constraints. The short forms include respectively 15 and 16 unique items. Reliabilities across different score levels ranged from 0.71–0.80 for both short forms, and the maximum difference in information between the short forms was 0.13.

**Conclusions:** DataK-RA is a new and promising tool that can be used by healthcare providers to measure disease and treatment related knowledge in patients with RA. The short forms can be used in pre/posttest intervention studies in which disease related knowledge is one of the outcomes. Because each short form includes unique items and IRT scores are adjusted for item characteristics, the application of these short forms will allow users of DataK-RA to avoid learning effects commonly associated with using the same items at two occasions. Furthermore, the equal and high reliabilities of both forms ensure that the observed score distributions for both versions will have similar variances.

**SAT0731-HPR** EARLY POSTOPERATIVE OUTCOMES OF UNILATERAL VERSUS BILATERAL TOTAL KNEE ARTHROPLASTY

M. Eymir<sup>1</sup>, B. Ünver<sup>1</sup>, V. Karatosun<sup>2</sup>. <sup>1</sup>School of Physical Therapy and Rehabilitation; <sup>2</sup>Department of Orthopaedics and Traumatology, School of Medicine, Dokuz Eylül University, Izmir, Turkey

**Background:** Many patients in need of total knee arthroplasty (TKA) have bilateral symptoms and require surgery to both extremities. Performance of a bilateral procedure under a single anaesthetic provides a reduced hospitalisation time, an isolated anaesthesia risk, a single rehabilitation, and substantial cost savings. However, previous studies' reports vary from unilateral TKA producing better outcomes than bilateral TKA, the 2 procedures producing no significant difference, and bilateral TKA producing a better outcome than unilateral TKA. There is a need for new studies to examine the differences between unilateral and bilateral TKA in terms of the early postoperative outcomes.

**Objectives:** The aim of this study was to compare the effect of the unilateral and bilateral TKA on the early postoperative outcomes.

**Methods:** The study group consisted of 71 patients (106 knees), who underwent primary TKR because of arthrosis were stratified either unilateral or bilateral TKA status. The mean age of unilateral (n=36) subjects were 66.00±10.71 years, and the mean age of bilateral (n=35) subjects were 64.17±7.61 years. Patients were evaluated regarding the knee function score (Hospital for Special Surgery (HSS) score), pain (Numeric Pain Rating Scale (NPRS)), knee range of motion, length of hospital stay, the day of active straight leg raise, the day of knee flexion angle achieved 70 degrees, quality of life (Short-Form 12 Health Survey (SF-12)). Functional activities were evaluated using the Iowa Level of Assistance Scale and walking speed was evaluated using the Iowa Ambulation Velocity Scale. Patients were evaluated preoperatively and at discharge. All patients underwent the same rehabilitation program.

**Results:** At baseline, demographic and anthropometric characteristics were similar in groups and there was no statistically difference between groups (p>0.05). When the patients' knee range of motion were compared, there were statistically differences (p=0.027) between groups after surgery. The unilateral group had better results in terms of postoperative knee flexion degree. There were no statistical differences in terms of the pain degree, HSS score, length of hospital stay, the day of active straight leg raise, the day of knee flexion angle achieved 70 degrees, IOWA help level and IOWA walking speed, SF-12 score between groups before and after TKA (p>0.05).

**Conclusions:** According to our results, the unilateral group had better result in terms of postoperative knee flexion degree. On the other hand, the bilateral method may provide an advantage in terms of a single rehabilitation, and substantial cost savings. Therefore, in this comparison to obtain more comprehensive results studies on larger series are needed. In this way, a more uniform and objective data can be achieved.

**SAT0732-HPR** RATING OF PERCEIVED EXERTION IN PATIENTS WITH RHEUMATOID ARTHRITIS – WHICH ARE THE CORRELATES?

N. Brodin<sup>1,2</sup>, N. Bobst<sup>3</sup>, C.H. Opava<sup>4</sup>. <sup>1</sup>Division of Physiotherapy, Karolinska Institutet, Department of Neurobiology, Care Sciences and Society, Huddinge; <sup>2</sup>Division of Physiotherapy, Danderyd University Hospital, Department of Orthopaedics, Stockholm, Sweden; <sup>3</sup>Departement G, Zürcher Hochschule für angewandte Wissenschaften (ZHAW), Zurich, Switzerland; <sup>4</sup>Division of Physiotherapy, Karolinska Institutet, Department of Neurobiology, Care Sciences and Society, Huddinge, Sweden

**Background:** People with rheumatoid arthritis (RA) are recommended to participate in physical activity to improve or maintain their health. The intensity of the physical activity is important to gain the health benefits. One way for the individual to monitor the intensity of physical activity is to use the Borg scale for rating of perceived exertion (RPE), which is claimed to be strongly correlated to heart rate (HR). While this is true for healthy individuals, RPE in people with RA might however be influenced by a range of additional factors.

**Objectives:** To analyse correlates of RPE assessed at the end of an aerobic capacity test in patients with RA.

**Methods:** Data from 192 people with RA participating in the <sup>PARA</sup> 2010 study were analysed. Their mean age was 59 years (SD 9.7), 159 (83%) were women, mean disease duration was 12 years (SD 9.4), mean DAS28 score was 2.95 (SD 1.25) and median Health Assessment Questionnaire (HAQ) score 0.375 (range 0–1.875). Submaximal tests of aerobic capacity on bicycle ergometers were performed according to the Åstrand protocol and perceived exertion was rated on the Borg RPE scale.<sup>9–20</sup> Data on the potential correlates pain (VAS, 0–100), fatigue (VAS, 0–100), general health perception (GHP, VAS, 0–100), lower extremity function (Timed Stands Test, TST, s), healthy physical activity levels (yes/no),

activity limitation (HAQ, 0–3), fear avoidance beliefs (Fear avoidance beliefs questionnaire, FABQ, 0–24), exercise self-efficacy (Exercise Self Efficacy Scale, ESES, 6–60), and depression (EQ5D, question # 5, 1–3) were collected. Generalised linear models (GLM) with normal log models were used to calculate each variable's correlation with the RPE. Correlates with p-value<0.10 were entered in a forward stepwise model.

**Results:** The correlation between RPE and working HR at the end of the aerobic capacity test was  $r_s=0.15$  (p<0.05). Analysis using GLM identified general health perception, lower extremity function, activity limitation, depression, resting HR and working HR as correlates of RPE with p-value<0.10. A forward stepwise model including these variables, together with age and gender, identified lower extremity function (OR: 1.0044/s, p=0.0001), resting HR (OR: 0.9977/beat, p=0.0071) and working HR (OR: 1.0030/beat, p<0.0000) as correlates of RPE.

**Conclusions:** As expected, RPE correlated with working HR, but only weakly. Although our study participants were instructed to focus on perceived central exertion in their ratings, it seems that they were not able to distinguish that from peripheral exertion. Considering this bias in ratings, wearable HR monitors should be recommended to people with RA for accurate feedback on physical activity intensity.

**SAT0733-HPR** DUTCH RECOMMENDATIONS FOR PHYSICAL THERAPY IN AXIAL SPONDYLOARTHRITIS (AXSPA)

S. van Weely<sup>1</sup>, F. van der Giesen<sup>1</sup>, F. van Gaalen<sup>2</sup>, I. van der Horst-Bruinsma<sup>3</sup>, S. Ramiro<sup>2</sup>, A. Weel<sup>4</sup>, N. Lopuhaä<sup>5</sup>, T. Vliet Vlieland<sup>1</sup>. <sup>1</sup>Orthopaedics, Rehabilitation and Physical Therapy; <sup>2</sup>Rheumatology, Leiden University Medical Center, Leiden; <sup>3</sup>Rheumatology, VU University Medical Center, Amsterdam; <sup>4</sup>Rheumatology, Maastricht Ziekenhuis, Rotterdam; <sup>5</sup>Dutch Arthritis Foundation, Amsterdam, Netherlands

**Background:** According to the ASAS/EULAR recommendations, physical therapy (PT), especially exercise therapy, is an essential element within the management of axSpA.<sup>1</sup> In the Netherlands considerable variation in the delivery of PT was observed,<sup>2</sup> suggesting suboptimal care delivery. This practice variation is likely to be related to the lack of specific recommendations regarding referral, assessment, content, and monitoring of its effectiveness and safety.

**Objectives:** To develop practice recommendations on PT in axSpA.

**Methods:** A taskforce of 31 experts was responsible for the recommendations. It consisted of patients,<sup>2</sup> rheumatologists,<sup>7</sup> physical therapists,<sup>13</sup> policy makers,<sup>3</sup> researchers<sup>2</sup> and representatives of patient organisations.<sup>4</sup> These were based on scientific evidence, expert opinion and patient values and were formulated following a combination of literature review and three expert-group meetings. Clinical questions were formulated in the first expert-group meeting. Then, a systematic literature review was performed to answer the clinical questions. It focused on systematic reviews, meta-analyses and (inter)national guidelines recommendations and consensus statements published after 2010 in English or Dutch. When this approach did not yield sufficient information, relevant RCTs or other types of research designs addressing (one of) the clinical questions were selected. Subsequently, draft recommendations based on the literature, expert opinion and patient values were formulated and discussed in a second meeting. In the third expert group meeting the recommendations were finalised and the level of agreement was determined by a written voting (rating from 1 (total disagreement) to 10 (total agreement)). We defined agreement if at least 80% voted ≥8.

**Results:** In the first meeting 18 clinical questions were formulated. Six questions pertaining to the content and safety of PT were merged and integrated. In total 12 practice recommendations were formulated on indication,<sup>2</sup> referral,<sup>2</sup> assessment/monitoring,<sup>2</sup> treatment,<sup>5</sup> reporting<sup>1</sup> and safety.<sup>2</sup> (Figure 1) Three recommendations were (partly) based on level 1 evidence (Dutch Evidence Based guidelines, EBRO); others were based on lower levels combined with the opinion of experts written in literature. Agreement was reached for 11 out of 12 recommendations. Mean levels of agreement were high and varied between 8.5–9.1.

Indication and referral	
1	Describes indications and reasons for referral to a PT
2	Describes the information that a referral to a PT should contain
Assessment and monitoring	
3	Describes selection of domains, personal and environmental factors that should be assessed at intake and monitoring
4	Describes recommended and optional measuring instruments in the PT assessment
Analysis, objectives, treatment plan, and treatment	
5	Describes on which factors the choice for the duration and form of a PT intervention should be based
6	Describes how a personalized plan should be made and which elements are included (information, education, supervised exercise therapy and planning)
7	Describes the intensity, duration and frequency of the exercise therapy and exercise plan, including monitoring
8	Describes when land or water-based exercise therapy is preferred.
9	Describes which interventions are not recommended in treatment.
Reporting	
10	Describes the information a report from a physiotherapist should contain to give insight in the treatment-effects
Safety	
11	Describes that consideration should be taken to certain comorbidities and axSpA specific aspects that can influence the daily functioning and the therapeutic process and what the contra-indications and PT modalities are
12	Describes information relevant to patients in relation to an increased fracture risk

**Abstract SAT0733HPR – Figure 1.** Short description of the content of the Dutch recommendations for physical therapy in axial Spondyloarthritis (axSpA)

**Conclusions:** Using a standardised process of professional guideline development, 12 practice recommendations for PT management of patients with axSpA were developed. They can guide clinicians and physiotherapists dealing with patients with axSpA, ultimately leading to a delivery of a better care. Next steps are the ratification by relevant professional societies as well as dissemination and implementation.

#### **SAT0734-HPR** CORRELATES OF PAIN AND PREDICTORS OF PAIN RELIEF IN A CONTROLLED RA STUDY IN INDIAN PATIENTS

T. Kianifard<sup>1</sup>, M. Saluja<sup>2</sup>, S. Samukaddam<sup>3</sup>, A. Chopra<sup>2</sup>. <sup>1</sup>Rheumatology Research, Tehran University of Medical Sciences, Tehran, Iran, Islamic Republic Of; <sup>2</sup>rheumatology; <sup>3</sup>Biostatistics, CENTER FOR RHEUMATIC DISEASES, Pune, India

**Background:** Potassium (K) enriched vegetarian diet (PEVT) significantly reduced pain (primary hypothesis and efficacy) compared to ad libitum diet in RA patients on standard drugs. We had earlier validated Indian version of RA Pain Scale/RAPS. EULAR 2014

**Objectives:** To determine correlates of pain (VAS) and RAPS and predictors of 'pain relief' in RA in a dietary intervention study

**Methods:** In the primary study, 172 consenting symptomatic patients ( $\geq 4$  cms pain VAS) were randomised into a 3 arm 16 week study [2 active PEVT arms, 1 control routine diet] with ongoing background medication [72% methotrexate, 60% prednisolone]; 155 patients completed study. Evaluation included ACR core set and other measures (plus dietary) and RAPS (4 domains- physiological, affective, sensory discriminative, cognitive; 24 questions, score 0–144). The study (80% power,  $\alpha < 0.05$ ) sample size was based on improvement in pain VAS (0–10 cms, with no pain at 0). Reduction in pain VAS of at least 1 cm on VAS was considered 'responder'. A Pearson correlation matrix was computed. A linear logistic regression model was used (good fit after 5 iterations). The dependent variable was number of 'respondents' (pain). 28 independent variables included clinical (+patient functional), laboratory (+steroid assay), drug use and dietary analytics

(+micronutrients) at baseline. From the latter, 13 qualified variables (a priori significance) were run in a forward stepwise model.

**Results:** Data below shows significant correlation of pain measures ( $p < 0.05$ ). Other measures with significant correlation  $\geq 0.3$  were: patient global assess-DAS 28, C-reactive protein (CRP)-Erythrocyte Sed rate (ESR), Haemoglobin-ESR, health assessment questionnaire score (HAQ)-medical outcome short form 36 physical (SF 36-phy), DAS 28-painful tender joint count, HAQ-general health on 100 mm VAS (GH). Significant ( $p < 0.05$ ) predictors in the first regression run were allocation to K intervention, female gender, and disease duration (less than 5 years). In the subsequent run, the significant predictors [Odds's Ratio, 95% confidence interval] were: K allocation arm (1.13, 5.27), disease duration less 5 years (1.98, 9.67), female gender ( $p = 0.01$ ), serum K (1.44, 6.29), body mass index (0.99, 4.76)

Correlates of RAPS: Swollen joint count (0.16), general health assessment 100 mm VAS (–0.18), morning stiffness (0.16), SF 36 phy (–0.35), SF36-mental (–0.21), serum potassium/K (0.16), C-reactive protein (0.25)

Correlates of PAIN VAS: Painful joint count (0.16), general health assessment 100 mm VAS (–0.43), C-reactive protein (0.2), dietary K (–0.22)

**Conclusions:** Despite a complex questionnaire, RAPS shared significant correlates with the popular and seemingly simplistic pain VAS. The association between dietary K and pain VAS was inverse and modest ( $p < 0.01$ ) and consistent with the primary study hypothesis. The predictors of pain response included patient 'allocation to the PEVD' in support of the efficacy result in the primary study.

#### **SAT0735-HPR** SEX DIFFERENCES IN ILLNESS PERCEPTIONS AND SELF-MANAGEMENT IN PATIENTS WITH GOUT

U. Bergsten<sup>1</sup>, M. Dehlin<sup>2</sup>, E. Klingberg<sup>2</sup>, A. Landgren<sup>2</sup>, L. Jacobsson<sup>2</sup>. <sup>1</sup>RandD department, Region of Halland, Halmstad; <sup>2</sup>Department of Rheumatology and Inflammation Research, University of Gothenburg, Gothenburg, Sweden

**Background:** Illness perceptions are important and can influence all aspects of management in chronic diseases. Differences in gender aspects of illness perceptions have been shown for other diseases, but have scarcely been examined in gout. Lifestyle and dietary adjustments are principal components of self-management of gout.

**Objectives:** to examine illness perception, self-management strategies and advice from healthcare professionals in Swedish patients with gout by sex.

**Methods:** All patients above 18 with diagnose of gout were identified from 12 primary centres (serving a population of 1 00 000 inhabitants) and one rheumatology clinic within western Sweden. Patients were sent a questionnaire including gout characteristics, demographics, illness perception questionnaire (B-IPQ), questions about diet, alcohol and advice from health care professionals. Age-adjusted differences between sexes were analysed in logistic regression models

**Results:** Of 1589 individuals with a gout diagnosis, 868 (69.3%) responded to the survey. The proportion of men was 80%. Mean age was 70 years for men and 75 years for women. Women reported modest but significant worse illness perception with regard to severity of disease, identity, concerns and emotional response (see table 1). Women had made more dietary food changes, whereas there was no difference regarding changes in alcohol reduction. Advice from health personal regarding dietary changes had more often been given to men (53% vs 22%) and among obese patients (BMI  $> 30$  kg/m<sup>2</sup>) more men (65% vs 47%) had been given advice about weight reduction.

**Conclusions:** Men with gout perceive their illness as less serious and are less likely to make dietary adjustments compared to women, despite been given more lifestyle advice from health care personal. There may be a need to focus more on how advices regarding disease and life style changes are given from a gender perspective for achieving optimal results.

### SAT0736-HPR COMPARISON OF CORE STABILISATION AND BALANCE IN HEALTHY CONTROLS AND PATIENTS WITH ANKYLOSING SPONDYLITIS

Y. Acar<sup>1</sup>, G. Can<sup>2</sup>, N. İlçin<sup>1</sup>. <sup>1</sup>Physical Therapy and Rehabilitation; <sup>2</sup>Dokuz Eylül University, izmir, Turkey

**Background:** Ankylosing spondylitis is thought to cause balance problems. One component of balance is core stability. Core stability can be defined as the ability of the lumbopelvic-hip complex to control the trunk in response to disturbances generated by movement of the limbs, or other perturbations. There is limited literature about balance problems in AS. However there is no study investigating the effect of AS on core stability.

**Objectives:** The aim of this study was to investigate whether there is a difference in balance and core stabilisation between patients with ankylosing spondylitis(AS) and healthy individuals.

**Methods:** 64 patients(40 male, 24 female) with AS and 64 healthy controls(39 male, 25 female) were included in this study. Demographic and physical characteristics(age, height, weight, body mass index) were recorded. Static and dynamic balance was evaluated with Biodex Balance System SD. Anteroposterior(AP), mediolateral(ML) and overall(OA) postural stability indices were obtained with bilateral stance(stable and unstable platform), single leg stance(stable platform). Also overall, forward, backward, right and left limits of stability were evaluated. For evaluation core stabilisation static and dynamic core endurance tests and hip strength assessment were used. Modified sit-up test for dynamic core endurance and four static endurance tests (flexor endurance, extensor endurance and lateral side bridge tests) recommended by McGill et al for static core endurance were used. Hip strength measurement were assessed by hand-held dynamometer.

**Results:** There were no significant differences between groups regarding to gender, age, weight, height, body mass index(p<0,05). Overall, anteroposterior and mediolateral indices for bilateral stance(stable platform) and left leg stance(stable platform) were statistically better in control group(p<0,05). Overall, forward, backward and right limits of stability scores were significantly higher in control group (p<0,05). All of the core endurance tests were statistically better in control group (p<0,05) table 1. Although all of the hip strength measurements were higher in control group than AS group, only statistically significant difference was found in hip abduction strength(p<0,05).

Abstract SAT0736HPR – Table 1. Comparison of the core endurance test results

	AS group(n=64) Median(IQR 25–75)	Control group(n=64) Median(IQR 25–75)	p value
Trunk flexion	34,10 <sup>(20,00–53,50)</sup>	56,50 <sup>(40,92–82,50)</sup>	0,00*
Trunk extension	43,30 (22,06–69,75)	86,00 <sup>(71,25–106,62)</sup>	0,00*
Right side bridge(s)	40,70 <sup>(23,12–59,95)</sup>	61,00 (43,5–84,38)	0,00*
Left side bridge(s)	40,00 <sup>(25,70–58,92)</sup>	61,5 (45,20–82,25)	0,00*
Sit-up test	17,50 <sup>(7,00–26,75)</sup>	24 <sup>(15,25–30,00)</sup>	0,004*

Mann Whitney U test. IQR: Interquartile Range \*p<0,05

**Conclusions:** To our knowledge this is the first study that investigating core stability in AS patients. The findings of this study showed AS patients have reduced core endurance and hip abductor strength. According to our results AS has negative effect on bilateral stance, left leg stance postural stability and limits of stability.

### HPR Epidemiology and public health (including prevention)

#### SAT0737-HPR MEASURES OF PHYSICAL ACTIVITY AND FEAR AVOIDANCE IN PEOPLE WITH CHRONIC PAIN

A. Bremander<sup>1,2,3</sup>, E. Haglund<sup>2,3</sup>, S. Bergman<sup>1,3,4</sup>. <sup>1</sup>Department of Clinical Sciences, Section of Rheumatology, Lund; <sup>2</sup>School of Business, Technology and Science, Halmstad University; <sup>3</sup>RandD centre, Spenshult, Halmstad; <sup>4</sup>Primary Health Care Unit, Department of Public Health and Community Medicine, Institute of Medicine, Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden

**Background:** Lifestyle factors such as physical activity (PA) has the possibility to contribute to improved health and quality of life in the population as well as in

chronic diseases. Most often PA is self-reported while measures of the aerobic capacity are more seldom measured in subjects with chronic pain.

**Objectives:** To describe physical activity levels (self-reported and aerobic capacity) in people with chronic pain classified as regional or widespread and to compare the findings with a group that report no pain.

**Methods:** From the 2016 follow-up of the Swedish population based Epipain cohort (n 1321), 146 subjects were invited to a clinical assessment where the aerobic capacity was assessed by using a submaximal bicycle test, the Ekblom-Bak test, together with assessment of the Borg scale for perceived exertion (RPE). Aerobic capacity was also classified as low, average or high according to data from the general population. Self-reported physical activity was coded as MVPA<sub>rec</sub> if recommended levels of PA was reported (physically active on a moderate level  $\geq 150$  min/week (MPA) or on an vigorous level  $\geq 75$  min/week (VPA) or not). The Fear Avoidance Beliefs Questionnaire for PA (FABQ-PA, 0–24 best to worst) and for work (FABQ-W, 0–48 best to worst) were also assessed. The participants were classified as having chronic widespread pain (CWP), chronic regional pain (CRP) or no chronic pain (NCP) based on a pain mannequin presenting 0–18 pain regions and if pain had lasted for 3 months or more. Chi2 and Kruskal-Wallis tests were performed to study differences between the three pain groups.

**Results:** 141/146 (97%) subjects (mean (SD) age 59.4 (8.2) years) whereof 61% were women, could be classified into pain groups; 43 as CWP (84% women), 43 as CRP (42% women) and 55 as NCP (58% women). The group with CWP was slightly older than those with CRP (mean (SD) age 57.0 (7.6) years vs. 61.9 (6.9) years,  $p < 0.02$ ). The CWP group also had lower aerobic capacity (mean (SD) 2.2 (0.5) l/min vs. 2.6 (0.6) l/min,  $p < 0.03$ ), and a larger proportion was classified as having low aerobic capacity (CWP 21%, CRP 7% and NCP 10%,  $p < 0.04$ ). The proportion of MVPA<sub>rec</sub> did not differ between the groups: CWP 70%, CRP 81% and NCP 74% ( $p > 0.5$ ). There was neither a difference between the groups in BMI, RPE or in sitting hours/week ( $p > 0.6$ ). However, differences were found in the FABQ where in the PA scale those with CRP had worse scores compared with NCP (mean (SD) 11.2 (7.3) vs. 6.0 (6.0),  $p < 0.001$ ), the difference between CWP (mean (SD) 8.9 (6.7)) and NCP was  $p < 0.06$ . In the work subscale of FABQ, CWP had worse scores compared with CRP (mean (SD) 18.9 (15.7) vs. 10.0 (12.5),  $p < 0.002$ ) and CRP had worse scores compared to those with NCP (mean (SD) 10.0 (12.5) vs. 6.5 (9.1),  $p < 0.001$ ).

**Conclusions:** In this sample of subjects with chronic pain or no pain, having widespread pain tended to affect the aerobic capacity negatively while self-reports of reaching recommended levels of physical activity did not differ between groups. Fear avoidance in relation to physical activity and especially in relation to work was more noticeable in subjects with chronic pain compared to those with no pain. Measures of aerobic capacity and information of fear avoidance beliefs might help health professionals to better tailor the non-pharmacological treatment for subjects with chronic pain.

#### SAT0738-HPR FACTORS ASSOCIATED WITH RISK OF FALLING IN ADULTS WITH KNEE OSTEOARTHRITIS: A CROSS-SECTIONAL STUDY

D.G. Manlapaz, P. Jayakaran, G. Sole, C.M. Chapple. *Centre for Health, Activity and Rehabilitation Research, School of Physiotherapy, University of Otago, Dunedin, New Zealand*

**Background:** There is evidence of increasing number of falls in adults with knee osteoarthritis (OA). However, the contributing factors for falling in adults with knee OA has not been substantially investigated.

**Objectives:** This cross-sectional study aimed to explore the relationship between falling in adults with knee OA and clinical characteristics of knee OA such as balance, pain, instability, muscle strength, and physical function.

**Methods:** Participants with knee OA were recruited from the community (Dunedin, New Zealand). The protocol of the study was registered in Australia New Zealand Clinical Trial Registry (ACTRN 12617000154303). Falls characteristics in the preceding year were collected to distinguish between those with and without history of falling. All participants completed the following measures: Sensory Organisation Test (SOT) using NeuroCom SMART Equitest system, version 8.4.0 which produced Composite Score; Knee injury and Osteoarthritis Outcome Score for knee OA related symptoms; Knee outcome survey for self-reported knee instability (buckling); Nicholas MMT hand-held dynamometer for quadriceps and hamstrings isometric muscle strength measured at 20 and 70 degrees; and Timed-Up and Go (TUG) test for physical function.

**Results:** Sixty-three participants with knee OA (30 female, 33 male), with a mean age (SD) of 53.78 (16.17) years were included in the study. Thirty-one (49%) participants reported at least one fall in the previous 12 months. The independent t-test suggested that the SOT Composite Score in fallers was significantly less (mean  $\pm$ SD: faller=72.16 $\pm$ 3.26, non-faller=74.84 $\pm$ 4.77;  $p < 0.012$ ) and the TUG test was significantly longer (mean  $\pm$ SD: faller=7.64 $\pm$ 1.29, non-faller=6.74 $\pm$ 0.78;

$p < 0.001$ ) when compared with the non-faller group. Also, lower muscle strength of knee flexors and extensors were significantly less in the faller group ( $p < 0.05$ ). Falling in the previous 12 months was associated with Composite Score (OR 0.85, 95% CI 0.74–0.97,  $p = 0.017$ ), knee extensors strength [20 degrees (OR 0.76, 95% CI 0.66–0.82,  $p = 0.025$ ) and 70 degrees (OR 0.71, 95% CI 0.55–0.91,  $p = 0.008$ )], and TUG test (OR 2.65, 95% CI 1.32–5.31,  $p = 0.006$ ) using univariate logistic regression analysis. There were no changes in these results with multivariable analyses adjusting for age, gender, and body mass index.

**Conclusions:** The study demonstrated that balance, knee muscle strength, and performance of physical function significantly differed between those with and without the history of falling. An understanding of these risk factors may help in implementing an appropriate evaluation and intervention strategy to reduce falls in this patient population. Given the prevalence of falls in knee OA, this study suggests that falls assessment should be part of the clinical practice routine when evaluating patients with knee OA.

**Background:** Several studies have suggested farming occupation with exposure to pesticides as risk factor for rheumatoid arthritis (RA).

**Objectives:** We investigated the association between pesticides exposure and risk of RA subsets in the Malaysian population.

**Methods:** Data from the Malaysian Epidemiological Investigation of Rheumatoid Arthritis (MyEIRA) population-based case-control study involving 1055 early RA cases and 1057 age, sex and residential area matched controls were analysed. All study subjects answered a structured questionnaire on a broad range of issues including occupational exposures to pesticides. The self-reported information on ever/never occupationally exposed to pesticides was used to estimate the risk of developing ACPA-positive and ACPA-negative RA. Association between pesticides exposure and the HLA-DRB1 shared epitope (SE) was evaluated.

**Results:** The proportion of ACPA positivity in the RA patients was 64.4% and 1.9% in the normal controls. The presence of HLA-DRB1 SE alleles in RA patients was 40.2% and 15.8% in the normal controls. Our data demonstrated that occupational exposure to pesticides was significantly associated with an increased risk of developing RA in the Malaysian population (OR 2.31, 95% CI 1.12–4.73,  $p = 0.03$ ). The association between occupational exposure to pesticides and risk of RA was observed with ACPA-positive RA (OR 3.10 95% CI 1.49–6.47,  $p = 0.003$ ), but not with ACPA-negative RA. A dramatically increased risk for ACPA-positive RA was seen in individuals who both exposed to pesticides occupationally and carried SE alleles (OR 28.06, 95% CI 3.58–220.09,  $p < 0.0001$ ).

**Conclusions:** This study demonstrates that occupational exposure to pesticides is associated with an increased risk of ACPA-positive RA in Malaysian population.

**Background:** Recent evidence from epidemiological studies has suggested that reproductive factors may play an important role for rheumatoid arthritis (RA) development. An inverse association was reported in several studies between parity and risk of RA.

**Objectives:** We investigated the association between parity and risk of anti-citrullinated peptide antibody (ACPA)-positive RA and ACPA-negative RA in the Malaysian population.

**Methods:** Data from the Malaysian Epidemiological Investigation of rheumatoid Arthritis (MyEIRA) population-based case control study involving 902 female early RA and 906 age and residential area-matched female controls were analysed. Parity history was assessed through a questionnaire. Parous women were compared with nulliparous women, by calculating odds ratio (OR) with 95% confidence intervals (CI).

**Results:** Our findings demonstrated that parity was significantly associated with decreased risk of developing RA in the Malaysian population (RA versus controls, 82% vs. 89%, OR 0.58, 95% CI 0.44–0.77,  $p < 0.001$ ). The association between parity and risk of RA was uniformly observed for ACPA-positive RA (OR 0.58, 95% CI 0.43–0.80,  $p < 0.001$ ) and ACPA-negative RA (OR 0.58, 95% CI 0.40–0.84,  $p < 0.01$ ) subsets, respectively. Compared with nulliparous women, the decreased risk was pronounced at the level of three and more live births for both ACPA-positive (OR 0.48, 95% CI 0.34–0.66,  $p < 0.001$ ) and ACPA-negative RA (OR 0.46, 95% CI 0.31–0.68,  $p < 0.001$ ) subsets.

**Conclusions:** Our data demonstrated that parity and level of three and more live births was associated with decreased risk of developing RA in the Malaysian population. The associated decrease risk was observed in both ACPA-positive and ACPA-negative RA subsets.

**SAT0741-HPR** **COGNITIVE-BEHAVIOURAL AND SOCIAL FACTORS DO NOT PREDICT RECURRENT SECONDARY HEALTH CARE USE IN PATIENTS WITH FIBROMYALGIA: A LONGITUDINAL STUDY**

J.E. Vriezolk<sup>1</sup>, V.M. Vervoort<sup>1</sup>, T.C. olde Hartman<sup>2</sup>, T. van Helmond<sup>1</sup>, W.H. van der Laan<sup>3</sup>, R. Geenen<sup>4</sup>, C.H. van den Ende<sup>1</sup>. <sup>1</sup>Rheumatology, Sint Maartenskliniek; <sup>2</sup>Primary and Community Care, Radboud University Nijmegen Medical Centre, Nijmegen; <sup>3</sup>Rheumatology, Sint Maartenskliniek, Woerden; <sup>4</sup>Psychology, Utrecht University, Utrecht, Netherlands

**Background:** Health care use in fibromyalgia (FM) is relatively high. Besides disease-related variables, cognitive-behavioural factors have been concurrently associated with health care use. It is unknown whether cognitive-behavioural and social factors also predict future health care use.

**Objectives:** To identify cognitive-behavioural and social factors predicting recurrent secondary health care use in FM.

**Methods:** Data were drawn from a prospective cohort of recently diagnosed patients with fibromyalgia (n=199), spanning 18 months. Patients were recruited after receiving their diagnosis and protocolled treatment advice by a rheumatologist. Using self-report questionnaires, health care use, cognitive-behavioural (i.e. illness cognitions, pain coping, coping flexibility), social (i.e. invalidation by family, spousal responses to pain and well behaviour), sociodemographic and disease-related variables including comorbidities, severity of FM, and depressive and anxiety symptoms were collected. Primary outcome was recurrent secondary health care use at 18 months follow-up defined as the use or non-use for each of the following four categories of secondary health care: consultation with medical specialists, diagnostic procedures, admission to health care institutions, and multimodal treatment program. A patient was considered a recurrent secondary health care user, if secondary health care from at least one of the four categories was used in the past six months. Univariate and multivariate logistic regression models examined whether and which variables were predictors for recurrent secondary health care use. Internal validation was performed to correct for over-fit of the final multivariate model.

**Results:** Recurrent secondary health care use was lower than initial secondary health care use. Univariate analysis showed that having at least one comorbidity, depressive feelings, severe consequences of fibromyalgia, low personal control and a high severity of fibromyalgia predicted recurrent secondary health care use. In the multivariate model, having at least one comorbidity was the only remaining predictor for recurrent secondary health care use.

**Conclusions:** Our results suggest that the existence of comorbidities as communicated by the patient is the strongest warning signal for recurrent secondary health care use in FM. There seems no value in using cognitive-behavioural and social factors for early identification of patients with FM at risk for recurrent secondary health care use.

**SAT0742-HPR** **EUROPEAN LEAGUE AGAINST RHEUMATISM RECOMMENDATIONS FOR THE ROLE OF THE NURSE (EULAR-RN) IN THE MANAGEMENT OF CHRONIC INFLAMMATORY ARTHRITIS (CIA): RESULTS OF PATIENTS IN NORDIC COUNTRIES**

M.L. Kukkurainen<sup>1</sup>, M. Kauppi<sup>2</sup>, Y. van Eijk-Hustings<sup>3</sup>. <sup>1</sup>Faculty of Business and Hospitality Management, Lahti University of Applied Sciences Ltd; <sup>2</sup>Rheumatology Unit, Päijät-Häme Central Hospital, Lahti, Finland; <sup>3</sup>Department of Patient and Care/Clinical epidemiology and medical technology assessment (KEMTA), Maastricht UMC, Maastricht, Netherlands

**Background:** The dissemination of the EULAR-RN in the management of CIA<sup>1</sup> have been completed in Europe and in the USA.<sup>2</sup> The treatment is supposed to be carried out based on shared decision making (SDM).<sup>3</sup> Lay versions of the recommendations and input from the patient organisations are essential in the integration of the recommendations and SDM.<sup>4</sup>

**Objectives:** The aims of this study were to assess agreement with and application of, and identify barriers against implementing the EULAR-RN in the management of CIA and to assess differences between individual Nordic countries.

**Methods:** A web-based survey was distributed using snowball sampling. Levels of agreement and application were assessed using a 0–10 rating scale (0=none, 10=full agreement/application). Reasons for disagreement with and barriers against applying each recommendation were sought. Differences between groups were assessed using the Kruskal-Wallis Test.

**Results:** A total of 318 patients from Finland participated in the survey. Their mean age was 52.1 years (SD 15.6). 47% had completed secondary education, 25% only primary and one third tertiary education. The mean duration of the disease was 17.7 years (SD 13.0), with a diagnosis of RA (63.5%), AS or PsA (29.8%, 6.7% respectively) and treated in general (45%), university (32%) or other hospitals. The median level of agreement was high, ranging from 8 to 10 in Finland

and from 7 to 10 in the other countries. Levels of agreement with the four recommendations differed between countries. Reasons for non-complete agreement in Finland included fear of losing contact with the rheumatologist and do not accept the nurse; barriers were if service is not offered or available and nurses were too busy. The application range was 0–9 in the four countries, with some individual differences (figure 1).

**Abstract SAT0742HPR – figure 1.** Application levels of the EULAR-RN in the Nordic countries

**Conclusions:** Further work and participation of patient organisations is needed for applying the EULAR-RN and removing the barriers against it.

#### **SAT0743-HPR** RELATION BETWEEN SERUM ALBUMIN AND PHYSICAL PERFORMANCE AND MOBILITY IN A COMMUNITY-BASED ELDERLY PEOPLE WITH OSTEOPOROSIS

M. Karapinar<sup>1</sup>, A. Abit Kocaman<sup>2</sup>, N. Kirdi<sup>1</sup>, B. Balam Yavuz<sup>3</sup>. <sup>1</sup>Department of Physiotherapy and Rehabilitation, Faculty of Health Sciences, Hacettepe University, Ankara; <sup>2</sup>Department of Physiotherapy and Rehabilitation, Faculty of Health Science, Kirikkale University, Kirikkale; <sup>3</sup>Department of Internal Medicine, Division of Geriatric Medicine, Hacettepe University, Ankara, Turkey

**Background:** Osteoporosis is a disease related to ageing and to other interacting variables, including genetic, metabolic, physical and nutritional factors. Several studies have reported that the serum albumin level in the elderly is significantly associated with muscle mass, muscle strength and functional capacity.<sup>1</sup> Even among a nondisabled older persons, lower albumin concentrations have been shown to be independently associated with poorer performance as assessed by objective physical performance tests.<sup>2</sup>

**Objectives:** The purpose of this study was to investigate the association of serum albumin with physical performance (muscle strength and mobility ability) in patients with osteoporosis.

**Methods:** For the study, 168 patients with OP (98 women and 70 men) underwent an interview, physical performance testing and blood analysis. A total of patients followed by Hacettepe University Faculty of Medicine Department of Internal Medicine, Division of Geriatric Medicine Department and Geriatric Rehabilitation Unit. We excluded those who Mini Mental State score is under 24 points, Mini Nutritional Assessment Test score is under 11 and have advanced kidney disease. Physical performance was evaluated with Five Times Sit to Stand (FTSS) and Six Metre Walk Test (SMWT). Hand grip strength was measured with dynamometer. Pearson's correlation coefficients were calculated for serum albumin, FTSS, SMWT and handgrip strength.

**Results:** Participants mean age of 72.73±6.34 years and BMI 22.56±2.98 kg/m<sup>2</sup> mean serum albumin concentration ±standart deviation was 41.9±3.5 g/L for women and 41.9±2.9 g/L for men. Serum albumin was associated significantly with physical performance (mobility and walking speed) and muscle strength (hand grip) were in men and women with OP (p<0.005).

	FTSS	Walking Speed	Hand Grip
Serum albumin (men)	0.001	0.001	0.022
P r	-0.322	-0.358	0.255
Serum albumin (women)	0.001	0.001	0.026
P r	-0.314	-0.243	0.205

**Conclusions:** Our study demonstrated that a decrease in the serum albumin level is associated with a decrease in physical performance and muscle strength, although causality is still unclear.

#### **SAT0744-HPR** PREVALENCE OF COMORBIDITIES IN PATIENTS WITH RHEUMATOID ARTHRITIS AND CORRELATION WITH DISEASE ACTIVITY AND TYPE OF THERAPY

M. Cabrera<sup>1</sup>, L. Villarreal<sup>1</sup>, D. Buitrago-Garcia<sup>2</sup>, P. Santos-Moreno<sup>3</sup>. <sup>1</sup>Health services, Biomab, Center For Rheumatoid Arthritis, Bogota; <sup>2</sup>Epidemiology, SIIES; <sup>3</sup>Rheumatology, Biomab, Center For Rheumatoid Arthritis, Bogota, Bogota, Colombia

**Background:** Rheumatoid arthritis (RA) is a common systemic autoimmune disease characterised chronic joint inflammation. Patients with RA are also reported to have higher prevalence of comorbidities such as cardiovascular disease, osteoporotic among others.<sup>1</sup> These comorbidities can be associated with higher mortality, poor life quality, and the increasing of costs for the health system.

**Objectives:** To describe the prevalence of comorbidities and characteristics of a Colombian population that assist to a RA specialised centre.

**Methods:** We performed a descriptive analysis; our main goal was to provide real-life data regarding characteristics of patients with RA. We collected sociodemographic information, DAS28, and prevalence of comorbidities regarding hypertension, cerebrovascular disease, diabetes mellitus, osteoporosis, renal chronic disease, or Sjogren's syndrome. We calculated means, and standard deviations for continuous variables and categorical variables were presented as rates. We estimated the prevalence of comorbidities and evaluate independent associations calculating prevalence ratios.

**Results:** 6376 patients were included in the analysis; mean age was 59 years ±12, 81% were woman and 19% were men. Mean DAS28 was 2.8±1.07. From all patients the prevalence of comorbidities was 42% hypertension, cerebrovascular disease, diabetes mellitus, osteoporosis, renal chronic disease, or Sjogren's syndrome. Most of these patients 60% reported to have hypertension with any of the others comorbidities mentioned above, or osteoporosis with other comorbidities

46%. Regarding pharmacological therapy a higher proportion of patients received conventional DMARDs 90% see table 1. The prevalence of comorbidities was associated with sex and disease activity but did not have any association with pharmacological therapy see table 2.

**Abstract SAT0744HPR – Table 1** Characteristics. of patients with RA and comorbidities

CHARACTERISTICS n (%)	WITHOUT COMORBIDITY		WITH ANY COMORBIDITIES	
	n	%	n	%
SEX				
FEMALE	2865	45%	2289	36%
MALE	795	12%	427	7%
DAS 28				
REMISION	1975	31%	1499	24%
LOW DISEASE ACTIVITY	581	9%	554	9%
MODERATE DISEASE ACTIVITY	929	15%	565	9%
SEVERE DISEASE ACTIVITY	175	3%	98	2%
MEDICATIONS				
Conventional DMARDs	2352	37%	3072	48%
Biological DMARDs	359	6%	580	9%

**Abstract SAT0744HPR – Table 2.** Assoc of comorbidities, sex, and disease activity.

Variable	PR*	IC 95%	P VALUE
Sex	7.21	6.58–7.89	0.000
DAS28	1.18	1.10–1.27	0.000
Therapy	0.91	0.86–0.96	0.000

PR: prevalence ratio

**Conclusions:** As other studies conducted in Asian or Australian populations high blood pressure is the most common disease among patients with RA followed by osteoporosis.<sup>1</sup> Sex is associated with higher comorbidities. According to these results it is important to consider the patient's context, medical conditions, and the number of comorbidities in order to understand the complexity of the management of patient with RA.

#### **SAT0745-HPR** TIME TO DIAGNOSIS, BUT NOT DISEASE DURATION, IS ASSOCIATED WITH POOR QUALITY OF LIFE IN SPONDYLOARTHRITIS: RESULTS FROM THE ASAS-COMOSPA STUDY

M.H. Derakhshan<sup>1</sup>, N. Goodson<sup>2</sup>, J. Packham<sup>3</sup>, R. Sengupta<sup>4</sup>, A. Molto<sup>5</sup>, H. Marzo-Ortega<sup>6</sup>, S. Siebert<sup>1</sup> on behalf of BRITSpA and ASAS-COMOSPA investigators.

<sup>1</sup>Institute of Infection, Immunity and Inflammation, University of Glasgow, Glasgow;

<sup>2</sup>Academic Rheumatology Department, University of Liverpool, Liverpool;

<sup>3</sup>Haywood Rheumatology Centre, Keele University, Keele; <sup>4</sup>Royal National

Hospital for Rheumatic Diseases, Bath, UK; <sup>5</sup>Hôpital Cochin, Paris Descartes

University, Paris, France; <sup>6</sup>NIHR LBRC, Leeds Teaching Hospitals Trust and

LIRMM, University of Leeds, Leeds, UK

**Background:** Spondyloarthritis (SpA) is a group of related chronic inflammatory conditions associated with impaired quality of life.

**Objectives:** To explore the potential associations between both "Time to Diagnosis" and "SpA Disease Duration" and current quality of life in SpA.

**Methods:** Using ASAS-COMOSPA, a large international cross-sectional study comprising 3984 patients with SpA, we investigated the association between either "Time to Diagnosis" (time from symptom onset to diagnosis) or "SpA Disease Duration" (time from symptom onset to study visit) and current quality of life at the single study visit. Data collected from 5 domains of quality of life in EQ-5D-3L were summarised as an index (ranging from -0.59 to 1.00). In separate models of linear regression, the association between the aforementioned chronology parameters with the quality of life index were investigated before and after adjustments for age, sex, education, HLA-B27, BMI, smoking, alcohol, and medication (NSAIDs, steroids, DMARDs, biologics) history.

**Results:** Data for 3923 patients (35.1% female; mean age 43.21 (SD: 13.89) years) were available for this analysis. The median (IQR) quality of life index was 0.64 (0.36–0.89) for the entire cohort. In multivariate analysis, "Time to Diagnosis" was significantly associated with poorer quality of life ( $p=0.005$ ). Other factors and covariates associated with adverse quality of life were higher BMI ( $p<0.001$ ), smoking ( $p=0.003$ ), ever use of NSAIDs ( $p<0.001$ ), ever use of steroids ( $p<0.001$ ) and ever use of biologics ( $p=0.002$ ). Factors associated with favourable quality of life were male gender ( $p<0.001$ ), higher education ( $p<0.001$ ) and HLA-B27 positivity ( $p=0.006$ ) (Table). In contrast, "SpA Disease Duration" was not associated with the current quality of life index when corrected for confounders, including age.

Table: Association between Quality of Life index and "Time to Diagnosis" in Spondyloarthritis, adjusted to all potential confounders

Factors	p value	Coefficients (B)	95% CI for B
Time to Diagnosis (1 year blocks)	0.005	-0.002	-0.004,-0.001
Age	0.134	-0.001	-0.002, 0.000
Sex (M vs F)	<0.001	0.070	0.045-0.096
Current BMI	<0.001	-0.008	-0.010,-0.005
Smoking (pack-year)	0.003	-0.001	-0.002, 0.000
Alcohol intake (higher)	<0.001	0.026	0.015-0.037
Education (higher)	<0.001	0.036	0.019-0.054
HLA-B27 (+)	0.006	0.037	0.011-0.064
Ever NSAIDs	<0.001	-0.122	-0.147,-0.096
Ever Steroids	<0.001	-0.138	-0.163,-0.113
Ever DMARDs	0.489	-0.009	-0.034, 0.016
Ever Biologics	0.002	-0.037	-0.061,-0.013

**Conclusions:** In this global cohort of patients with SpA, time to diagnosis but not the duration of SpA appears to be associated with current quality of life, as assessed by the EQ-5D-3L index. Future work should explore geographic variation and whether this association is the same for axial and peripheral SpA disease.

#### **SAT0746-HPR** COFFEE DECREASES METHOTREXATE INTOLERANCE AND INCREASES ITS COMPLIANCE IN RHEUMATOID ARTHRITIS (RA): A STUDY BY RHEUMATOLOGY NURSE COUNSELLORS

S.S. Baghel, R.D. Thakran, C. Messi, S. Kapoor, S. Garg, V. Kashyap, Q. Zaheer, A.N. Malaviya. *Rheumatology, Indian Spinal Injuries Centre, New Delhi, India*

**Background:** Methotrexate (MTX) is universally regarded as the 'anchor drug' for the treatment of Rheumatoid Arthritis (RA). Intolerance to MTX is the common cause of non-compliance that leads to poor disease control. The addition of coffee in the treatment regimen for MTX intolerance increases the patient compliance<sup>1</sup>. Therefore, awareness about the effect of coffee and counselling for strict adherence to the recommended coffee schedule should be an essential part of patient's education.

**Objectives:** To assess the effect of coffee on MTX intolerance in patients with RA.

**Methods:** RA patients attending the Rheumatology clinic, willing to participate in the survey were enrolled in this study. All the patients were asked to take weekly MTX dose along with coffee as per schedule. The coffee schedule advised was as follows: 2 strong cups of coffee early in the morning on the day of the week on which the MTX was scheduled. This was repeated in the late evening 1–3 hours before the dose of MTX. The 3rd dose of 2 cups of strong coffee was repeated the next morning. This schedule was repeated every week synchronised with the weekly dose of MTX. All the patients were counselled and explain to follow the coffee schedule. All the information was collected in a pre-designed form.

**Results:** 600 patients were enrolled in this study. All the patients were treated with the weekly dose of MTX. Among 600 patients 285 (47.5%) did not have any MTX intolerance; 315 (52.5%) had MTX intolerance. In the latter category, 200 (63.5%) patients had minimal intolerance not requiring any intervention. The remaining 115 (36.5%) patients had moderate or severe MTX intolerance. Among these, 52 (45.2%) had complete relief of symptoms with the addition of coffee and were able to continue taking the advised dose of MTX; 17 (14.8%) had partial improvement and continued taking MTX but only with antiemetic; 14 (12.2%) were minimally better but were somehow managing; 14 (12.2%) did not get any relief and discontinued MTX. Another as 18 (15.6%) patients did not agree to take coffee and continued with the symptoms of MTX intolerance.

The result of persistent counselling and explaining the coffee schedule with the help of audio-visual aids help the patients to manage MTX intolerance and increases the MTX compliance to ~60% of those with MTX intolerance.

If the intolerance symptoms disappeared completely over time, the patients were advised to discontinue coffee unless the patient liked coffee and preferred to continue taking it.

**Conclusions:** Coffee relieved the symptoms of MTX intolerance in 45.2% and partial relief in 14.8% of the patients. A significant number of patients did not like to take coffee. By intense regular counselling by the specialist rheumatology nurses about the benefits of coffee intake in MTX intolerant patients, helped in decreasing the intolerance and increased its compliance in patients with RA.

#### SAT0747-HPR THE IMPACT OF NON-PERSISTENCE ON THE DIRECT AND INDIRECT COSTS IN PATIENTS TREATED WITH SUBCUTANEOUS TUMOUR NECROSIS FACTOR-ALPHA INHIBITORS IN GERMANY

K. Ziegelbauer<sup>1</sup>, M. Hübinger<sup>1</sup>, S. Dombrowski<sup>1</sup>, K. Kostev<sup>1</sup>, M. Friedrichs<sup>2</sup>, H. Friedel<sup>2</sup>, S. Kachroo<sup>3</sup>. <sup>1</sup>IQVIA, Frankfurt am Main; <sup>2</sup>Team Gesundheit Gesellschaft für Gesundheitsmanagement mbH, Essen, Germany; <sup>3</sup>Merck and Co., Inc, New Jersey, USA

**Background:** No recent data is available about the association between non-persistence with subcutaneous TNFi and costs in Germany.

**Objectives:** The goal of the present study was to estimate the direct and indirect treatment costs in immune-mediated rheumatic disease (IMRD) patients initiating treatment with a subcutaneous biologic agent based on treatment persistence.

**Methods:** This is a retrospective cohort study based on the German statutory health insurance funds database. Patients aged  $\geq 18$  with a diagnosis of ankylosing spondylitis, psoriatic arthritis, or rheumatoid arthritis treated with subcutaneous TNF-alpha blockers (sc-TNFis) were included. Persistence was estimated as the duration of time from sc-TNFis therapy initiation to discontinuation, which was defined as at least 60 days without therapy. We performed 1:1 matching based on a propensity score that was constructed as the conditional probability of being persistent as a function of age, gender, index year, physician specialty, and Charlson comorbidity index. Finally, the differences in direct costs, indirect costs, and services between the matched pairs were estimated using the Wilcoxon test.

**Results:** After 1:1 matching, 678 persistent and 678 non-persistent patients were available for cost analyses. Both cohorts were similar in terms of age, gender, year of therapy initiation, CCI, and indication. Using a two-year time period, the costs for office based visits per patient were € 2319 in the persistent cohort, as compared to € 3094 in the non-persistent cohort ( $p < 0.001$ ). Co-medication costs were € 2828 in the persistent cohort, as compared to € 5498 in the non-persistent cohort ( $p < 0.001$ ), hospitalisation costs were € 3551 in persistent cohort, as compared to € 5890 in non-persistent patients, and sick leave costs were € 717 in persistent cohort, as compared to € 1241 in non-persistent patients.

**Conclusions:** The results of this study indicate that persistence with SC-TNFis treatment can be associated with several cost offsets for IMRD patients. For healthcare providers/payers, these findings reinforce the value of persistence, given the additional economic burden associated with non-persistent patients.

#### HPR Measuring health (development and measurement properties of PROs, tests, devices)\_\_\_\_\_

#### AB1397-HPR RELIABILITY, VALIDITY AND CROSS-CULTURAL VALIDITY OF THE TURKISH VERSION OF THE ABILHAND QUESTIONNAIRE IN RHEUMATOID ARTHRITIS INDIVIDUALS, BASED ON RASCH ANALYSIS

B. Basakci Calik<sup>1</sup>, E. Gür Kabul<sup>1</sup>, M. Tasci<sup>2</sup>, S. Erel<sup>3</sup>, I.E. Simsek<sup>4</sup>, P. Demir<sup>5</sup>, V. Cobankara<sup>2</sup>. <sup>1</sup>School of Physical Therapy and Rehabilitation, Pamukkale University; <sup>2</sup>Department of Internal Medicine, Division of Rheumatology, Pamukkale University School of Medicine, Denizli; <sup>3</sup>Pamukkale University School of Physical Therapy and Rehabilitation, Kınıklı-Denizli; <sup>4</sup>School of Physical Therapy and Rehabilitation, Dokuz Eylül Üniversitesi, İzmir; <sup>5</sup>Department of Biostatistics and Medical Informatics, Yıldırım Beyazıt University, Ankara, Turkey

**Background:** 80%–90% of Rheumatoid Arthritis (RA) individuals are thought to be affected by the hands and wrists. Patients complain of various symptoms that cause more difficulty while performing daily activities such as joint pain and stiffness, loss of joint range of motion, reduction of grip strength. Abilhand is a Rasch-built questionnaire and evaluates manual ability.

**Objectives:** This study aimed to evaluate reliability, validity and the cross-cultural validity of the Turkish version of the Abilhand questionnaire for Rheumatoid Arthritis individuals, based on Rasch Analysis.

**Methods:** A total of 90 participants who were diagnosed as RA according to the American College of Rheumatology (ACR) 2010 criteria with a mean age of  $51.8 \pm 10.9$  years were included in the study. Manual ability was evaluated by use of Abilhand Questionnaire; disease activity by Disease Activity Score 28 (DAS28), upper limb impairment by Jamar dynamometer, pinchmeter, Nine Hole Peg Test (NHPT); disability by Duruöz Hand Index (DHI) and quality of life by Nottingham Health Profile (NHP). Abilhand results were evaluated using Rasch analysis.

**Results:** The Abilhand-Turkish, consisting of 27 items, provided the invariance of item difficulty hierarchy in general. Item fit statistics, person-item residual correlation matrix and principal component analysis of the residuals was examined and 8 items were removed. As a result of the deletion of 8 items in the questionnaire, it was determined that the remaining 19 items provided Rasch model compatibility and the invariance of item difficulty hierarchy. DAS28, bilateral grip strength, dominant side, NHPT, DHI ve NHP were significantly correlated with the Abilhand measures.

**Conclusions:** The Abilhand-Turkish in individuals with rheumatoid arthritis is clinically valid and reliable. We recommend using the Abilhand-Turkish in clinical evaluations, in rehabilitation interventions, and in evaluating improvements due to its sensitivity.

**AB1398-HPR THE EFFECTS OF KINESIOPHOBIA ON PAIN, FATIGUE SEVERITY, FUNCTIONAL EXERCISE CAPACITY, FUNCTIONAL STATUS AND QUALITY OF LIFE IN FIBROMYALGIA**

Ç. Gülşen<sup>1</sup>, A. GÜÇLÜ GÜNDÜZ<sup>1</sup>, F. SÖKE<sup>1</sup>, K. ÇEKİM<sup>1</sup>, Y. AYDIN<sup>1</sup>, D. AKÇALI<sup>2</sup>.

<sup>1</sup>Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation;

<sup>2</sup>Pain Clinic, School of Medicine, Gazi University, Ankara, Turkey

**Background:** Kinesiophobia play an important role in the development of chronic pain in Fibromyalgia (FM) patients. This condition lead to increase clinical symptoms and reduce quality of life.

**Objectives:** The aim of the study is to examine the effects of kinesiophobia on pain, fatigue, functional exercise capacity, functional status and quality of life in FM patients.

**Methods:** Twenty-one FM patients were evaluated. We used Tampa Scale of Kinesiophobia (TSK) for perception kinesiophobia, Visual Analogue Scale (VAS) for pain intensity, Fatigue Severity Scale (FSS) for fatigue, six-minute walk test (6MWT) for functional capacity, Fibromyalgia Impact Questionnaire (FIQ) for the functional status, and Short-Form Health Survey (SF-36) for quality of life.

**Results:** The results of this study, there was a strong correlation between TSK and VAS, FSS, physical and mental components of SF-36 ( $r=0.754$ ,  $r=0.762$ ,  $r=0.780$ , and  $r=0.843$ , respectively;  $p<0.05$ ). There was a moderate correlation between TSK and FIQ and 6MWT ( $r=0.695$ ,  $r=0.510$ , respectively;  $p<0.05$ ).

**Conclusions:** The results of the present study indicate that kinesiophobia can adversely affect pain, fatigue, functional status and functional exercise capacity, which is result in impaired quality of life in FM. Further, it demonstrates kinesiophobia can be a clinically appropriate assessment to evaluate patients and to determine the effectiveness of treatments in FM.

**AB1399-HPR CONCURRENT VALIDITY AND STABILITY OF SUBGROUP ASSIGNMENT TO THREE LEVELS OF PAIN CONDITION SEVERITY IN PATIENTS WITH MUSCULOSKELETAL PAIN**

Ç. Emilson<sup>1</sup>, I. Demmelmaier<sup>1</sup>, S. Bergman<sup>2</sup>, S. Pettersson<sup>3</sup>, P. Åsenlöf<sup>1</sup>.

<sup>1</sup>Department of Neuroscience, Uppsala University, Uppsala; <sup>2</sup>Department of Public Health, and Community Medicine, Institute of Medicine, The Sahlgrenska Academy, University of Gothenburg, Gothenburg; <sup>3</sup>Department of Neurobiology, Care Science and Society, Division of Physiotherapy, Karolinska Institutet, Stockholm, Sweden

**Background:** Pain screening instruments have been used to identify risk factors for poor prognosis and are recommended for the stratification of treatment for musculoskeletal pain.

**Objectives:** The aim of this study was to investigate the concurrent validity of subgroup assignment based on the Örebro Musculoskeletal Pain Screening Questionnaire compared with reference instruments: The Pain Disability Index, the Tampa Scale for Kinesiophobia, and the Pain Catastrophizing Scale. A secondary aim was to investigate the stability of the subgroup assignment over a defined period of time.

**Methods:** Participants ( $n=40$ ) aged 18–65 years were recruited from five primary health care centres in Sweden. Data were collected using self-reported questionnaires. The subgroups based on the Örebro Musculoskeletal Pain Screening Questionnaire were pre-defined to low, moderate or high pain condition severity. The reference instrument data were dichotomized into low or high level based on previously used cut-off scores. Concurrent validity was analysed with Fisher's exact test. Stability was calculated using quadratic-weighted kappa analysis.

**Results:** The results indicated acceptable psychometric properties of the subgroup assignment based on the Örebro Musculoskeletal Pain Screening Questionnaire regarding concurrent validity, and the stability ( $K_w:0.51$ , 95% CI: 0.22–0.81) over two to three weeks. To further increase validity, it is suggested that subgroup assignment is complemented with other measures assessing e.g. pain catastrophizing.

**Conclusions:** In conclusion, assignment to subgroups with low, moderate and high levels of pain condition severity based on the Örebro Musculoskeletal Pain Screening Questionnaire, could be used as a valid basis for stratified treatment for patients with musculoskeletal pain.

**AB1400-HPR MUSCLE QUALITY INDEX IN OBESE SUBJECTS WITH HIP OSTEOARTHRITIS**

D.A Jerez<sup>1</sup>, R. Machado<sup>2</sup>, E. Cerda<sup>3</sup>. <sup>1</sup>Ciencias de la Rehabilitación, Universidad Andres Bello, Santiago, Chile; <sup>2</sup>Facultad de Ciencias del Deporte, Universidad de Granada, Granada, Spain; <sup>3</sup>Clencias de la salud, Universidad Católica de Chile, Santiago, Chile

**Background:** Obese older adults with hip osteoarthritis suffer a progressive loss of neuromuscular function affecting their activities of daily living.

**Objectives:** The objective of this study is to determine the behaviour of the muscular quality index in obese subjects with osteoarthritis and to compare the manifestations of strength and anthropometric variables with control subjects.

**Methods:** Thirty-two subjects (4 men and 28 women, 66.2±5.2 years of age, 159.2±7.5 cm, 71.5±11.7 kg) were evaluated. 14 subjects suffered osteoarthritis. Muscle circumference, limb length, body mass and sit and stand test were evaluated, in addition to the maximal voluntary isometric contraction in hip flexion and extension movements.

**Results:** The osteoarthritis group presented obesity ( $p=0.037$ ). The muscle quality index of the osteoarthritis group correlated with the weight ( $p=0.776^{**}$ ), with maximum peak strength in flexion ( $p=0.552^*$ ) and average maximal strength ( $p=0.574^*$ ). In the control group the muscle quality index correlated with: weight ( $p=0.689^{**}$ ), muscle circumference ( $p=0.571^*$ ), maximum peak strength in extension ( $p=0.534^*$ ), average peak strength in extension ( $p=0.523^*$ ), average maximal strength in extension ( $p=0.509^*$ ) and maximum impulse in extension ( $p=0.508^*$ ).

**Conclusions:** The muscle quality index is a useful tool to measure muscle quality in the healthy population, but is not clear enough for obese subjects with osteoarthritis, so it is necessary to perform future studies to determine their behaviour.

**AB1401-HPR AN EXPLORATORY STUDY EVALUATING FEASIBILITY AND EFFECTIVENESS OF TWO DIFFERENT EXERCISE PROGRAMS IN SYSTEMIC SCLEROSIS ASSOCIATED MICROSTOMIA**

E.Sydow<sup>1</sup>, S. Arat<sup>2</sup>, S. Severi<sup>1</sup>, R. Westhovens<sup>1,2</sup>, J. Lenaerts<sup>1</sup>, E. De Langhe<sup>1,2</sup>.  
<sup>1</sup>Rheumatology, University Hospitals Leuven; <sup>2</sup>KU Leuven Department of development and regeneration, Skeletal Biology and Engineering Research Center, Leuven, Belgium

**Background:** Systemic sclerosis (SSc) is a severe chronic connective tissue disease with a high disease burden. Oral involvement with impaired oral aperture (microstomia) is frequent and associated with impaired food intake, oral hygiene and secondary dental problems. Preventive measures through mouth-stretching and oral augmentation exercises have been shown to reverse the progression of microstomia.

**Objectives:** This exploratory study assesses the effectiveness and feasibility of two different exercise approaches designed to increase oral aperture.

**Methods:** Two groups had to exercise for 10 min, 3 times/day for 3 months. Group A exercised with a passive jaw motion device (Therabite), and Group B did mouth-stretching exercises. Patients were contacted 4 times by telephone to address encountered problems. The subjects used an exercise diary to document compliance. Patients were evaluated at baseline, 3 months (period without intervention), 6 months (at the end of the treatment after 3 months of intervention) and 9 months (follow-up).

**Results:** At present, 9 patients (Therabite n=4, mouth-stretching exercises n=5) were included and recruitment is ongoing. Seven patients completed the study and increase of oral aperture was observed in all patients in both groups. In the Therabite group, after 3 months of exercise, increase of oral aperture was 9, 2, 9 and 10 mm. In the mouth-stretching exercise group the increase of oral aperture was 11, 10 and 4 mm after 3 months. The compliance, measured as the ratio of executed exercises relative to the planned number of exercises was 95,2%, 85,7%, 98,9% and 63,7% in the Therabite group and 97,4%, 48,6% and 68,3% in the mouth-stretching exercise group.

**Conclusions:** An increase of oral aperture is observed in all patients after 3 months of exercising with the Therabite device as well as after mouth-stretching exercises. No clear differences are observed between both groups, but the study was not designed nor powered for this. Remarkably, a high compliance for the treatment regime was observed in most patients.

**AB1402-HPR VALIDITY OF BIODEX BALANCE SYSTEM IN FIBROMYALGIA PATIENTS**

F.Söke<sup>1</sup>, A. Güçlü Gündüz<sup>1</sup>, C. Gülsen<sup>1</sup>, Y. Aydın<sup>1</sup>, K. Çekim<sup>1</sup>, D. Akcalı<sup>2</sup>. <sup>1</sup>Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation; <sup>2</sup>Pain Clinic, School of Medicine, Gazi University, Ankara, Turkey

**Background:** Fibromyalgia (FM) patients are commonly suffer from balance problems and increased fall frequency. However, validity of any measurement tool has not been determined in clinical trials. Modified Clinical Test of Sensory Interaction and Balance Test (M-CTSIB) is a simple and easily administered test.

**Objectives:** The aim of the study was to investigate the validity and reliability of the M-CTSIB in FM patients.

**Methods:** Twenty-one FM patients and 15 age matched controls were evaluated M-CTSIB. M-CTSIB was evaluated by Biodes-BioSway<sup>TM</sup> (Biodes Inc., Shirley, New York). M-CTSIB evaluates the relationship between balance and visual, somatosensory and vestibular system. Tests carried out were 4 conditions, condition-1: eyes open-firm surface, condition-2: eyes closed-firm surface, condition 3: eyes open-foam surface, and condition 4: eyes closed-foam surface, for 30 s intervals with two repetitions. Body oscillations of the participants were calculated by the system and Sway Index scores obtained. High scores indicate high postural sway of the test subject.

**Results:** The results of this study, FM patients had significantly impaired balance in all conditions of M-CTSIB compared to controls ( $p<0.05$ ). Discriminatory power of all subcomponents of M-CTSIB between groups was excellent. The ROC areas under the curves were 0.803 for condition-1, 0.757 for condition-2, 0.833 for condition-3, 0.776 for condition-4 (AUC=0.803, AUC=0.757, AUC=0.833, AUC=0.776, respectively).

**Conclusions:** These results suggest that FM may lead to increase balance problems. M-CTSIB has been proved to be valid, objective and clinically useful method to detect balance impairments in FM patients.

**AB1403-HPR INVESTIGATION OF THE VALIDITY OF BETY SCALE IN PATIENTS WITH RHEUMATOID ARTHRITIS**

F.B.Öflaz<sup>1</sup>, G. Arın<sup>1</sup>, N.B. Karaca<sup>1</sup>, S. Apraş Bilgen<sup>2</sup>, E. Ünal<sup>1</sup>. <sup>1</sup>Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences; <sup>2</sup>Department of Internal Medicine-Rheumatology, Hacettepe University Faculty of Medicine, Ankara, Turkey

**Background:** The Cognitive Exercise Therapy Approach is a biopsychosocial model for the patients with rheumatic diseases.<sup>1</sup> Cognitive Exercise Therapy Approach Scale (the authors request that the abbreviation stay as "BETY" as the original in Turkish) is a scale that evaluates the biopsychosocial status of the patients with rheumatic diseases. This scale needs validation studies in different rheumatic diseases.<sup>2</sup>

**Objectives:** The aim of this study is to investigate the validation of the BETY scale in patients with Rheumatoid Arthritis (RA).

**Methods:** 120 RA patients were included in this study. To determine the functional status of the patient Health Assessment Questionnaire (HAQ) was used. Rheumatoid Arthritis Quality of Life Scale (RAQoL) and 36-Item Short Form Survey (SF-36) were used to measure quality of life. Hospital Anxiety and Depression Scale (HADS) was used to determine anxiety and depression levels. BETY scale was used to in addition to this questionnaires for the validation.

**Results:** 120 RA patients including 13 men and 107 women were participated in the study. The average age of the participating patients was 28,47±11,39 years and the body mass index was 28,4±6,56. There was a very high correlation between the BETY scale and RAQoL ( $r=0,817$ ,  $p<0,001$ ). There was high correlation between the BETY scale and

**Abstract AB1403HPR – Table 1.** Correlations

	RAQoL	SF-36 PF	SF-36 RL	SF-36 RLE	SF-36 P	SF-36 GHP	xHAQ	HADS Anxiety	HADS Depression

subscale of the HADS-Anxiety, HAQ and subscale of the SF-36 Pain ( $r=0.617$ ,  $p<0.001$ ;  $r=0.606$ ,  $p<0.001$ ;  $r=-0.610$ ,  $p<0.001$ , respectively). There was moderate correlation between the BETY scale and subscale of the HADS-Depression, subscales of the SF-36 form Physical Functioning, Role Limitations, Role Limitations Due to Emotional and General Health Perception ( $r=-0.597$ ,  $p<0.001$ ;  $r=-0.576$ ,  $p<0.001$ ;  $r=-0.525$ ,  $p<0.001$ ;  $r=-0.598$ ,  $p<0.001$ ;  $r=-0.420$ ,  $p<0.001$ , respectively) (Table 1–2).

**Conclusions:** There were high or moderate correlations between the BETY scale and valid and reliable scales that are developed for these parameters. The BETY scale can be considered as a valid scale in patients with RA.

#### AB1404-HPR PRELIMINARY NORMATIVE DATA OF ULTRASONOGRAPHIC MUSCLE THICKNESS AND CROSS-SECTIONAL AREA OF THE THENAR MUSCLES

F Karademir<sup>1</sup>, Ç. Ayhan<sup>1</sup>, G. Arın<sup>1</sup>, O. Dağ<sup>2</sup>, R. Soylu<sup>3</sup>. <sup>1</sup>Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences; <sup>2</sup>Department of Biostatistics; <sup>3</sup>Department of Biophysics, Hacettepe University Faculty of Medicine, Ankara, Turkey

**Background:** Muscle thickness and cross-sectional area (CSA) of the thenar muscles can vary depending on different pathologies (such as neuropathies, arthritis etc.). It is important to evaluate these muscles throughout the diagnosis and treatment processes to understand the pathophysiology of diseases and to identify new treatment strategies. Ultrasonographic imaging has been shown to be valid and reliable tool for the measurement of the muscle thickness and CSA of the particular thenar muscles,<sup>1–2</sup> however there are no studies demonstrating normative values of all thenar muscles.

**Objectives:** The purpose of this study is to obtain normative thickness and CSA values for the thenar muscles in healthy individuals by ultrasound and to assess the inter-rater reliability of sonographic muscle assessments.

**Methods:** The thenar muscles were examined ultrasonographically in eleven healthy volunteers. The assessment was carried out using Shimadzu SDU 1200-Pro US system working with 8–10 MHz linear probe. A custom-made foam cast was used for standardised positioning of the probe. The thickness and CSA parameters of FDI, OP, APB, flexor pollicis brevis (FPB), adductor pollicis (AdP) muscles were examined by two different investigators on the same image. Measurements were made from the palm side of the hand for APB, FPB, OP muscles and from the dorsal side of the hand for AdP and FDI muscles, using five different positions.<sup>3</sup> To analyse inter-rater reliability, the examinations of both raters were compared.

**Results:** Eleven healthy female subjects (mean age: 24.45±2.77 years; BMI: 21.43±2.48 kg/m<sup>2</sup>) were included in this study. Nine subjects had right hand dominance and 2 had left hand dominance. The reliability between two assessors, expressed as an interclass correlation coefficient (ICC), was excellent for all muscles (ICC range min:0.759, max:0.993  $p<0.05$ ).

The mean thickness values of muscles were ordered from thick to thin in longitudinal assessment as AP, FDI, FPB, OP, APB. The mean thickness values of muscles were ordered from thick to thin in transverse assessment as AP, FDI, FPB, OP, APB. The mean CSA values of muscles were ordered from thick to thin as AP, FPB, FDI, APB, OP.

**Abstract AB1404-HPR – Table 1**

Muscle		Longitudinal Thickness (cm)	ICC(p)	Transverse Thickness (cm)	ICC(p)	CSA (cm <sup>2</sup> )	ICC(p)
APB	D	0.54	0.976(<0.001)	0.43	0.877(<0.001)	1.0	0.969(<0.001)
	ND	0.54	0.943(<0.001)	0.38	0.872(<0.007)	0.90	0.836(<0.004)
OP	D	0.58	0.993(<0.001)	0.44	0.964(<0.001)	0.74	0.759(<0.017)
	ND	0.56	0.909(<0.001)	0.40	0.872(<0.002)	0.75	0.851(<0.003)
FPB	D	0.63	0.883(<0.001)	1.0	0.891(<0.001)	2.20	0.891(<0.001)
	ND	0.63	0.795(<0.011)	0.95	0.928(<0.001)	2.16	0.944(<0.001)
AP	D	1.26	0.997(<0.001)	1.28	0.981(<0.001)	2.68	0.900(<0.001)
	ND	1.25	0.967(<0.001)	1.26	0.986(<0.001)	2.42	0.886(<0.001)
FDI	D	1.03	0.977(<0.001)	0.95	0.956(<0.001)	1.96	0.948(<0.001)
	ND	1.0	0.968(<0.001)	0.93	0.959(<0.001)	1.97	0.896(<0.001)

D: dominant, ND: non-dominant

**Conclusions:** Ultrasonography can be used to reliably assess the thenar muscle architecture. This study is important to reveal the normative thickness and CSA values of the thenar muscles in healthy subjects. This data may provide a more comprehensive understanding of musculoskeletal problems and underlying pathophysiological mechanisms which consequently may have an impact on clinical decision making.

#### AB1405-HPR THE COMPARISON OF POSTERIOR SHOULDER TIGHTNESS IN PATIENTS HAVING CHRONIC NECK PAIN AND IN HEALTHY SUBJECTS

H.E TURKSAN<sup>1</sup>, G. YALÇINKAYA<sup>2</sup>, S. OZALEVLI<sup>2</sup>, O. KALEMCİ<sup>3</sup>. <sup>1</sup>School of Physical Therapy and Rehabilitation; <sup>2</sup>School of Physical Therapy and Rehabilitation; <sup>3</sup>Department of Neurosurgery, Dokuz Eylül University, İzmir, Turkey

**Background:** Chronic neck pain (CNP) causes the disruption of the thoracic region and the shoulder girdle biomechanics besides the cervical region. The shoulder capsule is often thickened in shoulder problems, which causes shoulder tightness. In the literature, the effect of CNP on shoulder tightness was not investigated.

**Objectives:** The purpose of this study is to investigate the posterior shoulder tightness (PST) in patients having CNP and to interpret the effect of patients functional level and posture.

**Methods:** Non-specific CNP patients (n=16, female) and healthy subjects (n=16, female) were included and no shoulder problem was identified. The severity of the pain with Visual Analogue Scale (VAS); PST with bubble inclinometer; functional disability level with Neck Disability Index (NDI); influence of posture with New York Postural Rating Scale (NYPRS), upper limb muscle strength evaluated with handgrip. The Mann-Whitney U test Pearson correlation analysis was used to determine the relationship between PST and functional disability levels.

**Results:** Age and BMI values of healthy subjects and patients with CNP were similar ( $p>0.05$ ). The mean duration of disease in patients with CNP was 60.63±35.37 months. Patients with CNP had lower PST values than healthy subjects, namely shoulder tightness is more than healthy subjects ( $p<0.001$ ). The functional disability level score was higher in patients with CNP than in healthy subjects ( $p<0.001$ ). NYPRS scores were lower in patients with CNP than in healthy subjects, namely the posture was more adversely affected in these patients ( $p<0.001$ ). Handgrip values were lower and the pain severity at rest and activity was

significantly higher in patients with CNP than in healthy subjects ( $p < 0.001$ , Table 1). PST correlated well with the NYPS value ( $r = -0.56$ ,  $p = 0.03$ ) and functional disability level ( $r = -0.63$ ,  $p < 0.001$ ) in patients with CNP.

**Abstract AB1405HPR – Table 1.** The comparison of clinical parameters in patients having chronic neck pain and healthy subjects

	Healthy Subjects mean ±SD	Patients with CNP mean ±SD	p
Age (years)	40.63±11.86	45.06±11.04	0.20
BMI (kg/m <sup>2</sup> )	26.25±6.57	25.81±4.06	0.76
Pain <sub>rest</sub> (VAS, cm)	0.13±0.52	2.77±2.51	<0.001
Pain <sub>activity</sub> (VAS, cm)	0.31±0.60	6.00±2.08	<0.001
PST (°)	66.89±13.15	43.6±9.27	<0.001
NDI	0.94±1.23	19.94±6.29	<0.001
NYPRS	60.38±4.60	43.13±8.34	<0.001
Handgrip Strength (kg)	28.48±4.08	23.00±5.65	0.003

SD: Standard Deviation, BMI: Body Mass Index, CNP: Chronic Neck Pain, PST: Posterior Shoulder Tightness, NYPRS: New York Postural Rating Scale, NDI: Neck Disability Index.

**Conclusions:** Pain and upper limb muscle strength loss due to problem in patients with CNP, adversely affect patients' posture and reduce their functional levels. For these reasons, it is suggested that the shoulder girdle should be evaluated besides the neck area in the treatment of patients having CNP and treatment should be included with appropriate physiotherapy and exercise program from the early period.

#### AB1406-HPR RELATIONSHIP BETWEEN KNEE MUSCLE STRENGTH, PAIN AND FUNCTIONAL OUTCOMES IN PATIENTS WITH PATELLOFEMORAL OSTEOARTHRITIS

H.Guney Deniz<sup>1</sup>, F. Tan<sup>1</sup>, B. Atilla<sup>2</sup>. <sup>1</sup>Physiotherapy and Rehabilitation Department, Hacettepe University Faculty of Health Sciences; <sup>2</sup>Orthopedics and Traumatology Department, Hacettepe University Faculty of Medicine, Ankara, Turkey

**Background:** Knee Osteoarthritis (OA) is one of the most common musculoskeletal disorders that adversely affect the functional levels of the patients. Traditionally, knee OA is considered as a problem at the medial compartment of the tibiofemoral (TF) joint. However, OA in patellofemoral (PF) joint can be seen around 25% of the patients. Since the biomechanics of PF joint are distinct from TF joint, the functional assessments specific to PF joint should be considered for PFOA patients.

**Objectives:** The aim of the study was to investigate the relationship between quadriceps femoris strength differences between PFOA patients and control group. Another aim was to define the relationship between pain, knee muscle strength, and functional outcomes in PFOA.

**Methods:** Twenty-five patients with PFOA (age=52.1 years, BMI=26.2 kg/cm<sup>2</sup>) and 20 age-matched controls (age=54.1 years, BMI=26.1 kg/cm<sup>2</sup>) were included in the study. The patients diagnosed with PFOA if they had a radiographic Kallgren and Lawrence score grade 2 or 3 in the PF joint, which was greater than KL score for the TF compartments. Pain level was measured with Visual Analogue Scale. The quadriceps femoris and hamstring isometric muscle strengths at 20° and 60° of knee flexion were measured with a hand-held dynamometer. The functional levels of the patients were determined with Kujala Patellofemoral Score and Western Ontario McMaster Universities Osteoarthritis Index (WOMAC). Student t-test was used for the comparison of quadriceps strength between PFOA and control groups. Spearman correlation test was used to determine the relationship between pain, muscle strength and functional outcomes.

**Results:** The quadriceps strength at 20° ( $p = 0.03$ ) and 60° ( $p = 0.01$ ) of knee flexion were lower in PFOA group when compared to control group. Hamstring strength at both angles was similar between groups ( $p > 0.05$ ). There were negative correlations between quadriceps muscle strength at 60° knee flexion and pain levels ( $r = -0.54$ ,  $p = 0.02$ ) and total WOMAC score ( $r = -0.33$ ,  $p = 0.01$ ). The quadriceps muscle strength at 20° knee flexion was only correlated with Kujala score ( $r = -0.47$ ,  $p = 0.01$ ). There

were no correlations between hamstring strength with pain and functional outcomes ( $p > 0.05$ ).

**Conclusions:** PFOA patients had significantly lower quadriceps strength than control group. Pain level, quadriceps muscle strength and functional outcomes were associated with each other in patients with PFOA. These findings suggest that interventions that have been designed to reduce pain and to improve function should be specific to the affected compartment in knee OA.

#### AB1407-HPR ADVERSE DRUG REACTIONS IN PATIENTS WITH RHEUMATOID ARTHRITIS

J. Urrego<sup>1</sup>, K. Mendez<sup>1</sup>, P. Santos-Moreno<sup>2</sup>. <sup>1</sup>Pharmaceutical Chemist; <sup>2</sup>Rheumatology, Biomab, Center For Rheumatoid Arthritis, Bogota, Bogota, Colombia

**Background:** adverse drug reactions (ADRs) are events that may seriously affect the health of people who use drugs for therapeutic purposes.<sup>1</sup> In the case of patients with rheumatic diseases the existence of comorbidities, the use of DMARDs, or polymedication may increase the risk of developing any type of adverse drug reaction.<sup>2</sup>

**Objectives:** We aim to describe the adverse drug reactions in patients with rheumatoid arthritis.

**Methods:** A cross sectional study was performed during 2017; we collected data from the patients who reported an adverse drug reaction in the consult with a multidisciplinary health care team. We collected the ADR characteristics, medication group and severity. Descriptive epidemiology was done.

**Results:** A total of 6793 patients were diagnosed with rheumatoid arthritis and comorbidities in our specialised centre where 1.8% (123) patients reported any adverse drug reaction, 82% were women. The main diagnosis was rheumatoid arthritis 88% followed by rheumatoid arthritis plus osteoarthritis 12%; less than 1% was other diagnoses. The drug that had a higher proportion of ADRs was methotrexate 33% followed by leflunomide 14%, Certolizumab 7% and acetaminophen combined with hydrocodone 6%; see table 1. The dermatological adverse events were the most common followed by gastrointestinal events and errors in self-medication 11%, these adverse events were classified as mild or moderate; see

**Abstract AB1407-HPR – Table 1**

ADVERSE EVENT	N	%
DERMATOLOGIC	31	25.2
GASTROINTESTINAL	20	16.26
SELF-MEDICATION	14	11.38
THERAPEUTIC	10	8.13
FAILURE		
PAIN	9	7.32
HEADACHE	8	6.5
BREATHING	7	5.69
DIFFICULTY		
GENERAL	5	4.07
DISCOMFORT		
DIZZINESS, DYSPNEA	4	3.25
HERPES ZOSTER - VIRUS	4	3.25
INFECTIOUS		
INFECTIOUS	2	1.63
HAIR-LOSS	2	1.63

**Conclusions:** The proportion of adverse events in our centre is low; other studies had shown, the frequency of patients with ADRs is common, mainly in patients who use anti rheumatic medications. This real life data can support the evidence for future studies in order to prevent ADRs.

**AB1408-HPR** **CONTENT VALIDITY OF A SWEDISH VERSION OF THE SATISFACTION WITH APPEARANCE SCALE IN SYSTEMIC SCLEROSIS – THE HEALTH PROFESSIONALS' PERSPECTIVE**

M Mattsson<sup>1</sup>, G. Sandqvist<sup>2</sup>, R. Hesselstrand<sup>2</sup>, L. Kwakkenbos<sup>3</sup>, A. Nordin<sup>4</sup>, C. Boström<sup>1</sup>. <sup>1</sup>Department of Neurobiology, Care sciences and Society, Karolinska Institutet, Huddinge; <sup>2</sup>Department of Clinical Sciences Lund, Lund University, Lund, Sweden; <sup>3</sup>Behavioural Science Institute, Radboud University, Nijmegen, Netherlands; <sup>4</sup>Department of Medicine, Karolinska Institutet, Solna, Sweden

**Background:** Systemic sclerosis (SSc) can lead to visible changes in appearance such as varied skin texture, pigmentations, facial changes, and hand contractures which could generate concerns among patients. Valid questionnaires that capture these concerns are of great value.

**Objectives:** To assess content validity of a Swedish translation of the Satisfaction with Appearance Scale (SWAP) from the perspective of health professionals (HPs).

**Methods:** The Swedish SWAP (SWAP-Swe) was originally translated into the context of burn injuries. The multi-disciplinary research team applied it to the context of SSc by changing burn injury to SSc, changing part of the lay out, and using a version with two subscales: A) *Social discomfort* and B) *Dissatisfaction with appearance*. Initially, the validity was tested by individual interviews with 10 HPs with varied occupational background, who had 5.5 years (median, range 2–30) experience of SSc patient care. The interview guide included questions concerning comprehensibility, relevance, and suggestions of items to include and exclude. The interviews were sound recorded, transcribed verbatim, and analysed by manifest, partly deductive, content analysis.

**Results: Comprehensibility** Most HPs stated that items were not difficult to understand, nevertheless, concerns were highlighted in subscale A, and suggestions for improvements were made. In subscale B words that were connected to the disease was thought to be missing. **Relevance** The items were overall considered to cover relevant aspects of appearance in SSc. **Include/exclude items** Inclusion of items concerning appearance of mouth, lips, nose, fingers, and feet was suggested. Other aspects such as stiffness when moving or limping were found to be lacking. **Suggestions for exclusion covered** "...appearance of my scalp" and items that was thought to be too harsh for the patients, such as "I don't think people would like to touch me". **Fear of hurting the patients** Most HPs felt that it might be inappropriate to focus on patients' appearance and they feared hurt reactions. Negatively formulated subscale labels and emotionally demanding items in subscale A contributed to these thoughts. **When and how to use** Thoughts were expressed about when to use the questionnaire, how they would handle the results, and the importance of discussing appearance issues.

**Conclusions:** SWAP-Swe was, considered by HPs to be comprehensible and covering relevant aspects of appearance in SSc. However, further development of SWAP-Swe is suggested to better cover disease specific appearance topics and to limit potential risk of negative emotions among patients. Interviews with patients with SSc will further contribute to the content validity of SWAP-Swe.

**AB1409-HPR** **GAIT STABILITY IN INDIVIDUALS WITH CHRONIC IDIOPATHIC NECK PAIN**

M Kirmizi<sup>1</sup>, I.E. SIMSEK<sup>2</sup>, A. ELVAN<sup>2</sup>, O. AKCALI<sup>3</sup>, S. ANGIN<sup>2</sup>. <sup>1</sup>Physical Therapy and Rehabilitation, Dokuz Eylul University Institute of Health Sciences; <sup>2</sup>School of Physical Therapy and Rehabilitation, Dokuz Eylul University; <sup>3</sup>Surgery Medicine Department of Orthopaedics and Traumatology, Dokuz Eylul University, Faculty of Medicine, Izmir, Turkey

**Background:** Gait stability ratio (GSR) is represented by step counts per metre during walking. Higher GSR value means to increase in time spent on double support period and decrease in dynamic components of gait, which refers to more stable gait pattern. Recent studies showed that individuals with chronic idiopathic neck pain (CINP) demonstrate altered balance and gait parameters. However, it is not clear whether GSR is affected in individuals with CINP.

**Objectives:** We have hypothesised that GSR could be altered in individuals with CINP because of their altered gait pattern. Therefore the aim of the study was to compare GSR, gait speed, step length and cadence between individuals with CINP and healthy controls and investigate the relationship between disability and spatiotemporal gait parameters in individuals with CINP.

**Methods:** Twenty-five individuals with CINP (17 female – 8 male, mean age: 37,28±13,47) and 25 healthy controls (17 female – 8 male, mean age: 36,6±14,2) recruited into this study. Participants with CINP completed the Turkish version of Neck Disability Index (NDI). All participants performed the 10-metre walking test in three walking conditions: Preferred walking (PW), walking with head rotation (HRW), walking at maximum speed (MAXW). Video analysis method involving slow motion camera (120 fps) was used to measure spatiotemporal gait parameters. GSR was calculated by dividing cadence (step/s) to gait speed (m/s). Independent samples t-test was used to compare groups for GSR and other gait parameters. Pearson correlation coefficients were computed to find associations between NDI and gait parameters.

**Results:** Individuals with CINP exhibited slower gait speed and cadence in all walking conditions (p<0.05). In individuals with CINP, step length was found to be shorter in only HRW (p<0.05), however, GSR was higher in HRW and MAXW (p<0.05). GSR values calculated in three walking conditions were found to be moderately correlated with NDI (r=507 for PW, r=533 for HRW, r=516 for MAXW, p<0.05). A negative and moderate correlation was found between preferred walking speed and NDI (r=-473, p<0.05).

**Conclusions:** Our results suggested that neck pain have a negative impact on gait parameters. Also, individuals with CINP had a more stable gait pattern involving less dynamic components. Assessment of GSR and related gait parameters in different walking conditions may be addressed in clinical assessment of CINP and may provide additional information for management of such disability.

**AB1410-HPR** **HEALTH PROFESSIONALS' PERSPECTIVE ON BENEFITS AND RISKS OF LOW DOSE GLUCOCORTICOIDS IN RA – AN INITIATIVE UNDER THE GLORIA PROJECT**

P.D.Carvalho<sup>1</sup>, F. Buttgereit<sup>2</sup>, M. Boers<sup>3,4</sup>, J.A.P D.Silva<sup>5</sup>. <sup>1</sup>Serviço de Reumatologia, Centro Hospitalar Do Algarve, Faro, Portugal; <sup>2</sup>Department of Rheumatology and Clinical Immunology, Charité – Universitätsmedizin Berlin, Berlin, Germany; <sup>3</sup>Department of Epidemiology and Biostatistics; <sup>4</sup>Amsterdam Rheumatology and immunology Center, VU University Medical Center, Amsterdam, Netherlands; <sup>5</sup>Faculty of Medicine and University Hospital, Coimbra, Portugal

**Background:** The Glucocorticoid Low-dose Outcome in Rheumatoid Arthritis Study (GLORIA) is an international investigator initiated pragmatic

randomised trial designed to study the effects of low dose glucocorticoids (GC) in elderly patients with Rheumatoid Arthritis (RA). The research team is also committed to promoting a better understanding of the risks and benefits of these drugs among health professionals and patients. In order to achieve these goals, it is important to assess the current concepts and concerns of health professionals (HP) regarding GCs.

**Objectives:** In this study, we evaluated the beliefs about GC benefits and risks of HP who regularly use and monitor them in the treatment of RA.

**Methods:** These surveys were disseminated to HP who have experience dealing with RA patients in their daily clinical practice. These surveys mainly enrolled physicians, but also nurses or physiotherapists who considered themselves experienced in this field. The surveys were made available in Portuguese and English, and disseminated through the GLO-RIA investigational team. National medical societies contributed by inviting clinicians to participate.

Regarding the questions on GC efficacy, HP could signal (dis)agreement on a 5 point scale: disagree, slightly disagree, neutral, slightly agree, and agree. Agreement was defined as the proportion of HP answering slightly agree or agree. Survey Monkey software was used to disseminate the online surveys.

**Results:** Responses provided by 130 HP are summarised in table 1. The results are presented taking all participating countries in account as the rates are similar between them. Most responses came from The Netherlands (57%) and Portugal (34%). Almost all participants were physicians (97%).

Efficacy of GC was highly endorsed. Close to 90% of HP considered low dose GC were very effective in the control of signs and symptoms of RA, and agreed that GC improve RA symptoms within days. Almost 80% agreed that GC reduce structural damage, and 85% disagreed that GC lose their efficacy after a few months.

The opinions of health professionals regarding frequency of GC adverse events are presented in table 2.

Regarding GC AE events, most of the respondents considered that low dose GC adverse events were very rare or rather rare, except for glycaemic control in patients with diabetes and osteoporosis. Acne and cardiovascular events were evaluated as very rare adverse events by approximately one third of HPs. However, there was significant heterogeneity in the responses.

**Abstract AB1410HPR – Table 1.** Health professional's characteristics (n=130) and data on GC's efficacy.

Country of participants, number (%)	
Netherlands	70 (57)
Portugal	41 (33)
Others	11 (9)
Physicians, number (%)	122 (97)
Level of agreement for statements, number (%)	
At a dose ≤ 7.5 mg prednisolone/day, GC:	
- are very effective in the control of signs and symptoms of RA	88 (90)
- improve RA symptoms within days	86 (88)
GC reduce the probability of articular damage caused by RA	77 (79)
In RA these doses of GC lose efficacy after a few	
- months of therapy	15 (15)
- years of therapy	18 (18)

GC – Glucocorticoid; RA – Rheumatoid Arthritis.

**Abstract AB1410HPR – Table 2.** Frequency of low dose GC's adverse events according to health professionals who attended this survey (% of HP per frequency category).

	None	Very rare (<1%)	Rather rare (1-3%)	Rather frequent (4-10%)	Frequent (11-20%)	Very frequent (>21%)	Don't know
Acne	13	33	29	19	2	1	4
Mood disturbances	8	19	40	28	4	0	2
Poor DM control	1	6	15	42	27	9	1
Cardiovascular events	6	34	33	16	3	0	9
Osteoporosis	1	7	21	43	19	7	3
Serious infections	13	33	42	11	1	0	1

**Conclusions:** GC are widely used drugs in RA. The vast majority of participating HPs are convinced that GCs are efficacious in the treatment of RA, including DMARD effects, and retain this efficacy long term. However, concerns about severe side-effects are also very prevalent.

## AB1411-HPR HYPERMOBILITY AND FIBROMYALGIA: COEXISTENCE OR MISTAKEN IDENTITY?

P. Donohue<sup>1</sup>, S. Chavrimootoo<sup>2</sup>, S. Ramakrishnan<sup>2</sup>. <sup>1</sup>Department Of Physiotherapy; <sup>2</sup>Department of Rheumatology, Our Lady's Hospital, Navan, Meath, Ireland

**Background:** The 2010 classification of fibromyalgia (FM) has many overlapping features with hypermobility-Ehler Danlos Syndrome (hEDS) such as chronic widespread musculoskeletal pain, sleep disturbances, fatigue and anxiety.<sup>2, 4, 5</sup> Indeed hEDS may be misdiagnosed as FM because of diffuse pain with a strong myofascial component.<sup>1</sup> Chopra<sup>1</sup> believes these should be considered as two distinct conditions which may co-exist. By classifying as one and ignoring the other are we doing our clients a disservice?

The five point questionnaire (5PQ) is a simple questionnaire used to detect hypermobility and is claimed to have good reproducibility in addition to satisfactory sensitivity and specificity.<sup>3</sup> This audit examined the numbers of FM clients that also fulfilled the hEDS criteria according to the 5PQ.

**Methods:** 66 clients with a consultant diagnosis of FM who attended the multidisciplinary FM education session were invited to fill in the 5PQ along with their fibromyalgia impact questionnaire (FIQ). 57 of the 66 completed both questionnaires over a 13 month period.

The cut off points of 2 out of 5 for the 5PQ and 50 on the FIQ were used.

The higher numbers on the 5PQ indicate increased likelihood of hypermobility.

Around 50 on the FIQ is typical for FM with higher values indicating increased severity.

The individual scores for the FIQ question on anxiety were also examined. Question 19 rates anxiety on a visual analogue scale from 0–10, the higher values indicating increased levels of anxiety.

**Results:** 54 females and 3 males aged between 18 and 76, mean age 51.

15 of the 57 (26%) scored 2 or above on the 5PQ suggestive of hypermobility.

Of those 15, 10 (66%) scored greater than 50 on the FIQ thus meeting the criteria of FM also.

7 of the 15 (47%) scored 8 or above on the anxiety scale.

**Conclusions:** From this audit 26% of FM clients also scored positively for hEDS as per the 5PQ. hEDS may account for some or all of their FM symptoms.

The 5PQ is a quick and easy tool to use. It may improve hEDS detection rates and could be used in a busy rheumatology clinic.

Further research is required to ascertain whether those with positive scores meet the physical criteria for hEDS.

## HPR Epidemiology and public health (including prevention)

### AB1412-HPR IS DIFFUSE ALVEOLAR HAEMORRHAGE IN ANCA-ASSOCIATED VASCULITIS PREDICTIVE OF POOR PROGNOSIS?

L. Garcia, C. Pena, R. Aguila Maldonado, A.C. Costi, A. Testi, V. Nagua, M. A. Garcia. *Rheumatology, Hospital San Martin La Plata, La Plata, Argentina*

**Background:** Diffuse alveolar haemorrhage (DAH) is a serious complication of anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV). Detailed characteristics of patients with AAV and associated DAH have been limited to case reports and a few case series, due to the rarity of the condition.<sup>1</sup> Prompt diagnosis is required as early treatment is crucial.

**Objectives:** To compare clinical manifestations, laboratory and immunological values, morbidity and mortality in patients with ANCA-associated vasculitis (AAV) with and without Diffuse Alveolar haemorrhage (DAH)

**Methods:** Retrospective cohort study. Data from the medical records of patients over the age of 18 were evaluated between the years 2000–2017. Ninety patients with diagnosis of AAV who met the criteria of ACR 1990 Classification or Chapel Hill Consensus Conference 2012 were included. DAH was diagnosed based on minor or major hemoptysis and/or respiratory insufficiency together with at least 1 positive result on x-ray and/or computed tomography scan. The sample was divided in two groups: with DAH (group 1) and without DAH (group 2) along the disease. We compared demographic data, Birmingham Vasculitis Activity Score (BVAS) and Five Factor Score (FFS) at the onset of the disease, hemogram, creatinine and ANCA antibodies by immunofluorescence and/or ELISA, clinical manifestations as renal, neurological, mucocutaneous, articular, cardiological, ophthalmological and ear, nose and throat (ENT) damage and mortality between groups.

Chi-square or Fisher's exact test was used for dichotomous variables as appropriate. P-value < 0.05 was considered statistically significant. Logistic regression analysis was used to identify predictors of survival.

**Results:** Group 1 included 24 patients (66% male, mean age at onset of the disease 54 years). Most frequent type of vasculitis was Granulomatosis with polyangiitis (GPA) 54%. Mean BVAS 21 points and FFS 1 point. Group 2 included 66 patients: 36% male, mean age of the disease 52 years, GPA 45%, BVAS was 17 points and FFS de 0 points. Table 1 shows demographic, clinical data and mortality of each group. Logistic regression analysis showed statistically significant difference between DAH and male sex (p: 0.017 OR 6.08 CI 95% 1.37–26.92).

Abstract AB1412-HPR – Table 1

	With HAD n=24 (26.6%)	Without HAD n=66 (73.4%)	p-value	OR (CI 95%)
Male sex	16 (66.7%)	24 (36.4%)	0.011	3.50 (1.30–9.38)
BVAS	21 points	17 points	0.009	
FFS	1 point	0 point	<0.001	
Anaemia	21 (87.5%)	30 (45.5%)	<0.001	8.4 (2.28–30.91)
Mucocutaneous disease	1 (4.2%)	19 (28.8%)	0.018	0.11 (0.01–0.91)
ENT disease	7 (29.2%)	35 (53%)	0.045	0.36 (0.13–0.99)
Neurological disease	4 (16.7%)	31 (47%)	0.009	0.22 (0.07–0.73)
Renal damage	24 (100%)	31 (47%)	<0.001	1.70 (1.40–2.23)
RPGN	13 (54.2%)	12 (18.2%)	0.001	5.31 (1.92–14.71)
Dialysis	8 (33.3%)	4 (6.1%)	0.003	6.8 (1.69–27.35)
Mortality	5 (22%)	12 (21%)	0.930	1.05 (0.32–3.44)

**Conclusions:** DAH was associated with increased morbidity but not modified the mortality in this group of patients. The results seem to be agree on the Five Factor Score<sup>2</sup> that does not include DAH within parameters.

### AB1413-HPR ADVANTAGES OF RHEUMATOLOGY NURSING VACCINATION OF PATIENTS WITH INFLAMMATORY RHEUMATIC DISEASES OF AUTOIMMUNE ORIGIN. ANALYSIS OF THE FIRST 3 YEARS

A Pons-Bas<sup>1</sup>, E. Ivars<sup>1</sup>, C. Cano<sup>1</sup>, M. Lorente<sup>1</sup>, J. Rosas<sup>1</sup>, G. Santos-Soler<sup>1</sup>, E. Salas<sup>1</sup>, J.M. Senabre-Gallego<sup>1</sup>, X. Barber<sup>2</sup>, on behalf of AIRE-MB Group.

<sup>1</sup>Rheumatology Department, Hospital Marina Baixa, Villajoyosa (Alicante); <sup>2</sup>CIO, Miguel Hernández University, Elche, Spain

**Background:** Patients with systemic autoimmune diseases (SAD) have higher incidence of infections. In our Service, until 2014 about 50% of patients did not complete vaccination for pneumococcus or hepatitis B virus (HBV).

**Objectives:** To know the characteristics of vaccinated patients and advantages of vaccination by Rheumatology nurse (Nurse-RHEU).

**Methods:** Observational study of patients in follow-up in rheumatology, vaccinated from 2015–2017, by SAD in treatment with biological therapy and/or immunosuppressive, by Nurse-RHEU, following the recommendations from SVR and the Valencian Society of Preventive Medicine and Public Health Consensus Document for the vaccination of patients with SAD, published in 2014. Nurse-RHEU, assumed from 2015 the vaccination of all rheumatology patients with SAD. The vaccines to be administered were: pneumococcal (13 V and/or 23 V) and hepatitis B virus (HBV).

Pneumococcal vaccination should be initiated with the conjugate/13 V type and at least 8 weeks later with a dose of polysaccharide/23 V vaccine. A single 23 V booster dose is recommended 5 years after the first dose. Only if patient have received a previous dose of 23 V, it is advisable to administer type 13 V, one year later. For the HBV vaccine, it is necessary previously check the immune status of the subject. If it is not immune, 3 doses will be administered (0–1–6 months).

Since 2015, our Section has: refrigerator, electronic access to the Vaccinated Nominal Registry of the Valencian Community (it collects data of the patient, date, type, batch of vaccine administered), specific database (epidemiological data of the patients, future dose programming, access to electronic medical records) and Nurse-RHEU trained. Previously, the nurse details possible side effects, and how to act or contact.

**Results:** Of the 261 patients vaccinated during 2015 to 2017, 65% were women, with mean age 53.57±15.50 years (10–81 years). The diagnosis was: rheumatoid arthritis: 48%, ankylosing spondylitis: 23%, psoriatic arthritis: 13%, systemic lupus erythematosus: 7%, uveitis: 4%, and others 5%. The reason for vaccination was: initiation treatment with a biological drug (51%), or immunosuppressive (49%). A total of 621 vaccines were administered, which were: 13-valent conjugate antineumotococcal: 259 (42%), 1 st VHB dose: 94 (15%), 2nd VHB dose: 85 (14%), 3rd VHB dose: 72 (12%), pneumococcal 23-valent polysaccharide: 111 (17%). All vaccines were registered in the Vaccinated Nominal Register of the Valencian Community.

**Conclusions:** 1. Patients with SAD in biological treatment and/or immunosuppressant, vaccinated by Nurse-RHEU, achieve a completeness of all doses of vaccination, close to 100%. 2. In a large part of the patients, vaccination is scheduled at the beginning of the diagnosis of the disease, at the first consultation or immunosuppressive treatment, the same day of the visit to the Rheumatologist, avoiding unnecessary visits to the patient. 3. An adequate electronic registry allows immediate access to information from any point in the Valencian Community, through access to the computer program of the Health department.

**Acknowledgements:** The study was supported with a research grant from the Association for Research in Rheumatology of Marina Baixa (AIRE-MB).

**AB1414-HPR** LONG TERM EFFECTIVENESS OF A TREAT TO TARGET APPROACH AND IMPACT IN OVERALL HEALTH IN PATIENTS WITH RHEUMATOID ARTHRITIS – A 3 YEAR FOLLOW-UP

D Buitrago-Garcia<sup>1</sup>, L. Villarreal<sup>2</sup>, M. Cabrera<sup>2</sup>, P. Santos-Moreno<sup>3</sup>. <sup>1</sup>Epidemiology, SIIES; <sup>2</sup>Health services; <sup>3</sup>Rheumatology, Biomab, Center For Rheumatoid Arthritis, Bogota, Bogota, Colombia

**Background:** Rheumatoid arthritis (RA) is a common chronic inflammatory disease. It is characterised by progressive, irreversible joint damage, impaired joint function and pain, the disease causes disability and reduced quality of life. Treat-to-target (T2T) is an acknowledged management strategy for RA. It proposes that the therapeutic target in RA should be a state of remission, or an alternative goal could be a low disease activity, additionally it looks to achieve long-term health quality of life for the patient.<sup>1,2</sup>

**Objectives:** To describe the effectiveness of a T2T strategy regarding Disease Activity Score 28 (DAS28) in a 36 month period in patients who receive conventional or biological DMARDs and attend at least at four consults per year in a specialised in RA centre.

**Methods:** A descriptive cohort study was conducted. Medical records of patients from specialised in RA centre were reviewed between 2015–2017; those patients were followed-up under T2T standards and a multi-disciplinary approach. Each patient had a minimum of 4 follow-up visits per year. Clinical follow-up was designed by the authors according to DAS28 as follows: every 3–5 weeks (DAS28 >5.1), every 7–9 weeks (DAS28 ≥3.1 and ≤5.1), and every 11–13 weeks (DAS28 <3.1). Therapy had to be adjusted with DAS28 >3.2 unless patient's conditions don't permit it; We divided patients in four groups: remission (REM), low disease activity (LDA), moderate disease activity (MDA) and severe disease activity (SDA) patients and the aim of the study was to look at what percentage of patients reached a LDA or REM. Descriptive epidemiology was done, we calculated means, and standard deviations for continuous variables and categorical variables were presented as rates. We analysed normality for DAS28, in order to compare disease activity at beginning and the end of follow-up.

**Results:** During three years 1146 patients had confirmed RA and attended to a specialised centre with a minimum of 4 visits per year, 86% were female and 14% were men, mean DAS28 at baseline was 3.69±1.10 with a median of 3.1 while at 3 years mean DAS28 was 2.94±0.87 with a median of 2.79. At baseline 46% were in LDA, 40% in MDA and 13% were in SDA. Regarding pharmacological therapy 63% were receiving conventional DMARDs while 37% were receiving biological DMARDs. When we evaluated the effectiveness of T2T approach in terms of disease activity at the end of 36 months 42% achieved remission and 26% LDA (in total 68.5% of patients improved clinically) see table 1. We performed a Wilcoxon test in order to compare the mean DAS28 at baseline and at the end showing statistical significance (p<0.05).

Abstract AB1414-HPR – Table 1

ACTIVITY LEVEL	AT BASELINE		3 YEARS FOLLOW-UP	
	n	%	n	%
REM			488	42.6
LDA	532	46.42	297	25.9
MDA	462	40.31	336	29.3
SDA	152	13.26	25	2.2

**Conclusions:** This real-world data demonstrates the effectiveness of a T2T multidisciplinary approach in patients with rheumatoid arthritis who remained in conventional or biological therapy during three years.

Abstract AB1415-HPR – Table 1

	Mean	SD		CI 95%		Mean	SD		CI 95%		p values

**AB1415-HPR** DIFFERENCES ON PAIN AND STRUCTURAL ANORMALITIES BETWEEN PATIENTS WITH RHEUMATOID ARTHRITIS AND THOSE WITH INESPECIFIC FOOT PAIN: CROSS SECTIONAL STUDY

G Gijon-Nogueron<sup>1</sup>, A. Reinoso-Cobo<sup>1</sup>, A.B. Ortega-Avila<sup>1</sup>, R. Caliz<sup>2</sup>. <sup>1</sup>Nursing and Podiatry, University of Malaga, Malaga; <sup>2</sup>Servicio de Reumatologia, Hospital Virgen de las Nieves, Granada, Spain

**Background:** The presence of foot pain and deformity is ubiquitous in Rheumatoid Arthritis (RA). Epidemiological studies consistently suggest a prevalence of foot pain of 90%.<sup>1</sup> Weight gain, high levels of fatigue and deformities such as hallux valgus and metatarsus primus varus, are very frequent too.<sup>2</sup>

**Objectives:** The aim of this study was to analyse pain levels and structural abnormalities among subjects with foot pain and patients with RA.

**Methods:** A sample comprised of 40 subjects was studied. Participants were recruited from a private podiatry clinic and from the Department of Rheumatology (Granada, Spain). The inclusion criteria were subjects with RA with a duration of at least 10 years according to the American Rheumatism Association criteria for RA, while patients with foot pain seeking podiatry services from April 2017 to January 2018 were used as control group. Outcome measures were as follows: foot pain, activity limitation, disability and foot health status by Foot Function Index questionnaire<sup>3</sup> and Hallux Valgus by Manchester Hallux Valgus Scale.<sup>4</sup>

**Results:** As shown in Table 1, we found statistical significant differences for the pain scale(p>0.001) and in total score(p>0.001) in the FFI scale between AR group and the control group, but not between group in the Manchester Hallux Scale (p=0.986)

Abstract AB1415-HPR – Figure 1

**Conclusions:** We found higher levels of pain in subjects with RA compared to the control group. Furthermore, although there are clinical

differences subjects with RA and with foot pain, we can not conclude strongly that RA increases the possibility of having deformities such as Hallux Valgus.

#### AB1416-HPR RISK FACTORS ASSOCIATED WITH FRACTURE RISK IN WOMEN WITH BREAST ADENOCARCINOMA IN A SEVILLE COHORT

G.M.Paz, on behalf of Giannina Del Aguila Biondi, Paloma Muñoz Reinoso, Isabel González Agudo, Juan Piedra, Juan Povedano, Blanca Hernández Cruz. *Reumatology, Macarena Hospital, Seville, Spain*

**Background:** Introduction: Women with breast cancer have a higher risk of osteoporotic fractures than the rest of the population of the same sex and age. This problem is due to multiple factors among which are the treatments to which they are subjected. Among them, chemical castration, chemo and/or radiotherapy, corticosteroids, surgery, monoclonal antibodies against HER-2 and aromatase inhibitors are related to increased bone resorption.

**Objectives:** Objectives: To assess the prevalence of and factors associated with fragility fractures in women with breast adenocarcinoma.

**Methods:** Patients and methods: Prospective, cross-sectional study in progress. In a multidisciplinary consultation of OP and Oncology of two third-level centres in Seville, women diagnosed with breast cancer are treated. The factors associated with the presence of vertebral and peripheral fragility fractures in these patients at the time of the first evaluation were analysed.

**Results:** Results: 409 women were included in this analysis, evaluated between September 2014 and December 2017. The median age (Q1-Q3) was 63 55–68 years. 38 (9%) fragility fractures were observed, 22 (5.4%) vertebral and 18 (4.4%) peripheral. Three patients presented peripheral and vertebral fractures. Factors such as smoking, family history, menopause age, exercise, sun exposure, milk consumption or BMI were not associated with fragility fractures. The t-score in the femoral neck or spine was also not associated with fragility fractures. Of the 88 patients treated with tamoxifen, 6 (6.8%) had fragility fractures compared to 32/320 (10%) of those who did not receive tamoxifen (p=0.367). They presented fragility fractures 22/215 (10%) women with letrozole compared to 16/194 (8%) that were not treated with letrozole (p=0.490). At the time of the first evaluation, the mean (SD) of the FRAX was 6.1 (5.3) in women without fractures and 11.7 (7.7) in those with fragility fractures (p<0.001). In the logistic regression, the only variable associated independently was the FRAX [FRAX >10, adjusted OR 8.9 (3.9–20.4), p<0.001]. The best logistic regression model explained 12% of fragility fractures

**Conclusions:** Conclusion: In women with breast cancer, FRAX is the only clinical variable associated independently with the presence of fragility fractures in our

#### AB1417-HPR PREDICTORS OF COGNITIVE DYSFUNCTION IN PATIENTS WITH LUPUS

H.Alessi<sup>1</sup>, L.A. Dutra<sup>1</sup>, L.A. Maria<sup>1</sup>, P.C. Coube<sup>1</sup>, O.G.P. Barsottini<sup>1</sup>, C. Kayser<sup>2</sup>, A. W.S.D.Souza<sup>2</sup>. <sup>1</sup>Department of Neurology and Neurosurgery; <sup>2</sup>Rheumatology Division, Universidade Federal de São Paulo – UNIFESP, São Paulo, Brazil

**Background:** Cognitive Dysfunction (CD) is one of the most common neuropsychiatric manifestations in systemic lupus erythematosus (SLE).

CD occurs independently of structural damage<sup>1,2</sup> or disease activity<sup>3</sup> impacts life quality.<sup>4</sup> Cardiovascular comorbidities, lower educational level and physical inactivity are risk factors for dementia in elderly worldwide<sup>6</sup> and are frequently found in SLE patients. Identifying the factors involved with CD in SLE can clarify physiopathological processes and preventive measures.

**Objectives:** To verify if cardiovascular comorbidities and physical inactivity are predictors of CD in Brazilian patients with SLE.

**Methods:** a 168 patients and healthy controls between 18 and 59 years were allocated into three groups: CON (n=57), SLEG (n=63) and NPSLE (n=48). Epidemiological information, laboratory results, medication use, cardiovascular comorbidities (hypertension, diabetes, dyslipidemia, previous myocardial infarction), SLICC and SLEDAI scores were compiled from charts. Variables were compared using ANOVA, Kruskal-Wallis, Mann-Whitney and Qui-square, and p<0.05.

**Results:** There were no differences between groups regarding age, educational level. There was also no difference in prevalence of diabetes, myocardial infarction, tobacco use and disease duration. SLEG and NPSLE had more hypertension (CON 18.9%; SLEG 55.6%; NPSLE 39.6%) and dyslipidemia than controls (CON 9.4%; SLEG 36.5%; NPSLE 39.6%). SLE patients presented more depression (p<0.001), anxiety (CON 9.5±8.3; SLEG 16.3±13.3; NPSLE 14.1±10.9; p=0.008) and lower levels of physical activities than controls. NPLES group presented more CD (CON 21.1%; SLEG 34.9%; NPSLE 62.5%) when compared to CON (p<0.001) and SLEG (p=0.012). Major neuropsychiatric manifestations (OR 2.460; 95% CI 1.007–6.008; p=0.048); low educational level (OR 0.870; 95% CI 0.756–1.000; p=0.050), anxiety (OR 1.031; 95% CI 0.994–1.069; p=0.096), and disease damage (OR 1.691; 95% CI 1.175–62.435; p=0.005) were independently associated with CD.

**Conclusions:** Neuropsychiatric manifestation, low educational level, anxiety and disease damage are predictors of CD in patients with SLE. Although cardiovascular comorbidity and sedentary lifestyle are a risk factor for dementia in general population, those variables might play a minor role in SLE patients.

#### AB1418-HPR LOW BACK PAIN AND INFLUENCE ON THE FUNCTIONAL DISABILITY OF THE ELDERLY POPULATION OF MANAUS – AMAZONAS, BRAZIL: A CROSS – SECTIONAL STUDY

I.M.B.Souza<sup>1</sup>, R.D.S.P.Rodrigues<sup>2</sup>, J.W.C. da Silva<sup>3</sup>, L.R. Merini<sup>2</sup>, S.L.K. Yuan<sup>1</sup>, A. P. Marques<sup>1</sup>. <sup>1</sup>Physical Therapy, Speech Therapy and Occupational Therapy Department, University of Sao Paulo, Sao Paulo; <sup>2</sup>Physical Therapy Collegiate, Federal University of Amazonas, Manaus; <sup>3</sup>Department of Social Gerontology, Pontifical Catholic University of Sao Paulo, Sao Paulo, Brazil

**Background:** Low back pain (LBP) is the primary cause of disability and absenteeism in the workplace, it is a complex multidimensional phenomenon with staggering social costs. These symptoms reduce functional capacity and limit both physical and psychosocial aspects of elderly life.

**Objectives:** To identify the influence of LBP on the functional disability in elderly subjects.

**Methods:** The study was approved by Research Ethics Committee of Medical School at University of Sao Paulo, Protocol. CAAE.56709716.5.1001.0065. This a cross-sectional study, 700 community-dwelling elderly participated, both genders, ≥60 years old, and functional

disability was measured using the Rolland Morris Disability Questionnaire – Brazil version (RMDQ–BR).

**Results:** The punctual prevalence of LBP was 42.09%, age 68.61±6.06 years old, women 78.14%, and the functional disability score assessment was 11.26±6.07. About responses frequently items (RMDQ–BR) were: I change position frequently to try to get my back comfortable (84%); I avoid heavy jobs around the house because of my back (75%); Because of my back, I try not to bend or kneel down (73%); Because of my back, I go upstairs more slowly than usual (62%); I walk more slowly than usual because of my back. (57%); Because of my back, I use a handrail to get upstairs (55%).

**Conclusions:** The data demonstrates that there is a relationship between DL and functional disability in the elderly. It has been verified that the constant change to the maintenance of the posture, the decrease of the walking speed, to climb stairs with assistance, and the accomplishment of the activities of the daily that require movements of flexion trunk or knee have been reported to be difficult to perform. These data may be useful in the development of preventive strategies by health professionals that aim to encourage changes in routine care of daily living activities.

#### AB1419-HPR CLINIC OF PREGNANCY AND RHEUMATIC DISEASES: EPIDEMIOLOGIC CHARACTERISATION

I Perez Onofre<sup>1</sup>, C.M. Skinner Taylor<sup>1</sup>, L. Perez Barboza<sup>1</sup>, D.A. Galarza Delgado<sup>1</sup>, J.A. Soria Lopez<sup>2</sup>, N.E. Rubio Perez<sup>3</sup>. <sup>1</sup>Rheumatology Service; <sup>2</sup>Obstetrician Service; <sup>3</sup>Pediatric Rheumatology Service, Universidad Autónoma de Nuevo León, Monterrey, Mexico

**Background:** Pregnancy in women with Rheumatic Diseases (RD) is of high risk and requires a close communication between the rheumatologist, obstetrician, and all other specialists involved. It may have an effect on the natural history of autoimmune disease, a phenomenon that is particularly relevant in Systemic Lupus Erythematosus (SLE) and Rheumatoid Arthritis (RA). Additionally, there are consequences that autoimmune disease may yield throughout the course of conception and gestation.

**Objectives:** To describe the epidemiological characteristics of patients seen at the Clinic of Pregnancy and Rheumatic Diseases (Clínica de Embarazo y Enfermedades Reumáticas, CEER) located in the Jose E. Gonzalez University Hospital in Mexico.

**Methods:** We conducted a descriptive transversal study of a cohort of 50 adult patients that attended CEER; which were categorised within three consultation groups (reproductive age, with a present or future desire to become pregnant, pregnant or in postpartum period). All patients were evaluated by the Maternal-Fetal Medicine and Rheumatology department. CEER was created in August 2017 and provided medical follow up for newly pregnant patients, those already pregnant, and patients in the immediate postpartum period. Epidemiological data was collected.

**Results:** Of the 50 patients, 8 (16%) with a present or future desire to become pregnant, 24 (48%) pregnant, just only one presented gestational diabetes; and 18 (36%) were in the immediate postpartum period. The median age was 32 years ( $SD=6.16$ ). The 18 births were live births obtained by caesarean section, 8 (55.8%) were pre-term (<37WG) and none presented eclampsia or preeclampsia. Of the patients, 22 (44%) had a diagnosis of RA, 10 (20%) had SLE, 10 (20%) had Antiphospholipid Syndrome, and the remaining 8 (16%) had other diagnoses (table 1). Only 18 (36%) had previous abortions.

**Abstract AB1419HPR – Table 1.** Association between current status and diagnosis

Current status	Systemic Lupus Erythematosus	Rheumatoid Arthritis	Antiphospholipid Syndrome	Other	Total
Reproductive age	0 (0%)	5 (10%)	2 (4%)	1 (2%)	8 (16%)
Pregnant	7 (14%)	6 (12%)	6 (12%)	5 (10%)	24 (48%)
Postpartum	3 (6%)	11 (22%)	2 (4%)	8 (16%)	18 (36%)

Note: n=50

**Conclusions:** The evaluation of patients with RD requires a close follow-up, which is why the population of reproductive age with RD must be seen early on. Considering that our results revealed a high percentage of preterm live births medical attention must be provided from the pre-conception to the postpartum period.

#### AB1420-HPR PATIENT DELAY IN RHEUMATOID ARTHRITIS. A SURVEY ON SYMPTOM INTERPRETATION BEFORE FIRST VISIT TO GENERAL PRACTITIONER

J Primdahl<sup>1,2,3</sup>, K. Mølbæk<sup>1</sup>, T. Ellingsen<sup>4,5</sup>, I.M.J. Hansen<sup>6</sup>, D.E. Jarbøl<sup>7</sup>, T. Løttenburger<sup>8</sup>, J.L. Ravn<sup>9</sup>, K. Hørslev-Petersen<sup>2,10</sup>. <sup>1</sup>King Christian X's Hospital for Rheumatic Diseases, Graasten; <sup>2</sup>Institute for Regional Health Research, University of Southern Denmark, Odense; <sup>3</sup>Hospital of Southern Jutland, Aabenraa; <sup>4</sup>Odense University Hospital; <sup>5</sup>Clinical Institute, University of Southern Denmark; <sup>6</sup>Svendborg Hospital, Odense University Hospital; <sup>7</sup>Research Unit of General Practice, Department of Public Health, University of Southern Denmark, Odense; <sup>8</sup>Lillebaelt Hospital, Vejle; <sup>9</sup>Lillebaelt hospital, Kolding; <sup>10</sup>King Christian X's Hospital for Rheumatic Diseases, Graasten, Denmark

**Background:** Early initiation of effective treatment of rheumatoid arthritis (RA) leads to improved clinical and radiological status in the patients. Thus, there is a need to decrease the time from patients experience their first joint symptoms to initiation of treatment. The patient's social context may influence the period from the patients experience their first joint symptoms until they present their symptoms to their general practitioner (GP) (patient delay (PD))

**Objectives:** Firstly, to explore whether socioeconomic and other factors influence PD in persons referred to a rheumatologist due to suspicion of RA. Secondly, if socioeconomic factors affected whether the patients subsequently received a diagnosis with inflammatory arthritis (IA)

**Methods:** We developed a survey based on previous Danish<sup>1,2</sup> and UK<sup>3</sup> studies regarding symptom interpretation and PD together with two patient research partners. We asked consecutive patients, referred to a rheumatology outpatient clinic or a private rheumatologist in the Region of Southern Denmark, with a suspicion of RA, to complete the survey online or in a paper version before examination by a rheumatologist. We used STATA/IC 15.0 for descriptive statistics, univariate, and multivariate logistic regression analyses.

**Results:** From December 2016 to July 2017, 144 patients completed the survey. In total 86 (60%) were female, mean age 55 (SD 15.3). In total 76 (53%) had short PD (0–3 months), 51 (35%) intermediate or long PD (≥4 months) (12% missing answers); 71 (49%) totally or partially agreed that their symptoms had a gradual onset. Three to seven months after the survey, 45 (22%) had received a diagnosis of some sort of inflammatory arthritis (IA). In the following analyses age was dichotomized (<or≥50 years). Age, sex, cohabitant status, educational level and whether patients undertook paid work or not, did not significantly affect

the duration of PD. Female sex reduced the odds for an IA diagnosis compared to male sex (OR 0.35,  $p=0.05$ ), but this did not reach significance in the multivariate analyses. Whether patients' totally or partially agreed that they had: confidence to their general practitioner, felt they had support from others, whether their symptoms were obvious to others or significantly affected their work or leisure time, did not affect PD. Only gradual onset of symptoms significantly increased the odds for longer PD (OR 2.20,  $p=0.04$ )

**Conclusions:** In Denmark, socioeconomic factors did not seem to affect PD, but gradual onset of symptoms significantly increased the odds for median or longer PD

#### AB1421-HPR IS THERE ANY CHANGE IN THE DEMOGRAPHICS OF RA PATIENTS CANDIDATE FOR bDMARD THERAPY?

M Ban<sup>1</sup>, K. Bezsila<sup>2</sup>, B. Rojkovich<sup>3</sup>. <sup>1</sup>*Rheumatology Out-patient, Hospitalier Brothers of St. John's of God*; <sup>2</sup>*Pharmacy, Hospitalier Brothers of St. John's of God*; <sup>3</sup>*Rheumatology, Hospitalier Brothers of St. John's of God, Budapest, Hungary*

**Background:** There are an increasing number of data that rheumatoid arthritis (RA) patients who are candidates for bDMARD (biologic disease modifying drug) therapy have nowadays a milder disease and lower disease duration than 10 years ago. The T2T strategy aims to achieve remission. Percentage of patients achieving the treatment goals seems to be a good quality indicator.

**Objectives:** To verify among our RA patients treated with bDMARD since 2006, whether they have lower disease activity (DAS28) and shorter disease duration and younger age nowadays than at the beginning of the biologic era. As a measure of quality: how many patients treated with bDMARD achieved remission.

**Methods:** This is a cross sectional study. Among 455 patients RA treated with 9 different bDMARD we selected those who were treated with the most widely used at the time of the study (12.01.2017). The 103 ADA treated patients' data were collected by means of a tablets with the help of study nurses. Descriptive statistics were used for analysis of data (age and disease duration at the start of bDMARD, DAS28 at start and last visit, percentage of patients on remission).

**Results:** 103 (incl. 15 men) biologic naive patients (age: 56±13,1) are treated with ADA at time of the study. In 3 years cohorts (2006–2008;2009–2011, 2012–2014, 2015–2017) we found no change of age, but a slight decrease of disease duration as well as DAS28 at bDMARD initiation.

**Abstract AB1421-HPR – Table 1**

Cohort	n	Age at bDMARD initiation	Disease duration at bDMARD initiation	DAS28 at bDMARD initiation
2006–2008	24	50±10.1	10±7.1	6.1±0.84
2009–2011	10	42±15.1	14±15.1	5.2±0.72
2012–2014	20	49±13.1	6±6.7	5.5±1.09
2015–2017	49	55±13.5	7±7.8	5.0±1.35

51%(53) of the 103 RA patients on ADA therapy were in remission.

**Conclusions:** In our study population on ADA treatment we didn't find significant shift toward younger patients, but the disease duration and activity of disease at the start of the ADA treatment slightly decreased. By means of bDMARD's half of the patients achieved remission.

**Disclosure of Interest:** None declared

#### AB1422-HPR PREVALENCE AND RISK FACTORS OF LOW BACK PAIN IN THE INDIGENOUS POPULATION OF GALIBI IN SURINAME: A CROSS-SECTIONAL COMMUNITY-BASED STUDY

N.B Ho-A-Tham<sup>1</sup>, B. Ting-A-Kee<sup>1</sup>, N. Struyf<sup>1</sup>, R. Wittoek<sup>2</sup>, Y. Vanlandewijck<sup>3</sup>, W. Dankaerts<sup>3</sup>. <sup>1</sup>*Physical Therapy, Anton de Kom University of Suriname, Paramaribo, Suriname*; <sup>2</sup>*Rheumatology, Ghent University Hospital, Ghent*; <sup>3</sup>*Faculty of Kinesiology and Rehabilitation Sciences, KU Leuven, Leuven, Belgium*

**Background:** Musculoskeletal disorders are regarded as the fourth greatest burden on world health. Among these disorders, low back pain (LBP) ranks first for disability and sixth for overall burden. However, there is a large range in prevalence in the general population (1.0% to 58.1%) due to environmental and individual factors. There is limited data on prevalence and risk factors for LBP in developing countries, especially for vulnerable groups. This includes indigenous populations. Therefore a study was done regarding LBP in an indigenous population in Suriname, a South-American middle-income country.

**Objectives:** The objective of the study was to determine prevalence of self-reported LBP and possible relationships with several risk factors (gender, age, education level, body mass index (BMI), and smoking) in an indigenous community.

**Methods:** Data on LBP in Galibi was acquired through the COPCORD (Community Oriented Program for the Control of Rheumatic Diseases) stage 1 method. Galibi is located in the rural eastern coastal area of Suriname and consists of two indigenous villages: Langamankondre and Christiaanankondre. The Ministry of Health provided ethical approval. Indigenous persons above 15 years, who were present in the village at the time of the study, were eligible for participation. After informed consent all participants were interviewed, and their anthropometric measurements were taken (height, weight, waist circumference). Association between LBP and risk factors were analysed with the chi square test. Significance level was set at  $p \leq 0.05$ .

**Results:** From 4–11 December 2016, a total of 153 persons participated in the study. There were 79 (52%) male and 74 (48%) female respondents. Mean age was 50.9 years (standard deviation 18.1 years; age range 16–92 years). A total of 80 respondents (52.2%) indicated that they had experienced at least one episode of LBP during their life time. Prevalence for males was 53.2% and 51.4% for females. The highest prevalence was among persons in the age group 55–74 years (60.3%). The lowest prevalence was found among persons who at least finished secondary school (41.2%). Smokers had a higher prevalence for LBP (60.7%) compared to non-smokers (50.4%), and LBP prevalence increased as BMI increased. None of the variables were significantly associated with LBP.

**Conclusions:** The life time prevalence of LBP among the study population was 52%. No significant difference in prevalence between genders was found. There was a higher prevalence for smokers, persons with a lower education level and those with an increased BMI. However, significant associations between LBP and risk factors were not found in this study. Further research in a larger population is recommended.

#### AB1423-HPR IMPACT OF OSTEOARTHRITIS ON WORK PARTICIPATION: A SYSTEMATIC REVIEW

S. Secchi<sup>1</sup>, C. Holder<sup>1</sup>, Y. Prior<sup>1,2</sup>. <sup>1</sup>*Health Sciences, University of Salford, Salford*; <sup>2</sup>*Rheumatology, MidCheshire NHS Hospitals Trust, Leighton Hospital, Crewe, UK*

**Background:** Osteoarthritis (OA) is a common musculoskeletal condition in working age adults and linked to substantial reduction in work productivity and increased risk of work loss.<sup>1,2</sup>

**Objectives:** This systematic review aimed to investigate the impact of OA on the individual's work participation to identify targets for interventions and reduce the risk of future work loss.

**Methods:** Database searches included the Cochrane Library, Medical Lit-

erature Analysis and Retrieval System Online, Excerpta Medica Database, Cumulative Index to Nursing and Allied Health literature, King's Fund, Allied and Alternative Medicine, Psychological Information Database, Applied Social Sciences Index and Abstracts, Ageline, Social Services Abstracts and British Nursing Index from earliest to November 2017. The PRISMA statement was used to guide the process. Observational, interventional and qualitative studies were included in the review and their methodological quality was assessed by two researchers using the Johanna Brigg Institute Checklists.

**Results:** Twenty-two studies, which were published in 2007 to 2016 (12 cross sectional; 5 cohort; and 5 qualitative) were included. Measurement of workplace limitation varied largely amongst the studies. High pain intensity, decreased physical functioning, physically demanding jobs, lack of opportunities to re-train, and lack of co-worker support were identified as important workplace factors associated with loss of productivity, and both presenteeism and absenteeism were predictive of job disruption and premature work loss. Function was identified as an important mediator of the impact of pain on work productivity, with physiotherapy and exercise classes that target pain and physical function<sup>3</sup> and maximising work place support<sup>4</sup> being recommended to prevent or reduce loss of work productivity. Qualitative studies emphasised the significance of physical environments, and social networks and support, recommending interventions to target individual needs to prevent future work loss.<sup>5</sup>

**Conclusions:** There is a wide range of scientific literature to suggest working people with OA are experiencing work instability due to pain, reduced physical functioning, activity limitation, and lack of co-worker and workplace support, placing them at increased risk of work disability. However, the measurement of workplace limitation varies greatly in this literature, making it hard to conduct empirical comparisons. Due to the temporal and biopsychosocial nature of work disability, there is a need for longitudinal studies to investigate the links between workplace factors and the onset and persistence of work instability in people with OA. Additionally, future qualitative studies should explore the role of personal and psychological factors, such as an individual's self-efficacy and coping skills, and the employer's perspectives on the provision of workplace support, to establish whether these potentially modifiable factors could influence work outcomes in people with OA.

#### AB1424-HPR CORRELATES OF SLEEP IN RHEUMATOID ARTHRITIS: A SYSTEMATIC REVIEW

*S. Gaffney*<sup>1</sup>, N. Kennedy<sup>1,2</sup>, S. Hanley<sup>1</sup>. <sup>1</sup>Allied School of Health; <sup>2</sup>Health Research Institute, University of Limerick, Limerick, Ireland

**Background:** Over 50% of those with a diagnosis of Rheumatoid Arthritis (RA) experience poor sleep quality,<sup>Scott 2010</sup> This may result in altered health-related quality of life in addition to decreased daytime function.

**Objectives:** The aim of this systematic review is to identify and compile an account of the correlates of poor sleep in those with RA.

**Methods:** Two reviewers carried out literature searches of nine electronic databases. Literature was chosen based on the application of eligibility criteria, implementation of quality assessment and in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines. Moher *et al* 2009

**Results:** Fifteen full-text studies were included in the review – fourteen of cross-sectional design, and one randomised controlled trial (RCT). This included 3283 participants with a diagnosis of RA in accordance with the American College of Rheumatology criteria. The outcome measures included in the literature were largely heterogeneous in nature and therefore a meta-analysis was deemed to be unsuitable.

**Conclusions:** There is evidence within the literature to suggest that interactions between pain, fatigue, depression and functional ability play a role in sleep quality in those with RA. However, longitudinal data is

required in order to determine the directionality of these relationships. The most prominent correlate of poor sleep is pain, with twelve studies identifying a positive association between the two variables. Conflicting evidence exists with regard to the association between sleep quality and disease activity, RA medications and patient demographics.

#### HPR Interventions (educational, physical, social and psychological)

##### AB1425-HPR THE EFFECTS OF AEROBIC EXERCISE TRAINING ON PAIN AND DISABILITY FROM OSTEOARTHRITIS OF THE KNEE IN POSTMENOPAUSAL WOMEN

*A. Daşkanan*, F. Kilic, E. D. KESKİN. *Kirikale University, Ankara, Turkey*

**Background:** The prevalence, incidence and severity of osteoarthritis (OA) increases in women after menopause. It was indicated that, loss of oestrogen at menopause period was related to the increase in the risk of OA development. It was well documented that aerobic exercise training has positive effects on knee osteoarthritis symptoms and menopausal symptoms however we did not found study on the effects of aerobic training in postmenopausal women with knee osteoarthritis.

**Objectives:** Objective of this study was to evaluate the effects of aerobic exercise training on pain and disability in postmenopausal women with knee osteoarthritis

**Methods:** The study was approved by the Kirikkale University Ethic Committee. 50 voluntary postmenopausal women aged 48–78 years, with stage 2–3 knee OA according to the Lawrence classification were recruited to the study. The clinical information (age, menopause age, duration of OA, etc.) of the patients were questioned.

The cases were randomly divided into two groups as control which was performed combine physiotherapy and treatment group. Combine physiotherapy lasted three weeks and included hot pack, short wave diathermy, transcutaneous electrical nerve stimulation (TENS) and home exercises. After completed treatment, physiotherapist asked the patients to perform home exercises two times every day in three weeks period.

In the treatment group, in addition to combine physiotherapy, walking training on the treadmill performed 5 days/week during 6 weeks. The training intensity was%50–70 maximal heart rate (220-age). 40 min total exercise duration, consisted of a five minute warm-up and cool-down, 30 min brisk walking.

Both groups were evaluated before and after 6 six weeks the treatment. Visual Analogue Scale (VAS) was used to the pain evaluation. Functional ability was assessed by Western Ontario and McMaster Osteoarthritis Index (WOMAC).

Statistical analyses were performed using SPSS version 16 software.

**Results:** It was not observed significant difference on age, body mass index, menopause age, menopause duration and VAS value, WOMAC scores (subscales of pain, stiffness and physical function) before the treatment. ( $p>0.05$ ).

After the treatment, VAS value, WOMAC all subscales' scores were significantly different in favour of treatment group ( $p<0.05$ ). It was found that, VAS value and WOMAC all subscales' scores improved in both groups after the treatment ( $p<0.05$ ).

Subscales of WOMAC' scores and VAS value showed a significant increase that corresponds to a large effect ( $d>0.8$ ) in the treatment group. In the control group, only VAS value showed a significant increase that corresponds to a large effect ( $d>0.8$ ), other increases on WOMAC subscales that corresponds to small and moderate effects ( $d=0.38–0.58$ ).

**Conclusions:** Aerobic exercise training which added to the combined physiotherapy may contribute to decrease of pain and disability in postmenopausal women with knee osteoarthritis.

**AB1426-HPR IMPLEMENTATION OF NURSE LED CLINIC IN RHEUMATOLOGY DEPARTMENT LJUBLJANA, SLOVENIA**

*D. Stanković, M. Pavič Nikolič, A. Antonič Zakoč. Department of Rheumatology, University Medical Centre Ljubljana, Ljubljana, Slovenia*

**Background:** Nurse-led clinics in Rheumatology Department in Ljubljana have been established in September 2011 after nurses finished education module. The main goal was to provide good care and improved monitoring of patients with rheumatoid arthritis, psoriatic arthritis and ankylosing spondylitis which are treated with biologics. In this way nurses started to contribute and shape new ways in helping patients to better manage their disease. With this new approach the nurses have applied some of the recommendations regarding the role of the nurse in treatment of patients with inflammatory rheumatic diseases.

**Objectives:** The aim of this study is to describe the organisation, purposes and activities of a nurse-led rheumatology clinics.

**Methods:** Nurse's intervention data was collected from January 2012 to December 2017. The data is allocated according to individual intervention which has been implemented. We used excel table to represent data.

**Results:** The patients have opportunity for telephone counselling with the dedicated nurse about issues with their anti-TNF therapies. Between January 2013 and May 2014 we collected data in which we recorded 101 calls from patients who were seeking information about biologics. We recorded how many patients had come to the nurse led-clinics. We sorted them in four groups; nurse led follow up clinics, education about self-administration of biologics or some other medicine, blood or skin tests and daily care unite (table 1).

**Abstract AB1426HPR – Table 1.** Number of patients after intervention

Intervention/ Year	2012	2013	2014	2015	2016	2017
<b>Nurse led follow up</b>	478	780	1009	1101	1303	1455
<b>Education</b>	74	117	153	130	141	156
<b>Other intervention</b>	265	316	374	395	448	476
<b>Daily care unit</b>	309	390	446	501	570	664

**Conclusions:** The number of interventions has increased and show importance of nurses in patient management. This is most evident in the area of patient education and monitoring.

**AB1427-HPR THE ROLE OF PARENTS' AWARENESS IN PHYSICAL ACTIVITY IN CHILDREN WITH JUVENILE IDIOPATHIC ARTHRITIS**

B. Monek<sup>1</sup>, D. Vitár<sup>2</sup>, R. Chrobot<sup>3</sup>, I. Orbán<sup>4</sup>, E. Kiss<sup>2</sup>, G. Poór<sup>1</sup>. <sup>1</sup>*Rheumatology*; <sup>2</sup>*Clinical Immunology, Adults' and Children's Rheumatology, National Institute of Rheumatology and Physiotherapy*; <sup>3</sup>*Semmelweis University*; <sup>4</sup>*Clinical Immunology, Adults' and Children's Rheumatology, National Institute of Rheumatology and Physiotherapy, Budapest, Hungary*

**Background:** Whilst Juvenile Idiopathic Arthritis (JIA) is one of the most common chronic diseases amongst children, the impact of physical therapy on affected children's life-quality and the importance of an appropriate and regular physical activity get less attention than they ought to. In addition, there are no such studies about the role of parents' awareness in connexion with the regular physical activity for children with JIA available yet.

**Objectives:** The purpose of the survey was to evaluate the awareness of parents in connexion with the Juvenile Idiopathic Arthritis' diagnose, its treatment options, the importance of regular physical activity and how it affects children's life-quality. Everyday experiences say that children with JIA take part in less physical activities than their healthy mates do. Our aim was to detect how important regular physical activity is for parents.

**Methods:** This is a descriptive analysis of our self-compiled questionnaire which has 41 questions. It is being filled in both online and in paper forms since the February of 2017 in the National Institute of Rheumatology and Physiotherapy on the Department of Clinical Immunology, Adults' and Children's Rheumatology. Participants of the study are parents whose child has the diagnose of Juvenile Idiopathic Arthritis and ages between 2–18. Parents whose child has not differentiated diagnose or is under 2 years are excluded.

**Results:** 48 answers met the criteria, 6 answer sheets were excluded. In case the children's condition get worse, 20,8% of parents marked wrong parental measures. All parents acknowledge the importance of physical activity, but only 63% of children do regular physiotherapy at home. Parents could not choose from or rank the appropriate and useful ways of physical activities. Beside the medical team (doctor, physiotherapist, nurse) parents get information from media and internet. They would like to get further information personally in words, in written forms or pamphlets. Parents of children with JIA miss psychic support, alternative treatment options and customised, complex information from the general treatment.

**Conclusions:** The findings of this study support the fact that parents of children with Juvenile Idiopathic Arthritis are well informed about the JIA's inflammatory nature and its symptoms, but they have few and wrong information in connexion with regular physical activity. They have a lack of knowledge about the different kinds of physical activities and sports' effects on the disease, due to which they choose ergonomically wrong kinds of activities in schools or pre-schools. Based on our results, we would like to develop a complex educational program including physical therapy as well.

**AB1428-HPR TWO-YEAR FOLLOW-UP OF THE THERAPEUTIC EXERCISE PROGRAM FOR PATIENTS WITH ROTATOR CUFF TENDINOPATHY: A SINGLE GROUP STUDY TO INVESTIGATE THE EFFECTS ON PAIN AND DISABILITY**

*E. Turgut, I. Duzgun. Physiotherapy and Rehabilitation, Hacettepe University, Ankara, Turkey*

**Background:** Although exercise training is accepted as one of the important and active treatment approach for the shoulder-related musculoskeletal problems,<sup>1</sup> the scientific rationale and long-term results for the inclusion of specific progressive exercises are less clear.

**Objectives:** This longitudinal, single group study aims to investigate the effects of a therapeutic exercise program on pain and disability in patients with the rotator cuff tendinopathy.

**Methods:** Twenty-eight participants with chronic non-traumatic unilateral shoulder pain diagnosed with rotator cuff tendinopathy (28.6±5.4 years old, symptoms duration 3.2±1.5 months) were included. The appropriate patient education and criteria-based, supervised exercise program including scapular and rotator cuff neuromuscular control exercises were performed. We evaluated self-reported shoulder pain and disability status by using Shoulder Pain and Disability Index (SPADI)<sup>2</sup> at baseline, after 6 week, 12 week training, at one-year-follow-up, and two-year-follow-up. Repeated measures ANOVA used for statistical analysis.

**Results:** Comparisons showed that there was significantly less SPADI-pain and SPADI-disability score reported starting from six-week after baseline and at two-year-follow-up (p<0.05).

**Conclusions:** The findings of the study showed that pain and disability gains can be achieved with 6 week progressive exercise training for participants with rotator cuff tendinopathy. Therefore, the progressive exercise training should be recommended to apply starting from early shoulder rehabilitation program.

**AB1429-HPR KINESIOTAPING MIGHT HELP TO IMPROVE POSTURAL DISPLACEMENTS IN ADOLESCENTS**

**E. Iliu, L. Rusu.** Faculty of Physical Education, Department of Sports Medicine and Kinesiology, University of Craiova, Craiova, Romania

**Background:** The optimal posture plays an important role for preventing musculoskeletal problems. The therapeutic effects of kinesiotaping have been shown in forward head posture and rounded shoulder posture in adults previously.<sup>1,2</sup> However, as to our knowledge, the effect of kinesiotaping on total posture has not been evaluated before in adolescents.

**Objectives:** To investigate the effect of kinesiotaping application on total posture in adolescents.

**Methods:** Twenty children (11 M/9 F) with postural displacements were enrolled in the study. The postural displacements were evaluated with a mobile application (PostureScreen) which was validated for postural assessment previously. The total scores which were obtained from the anterior view was used for the analysis. Assessments were performed at baseline and 45 min following the kinesiotaping application. The kinesiotaping application was performed as seen in Figure 1.

**Abstract AB1429-HPR – Figure 1**

**Results:** The median age was 12.5 years (IQR: 11.0/15.0 years), the median height was 145.5 cm (IQR: 142.5/166.5 cm) and the median

weight was 38.0 kg (IQR: 33.5/51.0 kg). A significant improvement was observed in anterior angulation degrees. While the baseline score was 8.70° (IQR: 4.10°/14.55°), the score improved following kinesiotaping application to 4.35° (IQR: 2.35°/6.30°) (p=0.009). No significant changes were detected in anterior translation, lateral translation and lateral angulation parameters (p>0.05).

**Conclusions:** According to our results kinesiotaping has a potential to improve postural displacements in adolescents. The improvement in the posture might be resulted from a sustained feedback on the trunk by the kinesiotaping. However, future longitudinal studies which are mainly focused on the chronic effect of kinesiotaping are needed to reveal the real potential of kinesiotaping on the postural displacements in adolescents.

**AB1430-HPR EFFECTIVENESS OF FUNCTIONAL RIGID TAPING ON PAIN, FUNCTION AND KINESIOPHOBIA IN PATIENTS WITH LOW BACK PAIN**

**F.M.Kavak<sup>1</sup>, B. Kavak<sup>1</sup>, E. Tonga<sup>2</sup>.** <sup>1</sup>Acibadem University, Atakent Hospital, Acibadem University, <sup>2</sup>Marmara University, Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation, Marmara University, Istanbul, Turkey

**Background:** A small number of studies in the literature suggest that rigid bands applied with different techniques in different regions are effective treatment techniques. On the other hand, there is no study of how rigid bands are effective in the treatment of acute and subacute lumbar pain.

**Objectives:** Purpose of this study is to determine the efficiency of functional tape application to patients with acute or subacute low back pain.

**Methods:** 40 patients with acute-subacute low back pain were divided into two groups: control and experimental group. To control group, McKenzie exercises, Transcutaneous Electrical Nerve Stimulation (TENS), Hot Pack (HP) and pulsed ultrasound treatments were applied. To experimental group, functional taping were applied in addition of these treatments. Range of Motion (ROM), Visual Analogue Scale (VAS), Tampa Scale of Kinesiophobia (TSK) and The Oswestry Disability Index (ODI) were evaluated pre- and post-treatment and datas were analysed with statistical methods. In analysis; p value was accepted p<0,05 for t test and Mann Whitney U test process.

**Results:** In the measurements that compared the improvement of both groups, based on pre- and post-treatment evaluations; improvement in the experimental group was significantly higher in all of these parameters of ROM, VAS, TSK and ODI than in the control group (p<0,05).

**Abstract AB1430-HPR – Table 1**

Abstract AB1430-HPR – Figure 1

**Conclusions:** The use of functional rigid taping in patients with acute and subacute low back pain provided a statistically significant improvement in all measured values of patients and provide better results than the control group. However, there is a need for comparative new studies in order to measure the effectiveness of rigid taping in a more accurate way.

#### AB1431-HPR DEVELOPING AN EVIDENCE-BASED GROUP PROGRAMME FOR OCCUPATIONAL THERAPY MANAGEMENT OF OSTEOARTHRITIS

*K McCausland. Department of Rheumatology, Our Lady's Hospital, Navan, Ireland*

**Background:** Patients with Hand OA form a significant proportion of Rheumatology referrals to Occupational Therapy. Occupational Therapy (OT) interventions for patients with Hand OA can reduce hand pain, and improve grip strength, hand function and quality of life. Under-resourcing of staff can mean that patients with Hand OA are waiting a long time for OT intervention. Providing OT interventions in a group setting for patients with arthritis has been used in Ireland and the UK with good results.

**Objectives:** To review the process of developing and piloting a group-based Occupational Therapy programme for patients with Hand Osteoarthritis. The programme would include self-management education, splinting and a hand exercise programme.

**Methods:** The group programme was developed and piloted with 4 different patient groups between December 2016 and September 2017. The programme was delivered by two OTs and one OT Assistant, with between 3 and 9 patients per group. Outcome measures were taken at week 1 and at the end of the programme, week 13.

**Results:** Initial results are very positive, with the majority of patients who attended the group sessions showing improved grip strength, reduced hand pain, better hand function and they also reported increased confidence of how to manage their arthritis.

**Conclusions:** The development and commencement of a pilot group programme for OT management of Hand OA in Our Lady's Hospital, Navan, Ireland, has provided effective intervention, and also provides patient access to therapy in a more timely manner.

#### AB1432-HPR MINDFULNESS-BASED STRESS REDUCTION (MBSR) PROTOCOL APPLIED TO SYSTEMIC SCLEROSIS (SSC) PATIENTS: A PILOT INTERVENTIONAL STUDY FOCUSED ON NURSING ASSESSMENT AND PERCEIVED STRESS

*K El Aoufy<sup>1</sup>, A. Pollina<sup>2</sup>, F. Piccioli<sup>3</sup>, A. Pezzutto<sup>4</sup>, M. Matucci Cerinic<sup>1</sup>, S. Maddali Bongi<sup>1</sup>. <sup>1</sup>Experimental and Clinical Medicina, Div. Rheumatology, University of Florence, Florence; <sup>2</sup>Professional Trainer (OASIS Professional Training in MBSR, Center for Mindfulness), Pisa; <sup>3</sup>University of Florence, Florence; <sup>4</sup>University of Padua, Padua, Italy*

**Background:** MBSR is a protocol, developed by John Kabat-Zinn, which fosters awareness by focusing on the present experience. Basing on scientific evidences, the numerous benefits of MBSR on diseases symptoms have been widely demonstrated.<sup>1-2</sup> No studies have used MBSR on SSC. SSC is characterised by skin and systemic involvement: patients may complain for pain, psychological distress, concerns about disfigurement and reduced self-esteem.<sup>3</sup> Thus, nurse's role is pivotal not only in improving SSC patients global health and quality of life (QoL) but also in ameliorating their self-management strategies.

**Objectives:** to assess the effect of MBSR protocol on sleep quality, QoL and perceived stress in SSC.

**Methods:** 28 SSC patients were enrolled and randomly assigned to experimental group or to control group, and were assessed at baseline and after 8 weeks of MBSR program for the experimental group compared to the control group. The following clinimetric outcomes were measured: QoL with SF-36, sleep quality with a NRS (0–10 range) and Likert scale on night awakenings, perceived stress scale (PSS) and Likert Scale on the way they cope with the stress. Data are presented as differences of Mean and Percentage (%), between and within the groups.

**Results:** QoL presented an improvement for Mental Index Subscale for the experimental group (44.3 to 49.06) while the control group did not show any modification (40.73–40.75). For the impact of sleep quality, MBSR obtained an improvement from 53.3% at baseline to 26.7% at the end of the study: these patients still felt a bad sleep quality but were from far better in respect to controls that did not show any change. In MBSR group night awakenings were reduced from 73% to 60%, while in the control group were increased from 54% to 67%. Satisfaction of sleep quality was slightly improved in MBSR group (6.8 to 7.6) while controls did not experience any change (5.25 to 5.45). MBSR patients at baseline classified stress as a "high" health problem (53%) while after MBSR training only 20% kept the same answer.

**Conclusions:** MBSR program, applied for the first time to SSC patients, showed a very good tolerability and a positive impact on aspects of life like sleep quality, stress perception and self-management strategies. The present study has limitations, nevertheless this is the first time that an alternative approach, such as MBSR, is used. Obviously, MBSR is a supportive approach which can provide to patients a self-management strategy against stress and disease perceptions and in the future it can be integrated to pharmacological therapy and clinical rehabilitation.

#### AB1433-HPR IMPROVING NURSING CARE IN PATIENTS WITH SYSTEMIC LUPUS ERYTHEMATOSUS

L.Gossens<sup>1</sup>, M. Limper<sup>1</sup>, G. Kiers<sup>2</sup>, E. Molendijk<sup>2</sup>, K.V.D. Brande<sup>3</sup>, P. Mosterman<sup>3</sup>, J. Ammerlaan<sup>1</sup>. <sup>1</sup>Rheumatology and Clinical Immunology, UMC Utrecht, <sup>2</sup>Hogeschool Utrecht, <sup>3</sup>Patient partner, UMC Utrecht, Utrecht, Netherlands

**Background:** Systemic Lupus Erythematosus (SLE) is a systemic inflammatory autoimmune disease with a heterogeneous presentation in which almost every organ can be affected<sup>1</sup>. SLE patients experience a lower health-related quality of life, due to variation of disease severity over time, arthritis, arthralgia, skin abnormalities, myalgia and general fatigue<sup>2</sup>. The treatment and support of patients with SLE is carried out by a multi-disciplinary team, composed of rheumatologists, clinical immunologists, nurse practitioners and rheumatology nurses. Although nurses have a major task concerning providing information, support, and education in SLE care<sup>3</sup>, little is known about how patients experience nursing care and what needs and expectations they have.

**Objectives:** To investigate the patients' needs for nursing support in order to optimise and standardise nursing care in a SLE clinical pathway.

**Methods:** To identify specific factors regarding nursing care for SLE patients, a literature search was performed. Subsequently, semi-structured interviews were held among patients with SLE from the department Rheumatology and Clinical Immunology of the University Medical Centre Utrecht (tertiary care referral centre with approx. 300 SLE pts/year). The interviews focused on patients' needs, quality of life and nursing care. The questions regarding quality of life were partially derived of the SLE QoL Questionnaire<sup>4</sup> and focused on; daily-, social- or occupational activities, symptoms, medical treatment, and negative emotions. Interviews were recorded, transcribed and analysed with thematic analysis by the researchers and patient partners.

**Results:** Several tools to explore individual needs among patients with SLE, such as the Dutch version of the Educational Needs Assessment Tool (D-ENAT), were identified<sup>5</sup>. Eight SLE patients were interviewed (female n=6, average age 37.5 years). All were using a DMARD and/or biological. Patients indicated a need for help with problems in daily life, information regarding SLE, peer support, and psychosocial help. Pain and fatigue were the most commonly reported symptoms. Most patients saw their nurse on an irregular basis. They appreciated the accessibility, accuracy, clarity, and patience of nurses.

**Conclusions:** There is a need for individualised nursing support in dealing with SLE. To assess individual needs among patients, a needs assessment tool could be used. Further research on the usefulness and effectiveness of a needs assessment tool in daily clinical practice is needed.

#### AB1434-HPR EFFECTS OF CORE STABILITY EXERCISES ON GRIP STRENGTH AND MANUAL DEXTERITY IN PATIENTS WITH CHRONIC NECK PAIN

M.Soyсал Tomruk<sup>1</sup>, B. Kara<sup>1</sup>, M. Tomruk<sup>1</sup>, M. Arda<sup>2</sup>. <sup>1</sup>Dokuz Eylül University School of Physical Therapy and Rehabilitation; <sup>2</sup>Dokuz Eylül University Neurosurgery Dept, Izmir, Turkey

**Background:** It is known that chronic neck pain causes sensorimotor disturbances. A reduction occurs in upper extremity functions due to pain and sensorimotor disturbances in chronic neck pain patients. Core stability exercises were thought to be effective in order to improve stability and muscular strength. However, there is insufficient information on whether core stability training improve grip strength and/or manual dexterity in chronic neck pain patients.

**Objectives:** The aim of this study was to investigate the effect of core stability exercises on grip strength and manual dexterity in patients with chronic neck pain.

**Methods:** Thirty-six patients with chronic neck pain were enrolled. Grip strength and manual dexterity were evaluated by hand held dynamometer and Nine Hole Peg Test, respectively. Patients were randomly divided into supervised core stability exercise and home exercise group. Patients underwent twelve-week exercise training. All assessments were repeated at the 12th week.

**Results:** Grip strength and manual dexterity were significantly increased in both groups ( $p < 0.05$ ). While both treatment methods had positive effects on grip strength and manual dexterity, core stability exercises were found to be more effective than home exercises to improve grip strength ( $p < 0.05$ ) and manual dexterity ( $p = 0.003$  for right side,  $p = 0.008$  for left side).

**Conclusions:** Core stability exercises were more effective than home exercises to improve manual dexterity and grip strength. Core stability training should be added to rehabilitation approaches in order to enhance upper extremity functions in patients with chronic neck pain.

#### AB1435-HPR EFFECTS OF FLAT CUSHIONING INSOLE ON GAIT PARAMETERS OF INDIVIDUALS WITH CHRONIC IDIOPATHIC NECK PAIN

M.KIRMIZI<sup>1</sup>, I.E. SIMSEK<sup>2</sup>, A. ELVAN<sup>2</sup>, O. AKCALI<sup>3</sup>, S. ANGIN<sup>2</sup>. <sup>1</sup>Physical Therapy and Rehabilitation, Dokuz Eylül University Institute of Health Sciences; <sup>2</sup>School of Physical Therapy and Rehabilitation, Dokuz Eylül University; <sup>3</sup>Surgery Medicine Department of Orthopaedics and Traumatology, Dokuz Eylül University, Faculty of Medicine, Izmir, Turkey

**Background:** Shock waves caused by ground reaction force dissipate through the body during walking, which brings about dynamic loading on bones and soft tissues. It was showed that individuals with neck pain walk with a stiffer spine due to protective movement strategy against pain. Degenerative changes, pain and increased stiffness decrease the shock absorption capacity of the spine and cause an increase in dynamic loading affecting the spine. It was known that chronic idiopathic neck pain (CINP) causes alternations in gait parameters, but it is still unclear if using flat cushioning insole affects gait parameters in individuals with CINP.

**Objectives:** The aim of the study was to investigate the effects of flat cushioning insole on neck pain during walking and gait parameters in individuals with CINP.

**Methods:** Twenty-one individuals with CINP (15 female – 6 male, mean age: 35,67±12,64) and 21 healthy controls (15 female – 6 male, mean age: 35,33±12,51) recruited into this study. Assessment of gait

parameters and pain were carried out in two sessions, standard shoe only and standard shoe with flat cushioning. In both sessions, all participants performed the 10-metre walking test in two walking conditions: normal walking (PW), walking at maximum speed (MAXW). The order of sessions and walking conditions were randomised. Plantar pressure parameters were assessed using pressure sensitive insoles and spatio-temporal parameters were assessed using video analysis method involving slow motion camera (120fps). Pain severity was assessed using Visual Analogue Scale at the beginning of both sessions and immediately following the end of the walking conditions in individuals with CINP. Paired sample t-test was used to determine the effects of flat cushioning insole on gait parameters for both groups and on neck pain for the only neck pain group.

**Results:** Our findings indicated that the flat cushioning insole results in a decrease in the maximum force, peak pressure, force-time integral, pressure-time integral and an increase in the contact area in both groups ( $p < 0.05$ ). In individuals with CINP, flat cushioning insole increased walking speed and step length in both walking conditions ( $p < 0.05$ ), however, it had no impact on cadence ( $p > 0.05$ ). Flat cushioning insole reduced the severity of neck pain during MAXW ( $p < 0.05$ ), but there was no difference in neck pain at beginning of both sessions and during PW conditions ( $p > 0.05$ ). In healthy individuals, no difference was found in spatiotemporal gait parameters between two sessions ( $p > 0.05$ ).

**Conclusions:** The study suggested that the flat cushioning insole reduces neck pain severity during walking and has positive effects on gait parameters in individuals with CINP. Flat cushioning insole may be used to decrease neck pain during walking and improve spatiotemporal gait parameters in individuals with CINP.

#### AB1436-HPR COMPARISON OF PHYSIOTHERAPY GAINS OF THE PATIENTS WITH AND WITHOUT OSTEOPENIA IN DISTAL RADIUS FRACTURES

M.Tomruk<sup>1</sup>, N. Gelecek<sup>1</sup>, O. Başçı<sup>2</sup>, M.H. Özkan<sup>2</sup>. <sup>1</sup>School of Physical Therapy and Rehabilitation, Dokuz Eylül University, İzmir; <sup>2</sup>Orthopedics and Traumatology, Dokuz Eylül University Faculty of Medicine, Izmir, Turkey

**Background:** It is known that osteopenia was correlated with severity of forearm fractures.<sup>1</sup> Since there is an increased risk of long-term impairment due to the involvement of wrist joint after distal radius fractures, physiotherapy is an integral component of the complete concept for the treatment.<sup>2, 3</sup> However, there are no recommendations supported by studies regarding which patients might possibly benefit more or less from physiotherapy.<sup>4</sup>

**Objectives:** The aim of this study was to compare physiotherapy gains of the patients with and without osteopenia in distal radius fractures.

**Methods:** 31 patients (13 with normal bone quality, 18 osteopenic) surgically treated with volar plating after distal radius fracture were included. Bone mineral density (BMD) was assessed by using Dual-energy X-ray absorptiometry (DEXA). A BMD T-Spine value higher than  $-1$  were considered as normal bone quality and the value between  $-1$  and  $-2.5$  were considered as osteopenia. A physiotherapy program, beginning at first day postoperatively, was applied for all patients, twice a week, through 12 weeks. Wrist and forearm range of motions (wrist flexion, wrist extension, ulnar deviation, radial deviation, forearm supination, forearm pronation), severity of pain, oedema and grip strength were assessed at 3rd week and 12th week postoperatively after ending of physiotherapy program. Physiotherapy gains of patients with normal bone quality (group 1, n=13) and patients with osteopenia (group 2, n=18) were compared.

**Results:** Median (min-max) BMD-T spine value was  $-0.3$  ( $-0.7$ – $-1.0$ ) for group 1 and  $-1.75$  ( $-1.3$  –  $-2.3$ ) for group 2. At baseline, there were no statistically significant differences between groups in terms of evaluated parameters ( $p > 0.05$ ). In-group analyses showed that all evaluated parameters except forearm pronation were significantly improved in both groups ( $p < 0.05$ ). Changes of the measurements in both groups were

similar and no significant differences were found in between-group analyses ( $p > 0.05$ ).

**Conclusions:** Physiotherapy gains of osteopenic patients with distal radius fractures were similar to patients with normal bone quality after 12 week treatment program. Wrist and forearm range of motions, severity of pain, oedema and grip strength of osteopenic patients can be improved like that of patients with normal bone quality after distal radius fracture by implementing physiotherapy program.

#### AB1437-HPR THE EFFECTS OF SHORT FOOT EXERCISE ON PAIN, KNEE AND FOOT BIOMECHANICS IN PATIENTS WITH PATELLOFEMORAL PAIN

P.Kısacık<sup>1</sup>, A. Karaduman<sup>1</sup>, V. Bayrakçı Tunay<sup>1</sup>, N. Bek<sup>1</sup>, Ö. A. Atay<sup>2</sup>.

<sup>1</sup>Physiotherapy and Rehabilitation; <sup>2</sup>Orthopaedics and Traumatology, Hacettepe University, Ankara, Turkey

**Background:** It was well known that patellofemoral pain (PFP) has multifactorial aetiology. Increased navicular drop measures and especially more pronated foot posture in stance phase have been reported as distal factors.<sup>1,2</sup> Foot orthosis are recommended as distal interventions but remained passive.<sup>3</sup> For this reason, short foot exercise (SFE),<sup>4</sup> as an active approach, may be of significant benefit in patients with PFP.

**Objectives:** The aim of this study was to investigate the effects of SFE on pain, knee and foot biomechanics in patients with PFP.

**Methods:** Twenty-two patients with PFP, mean age was  $40.91 \pm 10.73$ , included in this study. They were randomly divided into two groups. The first group (KHE) was followed under the exercise program including knee and hip exercises, and the second group (SFE) was followed under SFE in addition to the same exercise program 2 days per a week for 6 weeks. At the beginning and the end of the study, for pain at walking, sitting, squatting, climbing stairs Visual Analogue Scale (VAS) and Kujala Patellofemoral Symptom Scale (KPSS); for knee and foot biomechanics measurement of Q angle, Navicular Drop Test (NDT), Calcaneo-tibial angle (CTA) and Foot Posture Index (FPI) were performed.

**Results:** As a result of this study, it was found that all parameters were improved in both groups, whereas the improvements in the pain intensity (VAS) of sitting and stair activities, values of Q angles, NDT, CTA and FPI were statistically significant in SFE group compared to KHE group ( $p < 0.05$ ).

**Conclusions:** In conclusion, it was shown that SFE has positive effects on pain, knee and foot biomechanics in patients with PFP. At this point, SFE is an exercise approach in order to increase the success of the rehabilitation program in patients with PFP.

#### AB1438-HPR THE ASSESSMENT OF IMAGERY ABILITY IN PATIENTS WITH FAMILIAL MEDITERRANEAN FEVER

A. Alikaj<sup>1</sup>, A. Büyükaslan<sup>1</sup>, S. Uğurlu<sup>2</sup>, B. Dilek<sup>1</sup>. <sup>1</sup>Physiotherapy and Rehabilitation, Istanbul Medipol University; <sup>2</sup>Rheumatology, Cerrahpasa Medical Faculty, Istanbul, Turkey

**Background:** Studies have shown that individuals with FMF are more restricted in terms of physical function than the normal population and that depression and anxiety are more common in these individuals. Catastrophizing is the strongest psychological factor associated with pain. Imagery is a cognitive process fundamental to motor learning and performance. It is also a mental technique that can be utilised in many ways. A main function of imagery is to aid self-regulation of thoughts, feelings, and behaviours. Studies have shown to be more effective for individuals displaying a higher level of imagery ability when using imagery to improve motor and motivational outcomes, including self-efficacy. Several studies suggest that pain-related imagery may help to reduce distress and increase behavioural flexibility in individuals suffering from chronic pain. However, there is no published imagery research in FMF patients.

**Objectives:** The aim of this study was to assess imagery ability and pain catastrophizing in patients with familial mediterranean fever.

**Methods:** Between October and December 2017, 30 participants diagnosed with FMF were recruited through the Division of Rheumatology Department of Internal Medicine Cerrahpasa Medical Faculty University of Istanbul. The Istanbul Medipol University Ethics Committee approved the study. Demographic and participant characteristic information were recorded. Clinical data collected were: Age onset of FMF, age of diagnosis were inquired. Pain catastrophizing was assessed with Pain Catastrophizing Scale (PCS) and imagery ability was assessed with Movement Imagery Questionnaire-3 (MIQ-3). A total PCS score of 30 represents clinically relevant level of catastrophizing. MIQ-3 is a 12-item questionnaire to assess individuals ability to image four basic movements: a knee lift, jump, arm movement, and waist bend. Ease of imaging is measured in both visual and kinesthetic modalities. For each item, participants read a description of the movement. Then, they physically perform the movement before assuming the same starting position to either visually or kinesthetically image the movement. Following this step, participants rate their ease of imaging on a 7-point Likert-type scale ranging from 1 to 7 (*very hard/easy to see/feel*). After the items for each subscale are averaged, a higher score represents a greater ease of imaging.

**Abstract AB1438HPR – Table 1.** Demographic and clinical characteristics of study population

Variables	Mean ± SD
	Median (min-max)
Age	32.37 ± 11 (19-56)
BMI (Kg/m <sup>2</sup> )	24.39 ± 6.1 (17.3-40.3)
Age of Diagnosis	22.20 ± 14.7 (2-54)
Disease Duration	10.17 ± 7.6 (2-28)
Kinesthetic Imagery Ability	14.99 ± 4.5 (3.1-21.1)
Internal Imagery Ability	13.84 ± 5.3 (3.16-20.0)
External Imagery Ability	12.41 ± 4.7 (3.8-19.0)
Pain Catastrophizing Scale	23.27 ± 12.5 (6-44)

**Results:** The study included 27 female, 3 male. Mean age was 32±11 years, mean BMI was 24±6.1 kg/m<sup>2</sup>; (table 1). Kinesthetic imagery ability

was higher than internal and external visual imagery. There was no significant relationship between imagery and pain catastrophizing severity.

**Conclusions:** According to previous studies people with chronic pain had pain-related imagery, catastrophizing, and distress related in proportion with each other but in our study, we didn't find any significant relationship between imagery and catastrophizing. This may be due to small sample size or the pattern of pain in FMF which is periodic, intermittent, differently from chronic pain. Each patient with rheumatic disease should be addressed as a composite biopsychosocial being with unique characteristics and needs. Previous study have shown that imagery is an effective treatment for neuropathic and chronic pain. We suggest that imagery may be an effective method for management of pain in patients with FMF.

#### AB1439-HPR THE EFFECTS OF DIFFERENT EXERCISE PROTOCOLS ON FUNCTIONAL STATUS AND AEROBIC CAPACITY IN PATIENTS WITH ANKYLOSING SPONDYLITIS

S. Oksuz<sup>1</sup>, E. Unal<sup>2</sup>, G. Arin<sup>3</sup>. <sup>1</sup>Physiotherapy and Rehabilitation, Health sciences, Nicosia, Cyprus; <sup>2</sup>physiotherapy and rehabilitation, health science; <sup>3</sup>Physiotherapy and Rehabilitation, Health sciences, Ankara, Turkey

**Background:** Although there is the emphasis on the importance of life-long regular exercise to improve the efficacy of medication in the treatment of ankylosing spondylitis (AS) patients, there is a lack of information about the safe exercise dosage in clinical practice.

**Objectives:** In this study, we aimed to investigate the effects of different exercise protocols on functional status and aerobic capacity in patients with ankylosing spondylitis.

**Methods:** Thirty-one ankylosing spondylitis patients were evaluated and grouped according to their arrival order. Patients' spinal mobility (Bath Ankylosing Spondylitis Mobility Index), disease activity (Bath Ankylosing Spondylitis Disease Activity Index), flexibility (back scratch test), pulmonary functions (forced vital capacity with pulmonary function test, maximal inspiratory and expiratory pressures with respiratory muscle strength test), aerobic capacity (oxygen consumption test with submaximal modified Bruce protocol), fatigue level (Fatigue Severity Scale) and sleep quality (Pittsburgh Sleep Quality Index) were assessed. Group 1 (n=16) did both aerobic training and clinical pilates exercises, while group 2 (n=15) only did aerobic training. Patients did exercises for 8 weeks, 3 days a week under the supervision of a physiotherapist and then measurements were repeated.

**Results:** According to the measurements, it was found that disease activity level, respiratory muscle strength was improved (p<0.05) in both groups. When clinical pilates exercise was given additionally to aerobic training spinal mobility (BASMI score), upper extremities flexibility, forced vital capacity, fatigue severity and sleep quality (p<0.05) was also improved.

**Conclusions:** As a result of the study, it was noted that when clinical pilates exercises applied together with the aerobic exercise training in ankylosing spondylitis patients, effectiveness on functional status and aerobic capacity was increased.

#### AB1440-HPR YOGA-THERAPY FOR RHEUMATOID ARTHRITIS: RAPID IMPROVEMENT IN PROMS

V. Sadana<sup>1</sup>, T. Cartwright<sup>1</sup>, M. Cahill<sup>1</sup>, K. Anie<sup>1</sup>, C.B. Colaço<sup>2</sup>. <sup>1</sup>CMH, LNWH; <sup>2</sup>LNWH NHS Trust, Rheumatology Unit, CMH, LNWH NHS Trust, London, UK

**Background:** Rheumatoid Arthritis (RA) is associated with mood disorders and poor quality of life (QOL) Chorus et al., 2003 Yoga therapy (Y-T) has been used in several Long Term Conditions. Khalsa et al, 2016.

**Objectives:** This study investigated: a) impact of a 16 week Y-T intervention on functional outcomes and QOL in 10 adult-onset RA patients, b) acceptability and experiences of the intervention.

**Methods:** Ten adult RA patients (Ages: 29–71 Y; RA duration: 1–15 years) consented to 10 individual Y-T sessions (weekly ×4; biweekly ×6) with a yoga therapist in a standard consulting room. The intervention was tailored to the needs and abilities of each patient and included: breath-centred physical yoga postures, breathing and visualisation techniques, mantras and meditation, and Lifestyle/behavioural strategies. All participants completed measures to assess changes in health pre- and post-intervention (EQ-5D and HADS) and took part in a semi-structured

interview in a mixed methods design. Thematic analysis was applied to interview data.

**Results:** 98/100 sessions were attended by participants.

**Abstract AB1440HPR – Table 1.** Pre-Post 10 sessions Y-T metrics

Pre-Post Y-T Change:	PRE	POST	CHANGE
Mean Depression	6.70	2.30	-65%
Mean Anxiety	9.40	4.80	-48%
Mean HAQ	1.10	0.85*	-23%
Mean Pain Score (HAQ)	5.66	2.40	-58%
Mean Health Score (HAQ)	5.10	1.72	-66.3%
Mean health Utility (EQ-5D)	6.01	8.40**	+39.6%

\*8/10 HAQ reduced >0.35 =>MID (minimal important difference);

\*\*6/10 participants achieved EQ5D maximum score=1

Qualitative findings indicated that considerable value was placed on the therapeutic function of the consultation, of being listened to and receiving advice on concerns. Therapeutic mechanisms appeared to reflect tailored physical practices alongside psychosocial techniques which promoted psychological wellbeing and increased perceptions of control and self-efficacy. Several reported reductions in their medication and broader benefits such as improved sleep, mood and energy. All but one participant reported positive changes to their RA symptoms, including pain reduction, greater mobility and joint flexibility.

**Conclusions:** This novel pilot YT intervention was positively received by patients with RA, with high levels of adherence to both the course of treatments and the tailored home practice. The results suggest that yoga therapy has potential as an adjunct therapy to improve RA symptoms, increase self-care behaviours and address negative mood. Whilst promising, a larger multi-centre study is required to evaluate the therapeutic and cost-effectiveness of Y-T.

## HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative)

### AB1441-HPR DOES THE INCIDENCE OF INFECTIONS INCREASE IN PATIENTS WITH CHRONIC ARTHRITIS AND OSTEOPOROSIS TREATED WITH DENOSUMAB AND BIOLOGICAL THERAPY?

A Lopez Esteban<sup>1</sup>, F. Garcia<sup>2</sup>, I. Janta<sup>3</sup>, J.G. Ovalles<sup>3</sup>, B. Serrano<sup>2</sup>, J.C. Sanchez<sup>2</sup>, C. Garaballu<sup>2</sup>, C. Gonzalez<sup>2</sup>, T. Del Rio<sup>2</sup>, J. Lopez Longo<sup>2</sup>, C. Gonzalez<sup>2</sup>, I. Monteagudo<sup>2</sup>, J.C. Nieto<sup>2</sup>. <sup>1</sup>Rheumatología; <sup>2</sup>Rheumatology, Hospital Gregorio Marañón, Madrid, Spain; <sup>3</sup>Rheumatología, Hospital Gregorio Marañón, Madrid, -

**Background:** Biological therapies (BT) have changed the prognosis of chronic arthritis (CA); however, they have associated the increased risk of infections. Denosumab (DNS) is the first biologic approved for the treatment of osteoporosis (OP) and is also associated with an increased risk of infections.

**Objectives:** To evaluate the incidence of infections in patients with CA and OP treated with DNS alone or associated to another biological treatment.

**Methods:** A prospective observational study was designed in which all patients with OP who received treatment with DNS between January 2013 and December 2017 were included. The group of patients with CA (RA, EA, PsA) were treated, in addition to DNS as treatment for their OP, with BT. Follow-up was carried out in the rheumatology nursing examination room every 6 months. Demographic data, disease

characteristics, infections and associated comorbidities were collected. Serious infections were defined as those that required admission, suspension of therapy or death.

**Results:** 200 patients were included (81.1% women). The main diagnoses were OP 112 (51%) and AC 76 (34.5%) [RA 58 patients (26.3%), SpA 8 (3.6%), PsA 10 (4.5%)] and other rheumatologic diagnoses 32 (14.5%). Demographic data are shown in Table 1. Both groups were similar except for the higher GC consumption and the higher lumbar bone mass of the CA group. Of the patients with CA, 41 patients received a synthetic DMARD (MTX mainly, 90%), and 40 patients (53.9%) received GC. The average dose of DNS injections was 4.5 (1–10), with average treatment duration (range and DS) of 23.03 months (6–66, 13.3). The incidence of infections was 74 (39.3%), 31 patients had repeated infections. The most frequent were urinary tract infections (UTI), respiratory, mouth and other infections. There were 4 serious infections, 2 UTI and 2 pneumonias (both concluded in death, in patients with RA). The incidence of infections among patients with OP and with CA was similar in both groups (40 (35.7%) vs. 34 (44.7%), p<0.209). Multiple regression including age, synthetic DMARD, GC and duration of treatment with DNS showed that the duration of treatment with DNS [Exp (B)=1.058, p<0.001] and GC [Exp (B)=2.484, p=0.010] were the only predictors of increased risk of infections.

**Abstract AB1441-HPR – Table 1**

	OP (n=112)	CA (n=76)	p
Women, n (%)	99 (88.3)	66 (86)	0.822
Age, mean (SD)	66.9 (10.27)	67.7 (11.11)	0.622
BMD LS, mean (SD)	-2.9 (0.98)	-2.3 (1.5)	<b>0.003</b>
EPOC, n (%)	12 (10.7)	11 (14.4)	0.499
Smoking ever, n (%)	23 (20.5)	10 (13.1)	0.242
Diabetes mellitus, n (%)	13 (11.6)	14 (18.4)	0.209
Infections n (%)	40 (35.7)	34 (44.7)	0.227
Corticosteroid dose, mean (SD)	0.79 (4.1)	4 (5.59)	<b>&lt;0.0001</b>

**Conclusions:** Patients with CA and OP who receive DNS and TB have a similar incidence of infections. However, the risk of infection is higher in CA patients related with the use of GC. The most frequent infection was UTI followed by respiratory infections, but they did not suppose the suspension of the treatment in the majority of the cases.

### AB1442-HPR A MISUNDERSTOOD BURDEN – LIVING WITH SLE IN SOUTH AFRICA

A Phuti<sup>1</sup>, M. Schneider<sup>2</sup>, M. Tikly<sup>3</sup>, B. Hodkinson<sup>1</sup>. <sup>1</sup>Medicine; <sup>2</sup>Psychiatry and Mental Health, University of Cape Town, Cape Town; <sup>3</sup>Medicine, University of Witwatersrand, Johannesburg, South Africa

**Background:** Systemic lupus erythematosus (SLE) has a profound impact on health related quality of life (HRQOL). There has been no qualitative research to the explore patients' perspectives and unmet needs in SLE in sub-Saharan Africa.

**Objectives:** To examine the experiences and perceptions of SLE women.

**Methods:** In-depth interviews of 25 South African women with SLE were conducted to explore a range of HRQOL experiences including pain, fatigue, emotional health, sexual well-being, fertility and aesthetic concerns.

**Results:** Most patients (72%) were black Africans, the remaining were of mixed race ancestry, and only a quarter were employed. Living with pain was the commonest complaint, negatively impacting on activities of daily living, coping with family expectations, social life, sleep and intimacy with partners. Patients struggled to explain the pain to their families, employers, community and health care providers. Seventeen participants expressed the challenge of living with fatigue, described as "emotionally draining" and as "always tired, a person who doesn't have the energy." One patient believed that witches in church had supernatural powers that took all her energy away. Many felt their fatigue was misconstrued, and that they were labelled as 'simply lazy' by health professionals and family members. This pernicious fatigue had negative consequences on many facets of daily life, including caring for dependents, holding down steady job and sexual wellbeing. All patients experienced low emotional states ranging from anger, bitterness, anxiety, confusion, and sadness, which frequently resulted in suicidal ideation. Many patients experienced difficulties with conception, complicated pregnancies and miscarriage. The

pessimism of doctors regarding the prognosis of pregnancy in SLE left many patients feeling confused and depressed. Changes in physical appearance such as alopecia, rashes and weight fluctuations were also a major concern affecting self-image and libido, often leading to strained relationships and breakups. Coping mechanisms included intense spiritual beliefs giving them the courage to 'push through the difficult times'. Use of alternative therapies was common, which they believed helped contain the symptoms of SLE. These included drinking 'blessed' water, traditional herbal remedies, and soothing leaf or pressure applications to painful joints. A poor understanding of SLE by the patients themselves, family and the community, coupled with the unpredictable course of the disease, exacerbated frustration and uncertainty. For many patients, limited income, lack of basic services like public transport, dependency of family members, and comorbid diseases, such as HIV and tuberculosis, exacerbated the negative daily experiences of living with SLE. Patients felt that patient-led support groups, better education by health professionals, and public awareness of SLE would help them cope with the disease.

**Conclusions:** Indigent South African women with SLE in SA have complex, chronic and challenging life experiences. A poor understanding and acceptance of SLE by patients themselves, compounded by a background of poverty and a perception of being misunderstood by family members, health professionals and the community at large had negative impact on multiple dimensions of patient's lives.

**AB1443-HPR** **EXPLORING THE RELATION BETWEEN IMPAIRMENT RATING BY DAS-28 AND BODY FUNCTION, ACTIVITY-PARTICIPATION AND ENVIRONMENTAL FACTORS BASED ON ICF IN THE PATIENT WITH RHEUMATOID ARTHRITIS**

E. Gur Kabul<sup>1</sup>, U. Bas Aslan<sup>1</sup>, B. Basakci Calik<sup>1</sup>, M. Tasci<sup>2</sup>, V. Cobankara<sup>2</sup>. <sup>1</sup>School of Physical Therapy and Rehabilitation, Pamukkale University; <sup>2</sup>Department of Internal Medicine, Division of Rheumatology, Pamukkale University School of Medicine, Denizli, Turkey

**Background:** Rheumatoid Arthritis (RA) is the cause of functional loss and disability of individuals. It also results in negative effects on the emotional components as well as physical components related to health. If specific domains of medical condition criteria are systematically linked with relevant parts of ICF, we will have a common conceptual understanding of ICF and patient-oriented health criteria. It may also make clinical practices easy.

**Objectives:** The aim of this study was to link and allocate items of disability questionnaires with body function, activity participation and environmental factors based on ICF Hand Core Set. The other objective of this study is to examine the relationship between the impairment and the ICF components determined on the basis of disability questionnaires in participants with Rheumatoid Arthritis.

**Methods:** Impairment was evaluated by use of DAS28 and disability by Disabilities of Arm, Shoulder and Hand Questionnaire (DASH), Michigan Hand Outcomes Questionnaire (MHQS), Duruöz Hand Index (DHI), Arthritis Impact Measurement Scales 2 (AIMS 2) in participants with rheumatoid arthritis (n=100). Items of DASH, MHQS, DHI and AIMS 2 were linked and allocated with the ICF Hand Core Set as a result of three expert opinions. The data was analysed using Kappa index and Pearson's correlation coefficient.

**Results:** Based on expert distinction on DASH, MHQS, DEI and AIMS 2 items, MHQS covered the highest number of body function categories of ICF Hand Core Set with 8 and AIMS 2 covered the highest number of ICF Hand Core Set with totally 25 (body function=3, activity participation=20, environmental factors=2). While impairment (DAS28) had moderate correlation with subjective impairment (body function scores considered as subjective impairment) and activity participation for all assessment questionnaires (r=0.50–0.69); subjective impairment had high correlation with activity participation for DASH and MHQS (r>0.70) and also had moderate correlation with activity participation for AIMS 2 (r=0.50–0.69). Furthermore, subjective impairment had weak correlation with environmental factors (r=0.10–0.49).

**Conclusions:** We suggest that AIMS 2 is the most appropriate for clinicians and researchers who aim to perform a more comprehensive biopsychosocial assessment in patients with RA. In addition, the clinician's assessments and the impairment levels reported by the patients are inter-related and the impairment levels reported by patients is also affected by environmental factors.

**AB1444-HPR** **UNDERSTANDING FATIGUE BURDEN AND COPING STRATEGIES IN RHEUMATOID ARTHRITIS USING QUALITATIVE RESEARCH**

C. Zhang<sup>1</sup>, Y. Shaw<sup>2</sup>, B. Shakley<sup>1</sup>, L. Ferri<sup>3</sup>, K. Michaud<sup>2</sup>, D. McDonald<sup>1</sup>, T. A. Simon<sup>3</sup>. <sup>1</sup>LIFT1428, Chattanooga; <sup>2</sup>National Data Bank for Rheumatic Diseases, Wichita; <sup>3</sup>Bristol-Myers Squibb, Princeton, USA

**Background:** Fatigue is a major symptom of RA but is under-represented when considering an appropriate treatment and in the measurement of disease activity. At the same time, patients' perspectives on fatigue in the overall context of their RA and life have not been studied in detail before. To understand that perspective, we aimed to explore patients' lived experience with RA-related fatigue.

**Objectives:** We explored the narratives of patients with RA and their discourse on RA-related fatigue to assess the burden of disease and coping strategies.

**Methods:** Semi-structured interviews were conducted with adult patients with RA living in two geographical regions in the United States. Interviewees were asked to discuss their experiences with diagnosis, symptoms, physical and social limitations, coping with challenges, treatment and healthcare providers. The interviews were audio-recorded and transcribed verbatim. Transcripts were analysed for themes related to the burden of RA-related fatigue and coping strategies.

**Results:** Eighteen patients were interviewed, with ages ranging from 27 to 80 years and RA duration ranging from 4 to 40 years. Four themes emerged around the impact of RA-related fatigue, fatigue in context of RA symptoms, coping strategies and coping success (table 1).

**Abstract AB1444HPR – Table 1.** Burden of RA-Related Fatigue and Coping Strategies Themes

Theme	Details
Fatigue limits RA patients' ability to live their lives	<ul style="list-style-type: none"> <li>– Patients with RA have limited energy reserves to perform common activities of daily living</li> <li>- Fatigue creates 'brain fog' that reduces RA patients' ability to focus and diminishes academic and job performance</li> <li>- Patients with RA adjust their future career choices based on these limitations</li> </ul>
Fatigue and pain are intertwined	<ul style="list-style-type: none"> <li>– Fatigue is strongly connected with pain and it is difficult for patients with RA to separate the two symptoms. Pain and active RA symptoms increase fatigue. Fatigue also amplifies pain</li> <li>- Fatigue can be a bigger concern than pain. Patients with RA find it harder to manage fatigue compared with pain</li> </ul>
Coping with fatigue is an internal struggle	<ul style="list-style-type: none"> <li>– Patients with RA are faced with the tough choice of giving in to the fatigue or pushing through and risk exceeding energy reserves</li> <li>- Patients with RA who have difficulty coping with fatigue feel frustrated, embarrassed and inadequate</li> </ul>
Acceptance of limitations leads to more effective coping strategies	<ul style="list-style-type: none"> <li>– Patients with RA use a variety of coping strategies, often in combination</li> <li>- Coping strategies include pushing through the fatigue, using distractions, pacing oneself, sleeping, drinking coffee and using medication</li> <li>- Patients with RA who accept their limitations are more likely to pace themselves, as opposed to pushing through their limits, and have fewer negative emotions when they give up</li> </ul>

**Conclusions:** Fatigue is a major concern for patients with RA and can be more debilitating than pain. A patient's constant battle with fatigue can have physical, mental and emotional consequences.

#### AB1445-HPR PATIENT SATISFACTION IN A RHEUMATOID ARTHRITIS OUTPATIENT CENTRE

L. Villarreal<sup>2</sup>, D. Buitrago-García<sup>1</sup>, F. Rodríguez<sup>2</sup>, I. Mendez<sup>2</sup>, P. Santos-Moreno<sup>3</sup>.  
<sup>1</sup>Epidemiology, SIIES; <sup>2</sup>Health services; <sup>3</sup>Rheumatology, Biomab, Center For Rheumatoid Arthritis, Bogota, Bogota, Colombia

**Background:** Patient experience (PX) can be conceptualised as “the sum of all interactions, shaped by an organisation’s culture, that influence patient perceptions, across the continuum of care” nowadays patient satisfaction is considered as one of the quality for performance in health systems.<sup>1</sup> Rheumatology is mainly an outpatient, multidisciplinary medical specialty, therefore care does not stop at the diagnosis it continues during a long-term with frequent monitoring and patient participation.<sup>2</sup>

**Objectives:** Describe the results of a patient satisfaction survey in a specialised centre in Colombia during 2017

**Methods:** In our RA specialised centre during a 12 month period we performed a satisfaction survey in order to evaluate the health services provided. We evaluated the waiting times, timing on attention, appointment assignment, and information provided, the treatment received by the healthcare team, facilities among others. Patients evaluated the services provided in a scale from 1 to 5 were 1 was very bad, 2 bad, 3 regular 4 good and 5 very good. Descriptive epidemiology was performed for each variable presented.

**Results:** We performed 4756 surveys during 2017, 4550 surveys were completed with a 95% rate response, out of total 80% of respondents were female and 20% male. 80% of patients reported to receive their appointments on time; regarding the service provided by our health care professionals 99% of patients understood the indications regarding their treatment, 98% understood about the administrative procedures to program future appointments and to how to access to their medications, also 98% had clearly understood the date and time of their consultation (rheumatologist, physical therapist, nutritionist, psychologist, infusion therapy, among others.) The mean score for the overall assessment of the services was 4.2/5.0 (table 1). The average time of stay at our centre was 60 min±33. The main aspects to improve our patient satisfaction were the telephone programming of appointments, and the compliance regarding the delivery of medications.

**Abstract AB1445-HPR – Table 1**

Question	MEAN (SD)	MEDIAN (MIN – MAX)
How was the quality of the service provided?	4.25 (0.51)	4 (3–5)
How was the service provided by our health care team?	4.31 (0.49)	4 (1–5)
How was the service provided y in the waiting room?	4.27 (0.49)	4 (1–5)
Facilities	4.31 (0.49)	4 (1–5)
Overall experience	4.32 (0.53)	4 (3–5)

**Conclusions:** This survey describes well-functioning multidisciplinary services for all patients who visit to our specialised centre. On the other hand although we found that our patients are highly satisfied, there is a large opportunity to improve our services and generate evidence regarding other aspects that involve the patient’s health determinants.

#### AB1446-HPR INVESTIGATION THE EFFECT OF KINESOPHOBIA AND NECK DISABILITY LEVELS ON THE NECK AWARENESS IN CHRONIC NECK PAIN PATIENTS: PILOT STUDY

D. Onan<sup>1</sup>, O. ULGER<sup>2</sup>. <sup>1</sup>Physiotherapy and Rehabilitation; <sup>2</sup>Health of Sciences, Ankara, Turkey

**Background:** Chronic neck pain can cause patients to limit their activities due to kinesophobia. Patients may experience more disability during rest because of staying in the same position while restricting their activities, lacking exercise and muscles spasms. For these reasons, they may not be aware of many factors related to the position, movement, and shape of their necks.

**Objectives:** The aim of this study is to examine the effect of kinesophobia and neck disability levels on neck awareness in individuals with chronic neck pain.

**Methods:** Forty-two patients who have chronic neck pain and aged 18–65 years were participated in this study. The demographic characteristics of the patients were recorded, kinesophobia levels with Tampa Kinesiophobia Scale (TKS), neck disability level with Neck Disability Index (NDI) and neck awareness with Fremantle Neck Awareness Questionnaire (FNAQ) were evaluated. Correlation analysis were performed with Pearson correlation coefficients for parametric conditions and the Spearman correlation coefficients for nonparametric conditions.

**Results:** The mean age of the patients participating in the study was 42.4±13.47 years (7 men and 36 women). There was a moderate statistically significant positive correlation ( $r=0.462$ ,  $p<0.01$ ,  $p=0.002$ ) between FNAQ and NDI, indicating that individuals with chronic neck pain had kinesophobia reduced neck awareness. It was found that there was a very good relationship between FNAQ and NDI ( $r=0.602$ ,  $p<0.001$ ) and neck awareness decreased as the neck disability level increased. There was a moderately significant relationship between TKS and NDI ( $r=0.567$ ,  $p<0.001$ ), levels of kinesophobia increased as neck disability increased.

**Conclusions:** It has been shown that the high level of kinesophobia and neck disability results in a negative effect on neck awareness and that these three variables are interrelated as a result of our work on neck awareness, which has been rarely studied in the literature. Therefore, increasing the activity and movement will reduce the level of neck disability and increase awareness. For this reason, patients with chronic neck pain need to be directed in terms of activity and movement.

#### AB1447-HPR BIOPSYCHOSOCIAL STATUS OF JIA PATIENTS: PERSPECTIVES OF DAILY LIVING ACTIVITIES, DISEASE ACTIVITY AND FAMILY IMPACT

E. Ünal<sup>1</sup>, E.D. Batu Akal<sup>2</sup>, E.H. Sönmez<sup>3</sup>, Z.S. Arıcı<sup>4</sup>, P. Kısacık<sup>1</sup>, G. Arın<sup>1</sup>, N. B. Karaca<sup>1</sup>, D. Aydın Hakkı<sup>5</sup>, R. Alpar<sup>5</sup>, Y. Bilginer<sup>3</sup>, S. Özen<sup>3</sup>. <sup>1</sup>Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences; <sup>2</sup>Ankara Training and Research Hospital; <sup>3</sup>Department of Pediatrics-Rheumatology, Hacettepe University Faculty of Medicine, Ankara; <sup>4</sup>Şanlıurfa Training and Research Hospital, Şanlıurfa; <sup>5</sup>Department of Biostatistics, Hacettepe University Faculty of Medicine, Ankara, Turkey

**Background:** Juvenile Idiopathic Arthritis (JIA) is the most frequent chronic rheumatic disease during childhood. It can result in disabilities, loss of quality of life and mood changes.<sup>1</sup> Furthermore, literature reviewing the effects of arthritis on children and family is inconsistent, with studies showing significant difference or not, compared to healthy children.<sup>2</sup>

**Objectives:** The purpose of this study is to present results regarding the functional status, psychosocial status and disease activity of children with JIA and their effects on the child’s family. The second aim is to present the correlations between these parameters.

**Methods:** The study included children diagnosed with JIA who applied to Hacettepe University İhsan Doğramacı Children's Hospital Rheumatology Department. After demographic data was collected, all children were assessed with Child Health Assessment Questionnaire (CHAQ) for daily living activities, with the Juvenile Arthritis Disease Activity Score (JADAS) for disease activity and with a newly developed scale from Hacettepe University Faculty of Health Sciences Department of Physiotherapy and Rehabilitation for children with rheumatism by Edibe Ünal<sup>3</sup> for functional and psychosocial status. Cut-off point was accepted as  $\leq 2.7$  for disease activity.<sup>4</sup> The Family Impact Scale (FIS) was used to assess perspective of parents.

**Results:** A hundred and ninety-six children were included in the study. The mean age of children was  $12,44 \pm 3,97$  and female/male ratio was 55,6/44,4. Although the mean JADAS score was  $3,33 \pm 4,21$ , it only detected active disease in 81 children. There was a moderate correlation between CHAQ (Pain) and functional scores of Ünal's scale and JADAS score. CHAQ total score was well correlated with function and psychosocial scores. The correlation between FIS and other scales was very low.

Abstract AB1447HPR – Table 1. Descriptives

	Mean±SD
JADAS	3,33±4,21
CHAQ (Total)	0,32±0,38
CHAQ (Pain)	2,31±3,01
CHAQ (General VAS)	3,52±2,99
Function (range: 0–30)	4,09±5,85
Psychosocial (range: 0–30)	13,25±5,76
FIS	43,6±10,12

Function; Psychosocial; Functional and Psychosocial subscales of Ünal's scale.<sup>3</sup>

Abstract AB1447HPR – Table 2. Correlations

	CHAQ Pain	Function	Psychosocial
JADAS	r 0,499	0,423	0,216
	p 0,000	0,000	0,003
CHAQ (Total)	r 0,384	0,757	0,507
	p 0,000	0,000	0,000
CHAQ (Pain VAS)	r	0,438	0,308
	p	0,000	0,000
CHAQ (General VAS)	r	0,360	0,358

**Conclusions:** Our results show that pain and function alter disease activity in children with JIA. It is seen that psychosocial states of children and their functional states expressed by their own knowledges also affect their daily life. These changes did not affect the viewpoint of the family.

#### AB1448-HPR PATIENTS EXPERIENCE WITH A NURSE-LED TELEPHONE SERVICE IN AN OUTPATIENT CLINIC

E Moholt, C.L. Olsen, S.R. Molvik, S. Arnkværn, H. Lunøe, A. Fernmo, G. Stenberg, A.-B. Aga. *Diakonhjemmet Hospital, Oslo, Norway*

**Background:** According to "EULAR recommendations for the role of the nurse in the management of chronic inflammatory arthritis"<sup>1</sup>, patients with rheumatic diseases should get access to nurse-led telephone service. Patients call if they have a flare and need an appointment with the rheumatologist, have questions regarding their disease, medical treatment, infections or side-effects.

Patients experience with calling a nurse need further investigation.

**Objectives:** The objective for this study was to explore and describe the patients' experience with the nurse-led telephone service in an outpatient clinic at a rheumatology department.

**Methods:** The helpline is open 2 hours daily during the week, and served by 2–3 nurses. Patients at the outpatient-clinic between 01.10.17 and 29.12.17, were invited to answer a questionnaire about the nurse-led telephone service.

The questions were about access to a nurse, if they got the help they needed, if they had confidence in the nurse's knowledge, understanding her information, if the helpline was important in their lives with a chronic disease and if the nurse-led telephone service gives comfort or makes them feel secure.

They could choose between 5 different answers: not at all, to a small degree, to some degree, to a large degree or to a very large degree. It was also possible to write comments.

All the answered phone calls were registered.

**Results:** The nurse-led telephone service answered mean (min–max) 30<sup>19–48</sup> phone calls every day, and in total 1875 calls during the period of 3 months. Only 29% of these patients needed and got an appointment with a rheumatologist.

341 patients answered the questionnaire.

68 commented regarding long time to wait, or a need for extended time for the telephone service. However, concerning how easy the access to a nurse on helpline was, 70% answered to a large or a very large degree, as shown in table 1.

89% answered that they to a large or a very large degree got the information or help they needed from the nurse.

90% answered that they to a large or a very large degree trusted the nurse's professional skills.

The nurse spoke to them so they could to a large or a very large degree understand her according to 92% of the respondents.

There was some variation in the answers about the helpline's importance in their life with a chronic disease, but 44% answered to a very large degree and only 4.7% answered not at all.

66% answered that access to a nurse on helpline provides a very large degree of security.

Abstract AB1448HPR – Table 1. Results from the questionnaires with response shown in% (N)

Question	Not at all	To a small degree	To some degree	To a large degree	To a very large degree
Was it easy to get in touch with the nurse on the helpline?	2.9 (10)	4.4 (15)	20 (68)	41.4 (141)	28.5 (97)
Did you get the information/help you needed from the nurse at the helpline?	1.2 (4)	2.1 (7)	5.6 (19)	32.5 (111)	56.3 (192)
Did you trust that the person was professionally skilled?	0.6 (2)	1.5 (5)	4.1 (14)	31.4 (107)	59.2 (202)
Did you experience that the nurse talked to you so you could understand her?	0.3 (1)	0 (0)	3 (10)	27.4 (93)	64.6 (219)
Is the helpline important to you in your life with a chronic disease?	4.7 (16)	8.8 (30)	12.4 (42)	24.2 (82)	44 (149)
How much security is there for you to have access to a nurse on helpline?	1.2 (4)	1.8 (6)	5.3 (18)	20.7 (70)	66.4 (225)

**Conclusions:** This study shows that calling a nurse-led telephone service is valuable for patients with a rheumatic disease. Although there can be some time to wait, almost 90% got the help they needed, understood the nurse and had confidence in the nurse's knowledge.

Only 13.5% answered that nurse-led telephone service has not at all or a small degree of importance in their lives with a chronic disease.

The nurse-led telephone service was important to a large or very large degree to feel secure and confident for 87% of the participants in this study.

**AB1449-HPR** **PATIENT FACTORS CONTRIBUTING TO AND SHARED DECISION MAKING IN STARTING/SWITCHING BIOLOGICS SPONDYLOARTHRITIS**

E Beckers, Y. van Eijk – Hustings, A. Boonen, A. van Tubergen. *Rheumatology, Maastricht University Medical Center, Maastricht, Netherlands*

**Background:** Biologics are effective for treating symptoms in patients (pts) with active spondyloarthritis (SpA) and a number of drugs are available with different working mechanisms, and mode and interval of administration for this indication. Starting/switching a specific biologic occurs for various reasons. It is increasingly advocated to involve pts in treatment decisions. Pts can have various needs and expectations when involved in shared decision making.

**Objectives:** To explore which pts factors contributed to starting or switching biologics in SpA, how pts experienced shared decision making in this process, and the needs of pts starting biologics.

**Methods:** Pts with SpA were recruited from the rheumatology department, Maastricht University Medical Centre. In semi-structured focus group interviews pts were asked to elaborate on when and why biologics were started and switched and if they were involved in the treatment decision. A decision aid for rheumatoid arthritis (RA) biologics was shown and pts were asked if they consider a similar decision aid for SpA as valuable. Interviews were audiotaped, transcribed and analysed in NVIVO11 software.

**Results:** In total, 14 pts with SpA participated in 4 focus group interviews. Three pts were diagnosed with axial SpA, 5 pts with peripheral SpA and 6 pts were diagnosed with axial- and peripheral SpA, with or without concomitant extra-articular manifestations. Mean age was 62 years (range 41–77 years), 10 were female (62.5%). Average time since diagnosis was 28 years. Pts started on average 7.3 years (range 1–14 years) ago with their first biologic. Six pts used 1 biologic, 5 pts had switched once or twice, and 3 pts switched more than 3 times. Factors contributing to starting a first biologic were disease activity, fatigue, intolerance to prior medication, and ineffectiveness of prior medication. Two pts were included in a biological trial. Factors contributing to switching were adverse effects and ineffectiveness of prior biologic.

Most pts were not involved in decision making when biologics were started or could not remember this. Some pts mentioned that only one or limited options were available at the time of start, and that the decision to start was made by the rheumatologist. However, also when more agents became available, decision for a specific biological was often made by the rheumatologist without discussing treatment options.

Pts underlined the importance of how care providers offer a treatment decision. When the decision was offered as a suggestion, "Shall we do.", it was experienced more pleasurable than when the decision was offered as a command, "Let 's do."

All pts expressed their wish to develop a decision aid in which clear information about each biologic is provided on mode of administration, interval, and effect on different SpA features. One pt explicitly stated that he did not want to be actively involved in decision making, but preferred that the care provider decides.

**Conclusions:** When involving SpA pts in shared decision making on start/switching of a biological, information on effectiveness on disease activity, fatigue, adverse events as well as expected duration of effectiveness should be provided, in addition to modes of administration and interval of each agent. A decision aid can support pts in this.

**AB1450-HPR** **COMPARISON OF BIOPSYCHOSOCIAL STATUS OF RHEUMATOID ARTHRITIS AND FIBROMYALGIA PATIENTS**

F.B. Oflaz<sup>1</sup>, M. Zahidnova<sup>1</sup>, G. Arın<sup>1</sup>, N.B. Karaca<sup>1</sup>, S. Apraş Bilgen<sup>2</sup>, E. Ünal<sup>1</sup>.  
<sup>1</sup>Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences; <sup>2</sup>Department of Internal Medicine-Rheumatology, Hacettepe University Faculty of Medicine, Ankara, Turkey

**Background:** Rheumatic diseases have biopsychosocial effects on individuals.<sup>1</sup> This affection includes the combination of anxiety, depression, and participation in daily living activities. It can be thought that individuals can be affected from different diseases in different ways.

**Objectives:** The aim of this study is to compare the biopsychosocial status of patients with Rheumatoid Arthritis (RA) and Fibromyalgia (FMS).

**Methods:** Individuals diagnosed with Rheumatoid Arthritis (RA) and Fibromyalgia (FMS) who applied to the Rheumatology Department of the Medical Faculty of Hacettepe University were included in the study. After the

demographic characteristics of the individuals were recorded; daily living activities were assessed with the Health Assessment Questionnaire (HAQ), quality of life with Short Form 36 (SF-36) scale, anxiety and depression levels with Hospital Anxiety and Depression Scale (HADS) and disease related biopsychosocial status with the Cognitive Exercise Therapy Approach Scale (BETY) which is a newly developed scale in rheumatic patients (the authors request that the abbreviation stay as "BETY" as the original in Turkish).<sup>2</sup>

**Results:** 120 RA and 99 FMS patients were included in the study. The scores of individuals on scales are shown in Table 1. When analysed in terms of differences according to RA and FMS, the anxiety and depression scores of the HADS scale and the SF-36 quality of life scale of the individuals were found to differ between the Physical Functioning, Social Functioning, General Mental Health, Role Limitations Due to Emotional Problems, Vitality Energy or Fatigue and General Health Perception sub-parametric scores.

**Abstract AB1450HPR – Table 1.** Comparison of two groups.

	RA (n=120)	FMS (n=99)	p
Age	51,91 ±11,39	43,03±8,42	0,00
BMI	28,47±6,55	27,46±5,67	0227
HAQ	13,48 ±11,86	11,7±9,47	0229
HADS-A	7,07±5,4	9,59±4,82	0000
HADS-D	5,62±4,39	9,23±4,46	0000
BETY	60,64 ±29,74	67,14±22,7	0075
SF36-FF	45,12 ±26,09	38,44 ±22,45	0046
SF36-FR	28,54 ±43,63	20,95 ±34,57	0162
SF36-A	39,87 ±25,76	42,06 ±20,25	0492
SF36-SI	36,67 ±45,82	50,63±25,9	0008
SF36-RS	73,15 ±19,82	53,87 ±20,25	0000
SF36-ER	55,1±24,91	30,03 ±41,83	0000
SF36-EC	70,41±30,4	27,27 ±19,99	0000
SF36-GS	50,08 ±24,76	38,38 ±16,61	0000

PF: Physical Functioning, RL: Role Limitations, RLE: Role Limitations Due to Emotional, VEF: Vitality, Energy or Fatigue, GMH: General Mental Health, SF: Social Functioning, P: Pain, GHP: General Health Perception

**Conclusions:** Physical function, mental health, emotional role strength, energy vitality and general health perception, anxiety and depression levels in RA patients were found to be better than FMS patients. The activities of daily living were thought to be unaffected by the changing parameters of pain and biopsychosocial status.

**AB1451-HPR** **BURDEN AMONG CAREGIVERS IN RHEUMATOID ARTHRITIS – A PILOT STUDY**

D. Buitrago-Garcia<sup>2</sup>, I. Mendez<sup>1</sup>, F. Rodriguez<sup>1</sup>, L. Villarreal<sup>1</sup>, P. Santos-Moreno<sup>3</sup>.  
<sup>1</sup>Health services, Biomab, Center For Rheumatoid Arthritis, Bogota; <sup>2</sup>Epidemiology, SIIES; <sup>3</sup>Rheumatology, Biomab, Center For Rheumatoid Arthritis, Bogota, Bogota, Colombia

**Background:** Rheumatoid arthritis (RA) is a chronic, inflammatory disease of the joints affecting more than 1% of global population, it is a long term condition that causes pain and disability.<sup>1</sup> Evidence had shown that

most of the patients are moderately disabled, and about 10% of the patients suffered from severe disablement which brings the necessity of a caregiver to become the patient's companion due to its chronic disease.<sup>2</sup> The caregiving role can have an impact in the psychological and physical spheres of the caregiver's life.<sup>3</sup>

**Objectives:** The aim of this study was to explore demographical characteristics and caregiver burden through the Zarit Scale.

**Methods:** We conducted a cross sectional study in a meeting where caregivers in a rheumatoid arthritis specialised setting. We collected sociodemographic information, and applied the Zarit caregiver burden interview (ZBI) adapted to Spanish. The ZBI includes 22 questions which has 5 responses from 0 (never) to 4 (nearly always), where scores lower than 47 indicated little to no burden, 47 to 55 low burden and >55 intense burden. We calculated means, and standard deviations for continuous variables and categorical variables were presented as rates. We categorised age of caregivers and compared to it to ZBI score, we used X<sup>2</sup> to perform bivariate analysis.

**Results:** 115 caregivers were included in the study, 63% were female and 37% were male. Mean age was 49 years±18 and 35% were single. Regarding educational level 44% had college degree, most of caregivers 30% had a full time job, and also 45% had other family members as their responsibility. See table 1. Zarit mean score was 44±14, additionally 71% had a score lower than 47. See table 1. Regarding age groups 35% of patients were older than 60 years and 15% of them were considered with intense burden disease, there was no statistical association between age and disease burden, see table 2.

**Abstract AB1451HPR – Table 1.** Zarit score

Zarit Score		
<47	82	71
47–55	14	12
>55	19	17

**Abstract AB1451HPR – Table 2.** Zarit scale classification according to age groups

Variable	15–39 years n=36	40–60 years n=38	Older than 60 years n=41	P value
No burden	20	28	30	0.108
Low burden	8	5	5	0.375
Intense burden	8	5	6	0.436

**Conclusions:** Although a high proportion of caregivers reported to have not burden, it is important to develop strategies and activities in order to attend the necessities of the caregivers in order to reduce the overload of responsibilities among them. Also further research is needed in order to identify the risk factors or protector factors that can prevent disease burden in caregivers.

#### AB1452-HPR WHICH ONE HAS A GREATER EFFECT ON FUNCTION AND THE PSYCHOSOCIAL STATUS IN JIA?: DISEASE TYPE OR THE PRESENCE OF PAIN

G. Arın<sup>1</sup>, H.E. Sönmez<sup>2</sup>, N.B. Karaca<sup>1</sup>, E. Sağ<sup>2</sup>, A. Özçadırcı<sup>1</sup>, S. Demir<sup>2</sup>, F. B. Oflaz<sup>1</sup>, Y. Bilginer<sup>2</sup>, D. Aydın Haklı<sup>3</sup>, R. Alpar<sup>2</sup>, E. Ünal<sup>1</sup>, S. Özen<sup>2</sup>. <sup>1</sup>Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences; <sup>2</sup>Department of Pediatric Rheumatology; <sup>3</sup>Department of Biostatistics, Hacettepe University Faculty of Medicine, Ankara, Turkey

**Background:** Juvenile idiopathic arthritis (JIA) is a chronic inflammatory childhood disease with symptoms such as joint inflammation, pain and

loss of quality of life.<sup>1</sup> Types of disease and the presence of pain can impact the child psychosocially, as well as affecting functional activity.<sup>2</sup>

**Objectives:** The aim of this study is to examine the results of functional and psychosocial status according to the disease type and the presence of pain symptoms in children with JIA.

**Methods:** The study included 71 children diagnosed with JIA who applied to the Hacettepe University İhsan Doğramacı Children's Hospital Rheumatology Department. Following the collection of demographic information, functional status was assessed with the Child Health Assessment Questionnaire (CHAQ) and psychosocial and functional status was assessed with the scale developed in Hacettepe University Faculty of Health Sciences Department of Physiotherapy and Rehabilitation for functional and psychosocial status of children with rheumatism by Edibe Ünal.<sup>3</sup> Children were divided into groups according to disease type as oligoarthritis or polyarthritis and the presence or absence of pain.

**Results:** Table 1 shows the mean age and numbers of children. There was no difference between the groups according to disease type (p>0,05). On the other hand, comparing scores for the CHAQ total, CHAQ general VAS assessment, functional and psychosocial status according to the presence or absence of pain revealed significant differences (p<0,05).

**Abstract AB1452HPR – Table 1.** Assessment values and comparison statistics

	Disease Type			Pain		
	Oligoarthritis (n=51)	Polyarthritis (n=20)	p	Present (n=21)	Absent (n=50)	p
Age (years)	10,88±3,81	13,50±3,92	0016	11,71 ±3,77	11,58 ±4,12	0885
CHAQ Total	0,28±0,29	0,46±0,41	0127	0,51±0,4 ±0,27	0,26 ±0,27	0012
CHAQ (General VAS)	2,49±2,43	3,93±3	0068	4,46 ±2,86	2,24±2,3	0002
Function (range 0–30)	4,72±4,85	5,05±6,32	0766	7,85±6,6 ±4,02	3,54 ±4,02	0004
Psychosocial (range 0–30)	23±5,67	14,5±5,82	0363	16±5,74 ±5,4	12,34 ±5,4	0012

Function; Psychosocial; Functional and Psychosocial subscales of Ünal's scale.<sup>3</sup>

**Conclusions:** We conclude that pain has a greater effect on functional, psychosocial and overall disease assessment in children with JIA when compared to the disease type. Thus, it must be taken into consideration that child's ability to cope with pain should be improved.

#### AB1453-HPR ARE DMARD THERAPIES EFFECTIVE ON QUALITY OF LIFE, ANXIETY AND DEPRESSION LEVELS IN PATIENTS WITH RHEUMATOID ARTHRITIS?

G.İ. Kinikli<sup>1</sup>, F. Akar<sup>2</sup>, S. Demirtaş<sup>2</sup>, M.A. Duman<sup>2</sup>, S. Ergin<sup>2</sup>, M.E. Gebes<sup>2</sup>, Y. Guneser<sup>2</sup>, G. Kinikli<sup>2</sup>. <sup>1</sup>Department of Physiotherapy and Rehabilitation, Faculty of Health Sciences, Hacettepe University; <sup>2</sup>Department of Rheumatology, Faculty of Medicine, Ankara University, Ankara, Turkey

**Background:** Rheumatoid arthritis (RA) is a chronic inflammatory autoimmune disease with persistent joint inflammation manifesting as joint pain, stiffness, and swelling. Treatment of rheumatoid arthritis (RA) should be aimed at achieving the lowest possible disease activity. Conventional DMARDs (eg, methotrexate [MTX], hydroxychloroquine, and sulfasalazine) are still widely used in newly diagnosed RA patients. On the other hand, the rate of biologic therapy use in clinical practice is rising as more agents become available in spite of efficacy of these treatments is broadly comparable. Depression is a common under-recognised co-morbidity in patients with RA accompanying with substantial disability, reduced quality of life.

**Objectives:** The aim of this study was to determine whether depression level is effected by response to therapy and compare the effectiveness of DMARD therapies in terms of quality of life, anxiety and depression levels in patients with RA.

**Methods:** A total of 105 patients (Conventional DMARDs, n=67; Biological Therapy, n=38) with RA participated to the study. Disease activity was assessed using the Disease Activity Score in 28 joints (DAS28). Remission was defined as the absence of disease activity (i.e. tender joint count [TJC]=0+ swollen joint count [SJC]=0+ESR <10 mm/hr). The Hospital Anxiety and Depression Scale (HADS) was used to measure both anxiety and depression level. The Rheumatoid Arthritis Quality of Life (RAQoL) questionnaire was applied to assess quality of life. The drug therapy groups were compared using the Kruskal-Wallis test and the Chi-square test. Correlation between the scales was evaluated by Spearman's correlation coefficient.

**Results:** There was no statistical difference in terms of RAQoL scores, disease activity and anxiety/depression scores between conventional DMARDs (RAQoL=16.78; DAS Remission=%46.3; Anxiety score=9.31; Depression score=7.34) and biological therapy (RAQoL=13.87; DAS Remission=%36.8; Anxiety score=8.24; Depression score=9.13) (p=0.096; p=0.816). RAQoL scores were significantly higher in patients with higher disease activity treated with conventional DMARDs (conventional DMARDs, DAS Activity=%43.3; biological therapy, DAS Activity=%39.5; RAQoL=17.54; p=0.006). RAQoL scores were statistically lower in patients with lower disease activity (p<0.001). Depression levels were statistically higher than anxiety levels (p=0.008).

**Conclusions:** Our results demonstrated that the presence of depression coexisting with RA independent from disease activity may result in poorer clinical response to standard therapies. According to recent ACR recommendations, RA patients who may be candidates for biologics (eg, infliximab, etanercept, adalimumab) include patients with high disease activity, and those who have previously failed to respond adequately to conventional DMARD therapy. However, the results of the study suggest that different pharmacological therapies are not enough to improve quality of life in patients with RA. There is a need for certain non-pharmacological treatments integrated with medication management based on bio-psychosocial approaches to cope with depression in RA patients.

#### AB1454-HPR INTERACTIONS BETWEEN WOMEN WITH RHEUMATOID ARTHRITIS AND NURSES IN NURSING CONSULTATIONS – BALANCING ILLNESS, MOTHERHOOD AND WORK LIFE

H Feddersen<sup>1,2,3</sup>, T.M. Kristiansen<sup>4</sup>, P.T. Andersen<sup>5</sup>, K. Hørslev-Petersen<sup>1,2</sup>, J. Primdahl<sup>1,2,6</sup>. <sup>1</sup>Institute for Regional Health Research, University of Southern Denmark, Odense; <sup>2</sup>King Christian Xth Hospital for Rheumatic Diseases, Graasten; <sup>3</sup>Institute for Health Education, University College of Southern Denmark, Aabenraa; <sup>4</sup>Department of Medicine and Health Technology, Aalborg University, Aalborg; <sup>5</sup>Department of Public Health, University of Southern Denmark, Esbjerg; <sup>6</sup>Hospital of Southern Denmark, Aabenraa, Denmark

**Background:** Patients with rheumatoid arthritis (RA) are offered outpatient follow-up in nurse-led consultations.<sup>1</sup> RA affects almost every aspect of daily life.<sup>2</sup> Many women with rheumatoid arthritis find it challenging to be mothers and simultaneously participate in paid work.<sup>3</sup>

**Objectives:** To investigate how women's understanding of RA, motherhood and working life are parts of the interactions with nurses during nursing consultations.

**Methods:** Participant observations were conducted during 10 women's attendance in nursing consultations and subsequently the women were interviewed about their experiences. Data generation and analysis were carried out according to the principles of constructivist grounded theory.<sup>4</sup>

**Results:** A core category was developed: "Cooperation through mutual recognition" which describes how women and nurses through verbal and non-verbal communication confirm their common understanding of the

content and form of nursing consulting. Furthermore, three sub-categories were identified:

1) "On safe ground" illuminates, that biomedical aspects of the disease such as blood tests results, examination of the joints and pharmacological treatments represent the foundation of the dialogue. This interaction has elements that may be characterised as ritualised behaviour.

2) "Taking risks" documents how both parties are more aware of the counterparts' reaction when it comes to dialogue concerning how the women manage illness in everyday life along with motherhood and paid work.

3) "Gentle correction" shows how the nurses gently express when they find the women's talk is too far out.

**Conclusions:** The biomedical aspects of the disease (disease perspective) constitute the starting point for a discussion and allow both parts to initiate conversations on the women's subjective understanding (illness perspective) of how illness, motherhood, and work are managed.

#### AB1455-HPR THE EXPERIENCE OF LIVING WITH FATIGUE AMONG PEOPLE WITH RHEUMATOID ARTHRITIS – A QUALITATIVE META-SYNTHESIS

J Primdahl<sup>1,2</sup>, A. Hegelund<sup>3</sup>, A.G. Lorenzen<sup>4</sup>, K.B. Loeppenthin<sup>5</sup>, E. Dures<sup>6</sup>, B. A. Esbensen<sup>7</sup>. <sup>1</sup>King Christian X's Hospital for Rheumatic Diseases, University of Southern Denmark, Graasten; <sup>2</sup>Hospital of Southern Jutland, Aabenraa; <sup>3</sup>Center of COPD Competence in Region Zealand, Naestved, Slagelse and Ringsted Hospital, Denmark, Slagelse; <sup>4</sup>Department of Quality, Research, Innovation and Education, Odense University Hospital, Odense; <sup>5</sup>The Danish Cancer Society Research Center, Copenhagen, Denmark; <sup>6</sup>University of the West of England, Bristol, UK; <sup>7</sup>Centre for Rheumatology and Spine Diseases VRR, Head and Orthopaedics Centre, Rigshospitalet, Copenhagen, Denmark

**Background:** People with Rheumatoid Arthritis (RA) experience fatigue as the most significant symptom of their illness. Despite a substantial body of knowledge about fatigue, there is a need for an overall comprehensive understanding of the experience of living with fatigue among people with RA

**Objectives:** To identify, appraise and synthesise qualitative studies on experiences of living with fatigue in people with RA

**Methods:** We conducted a qualitative meta-synthesis, inspired by Sandelowski and Barroso<sup>1</sup>. This included a systematic literature search conducted in February 2017, for studies published in the past 15 years, in the databases PubMed, Cinahl, Embase, SveMed, PsychInfo and Web of Science. To be included the studies had to include findings regarding the experience of adults with RA living with fatigue. The international Critical Appraisal Skills programme was used to assess the quality. The analysis and synthesis were inspired by Malterud's systematic text condensation<sup>2</sup>

**Results:** Eight qualitative articles were included. The synthesis resulted in an overall theme 'fatigue: the vicious cycle of an unpredictable symptom'. In addition, the analysis derived five subthemes, 'being alone with fatigue', 'necessary prioritising in everyday life', 'when time gets a different meaning', 'language as a tool for increased understanding' and 'strategies to manage fatigue'. Fatigue affects all areas of everyday life for people with RA. They strive to plan and prioritise, pace, relax and rest. In addition, they try to make use of a variety of words and language to help others understand that the RA-related fatigue they experience is not 'normal' fatigue. People with RA-related fatigue experience feeling alone with their symptom, but they develop their own strategies to manage fatigue in their everyday life

**Conclusions:** The unpredictability of RA-related fatigue is dominant, pervasive and is experienced as a vicious cycle, which can be described in relation to its physical, cognitive, emotional, social and behavioural impact.

Acknowledgement and support from health professionals can make a difference to people with RA-related fatigue

#### AB1456-HPR SHARED DECISION MAKING IN PRACTICE AND NEEDS OF RHEUMATIC PATIENTS ON NURSING SUPPORT

J.H.E Voorneveld-Nieuwenhuis. *Rheumatology, Maasstad Hospital Rotterdam, Rotterdam, Netherlands*

**Background:** Value Based Health Care entails creating value for the patient by providing meaningful care. Meaningful care can be given with focus at the perspective of the patient. Nurses play a role in measuring and monitoring care outcomes, but also have an important role in providing information about, treatment options and counselling of patients with their illness and treatment. Nurse consultation is part of the clinical pathway for rheumatoid arthritis patients.

**Objectives:** What are the needs and expectations of a patient at a consultation with the rheumatology nurse?

What do rheumatology nurses discuss with patients and their relatives during the nursing consultation and does this fit with the nursing competences from the generic self-management model?

**Methods:** Beside literature research two focus groups with patients about nursing care in the out-patient clinic were held. Also 10 nurse consultations were analysed from 3 different nurses. Qualitative data from both focus groups and observations were analysed and encoded with Atlas.ti.

**Results:** Patients were positive about the time spending for education and information. They expect the nurse to be a guide and give reliable information. They wanted emotional support especially when medication change and in the begin period when diagnose is set. Suggestions for subjects for follow up consultation like medication check, co-morbidity screening were positively received. Talking about self management is also a well received subject. A specific tool for self management like the self management web could support both patients and nurses.

Observation in practice showed that nurses give education and advice, but coaching is a less used skill.

**Conclusions:** Patients want emotional support, education about illness and self management support. Nurses are well equipped in give information and advice but must be educated in using there coaching skills and support patients to talk about their experienced problems in daily live.

#### AB1457-HPR AGGRESSION, DEPRESSION LEVEL AND GOUT-RELATED CHARACTERISTICS AMONG FILIPINOS DIAGNOSED WITH GOUTY ARTHRITIS: A CROSS-SECTIONAL, MULTI-CENTRE STUDY

J.M.A Pazcoguín<sup>1</sup>, M.A.S. Vargas<sup>1</sup>, D.G. Manlapaz<sup>2</sup>. <sup>1</sup>The Graduate School, <sup>2</sup>College of Rehabilitation Sciences, University of Santo Tomas, Manila, Philippines

**Background:** Uric acid (UA) is the end-product of purine metabolism in humans. Hyperuricemia or the elevated levels of serum UA have been implicated in the development of multiple health problems, including gout. Several studies show that UA predicts changes in behaviour over-time.

The importance of these behavioural changes can affect implementation of psychotherapeutic intervention and rehabilitation. However, there is a dearth of literature to support the relationship between gout-related characteristics and the aggressive and depressive behaviour of individuals with gouty arthritis.

**Objectives:** The primary aim of this study was to determine the predictors of aggression and depression tendencies through exploring the association of gout-related characteristics with the level of aggression and depression among adults aged 30–79 years old diagnosed with gouty arthritis within the healthcare facilities of Manila.

**Methods:** This study employed an observational, cross-sectional multi-centre design that was conducted in various healthcare facilities within the city of Manila. The participants were composed of 75 Filipino individuals diagnosed with gouty arthritis.

**Results:** Using logistic regression with significance level of  $p \leq 0.05$ , findings revealed that there were significant associations between the aggression and gout-related characteristics, specifically the average gout pain level ( $p=0.013$ ), gout duration ( $p=0.022$ ) and serum UA ( $p=0.018$ ). Furthermore, results also showed that there were significant correlations between the depression and gout-related characteristics such as self-reported comorbidities ( $p=0.020$ ), average gout pain level ( $p=0.032$ ), serum UA ( $p=0.045$ ), number of joints with gout ( $p=0.016$ ), and number of gout attacks ( $p=0.029$ ).

**Conclusions:** Findings revealed that the higher the values are in the gout-related characteristics, the higher the level of aggression and depression among gout patients. These significant associations can be considered as predictors of aggression and depression tendencies which validates the necessity to address the biopsychosocial aspect of an individual and to consider an effective approach on psychotherapeutic intervention and rehabilitation.

#### AB1458-HPR WORK PARTICIPATION OF PEOPLE WITH MUSCULOSKELETAL DISORDERS IN IRELAND: A QUALITATIVE MULTI-STAKEHOLDER ANALYSIS

K Robinson<sup>1</sup>, K. O'Sullivan<sup>1,2</sup>, A. Synnott<sup>1</sup>. <sup>1</sup>Clinical Therapies; <sup>2</sup>Health Research Institute, University of Limerick, Limerick, Ireland

**Background:** Musculoskeletal disorders (MSD's) are a leading cause of work disability. Good work offers many potential benefits to employees with MSDs. Understanding the perspectives of all the players involved in helping people with MSD's to stay at, return to and remain in work will advance understanding of work related interventions and services. Given the varying health and social insurance systems across international contexts there is a need to develop contextually specific knowledge.

**Objectives:** To explore in-depth the perspectives of multiple stakeholders involved in helping people with MSD's stay at, return to or remain in work.

**Methods:** In-depth qualitative interviews were completed with people with MSD's, health professionals, and employers to explore their perspectives on what factors support people with MSD's to stay in, return to, or remain in work in Ireland. Data were analysed using thematic analysis.

**Results:** Across all stakeholder groups biological factors were most implicated as the reason for work absences and the resolution of symptoms

was identified as the single greatest enabler of return to work. Although pockets of good practice were identified, in the main, health professionals and employers describe uncertainty about their role and responsibilities and describe a narrow scope of practice. Patients report a mostly adversarial experience of vocational supports.

**Conclusions:** Irish vocational rehabilitation stakeholders do not report awareness of the complex interplay of biological, psychological and social factors influencing work participation for people with MSD's. Vocational supports and services are hampered by role uncertainty and consequentially adversarial experiences for service users.

**Acknowledgements:** The authors acknowledge funding support from the Health Research Institute, Univeristy of Limerick for this study.

### AB1459-HPR PATIENTS WITH RHEUMATOID ARTHRITIS HAVE LATERALITY ON THE UPPER LIMBS RANGE OF MOTION

K Tsujimura<sup>1</sup>, S. Kato<sup>1</sup>, C. Nagata<sup>1</sup>, S. Nakazaki<sup>2</sup>. <sup>1</sup>Rheumatology, Kamiaraya Clinic; <sup>2</sup>Rheumatology, Johoku Hospital, kanazawa, Japan

**Background:** Biological disease-modifying antirheumatic drug (bDMARD) has been introduced since 2003 in Japan. In many patients, bDMARD has made it possible to control the disease activity of rheumatoid arthritis (RA), and has led to the structural remission and the functional remission. As for the structural damage, the relationship between mechanical stress and radiographic damage in RA has been recently reported. Koh reported that radiographic damage was worse and progressed more rapidly in the dominant hand in individuals with early RA<sup>1</sup>. Nakazaki reported that the eroded joint count was significantly more in the dominant than the non-dominant upper extremity<sup>2</sup>. Incidentally, there are few studies as for the relationship between mechanical stress and functional impairment, while joint range of motion (ROM) plays a important role on the physical function of the patients with RA.

**Objectives:** The aim of this study is to examine whether patients with RA have difference between right and left on the upper limbs and to see whether mechanical stress influences on ROMs.

**Methods:** We assessed 103 RA female patients aged less than 75 years old with their disease onsets after 2003 and their disease durations within 10 years. Exclusion criteria were the patients with past history of any apoplexy or fracture. We measured the ROM of joints including the shoulder, elbow, wrist, hip, knee, and ankle. The ROMs were measured by criteria of the Japanese Orthopaedic Association and the Japanese Association of Rehabilitation Medicine, and then the joints with restricted ROM were counted to see if any difference between right and left limbs. Data were analysed by using McNemar's test and judged as statistically significant when p value was less than 0.01.

**Results:** The mean age was 57.1 (26~74) years, the mean disease duration was 64.0 (7~120) months, the rate of bDMARD was 33.3%, the right limb was dominant in 99.0% among the patients. As for the ROM of upper limbs, the forearm pronation and the wrist flexion of the right limbs demonstrated significantly more restricted ROM compared with the left limbs (p<0.001). The ROM of lower limbs showed no significant laterality.

Abstract AB1459-HPR – Figure 1

**Conclusions:** The ROM limit count in the upper limbs was significantly more in the right limbs than the left limbs and the right limb was dominant in 99% of the patients, therefore it was suggested that the mechanical stress influenced the ROM of upper limbs and physical function in patients with RA even in the era of the bDMARD.

### AB1460-HPR PSYCHOLOGICAL VARIABLES PREDICTOR OF SLEEP DISORDERS IN PATIENTS WITH ANKILOSING SPONDYLITIS AND PSORIASIC ARTRITIS. MULTICENTER STUDY

L Cano Garcia<sup>1</sup>, N. Mena-Vázquez<sup>1</sup>, M.D. Hernández-Sánchez<sup>2</sup>, R. SEGURA-RUIZ<sup>3</sup>, C. Domínguez-Quesada<sup>4</sup>, S. Manrique-Arja<sup>1</sup>, I. Ureña-Garnica<sup>1</sup>, F. G. Jiménez-Núñez<sup>1</sup>, E. Vilchez-Ocaña<sup>1</sup>, A. Fernández-Nebró<sup>5</sup>. <sup>1</sup>Rheumatology, Hospital Regional Universitario De Málaga, Instituto De Investigación Biomédica De Málaga (ibima), Universidad De Málaga, Málaga; <sup>2</sup>Rheumatology, Complejo Hospitalario de Jaén, Jaén; <sup>3</sup>Rheumatology, Hospital Reina Sofía, Córdoba; <sup>4</sup>Rheumatology, Hospital Virgen Macarena, Sevilla; <sup>5</sup>Rheumatology, Hospital Regional Universitario De Málaga, Instituto De Investigación Biomédica De Málaga (ibima), Departamento De Medicina Y Dermatología, Universidad De Málaga, Málaga, Spain

**Objectives:** To study the variables associated with the severity of insomnia and hypersomnia according to the Oviedo sleep questionnaire (COS) in patients with ankylosing spondylitis (AS) and psoriatic arthritis (PsA).

**Methods:** Design. Transversal descriptive study. PATIENTS: Patients with follow-up AS or PSA were selected by consecutive sampling in rheumatology units of 4 Spanish cities. Selection criteria: age  $\geq 16$  years old) with AE (New York criteria) or PSA (CASPAR criteria) able to understand and willing to carry out the questionnaires. Protocol: they were explained and the patients were given to meet the selection criteria and the informed consent signed a battery of questionnaires; his doctor performed the evaluation of disease activity and recorded comorbidities and current medication. Main outcomes: the 3 dimensions of COS:<sup>1</sup> Subjective satisfaction with sleep,<sup>2</sup> Insomnia and<sup>3</sup> Hyperinsomnia. Other variables: current medication for AE or PsA, comorbidities, use of sleeping drugs and/or CPAP according to the COS questionnaire, disease activity: axial AS (BASDAI) and PSA (DAS28), quality of life related to health (HRQL) through SF-36, pain perception (Brief Pain Inventory BPI questionnaire), AE (BASDAI) and PSA (DAS28) and fatigue through FACIT, emotional intelligence through TMMS, resilience with the resilience questionnaire, anxiety screening and depression through HADs. Statistical analysis: Descriptive analysis of the main variables. Bivariate using T-Student, Mann Whitney U and  $\chi^2$  followed by binary logistic regression (RLB) (Vd: Insomnia: value greater than 22 of the insomnia scale).

**Results:** 302 patients participated: 152 patients with AE and 149 patients with PA (47.8% women, 48.97 $\pm$ 10.26 years) with an average of 8.35 $\pm$ 6.8 years of disease. They used 47.8% biological therapy. The most frequent comorbidities were: disc disease 143 (47.5%), visual impairment 60 (19.9%), anxiety 49 (16.3%), obesity 47 (15.6%) and depression 45 (15%). In the bivariate analysis it was observed that patients with AE suffered more insomnia than patients with PSA (57% vs 43%, p=0.029), they took more drugs to sleep (30.3% vs 22.9%, p=0.001) and suffered a higher activity of the disease measured by BASDAI (mean [SD] 4.7 [1.8] vs 3.8 [1.9], p=0.005). In insomnia in PsA, it was not associated with the degree of activity measured by DAS28 but it was associated with depression. In the binary logistic regression analysis (RLB), insomnia was associated with BASDAI and depression. Therefore, patients with greater BASDAI and depression have almost twice the risk of presenting insomnia in patients with spondyloarthropathies. There are no associations of insomnia with the resilience and emotional intelligence with results above the cut, that is, patients with good resilience and emotional intelligence.

**Conclusions:** There is an association between insomnia, disease activity and depression in the group of AE, in the case of PSA there is a relationship with depression. Insomnia is a problem related to depression, so education in sleep hygiene in nursing consultation could be of help for insomnia.

**AB1461-HPR** **FREQUENCY OF RHEUMATOID FACTOR ISOTYPES IN PARAGUAYAN PATIENTS WITH RHEUMATOID ARTHRITIS**

L. Roman<sup>1</sup>, S. Riquelme-Granada<sup>1</sup>, G. Avila-Pedreti<sup>1</sup>, I. Acosta-Colman<sup>1</sup>, M. E. Acosta<sup>2</sup>, I. de Guillen<sup>2</sup>, M. Duarte<sup>1</sup>, M.T. Filartiga<sup>3</sup>, S. Cabrera-Villalba<sup>1</sup>.  
<sup>1</sup>Reumatología, Hospital de Clínicas; <sup>2</sup>Investigación, Instituto de Investigación de Ciencias de la Salud, San Lorenzo; <sup>3</sup>Laboratorio, Laboratorio Curie, Asunción, Paraguay

**Background:** Rheumatoid Arthritis is a chronic rheumatic disease characterised by polyarticular inflammation. The rheumatoid factor is one of the most known prognostic markers, not only its presence, but also the levels. It also presents different isotypes (IgG, IgM, IgA), which can affect the course of the disease.

**Objectives:** To analyse the presence of different rheumatoid factor (RF) isotypes in Paraguayan patients with rheumatoid arthritis (RA) and to study their association with clinical and analytical characteristics.

**Methods:** Descriptive, cross-sectional study. A large number of clinical and serological variables were recorded. The anti-CCP 3.1 and Rheumatoid factor (RF) isotypes IgA, IgG, and IgM were measured in serum samples by ELISA (enzyme-linked immunosorbent assay) (NV<17 U/ml). Statistical analysis was performed using SPSS v.23. Quantitative variables were characterised by their means and standard deviations, while the qualitative variables were characterised according to the percentage of patients. The comparison of clinical and serological variables was performed using the chi-squared test and the student test respectively for qualitative and quantitative variables.

**Results:** 103 patients with RA were included, 86.4% were female, with a median age of onset of 44.7±13.6 years, and the mean disease duration was 7.13±7.03 years. The oligoarticular onset was the most frequent (46.6%). 13.7% were smokers. Extra-articular manifestations were present in 13.5%. The most frequent treatment was methotrexate (84.3%). Erosions were observed in 43.2% of patients. 28% were in remission of the disease measured by the DAS28 index. The average of HAQ was 0.47% ±0.58. 91.3% had anti-CCP positive, the mean anti-CCP levels were 290.5±152.8 U/mL. RF isotypes was observed in 75.7%, 53.4% and 38.8% for IgM, IgA and IgG respectively. Mean levels were as follow, IgA 85.62±56.6 U/mL, IgM 96.7±30.9 U/mL, IgG 70.98±72.42 U/mL. 32% of the patients had 2 isotypes of RF, while 25.2% had the 3 isotypes. The 57.3% had ≥2 isotypes of RF. We did not find significant differences when comparing gender, age, disease duration, form of onset, extra-articular manifestations, smoking status, erosions, disease activity, HAQ, treatment, between the different RF isotypes, and levels, except in the presence of anti-CCP with the RF-IgM isotype (p<0.000).

**Conclusions:** This is the first study of RF isotypes in Paraguayan patients with RA. The most frequent isotype of RF was IgM. More than 50% of patients had 2 or more RF isotypes. The majority of patients with positive RF had high levels of different isotypes, being the highest IgM.

**AB1462-HPR** **ACTIVITY LIMITATIONS AND PERCEIVED HEALTH-RELATED QUALITY OF LIFE IN PEOPLE WITH INCLUSION BODY MYOSITIS – A CROSS-SECTIONAL STUDY**

M. Regardt<sup>1,2</sup>, B. Eriksson<sup>1</sup>, L. Christopher-Stine<sup>3</sup>. <sup>1</sup>Function Area Occupational therapy and Physiotherapy, Karolinska University Hospital; <sup>2</sup>Department of Learning, Informatics, Management and Ethics, Karolinska institutet, Stockholm, Sweden; <sup>3</sup>Johns Hopkins Myositis Center, Baltimore, USA

**Background:** Inclusion body myositis (IBM) is a slowly progressive inflammatory myopathy with muscle weakness around thighs, knees and finger flexion muscles. Most people are 50 years or older at onset and there are more men than women with ratio of 2–3: 1. The diagnosis leads to activity limitations in daily life.

**Objectives:** The aim of this study was to describe how individuals with IBM describe their activity limitation and how they estimate their perceived health-related quality of life as well as to describe the correlation between activity limitation and experienced health-related quality of life.

**Methods:** A quantitative cross-sectional study involving a total of 29 people with IBM participated. Data collection was performed in Stockholm Sweden. The Myositis Activities Profile (MAP) were used to measure activity limitation and the Short Form-36 (SF-36) were used to measure experienced health-related quality of life.

**Results:** Activity limitations were estimated from no difficulty to impossible to do. The activity with the highest value (very difficult) was movement.

There was a significant difference between individuals with IBM and Swedish normative references measured with SF-36 in physical function, physical role function, general health and social function (p≤0.01).

There were high correlations between SF-36 physical and social function with MAP's movement, household activities, social activity, work/school and leisure (−0.872 ≥r<sub>ss</sub>−0.702; p≤0.001).

**Conclusions:** Participants estimated activity limitations in many areas, of which movement was estimated as very difficult. The study demonstrated correlation between activity limitations and the experience of impaired health-related quality of life. In order to make positive impact on the health-related quality of life, it is important to focus on social areas such as family, friends and leisure activities, as well as optimising everyday living with proper mobility tools.

**Acknowledgements:** We would like to thank all the participant for taking time to be part of this study.

We acknowledge The Myositis Association for making this study possible with a fellowship grant.

**Disclosure of Interest:** None declared

**AB1463-HPR** **IS THERE ANY DIFFERENCE IN JOINT POSITION SENSE AMONG DIFFERENT KNEE ANGLES IN PATIENTS WITH KNEE OSTEOARTHRITIS?**

M. Eyrimir<sup>1</sup>, B. Ünver<sup>1</sup>, V. Karatosun<sup>2</sup>. <sup>1</sup>School of Physical Therapy and Rehabilitation; <sup>2</sup>Department of Orthopaedics and Traumatology, School of Medicine, Dokuz Eylül University, Izmir, Turkey

**Background:** The joint related structures such as joint capsule, menisci, ligaments, muscles, skin provide the sensory input for the knee proprioception. Individuals with knee osteoarthritis (OA) have poor proprioceptive sense when compared with the same ages healthy individuals. Due to OA, the joint structures such as menisci, ligaments, and joint capsule rapidly undergo degeneration, and the deficiency of the knee proprioception progresses. Daily activities such as stair climbing, rise from a chair, walking require different knee joint angles. Therefore, the evaluation of the knee position sense at different joint angles is necessary for a better understanding of the knee proprioceptive sense deficit and for planning rehabilitation program in patients with knee OA.

**Objectives:** The purpose of this study was to analyse the knee joint position sense in different knee joint angles and to compare the results.

**Methods:** The study group consisted of 80 patients (62 female/18 male, 124 knees), with unilateral or bilateral knee OA and with a mean age 65.5±9.1 years were included in the study. Patients were evaluated regarding knee proprioception in knee joint angle 30°, 60° and 75°. The starting position was in knee joint angle 90° flexion, and the target angles was attempted to replicate using active knee extension movements. Patients performed active joint angle replication test in sitting position at a standard back supported chair. The average of the 3 repetitions of active joint repositioning test was recorded position sense score. The angular displacements from the target angles (in knee joint angle 30°, 60°, 75°) at the end of the active reproduction tests were recorded as position sense deficit scores.

**Results:** When the patients' knee position sense deficit at different joint angles (in knee joint angle 30°, 60° and 75°) were compared, there were statistically differences between at joint angle 75° and 60° (p=0.002), and also there were statistically differences between at joint angle 75° and 30° (p=0.001). However, there were not statistically differences between the patients' knee position sense deficit at joint angle 30° and 60° (p>0.05).

**Conclusions:** According to our results, the patients with knee OA have better proprioceptive acuity at knee joint angle 30°, 60° than at knee joint angle 75°. Specifically, the detection of active knee movement occurred with lower target angle displacement at a starting knee angle close to terminal extension (30°) than at knee angles closer to midrange (75°). These results can be reasonably speculated that proprioceptive input arose primarily from hamstring muscle stretching, posterior capsule tautness, and possibly ligament strain. It could be argued that the observation of the greater motor responses at decreased angles likely have been facilitated from enhanced sensitivity of these sensory terminals. Also, the results of this study may provide guidance for future proprioceptive sensory evaluations and provide guidance for planning rehabilitation programs in patient with knee OA.

**AB1464-HPR ACUTE EFFECTS OF COLD – PACK APPLIED IN DIFFERENT WAYS FOLLOWING FATIGUE ON POSTURAL STABILITY, PROPRIOCEPTION AND MOTOR PERFORMANCE**

O Aydogdu, Z. Sari. *Physiotherapy and Rehabilitation, Marmara University, Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation, Istanbul, Turkey*

**Background:** There is a lack of literature examining local cooling on postural stability, proprioception, and motor performance following fatigue.

**Objectives:** The purpose of this study was to examine the effects of cold-pack applied on knee joint following fatigue on postural stability, proprioception, and motor performance in healthy subjects. It was hypothesised that fatigue might cause deficits in measurements of postural stability, proprioception, and motor performance and cold-pack treatment applied on knee joint in different ways might prevent this deficit.

**Methods:** Sixty healthy subjects (33 female, 27 male; age=22.00±1.37 years, height=169.62±9.21 cm, weight=63.48±12.61 kg) were participated in the study. Subjects had no history of lower extremity injury, vestibular or postural stability problems, proprioception problems, hip, knee, and ankle instability. Postural stability, knee proprioception and motor performance were assessed by Pedalo Sensamove System, Biodex System Pro 4, and Stair Climbing Test, respectively.

The subjects were received a clinically-used fatigue protocol on a cycle ergometer. The Modified Borg's Rate of Perceived Exertion Scale has been used for fatigue determination. All assessments were performed three times at rest, immediately after fatigue and cold-pack treatment.

**Results:** There were no significant changes in terms of postural stability and knee proprioception after fatigue and cold-pack treatment compared to the condition at rest in all groups ( $p>0.05$ ). However, motor performance was significantly decreased following fatigue compared to the condition at rest ( $p<0.05$ ).

**Conclusions:** The hypothesis of this study, that fatigue could cause a deficit in measurement of motor performance was supported. On the other hand, postural stability and proprioception did not decrease following fatigue. According to the results of our study, we concluded that the subjects do not benefit from the use of cold-pack for compensating deficit in measurement of motor performance following fatigue.

**DOI:** 10.1136/annrheumdis-2018-eular.6899

**AB1465-HPR IMPACT OF ULCERS IN QUALITY OF LIFE AND FOOT FUNCTION IN SYSTEMIC SCLEROSIS PATIENTS**

R Ghisleni<sup>1,2</sup>, A. Janowska<sup>3</sup>. <sup>1</sup>University of Florence, Florence; <sup>2</sup>Freelance podiatrist, Bergamo; <sup>3</sup>Department of Dermatology, University of Pisa, Pisa, Italy

**Background:** Systemic Sclerosis (SSc) is a progressive, highly disabling pathology associated with pain, functional limitation, loss of ability at work and high social costs. Recent studies have proved that quality of life is worst in SSc patients than in healthy people, however there is lack in literary works investigating ulcers and lower limb complications.

**Objectives:** The aim of the present study is to investigate health-related quality of life and foot function in patients affected by SSc with or without ulcers.

**Methods:** 215 patients (mean age 48,6 years SD ±12,3) completed four questionnaires: Short-Form 36 (SF-36) and Health Assessment Questionnaire (HAQ) for quality of life, Foot Function Index (FFI) for foot function, Cardiff Wound Impact Scale (CWIS) for patients with ulcers only (88). Demographic data were also investigated such as sex, occupation and living place. In addition, further information about type of SSc, age at diagnosis of SSc, age at first Raynaud phenomenon, podiatric assessment and orthopaedic insoles or shoes wear was inquired.

**Results:** SF-36 scores were significantly lower in patients with ulcers than in patients without ulcers ( $p=0,001$ ) as regards the physical component score (PCS). PCS was also positively correlated to its own sub-domain Physical Function ( $R=0,81$ ), Role Physical ( $R=0,72$ ) and Body Pain ( $R=0,71$ ). SF-36 Mental component score (MCS) was positively correlated to its own sub-domain Mental Health ( $R=0,85$ ) and Role Emotional ( $R=0,77$ ). HAQ scores were significantly higher in patients with ulcers than in patients without ulcers ( $p<0,001$ ). PCS was negatively correlated to the HAQ ( $R=0,75$ ). FFI scores were significantly higher in patients with ulcers than in patients without ulcers ( $p=0,001$ ). CWIS scores were pretty high (50,6% SD ±26,6). Chi-square-test wasn't statistically significant ( $p=0,926$ ): ulcers and age are not correlated. Only 17 patients out of 215 were used to wear orthopaedic footwear, 38 wore foot orthoses and 71 were informed about the figure of the podiatrist.

**Abstract AB1465-HPR – Table 1.** Questionnaire scores and P-value

Group	SF-36		HAQ	FFI	CWIS
	PCS	MCS			
All patients	35.78±10.3	39.40±11.1	0.90±0.6	23.16%±24.7	-
Patients with ulcers	33.0±9.4	37.7±11.6	1.11±0.6	28.9%±27.5	50.6%±26.6
Patients without ulcers	37.73±10.5	40.6±10.5	0.74±0.6	19.1%±21.6	-
P-value	0.001	0.07	<0.001	0.001	-

**Conclusions:** According to the literature,<sup>1-2</sup> patients with SSc show an impaired quality of life compared to healthy subjects. The majority of patients are unemployed or stay at home due to disability. Furthermore, in case of ulcers, the more pain grows, the more foot function is reduced as well as quality of life gets worse. Wounds could be considered as a biomarker of pathology progression; therefore, clinicians should pay more attention in prevention improving lower limb assessment and treatment.

**AB1466-HPR EFFECTS OF SHORT-TERM NEUROMUSCULAR ELECTRICAL STIMULATION ON PAIN, QUADRICEPS MUSCLE STRENGTH, PHYSICAL PERFORMANCE AND KINESIOPHOBIA IN PATIENTS WITH OSTEOARTHRITIS OF THE KNEE (A PRELIMINARY STUDY)**

S Aydoğan Arslan<sup>1</sup>, A. Daşkapan<sup>1</sup>, E.D. Keskin<sup>2</sup>, B.B. Atak<sup>3</sup>, F. Kılıç<sup>2</sup>. <sup>1</sup>Department of Physiotherapy and Rehabilitation, Kırıkkale University, Faculty of Health Sciences; <sup>2</sup>Department of Physical Medicine and Rehabilitation; <sup>3</sup>Department of Physical Medicine and Rehabilitation, Kırıkkale University Faculty of Medicine, Kırıkkale, Turkey

**Background:** Osteoarthritis may cause fear of movement, increased pain, detention, reduced muscle strength, and range of motion. Quadriceps muscle strengthening is a common goal in the management of knee osteoarthritis. Neuromuscular electrical stimulation (NMES) is considered to be an effective technique for strengthening the quadriceps muscle. It has been used to treat patients with knee osteoarthritis.

**Objectives:** The aim of the study is to determine the effect of short-term neuromuscular electrical stimulation on pain, strength, physical performance and kinesophobia in patients with knee osteoarthritis.

**Methods:** 20 patients (9 women 11 men, who were 40–75 years, diagnosed as stage 2 or stage 3 knee OA according to Kellgren-Lawrence criteria, participated to the study. Socio-demographic data of all individuals were recorded. The cases were randomly divided into two groups as control group (n=10) and study group (n=10). Control group treatment consisted of conventional physiotherapy program (hot pack, transcutaneous electrical nerve stimulation (TENS), ultrasound and home exercises). In the study group, NMES application was added to conventional physiotherapy program. Both groups were treated five days/week for two weeks. The patients were assessed; before and after treatment. The pain was assessed by Visual Analogue Scale (VAS). Muscle strength was assessed by manual muscle test. Stair-climb test was performed to evaluate physical performance. Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC) was used to assess functional disability. Kinesiophobia was evaluated by Tampa Kinesiophobia Scale.

**Results:** There was no significant difference between control and study groups in terms of age, Body Mass Index, the scores of VAS value, Quadriceps Muscle strength, Stair-climb test, WOMAC and TAMPA scores at baseline ( $p>0.05$ ). Post treatment VAS value decreased significantly in both groups compared with pretreatment values ( $p<0.05$ ). However the scores of Quadriceps Muscle strength, Stair-climb test, WOMAC and TAMPA did not change significantly in both groups after the treatment. When compared the two groups, all the outcomes were similar ( $p>0.05$ ) after the treatment.

**Conclusions:** Because of the preliminary report and less number of patients; drawing definitive conclusions is not possible. It seems that, short-term conventional physiotherapy program decreased only pain, but did not improve strength, physical performance, functional disability and kinesiophobia. Also, we thought that short-term NMES application which added to conventional physiotherapy program did not provide superiority over treatment outcomes.

#### AB1467-HPR MEASUREMENT OF CERVICAL PROPRIOCEPTION IN PATIENTS WITH AXIAL SPONDYLOARTHRITIS

*T. Ozgen<sup>1</sup>, E. Tonga<sup>1</sup>, M.G. Polat<sup>1</sup>, S. Akar<sup>2</sup>. <sup>1</sup>Physiotherapy and Rehabilitation, Marmara University, Istanbul; <sup>2</sup>Rheumatology, Katip Celebi University, Izmir, Turkey*

**Background:** Axial spinal inflammation and spinal posture disorders in axial spondyloarthritis (axSpA) may deteriorate proprioception which may be caused by pathologic involvement of spinal entheses containing proprioceptive afferents.<sup>1</sup> Cervical spine is one of the main inflammation area in axSpA.<sup>2</sup> Impaired cervical proprioception has negative effects on postural control system.<sup>3</sup> The cervicocephalic relocation measure by laser pointer is found a reliable method to measure cervical sensory function in healthy participants in a recent study.<sup>4</sup> And there is limited data that regarding cervical proprioception in axSpA.

**Objectives:** To examine the differences in cervical joint proprioception between patients with axSpA and healthy subjects.

**Methods:** The cervical joint position errors (JPE) were measured to evaluate proprioceptive function accuracy in patients with 29 axSpA and 21 healthy subjects by laser pointer with cervical application. Neutral head position method was used to evaluate proprioception in flexion, extension, rotation and lateral flexion in right and left movement directions at sitting position (figure 1).<sup>5</sup> Three measures were performed, and the average of the three trials was used for analysis. The distance between zero spot and joint position which patient had been reconstructed was measured by centimetre. Spinal mobility evaluated by BASMI, function evaluated by BASFI and HAQ-S; disease activity defined by BASDAI, pain and fatigue were evaluated by VAS.

Abstract AB1467HPR – Figure 1

**Results:** There were 29 patients (21 men, mean ( $\pm$ SD) age; 41.4 $\pm$ 10.9 years) and 21 healthy subjects (15 men, mean age 41.1 $\pm$ 11.3 years). BASMI, HAQ-S and fatigue score were significantly higher in patients (BASMI values were 3.9 $\pm$ 2.3 vs 1.3 $\pm$ 0.7,  $p$ <0.001; HAQ-S values were 2.1 $\pm$ 0.8 vs 0.8 $\pm$ 0.2,  $p$ <0.001; fatigue values were 37.2 $\pm$ 23.3 vs 16.2 $\pm$ 14.9,  $p$ =0.001). The comparison of cervical JPE showed significantly larger errors ( $p$ <0.05) in patients with axSpA, except right rotation ( $p$ =0.166) (table 1).

#### Abstract AB1467HPR – Table 1

Comparison of joint position errors between patients with axSpA and healthy subjects			
Variable (cm)	AxSpA patients (n=29) (mean $\pm$ SD)	Healthy subjects (n=21) (mean $\pm$ SD)	P value
JPE in flexion	9.88 $\pm$ 6.70	4.66 $\pm$ 3.57	<b>0.001</b>
JPE in extension	12.99 $\pm$ 8.99	5.55 $\pm$ 2.98	<b>0.001</b>
JPE in right rotation	11.10 $\pm$ 6.56	8.62 $\pm$ 4.41	0.166
JPE in left rotation	10.59 $\pm$ 6.51	7.02 $\pm$ 5.78	<b>0.011</b>
JPE in right side bend	11.32 $\pm$ 6.53	6.39 $\pm$ 3.54	<b>0.001</b>
JPE in left side bend	9.62 $\pm$ 6.18	6.14 $\pm$ 4.46	<b>0.036</b>

JPE=Joint position error,  $p$  values are based on Mann-Whitney U test.

**Conclusions:** Cervical joint position sense is impaired in subjects with axSpA. Proprioceptive training may help to boost the effectiveness of rehabilitation.

#### AB1468-HPR SATISFACTION WITH THE BDMARD ETANERCEPT BIOSIMILAR (SB4) PRE-FILLED PEN AMONG RHEUMATOID ARTHRITIS AND SPONDYLOARTHROPATHY PATIENTS; A GERMAN OBSERVATIONAL STUDY

*U Müller-Ladner<sup>1</sup>, S. Zinke<sup>2</sup>, P.M. Aries<sup>3</sup>, C. Maucksch<sup>4</sup>. <sup>1</sup>Abteilung für Rheumatologie und Klinische Immunologie, Kerckhoff-Klinik GmbH, Bad Nauheim; <sup>2</sup>Rheumapraxis Zinke, Berlin; <sup>3</sup>Rheumatologie im Struenseehaus, Hamburg; <sup>4</sup>Biogen GmbH, Ismaning, Germany*

**Background:** The TNF $\alpha$  inhibitor etanercept was the first targeted biological disease modifying anti-rheumatic drug (bDMARD) approved for treatment of RA; the first etanercept biosimilar (SB4) was authorised in the EU in January 2016. Various administration devices have been developed for convenient subcutaneous self-injection of bDMARDs including pre-filled pens.

**Objectives:** This study aims to document general patient satisfaction in day-to-day use of the SB4 pre-filled pen. Patients' experience regarding handling, convenience, other features and the associated training on self-injection is also evaluated.

**Methods:** This non-interventional, cross-sectional study is enrolling patients who are treated according to usual medical practice. Patients had experience with the SB4 pre-filled pen in accordance with the prescribing information for at least 3 months prior to completing the onetime standardised patient questionnaire. This study started in August 2017, is ongoing and plans to enrol 500 patients in total from 50 centres across Germany. Subgroup analyses by previous therapy, modality of administration and by indication group are pre-planned.

**Results:** By November 2017, completed surveys from 142 patients were available for interim analysis. Mean age was 55 years, 61% were female

and the median duration of the disease was 6 years. The indications were rheumatoid arthritis in 63% (median disease activity score DAS28: 2.4), psoriatic arthritis in 19% (median DAS28: 2.5) and axial spondyloarthritis in 18% of patients (median BASDAI: 3.0). 68% of patients were new to bDMARD therapy. Previous therapies included conventional synthetic DMARDs (67% of patients), steroids (49%), non-steroidal anti-inflammatory drugs (43%) and bDMARDs (32%). Patient satisfaction response rates are shown in table 1.

**Abstract AB1468HPR – Table 1.** Patient-assessed satisfaction with SB4-pre-filled pen by previous treatment (Full Analysis Set)

	New to bDMARD (n=96)	Switch from syringe (n=22)	Switch from pen (n=21)	Switch from intravenous bDMARD therapy (n=2)	Total* (n=142)
General satisfaction: (very) satisfied	79 (82%)	19 (86%)	17 (81%)	2 (100%)	118 (83%)
Ease of execution: (very) simple	90 (94%)	18 (82%)	17 (81%)	2 (100%)	128 (90%)
Satisfaction with training on injection with the training pen**:	81/85 (95%)	20/21 (95%)	16/19 (84%)	2/2 (100%)	120/128 (94%)

\*Missing responses are not included in calculations; total includes one patient with unknown previous therapy.

\*\*Number of (very) satisfied patients/total number of patients who received injection training

**Conclusions:** High level of patient general satisfaction as well as satisfaction with the ease of use were reported with the etanercept biosimilar (SB4) pre-filled pen for patients who were new to bDMARDs or who had switched from other bDMARDs.

**AB1469-HPR A STUDY TO INVESTIGATE WHETHER IF ANY BARRIERS IN ETHNIC MINORITY PATIENTS MAY IMPACT ON RESEARCH PARTICIPATION IN A DISTRICT GENERAL HOSPITAL (2011)**

V Ramasamy. *Rheumatology, Clinical Research Unit, Barts Health Trust, London, UK*

**Background:** A literature review of the current evidence suggests that research barriers exist within a diverse and ethnic population and that these barriers are often perceived to be cultural, behavioural, structural, organisational or clinical. Though a number of studies have been done showing the impact the above, these cannot be generalised at a local level. Hence, it is of vital importance that those involved in undertaking clinical studies locally are aware of the factors which may be preventing them from recruiting ethnic patients in their respective specialist area. There is a need to evaluate systems currently in place and to investigate whether factors such as attitudes, beliefs, health care professionals approach and patient experience may have an impact on recruitment.

**Objectives:** The aim of this study is to investigate whether any barriers exists within a small sample of ethnic minority patients who have been previously approached to participate in a clinical trial in a local hospital.

**Methods:** A qualitative study involving semi-structured interviews with both consultants active in research and patients with a background of inflammatory conditions invited to participate in a study locally. Purposive sampling was applied in all three groups. Participant information sheets and invitation letters was sent to all participants with a two week follow up by telephone for patients. Consent was taken from all participants, open-ended questions used during the interviews, the data collected by hand notes and then analysed using the five stages of the framework approach. Data was analysed in 3 groups:<sup>1</sup> investigators,<sup>2</sup> consented patients and<sup>3</sup> unconsented patients.

**Results:** A total of 24 patients were invited and twelve agreed to attend for individual interviews. Out of twelve investigators approached, eight responded to the invitations. Investigators' displayed positive attitudes towards recruitment, reported language and some cultural barriers along

the informed consent pathway and a gap in support systems within research. Patients from both groups reported a lack of awareness in clinical trials. Fears of study drug and a lack of trust to commit were the main themes that emerged from the unconsented group. Cultural barriers did not have an impact on the informed consent process in both groups.

**Conclusions:** This study is among the first that has been conducted in our trust and focused on main areas of qualitative research looking at patients' responses when invited to participate in a trial and complexities of recruitment from a healthcare professional perspective. The findings provide evidence of research barriers that exist within the trust perceived by investigators and patients Unfortunately, few studies have focused on various background of ethnicity within different specialties. This could be because it is difficult to carry out studies without focusing specifically on a certain area of disease or a particular group of patients. These findings can only be generalised to areas of research locally upon further exploration of these barriers, which may have a significant impact on the recruitment of ethnic minority patients.

**Objectives:** In patients with spondyloarthritis (SpA: axial SpA or psoriatic arthritis [PsA]), treated with golimumab as second biological therapy (after failure or withdrawal of a first anti TNF- $\alpha$  drug), we describe patients' insights with regard to their beliefs and their satisfaction with golimumab therapy.

**Methods:** Patients on golimumab from GO-BEYOND, a retrospective study undergone in 20 Spanish rheumatology clinics, were requested to respond to the *Beliefs About Medicines Questionnaire* (BMQ). Statements of the BMQ include a 5-item necessity and a 5-item concern scale with Likert response options from "strongly agree" to "strongly disagree". Patients also responded to questions on their satisfaction and experience with golimumab self-injection. Descriptive data are displayed, and responses to the BMQ in axial SpA vs PsA patients were compared with the chi-square test.

**Results:** 123 patients on golimumab as second anti TNF- $\alpha$  responded (81 axial SpA and 42 PsA, mean age 49 years [SD=11], 40% women). Patients showed strong beliefs in the necessity of golimumab for the treatment of their SpA (percentages of "agree" or "strongly agree" to the necessity statements: 50%–80%), but also concerns: half the patients agreed/strongly agreed to be worried about long term effects of golimumab, and  $\approx$ 30% about becoming too dependent on the drug (table 1). Responses were similar in axial SpA and PsA patients (table 1). 111 patients declared to self-inject golimumab. Of these, 22.7% considered the experience with self-injection as very positive, 66.4% as positive, 10.0% neutral and only 0.9% unfavourable, and the use of the device very easy (37.3%), easy (57.3%), neutral (3.6%) and only 1.8% difficult. Finally 36.4% and 49.1% were very satisfied or satisfied with the interval of administration of golimumab, 11.8% were neutral and only 1.8% and 0.9% declared to be dissatisfied or very dissatisfied.

**Abstract AB1470HPR – Table 1.** Percentage of patients who responded “strongly agree” or “agree” to the BMQ statements

	All (n= 123)	Axial SpA (n= 81)	PsA (n= 42)
<b>Necessity scale</b>			
My health, at present, depends on golimumab*	72.7%	71.8%	75.0%
My life would be impossible without golimumab*	51.5%	49.3%	57.1%
Without golimumab*, I would be very ill	63.6%	60.6%	71.4%
My health, in the future, will depend on golimumab*	42.4%	46.5%	32.1%
Golimumab* protects me from becoming worse	89.7%	88.7%	85.7%
<b>Concerns scale</b>			
Having to inject golimumab* worries me	29.3%	29.6%	28.6%
I sometimes worry about the long-term effects of golimumab*	49.5%	49.3%	50.0%
Golimumab* is a mystery to me	35.7%	35.2%	37.0%
Golimumab* disrupts my life	7.1%	9.9%	0.0%
I sometimes worry about becoming too dependent on golimumab*	30.3%	32.4%	25.0%

All p-values>0.1. \*For a better understanding, the commercial name was used in the patients' questionnaire

**Conclusions:** Patients with SpA currently using golimumab as second anti TNF-alpha describe strong beliefs in the necessity of golimumab and good experience and satisfaction with self-administration. The BMQ also identified concerns that should be addressed in the clinic. The study is limited to the subset of patients still on golimumab at the study visit.

**AB1471-HPR INVESTIGATION OF THE EFFECT OF MANUAL THERAPY AND CERVICAL STABILISATION EXERCISES ON DISABILITY, KINESIOPHOBIA, DEPRESSION AND ANXIETY IN CHRONIC NECK PAIN PATIENTS: A PILOT STUDY**

Y Ozel Aslyuce, D. Onan, O. Ulger. *Health of Sciences, Ankara, Turkey*

**Background:** Neck pain is a common pain after low back pain and becomes chronic in most of the individuals (43%). Due to the severe pain experienced in chronic neck pain (CNP) individuals, the level of disability, depression and anxiety increases and kinesiophobia develops. Cervical stabilisation exercises in individuals with CNP are one of the most effective treatment methods applied recently and the main purpose is to provide training of deep cervical muscles. Manual therapy approaches such as suboccipital release and post-isometric relaxation techniques provide relaxation of the fascia and superficial muscles. These techniques are rarely applied compared to cervical stabilisation exercises and the number of studies done in the literature is very limited. The effects of these three approaches in the treatment of pain severity, disability, kinesiophobia, depression and anxiety are not known in the patients with CNP.

**Objectives:** The aim of this study is to investigate the effect of physiotherapy program consisting of suboccipital relaxation technique, post-isometric relaxation technique and cervical stabilisation exercises on pain severity, disability, kinesiophobia, depression and anxiety in individuals with CNP.

**Methods:** Ten patients who have CNP aged 18–65 years (mean age 37.11±4.26) were included in this study. Pain intensity at rest, activity and night with visual analogue scale (VAS), levels depression with Beck Depression Scale (BDS), anxiety with Beck Anxiety Scale (BAS), kinesiophobia with Tampa Kinesiophobia Scale (TKS) and disability with Neck Disability Index (NDI) were assessed. All participants in the study were included in a 10-session physiotherapy program that included suboccipital relaxation, post-isometric relaxation to the upper part of the trapezius muscle, and cervical stabilisation exercises.

**Results:** It was found that pain intensity at rest, activity and night were significantly decreased after treatment (p=0.008). Disability (p=0.008) and kinesiophobia (p=0.01) level were also significantly dropped. Depression (p=0.015) and anxiety levels (p=0.024) were statistically significantly improved after treatment.

**Conclusions:** As a result of our study, pain, depression and anxiety levels decreased, kinesiophobia and disability were improved after physiotherapy applied to individuals with CNP. The suboccipital relaxation and post-isometric relaxation techniques applied before cervical stabilisation exercises increased the adaptation to the exercise by providing relaxation of the painful and tense region in the patients. We think that the activation of the deep cervical muscles is facilitated when the tension of the superficial muscles and the fascia are relaxed. Soft tissue loosening does not

result in pain during and-exercise, which may have reduced the tendency for kinesiophobia, anxiety and depression in patients.

**AB1472-HPR INFLAMMATORY OR RHEUMATOID ARTHRITIS PATIENTS' PERSPECTIVES ON THE EFFECT OF ARTHRITIS GLOVES ON THEIR HAND PAIN AND FUNCTION (A-GLOVES TRIAL): A QUALITATIVE STUDY**

Y Prior<sup>1,2</sup>, N. Arafin<sup>1</sup>, C. Bartley<sup>1</sup>, A. Hammond<sup>1</sup>. *<sup>1</sup>Health Sciences, University of Salford, Salford; <sup>2</sup>Rheumatology, MidCheshire Hospitals NHS Trust, Leighton Hospital, Crewe, UK*

**Background:** Arthritis (compression) gloves are frequently provided to people with inflammatory (IA) or rheumatoid arthritis (RA) in the NHS, to help reduce swelling and alleviate hand pain by providing compression and improving circulation. However evidence for their effectiveness is limited.<sup>1</sup>

**Objectives:** Nested within a randomised controlled trial (RCT) testing the effectiveness of intervention (compression) gloves with control gloves (fitted at least one size too big) in people with RA and IA, this qualitative study aimed to explore patients' perspectives on the effect of the arthritis gloves on their hand pain and function.

**Methods:** Once randomised, participants were provided joint protection and hand exercise booklets and fitted with either the intervention or the control glove(s) by a trained occupational therapist.<sup>2</sup> Both gloves had similar thermal qualities but control gloves did not apply compression. Semi-structured interviews were conducted with 10 participants, purposively selected from each group (n=20) following 12 weeks of glove wear. Interviews were audio-recorded, transcribed and analysed by three researchers using thematic analysis with a critical realist perspective.

**Results:** Participants' perspectives on the effects of the arthritis gloves had three emergent sub-themes. These were<sup>1</sup> Usage: both groups predominantly used the gloves for activities such as wearing them outdoors to keep hands warm, night-time wear to help with sleep, and doing light domestic activities (e.g. dusting). Gloves were not used for cooking or washing-up or for personal activities of daily living (e.g. toileting, grooming) “*What didn't help as such, obviously was with washing etc. and toileting because I had to keep taking them off and putting them back on again*”.<sup>2</sup> Symptomatology: while some reported that gloves helped to keep their “*hand pain in check*” others said that gloves had no effect on their hand pain or that they'd found “*it's made them worse*”. Participants from both groups frequently mentioned the warmth element of the gloves, as a positive attribute to help with their symptoms.<sup>3</sup> Aesthetics: participants had opposing views on the appearance of the arthritis gloves. Some felt that the intervention gloves “*look a bit ugly with the seams outside*” or stated that they “*would not want to wear that colour*” but did not think they were obtrusive. Most noticeably, patients seemed to view the arthritis gloves as ordinary everyday gloves, rather than a medical device “*if it was cold I wore them outside*”.

**Conclusions:** Trial participants reported experiencing similar effects from wearing either the intervention or control gloves, with varied perspectives on whether or not gloves affected hand pain and/or function. Overall, patients did not reflect on the compressive but rather the thermal qualities of the gloves, as warmth was the main effect perceived.

## HPR Service developments, innovation and economics in healthcare

### AB1473-HPR QUALITY OF REFERRAL LETTERS RECEIVED IN RHEUMATOLOGY

D Palma-Sanchez, A.D.C. Haro-Martinez, M.J. Moreno-Martinez, E. Peñas-Gonzalez. *Rheumatology, Hospital Rafael Méndez, Lorca, Spain*

**Background:** The referral letter is an essential tool in the relationship between Primary Care and other specialties with Rheumatology. In our area, in 2010, a computer system called SELENE was introduced at hospital level and, in Primary Care, O.M.I. was set up more than 20 years ago

**Objectives:** To assess the quality of referral letters received in the Rheumatology Unit during the first four months of 2017

**Methods:** Retrospective and descriptive study, in which referral letters received in the Rheumatology Unit between January and April 2017 were analysed. The following variables were collected: medical specialty that sent the document, computerization of the document, reference to medical history, chronic treatments, current disease, physical examination, complementary tests, presumption diagnosis, treatment for the current process, and number of reasons for consultation per document. The quality of the document was assessed using the recommendations of Irazábal and Gutiérrez modified by Morera et al, which classified them as: good, acceptable and bad (table 1).

**Abstract AB1473HPR – Table 1.** Quality of referral letters.

**Good:** It includes medical history, familiar medical history, chronic treatment, current disease, complementary tests, presumption diagnosis, differential diagnosis and reason for consultation

**Acceptable:** It includes reason for consultation and enough information about current disease, although not all those included in the previous one

**Bad:** Unreadable, without enough information to assess the current disease or absence of information

In the descriptive statistical analysis of quantitative variables, the mean and standard deviation were used. Frequencies were used to analyse qualitative variables

**Results:** 1234 referral letters were included and 90.3% were computerised. The specialties that referred patients more frequently were: Primary Care (84.7%), Traumatology (3.4%), Neurology (1.9%) and Emergency (1.6%). 14.5% of the documents included more than one reason for consultation. The variables related to the fulfilment of quality criteria in the referral letters are shown in Table 2. Regarding the quality level, 4.1% of the documents were good, 95.2% acceptable and 0.6% bad.

**Abstract AB1473HPR – Table 2.** Quality criteria in the referral letters

Reference to medical history, n (%):	242 (21.7)
Reference to chronic treatment, n (%):	67 (6)
Reference to symptoms, n (%):	1050 (94.3)
Reference to physical examination, n (%):	170 (15.3)
Reference to complementary tests, n (%):	740 (66.4)
Reference to treatment for the current process, n (%):	373 (33.5)
Reference to presumption diagnosis, n (%):	712 (64.3)

**Conclusions:** The quality of the referral letters was mostly acceptable. Therefore, there is much room to improve, especially in the sections referencing medical history, chronic treatment, physical examination and treatment for the current process

**Disclosure of Interest:** None declared

### AB1474-HPR ARE CLINICAL PATHWAYS USEFUL IN CLINICAL PRACTICE?

D Palma-Sanchez, A.D.C. Haro-Martinez, M.J. Moreno-Martinez, E. Peñas-Martinez. *Rheumatology, Hospital Rafael Méndez, Lorca, Spain*

**Background:** The aim of clinical pathways is to improve the care of patients with chronic diseases, ensuring continuity of care through a better coordination and communication between Primary and Hospital Care. Even though clinical pathways have proved to be effective, their

publication and dissemination does not necessarily lead to the systematic use of them in clinical practice.

**Objectives:** To assess the fulfilment of clinical pathways in area III of Murcian Health Care System.

**Methods:** Retrospective and descriptive study in which the fulfilment of clinical pathways in musculoskeletal pathology was analysed in the Rheumatology Unit the first four months of 2017. The variables collected were: reason for consultation, waiting time for an appointment and fulfilment of clinical pathways in the following clinical processes: back pain, shoulder pain, knee pain and fibromyalgia.

In the descriptive statistical analysis of quantitative variables, the mean and standard deviation were used. Frequencies were used to analyse qualitative variables

**Results:** 1234 referral letters were received in Rheumatology during the first four months of 2017, 85.1% were mechanical pathology, 8.2% inflammatory pathology and 4.1% bone metabolism pathology. 628 were susceptible to follow the clinical pathways implemented in musculoskeletal pathology: 462 (73.56%) were back pain, 87 (13.85%) knee pain, 73 (11.62%) shoulder pain, and 6 (0.95%) fibromyalgia. The clinical pathways were fulfilled in 252 (40.12%) of the cases.

**Abstract AB1474HPR – Table 1.** Fulfilment of clinical pathways

Back pain, yes (%)	206 (44.6)
Shoulder pain, yes (%)	26 (35.6)
Knee pain, yes (%)	19 (21.1)
Fibromyalgia, yes (%)	1 (14.3)

**Conclusions:** The fulfilment of clinical pathways in musculoskeletal pathology in our health care area was carried out in less than half of the cases. Therefore, it is necessary to implement procedures to make easier their use in clinical practice

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.5315

### AB1475-HPR COST EVOLUTION OF BIOLOGICAL AGENTS FOR THE TREATMENT OF SPONDYLOARTHRITIS IN A SPANISH TERTIARY HOSPITAL: INFLUENTIAL FACTORS IN PRICE DEVELOPMENT

M. Á. González Fernández<sup>1</sup>, E. Villamañan Bueno<sup>1</sup>, I. Jiménez Nácher<sup>1</sup>, F. Moreno Ramos<sup>1</sup>, A. Herrero Ambrosio<sup>1</sup>, C. Plasencia Rodríguez<sup>2</sup>, A. Balsa<sup>2</sup>. <sup>1</sup>Pharmacy Department, <sup>2</sup>Rheumatology Department, University Hospital La Paz, Madrid, Spain

**Background:** Spending on biological agents has risen dramatically in Spanish hospitals due to the drugs' high cost and the increased prevalence of spondyloarthritis.

**Objectives:** To calculate and compare the annual cost per patient with spondyloarthritis and for each biological drug according to clinical practice from 2009 to 2016 and to analyse the factors that influence consumer pricing, such as biological therapy optimisation (by monitoring drug and anti-drug antibody serum levels), the use of tumour necrosis factor inhibitor biosimilars, and drug discounts, refunds, and rebates.

**Methods:** We conducted a retrospective observational study that analysed patient demographic parameters, disease activity, and annual cost per patient and per drug and determined the economic factors that affected on consumer pricing.

**Results:** A total of 129, 215, and 224 patients were treated in 2009, 2013, and 2016, respectively; 77 (59.69%), 133 (61.86%) and 139 (62.05%), respectively, were men aged 46.04 (±12.57), 47.76 (±12.35) and 48.27 (±13.49) years, respectively. Nonstatistically significant differences were observed.

The annual cost per patient decreased during the study period (from €11.604 in 2009, €8.513 to €7.464 in 2016). There was an increase in the number of marketed biological drugs and in the total savings per drug, with discounts and bonus units in 2016 reaching 12%–18% for etanercept, adalimumab, certolizumab, and golimumab and up to 25% for the recently released secukinumab, while rebates for biosimilar infliximab reached 69% in 2016. Biological therapy optimisation reached 47.5% in 2016, which resulted in cost savings of 23.89%, in addition to the savings from refunds and rebates (11.06%) in 2016.

**Conclusions:** The resulting treatments after the rebates, invoice discounts, and optimizations were more cost-effective, leading to a significant decrease in the annual cost per patient and an overall reduction in expenditure for these drugs.

#### AB1476-HPR EFFECTS OF WEARABLE TECHNOLOGY AS VIRTUAL REHABILITATION ON FUNCTIONAL OUTCOMES IN PATIENTS WITH ANTERIOR CRUCIATE LIGAMENT RECONSTRUCTION

*Q Aydogdu, Z. Sar. Physiotherapy and Rehabilitation, Marmara University, Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation, Istanbul, Turkey*

**Background:** Virtual rehabilitation systems play an increasing role in rehabilitation. They provide an interactive environment and increased motivation for patients during the session.<sup>1</sup> In recent years, intervention methods based on virtual reality have been studied. However, existing studies are limited because most of them focused on the balance ability of the elderly or studied in stroke patients with same systems.<sup>2</sup> Thus, it is necessary to investigate the effects of virtual rehabilitation in patients with Anterior Cruciate Ligament (ACL) Reconstruction.

**Objectives:** The purpose of this study was to investigate the effects of a wearable technology as virtual rehabilitation which provides visual and auditory stimulus aimed for educating and controlling the joint on proprioception, postural stability and fear of re-injury in patients with ACL reconstruction.

Abstract AB1476-HPR – Figure 1

**Methods:** Nineteen patients (age=28.47±6.18 years, height=176.31±6.06 cm, weight=79.47±14.38 kg) with ACL reconstruction were participated in this study. In addition to conventional physiotherapy, a virtual rehabilitation treatment applied with visual and auditory stimulus three times in a week for 8 weeks. Knee proprioception, postural stability and fear of re-injury were measured with Biodex System Pro 4 Isokinetic Dynamometer, Pedalo Sensamove System, Tampa Kinesiophobia Score, respectively.

**Results:** There were statistically significant improvements in measures of proprioception (p=0.003), postural stability (p=0.001), and fear of re-injury (p=0.001) between pre- and post – treatment.

**Conclusions:** According to the results, wearable technology as virtual rehabilitation may be beneficial on proprioception, postural stability, and fear of re-injury to treat patients with anterior cruciate ligament reconstruction. We conclude that devices used as wearable technologies should be used as treatment modalities in clinical services because of providing feedback, easy to carry and interactive treatment.

#### AB1477-HPR ADHERENCE TO RCOPHTH GUIDELINES IN MONITORING OF HYDROXYCHLOROQUINE BY RHEUMATOLOGISTS AT LNWH CMH

*Q Adamjee, B. Colaco, P. Gulati, C. Cleland, D. Naumink. London North West University Healthcare, NHS trust, London, UK*

**Background:** The Royal College of Ophthalmologists (RCOPHTH) published in 2017 revised recommendations regarding screening for hydroxychloroquine (HCQ) toxicity. Recent data reported the prevalence of retinopathy to be around 7.5% and depending on dose and duration can rise to 20%–50% after 20 years of therapy. Much higher than the 0.5% reported previously in the 2009 guidelines. Risk is increased in patients taking more than 5 mg/kg/day, and those with renal dysfunction, pre-existing retinopathy or also taking tamoxifen. Retinopathy appears as damage to the photoreceptors, followed by degeneration of the retinal pigment epithelium (RPE). This can produce visual loss and a "Bull's eye maculopathy".

Current guidelines state patients looking to take HCQ long term should have a baseline screening (10–2 Humphrey visual test) in a hospital eye department, and then be referred for annual screening after 5 years of therapy. Dosage should ideally be kept ≤5 mg/kg/day.

Previous guidelines recommend a maximum dose of ≤6.5 mg/kg/day, and baseline optometrist review. Referral to ophthalmologist only if a visual impairment or eye disease is detected at the baseline assessment or the patient notices reduced vision whilst on treatment. Long term HCQ patients, were advised to agree and individual screening arrangement with the local ophthalmologist.

**Objectives:** This single point of care audit was to assess real world practice at Central Middlesex Hospital against the new 2017 guidance as a gold standard.

**Methods:** HCQ questionnaires were collected from patients attending regular appointments over one month October–November and recorded:

- 1) date commenced HCQ,
- 2) est. total dose,
- 3) weight and
- 4) last retinal screen;

Hospital EPR database was used to confirm or assist documentation of therapy data.

**Results:** In one calendar month 152 of 414 patients were prescribed HCQ.

94/152 of the patients had been on HCQ for >5 years.

63/152 patients were high risk with doses of >5 mg/kg/day.

55/152 patients had either failed to attend a baseline screening, or had no record of having had a baseline screen.

Of the 21 patients that had started HCQ after the introduction of the new guidelines (2017); only 5 had failed to have a baseline hospital screen (3/5 instead had optometrist/high street screen instead). No cases of HCQ related retinopathy had been reported.

**Conclusions:** Real world OHC retinal screening was poor compared to new Guidance. These figures imply a huge medico-legal responsibility for the previously considered rare risk of retinal damage from OHQ. The logistics of the workload in Eye Clinics will necessitate local solutions including nurse screening clinics and closer monitoring and documentation of outcomes. This rare but serious complication of a very well tolerated and effective agent will not come at a cheap price today. A repeat audit following 12 months of an agreed screening policy is recommended.

## HPR Professional education, training and competencies

### AB1478-HPR PROMOTING EXERCISE IN RHEUMATIC DISEASES: PHYSICAL THERAPISTS' UNDERSTANDING

E Swärth<sup>1,2</sup>, C. Opava<sup>1,3</sup>, L. Nygård<sup>4</sup>, I. Lindquist<sup>1</sup>. <sup>1</sup>Department of Neurobiology, Care sciences and Society, Division of Physiotherapy, Karolinska Institutet; <sup>2</sup>Functional Area Occupational Therapy and Physiotherapy, Allied Health Professionals' Function, Karolinska University Hospital, Huddinge; <sup>3</sup>Rheumatology Clinic, Karolinska University Hospital, Stockholm; <sup>4</sup>Department of Neurobiology, Care sciences and Society, Division of occupational therapy, Karolinska Institutet, Huddinge, Sweden

**Background:** Physical therapists have unique expertise in planning, prescribing and supporting exercise programs for patients with chronic diseases. Promoting exercise can be a challenge and include a range of strategies, but descriptions of physical therapists' experiences within the field of rheumatology are limited.

**Objectives:** The purpose of this study was to explore and describe ways of understanding exercise promotion among physical therapists working with patients having rheumatic diseases.

Abstract AB1478-HPR – Figure 1

**Methods:** A phenomenographic approach was used to analyse semi-structured interviews with 25 physical therapists, working primarily within the

field of rheumatology, from eight different physical therapy departments at hospitals in various cities of Sweden.

**Results:** Four categories related to the promotion of exercise were identified: *to tell and monitor; to identify and pilot; to discuss and enable; and to listen and inspire*. Key aspects were responsibility, setting and supervision, tools to support change and the role as an educator. The findings are interpreted as a hierarchically organised structure, where the understandings of the PTs differ in respect to comprehensiveness regarding some aspects of interaction and collaboration with the patients.

**Conclusions:** Physical therapists working with patients having rheumatic diseases understand exercise promotion in different ways and these understandings differ in respect to comprehensiveness, which might lead to unequal promotion. A more comprehensive repertoire would probably make physical therapists more prepared to meet patients' needs for different strategies in the adoption and maintenance of exercise behaviours.

**Disclosure of Interest:** None declared

### AB1479-HPR MULTIFACETED INTERVENTION TO IMPROVE MEDICATION UNDERSTANDING AND COMPLIANCE AMONG PATIENTS WITH AUTOIMMUNE INFLAMMATORY RHEUMATIC DISEASES

R Thakran, S.S. Baghel, C. Messi, S. Garg, S. Kapoor, V. Kashyap, Q. Zaheer, A. Malaviya. *Rheumatology, Indian Spinal Injuries Centre, New Delhi, India*

**Background:** Non-compliance with treatment in patients with autoimmune inflammatory rheumatic diseases are directly associated with relapse, deformities and higher treatment cost. Many of times it can be related to poor understanding of complex drug regimen. Consistent reports of sub-optimal treatment adherence among patients with autoimmune inflammatory rheumatic disease underscore the importance of understanding how adherence can be promoted and supported.

**Objectives:** To evaluate the efficacy of various methods of drug explanation to AIRD patients in rheumatology OPD.

**Methods:** It is a retrospective study of 100 DMARD naive first visit patients in rheumatology OPD. Demographic and clinical information were noted in pre-designed performa. After prescription of DMARDs regimen by rheumatologists, various methods are used to explain the advised prescription such as using permanent markers on medication strips, making envelopes, using different medication performa in their local language, as well as counselling regarding importance of medication; done by rheumatology nurse. Adherence rate and reasons of non adherence was measured by different methods like interview, pill counts, review of prescription on their routine follow up visits.

**Results:** 1. 79.8% of patients fully understood and had adherence with their prescribed medication.

2. 20.2% were non-adherent with the prescribed treatment, varying from occasional to complete failure. The factors for non-adherence were identified.

- 25% patients stopped when no symptoms.
- 22.5% got influenced by alternative therapy.
- 20% family pressure and financial constrains.
- 12% of myths about side effects of medication.
- 15% lost follow up.
- 5% had doubts could not understood properly.

On stactical analysis of all methods of drug explanation, use of permanent marker on medicine strips were found to be most effective.

**Conclusions:** As per results non-adherence to treatment due to poor understanding of drug regimen is very low. But another factors were identified which have influence over adherence rate. In a busy OPD a single sitting counselling is not adequate. To summarise patients need more intensified and focused counselling to improve adherence.

PARE0001

### #DOESNTSHOWDOESNTEXIST/#SYNSINTEFINNSINTE – AN AWARENESS CAMPAIGN FOR PUBLIC TRANSPORT BY SWEDISH NATIONAL ORGANIZATION FOR YOUNG RHEUMATICS

K. Nordlund, M. Beermann. *Swedish National Organization for Young Rheumatics, Stockholm, Sweden*

**Background:** "Rheumatism amongst young people, is that really a thing?" "Isn't rheumatism something that only old people have?" "You seem so happy and so active, surely you can't be in pain?" These are all questions that young people with rheumatism have to listen to, and answer every day. Yes, it's possible to have rheumatism even as a young person, and to be in pain, even though we're not letting it show. We know adjustment is possible, and that we can live our life to the fullest and follow our dreams, despite rheumatism. But sometimes it demands some extra understanding from the people around us. That's what we wanted to recognize, for the second year in a row, but with another approach, and created a campaign together with AbbVie.

**Objectives:** It can be hard to understand and fully grasp something you can't see, something that is invisible. But as young people with rheumatism, we have to live and deal with our swollen joints, with the pain and the fatigue, and with the side effects of our medication. None of which should be questioned. We recognized that this was an issue for most people with rheumatism, especially young people, and especially in the public transport. Therefore, we wanted to start a conversation about that we, young people with rheumatism that doesn't show, can also need to sit down at the priority seats. The main purpose with our campaign was to acknowledge the fact that you can't always tell whether or not a person has a diagnosis, or is in pain. We also wanted to show young people with rheumatism that they are not alone in their situation.

**Methods:** We wanted to make a quiz. Each pair of person with and without rheumatism in the campaign is presented in a photo taken on a bus next to each other with a quiz question. For example: "Who of us needs to sit on the bus so we can hang out in the skate park this afternoon?" The whole idea of the quiz is to make people realize that it is impossible to see if a person needs to sit on the bus or not, that you have to trust us when we asks for a seat. Every answer is put together with the person's story about their passion in life and what it's like to live and deal with an invisible disability in public transport. The quiz was released on October 9th 2017, together with a new decal for public transport that all of our members helped us put on buses and trains all over Sweden, pins to wear all week for all our members, debate articles in local and national papers, interviews in radio and television, letters and decals to all public transport companies, and a social media campaign with photo and personal story each day. People were also told to share their own stories under the hashtag #synsintefinnsinte

**Results:** The campaign ended up being our organization's most successful campaign to this date, we reached over 4.5 million people – more than we could ever dream of. The campaign had more likes and shares on both Facebook and Instagram than any of our other campaigns has had so far. The debate articles in local and national papers were really important for the campaign and started a lot of discussions, debate and awareness. The photos combined with the personal stories make a powerful statement. We managed to show that young people with rheumatism some days also need access to the priority seats and we look forward to the conversation continuing on at #synsintefinnsinte.

PARE0002

### ADHERENCE TO THERAPY AND PATIENTS ENGAGEMENT IN ITALY: A CLOSE LINK

U.G. Viora, R. Broggin, G. Campolieti, F. Leonardi, F. Padovani, S. Tonolo, on behalf of ANMAR Italia. *ANMAR Italia, Rome, Italy*

**Background:** In the last years ANMAR Italia and the federated Regional Association worked hard to educate people with Rheumatic diseases (RMDs) to an appropriate adherence to the therapy prescribed, as the Mosaico project confirmed that even patients in bio-technological therapies reveal unwillingness to assume their drugs within the schedule prescribed by the rheumatologist (timing and doses).

"ANMAR we care", study by the Italian Association of patients with Rheumatic diseases (ANMAR) in 2017 thanks to an unrestricted grant from ABBVIE and the precious collaboration of the Engage Minds Hub Research Center of Università Cattolica del Sacro Cuore di Milano directed by prof. Guendalina Graffigna, intended to analyze the problem again after the campaigns acted in the last two years and to link adherence to therapies with the degree of patient engagement.

**Objectives:** to verify the percentage of adherent patients and their degree of adherence to the therapy.

To appraise the relationship among adherence and engagement of people with rheumatic diseases.

**Methods:** in the study we administered to patients a specifically pursued questionnaire containing a fair number of questions on adherence to therapies.

This sub-analysis was made using the answers to those questions and data have been interpolated with those related to the level of engagement of the patients.

**Results:** overall data confirm that in Italy also in 2017 the percentage of people with RMDs adherent to therapies settles in dissatisfying degrees (54%) and that such includes patients partially adherent.

Looking at the relationship within adherence and engagement, if divided in the four groups anticipated by the PHE Model the percentage are: Blackout (cognitive blindness, deny, freezing) 47%, Arousal (superficial knowledge, alert, behavioral disorganization) 46%, Adhesion (cognitive adhesion, acceptance, formal adherence) 61%, Eudaimonic Project (sense making, elaboration, situated practices) 78%.

Notice that patients with Psoriatic Arthritis are the most adherent, followed by those with Fibromyalgia, Spondylitis and finally with Rheumatoid Arthritis.

**Conclusions:** this analysis highlights that the information and awareness campaigns made in the last years were useful, but results are still far away from the optimum.

As we expected, the engagement degree hardly affects the adherence process, but totally unexpected is that patients in "Arousal" are more confused and less adherent than those in "Blackout".

PARE0003

### PROVIDING PATIENT AND FAMILY EDUCATION AND SUPPORT FOR CHILDREN WITH RHEUMATIC DISEASES AND THEIR FAMILIES: CASSIE AND FRIENDS ANNUAL FAMILY DAY IN BC

J. Wilson<sup>1</sup>, L. Tucker<sup>2</sup>, on behalf of Tucker, Petty, Setton, Houghton, Morishita, Guzman, Brown, Green, Tekano, Davidson, Best, Eccles, Cabral.. <sup>1</sup>Executive Director, *Cassie and Friends Society for Children with Juvenile Arthritis and other rheumatic diseases*; <sup>2</sup>*Pediatric Rheumatology, BC Children's Hospital, Vancouver, Canada*

**Background:** Family Day, an annual patient education event starting in 2009, is organized and funded by Cassie and Friends, a registered BC charity dedicated to transforming the lives of children with rheumatic diseases and their families. It is a full day, multi-track conference held outside the hospital environment, organized collaboratively by the pediatric rheumatology team members at BC Children's Hospital and the Cassie and Friends' volunteer conference committee.

**Objectives:** To describe the growth and impact of an annual Family Day event on children with rheumatic diseases and their families in BC.

**Methods:** The program includes lectures, round table discussions, and patient panels for parents and caregivers, with both age-related recreational and educational activities for children and youth (i.e. peer to peer support). Content and format of the program is informed annually by feedback from previous Family Days and advice from pediatric rheumatology team members. Formal feedback from attendees (parents) is provided by a post-event survey.

**Results:** Registration has increased annually from just a handful of families in 2009 to 141 attendees in 2015, and 372 attendees in 2017( with a waitlist). In 2017, attendees were 81 children and youth with rheumatic diseases, 68 siblings, and 150 parents and caregivers. A total of 72 speakers and volunteers

participated. 186 participants had attended Family Day the previous year; 148 participants were first time attendees. Families came from 29 communities throughout British Columbia. 59% of attendees completed the post-event survey. The event was rated as very good or excellent by 98% of respondents, with most stating they would recommend Family Day to other families, and planned to attend the event next year. Parents enjoyed opportunities to meet other parents and health professionals in small interactive groups, and asked for more actionable strategies to help them with their children. The post-meeting questionnaire identified what families perceived as their greatest challenges in dealing with their child's rheumatic disease: day-to-day family life, pain, well-being, school, medications and treatments, and fear.

Please also see our Family Day video with kids and teens sharing what the day means to them: <https://vimeo.com/234426339>

**Conclusions:** A family-centered interactive educational and recreational day offers the opportunity for peer-to-peer connections, education and support for families of children, and youth with rheumatic diseases, and promotes the formation of a strong community addressing family and child needs.

#### PARE0004 LET'S MOVE WITH ARTHRITIS! – NORDIC WALKING FOR PEOPLE WITH RMDs

*P. Balazova, J. Dobsovicova Cernakova. Slovak League Against Rheumatism, Piestany, Slovakia*

**Background:** Slovak League against Rheumatism (SLAR) identified a need among its members to provide support when it comes to physical exercise and rheumatic diseases. Nordic Walking is fitness walking with specially designed poles. It uses 90% of the skeletal muscles. Nordic Walking is ideal for neck, shoulder and back problems while it also reduces pressure on knees and joints. Poles propel the walker along, making it easier to move faster than normal without feeling the effort. With the cooperation with the Slovak Nordic Walking Association, SLAR provides trainings in local branches and encourages individuals to do physical activities while monitoring their progress.

**Objectives:** The aim of the project Let's Move with Arthritis! is to improve treatment, prevention and rehabilitation of RMDs, to support healthy lifestyle and thus lower the impact of RMDs on individuals and society through a structured training on the correct Nordic Walking techniques.

**Methods:** The project Let's Move with Arthritis! started in September 2017 when SLAR obtained 5 pairs of Nordic Walking poles for each of our 17 local branches and clubs. SLAR provided trainings with the cooperation of the Slovak Nordic Walking Association. Individuals were tracking their progress using excel sheets. The goal was to achieve 1 000 000 steps for people with RMDs by 14 October when SLAR held its World Arthritis Day event. Steps of all individuals in local branches were summed up and the goal was not only achieved, it was overcome.

**Results:** A total of 506 individuals participated in the Nordic Walking trainings from September until 14 October 2017. They walked 1 144 km and made 3 386 517 steps. Each of the participating branches provided SLAR with a final report that showed that the cooperation with the instructors of the Slovak Nordic Walking Association was excellent. The activities showed that people with RMDs walked with enthusiasm. The local branch in Kosice made the most steps – over 800 000. Participants were keen on continuing Nordic Walking trainings also without instructors and beyond October 2017.

**Conclusions:** The project Let's Move with Arthritis! proves that even people affected by RMDs are able to do physical exercise, in our case Nordic Walking. Importantly, the project provided simplified and step-by-step instructions to Nordic Walking with the aid of the Slovak Nordic Walking Association. The instructors provided individuals with warm-up techniques, correct Nordic Walking techniques and cool-down techniques after each session. The aim of the project was to reach at least 1 000 000 steps for people with RMDs but it also proved that people with RMDs benefit from physical activities like Nordic Walking when using correct techniques. It can improve their quality of life, increase mobility, improve coordination and strengthen the ligaments. Each participant expressed the will to continue with the project beyond October 2017.

**Acknowledgements:** We would like to acknowledge the Slovak Nordic Walking Association for their guidance and support.

#### PARE0005 DEVELOPMENT & DISSEMINATION OF A RESOURCE ABOUT METHOTREXATE USE FOR AND BY PATIENTS WITH INFLAMMATORY ARTHRITIS

*D. Richards<sup>1</sup>, N. Robertson<sup>2</sup>, L. Wilhelm<sup>3</sup>, L. Proulx<sup>2</sup>, A. McKinnon<sup>1</sup>, J. Gunderson<sup>4</sup>, C. Reece<sup>2</sup>, A. Sirois<sup>5</sup>. <sup>1</sup>Canadian Arthritis Patient Alliance, Toronto; <sup>2</sup>Canadian Arthritis Patient Alliance, Ottawa; <sup>3</sup>Canadian Arthritis Patient Alliance, King County; <sup>4</sup>Canadian Arthritis Patient Alliance, Glaslyn; <sup>5</sup>Canadian Arthritis Patient Alliance, Montreal, Canada*

**Background:** In managing inflammatory arthritis, methotrexate is often one of the first therapies prescribed.<sup>1,2</sup> Methotrexate is a therapy used long-term and often in combination with other medications.<sup>3,4</sup> As people who live with arthritis, we know that for a variety reasons, people do not use methotrexate as prescribed by their healthcare provider and as a result, they may not experience its maximum benefits.

**Objectives:** We set out to build and disseminate a resource about methotrexate and its use from the patient perspective. It is our aim to help patients find ways to deal with taking their methotrexate by sharing other patients' experiences and tips with them.

**Methods:** We surveyed people who live with arthritis about their attitudes and coping mechanisms related to taking methotrexate, seeking tips and tricks to share. A Board member/project manager created an online survey that was medically reviewed (English, French) and collected responses (circulated via newsletter, social media, patient organizations). Following the analysis of survey responses, a resource was developed and reviewed by 2 rheumatologists and a pharmacist. The resource was disseminated using similar methods to the survey.

**Results:** The survey response was global (363 responses, 77% with rheumatoid arthritis, 22% with psoriatic arthritis, 63% in Canada). Almost half of the survey respondents indicated they "do not like taking methotrexate, but it helps me manage my arthritis." Along with 5 top adaptations made to better tolerate taking methotrexate, a major gap was that 80% of respondents indicated not talking to their physician or pharmacist about finding an appropriate solution with respect to taking methotrexate. A web-based resource was developed and its dissemination plan are currently being completed and will be presented.

**Conclusions:** CAPA created a web-based, medically reviewed resource about taking methotrexate informed by patients' experiences who live with inflammatory arthritis. This resource aims to help people better manage taking methotrexate and is being disseminated.

**PARE0006** **A SUMMARY OF KEY FINDINGS FROM THE SJÖGREN'S SYNDROME FOUNDATION'S NATIONAL PATIENT SURVEY RELATED TO TREATMENTS AND MEDICATIONS USED**

S. Taylor<sup>1</sup>, K.M. Hammi<sup>2</sup>. <sup>1</sup>Sjögren's Syndrome Foundation, Reston, VA; <sup>2</sup>Sjögren's Syndrome Foundation, Reston, United States

**Background:** Sjögren's is a systemic autoimmune disease that affects the entire body. The purpose of this major national patient survey was to gain an understanding from adults who have been diagnosed with Sjögren's about the impact of the disease on their quality of life, including information on the treatments and medications used to manage the disease.

**Methods:** The Sjögren's Syndrome Foundation (SSF) conducted the *Living with Sjögren's* survey between May 11 and July 11, 2016. Participants were recruited by Harris Poll from a pool of 9,252 active SSF patient members. The survey was conducted among adults aged 18 years or older who reported having been clinically diagnosed with Sjögren's by a physician or other medical professional. The survey asked closed-ended questions about patient experiences with Sjögren's and the impact it has on their quality of life.

**Results:** There were 3,072 survey responses (33% response rate), 2,963 of which were included in the analyses. Survey respondents were 96% female and 4% male; 32% were aged 60 years or less. On average, respondents reported using 8.8 medications and treatments to help manage their Sjögren's symptoms, with an average of more than four prescription medications and treatments. When comparing patients living with Sjögren's between 0–4 years and 5–9 years, respondents in the latter group reported using slightly more treatments, on average (8.7), compared to those living with Sjögren's for a shorter period (8.2 mean). Nearly all respondents (97%) reported using eye drops, artificial tears, or non-prescription eye ointments. Other medications reportedly used by a majority of respondents include ibuprofen or other anti-inflammatory agents (81%), disease-modifying anti-rheumatic drugs (DMARDs) (67%), over-the-counter or prescription fluoride (67%), and corticosteroids (62%). Notably, patients 60 years and younger were significantly more likely than patients older than 60 years to have used health food supplements or remedies (90% vs. 87%), exercise (88% vs. 83%), and alternative therapies (70% vs. 58%) in attempt to treat their Sjögren's. Nearly all respondents (96%) indicated they wished that additional treatments for Sjögren's were available. Specifically, respondents indicated a need for new treatments for fatigue (63%), brain fog/forgetfulness (53%), sleep problems (51%), joint pain or swelling (48%) and muscle pain (43%).

**Conclusions:** Patients reported relying on a large number and variety of treatments to manage their Sjögren's as well as the need for new treatment options to treat the various manifestations of the disease. The findings from this survey will help to inform and support future SSF efforts to increase public and professional awareness of Sjögren's and encourage research into new treatments and a cure.

**Disclosure of Interest:** None declared

**PARE0007** **FAMILY DAY BY THE SWISS LEAGUE AGAINST RHEUMATISM: A NETWORKING EVENT FOR CHILDREN AFFECTED BY JIA AND THEIR FAMILIES**

M. Roffler, V. Krafft. *Swiss League Against Rheumatism, Zurich, Switzerland*

**Background:** In Switzerland 0,7 out of 1'000 children is affected by juvenile idiopathic arthritis (JIA). The incidence of JIA is 11:100'000 (1). The families affected by JIA are spread over three different language regions (the German, French and Italian regions). It is difficult for these families to get in touch with other affected

families since there is no support group for JIA. A support group has never been established due to the uneven distribution in Switzerland.

**Objectives:** The aim is to offer continuing education for parents of affected children concerning their chronic disease, as well as their dealing with the illness as a family. Furthermore parents and children shall attain the opportunity to exchange information about their experiences and problems with peers in an informal setting.

**Methods:** The Swiss League Against Rheumatism has established the so-called "Family Day" (German: Familientag) which features a program for affected children/youths and their siblings as well as a separate program for their parents on the same day. In order to enable families from all Swiss language regions to participate in the "Family Day", it takes place separately in German and French in both language regions. Since most Italian speaking families in Switzerland either speak German or French, the "Family Day" is equally open to them. The Swiss League Against Rheumatism collaborates with the task group "Paediatric Rheumatology Switzerland" in order to develop relevant contents. The program for the parents aims at imparting medical therapeutic knowledge about their child's disease. Several additional main topics (e.g. uveitis, developmental paediatrics) are chosen and presented by certified experts. All are made in layman language and explain medical terms thoroughly. The parents additionally get the opportunity for formal and informal exchange within their group. The children and youth program (0–16 yrs.) is dedicated to a specific non-medical topic (e.g. magic tricks). The children are divided into several age-specific subgroups and are assisted by staff from the Swiss League Against Rheumatism. Teenagers (11–16 yrs.) may attend a specialized program during half a day.

The "Family Days" are easily financed by foundation endowments.

**Results:** From 2011 to 2017 329 families (1157 individuals) participated in the "Family Day", of which 27% were in the French-speaking part of Switzerland. For participating parents this event became essential in order to educate themselves concerning their child's disease and to exchange experiences with other affected families. For most families the "Family Day" has become a fixed event in their yearly calendar. Many families participate on a regular basis for several years.

**Conclusions:** The "Family Day" has been taking place for 7 years and remains an objective for the future. Demand from parents of affected children continues to be strong and continues to increase. Since support groups have not yet been possible to implement due to demographics, this one-day-event remains a unique resource for affected families.

**PARE0008** **SURVEY RESULTS FROM A NATIONWIDE ONLINE AWARENESS CAMPAIGN SUGGEST A CLEAR DIFFERENCE IN TREATMENT AND PERCEPTION OF QUALITY OF HEALTHCARE FOR PATIENTS DIAGNOSED WITH PSORIASIS ARTHRITIS, PSA, VERSUS PATIENTS WITH SYMPTOMS SIMILAR TO PSORIASIS ARTHRITIS I.E. PSORIASIS AND JOINT PAIN**

N. Unesi, E.-M. Dufva, L. Håkansson. *Swedish Rheumatism Association, Stockholm, Sweden*

**Background:** Psoriasis arthritis (PsA) is a chronic inflammatory joint disease closely linked to psoriasis in the skin. The need for increased knowledge of PsA is extensive in both the public and in healthcare in Sweden. For that reason Swedish Rheumatism Association, Swedish Psoriasis Association and health portal company NetDoktor, with support from Novartis, initiated a web-based awareness campaign, which included a survey, in April 2017.

On December 17, approximately 12,500 people, of which about 4,000 with the diagnosis PsA and 8,500 with psoriasis and joint pain, had taken part of the material. Of these, approximately 2,400 people participated fully and provided detailed information on how they view their disease and the care they are offered.

**Objectives:** Raise awareness and educate about to PsA aimed specifically to people with PsA or with symptoms consistent with the diagnosis – but also relatives, healthcare professionals and the interested public.

**Methods:** The awareness campaign consisted of five lessons that provided participants with increased knowledge about PsA, and a survey about their experience of healthcare. The survey gave us a foundation to address the deficiencies in healthcare, and in patient needs. The lessons highlighted the following issues: background, causes, symptoms, comorbidity, diagnostics, drug treatment and prognosis.

**Results:** The average waiting time for a diagnosis among the survey participants was 3,5 years. Every fourth person had waited 5 years or more, and over 10 percent waited more than 10 years for a diagnosis. The survey showed remarkable

differences in life quality between people who have a diagnosis and people who do not have a PsA diagnosis or who have not yet received one:

### 1. Many are without diagnosis and treatment

High proportion of undiagnosed patients have symptoms indicating PsA. Many have suffered a long time from joint related pain and sought out treatment from a number of doctors.

3 out of 4 with joint pain have negative or very negative experiences of healthcare related to their joint pain. The survey participants indicated that they suffer from waiting a long time for healthcare.

### 2. Major differences in perception of care and treatment

Statistics on overall satisfaction with healthcare show remarkable differences that can be linked to getting a diagnosis. People with joint pain but without a PsA diagnosis indicate a great dissatisfaction with the care they receive. People who have been diagnosed with PsA are overall quite satisfied with the care and treatment they receive after getting a diagnosis.

### 3. High use of opiate remedies for pain

The use of pain reliever opiate drugs is remarkably high in the group with joint pain but without the diagnosis of PsA. Also very high use of non-steroidal anti-inflammatory drugs, NSAIDs.

**Conclusions:** Given that the prevalence for psoriasis arthritis in Sweden is between 10 000 -30 000 people, it is likely that the awareness campaign reached a considerable number of people with the diagnosis or with symptoms similar to it. The longer the patient goes without adequate healthcare the worse the disease gets. If untreated it could lead to permanent joint damage. Early diagnosis and treatment are important to slow down the disease.

## PARE0009 CANADIAN ARTHRITIS PATIENT ALLIANCE: UNDERSTANDING MEMBER PROFILES AND NEEDS

N. Robertson<sup>1</sup>, L. Wilhelm<sup>2</sup>, D.P. Richards<sup>3</sup>, L. Proulx<sup>4</sup>, A. McKinnon<sup>3</sup>, J. Gunderson<sup>5</sup>, C. Reece<sup>4</sup>, A. Sirois<sup>6</sup>. <sup>1</sup>Canadian Arthritis Patient Alliance, Navan; <sup>2</sup>Canadian Arthritis Patient Alliance, Midlands, King County; <sup>3</sup>Canadian Arthritis Patient Alliance, Toronto; <sup>4</sup>Canadian Arthritis Patient Alliance, Ottawa; <sup>5</sup>Canadian Arthritis Patient Alliance, Glaslyn; <sup>6</sup>Canadian Arthritis Patient Alliance, Montreal, Canada

**Background:** Established in 2002, the Canadian Arthritis Patient Alliance (CAPA) is a grass-roots, patient-driven, independent, national organization with members across Canada. CAPA believes the first expert on arthritis is the individual who has the disease. We assist members to become advocates not only for themselves but all people with arthritis. CAPA works with other organizations, representatives from all levels of government, and researchers to ensure the patient voice is both heard and present. We communicate the latest news on health policy developments, research, technology and emerging issues relevant to members through our newsletter, website, Facebook, Twitter and YouTube channels. CAPA welcomes all of those who support CAPA's goals, especially Canadians with arthritis, to become members.

**Objectives:** CAPA underwent a strategic renewal in 2013, re-establishing its focus and operations. Since that time, CAPA has produced an annual strategic plan, and reported on yearly achievements in relation to the plan. In 2017, CAPA decided to conduct a membership survey.

The survey was designed with three objectives in mind: (1) Understand our membership's profile and interests, (2) Understand member awareness and support for CAPA projects and strategic direction, and (3) Seek membership input on CAPA's website.

**Methods:** A survey was created using Survey Monkey (in both English and French, Canada's official languages) and sent to members. Results of the survey were sent to the members and made available on CAPA's website ([http://www.arthritispatient.ca/files/5315/1128/7211/CAPA\\_Survey\\_-\\_Spring\\_2017.pdf](http://www.arthritispatient.ca/files/5315/1128/7211/CAPA_Survey_-_Spring_2017.pdf)). As an additional incentive, two C\$50 VISA gift cards were drawn from among Canadian respondents. The survey was open from May 1 to 21, 2017.

**Results:** The response rate to the survey was 23% (that is, 85 respondents out of a possible 369). Of those who responded, the majority were women, with over 75% aged 55 years of age or over. Respondents came from all across Canada. Members generally came to CAPA to find information and stay abreast of events in the arthritis community; only a small portion, 17%, joined to become more involved. Members supported CAPA's strategic direction, which aligned with their stated interests.

Members also provided feedback on the website. For the most part, members appreciated the information, providing some recommendations moving forward, including supporting a mobile friendly website (i.e., responsive design).

**Conclusions:** CAPA is using the information from this membership survey as confirmation of its strategic direction moving forward; continued focus will be on providing information, connecting with key stakeholders in the arthritis community (Canadian and abroad), and undertaking focused projects as they arise.

Member feedback has been critical in guiding the website redevelopment, which is currently underway. We expect it to be complete in early summer 2018.

**Acknowledgements:** CAPA would like to thank the organizations that collaborate with us as well as various pharmaceutical companies whose funding enables our operation.

**Disclosure of Interest:** None declared

## PARE0010 NATURALLY HEALING THE CHRONIC PAIN AND HEALTH MAINTENANCE

A. Phoka Charalambous. Cyprus League Against Rheumatism, Nicosia, Cyprus

**Background:** Everyday life is not easy for people with RMDs. Chronic Pain is the "roommate" usually on patient's life. Patients usually try to find other ways of confronting their symptoms, beyond drugs or other classic options such as physiotherapy. One of these ways that often people with RMD's are discussing is the treatment with Natural Healing Sources based on water which is used in various cultures from ancient times. Cyprus League Against Rheumatism gives these opportunities to the members every year; by organizing excursions in Natural healing resorts at least two times per year.

**Objectives:** The aim of organizing therapeutic trips to therapeutic treatment centers – Natural Healing Resorts, was to give members the opportunity to get acquainted with and experience this mode of therapy, with team approached on rehabilitation treatments, for patients who cannot afford to visit as individuals because of the cost or to travel as individuals tourists and they need extra services and attention. In addition to therapeutic qualities, it would also give psycho-social affiliation to people who would participate, which CYPLAR gives a lot of insight into all of its programs

**Methods:** In 2012 CYPLAR approach the Ayioi Anaryiroti Natural Healing Resort & Spa which is situated in Miliou, a small village in Paphos area, and their thermal waters are from ancient times, organized the first trip to this healing Resort.

In 2014 CYPLAR approached a Cypriot travel agency, and asked for help to organize a trip in Sandanski, in Bulgaria, as after a research find that it is a very good and famous thermal water springs and not too far from Cyprus so was easy to access and not too expensive.

**Results:** The trip to Ayioi Anaryiroti Natural healing Resort & Spa was very successful so every year at least one time is organized a trip for a weekend. The difference for the people with RMDs participated in this trip instead of going alone, is that CYPLAR is having better rates for members for this special weekend, and also the therapeutic treatments during this weekend are targeted on RMD's. Another ad is that people are coming close to each other, bonding, and sharing their experiences. Every time around 20 people with RMD's are participating on these trips. CYPLAR members have all year around discount. Future Goal is to be organized twice times per year.

The trip to Sandanski is organized every year in July (3 times until now). It is a ten days program and includes examination, target treatments based on each participant and his/her needs, also include sightseeing tours in the area, entertainment dinners, and many other amenities. It is a very succeed therapeutic excursion that 40 people are participating and has a lot of good results. CYPLAR conducted a survey among the participant of the last trip in July 2017 and the results are very encouragingly to continue and have these excursions for more and more years. At the question "Do you want to go again in Sandanski with Cyplar?" The answer was **Yes** for the **95%** of the participants. Results showed also the need for people with RMDs to have this kind of therapies in their life and the beneficial effects on their health status.

**Conclusions:** Patients with RMD's need these types of therapy for their body health but also for their psychosocial improvement. CYPLAR will continue to support the members with these two excursions but also is trying to find new resorts to enrich the program and give more opportunities for members.

## PARE0011 FUNKA UTAN SKAM TO FUNCTION WITHOUT SHAME

T. Diaq. The Swedish Rheumatism Association, The Swedish Rheumatism Association, Stockholm, Sweden

**Background:** Introduction:

Kids, youngsters and adults with an immigrant background are more vulnerable in the new country of arrival. It is quite hard to learn a new language and the rules and regulation in the new country.

In several cultures, people with a visible or invisible disability can experience guilt and Shame because of their diagnoses. Due to the cultural background, most of the time the families are also feeling the same. This feeling could be conscious or unconscious due to the cultural background.

Therefor did the Swedish National Assyrian Organization (SNAO) take the initiative to start a knowledge-sharing project together with the Swedish Rheumatism Association and the Swedish Neuro-Association to inform and educate the kids and their parents with the Assyrian background.

**Objectives:** The aim of this project is to empower the persons and families suffering of an RMD or/and neurological disease among the immigrants from Syria and to break barriers within the immigran's society as well as saving on the national welfare system.

**Results:** To achieve such a project the SNAO applied for funds from the Swedish General Inheritance fund nad worked closely with the Swedish Rheumatism Association as well as the Swedish Neuro-Association.

The project included other stakeholders that could embrace the goal and use unconventional methods to mark the point and reach out to the target group.

- Organizing weekend seminars open for to the target group
- Working with *Läsa för integration* (Reading for integration) <http://www.lasaforintegration.se/index.html>
- Opratat is a theater group that lifts difficult subjects to the surface and make a pedagogic scen of the subject. <http://anhoriga.se/opratat/>
- The Swedish Disability Rights Federation: that enable the project to reach a broader target but also to reach the decision makers.

**References:** The project reach a great number of immigrant with an Assyrian background and could inform the attendees about their right and how the Swedish society works. This was of a great help to the families as well as the kids.

<sup>1</sup>Rheumatology, CHU Grenoble Alpes, Grenoble; <sup>2</sup>AFLAR, Paris; <sup>3</sup>Rheumatology, University Hospital, Lille; <sup>4</sup>Rheumatology, University Hospital, Saint Etienne; <sup>5</sup>CNOMK, Paris; <sup>6</sup>Rheumatology, University Hospital, Rennes; <sup>7</sup>Rheumatology, University Hospital Cochin, Paris; <sup>8</sup>CFMR, castelnaudary; <sup>9</sup>Orthopaedic Surgery and Traumatology Department, HUEP – Saint-Antoine; <sup>10</sup>Pro-Rhumato, Paris; <sup>11</sup>Menopause Unit and Metabolic bone diseases, Paule de Viguier Hospital, Toulouse; <sup>12</sup>Coordinator, Empatient, Paris; <sup>13</sup>SNMR, Marseille; <sup>14</sup>ANDAR; <sup>15</sup>ONPP; <sup>16</sup>Director, Empatient; <sup>17</sup>AFRETH, Paris; <sup>18</sup>General Medicine university; <sup>19</sup>Rheumatology, University Hospital, Limoges; <sup>20</sup>Prevention and Treatment Center for Diseases of Ageing Antonin Balmes, University Hospital, Montpellier; <sup>21</sup>Asthma & Allergy; <sup>22</sup>AFS, Paris, France

**Background:** Osteoporosis is a major public health issue with 5 million of French affected. Overall, she seriously underestimated, and costs are barely covered in France. Considering this situation, AFLAR were urged to create the so-called National Osteoporosis Alliance made up of 15 various stakeholders and patients.

**Methods:** National consultations on osteoporosis rely methodologically on 2 pillars: First the bottom-up reporting on patient needs and expectations. Second the conduct of coordination meetings with various osteoporosis key stakeholders and patients as part of regional panel-discussions. The aim is to provide an overview of real obstacles contributing to the lack of government subsidies for osteoporosis and write consensual proposals compiled into a white paper.

**Results:** An online survey along with a citizen's panel were key to provide feedbacks on difficulties, knowledges and believes but also patient needs. From November 2016 to June 2017, 10 days of dialogue and debate covering 5 various topics were convened in 10 different cities: Consultation and consolidation work regarding proposals made during various panel-discussions allowed synthesis around one call: the creation of a real public health plan against osteoporosis-related fractures relying on 7 key axis.

**Conclusions:** The human and medico-economic rational considering dramatic fallouts caused by osteoporosis has been illustrated many times over. The policy makers mobilization made by stakeholders through white paper release, a real manifesto for public health plan against osteoporosis-related fracture, remain a significant challenge to face.

**PARE0013 SOURCES OF INFORMATION AND KNOWLEDGE ABOUT RHEUMATIC DISEASES AMONG PEOPLE WITH RHEUMATIC DISEASES IN POLAND AND IN OTHER EUROPEAN COUNTRIES**

J. Grygielska<sup>1</sup>, A. Klak<sup>1</sup>, J. Owoc<sup>1</sup>, E. Gawińska-Drużba<sup>1</sup>, F. Raciborski<sup>2</sup>.

<sup>1</sup>Department of Gerontology, Public Health and Didactics, National Institute of Geriatrics, Rheumatology and Rehabilitation; <sup>2</sup>Medical University of Warsaw, Warsaw, Poland

**Background:** Knowledge on rheumatic and musculoskeletal diseases (RMDs) is an important factor in helping patients live independent lives as long as possible. The internet and easy access to all sorts of information make it seem that delivering appropriate information to patients is one of the key objectives of health promotion.

**Objectives:** The aim of this study was to evaluate patients' knowledge on RMDs and find out how and when they seek and retrieve relevant information. The results provide an opportunity to increase efforts in proper education of patients and health care professionals, reduce adverse effects of incorrect information and increase self-awareness as well as personal health responsibility among patients.

**Methods:** We used questionnaires for patients with RMDs and carried out focus group interviews. The Computer-Assisted Web Interview Questionnaire was divided into 2 sections: one describing characteristics of respondents and evaluating importance of various information and its sources and the latter which tested knowledge on RMDs. The respondents were asked to rate their own knowledge and information provided by their physician. All the data were collected in 2017. We used two language versions of the questionnaire – Polish and English for international patients. The results from both groups were compared.

Both versions were distributed with the help of patient organizations. The link to the English version was distributed with the kind support from EULAR.

**Results:** We received 207 on-line responses – 140 in Polish and 67 in English. Both language groups had similar characteristics, however the English-speaking

respondents (EG) had a university degree more often (82% vs. 64%). The largest group of respondents were experienced patients with more than 10 years from diagnosis (47% in Polish group (PG) and 54% in EG). The EG was more diversified in terms of a diagnosis.

The information about a disease and methods of treatment were the most important pieces of information for the respondents (83% of PG rated it very important and 78% in EG) followed by finding a doctor (79% vs. 76% respectively). The three most important sources of information were: PG-Internet 46%, rheumatologist 35%, medical books 15%; EG- Internet 43%, rheumatologist 21%, lectures for patients – 15%.

**Conclusions:** The Results of Polish and English surveys were similar. The English group was more often interested in facilitating everyday life and finding support in living with a disease.

The test of knowledge on RMDs results confirmed that myths are still present among some patients. As much as 25% of Polish and 49% of international respondents associate occurrence of inflammatory rheumatic disease with weather conditions. Majority of people (94% in both groups) are aware that moderate physical activity is recommended in rheumatic diseases. The results also suggest insufficient knowledge about treatment methods and curability of RMDs. It is important to increase efforts in dissemination of appropriate knowledge among patients and health professionals using different methods. Such attitude should help in minimizing adverse effects that result from lack of knowledge or self-awareness.

**Acknowledgements:** The study was financed from the statutory funds of the National Institute of Geriatrics, Rheumatology and Rehabilitation.

#### PARE0014 GETTING THE PULSE ON WORKPLACE EXPERIENCES AND ACCOMMODATIONS

L. Proulx<sup>1</sup>, L. Proulx<sup>1</sup>, N. Robertson<sup>1</sup>, D.P. Richards<sup>2</sup>, L. Wilhelm<sup>3</sup>, J. Gunderson<sup>4</sup>, A. Sirois<sup>5</sup>, A. McKinnon<sup>2</sup>. <sup>1</sup>Canadian Arthritis Patient Alliance, Ottawa; <sup>2</sup>Canadian Arthritis Patient Alliance, Toronto; <sup>3</sup>Canadian Arthritis Patient Alliance, King's County; <sup>4</sup>Canadian Arthritis Patient Alliance, Glaslyn; <sup>5</sup>Canadian Arthritis Patient Alliance, Montreal, Canada

**Background:** As a patient-driven and managed non-profit organization, the Board members of the Canadian Arthritis Patient Alliance (CAPA) have experienced many of the workplace challenges of arthritis first-hand. Recognizing the importance of being able to contribute in the workplace, CAPA recently initiated a project focused on broadening the understanding of the challenges faced by people living with arthritis in the workplace; and, to develop workplace tools and appropriate advocacy activities to address these challenges.

**Objectives:** A survey concerning arthritis in the workplace was developed with the goal of enhancing the understanding of the workplace challenges faced by people with arthritis, including the type and effectiveness of personal and workplace accommodations and the effectiveness of available resources.

**Methods:** A Board member/project manager developed the survey in consultation with people living with arthritis. The survey was available in English and French and targeted to people who live with various forms of arthritis, including inflammatory arthritis as well as Systemic Lupus Erythematosus, osteoarthritis, etc. The survey was distributed to membership in December 2017 through the newsletter and social media channels. Further promotion of the survey was completed through outreach to French and English patient and non-profit groups. The results were collected online through a survey platform and analyzed using basic statistical techniques.

**Results:** At the date of submission, 218 survey responses were received (127 English responses, 91 French responses) and the majority of respondents (over 90%) live in Canada. Over 80% of respondents live with inflammatory arthritis and 86% reported that arthritis affected them moderately or significantly in the workplace. Although 49% of respondents indicated that working had a positive effect on their lives, 66% indicated that working took energy away from other life activities. The most highly helpful workplace accommodations were: flexible hours of work (58%), breaks to give joints/body time to recover (55%), paid time away from work to attend medical appointments (47%), and working from home one or more days per week (39%). The most highly used personal accommodations were: reduction of social activities (77%), pacing during the work day (70%) and spreading out non-work activities (64%). The survey responses will be further summarized for the presentation, along with ideas for development of resources based on the gaps identified.

**Conclusions:** CAPA developed a workplace survey to broaden the understanding of the challenges faced by people living with arthritis in the workplace. Early analysis of the survey indicates a number of implications such as the significant impact of arthritis on the workplace and the impact on other life activities. CAPA will develop appropriate workplace tools and plan advocacy activities in order to address the survey findings.

#### PARE0015 LARGE-SCALE SURVEY OFFERS GENERAL INSIGHT AND BASIS FOR POLICY DRAFTING

S. De Jong, I. Koopmans, M. Feith. *Patient advocacy, Dutch Arthritis Foundation, Amsterdam, Netherlands*

**Background:** The Dutch Arthritis Foundation (DAF) commissioned a large-scale survey to gain a broad insight into the various aspects of living with RMDs in the Netherlands. The results offer an insight into the prevalence of RMDs, as well as into living with RMDs and the use and standard of relevant healthcare and social care in our country. This was the first survey of this scale in the Netherlands.

**Objectives:** The survey aimed to generate data about the prevalence and the impact of RMDs on people's every-day lives in the Netherlands. The DAF will use the results to better inform parties involved in caring for people with RMDs and to help them with policy drafting, such as authorities, healthcare insurers and healthcare providers.

**Methods:** The bulk of all data consists of statistical data from the NIVEL Healthcare Registrations (from 355 GP clinics, which register 1.1 million RMD patients). The survey also built on statistical and qualitative data from Vektis (business intelligence centre for the healthcare industry) and the National Institute of Public Health and Environmental Protection. Patients were contacted through the National Panel for Chronical Patients and asked to score their quality of life, the impact RMD has on their lives, and the standard of care. Rheumatologists, health professionals in rheumatology and orthopaedics were also represented in the monitoring group. The survey was carried out for four key disorders – chronic inflammatory rheumatism, osteoarthritis, gout and osteoporosis. These disorders are registered by both GPs and specialists. Fibromyalgia is not registered as a specific disorder by GPs and was therefore outside the scope of the survey.

**Results:** The report generated the following results for the more than two million people with RMDs in the Netherlands:

1 in 9 people have a RMD; More than 2 million people have a RMD; Every day, 700 people are diagnosed with a form of RMD; There are 1.3 million people with osteoarthritis; 400,000 people with osteoporosis; 370,000 people with gout; 220,000 people with inflammatory rheumatism such as RA, ax-SpA, SLE, Sjögren syndrome and scleroderma.

69% of people with RMD are restricted by their symptoms in their day to day life; 50% of people with RMD between the ages of 40 and 65 are not in paid employment;

54% of people with RMD indicate they suffer from loneliness;

50% of people with RMD deal with incomprehension;

65% uses medication, 37% physiotherapy.

**Conclusions:** The report shows the extent of the impact of RMDs, not only medically, but also with regard to social effects. This was the first study to adequately reveal the sense of loneliness among RMD patients, laying bare the incomprehension they face in others. It also studied the impact of RMDs on employment, the great reliance on voluntary carers, and the fact that many people with a RMD also suffer other symptoms. The report was able to pinpoint the most vulnerable patients, and therefore provides a clear indication as to where improvements can be made. It also clearly shows that there is room for improvement when it comes to the registration of specific disorders such as fibromyalgia, but also disorders classed as a form of inflammatory arthritis, to enable the generation of objective data from the registration systems.

**Disclosure of Interest:** None declared

#### PARE0016 THE ROLE OF EMPATHY QUOTIENT IN PATIENT-PHYSICIAN COMMUNICATION: A TOOL TO IMPROVE MEDICATION ADHERENCE

A. Celano. *Italian National Association for People with Rare and Rheumatic Diseases – APMAR Italia, Lecce, Italy*

**Background:** Brain circuits governing the identification with others and those regulating the care feeling towards suffering people form wide distinct brain networks and are essential elements of empathy. This last is ruled by the "circuit of

empathy" involving ten interconnected brain areas, operating on a personal base. This explains why some people have little or no empathy, and consequently, high or low propensity to communicate effectively: lower "empathy quotient" leads to inadequate social competence. The circuit of empathy is a very sophisticated and complex system, and its erosion is due to both genetic (deficiencies) and environmental (life experiences) factors.

**Objectives:** The EQ increase is essential to improve patient-physician communication and enhance medical adherence. It is easy to achieve it by promoting the ability to understand others' feelings and thoughts and to interpret signals and experience (beyond the symptoms), as well as by using effective communication. Being open improves quality and effectiveness of the patient-physician relationship, as well as medical adherence.

**Methods:** Observation, EQ measurement on patients and health personnel—APMAR carried out an observation activity to evaluate possible EQ improvement in patients and health personnel, and enhance medication adherence. Interventions were classified based on target (patient/health personnel), focus (educational/behavioural/affective), implementation (general/customized), complexity (one or more aspects) and the operator involved, followed by specific evaluation on adherence and disease outcomes. Patients suffering from rheumatological diseases and health personnel were interviewed to collect psychosocial information and indicatively measure their EQ. This allowed to act directly on parameters determining empathy improvement. Effective engagement was achieved through diagnostic alliance\*, therapeutic alliance\*, disease self-awareness, medication adherence and self-administration. 78 patients and 10 health personnel followed a training to improve EQ and ability to relate effectively through communication, narrative and psychodynamic. Health personnel followed an experiential and practical training, with cognitive, emotional and behavioural elements inspired by psychodynamic, Gestalt, AT, NLP, to learn how to use situational logic, modulate tone of voice, speech quality and speed, gestures, also using NBM principles. 30-minute individual monthly consultations and cognitive-behavioural therapy were conducted.

**Results:** Interventions showing some impact on medication adherence were direct, personalized on the patient and mediated by the health personnel. Disease outcomes, patients' self-care education and decision-making were considered, and a gym program was included. Follow-up occurred every 2 months (total 10 months); 86% of patients were adherent and the program significantly improved disease outcomes such as DAS28, pain, exacerbations, functional disability and quality of life.

**Conclusions:** The EQ increase is essential to improve patient-physician communication and to enhance medical adherence.

#### PARE0017 SUPPORTING YOUNG PEOPLE WITH RMDs IN MANAGING ISSUES AROUND RELATIONSHIPS, PREGNANCY AND SEXUALITY

*W. Olsder, L. van Nieuwkoop, A.A.J. Haenen. Youth-R-Well.Com, Lisse, Netherlands*

**Background:** Young people with rheumatic and musculoskeletal diseases (RMDs) experience issues considering relationships, pregnancy and sexuality (Kedde, 2012). The report of the PARE Youth Research Project shows that in the Netherlands 42% of the young people with RMDs report an impact on their sexual life (Poldemaa, Tammaru & de Wit, 2014). Furthermore, 24% of the respondents want to receive information about managing sexual health issues. During past events organised by Youth-R-Well.com (the Dutch organisation for young people with RMDs), the young people indicated that they had questions about managing relationships and getting pregnant. For instance, they had questions about the hereditary of the disease, the impact of medication when getting pregnant, and how they could improve their sexual life. This shows a clear need for more information about managing relationships, pregnancy and sexuality from young people with RMDs.

**Objectives:** To respond to this need of young people with RMDs, Youth-R-Well.com organised an event around managing issues that are faced with relationships, pregnancy and sexuality. The main objective was to inform and empower the patients and their partners around these three topics. Informing patients and helping them managing issues around these three themes, aims to improve their social life, increase their self-management and in turn increase their quality of life.

**Methods:** Young people with RMDs might encounter a barrier for discussing issues around relationships, pregnancies and sexuality with their health care providers. Therefore, Youth-R-Well.com organised an informal event to inform the young people about these topics. The event consisted of three speakers: a rheumatologist speaking about pregnancies, a sexologist speaking about sexual issues and a young person with an RMD speaking about her personal experience with (sexual) relationships and getting pregnant. The event was interactive, such that young people had the chance to ask questions about all topics.

**Results:** In total, 30 young people between the age of 20–30 attended the event. The attendees evaluated the event with an average of 8,2/10. During the event, there was an informal, safe atmosphere. The attendees were not afraid to ask their questions and discuss the topics with others. From the three presentations, the attendees most highly valued the presentation of the rheumatologist about pregnancy (8,6/10).

**Conclusions:** An event from a patient organisation decreases the barrier to discuss issues around relationships, pregnancy and sexuality for young people with RMDs. Combining information from health care professionals with peer support, can help in managing issues around these three topics, empower young people with RMDs, and eventually increase their quality of life.

## Speaker Abstracts

### Patient information and education

#### AB1480-PARE MOTIVATION OF RHEUMATOID ARTHRITIS PATIENTS FOR SMOKING CESSATION

*I. Holc, A. Pahor, M. Božič, M. Dobnik. Dept. Of Rheumatology, UMC Maribor, Maribor, Slovenia*

**Background:** The intensive nursing care algorithm in the individual treatment of a rheumatoid arthritis patient includes the "treat to target" treatment approach while predicting the extended role of a nurse in patient care. Nurse's responsibility for patients suffering from rheumatoid arthritis includes a deeper knowledge of the patient's health status (14 activities – Virginia Henderson), implementation of customised nursing care, education, consultation, as well as offering support to patients and their families. Smoking is a major global health issue due to increasing tobacco use and problems associated with cessation of smoking.

**Methods:** The study group comprised of 90 patients (34 male, 56 female) aged 56 to 72 years, (mean 64.29 years) treated in an outpatient clinic of Department of Rheumatology, University Medical Centre Maribor, Slovenia. All patients suffered from rheumatoid arthritis. 34 (44%) of them were smokers, 54 (44%) non-smokers and 11.11% of them used to smoke, 45 patients were treated with biological disease modifying anti-rheumatic drugs (bDMARDs) The research is based on quantitative methodology. Questionnaire was used as the research method. For statistical analysis, a t-test and Spearman correlation was used.

**Results:** The analysis did not show any statistically significant correlations between gender, age, or level of patients' education and desire to quit smoking. Nor we found any statistically significant correlations with patients' awareness to smoking – among those who are treated and those who are not treated with bDMARDs.

**Conclusions:** Every nurse should offer advice to rheumatoid arthritis patients to quit smoking as this is the best decision rheumatoid arthritis patients can make in order to improve their health. This mission carried out by a nurse is of great importance not only for the patient but also for public health. Nurses need to understand the motives and obstacles in association with smoking cessation. In addition, they need to be aware of the options that are available to help patients quit smoking. The most important factor for an effective smoking cessation is motivation. Important

negative factor that impact smoking cessation is the pleasure while smoking.

## Building patient led organisations

### AB1481-PARE CANADIAN ARTHRITIS PATIENT ALLIANCE: WHO ARE WE? WHAT HAVE WE BEEN UP TO?

C. Reece, N. Robertson, L. Wilhelm, L. Proulx, D. Richards, A. McKinnon, J. Gunderson, A. Sirois. *Canadian Arthritis Patient Alliance of Canada, Ottawa, Canada*

**Background:** The Canadian Arthritis Patient Alliance (CAPA) is a grass-roots, patient-driven, independent, national advocacy organisation with volunteer members from across the country. CAPA's fundamental belief is that the first expert on arthritis is the individual who lives with the disease and who provides a unique perspective that is all too often absent in health care, health policy and research.

**Objectives:** Here we will present a poster with the intent to give an overview of what CAPA is, the resources that are available to individuals living with arthritis, our involvement in research as well as our collaboration with other health organisations and government.

**Methods:** CAPA continues to promote its Arthritis Patient Charter and provide print outs to organisations that request it. It has conducted various surveys to better understand the needs of its members and develop support materials to help address these needs. CAPA also worked with Health Canada on various initiatives in regards to health policy development, drug review policy and patient engagement initiatives as well as participated as collaborators on research teams.

**Results:** The following key accomplishments and continued projects will be highlighted:

- 1) Arthritis Patient Charter was developed with other groups in the Canadian arthritis community that outlines the rights and responsibilities that arthritis patients should expect in their care.
- 2) Collaboration on research teams – for example, as a Member of the Canadian Institutes of Health Research (CIHR) Strategy for Patient-Oriented Research (SPOR) as well as on CIHR's Institute of Musculoskeletal Health and Arthritis Research (IMHA) Ambassadors. Individual CAPA members also work with researchers to contribute to their projects and have co-authored research publications.
- 3) A methotrexate resource – A survey on the topic of Methotrexate was developed by CAPA Board members with the advice from a rheumatologist was as circulated through its wide network in English and French via social media, newsletters and an email blast to our membership. Patient resources will be developed based on the survey response.
- 4) Pregnancy with Arthritis – a web-based resource created with patient input to help those contemplating a step into parenthood.
- 5) Biosimilar and medical cannabis resources – along with its position papers, CAPA has created a video to help patients understand this type of medication. CAPA has also written a position paper on Medical Cannabis.
- 6) Other forms of input – CAPA provides the patient perspective via official submissions to Health Canada, and the Canadian Agency for Drugs and Technologies in Health.

**Conclusions:** CAPA will present highlights of its key achievements and continued collaboration within the arthritis community. CAPA continues to engage with various organisations in order to identify gaps within the community with the intent to develop needed resources for patients and caregivers and direct our advocacy efforts.

**Acknowledgements:** CAPA would like to thank the organisations that collaborate with us as well as various pharmaceutical companies whose funding enables its operation.

## Arthritis research

### AB1482-PARE PARTICIPATION IN CLINICAL TRIALS HAS A POSITIVE IMPACT ON THE PSYCHOLOGICAL AND EMPLOYMENT WELL-BEING OF PATIENTS WITH INFLAMMATORY ARTHRITIS

H. Alkomy, C. Tierney, V. Ramasamy, P. Knight, E. Ingram, S.-E. Aconstaninesei, A. Pakozdi, Y. Abbye-Nayake, H. Tahir. *Rheumatology, Barts health, London, UK*

**Background:** Biologic therapies have improved the physical well-being of patients with Inflammatory arthritis. However, there remains a lack of emphasis on addressing patients' psycho-social needs in routine rheumatology practice.

**Objectives:** The aim of this study was to explore the unmet psychological, emotional and social needs of inflammatory arthritis patients (Rheumatoid Arthritis (RA), Psoriatic Arthritis (PsA), Axial Spondyloarthritis (AS)) entering clinical trials, and to evaluate the factors leading to improvement in physical and psychological wellbeing during the clinical trial.

**Methods:** A cross sectional survey was distributed to all inflammatory arthritis patients having completed a minimum of 12 weeks of treatment within phase II and III clinical trials, in Whipps Cross University Hospital, between Nov 2017 and Jan 2018. The anonymous survey included satisfaction scales with scores ranging from 0 to 10 (0=extremely dissatisfied and 10=extremely satisfied) to rate physical (ie: improvement in joints pain and swelling) and psychological satisfaction during the clinical trial. Factors contributing to patients' physical and psychological improvement were also explored. Employment status and changes were also explored.

**Results:** A total of 46 questionnaires were completed with 5 excluded from analysis due to missing data. Of the 41 patients, 26 (63%) had PsA, 3 (7%) AS, and 12 (29%) RA. 22 (54%) patients were male. 26 (63%) patients were white caucasian, 9 (21%) were Asian and 6 (15%) were from other ethnic backgrounds. 71% of the patients were aged between 36–60.

37 (90%) of patients were satisfied with their physical improvement (joint pain and swelling) during the clinical trial. 34 (83%) said their inflammatory arthritis had a negative impact on their psychological well-being, however 39 (96%) were satisfied with the emotional support received from the clinical research staff.

The most frequently reported factors contributing to their psychological improvement included, in all patients (41, 100%), the involvement of the clinical research staff and the frequency of regular follow ups. In 40 (98%) patients, the clinical research doctor and the clinical research environment and in 36 (88%) patients the study drug itself.

Regarding employment status, 29 (71%) were employed prior to participating in the clinical trial, and 18 (44%) reported improvement in their employment situation after entering the clinical trial. These included new job positions,<sup>5</sup> reduction in sick leave days,<sup>5</sup> and the capability of working more hours.<sup>1</sup>

**Conclusions:** Inflammatory arthritis is associated with a high prevalence of psychological burden. Addressing the physical needs solely and ignoring the psychological wellbeing of patients can adversely affect their quality of life. The current survey highlighted that by participating in clinical trials, the majority of inflammatory arthritis patients, gained additional satisfaction with regards to their psychological and emotional needs and received invaluable support within the trial setting. This led to improved well-being and employment satisfaction. We would therefore, encourage health care professionals to invest in the psychological and emotional wellbeing of patients in routine clinical practice.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.6647

## Innovations in arthritis health care

### AB1483-PARE DEVELOPMENT AND ADAPTATION OF RHEUMABUDDY FOR YOUNG PEOPLE WITH JIA, THEIR FAMILIES AND PEOPLE WITH RA RESIDING IN THE UK

A Gilbert<sup>1,2</sup>, <sup>1</sup>The National Rheumatoid Arthritis Society, Maidenhead, UK; <sup>2</sup>Daman, Copenhagen, Denmark

**Background:** The number of children and young people (CYP) with JIA needing support is on the increase as available allied services continue to face cuts and are under more pressure than ever. A valuable life skill for any CYP with a long-term condition is self-management, the ability to control emotions, learn resilience, communicate, work toward goals and ultimately improve their physical and emotional wellbeing.

**Methods:** Rheumabuddy is a Danish app developed for children (aged over 12) adults in Denmark with RA. We were approached by the developers, Daman, in June 2016 and meetings and discussions followed regarding NRAS launching and distributing this innovative app in the UK. For a JIA audience, our main concerns were online child safety issues and whether the app could be used by younger children with JIA with their parents as well as by adults with RA. A survey of parents and young people with JIA and RA followed and after discussions with pilot users some adaptations were made, and child safety protection protocols were put in place between NRAS and Daman.

**Results:** Daman appointed NRAS as its UK partner and NRAS undertook a soft launch of Rheumabuddy in November 2017.

**Conclusions:** Since its launch, to date we have 2000 active users who are a mixture of children with JIA and their parents, adults with JIA and adults with RA. Here are some quotes from users:

"Rheumabuddy has been so helpful and I am now able to track my progress which I can show my consultant. I would often forget how I felt 3 or 4 months ago"

"The Rheumabuddy app was a way for my daughter to let me know how she felt each day, normally she doesn't like discussing it"

We know that CYP are growing up in a challenging and fast changing world. The ability to use self-management strategies effectively is a skill that becomes very important for success as children grow into adulthood yet is hard to acquire through the NHS alone. Rheumabuddy encourages the self-monitoring and regular recording of key patient reported outcomes. Changes in symptoms over time can be displayed in graph format and can be shared with HCP's, family, and school. The collation of cumulative data around mood, pain and fatigue can, for example, lead to empowerment of the individual or family resulting in ability to effect positive lifestyle change in the person with JIA or RA.

## Best practice campaigning

### AB1484-PARE FORMING PROGRESSIVE PATIENT ALLIANCES FOR PROGRESSIVE THINKING

E Kritza<sup>1</sup>, E. Tsigki<sup>2</sup>, V. Romero Pazos<sup>3</sup>, B. Boteva<sup>4</sup>, S. Micallef<sup>5</sup>. <sup>1</sup>Chair, Agora, Heraklion, Greece; <sup>2</sup>Agora Secretariat, Agora, Groningen, Netherlands; <sup>3</sup>Vice-Chair, Agora, La Coruna, Spain; <sup>4</sup>Board Member, Agora, Sofia, Bulgaria; <sup>5</sup>Treasurer, Agora, Msida, Malta

**Background:** The role and scope of influence of patient organisations has been undeniably increasing. Wilson 1999 Patients are in the lead of influencing the decision-making processes in healthcare and in doing so, forming strategic and constructive alliances through umbrella organisations can be of great value. This article discusses the benefits of forming progressive alliances between RMDs patient organisations using the example of the partnership between Agora and the Global Alliance for Patient Access (GAfPA). The data presented has been drawn from the first joint project between Agora and GAfPA (2017) in an effort to raise awareness about access to Biosimilar and Biologic medicine, in combination with developing self-management skills in the sense of a holistic model for treating and managing RMDs.

**Objectives:** The objectives of the joint project were to provide patient groups with a greater understanding of the current policy landscape for Biologic and Biosimilar medicines in Europe; equip patients with effective tools to inform policymakers about patient concerns; kick-start the

establishment of an advocacy platform for the Agora organisations; and to examine the role of self-management programmes in supporting patients with RMDs along with the use of technology (HTA). The main objective of this article is to examine the role of strategic alliances in creating a strong patient front that seeks to become part of the decision-making processes and influence policy changes on national and EU levels. Auch alliances offer patients a new perspective and a progressive way of thinking healthcare matters.

**Methods:** Keynote presentations and group discussions were carried out. The patients who participated in the workshop were exposed to the fundamental information about the use of Biologic and Biosimilar medication and related policy issues and were engaged in a discussion that eventually led to the composition of a position paper with concrete principles on the use of this treatment.

**Results:** Agora and GAfPA have published the "Patients Principles around the use of Biologics and Biosimilars", which was disseminated amongst the Agora members and has been used to raise awareness about the specific topic in each country-member.

**Conclusions:** The alliance between Agora and GAfPA has enabled Agora to strengthen its advocacy efforts and focus towards becoming more active in monitoring policy changes. There was a strong consensus that the patient voice should be central to all discussions about commencing or switching treatments and that shared decision making should always be an integral part of the process. The collaboration between national and umbrella organisations has created a strong network of patients, who share similar ideas, principles and support each other towards advocating for patients' rights to a higher quality of life. These principles would certainly be of interest to EULAR PARE members and other patient organisations beyond the immediate AGORA/GAfPA network, who could consider using them in their own advocacy work and/or when supporting individual patients in their organisations.

### AB1485-PARE REUMANIFEST: JOINING FORCES FOR POLITICAL URGENCY

N Lopuhaä, M. Feith. *Patient Advocacy, Dutch Arthritis Foundation, Amsterdam, Netherlands*

**Background:** In 2012, health insurance provisions for people with RMDs were cut drastically when reimbursement of physical therapy under the Dutch basic health insurance package was scrapped for reasons including lack of scientific evidence, the economic crisis and rising healthcare costs. The effect has been counterproductive. Costs have gone up as more patients use more medication and visit their rheumatologist and other specialists more often. It has also led to patients not getting the care they need. Because the Dutch Arthritis Foundation (DAF) believes that patients with RMDs should have access to the care they need, it launched a lobby to influence key governmental and political stakeholders.

**Objectives:** According to the DAF, patients with RMDs need access to the physical therapy they need. Efforts made in this area, such as the introduction of a registration point and impact research to demonstrate the effect of decreased accessibility, remained unsuccessful. We needed to adopt a different approach to instil in the government and political stakeholders a sense of urgency and to raise general awareness of the issue.

**Methods:** Parties in the field of RMD have now joined forces by:

- consulting patients and care providers in a national survey: "Why is physiotherapy important to you?"
- drafting a Reumanifest in which patients, doctors and researchers lobby for reinstatement of physiotherapy in the basic medical insurance package.
- having the Reumanifest signed by patients, caregivers, professional organisations, professors, and other patient organisations (more than 25 000 responses).

**Results:** The Reumanifest was presented to political parties as a petition, and appeared in newspapers as an advertisement. This led to critical questions being asked to the Dutch Minister of Health, and put the issue

and its urgency firmly back on the political agenda. With renewed political pressure on the issue, we expect that this will eventually lead to a solution for people with RMDs who need physiotherapy, but who now have to pay for this privately. The campaign has increased awareness among the cabinet and other political stakeholders.

**Conclusions:** By joining forces, you can make your voice heard in politics, as support from various perspectives lends credibility and relevance to the urgency.

**Disclosure of Interest:** None declared
