**Conclusions:** The first results from this real-world PsA study reinforce findings from previous clinical trials of APR. In pts with  $\geq 4$  and  $\geq 7$  months of follow-up, APR was associated with improvements in both physician-assessed and patient-reported outcomes, with possibly a greater benefit in biologic-naive compared with biologic-experienced pts. Safety and tolerability were similar to the known profile of APR.

### PERSISTENCE WITH SUBCUTANEOUSLY ADMINISTERED BIOLOGICS AMONG PATIENTS WITH PSORIATIC ARTHRITIS: ANALYSES FROM A US CLAIMS DATABASE

K. Oelke<sup>1</sup>, O. Chambenoit<sup>2</sup>, A. Majihoo<sup>3</sup>, S. Gray<sup>4</sup>, K. Higgins<sup>4</sup>, P. Hur<sup>2</sup>.  
<sup>1</sup>Rheumatic Disease Center, Glendale, WI; <sup>2</sup>Novartis Pharmaceuticals Corporation, East Hanover, NJ; <sup>3</sup>Shores Rheumatology, St. Clair Shores, MI; <sup>4</sup>Truven Health Analytics, an IBM Company, Cambridge, MA, USA

**Background:** Persistence with biologic therapies among patients with psoriatic arthritis (PsA) provides insight into the real-world effectiveness of biologics in routine clinical practice. With different dosing schedules and durations of action of currently available biologics, measuring persistence using varying treatment gap cutoffs may better guide physicians in their treatment decisions.

**Objectives:** To evaluate the persistence of subcutaneously (SC) administered biologics in patients with PsA.

**Methods:** Patients with  $\geq 1$  pharmacy claim for an FDA-approved SC biologic (adalimumab, certolizumab pegol, etanercept, golimumab, and secukinumab) for the treatment of PsA between 01/15/2016 and 07/31/2017 were identified in the Truven Health Analytics MarketScan Commercial and Medicare Supplemental Databases. Eligible patients were aged  $\geq 18$  years at the time of biologic initiation (index date) and continuously enrolled with medical and pharmacy claims  $\geq 12$  months prior to (baseline period) and  $\geq 12$  months after the index date. Patients had  $\geq 1$  PsA diagnosis (ICD-9-CM 696.0 or ICD-10-CM L40.5x) and no pharmacy claims for the index biologic during the baseline period. Persistence over 12 months was measured as the discontinuation rate and number of days persistent on the biologic therapy from the index date to reported treatment gaps of  $\geq 45$ ,  $\geq 90$ , and  $\geq 180$  days based on clinical expert opinion, or the end of follow-up if no gap was observed. The median time to discontinuation of the index biologic over 12 months was assessed by Kaplan-Meier analysis for each treatment gap cutoff.

**Results:** A total of 1558 patients with PsA enrolled in the analysis initiated SC biologics, including adalimumab (n=720), certolizumab pegol (n=93), etanercept (n=426), golimumab (n=64), and secukinumab (n=255). Overall, 680 patients (43.6%) discontinued their index biologic therapy during 12 month follow-up. The 12 month discontinuation rate for each treatment gap cutoff was lowest with secukinumab compared with other SC biologics (51.8%, 36.5%, and 21.6% for patients with treatment gaps  $\geq 45$  days,  $\geq 90$  days, and  $\geq 180$  days, respectively). Mean days persistent on the index biologic was the highest with secukinumab for each treatment gap cutoff (254.5 days, 282.8 days, and 307.5 days for patients with treatment gaps  $\geq 45$  days,  $\geq 90$  days, and  $\geq 180$  days, respectively) and the lowest with certolizumab pegol (218.1 days and 240.7 days for patients with treatment gaps  $\geq 45$  days and  $\geq 90$  days, respectively) and etanercept (270.7 days for patients with a treatment gap  $\geq 180$  days; table 1). The median (95% CI) time to discontinuation for patients with a treatment gap  $\geq 45$  days was the highest with secukinumab (308 [238 to >365] days) and lowest with certolizumab pegol (216 [155 to 274] days). Median time to discontinuation could not be calculated for patients with treatment gaps  $\geq 90$  days or  $\geq 180$  days due to low event rates and limited follow-up.

**Abstract AB0931 – Table 1.** Persistence With Index Biologic Therapies Over 12 Months of Follow-Up in Patients With Psoriatic Arthritis (N = 1558)

	Adalimumab (n = 720)	Certolizumab Pegol (n = 93)	Etanercept (n = 426)	Golimumab (n = 64)	Secukinumab (n = 255)
<b>Discontinuation of index drug, n (%)</b>					
Treatment gap $\geq 45$ days	395 (54.9)	61 (65.6)	255 (59.9)	38 (59.4)	132 (51.8)
Treatment gap $\geq 90$ days	307 (42.6)	48 (51.6)	203 (47.7)	29 (45.3)	93 (36.5)
Treatment gap $\geq 180$ days	208 (28.9)	32 (34.4)	148 (34.7)	21 (32.8)	55 (21.6)
<b>Days persistent on index drug, mean (SD)</b>					
Prior to gap of $\geq 45$ days	253.2 (120.5)	218.1 (127.1)	236.5 (125.8)	233.5 (128.4)	254.5 (123.8)
Prior to gap of $\geq 90$ days	206.0 (123.8)	240.7 (131.9)	249.5 (130.4)	253.7 (132.4)	282.8 (117.5)
Prior to gap of $\geq 180$ days	288.7 (122.7)	272.1 (131.8)	270.7 (132.5)	273.0 (135.7)	307.5 (112.2)

<?>Days persistent (ie, time to discontinuation) was defined as the time from the index prescription fill to the last day the drug was on hand to give a gap of  $\geq 45$ , 90, or 180 days without the index drug, or the end of follow-up if no gap was observed.

**Conclusions:** Patients who initiated secukinumab showed higher persistence over 12 months of follow-up compared with the other SC biologics assessed, regardless of the treatment gap.

### HELICOBACTER PYLORI ANTIGEN SPECIFIC ANTIBODIES IN PSORIATIC ARTHRITIS

E. Patrikiou<sup>1</sup>, C. Liaskos<sup>1</sup>, E. Zafiriou<sup>2</sup>, G. Efthymiou<sup>1</sup>, T. Scheper<sup>3</sup>, W. Meyer<sup>3</sup>, A. Roussaki-Schulze<sup>2</sup>, L.I. Sakkas<sup>1,4</sup>, D.P. Bogdanos<sup>1</sup>. <sup>1</sup>Rheumatology and Clinical Immunology; <sup>2</sup>Dermatology, Faculty of Medicine, School of Health Sciences, University of Thessaly, Larissa, Greece; <sup>3</sup>Institute of Immunology, EUROIMMUN, Lübeck, Germany

**Background:** The role of *Helicobacter pylori* (Hp) infection in the aetiopathogenesis of psoriatic arthritis (PsA) and psoriasis (Ps) is currently inconclusive, as studies reported increased, decreased or comparable to controls frequency of anti-Hp antibodies.

**Objectives:** To test antigen-specific Hp antibodies in a well-defined cohort of PsA patients and demographically matched Ps patients and healthy controls (HCs).

**Methods:** A total of 140 serum samples (48 PsA, 37 Ps and 55 HCs) were tested for anti-Hp antibodies by a western blot immunoassay using whole Hp extract as antigenic source.

**Results:** Overall, anti-Hp seropositivity was similar in PsA (19/48, 39.6%) and Ps (16/37 43.2%, p>0.05) but significantly lower compared to HCs (33/55, 60%, PsA vs HC, p=0.039). Overall, IgG anti-CagA and VacA, the most diagnostically relevant anti-Hp antibodies, were present in 26/48 (54.2%) and 5/48 (10.4%) PsA patients, respectively, compared to 15/37 (40.5%) (p=ns) and 1/37 (2.7%) (p=ns) Ps respectively, as well as in 39/55 (70.9%), (p=0.079) and 4/55/97.2%) (p=ns) HCs, respectively. Compared to HCs, patients with PsA had higher reactivity to p29 (UreA) (31/48, 64.6% vs 24/55, 43.5%, p=0.033) and to p54 (24/48, 50% vs 15/55, 27.2%, p=0.017) and tended to have higher positivity against p75 antigen (9/48, 18.9% vs 3/55, 5.4%, p=0.062). Reactivity to p50 (15/48, 31.3% vs 50.9, p=0.042) and p33 antigen (3/48, 6.3% vs 10/55, 18.2%, p=0.061) was lower in PsA than in HCs. No differences on anti-Hp antigen specific antibodies was found between PsA and Ps.

**Conclusions:** Although overall reactivity to Hp in PsA and Ps is lower than HCs, Hp infection cannot safely be considered a protecting microbial agent for these diseases, as reactivities to some Hp antigens are more frequently recognised to these diseases than in HCs.

### SURVIVAL AT 6 AND 12 MONTHS OF USTEKINUMAB IN PATIENTS WITH PSORIATIC ARTHRITIS IN CONDITIONS OF CLINICAL PRACTICE

L. Perez Albaladejo, I. Notario Ferreira, I. Añón Oñate, M. Á. Ferrer González, M. J. Soto Pino, S. Quirosa Flores, A. García Sánchez, M.C. Ramírez Barberena, M. Ramírez de la Torre, J.M. Andreu Ubero, R. Cáliz Cáliz. *HOSPITAL UNIVERSITARIO VIRGEN DE LAS NIEVES, Granada, Spain*

**Introduction:** Psoriatic arthritis (PsA) is a chronic inflammatory disease associated with skin psoriasis. Ustekinumab is a monoclonal antibody which inhibits IL12/23 and has proven efficacy and safety in the treatment of patients with PsA.

**Objectives:** To determine the survival rate and the reasons for Ustekinumab discontinuation in a patient cohort with PsA in conditions of clinical practice.

**Methods:** Descriptive, prospective, longitudinal and open study including 66 patients diagnosed with PsA and treated with Ustekinumab at dosis according to the data sheet (45 mg in the 0, 4 and every 12 weeks), except for 3 patients who were administered a 90 mg dose with the aforementioned regimen. The patients were monitored at 6 and 12 months. The following variables were collected: age, sex, years of evolution, previous treatment with Synthetic Disease Modifying Anti-Rheumatic Drugs (DMARDs) and/or biologic DMARD. All the adverse events (AE) which caused the discontinuation of the drug in patients who had received at least one dose of Ustekinumab were also collected. The Kaplan-Meier method was used to analyse the survival rate. The survival rate in naïve patients with biologic DMARD was compared with those who had received at least one biologic DMARD treatment before; and patients treated with Ustekinumab in monotherapy with those who were in a combined therapy with DMARDs. The Log-Rank Test was used for the comparative analysis of both subgroups

**Results:** Out of the 66 patients of our cohort, 34 (51.5%) were women, whose mean age was 47.2 $\pm$ 11.3 years. 49 presented only peripheral affection (74.2%), mainly in polyarticular form, and 10 had mixed affection. The rest presented axial affection exclusively. Our patients had been suffering from this disease for

an average of 6±7.7 years, and had received an average of 1.26±1.45 previous biologic DMARD. 51.5% were receiving Ustekinumab in a combined therapy with DMARD (most of them Methotrexate) and 48.5% were in monotherapy. The survival rates at 6 and 12 months were 85% and 74.6% respectively. Comparing the subgroups, the naïve patients with biologic DMARDs presented higher survival rates at 6 (91.6% vs 80.7%) and at 12 months (85.1% vs 66.7%), a statistically significant difference with the group that received previous biologic DMARD ( $p=0.036$ ). The patients in combined therapy with DMARDs presented higher rates of survival than the patients in monotherapy with Ustekinumab (90% vs 80%; 78% vs 71.1% at 6 and 12 months respectively), although the differences were not statistically significant. The main reason for discontinuation was the decrease of efficacy (14 patients; 21.2%), mostly in patients who had received previous treatment with biologic DMARD. 5 patients (7.6%) did not continue due to AE (2 due to relapsing herpes zoster; 1 patient deceased, with a personal history of neoplasms and a previous treatment with anti-TNF; and 2 had reactions at the injection site).

**Conclusions:** Ustekinumab is a safe drug, presenting high rates of drug retention, especially in patients who have not received any previous biologic therapy.

**Disclosure of Interest:** None declared

### OBESITY IN PATIENTS WITH PSORIATIC ARTHRITIS IN OUR AREA

L. Montolio-Chiva<sup>1</sup>, M. Robustillo-Villarino<sup>1</sup>, A. Sendra-García<sup>2</sup>, A. Martínez-Ferrer<sup>1</sup>, C. Vergara-Dangond<sup>1</sup>, M. Aguilar-Zamora<sup>1</sup>, A.V. Orenes-Vera<sup>1</sup>, E. Valls-Pascual<sup>1</sup>, D. Ybáñez-García<sup>1</sup>, V. Núñez-Monje<sup>2</sup>, I. Torner-Hernández<sup>1</sup>, J.J. Alegre-Sancho<sup>1</sup>.  
<sup>1</sup>Rheumatology, Hospital Dr Peset, <sup>2</sup>Rheumatology, Foundation for the Promotion of Health and Biomedical Research of Valencia (FISABIO), Valencia, Spain

**Background:** Obesity is a comorbid condition in patients with psoriasis which tends to be less common in patients with psoriatic arthritis (PsA). In the general population, obesity is associated with increased inflammatory load and vascular risk, and with hypovitaminosis D.

**Objectives:** To explore the relationship between obesity and disease activity, vascular damage, serum concentrations of vitamin D (25OHD) and bone mineral density (BMD) in patients with PsA.

**Methods:** Descriptive cross-sectional study. Patients with PsA patients and peripheral joint involvement were consecutively included. Demographic (age, sex), clinical [duration of the disease, BMI (body mass index), DAS28] and analytical (25OHD, CRP, ESR) variables were collected. Patients with a BMI  $\geq 30$  kg/m<sup>2</sup>; were considered obese, and we considered vitamin D deficiency when 25OHD  $< 20$  ng/ml and vitamin D insufficiency when 25OHD 20–30 ng/ml. Within a period of 3 months, atheroma plaque and intima media thickness (IMT) measurement was performed by ultrasonography of the carotid arterial tree using an Esaote MyLab70XVG with a 7–12 MHz linear transducer and an automated program measuring IMT through radiofrequency (Quality intima media Thickness in real time, QIMT). Pulse wave velocity (PWV) was obtained by analysis of brachial pulse waves with an automated and validated system (Mobil O Graph). IMT  $> 900$   $\mu$  and PWV  $\geq 10$  m/s were considered pathological. Measurement of BMD was performed using an HOLOGIC densitometer. Statistical analysis was performed with the SPSS 17.0 program.

**Results:** We included 108 patients, 60% women, with a mean age of 55.6 (SD 12.6) years and a mean duration of PsA of 19.5 (SD 28) years. The mean BMI was 27 (DE 5.4) kg/m<sup>2</sup>; 35% of the patients being obese. The mean CRP, ESR and DAS28 were 6.6 (DE 4.5) mg/l, 10.7 (DE 11) mm/h and 2.32 (DE 0.8), respectively. 28% of patients had 25OHD deficiency and 32% had 25OHD insufficiency. The mean values of the IMT and PWV were 715 (SD 149)  $\mu$  and PWV 8 (SD 1.8) m/s, respectively. 12% of patients had osteoporosis, and up to 39% had osteopenia. Obesity was associated with a higher PsA activity measured by CRP (8.5 vs 5.7 mg/L,  $p=0.001$ ) and ESR (38.6 vs 8.7 mm/h,  $p=0.04$ ), although DAS28 was not different between groups. We also observed differences between obese and non-obese regarding the mean values of IMT (770 vs 709  $\mu$ ,  $p=0.046$ ) and PWV (8.9 vs 8 m/s,  $p=0.021$ ), the presence of atheroma plaque nearly reaching statistical significance (39% vs 30%,  $p=0.07$ ). No association was observed between obesity and 25OHD levels, BMD and DAS28.

**Conclusions:** obesity is linked to an increased inflammatory load and more vascular damage in our PsA patients. A strategy of tight control of obesity and other vascular risk factors should be implemented when monitoring PsA patients.

**Disclosure of Interest:** None declared

### CANADIAN ADALIMUMAB POST-MARKETING OBSERVATIONAL EPIDEMIOLOGICAL STUDY ASSESSING THE EFFECTIVENESS OF ADALIMUMAB VS NON-BIOLOGIC DMARDs IN PSORIATIC ARTHRITIS (COMPLETE-PSA): 12-MONTH EFFECTIVENESS DATA

M. Khraishi<sup>1</sup>, L. Bessette<sup>2</sup>, A. Chow<sup>3</sup>, B. Haraoui<sup>4</sup>, V. Pavlova<sup>5</sup>, J. Stewart<sup>6</sup>, V. Remple<sup>7</sup>. <sup>1</sup>Memorial University of Newfoundland, St. John's; <sup>2</sup>Laval University, Centre Hospitalier de l'Université Laval, Quebec; <sup>3</sup>University of Toronto, Toronto; <sup>4</sup>Centre Hospitalier de l'Université de Montréal, Montreal; <sup>5</sup>McMaster University, Hamilton; <sup>6</sup>University of British Columbia, Penticton; <sup>7</sup>AbbVie Corporation, Montreal, Canada

**Background:** To date, observational studies comparing the effectiveness of adalimumab (ADA) to non-biologic DMARDs (nbDMARD) in psoriatic arthritis (PsA) patients failing prior treatment are scarce. COMPLETE-PSA is a Canadian post-marketing observational study which assessed real-life effectiveness of ADA and non-biological therapies (NSAIDs and DMARDs) in PsA management following initial treatment failure.

**Objectives:** This analysis aimed to describe the baseline demographic and disease parameters of patients initiating nbDMARD or ADA and compare the 12 month real-life effectiveness of both treatments.

**Methods:** Patients eligible for COMPLETE PsA are anti-TNF $\alpha$  naïve adults, with active PsA who require change in their treatment regimen, per the judgment of the treating physician. In the current analysis patients enrolled during Jul/2011–Jun/2016 were included. Outcome measures analysed were: DAS28, SF-12, DLQI, presence of extra-articular manifestations (EAMs; enthesitis and dactylitis), psoriasis BSA, achievement of modified MDA (defined as achievement of [i] 4 of 6 (MDA 1) and [ii] 5 of the following 6 criteria (MDA 2): TJC  $\leq 1$ , SJC  $\leq 1$ , BSA  $\leq 3\%$ , pain VAS  $\leq 15$  mm, PtGA  $\leq 20$  and HAQ  $\leq 0.5$ ), modified remission (defined as SJC=0, TJC=0, absence of enthesitis and dactylitis, BSA  $\leq 3\%$  and HAQ  $\leq 0.5$ ), DAPSA LDA ( $\leq 14$ ), and DAPSA remission (REM;  $\leq 4$ ). Analyses were conducted by initial group assignment (intent-to-treat approach).

**Results:** 406 patients were included (nbDMARD n=146, ADA n=260). Baseline demographics were comparable between treatment groups. However, patients initiating ADA were more likely to be unemployed (47.3% ADA vs 34.9% nbDMARD,  $p=0.015$ ), had higher DAS28 (4.8 vs 4.4,  $p=0.002$ ) and total DLQI score (6.1 vs 4.3,  $p=0.007$ ), and were more likely to have BSA  $\geq 3\%$  (44.6% vs 35.0%,  $p=0.063$ ) and high DAPSA disease activity (50.8% vs 32.3%,  $p=0.015$ ). A higher proportion of nbDMARD patients had dactylitis (36.1% vs 25.3%,  $p=0.023$ ). No differences were observed between groups in enthesitis, overall EAMs, or QoL at baseline.

Upon 12 months of treatment, mean adjusted DAS28 (2.6 vs 3.4,  $p<0.001$ ) and DLQI (2.2 vs 2.9,  $p=0.530$ ) scores, but not SF-12, were lower in the ADA group. Furthermore, although statistical significance was not always met, patients treated with ADA had lower DAPSA score ( $p=0.025$ ) (LDA/REM: 64.9% vs 58.6%; REM: 37.7% vs 17.1%), were more likely to be in modified remission (14.7% vs 9.7%,  $p=0.311$ ), and to have mMDA (mMDA 1: 15.6% vs 12.6%,  $p=0.529$ ; mMDA 2: 17% vs 11.5%,  $p=0.253$ ) and BSA  $< 3\%$  (89.3% vs 83.9%,  $p=0.207$ ). Also, EAM prevalence decreased in both groups but was significantly lower in the ADA group (17.4% vs 35.8%,  $p<0.001$ ).

Over time, 9.6% of ADA patients initiated another biologic and 32.2% of patients in the nbDMARD group initiated biologic treatment ( $p<0.001$ ).

**Conclusions:** PsA patients initiating ADA in Canadian routine clinical care have significantly greater baseline disease severity compared with those initiating nbDMARDs. However, 12 month ADA treatment improved disease control and EAMs. DAPSA-REM evaluation seems more sensitive than mMDA in differentiating both populations.

**GOLIMUMAB IMPROVES DISEASE SIGNS AND SYMPTOMS, CONCOMITANT DISEASES AND CONCOMITANT DRUG USE IN PATIENTS WITH PSORIASIS ARTHRITIS IN A REAL-LIFE SETTING IN GERMANY**

K. Krüger<sup>1</sup>, G.R. Burmester<sup>2</sup>, S. Wassenberg<sup>3</sup>, A. Thiele<sup>4</sup>, M.H. Thomas<sup>5</sup>.  
<sup>1</sup>Rheumatologisches Praxiszentrum, München; <sup>2</sup>Department of Rheumatology and Clinical Immunology, Charité- Universitätsmedizin, Berlin; <sup>3</sup>Rheumazentrum Ratingen, Ratingen; <sup>4</sup>Krankenhaus St. Josef, Wuppertal; <sup>5</sup>Medical Affairs, MSD Sharp and Dohme GmbH, Haar, Germany

**Background:** Golimumab (GLM) has demonstrated efficacy and safety in several randomised clinical trials in Psoriatic Arthritis (PsA) patients. Data on disease signs and symptoms, concomitant diseases and concomitant drug in daily clinical practice are rare

**Objectives:** The aim of this subanalysis was to assess the effectiveness of GLM in patients with established PsA in a real-world setting in Germany

**Methods:** Descriptive post-hoc analysis of the non-interventional, prospective, 24 month study GO-NICE. Patients with established PsA starting with GLM 50 mg SC once monthly under routine clinical care conditions. Endpoint measures were: Physician's Global Assessment (PhGA) of patient's health status (visual analogue scale VAS: 0 no discomfort – 10 strong discomfort), change in concomitant diseases, concomitant drug use, inflammatory markers (CRP/ESR), improvement of the skin (PhGA-score: 0=none – 3=severe).

**Results:** A total of 501 patients with PsA were included at 121 sites and 231 (46.1%) completed the 24 month observation period. At baseline (BL) mean age 50.3 (±12.1) years, 271 (54.1%) females, mean time since first diagnosis 13.0 ±11.5 years, BMI 28.1 (±5.4) kg/m<sup>2</sup>. 169 (73.8%) patients received basic therapeutics, 286 (57.1%) had none previous biologics use, 136 (27.1%) one, and 79 (15.8%) at least two biologics.

439 (87.8%) had extra-articular diseases manifestations at BL. The most common were psoriasis (n=394, 78.8%), nail involvement (n=197, 39.4%), dactylitis (n=106, 21.2%), and enthesitis (70, 14.0%) at BL. The three most concomitant diseases were cardiovascular disease (n=151, 30.1%), depressive disorder (n=60, 12.0%), and diabetes mellitus (n=52, 10.4%). On GLM treatment, remarkable improvements were seen (table 1):

Abstract AB0936 – Table 1

· CRP [mg/l] (% outside n.r.)	19.8 (45.8)	8.7 (16.3)	8.4 (15.1)
· ESR [mm/h] (% outside n.r.)	24.9 (36.5)	13.7 (13.0)	13.6 (15.1)

Additionally, the percentage of patients with severe psoriatic symptoms decreased from 11.8% (BL) to 1.8% (M12) to 0.4% (M24), and the percentage of patient without any symptom increased from 8.8% (BL) to 31.8% (M12) to 36.2% (M24). An increase in any of the prespecified concomitant diseases was not observed. No new safety signals were detected.

**Conclusions:** GLM SC once-monthly, administered to PsA patients according to routine clinical practice in Germany, showed remarkable improvements in Physician's Global Assessment of patient's health status, decrease in the number of concomitant diseases and concomitant glucocorticoids use, inflammatory markers (CRP/ESR) and skin symptoms over 24 months of treatment.

**EFFICACY OF NEW TREATMENTS ON DACTYLITIS OF PSORIASIS ARTHRITIS: UPDATE OF SYSTEMATIC LITERATURE REVIEW**

M. Sondag, F. Verhoeven, X. Guillot, C. Prati, D. Wendling. *Rheumatology, Hôpital Jean Minjoz, Besançon, France*

**Background:** Dactylitis is a frequent disabling feature of psoriatic arthritis (PsA). Therapeutic strategy on dactylitis is not really codified.

**Objectives:** The objective of the study was to evaluate efficacy on dactylitis of different treatments actually available in PsA.

**Methods:** We performed a literature review from June 2014 to October 2017 based on Pubmed, using the search terms "psoriatic arthritis" and "treatment" with only clinical trials. 89 articles were identified (English-language reports only). Thus, we selected only randomised, double-blind placebo-controlled trials in which analysis of dactylitis was exposed: 11 articles were selected for full review.

**Results:** Significant improvement of dactylitis (p<0.05) compared to placebo was observed with the use of golimumab in GO-VIBRANT, ustekinumab in PSUMMIT-1/PSUMMIT-2 trial, with apremilast 30 mg only in PALACE 3, with ixekizumab and adalimumab in SPIRIT-P1 (post hoc analysis).

For secukinumab, results are different: McInnes *et al.* (FUTURE 2) found no significant efficacy with 47% of dactylitis resolution at 24 weeks for secukinumab vs 11% for placebo (p=0.9195). At the opposite, Kavanaugh *et al.* (FUTURE 2) demonstrated secukinumab efficacy on anti-TNF-naïve (300 mg and 150 mg dosages) and anti-TNF-exposed patients (only 300 mg).

For Mc Innes *et al.*, clazakizumab permitted great decreases in the mean number of dactylitis from baseline to weeks 16 and 24 but no statistical data are available in the report. Similarly, in a recent publication, promising results were found for tofacitinib and abatacept, but no statistical data are available.

At the opposite, no significant efficacy was demonstrated in a randomised controlled trial with brodalumab.

Calculating of effect size was possible and available only in one study: secukinumab's effect size was 4.35 in McInnes study (FUTURE 2). Calculation of Odds Ratio (with of residual dactylitis between treatment and placebo groups was possible on part of studies with significant results for clazakizumab (200 mg dosing) and secukinumab in patients TNF exposed (figure 1).

Treatment	Ustekinumab (PSUMMIT 1-2)	Clazakizumab 200 (McInnes)	Clazakizumab 100 (McInnes)	Clazakizumab 25 (McInnes)	Abatacept (McInnes)	Secukinumab (FUTURE 2, McInnes)	Secukinumab (TNFi-naïve) (FUTURE 2, Kavanaugh)	Secukinumab (TNFi-exposed) (FUTURE 2, Kavanaugh)
Lower range	0.21	0.06	0.02	0.10	0.30	0.48	0.01	0.01
Mean	0.48	0.21	0.14	0.47	0.65	0.77	0.07	0.13
Upper range	1.01	1.58	0.93	2.19	1.40	1.24	0.58	1.15

Abstract AB0937 – Figure 1. Odds Ratio for residual dactylitis in treatment/placebo groups

**Conclusions:** Dactylitis was always used as secondary outcome criteria with heterogeneous results. So conclusions need to be cautious. This invalidating clinical manifestation need to be evaluated as a primary outcome in the future.

**Disclosure of Interest:** None declared

**AB0938 TREATMENT PATTERNS IN EARLY PSORIATIC ARTHRITIS ACCORDING TO THE AGE OF ONSET**

M. Gilio<sup>1,2</sup>, G. Tramontano<sup>1</sup>, U. Bottoni<sup>3</sup>, A. Padula<sup>1</sup>, S. D'Angelo<sup>1</sup>. <sup>1</sup>Rheumatology Institute of Lucania (IRel), the Rheumatology Department of Lucania, San Carlo Hospital of Potenza, Potenza; <sup>2</sup>PhD Scholarship in Life Sciences, Department of Health Sciences, University of Catanzaro "Magna Graecia"; <sup>3</sup>Department of Health Sciences, University of Catanzaro "Magna Graecia", Catanzaro, Italy

**Background:** The initial treatment of Psoriatic Arthritis (PsA) is largely based on the extent of musculoskeletal involvement and disease severity according to the stepwise approach of EULAR and GRAPPA recommendations for PsA management, but without regard to the age of onset.

**Objectives:** This prospective observational study aimed<sup>1</sup> to describe treatment prescribing patterns in PsA over the first 2 years of follow-up and<sup>2</sup> to determine if the treatment patterns are conditioned by the age of onset.

**Methods:** Patients with at least 2 years of follow-up within the PsArT (Psoriatic arthritis Age-related Treatment patterns) study were included. Patients with a diagnosis of early (symptom duration <52 weeks) PsA, made by rheumatologists with long-standing expertise in PsA, were consecutively recruited and divided into Adult-Onset (AOPsA) (age <60 years) and Late-Onset (LOPsA) (onset age ≥60 years) PsA according to the age at the onset of musculoskeletal manifestations. For the aim of this study, patient's data were collected at the enrolment (baseline) (T0), at 12 months (T12) and at 24 months (T24). Clinical, laboratory features and treatment patterns, over 2 years were described according to the age stratification.

**Results:** 46 PsA patients (22 M, 24 F; age 49±16, range 16–90 years) with a disease duration of 20±15 weeks (range 1–52) were enrolled. Compared to the 31 patients with AOPsA, the 15 patients with LOPsA had a significant shorter disease duration (17±15 vs. 21±15 weeks, p<0.05) and showed more frequently increased levels of ESR (75% vs. 43%, p<0.05) and CRP (87% vs. 52%, p<0.01). In addition, patients with LOPsA developed more frequently inflammatory extremity swelling with pitting oedema (IESPE) over the dorsum of hands and/or of the feet (56% vs. 13%, p<0.01). There were no other significant differences between the 2 groups even though more males were observed in the LOPsA group (56% vs. 42%, p>0.05). The sensitivity of the CASPAR criteria was similar in AOPsA (78%) and LOPsA (75%). Of 46 patients during the first year 80.4% received non steroidal anti-inflammatory drugs, 32.6% received oral corticosteroids, 13.0% received local corticosteroids, 19.5% received synthetic disease-modifying anti-rheumatic drugs (sDMARDs) and 6.5% received biologics (bDMARDs: IFX, ADA, GOL, ETN). During the second year of follow up 73.9% received non steroidal anti-inflammatory drugs, 30.4% received oral corticosteroids, 50% received synthetic disease-modifying anti-rheumatic drugs (sDMARD), 15.2% received biologics (IFX, ADA, GOL, ETN) and received 30.4% local corticosteroids. (see figure) About the drug intake the only statistical significant difference between the two groups was the rate of patients using NSAIDs in LoPsA group during the first year (100% vs. 70.9%, p value 0.02). There were no other significant differences in drug intake, therapy changes, discontinuation, add-on therapy according to the age of PsA onset.

Abstract AB0938 – Figure 1

**Conclusions:** During the two years of follow up period a high proportion of patient received NSAIDs in LoPsA group during the first year. The main limit of our study is the low number of patients, therefore a greater number could help to understand whether the age of onset may affect the use of specific type of drugs.

**AB0939 OFF-LABEL SECUKINUMAB DOSE ESCALATION IN THE TREATMENT OF MODERATE-TO-SEVERE PSORIASIS: A MULTICENTER, RETROSPECTIVE STUDY**

M. Phung<sup>1</sup>, A. Ighani<sup>2</sup>, J.R. Georgakopoulos<sup>3</sup>, R. Vender<sup>4</sup>, L. Giroux<sup>5</sup>, P. Lansang<sup>6</sup>, J. Yeung<sup>7,8</sup>. <sup>1</sup>Department of Pharmacology and Toxicology, <sup>2</sup>Faculty of Medicine, University of Toronto, Toronto; <sup>3</sup>Schulich School of Medicine and Dentistry, Western University, London; <sup>4</sup>Division of Dermatology, Department of Medicine, McMaster University, Hamilton; <sup>5</sup>Department of Dermatology, The Northern Ontario School of Medicine, Sudbury; <sup>6</sup>Division of Dermatology, Sunnybrook Health Sciences Centre; <sup>7</sup>Division of Dermatology, Faculty of Medicine, University of Toronto, Toronto; <sup>8</sup>Probiy Medical Inc., Waterloo, Canada

**Background:** There have been significant advancements in the development of biologics over the past decade that revolutionised treatment for psoriasis and psoriatic arthritis. Interleukin (IL)-17A is a pro-inflammatory cytokine that plays a pivotal role in the pathogenesis of psoriatic disease, and is therefore a target for biologic drug development. Secukinumab is an IL-17A antagonist approved in 2015 for the treatment of psoriatic arthritis and moderate-to-severe psoriasis in adults. Its current approved dosing schedule for psoriasis patients is 300 mg subcutaneous weekly for 5 weeks, followed by monthly maintenance dosing.<sup>1</sup>

Some psoriasis patients in clinical practice exhibit a suboptimal response to secukinumab or experience relapse with the approved dosing schedule. In these cases, clinicians may use off-label secukinumab dose escalation regimens, which involve increasing the maintenance dosing frequency to every 2 or 3 weeks, or increasing the monthly dose to 450 mg. No guidelines currently exist for high dose secukinumab regimens.

**Objectives:** The objective of this study was to assess the efficacy and safety of off-label high dose secukinumab regimens in adults with moderate-to-severe psoriasis.

**Methods:** We performed a retrospective chart review for adult patients diagnosed with moderate-to-severe psoriasis treated with an off-label secukinumab up-dose regimen. Efficacy was measured using Psoriasis Area and Severity Index (PASI)-75 or a Physician Global Assessment (PGA) score of 0 or 1 after dose escalation. To assess safety, adverse events (AEs) were recorded.

**Results:** Twenty-five patients were included in this study, 13 (52%) of which also had psoriatic arthritis. The mean treatment time with secukinumab prior to dose escalation was 44.5 weeks. Twelve patients had PASI recorded prior to dose escalation, with a mean score of 5.7. Of the remaining 13 patients, 1 had no documentation of disease severity and 12 had PGA scores of 0 (n=2), 1 (n=1), 2 (n=5), 3 (n=2), and 4 (n=2). These patients then increased their dose to 300 mg secukinumab every 3 weeks (n=10), 300 mg every 2 weeks (n=9), or 450 mg monthly (n=6). Mean follow-up time was 15.9 weeks after dose escalation, where 4 patients achieved PASI-75 and 10 achieved PGA 0 or 1. Therefore, 14 out of 25 (56%) patients had effective outcomes from secukinumab dose escalation based on our study endpoints. AEs included one case of the common cold and an upper respiratory tract infection after dose escalation.

**Conclusions:** This study provides evidence of safety and moderate efficacy for high dose secukinumab regimens in psoriasis patients who display an inadequate response to the approved regimen. Increased dosing did not result in more AEs compared to secukinumab phase 3 clinical trials that used the approved regimen.<sup>2</sup> As such, there may be a role for increased dosing in psoriatic arthritis patients.

**AB0940 HEALTH SERVICES RESEARCH PROJECT FOR THE EARLY DIAGNOSIS OF PSORIATIC ARTHRITIS: MONOCENTRIC QUESTIONNAIRE-BASED STUDY TO IDENTIFY PATIENTS WITH ARTHRITIS AND DETECT SIGNS OF DEPRESSION IN 150 PATIENTS**

N. Frede<sup>1</sup>, F. Schauer<sup>2</sup>, C. Schempp<sup>2</sup>, S. Finzel<sup>1</sup>, F. Rötter<sup>1</sup>, R. Voll<sup>1</sup>, J. Thiel<sup>1</sup>, N. Venhoff<sup>1</sup>. <sup>1</sup>Department of Rheumatology and Clinical Immunology; <sup>2</sup>Department of Dermatology, Medical Center – University of Freiburg, Freiburg, Germany

**Background:** Psoriatic arthritis (PsA) is an inflammatory rheumatic disease affecting approximately 30% of psoriasis (PsO) patients. Despite increased awareness there is still a considerable delay in diagnosis. Untreated PsA may lead to irreversible joint destruction associated with a high rate of disability and depression. A timely diagnosis and initiation of treatment are therefore essential.

**Objectives:** In order to minimise diagnostic delay and improve patient care, we have implemented a questionnaire-based screening procedure in the dermatology outpatient clinic to identify patients with suspected PsA.

**Methods:** A questionnaire-based screening (PEST, FFbH, WHOQOL-BREF, Phq9, GHQ-12) was used to assess PsO patients for PsA, depression, comorbidities, and quality of life (QOL).

**Results:** So far we have assessed 150 PsO patients. 79% reported joint affection with a mean number of 4.58 involved joint regions, predominantly at the lower extremities. 34% described axial involvement. 42% had a score of  $\geq 3$  in the PEST tool, being suspicious for PsA. 4% had a clinically relevant functional impairment in daily life assessed by FFbH questionnaire (score  $< 60\%$ ). In WHOQOL-BREF PsO patients scored lower on the physical health as well as the psychological wellbeing scale when compared to reference values for healthy controls, while results in the social relationship and environment domains were comparable. When comparing patients with suspected PsA to PsO without arthritis the former group reached significantly lower scores in the physical health domain ( $p=0.0001$ ), in the psychological wellbeing ( $p=0.0434$ ), and environment domains ( $p=0.0384$ ), especially regarding items assessing body image/appearance and negative feelings for psychological wellbeing as well as physical security and mobility/transport in the environment domain. For the social domain there were no differences. In the Phq9 questionnaire patients reached a mean of 6.5 points equalling mild depressive symptoms. 16% of PsO patients had moderate depressive symptoms, while 9% had severe depressive symptoms. In patients with suspected PsA 44% had moderate (26%) or severe (18%) depression compared to 7% and 2% respectively in PsO patients without arthritis.

**Conclusions:** Screening questionnaires are valuable tools for dermatologists as well as general practitioners and help to identify PsO patients with musculoskeletal involvement pointing towards psoriatic arthritis. Thus, screening questionnaires can add to ensure timely referral of patients with inflammatory joint involvement and depression to the corresponding specialists and help to avoid a delay of treatment. Our data confirm an association of psoriasis, depressive symptoms and reduced quality of life, which was even stronger in patients with psoriatic arthritis.

#### PATIENT AND PHYSICIAN GLOBAL ASSESSMENTS REFLECT STRONGLY DIVERGING ATTITUDES BETWEEN PATIENTS WITH PSORIATIC ARTHRITIS AND THEIR RHEUMATOLOGISTS TO SEVERITY OF DISEASE AND TO THE RELATIVE IMPORTANCE OF DIFFERENT OUTCOME MEASURES

*O. Rintek Madsen, Center for Rheumatology and Spine Diseases and the DANBIO Registry, Copenhagen University Hospital Rigshospitalet/Gentofte, Hellerup, Denmark*

**Background:** Assessment of disease activity is important in the evaluation and monitoring of patients with psoriatic arthritis (PsA) in clinical care and research. As there is no single 'gold standard' variable for assessment of disease activity several markers of disease activity are used, among these "global assessment" by the patient (PaGI) and by the physician (PhGI). The agreement and interplay between PaGI and PhGI are not well clarified in patients with PsA, however.

**Objectives:** The study aimed to examine associations on the group level and agreements on the individual patient level between PaGI and PhGI as scored on visual analogue scales (VAS) in the daily clinic by patients with active PsA and by their rheumatologists.

**Methods:** Traditional disease activity data on 76 PsA patients with active disease planned to initiate biological treatment were extracted from the Danish DANBIO registry for biological treatment in rheumatology. Data comprised PaGI, PhGI and pain (0–100 VAS), 28 swollen joint count (SJC), 28 tender joint count (TJC), CRP, HAQ-DI and DAS28-CRP(4 v). Analyses were performed using parametric statistics. The association between PaGI and PhGI was examined by simple linear regression analysis. The predictability of PaGI and PhGI, respectively, by all other disease markers mentioned and by age and sex was examined using stepwise multiple regression analysis. Agreement between the VAS scores was expressed as the bias (mean difference between intra-individual scores) and the 95% lower and upper limits of agreement (LLoA; ULoA) according to the Bland-Altman method.

**Results:** Mean age was  $52.2 \pm 11.1$  years and mean DAS28-CRP  $4.7\% \pm 1.1$ . 59.2% of the patients were women. Mean PaGI was  $63.7 \pm 23.2$  and mean PhGI  $39.9 \pm 19.8$  ( $p < 0.0001$ ). Thus the difference between PaGI and PhGI was substantial on the group level. Differences between PaGI and PhGI were even more

pronounced on the individual level, however. The average difference was 23.8 (bias) but differences on the individual level ranged from  $-21.9$  (LLoA) to  $+69.5$  (ULoA). The corresponding results for PaGI vs. pain was 4.9 (bias),  $-17.1$  (LLoA) and 22.0 (ULoA), and for pain vs. PhGI 18.9 (bias),  $-23.0$  (LLoA) and 60.8 (ULoA). PaGI was significantly but weakly correlated with PhGI ( $R=0.42$ ,  $p < 0.0001$ ) with a high standard error of estimation (SEE)=21.2. PaGI was independently predicted by pain ( $\beta=0.76$ ,  $p < 0.0001$ ) and HAQ-DI ( $\beta=0.19$ ,  $p < 0.01$ ) and was not predicted by PhGI ( $p=0.61$ ) ( $R=0.78$ ,  $SEE=10.5$ ,  $p < 0.0001$ ). PhGI was independently predicted by SJC ( $\beta=0.43$ ,  $p < 0.0001$ ) followed by pain ( $\beta=0.41$ ,  $p < 0.0001$ ) and CRP ( $\beta=0.20$ ,  $p < 0.05$ ) ( $R=0.70$ ,  $SEE=14.4$ ,  $p < 0.0001$ ) with no significant contribution by PaGI ( $p=0.49$ ).

**Conclusions:** In patients with active PsA initiating biological treatment, PaGI was in general scored considerably higher than PhGI. On the individual patient level, differences between PaGI and PhGI varied substantially. PaGI was best explained by pain, and PhGI by SJC. The findings reflect strongly diverging attitudes between PsA patients and their rheumatologists to severity of disease and to the relative importance of different outcome measures.

AB0942

#### CONCORDANCE BETWEEN FATIGUE, PAIN AND PATIENT GLOBAL ASSESSMENT IN INDIVIDUAL PATIENTS WITH PSORIATIC ARTHRITIS

*O. Rintek Madsen, Center for Rheumatology and Spine Diseases and the DANBIO Registry, Copenhagen University Hospital Rigshospitalet/Gentofte, Hellerup, Denmark*

**Background:** Associations between fatigue (FTG), pain and patient global assessment (PaGI) have been examined on the group level in patients with psoriatic arthritis (PsA), but studies focusing on the concordance between these patient-reported outcome measures (PROMs) in individual patients are missing. A better understanding of how tight the measures are bounded in individuals may improve our ability to deal with them in the daily clinic.

**Objectives:** To examine associations on the group level and concordance on the individual patient level between FTG, pain and PaGI as scored on 0–100 visual analogue scales (VAS) in the daily clinic by patients with PsA. The influence of other clinical disease activity measures on these measures was also examined.

**Methods:** Data on 132 outclinic PSA patients treated with biological agents were extracted from the Danish registry for biological treatment in rheumatology (DANBIO). Data comprised VAS FTG, pain, PaGI and physician global assessment (PhGI), and HAQ-DI, swollen and tender joint counts (66/68), CRP, DAS28-CRP and age. Simple linear regression analyses were used to assess the association between FTG, pain and PaGI. Independent predictors of FTG, pain and PaGI were identified using stepwise multiple regression analysis. Degrees of association were expressed by coefficients of correlation, beta-values and standard errors of estimation (SEE). Concordance between FTG, pain and PaGI on the individual patient level was examined using the Bland-Altman method yielding 95% lower and upper limits of agreement (LLoA and ULoA) and corresponding biases (mean of intra-individual differences).

**Results:** Mean age was  $54 \pm 13$  years, mean DAS28  $3.7 \pm 1.5$  and mean PaGI  $56 \pm 28$ . FTG, pain and PaGI were strongly inter-associated but errors of estimation were substantial ( $r$ -range 0.80–0.94,  $p < 0.0001$ ,  $SEE$ -range 11.5–16.9). FTG, pain and PaGI were only poorly correlated with objective measures of disease activity (for example,  $r$ -range for swollen joint count 0.19–0.25,  $p < 0.05$ ). FTG was independently predicted ( $\beta$ ,  $p$ -value) by PaGI (0.51,  $< 0.001$ ) and pain (0.31,  $< 0.05$ ) ( $R^2=0.66$ ,  $p < 0.05$ ,  $SEE=16.7$ ), pain by PaGI (0.82,  $< 0.0001$ ) and HAQ-DI (0.15,  $< 0.005$ ) ( $R^2=0.88$ ,  $p < 0.005$ ,  $SEE=10.5$ ) and PaGI by pain (0.80,  $< 0.0001$ ) and fatigue (0.17,  $< 0.001$ ) ( $R^2=0.89$ ,  $p < 0.001$ ,  $SEE=12.4$ ). Swollen and tender joint count, CRP and PhGI did not add to the explanation of the patient-reported VAS scores. The bias [LLoA; ULoA] for FTG versus pain was  $8.5 \pm 19.1$  ( $p < 0.0001$ ) [ $-29.1$ ; 45.9], for FTG versus PaGI  $4.1 \pm 19.4$  ( $p < 0.05$ ) [ $-34.0$ ; 42.2] and for PaGI versus pain  $4.4 \pm 11.5$  ( $p < 0.0001$ ) [ $-18.1$ ; 26.9]. Thus biases were small but limits of agreement were pronounced.

**Conclusions:** In patients with PsA, VAS FTG, pain and PaGI were nearly identical and were strongly inter-associated on the group level with no explanatory influence of more objective measures. However, on the individual patient level substantial discrepancies between the VAS scores were observed. The findings emphasise the complexity of understanding and dealing with PROMs in the daily clinic.

**SUSTAINED IMPROVEMENTS WITH UP TO 104 WEEKS OF APREMLAST MONOTHERAPY IN BIOLOGIC-NAÏVE SUBJECTS WITH ACTIVE PSORIATIC ARTHRITIS: RESULTS FROM A PHASE 3B, RANDOMISED, CONTROLLED TRIAL**

P. Nash<sup>1</sup>, K. Ohson<sup>2</sup>, J. Walsh<sup>3</sup>, N. Delev<sup>4</sup>, D. Nguyen<sup>4</sup>, L. Teng<sup>4</sup>, M. Paris<sup>4</sup>, J. J. Gomez-Reino<sup>5</sup>, J.A. Aelion<sup>6</sup>. <sup>1</sup>University of Queensland, Brisbane, Australia; <sup>2</sup>University of Newfoundland, St. John's, Newfoundland, Canada; <sup>3</sup>University of Utah School of Medicine, Salt Lake City; <sup>4</sup>Celgene Corporation, Summit, USA; <sup>5</sup>Hospital Clinico Universitario, Santiago, Spain; <sup>6</sup>West Tennessee Research Institute, Jackson, USA

**Background:** ACTIVE is the first apremilast (APR) study to demonstrate onset of response to APR starting at Week 2 in biologic-naïve subjects with psoriatic arthritis (PsA) who may have had exposure to 1 prior conventional disease-modifying anti-rheumatic drug.

**Objectives:** To determine the efficacy and safety of APR through Week 104 in the ACTIVE study.

**Methods:** Subjects were randomised (1:1) to receive APR 30 mg BID or placebo (PBO) for 24 weeks; thereafter, all subjects received active treatment with APR. The long-term durability of APR treatment on various PsA manifestations was evaluated. Along with safety data, adverse events (AEs) of diarrhoea were further characterised.

**Results:** A total of 219 subjects were randomised (APR: n=110; PBO: n=109); 89% (142/160) of subjects entering year 2 of the study completed the Week 104 visit, and 64.8% (142/219) of randomised subjects completed the Week 104 visit, including 60.9% (67/110) of subjects randomised to APR at baseline. Early onset of response to APR was observed for ACR20 response and improvements in DAS-28 (CRP), HAQ-DI, enthesitis (in subjects with enthesitis at baseline), and morning stiffness severity. With continued APR exposure, the Week 104 ACR20 response rate was 62.9%; ACR50 and ACR70 response rates were 33.3% and 20.1%, respectively. Mean percent change in swollen joint count was -75.9%, and mean percent change in tender joint count was -68.3%. In all, 65.7% of APR subjects with baseline enthesitis reached a Gladman Enthesitis Index score of 0 (table 1). More than half of the APR subjects had improvements in morning stiffness severity. Sustained improvements in physical function were also observed, with a mean change of 5.9 in the SF-36v2 Physical Functioning score and a mean change in HAQ-DI score of -0.37 at Week 104. Safety findings for the APR-exposure period were consistent with previous reports. The most commonly reported AEs ( $\geq 5\%$  of subjects) during the APR-exposure period were bronchitis (5.3%), headache (6.3%), hypertension (6.3%), nasopharyngitis (8.3%), upper respiratory tract infection (8.3%), nausea (8.7%), and diarrhoea (16.5%). New incidences of protocol-defined diarrhoea ( $\geq 2$  watery/liquid stools/day) decreased during long-term APR exposure. Over the APR-exposure period, serious AEs occurred in 7.3% of subjects; 8.3% of subjects discontinued treatment due to an AE. No serious opportunistic infections, including tuberculosis reactivation, or cases of serious depression were seen.

	Week 52 APR 30 mg BID n=171	Week 104 APR 30 mg BID n=144

Abstract AB0943 – Figure 1

Week 52 and Week 104 analyses were data as observed among all subjects who received APR, regardless of when APR treatment started (baseline, Week 16 or Week 24); actual number of subjects may vary for each end point depending on availability of data.

\*Evaluated in subjects with enthesitis at baseline (Gladman Enthesitis Index score  $>0$ ).

ACR20/50/70= $\geq 20\%/ \geq 50\%/ \geq 70\%$  improvement in modified American College of Rheumatology response criteria; n/m=number of responders/number of subjects with sufficient data for evaluation; DAS-28=28 joint count Disease Activity Score; CRP=C reactive protein; SF-36v2=36 item Short-Form Health Survey version 2; HAQ-DI=Health Assessment Questionnaire-Disability index; MCID=minimal clinically important differences.

**Conclusions:** In biologic-naïve subjects treated with APR, early onset of effect was observed across PsA manifestations, including morning stiffness severity and enthesitis, with sustained improvements through Week 104 in the subjects continuing APR therapy. AEs were consistent with those reported for other APR phase 3 PsA and psoriasis studies.

AB0944

**EFFICACY AND SAFETY OF IXEKIZUMAB WHEN USED ALONE OR IN COMBINATION WITH CONVENTIONAL DISEASE-MODIFYING ANTIRHEUMATIC DRUGS (CDMARDs) IN TNF-EXPERIENCED PATIENTS WITH PSORIATIC ARTHRITIS**

P. Nash<sup>1</sup>, F. Behrens<sup>2</sup>, A.-M. Orbai<sup>3</sup>, S. Rathmann<sup>4</sup>, D. Adams<sup>4</sup>, O. Benichou<sup>4</sup>, A. Deodhar<sup>5</sup>. <sup>1</sup>Univ. of Queensland, Brisbane, Australia; <sup>2</sup>Goethe Univ., Frankfurt, Germany; <sup>3</sup>Johns Hopkins Univ., Baltimore; <sup>4</sup>Eli Lilly, Indianapolis; <sup>5</sup>Oregon Health and Science Univ., Portland, USA

**Background:** Registry studies<sup>1,2</sup> suggest that cDMARDs do not improve TNFi efficacy in the treatment of psoriatic arthritis (PsA), but studies of novel biologics are warranted. In SPIRIT-P2, TNFi-experienced patients with active PsA were treated with ixekizumab (IXE), a high-affinity monoclonal antibody that selectively targets IL-17A.

**Objectives:** We conducted post-hoc analyses of SPIRIT-P2 data to investigate the efficacy and safety of IXE relative to placebo (PBO) when used alone or in combination with background MTX or cDMARDs in patients with PsA.

**Methods:** SPIRIT-P2 (NCT02349295) is a phase 3, multi-centre, randomised, double-blind, placebo-controlled trial of IXE in adults with active PsA and prior TNFi-inadequate response or intolerance. Patients were randomised 1:1:1 to receive PBO, 80 mg IXE either every 4 weeks (Q4W) or every 2 weeks (Q2W), after receiving a 160 mg initial IXE dose. Eligible established background cDMARD therapy was allowed in the double-blind treatment period (Week 0–24), but no changes were allowed unless for safety reasons or due to inadequate response at week 16. Efficacy and safety were assessed at week 24. Efficacy outcome measurements included ACR 20/50 responses, achievement of minimal disease activity (MDA), 28-joint disease activity score using CRP (DAS28-CRP), disease activity in psoriatic arthritis (DAPSA), and HAQ-DI. All comparisons were made relative to PBO by Fisher's exact test for categorical end points and analysis of covariance models for continuous end points.

**Results:** At baseline, 185 (51%) patients received background cDMARDs. Of these patients, 149 received background MTX. ACR20, ACR50, and MDA response rates were significantly higher in patients treated with IXE versus PBO regardless of background cDMARD use (table 1). Disease activity improved significantly with IXE versus PBO in each subgroup, as measured by DAS28-CRP and DAPSA. Likewise, physical function improved with IXE versus PBO as indicated by significantly more profound decreases in HAQ-DI with IXEQ4W with or without background cDMARDs, and with IXEQ2W monotherapy. HAQ-DI improvements were significantly more profound versus PBO in patients treated with IXEQ4W with or without background cDMARDs, and with IXEQ2W monotherapy. Among IXE treated patients, higher proportions of patients achieved HAQ-DI MCID in all subgroups versus PBO, but these were only significantly higher in patients treated with IXEQ4W or IXEQ2W monotherapy. Regardless of background cDMARD use, efficacy outcomes were significantly improved with both IXE groups versus PBO, except for HAQ-DI for IXEQ2W in combination with cDMARDs and HAQ-DI MCID in all background cDMARD subgroups. The proportions of patients who experienced  $\geq 1$  treatment emergent adverse events (AE), serious AEs (including serious infections), or discontinuations due to AEs were comparable to the overall trial population.<sup>3</sup>

**Abstract AB0944 – Table 1.** SPIRIT-P2 outcomes and safety results at 24 weeks according to cDMARD use at baseline.

**AB0945 SECUKINUMAB EFFICACY IN PATIENTS WITH ACTIVE PSORIATIC ARTHRITIS: POOLED ANALYSIS OF FOUR PHASE 3 TRIALS BY PRIOR ANTI-TNF THERAPY AND CONCOMITANT METHOTREXATE USE**

B. Kirkham<sup>1</sup>, P.J. Mease<sup>2</sup>, P. Nash<sup>3</sup>, A. Balsa<sup>4</sup>, B. Combe<sup>5</sup>, J. Rech<sup>6</sup>, R. Martin<sup>7</sup>, G. Ligozio<sup>7</sup>, K. Abrams<sup>7</sup>, L. Pricop<sup>7</sup>, on behalf of the FUTURE 2, 3, 4 and 5 study groups. <sup>1</sup>Guy's and St Thomas' NHS Foundation Trust, London, UK; <sup>2</sup>Swedish Medical Centre and University of Washington, Seattle, USA; <sup>3</sup>University of Queensland, Brisbane, Australia; <sup>4</sup>Instituto de Investigación Sanitaria del Hospital Universitario La Paz, Madrid, Spain; <sup>5</sup>Hôpital Lapeyronie, Université Montpellier 1, Montpellier, France; <sup>6</sup>Friedrich-Alexander-University Erlangen-Nürnberg (FAU), Monash University, Erlangen, Germany; <sup>7</sup>Novartis Pharmaceuticals Corporation, East Hanover, USA

**Background:** Secukinumab has demonstrated rapid, significant and sustained improvement in the signs and symptoms of psoriatic arthritis (PsA) in multiple Phase 3 studies.<sup>1-3</sup>  
**Objectives:** To report pooled efficacy results for secukinumab versus placebo at Week (Wk) 16 in PsA patients (pts) by previous anti-TNF therapy and with or without concomitant methotrexate (MTX) use from four Phase 3 studies: FUTURE 2, FUTURE 3, FUTURE 4 and FUTURE 5.  
**Methods:** Overall, 397, 414, 341, and 996 pts with active PsA were randomised in FUTURE 2, FUTURE 3, FUTURE 4 and FUTURE 5, respectively. Secukinumab doses included subcutaneous (s.c.) 300 mg and 150 mg administered at

baseline (BL) with loading doses at Wks 1, 2, and 3, followed by maintenance dose every 4 wks (q4w) starting at Wk 4 and s.c. secukinumab 150 mg administered at BL without loading dose, followed by q4w starting at Wk 4. Data collected up to Wk 16 were pooled. Assessments included ACR20/50/74, DAS-28 CRP, PASI 75/90, SF-36 PCS, HAQ-DI, and resolution of dactylitis, and enthesitis. Pooled analyses examined the effect of prior anti-TNF use (naïve/inadequate response or intolerance to these agents, -IR) and with/without MTX use on clinical endpoints and are reported after application of non-responder imputation for binary variables and a mixed-effects model for repeated measures for continuous variables.

**Results:** A total of 2049 pts were included in the analysis, of which 461, 572, 335, and 681 pts received secukinumab 300 mg, 150 mg, 150 mg without load and placebo, respectively. Improvements were observed with secukinumab vs placebo for all endpoints at Wk 16 in both anti-TNF-naïve and anti-TNF-IR pts and in pts with and without concomitant MTX use. Higher ACR and PASI responses and greater improvement of disease activity were observed in anti-TNF-naïve pts compared to anti-TNF-IR pts. Secukinumab 300 mg provided numerically higher ACR and PASI responses compared to the 150 mg dose particularly for anti-TNF-IR pts and in pts with no concomitant MTX use. Earlier responses were observed with secukinumab with load compared to without load primarily across ACR, DAS28-CRP and PASI endpoints.

**Abstract AB0945 – Figure 1**

**Conclusions:** Secukinumab provided improvements in the signs and symptoms of active PsA regardless of previous anti-TNF therapy or concomitant MTX use. Higher response rates were generally observed in anti-TNF-naïve pts compared to anti-TNF-IR pts. Secukinumab 300 mg was associated with higher responses compared to 150 mg particularly in anti-TNF-IR pts and in pts with no concomitant MTX use.

**AB0946 IMPROVEMENTS IN WORK PRODUCTIVITY WITH UP TO 104 WEEKS OF APREMILAST MONOTHERAPY: RESULTS FROM A PHASE 3B, RANDOMISED, CONTROLLED STUDY IN BIOLOGIC-NAÏVE SUBJECTS WITH ACTIVE PSORIATIC ARTHRITIS**

P.J. Mease<sup>1</sup>, D.D. Gladman<sup>2</sup>, E.K. Davenport<sup>3</sup>, X. Zhou<sup>3</sup>, B. Guertel<sup>4</sup>, L. Teng<sup>4</sup>, S. Kaura<sup>4</sup>, P. Nash<sup>5</sup>. <sup>1</sup>Swedish Medical Center and University of Washington School of Medicine, Seattle, USA; <sup>2</sup>Krembil Research Institute, Toronto Western Hospital, Toronto, Canada; <sup>3</sup>RTI Health Solutions, Research Triangle Park; <sup>4</sup>Celgene Corporation, Summit, USA; <sup>5</sup>University of Queensland, Brisbane, Australia

**Background:** Psoriatic arthritis (PsA) patients may experience disease manifestations across multiple domains and impaired functioning in daily activities at home and work. The phase 3b ACTIVE study is evaluating the efficacy of apremilast (APR) monotherapy in biologic-naïve subjects with active PsA who may have had exposure to 1 prior conventional DMARD.

**Objectives:** To assess work productivity through Week 104.

**Methods:** Subjects were randomised (1:1) to receive APR 30 mg BID or placebo (PBO). Subjects who did not improve by  $\geq 10\%$  in swollen and tender joint counts at Week 16 were eligible for early escape. At Week 24, all remaining PBO subjects were switched to APR. Work productivity and activity impairment were assessed at baseline (BL) and Week 16 using the 6-item, self-administered Work Productivity and Activity Impairment Questionnaire: Psoriatic Arthritis (WPAI:PsA). WPAI:PsA includes 4 subscale scores (Absenteeism, Presenteeism, Work Productivity Loss, and Activity Impairment), each ranging from 0% to 100%; higher scores indicate greater impairment. Work-related subscales were evaluated only among employed subjects, while activity impairment was evaluated among all subjects, regardless of employment. Correlations were examined at Week 16 between WPAI:PsA subscale scores and the SF-36v2 domain scores for Physical Functioning (PF), Bodily Pain (Pain), and Vitality (VIT), as well as associations with ACR20 response. Improvement in work productivity was assessed through Week 104.

**Results:** BL characteristics were similar between APR and PBO subjects with WPAI:PsA scores included in this analysis. At Week 16, APR significantly improved work productivity and the ability to carry out daily activities vs PBO, with significantly greater mean improvements observed in the overall Work Productivity Loss ( $p=0.001$ ) and Activity Impairment ( $p<0.001$ ) scores (table 1). Estimated mean change in the Absenteeism score was similar with APR vs PBO ( $p=0.679$ ). By contrast, the Presenteeism score showed significant improvement with APR vs worsening with PBO ( $-10.8\%$  vs  $4.1\%$ ;  $p=0.002$ ). At Week 16, statistically significant correlations were observed between WPAI:PsA subscale scores (except Absenteeism) and the SF-36v2 domain scores for PF, Pain, and VIT, as were associations with ACR20 response. Among subjects randomised to APR at BL, improvements in Week 16 WPAI:PsA subscale score were generally maintained through Week 104 in those continuing APR.

Improvements in WPAI:PsA Subscale Scores (% Point) at Week 16				
WPAI:PsA Subscale	APR 30 mg BID LS Mean (95% CI)	PBO LS Mean (95% CI)	Treatment Difference (95% CI)	P Value
Presenteeism	n=39 -10.8 (-17.8, -3.8)	n=56 4.1 (-1.7, 9.9)	-14.9 (-24.1, -5.8)	0.002
Work Productivity Loss	n=40 -11.9 (-18.8, -5.0)	n=55 3.5 (-2.4, 9.4)	-15.4 (-24.5, -6.2)	0.001
Activity Impairment	n=87 -11.8 (-16.4, -7.1)	n=103 -0.5 (-4.7, 3.8)	-11.3 (-17.6, -5.0)	<0.001
Absenteeism	n=40 -3.6 (-5.9, -1.3)	n=55 -3.0 (-4.9, -1.0)	-0.6 (-3.7, 2.4)	0.679

Abstract AB0946 – Figure 1

Results are from an analysis of covariance model, adjusted with BL WPAI:PsA subscale score, BL prednisone use (yes/no), and previous DMARD use (yes/no). LS mean is estimated using the observed margins of the covariates. WPAI:PsA scores were evaluated for subjects with values at both BL and Week 16. Absenteeism, Presenteeism, and Work Productivity Loss were evaluated only among employed subjects. Activity Impairment scores were evaluated among all randomised subjects with scores at BL and Week 16, regardless of employment status. CI=confidence interval; LS=least square.

**Conclusions:** In biologic-naïve subjects with PsA, APR monotherapy contributed to an overall improvement in work productivity at Week 16, which correlated with SF-36v2 PF, Pain, and VIT scores and was associated with ACR20 response; improvements in WPAI:PsA subscale scores were generally maintained to Week 104.

**AB0947 IMPACT OF CLINICAL SPECIALTY SETTING ON DISEASE MANAGEMENT IN PATIENTS WITH PSORIATIC ARTHRITIS: RESULTS FROM A CROSS-SECTIONAL OBSERVATIONAL STUDY IN THE UNITED STATES**

P.J. Mease<sup>1</sup>, B. Lockshin<sup>2</sup>, C. Liu<sup>3</sup>, E. Siegel<sup>4</sup>, L. Chen<sup>5</sup>, X. Bu<sup>5</sup>, X. Wang<sup>5</sup>, K. Douglas<sup>5</sup>. <sup>1</sup>Swedish Med. Ctr. and Univ. of Washington, Seattle; <sup>2</sup>US Dermatology Partners, Rockville; <sup>3</sup>Bellevue Dermatology Clinic, Bellevue; <sup>4</sup>Arthritis and Rheumatism Associates and Georgetown Univ., Rockville; <sup>5</sup>AbbVie Inc, N Chicago, USA

**Background:** Early diagnosis and effective treatment has been shown to decrease functional disability and structural progression in patients (pts) with psoriatic arthritis (PsA).<sup>1</sup> However, factors that influence treatment management decisions are poorly understood.

**Objectives:** To evaluate the impact of clinical specialty setting on the management of US pts with PsA.

**Methods:** LOOP was a multi-centre, cross-sectional observational study conducted across 44 sites in US. Adult pts who was suspected or an established diagnosis of PsA who were routinely visiting a rheumatologist (rheum) or a dermatologist (derm) were eligible to participate in this study. Each enrolled pt was assessed by both rheum and derm. The association between enrolling or diagnosing clinical specialty setting and time from symptom onset to PsA diagnosis and to different disease management steps were examined.

Abstract AB0947 – Table 1. Current Disease Activity and Disease Burden by Clinical Specialty in US Patients with PsA from LOOP Study

Measure*	Rheum (N=366)	Derm (N=147)	P-value*
TJC68	8.2 (10.8)	9.9 (10.3)	.095

BSA=body surface area with psoriasis; DAS28 (CRP)=28 joint disease activity score based on C-reactive protein; DAS28 (ESR)=DAS28 based on erythrocyte sedimentation rate; Derm=dermatologist; DLQI=Dermatology life quality index; HAQ-DI=health assessment questionnaire – disability index; LEI=Leeds enthesitis index; MCS=mental component score; PASI=psoriasis area and severity index; PCS=physical component score; PGA=physician global assessment; PsA=psoriatic arthritis; PtGA=patient's global assessment of disease; Rheum=rheumatologist; SF12v2=Short form 12-item health survey version 2.0; SD=standard deviation; SJC66=swollen joint count, 66 joints; TJC68=tender joint count, 68 joints.

**Results:** Of 681 pts enrolled, 513 pts with a confirmed diagnosis of PsA were included in this analysis. PsA diagnosis was established prior to study entry in 404 pts (established pts), while diagnosis was confirmed during the study in 109 pts (suspected pts). In established pts, PsA was first diagnosed in 352 (87.1%) pts by a rheum and 40 (9.9%) pts by a dermatologist. Among suspected pts, 87 (79.8%) and 15 (13.8%) pts were being managed by dermatologist and rheumatologist setting, respectively. Patient demographics and disease characteristics were comparable between PsA pts enrolled by rheumatologist and dermatologist setting. Current disease activity and disease burden were also mostly similar between rheumatologist and dermatologist setting (table 1); though pts enrolled in dermatologist setting had higher scores on skin measures and enthesitis. The median (95% CI) time from symptom onset to PsA diagnosis was 1.0 (0.5, 1.1) and 2.6 (1.7, 4.1) years (y) in pts enrolled in rheumatologist and dermatologist setting, respectively ( $p < 0.001$ ). However, the median time to PsA diagnosis was 0.9 (0.5, 1.0) and 1.0 (0.0, 2.0) y in pts diagnosed by rheumatologists and dermatologists, respectively. After PsA diagnosis, the median time to first csDMARD and to first bDMARD was 1.0 and 2.4 y, respectively. Overall, 282 (55.0%) and 354 (69.0%) pts received csDMARDs and bDMARDs, respectively. Treatment with first csDMARD occurred in 106 (20.7%) pts before PsA diagnosis and 176 (34.3%) pts after diagnosis; for first bDMARD, it was 121 (23.6%) and 233 (45.4%) pts, respectively.

**Conclusions:** The duration from symptom onset to PsA diagnosis was longer in pts enrolled by dermatologists and was similar in pts diagnosed by both rheumatologists and dermatologists. The median time was longer for treatment with first bDMARD compared with first csDMARD. Current disease activity and disease burden highlight the delay in PsA diagnosis and the need for appropriate management of PsA pts, irrespective of clinical specialty setting.

AB0948

#### TUMOUR NECROSIS FACTOR INHIBITORS AND THEIR IMPACT ON DIABETES MELLITUS AMONG PATIENTS WITH PSORIATIC ARTHRITIS

S. Mantravadi<sup>1,2</sup>, M. George<sup>2</sup>, A. Ogdie<sup>2</sup>. <sup>1</sup>Thomas Jefferson University; <sup>2</sup>University of Pennsylvania, Philadelphia, USA

**Background:** Tumour necrosis factor is a key inflammatory cytokine in the pathogenesis of psoriatic arthritis (PsA) and diabetes mellitus (DM). <sup>1,2</sup>Tumour necrosis factor inhibitors (TNFi) have been shown to be associated with a decreased incidence of DM, but it is unknown whether treatment of PsA with TNFi has off-target therapy benefits for patients with DM. <sup>3</sup>

**Objectives:** To determine whether initiation of a TNFi, compared to initiation of methotrexate (MTX) or metformin, results in a decrease in Haemoglobin A1c (HbA1c) in patients with PsA, DM, and elevated HbA1c.

**Methods:** A retrospective cohort study was conducted in OptumInsight, a de-identified administrative claims database that includes laboratory values for approximately 10% of patients. Data from 2000–2014 was included. We identified patients with PsA and DM (defined by ICD-9CM codes), with an HbA1c  $\geq 7$  and examined change in HbA1c among new initiators of a TNFi (etanercept, adalimumab, certolizumab, or golimumab), MTX, and metformin (positive control). A baseline period of 12 months prior to the index date was required to capture potential confounders. All patients were required to have one HbA1c in the six months prior to and one HbA1c in the 6 months after drug initiation. We evaluated median

HbA1c change in each group and then assessed statistical differences using the Wilcoxon Rank Sum test (unadjusted). We then used linear regression models to determine the relative differences in HbA1c change using MTX as the reference and adjusted for age, sex, baseline A1c, DM medications, and comorbidities in the baseline period, with clustering to account for multiple new drug initiations per patient.

**Results:** Among 914 drug initiations in 756 patients with PsA and available HbA1c values, HbA1c was  $\geq 7$  before 125 (44%) of TNFi initiations, 90 (43%) of MTX initiations, and 233 (55%) of metformin initiations. The average time between baseline and follow-up HbA1c values was 231 days. Median HbA1c change was  $-0.50$  (IQR  $-1.30, 0.30$ ) after TNFi initiation,  $-0.40$  (IQR  $-1.50, 0.10$ ) after MTX initiation, and  $-0.90$  (IQR  $-1.80, 0$ ) after metformin initiation (figure 1). In adjusted analyses, TNFi initiators had a similar decrease in HbA1c compared to MTX initiators,  $\beta$  0.02 (95%CI:  $-0.29, 0.33$ ). Metformin initiators had a significantly greater change in HbA1c than MTX patients,  $\beta$   $-0.43$  (95%CI:  $-0.72, -0.13$ ).

Abstract AB0948 – Figure 1

**Conclusions:** TNFi and MTX initiation lead to a decline in HbA1c by half as much as metformin. Changes in HbA1c were not different among patients initiating TNFi versus MTX.

#### SERUM 25-HYDROXYVITAMIN D STATUS IN PATIENT WITH PSORIATIC ARTHRITIS

S. Tsuji<sup>1</sup>, J. Hashimoto<sup>1</sup>, T. Noguchi<sup>2</sup>, S. Akita<sup>2</sup>, K. Yachi<sup>2</sup>, S. Ohshima<sup>1</sup>, Y. Saeki<sup>3</sup>, M. Higashiyama<sup>4</sup>. <sup>1</sup>Department of Rheumatology and Allergology; <sup>2</sup>Department of Orthopaedic Surgery; <sup>3</sup>Department of Clinical Research, NATIONAL HOSPITAL ORGANIZATION, OSAKA MINAMI MEDICAL CENTER, Kawachinagano City, Osaka; <sup>4</sup>Department of Dermatology, Nissay Hospital, Osaka city, Japan

**Background:** Vitamin D has been recognised not only in calcium metabolism and bone metabolism but also in the physiological activities of a wide variety of cells, and its deficiency is caused by fractures/falls, osteoporosis and other various disease risks have been reported.

**Objectives:** To clarify vitamin D satisfaction status of patients with PsA, which is one of spondyloarthritis, by measuring serum 25OHD concentration.

**Methods:** 180 patients with PsA satisfying CASPAR criteria during the visit to our hospital between August 2016 and June 2017, 125 males, averaging age 54.1 y.o., BMI average 24.2, mean disease duration of PsA and psoriasis were 8.1 years, 19.3 years, respectively. The type of psoriatic arthritis was 79 spondylitis type and 101 peripheral type. MTX was 51.7% as an agent for treating PsA, and the average dose was 8.3  $\pm$  3.1 mg/week. The number of biologics use was 37.2%. There were 9 cases of osteoporosis and 21 cases of osteopenia, 20 patients who were undergoing treatment for osteoporosis, and all patients were treated with activated VD3. 110 patients (61.1%) had active type VD3 paint applied to psoriasis eruption. The ACPA positive rate was 7.4%, the rheumatoid factor positive was 17.7%, and

average CRP was  $0.25 \pm 0.36$  mg/dl. The test method for the serum 25OHD concentration was measured with the CLIA antibody method (SRL, Inc.). Regarding the judgment criteria of deficiency, although various discussions are in progress, "the index of serum 25OHD deficiency less than 20 ng/ml" prepared by the institute of medicine (IOM) in 2011 was used. As a study item, firstly, the degree of satisfaction of vitamin D using serum 25OHD concentration was determined. Second, it divided into VD deficient group and non-deficient group age, sex, disease duration, psoriatic arthritis type, blood biochemical test, presence of active VD administration, presence or absence of active type VD coating for skin, presence or absence of MTX · BIO, Osteoporosis · Percentage of osteopenia · The presence or absence of vulnerability fracture history was compared between both groups.

**Results:** Mean serum 25OHD concentration in patients with PsA was  $16.4 \pm 6.3$  ng/ml and serum 25OHD deficiency was observed in 134 cases (74.4%).

Factors that showed significant differences between the two groups (VD deficient group/normal group) were age ( $54.4/59.0$  y.o.  $p=0.032$ ), gender (female rate) 35.0%/11.9%:  $p=0.040$ , ACPA negative rate 97.0%/85.2%:  $p=0.010$ , serum MMP-3 ( $69.0/98.4$  ng/ml  $p=0.030$ ), active vitamin D top coating use rate for skin 54.0%/88.9%:  $p=0.001$ , Biologics treatment rate 49.3%/11.1%:  $p<0.001$ .

**Conclusions:** 74.4% of patients with PsA had vitamin D deficiency.

In the vitamin d-deficient group, low age, high female rate, ACPA negative, low serum MMP-3, VD coating low use rate for skin, biological product high usage rate were significant.

### AB0950 MINIMAL DISEASE ACTIVITY IN REAL LIFE IN PSORIATIC ARTHRITIS

S.B. Ureyen<sup>1</sup>, D. Solmaz<sup>1</sup>, N. Al Asoimi<sup>1</sup>, on behalf of PsArt-ID (Psoriatic Arthritis-International Database), E. Dalkilic<sup>2</sup>, M. Can<sup>3</sup>, A. Erden<sup>4</sup>, C. Ozisler<sup>4</sup>, M. Cinar<sup>4</sup>, L. Kilic<sup>4</sup>, U. Kalyoncu<sup>4</sup>, S.Z. Aydin<sup>1</sup>, on behalf of PsArt-ID (Psoriatic Arthritis-International Database). <sup>1</sup>PsArt-ID, Ottawa, Canada; <sup>2</sup>PsArt-ID, Bursa; <sup>3</sup>PsArt-ID, Istanbul; <sup>4</sup>PsArt-ID, Ankara, Turkey

**Background:** Minimal disease activity (MDA) is an important target in patients with psoriatic arthritis (PsA), however it is also criticised for having low threshold for patient reported outcomes (PRO).

**Objectives:** The aim of the study was to assess the prevalence of MDA components in patients with PsA and to evaluate disease characteristics and patterns in patients with or without MDA.

**Methods:** PsArt-ID (Psoriatic Arthritis- International Database) is a prospective, multicentre web-based registry ([www.trials-network.org](http://www.trials-network.org)). PsA patients who had at least 1 year of disease duration were included for this analysis. Patients were considered in MDA when they met at least 5/7 of the MDA criteria (figure 1).

**Abstract AB0950 – Table 1.** The demographics and disease characteristics according to MDA

	no MDA 170/317 (53.9)	MDA 147/317 (46.0)	p value
Female	109/188 (58)	79/188 <sup>42</sup>	0.061
Age (years)*	50 (40–59)	51.5 (37–60.5)	0.924
Education years*	11 (5–15)	11 (5–14)	0.738
Disease duration (months)*	95 (66–155)	88 (59–155)	0.843
Nail involvement	92/171 (53.8)	73/146 <sup>50</sup>	0.500
Dactylitis	65/170 (38.2)	55/147 (37.4)	0.881
Enthesitis	35/170 (20.6)	16/147 (10.9)	<b>0.022</b>
<b>PsA clinical pattern</b>			
Polyarthritis	78/170 (45.9)	70/146 (47.9)	0.714
Oligoarthritis	66/170 (38.8)	50/146 (34.2)	0.415
Monoarthritis	1/170 (0.6)	9/146 (6.2)	<b>0.007</b>
DIP joint involvement	42/170 (24.7)	23/146 (15.8)	<b>0.050</b>
Axial involvement	79/170 (46.5)	56/146 (38.4)	0.171
Arthritis mutilans	0/170 (0)	1/146 (0.7)	0.462

**Results:** In January 2018, 1283 patients from Turkey and 119 patients from Canada were recruited, 317 of whom had full data for MDA and were included in this analysis. The demographics, disease characteristics and patterns in patients with MDA achieved vs not are summarised in the table. There were no differences regarding demographics in both groups. The monoarthritis subtype (RR: 2.01, 95% CI: 1.579–2.559), the absence of enthesitis (RR: 1.570, 95% CI: 1.027–2.398) and the absence of distal interphalangeal joint disease (RR: 1.1, 95% CI: 1.001–1.25) were associated with higher probability of achieving MDA. Across different domains included in MDA, pain VAS $\leq 15$  and PtGA  $\leq 20$  could less frequently be achieved even when MDA is fulfilled as 44.5% and 26.5% of patients

respectively still did not fulfil these domains (figure 1). On the other hand, for patients that did not achieve MDA, the body surface area (51.2%) and swollen joint count (53.5%) domains could be achieved in the majority of the patients and 93.5% of them had no enthesitis using the Leeds enthesitis index. Physician global assessment ( $>21$  vs  $\leq 20$ ) and BASDAI ( $>41$  vs  $\leq 40$ , only for axial disease) had only moderate agreement with MDA (achieved or not) ( $\kappa=0.47$ ,  $p=0.05$  and  $\kappa=0.469$ ,  $p=0.072$ ; respectively).

All data were given n/total n (percentage (%)) or median (first-third percentiles)\*. MDA: minimal disease activity; PsA: Psoriatic Arthritis; DIP: distal interphalangeal.

**Abstract AB0950 – Figure 1.** The distribution of all MDA domains in patients achieving MDA and patients not achieving MDA. TJC: tender joint counts; SJC: swollen joint counts; TEP: tender enthesal points; BSA: body surface area; PtGA: patient global activity; VAS: visual analogue scale; HAQ: Health Assessment Questionnaire.

**Conclusions:** The MDA criteria provide an objective target for treatment in trials and clinical practice; however in real life PROs are the most significant barriers to achieve MDA within all domains. Leeds enthesitis index was not able differentiate MDA, for being negative in the vast majority of the patients. Monoarthritis subtype is a good prognostic factor whereas DIP joint disease and history of enthesitis are poor prognostic factors to achieve MDA.

### AB0951 ULTRASONOGRAPHIC ASSESSMENT OF NAIL IN PSORIATIC DISEASE FOUND A LINK BETWEEN NAIL DISORDER AND SOFT TISSUE SWELLING AROUND THE NAIL

T. Okano<sup>1</sup>, K. Inui<sup>1</sup>, Y. Yamada<sup>1</sup>, K. Mandai<sup>1</sup>, K. Mamoto<sup>1</sup>, Y. Sugioka<sup>2</sup>, T. Koike<sup>2,3</sup>, H. Nakamura<sup>1</sup>. <sup>1</sup>Department of Orthopedic surgery; <sup>2</sup>Center for Senile Degenerative Disorders (CSDD), Osaka City University Graduate School of Medicine, Osaka; <sup>3</sup>Search Institute for Bone and Arthritis Disease (SINBAD), Shirahama Foundation for Health and Welfare, Wakayama, Japan

**Background:** Although skin lesion is the most typical findings in patients with psoriasis (PsO), nail psoriasis is also one of the clinical manifestation. Moreover, nail disorders in PsO are known as a risk factor for psoriatic arthritis (PsA). However, pathological feature and the relationship with inflammation of the soft tissue around the nail is unknown.<sup>1–2</sup>

**Objectives:** The aim of this study was to compare the soft tissue thickness around the nail in patients with PsO, PsA and other rheumatic diseases by using ultrasonography.

**Methods:** Twenty-five PsO · 35 PsA · 23 rheumatoid arthritis (RA) · 28 ulcerative colitis (UC) and 13 Crohn's disease (CD) patients performed ultrasonographic assessment in nail were included in this analysis. Ultrasonographic examination was performed by using HI VISION Ascendus (Hitachi Medical Corporation, Japan) with a multifrequency linear transducer (18–6 MHz) and the grey scale (GS) and power Doppler (PD) findings were assessed. The distance between the proximal nail fold on the dorsal side of the nail matrix and the nail bed on the volar side of the nail matrix was measured by electric calliper

**Results:** The distance between the proximal nail fold and the nail bed was  $2.58 \pm 0.56$  mm in PsA and  $2.55 \pm 0.58$  mm in PsO patients ( $p=0.603$ ). Among the 60 patients who combined PsO and PsA patients, 41 patients with nail psoriasis and 19 patients without nail psoriasis was compared. The distance was  $2.68 \pm 0.62$  mm in patients with nail psoriasis and  $2.30 \pm 0.41$  mm in without nail psoriasis ( $p<0.001$ ), which was also swelling compared with the RA, UC and CD group.

**Abstract AB0951 – Table 1.** The thickness of proximal nail fold, nail bed and proximal nail fold + nail bed in patients with psoriasis, psoriatic arthritis and other rheumatic disease

	proximal nail fold (mm)	nail bed (mm)	proximal nail fold +nail bed (mm)
Psoriasis (n=25)	1.23±0.27	1.33 ±0.47	2.55±0.58
Psoriatic arthritis (n=35)	1.33±0.35	1.25 ±0.38	2.58±0.56
Psoriasis or psoriatic arthritis with nail psoriasis (n=41)	1.34±0.34	1.36 ±0.45	2.68±0.62
Psoriasis or psoriatic arthritis without nail psoriasis (n=19)	1.18±0.27	1.11 ±0.29	2.30±0.41
Rheumatoid arthritis (n=23)	1.14±0.27	1.14 ±0.33	2.27±0.46
Ulcerative colitis (n=28)	1.21±0.28	1.22 ±0.33	2.43±0.49
Crohn's disease (n=13)	1.11±0.25	1.14 ±0.37	2.25±0.49

**Conclusions:** Soft tissue thickness around the nail in patients with PsO and PsA was compared with other rheumatic diseases by ultrasonographic assessment. In patients with PsO and PsA with nail psoriasis, soft tissue swelling around nail was observed.

AB0952

#### HIGH PREVALENCE OF INFLAMMATORY AND NON-INFLAMMATORY LIVER AND GASTROINTESTINAL DISEASES IN YOUNG PATIENTS WITH PSORIATIC ARTHRITIS: A HOSPITAL-BASED STUDY

N. Batkaeva<sup>1</sup>, E. Batkaev<sup>2</sup>, T. Korotaeva<sup>3</sup>. <sup>1</sup>Dermatology, Peoples' Friendship University of Russia (RUDN University); <sup>2</sup>Dermatology, Peoples' Friendship University of Russia (RUDN University); <sup>3</sup>Research Institute of Rheumatology n. a. V. A. Nasonova, Moscow, Russian Federation

**Background:** Psoriatic arthritis (PsA) is associated with numerous comorbidities, including gastrointestinal (GI) and liver diseases (LD). But there is limited data about the prevalence of these disorders among patients (pts) with PsA and severe psoriasis (PsO) in Russian population.

**Objectives:** to evaluate the prevalence of LD and GIT comorbidity in a hospital-based cohort of PsA pts.

**Methods:** 417 (304 Male (M.)/113 Female (F.)) PsA pts, according the CASPAR criteria, mean age 38.5±11.3/36.1±11.0 years (yrs) accordingly, PASI 49.4±0.56, PsA duration 6.6±7.4 years were included. PsA pts with all GIT and LD, including Diseases of oesophagus, stomach and duodenum (K20–K31), Disorders of gallbladder, biliary tract and pancreas (K80–K87), Alcoholic and toxic liver disease (K70–K77) (LD), Viral hepatitis (B15–B19) (VH), non-infectious enteritis and colitis (K55–K63) NEC were identify in the hospital Database and coding by International Statistical Classification of Disease and Related Health Problems (ICD-10) between 2010–2015 years. M±m, t-test, (%) were calculated. All p<0.05 were considered to indicate statistical significance.

**Results:** 229 (159 – M./70 – F.) out of 417 pts (54.9%) had LD and GIT disorders. Gallbladder, biliary tract and pancreas disease coding as K80–K87 were found in significantly more cases in F. compare to M. pts – in 26 out of 70 pts (37.4%) and in 31 out of 159 pts (19.4%) accordingly (p<0.05). NEC coding as K55–K63 was found in M. only – in 1 out of 159 (0.62%) pts. Diseases of oesophagus, stomach and duodenum coding as K20–K31 were found in 96 out of 229 pts (42%). All of the alcoholic, toxic and viral liver disease were found in 75 out of 229 pts (32.75%). LD coding as K70–K77 were found in 33 out of 75 pts (44%). VH coding

as B15–B19 were found in 42 out of 75 pts (56%). No significantly gender differences were found in those group of pts.

**Conclusions:** GIT and LD were found in more than half of young pts with PsA and severe PsO. That information should be taken in account during the choice of safety therapy in this group of pts.

**Disclosure of Interest:** None declared

AB0953

#### PSAID-12 CAN BE USED TO DETERMINE THE ANTI-TNF TREATMENT DECISION IN THE PSORIATIC ARTHRITIS REGISTRY

U. Kalyoncu, S. Kiraz, S. Apras Bilgen, O. Karadag, A. Akdogan, L. Kilic, A. Erden, B. Armagan, A. Sari, I. Ertenli. *Hacettepe University, Department of Internal Medicine, Division of Rheumatology, Ankara, Turkey*

**Background:** Psoriatic Arthritis Impact of Disease (PsAID-12) score has 12 questions and each question has its own weight. PsAID-12 is developed to be used in daily practice. However, in the daily practice, there has been no information on the utilisation of determining the response of the biological DMARD treatment.

**Objectives:** The assessment of utilisation of PsAID-12 for PsA patients on determination of the efficiency and inefficiency of anti-TNF treatment in a biological registry.

**Methods:** In this study patients were taken from Hacettepe University biological database (HUR-BIO). Since January 2013 PsAID-12 score was built in HUR-BIO database. PsAID-12 score was known for 116 patients before starting off the first anti-TNF treatment and 88 patients whose PsAID-12 score was 4 and above were included in the enquiry. Overall, 70 PsA patients included to analysis. Demographic data before anti-TNF treatment of PsA patients were noted. The decision of continuation, stopping or switching to another anti-TNF drugs were performed by both clinicians and the patients agreement. According to baseline evaluation, decrease of 20 mm and above on pain-VAS score and PGA, improvement of 0.22 unit and above on HAQ-DI score, or decrease of 1.2 unit and above on DAS-28 score were considered favourable to the anti-TNF treatment. Stopping or switching the anti-TNF treatments due to inefficiency was definitely a negative response. Pain-VAS score being under 15 mm or below, global-VAS score being 20 mm and below, HAQ-DI score being 0.5 and below, DAS-28 score being 2.6 and below were determined as targeted goals. Changes were analysed comparing to baseline level in PsAID-12 score, in compliance with the favourable and unfavourable responses to Anti-TNF treatments. In determining the response of the treatment, standardised response mean (SRM) was used.

**Results:** Seventy (78.6% female) patients were analysed, mean age was 45.5 (12.0). Mean follow-up duration was 18.3 (12.6) months, and total of 213 clinical visits were performed, median 3<sup>1-3</sup> control visits were done. At baseline, the mean (SD) DAS-28 4.07 (1.22), HAQ-DI 0.86 (0.53), pain-VAS 6.9 (2.1), PGA-VAS 6.4 (1.7), and PsAID-12 6.6 (1.5) were as follows. Anti-TNF treatments were stopped due to inefficacy in 43/210 (20.5%) outpatient visit during the follow-up period. The results of anti-TNF stopped and continuing patients; Δ PsAID-12 were 0.38 (1.71), and 3.12 (2.14), respectively and PsAID-12 baseline/control visits 0.96 (0.29) vs 0.50 (0.33), respectively. Level of favourable response and achieving to goal according to ΔPsAID-12 and PsAID-12 Baseline/control visit were shown table 1. On the follow up visits, among measured parameters one of the highest SRM was detected in PsAID-12; PsAID-12 (1.10), DAS-28 (1.14), PGA (0.88), Pain (0.85), and HAQ-DI (0.51), respectively.

**Abstract AB0953 – Table 1.** Goals and responses of Anti-TNF treatment

			ΔPsAID-12	PsAID-12 Baseline/control
Level of favorable response to anti-TNF treatments	Δ Pain ≥ 20 mm	Yes n=136	3.4 (1.9)	0.47 (0.33)
		No n=77	1.1 (1.9)	0.81 (0.34)
	Δ PGA ≥ 20 mm	Yes n=133	3.4 (2.1)	0.45 (0.33)
		No n=80	1.2 (2.0)	0.84 (0.31)
	Δ HAQ-DI ≥ 0.22	Yes n=110	3.5 (2.0)	0.44 (0.29)
		No n=103	1.6 (2.1)	0.74 (0.38)
Δ DAS-28 ≥ 1.2	Yes n=122	3.5 (2.1)	0.44 (0.31)	
	No n=70	1.2 (1.8)	0.80 (0.32)	
Level of achieving the goal of PsA treatment	Pain ≤ 15 mm	Yes n=57	4.3 (2.1)	0.28 (0.32)
		No n=156	1.9 (2.1)	0.71 (0.32)
	PGA ≤ 20 mm	Yes n=68	4.2 (2.1)	0.28 (0.29)
		No n=145	1.8 (2.0)	0.74 (0.32)
	HAQ-DI ≤ 0.5	Yes n=136	3.5 (2.1)	0.43 (0.32)
		No n=77	0.9 (1.7)	0.89 (0.28)
DAS-28 < 2.6	Yes n=118	3.1 (2.3)	0.48 (0.35)	
	No n=85	1.7 (2.2)	0.75 (0.36)	

**Conclusions:** Having 3.5 unit or 50% decrease in the PsAID-12 score indicates a favourable response to anti-TNF treatment, 4 unit or 70% decrease indicates level

of targeted response. PsAID-12 appears to be an effective composite index for retaining the response of the treatment in biological registry.

**A RANDOMISED, DOUBLE-BLIND TRIAL COMPARING THE EFFICACY, SAFETY AND IMMUNOGENICITY OF MSB11022, A PROPOSED BIOSIMILAR OF ADALIMUMAB, VERSUS ADALIMUMAB ORIGINATOR IN PATIENTS WITH MODERATE-TO-SEVERE PLAQUE PSORIASIS**

J. Hercogová<sup>1</sup>, K.A. Papp<sup>2</sup>, C.J. Edwards<sup>3</sup>, V. Chyrok<sup>4</sup>, T. Halady<sup>4</sup>, M. Ullmann<sup>4</sup>, P. Vlachos<sup>5</sup>. <sup>1</sup>Charles University, Prague, Czech Republic, <sup>2</sup>Probit Medical Research Inc, Waterloo, ON, Canada, <sup>3</sup>University of Southampton, Southampton, UK, <sup>4</sup>Fresenius Kabi, Aubonne, <sup>5</sup>Cytel, Geneva, Switzerland

**Background:** Adalimumab is a fully human anti-TNF mAb, indicated for the treatment of multiple inflammatory disorders. MSB11022 is a proposed adalimumab biosimilar that has shown analytical similarity [1] and bioequivalence to US-licensed and EU-approved adalimumab originator, as well as comparable safety, tolerability and immunogenicity in a phase I trial [2].

**Objectives:** The aims of this multicentre, double-blind, parallel-group, 52-week phase III study (AURIEL-PsO, NCT02660580) were to demonstrate equivalence in efficacy (Psoriasis Area and Severity Index [PASI] 75) and to compare the safety and immunogenicity of MSB11022 vs. adalimumab originator in patients with moderate-to-severe chronic plaque psoriasis. This study was designed in-line with the biosimilar regulatory framework as part of the totality of evidence to confirm similarity and rationale for extrapolation.

**Methods:** A total of 443 eligible patients (391 evaluable, including 43 with psoriatic arthritis) from 69 sites in 12 countries were randomised 1:1 and treated with MSB11022 (n=202) or adalimumab originator (n=189) (80 mg subcutaneously [SC] on day 1; 40 mg SC every other week from weeks 2–14). The primary endpoint was PASI 75 at week 16; equivalence was established if the 95% confidence interval (CI) for the treatment difference was within ±18%. Secondary endpoints included % change from baseline in PASI (equivalence confirmed if 95% CI within ±15%), Physician Global Assessment (PGA), quality of life (QoL), immunogenicity and safety. Interim results at week 16 are presented.

**Results:** Patient baseline characteristics were comparable between MSB11022 and adalimumab originator groups: mean age 44.8 vs. 42.4 years, male 66.8% vs. 68.3%, mean PASI score 20.7 vs. 21.2, respectively. PASI 75 scores were 89.6% for MSB11022 and 91.5% for adalimumab originator (difference -1.9% [95% CI -7.82-4.16]). Mean % change from baseline in PASI was -90.6% for MSB11022 and -91.7% for adalimumab originator (difference -1.0% [95% CI -1.23-2.98]). PGA and QoL scores were comparable between treatment groups. The incidence of treatment-emergent adverse events (TEAEs)/serious TEAEs was 51.1/3.6% for MSB11022 and 53.2/2.7% for adalimumab originator. Immunogenicity profiles of MSB11022 and adalimumab originator were also similar and consistent.

**Conclusions:** Week 16 results of this phase III confirmatory study demonstrated equivalent efficacy and similar safety and immunogenicity profiles for MSB11022 vs. adalimumab originator at 16 weeks in patients with moderate-to-severe chronic psoriasis.

**TILDRAKIZUMAB EFFICACY OVER TIME BY WEEK 28 RESPONSE LEVELS IN TWO PHASE 3 CLINICAL TRIALS IN PATIENTS WITH CHRONIC PLAQUE PSORIASIS**

A. Blauvelt<sup>1</sup>, H. Sofen<sup>2</sup>, K. Papp<sup>3</sup>, M. Gooderham<sup>4</sup>, Y. Zhao<sup>5</sup>, S. Lowry<sup>5</sup>, A. Mendelsohn<sup>5</sup>, J. Parnoo<sup>5</sup>, Q. Li<sup>6</sup>, C.L. Rosa<sup>5</sup>, K. Reich<sup>7</sup>. <sup>1</sup>Oregon Medical Research Center, Portland; <sup>2</sup>Medicine, University of California at Los Angeles, Los Angeles, USA; <sup>3</sup>Probit Medical Research, Waterloo; <sup>4</sup>Skin Centre for Dermatology, Peterborough, Canada; <sup>5</sup>Sun Pharmaceuticals, Princeton; <sup>6</sup>Merck and Co., Inc., Kenilworth, USA; <sup>7</sup>SCIderm Research Institute and Dermatologikum, Hamburg, Germany

**Background:** Tildrakizumab (TIL), a high affinity, humanised, IgG1/κ monoclonal antibody for IL-23p19, recently demonstrated efficacy in patients with chronic plaque psoriasis in two, phase 3 clinical trials.

**Objectives:** To examine efficacy from baseline to week 52 among TIL patients achieving various Psoriasis Area and Severity Index (PASI) responses at week 28.

**Methods:** ReSURFACE 1 (NCT01722331) and reSURFACE 2 (NCT01729754) were double-blind, randomised controlled trials in subjects with moderate-to-severe chronic plaque psoriasis<sup>1</sup>. Part 1 (0–12 weeks) was placebo controlled; Part 2 (12–28 weeks) re-randomised placebo patients to TIL; Part 3 (28–64 weeks, reSURFACE 1; 28–52 weeks, reSURFACE 2) patients with ≥PASI 50 were re-randomised to continue or increase TIL dose or to placebo based on response at week 28. In this post-hoc pooled analysis, patients on TIL 100 mg and 200 mg from baseline to week 52 were classified in 5 mutually exclusive groups based on their week-28 PASI response: PASI <50, PASI 50–74, PASI 75–89, PASI 90–99, and PASI 100. Baseline characteristics and % PASI improvement from baseline up to week 52 (observed data) were examined for each group.

**Results:** This analysis included 575 (TIL 100 mg) and 581 (TIL 200 mg) patients; the overall pooled Week 28 PASI 75/90/100 responses were 77%/54%/23% (TIL 100 mg) and 78%/58%/29% (TIL 200 mg). At week 28, 133 (23.1%), 175 (30.4%), 137 (23.8%), 82 (14.3%), and 48 (8.3%) TIL 100 mg patients and 170 (29.3%), 169 (29.1%), 114 (19.6%), 105 (18.1%), and 23 (4.0%) TIL 200 mg achieved PASI 100, PASI 90–99, PASI 75–89, PASI 50–74, and PASI <50, respectively. On average, PASI 100 patients were younger, lighter, and had shorter disease duration at baseline compared to other response groups. For TIL 100 mg, % PASI improvement was highest for PASI 100 and least for PASI <50 patients for all visits up to week 28 (week 4: 53%, 46%, 38%, 30%, and 16%; week 28: 100%, 95%, 83%, 64%, and 33% for PASI 100, PASI 90–99, PASI 75–89, PASI 50–74, and PASI <50 categories, respectively). Among patients achieving PASI >50 at week 28 and continued up to 52 weeks, % PASI improvement remained consistent or improved from week 28 to week 52. Similar results were observed for TIL 200 mg as well as subgroup analysis with bio-naïve and bio-experienced patients, respectively.

**Conclusions:** The majority of TIL 100 and 200 mg patients achieved PASI>50 response at week 28, and PASI improvement was maintained from week 28 to week 52. Among patients achieving ≥PASI 90 at week 28, TIL 100 and 200 mg were associated with rapid improvement by week 4.

**AB0956** **LEUCINE-RICH ALPHA-2 GLYCOPROTEIN IS A PREDICTABLE BIOMARKER FOR THERAPEUTIC RESPONSE AND CLINICAL RELAPSE TO BIOLOGICS, BUT NOT TO APREMILAST IN PATIENTS WITH PSORIASIS**

Y. Shibata<sup>1</sup>, S. Serada<sup>2</sup>, M. Fujimoto<sup>2</sup>, H. Nakajima<sup>1</sup>, S. Sano<sup>1</sup>, T. Naka<sup>2,3</sup>.  
<sup>1</sup>Dermatology, <sup>2</sup>Center for Intractable Immune Disease, Kochi Medical School, Kochi; <sup>3</sup>Laboratory of Immune Signal, National Institutes of Biomedical Innovation, Health and Nutrition, Osaka, Japan

**Background:** Leucine-rich alpha-2 glycoprotein (LRG) is a 50 kDa protein produced by hepatocytes, endothelial cells, neutrophils and macrophages, and it was identified as an inflammatory biomarker that correlates with the disease activity of autoimmune diseases such as inflammatory bowel disease and rheumatoid arthritis. We recently reported that LRG could also be a biomarker of psoriasis, which correlated with the clinical severity scores such as Psoriasis Area and Severity Index (PASI), Disease Activity Score 28 (DAS-28) and Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) more closely than common inflammation markers like C-reactive protein (CRP) and erythrocyte sedimentation rate (ESR). The biologics are innovative therapies for psoriasis, however they can cause side effects and increase medical cost. Recently, apremilast, a small molecule inhibitor of phosphodiesterase 4, was approved for treatment of psoriasis in Japan, yet the precise mechanism remains unknown.

**Objectives:** To explore the eligibility of serum LRG for a biomarker to monitor the responses to biologics and apremilast in psoriasis.

**Methods:** Antibodies to TNF-alpha, IL-12/IL-23p40, IL-17A and IL-17 receptor A and apremilast were administered in patients with psoriasis vulgaris and psoriatic arthritis (n=15, 6, 14, 4 and 8 respectively). Serum LRG levels were measured by enzyme-linked immunosorbent assay. Serum CRP and ESR, and PASI, DAS-28 and BASDAI were also recorded.

**Results:** Serum LRG decreased along with the improvement of clinical scores after the administration of biologics, and reflected the change of scores more accurately than CRP and ESR. Furthermore, the LRG levels preceded the changes of clinical symptoms and predicted both primary and secondary treatment failure at the early time point, allowing us to determine if we should increase the doses, discontinue or switch to another drug. In some patients with PASI clear, complete regression of eruption, after biologics, serum LRG rose from the baseline while their PASI scores remained stable; however, they later relapsed. On the other hand, LRG did not reflect the therapeutic effectiveness of apremilast.

**Conclusions:** Serum LRG in psoriasis patients would be a sensitive biomarker for predicting the effectiveness and treatment failure of biologics, but not of apremilast. Monitoring LRG levels may enable us to decide the timing of bio-attenuation and to detect the relapse after discontinuation of biologics.

**Background:** Among patients with psoriasis, risk factors for developing musculoskeletal manifestations, known as psoriatic arthritis (PsA), are not recognised well.

**Objectives:** The aim of this study is to clarify the relationship between severity of skin disease and arthritis.

**Methods:** Psoriasis patients referred from dermatologists for assessment of musculoskeletal manifestations between June 2015 and July 2017 were enrolled. Their age, comorbidity, disease duration and treatment were collected. Presence of inflammatory back pain, sacroiliac joint tenderness or enthesitis were examined. Severity of skin symptoms were evaluated by dermatologists in Psoriasis area and severity index (PASI). Psoriatic arthritis screening and evaluation (PASE) and disease activity score (DAS28 ESR) were also evaluated. PsA was diagnosed by The Classification for Psoriatic Arthritis (CASPAR) criteria assisted with musculoskeletal ultrasound examination.

**Results:** Among 107 patients with psoriasis referred from dermatologists during designated period, 63 patients were diagnosed as PsA. These PsA patients were compared with 44 patients who had no arthritis (PsO). Multiple logistic regression analysis showed neither of age, sex, PASI, disease duration, rheumatoid factor (RF), CRP or Matrix Metalloproteinase-3 (MMP3) had no association with presence of PsA (table 1). Among 63 patients with PsA, those using NSAIDs (p=0.028), those with inflammatory back pain (p=0.002) and male patients (p=0.017) had significantly high PASI. PASI significantly correlated with age (Spearman's correlation coefficient R=-0.303; p=0.016), body height (R=0.301; p=0.019) and weight (R=0.383; p=0.002), but not with DAS28 ESR, MMP3 or disease duration (table 2).

Table 1 multiple logistic regression analysis for presence of PsA

variables	OR	95% CI	P value
age	0.99	0.95-1.03	0.538
sex	2.13	0.66-6.90	0.207
PASI	0.96	0.89-1.03	0.258
disease duration	0.99	0.96-1.04	0.847
RF	0.99	0.99-1.01	0.408
CRP	2.76	0.76-10.10	0.125
MMP3	1	1.00-1.01	0.271

Abstract AB0957 – Table 2. Correlations with PASI in patients with PsA (Spearman's correlation)

variables	R	P value
age	-0.303	0.016
body height	0.301	0.019
body weight	0.383	0.002
disease duration	0.134	0.311
PASE	0.088	0.504
DAS28 ESR	-0.268	0.110
RF	0.152	0.273
CRP	0.211	0.105
MMP3	0.133	0.310

**Conclusions:** PASI did not associate with presence of arthritis. Furthermore, even DAS28 ESR, reflecting musculoskeletal manifestations, or disease duration did not correlated with PASI among patients with PsA. These indicates severity of skin symptoms is not associated with musculoskeletal manifestations in patients with psoriasis.

**Disclosure of Interest:** None declared

## Osteoarthritis

### AB0958 KNEE PAIN IN OSTEOARTHRITIS: CORRELATION WITH SONOGRAPHIC FINDINGS

A. Radwan, A. Radwan, M. Khalifa, A.M. Elsaman. *Rheumatology and Rehabilitation, Sohag University, Sohag, Egypt*

**Background:** Osteoarthritis (OA) is a common joint disorder, with the knee being one of the most frequently involved sites. Knee OA causes pain and stiffness and can lead to considerable disability and consequently to a reduced quality of life (Wideman et al. 2014). The level of radiographic knee OA is, at most, moderately associated with the level of pain. Therefore, it is unlikely that pain is predominantly caused by only bone and cartilage pathology. Mechanical, structural, inflammatory, bone-related, neurological and psychological factors play a role in the process that results in painful knee OA (Wenger et al. 2013).

As OA is a disease of the entire joint that is characterised by cartilage breakdown, subchondral bone alterations and formation of osteophytes, as well as soft tissue abnormalities including meniscal degeneration, bursitis, tendonitis, Baker's cyst and synovial inflammation; information about these soft tissue structures might provide more insight into their potential role in the complex process of pain in knee OA (Cook 2016).

Musculoskeletal ultrasonography (US) is a relatively new imaging tool that is non-invasive, safe and relatively inexpensive and is able to create static as well as dynamic images. In addition, it has been shown to be more sensitive than clinical examination in picking up peri- and intra-articular soft tissue lesions (Beyers et al. 2014).

**Objectives:** To investigate the cause of pain in Knee OA by comparing sonographic and clinical findings in painful and non-painful osteoarthritic knee.

**Methods:** A cross-sectional case-control study carried out on fifty patients attending to Sohag University Hospitals rheumatology and rehabilitation outpatient clinic with Knee OA fulfilling ACR clinical criteria. They were divided into two groups. Group A (53) patients with knee pain (VAS 33 mm) during physical activity once at least in the previous 3 days prior to inclusion. Another (42) patients without knee pain for at least 1 month prior to inclusion (VAS 0 mm). All of the participants were subjected to the following:

- Full history (demographic data and personal history, detailed history of general health condition and chronic or current diseases).
- Knee clinical examination (including varus deformity angle assessment)
- Sonographic evaluation: of Effusion, Synovial hypertrophy, Baker's cyst, Enthesitis, Power Doppler by SOLAR score, menisci protrusion, bursitis, sonographic signs of Gout or CPPD and scoring of the osteophytes and cartilage

**Results:** Our study showed that the painful OA group are more obese, more varus deformities, effusion, synovial hypertrophy, cartilage changes, and higher grading of osteophytes than the control group. On the other hand, Baker cyst and meniscal protrusion echogenic foci, double contour, erosions, meniscal and cartilage calcification showed a non-significant difference between the two groups. We included all of the demographic, clinical and sonographic factors in a univariate regression analysis, and this analysis showed that synovial hypertrophy, effusion, the degree of cartilage changes, the degree of osteophytes, bursitis, and weight may be possible risk factors for pain among OA patients.

**Abstract AB0958 – Table 1.** Multivariate logistic regression analysis of the possible independent risk factors for pain among painful OA group compared to the non painful OA group.

Item	Odd's ratio	CI of Odd's	P value	Rank as a possible risk for pain
Weight	1.078	0.726-1.602	0.710	6
Effusion	4.312	2.172-24.422	0.013	3
Synovial hypertrophy	7.230	0.741-70.526	0.089	4
Degree of cartilage changes	9.523	2.354-38.532	0.002	1
Grade of osteophytes	12.268	2.112-71.283	0.005	2
Bursitis	5.151	0.239-0.296	0.296	5

Abstract AB0958 – Figure 1

**Conclusions:** Cartilage degeneration, osteophytes, effusion, synovial hypertrophy, bursitis, and overweight respectively, are the leading causes of pain in knee OA.

**Disclosure of Interest:** None declared

Eussen<sup>1,10</sup>. <sup>1</sup>Department of Epidemiology; <sup>2</sup>CAPHRI Care and Public Health Research Institute, Maastricht University; <sup>3</sup>Department of Internal Medicine, Division of Rheumatology; <sup>4</sup>Department of Clinical Pharmacy and Toxicology, Maastricht University Medical Center+, Maastricht; <sup>5</sup>Friesland Campina, Amersfoort; <sup>6</sup>Department of Orthopaedics; <sup>7</sup>Department of Internal Medicine, Maastricht University Medical Center+; <sup>8</sup>Department of Rehabilitation Medicine, Maastricht University, Maastricht; <sup>9</sup>CAPHRI Care and Public Health Research Institute, Maastricht University, Amersfoort; <sup>10</sup>CARIM School for Cardiovascular Diseases, Maastricht University, Maastricht, Netherlands

**Background:** Observational studies showed inverse associations between milk consumption and knee osteoarthritis (knee OA).<sup>1, 2</sup> There is lack of information on the role of specific other dairy product categories.

**Objectives:** To explore the association between dairy consumption and presence of clinical knee OA in individuals aged 40–75 year participating in the Maastricht Study.

**Methods:** Presence of clinical knee OA was defined according to a slightly modified version of the American College of Rheumatology (ACR) clinical classification criteria.<sup>3</sup> Data on dairy consumption was appraised by a 253-item Food Frequency Questionnaire covering 47 dairy products with categorization on fat content, fermentation or dairy type. Multivariable logistic regression analyses were performed to estimate odd ratios (ORs) and 95% confidence intervals (95% CI), while correcting for relevant factors.

**Results:** Of the 3010 participants included in this study, 427 individuals (14%) were classified as having clinical knee OA. Significant inverse associations were observed between presence of clinical knee OA and intake of full-fat dairy and Dutch, primarily semi-hard, cheese, with OR for the highest compared to the lowest tertile of intake of 0.68 (95%CI 0.50–0.92) for full-fat dairy, and 0.75 (95%CI 0.56–0.99) for Dutch cheese. No significant associations were found for other dairy product categories.

**Conclusions:** In this Dutch population, higher intake of full-fat dairy and Dutch cheese, but not milk, was cross-sectionally associated with lower presence of clinical knee OA. Prospective studies need to assess the relationship between dairy consumption, and in particular semi-hard cheeses, with incident knee OA.

### AB0960 POLYORBIDITY AND COGNITION IN AMBULATORY POSTMENOPAUSAL HIP AND KNEE OSTEOARTHRITIS PATIENTS

A.A. Popov<sup>1</sup>, N.V. Izmozherova<sup>2</sup>, N.A. Getmanova<sup>2</sup>. <sup>1</sup>Hospital Therapy Dept, <sup>2</sup>Pharmacology and Clinical Pharmacology Dept., Ural State Medical University, Ekaterinburg, Russian Federation

**Background:** Osteoarthritis (OA) has been reported to be a risk factor of morbidity, disability and premature cardiovascular mortality.

**Objectives:** to assess the impact of polyorbidity on cognitive function in postmenopausal women with primary OA.

**Methods:** cross-sectional study included ambulatory 682 postmenopausal women aged 48 to 62 (median 56; 25%–75%: 52.0 / 60.0). Inclusion criteria were: confirmed postmenopausal status and Kellgren stage 2 or 3 OA of the knee and/or hip joints fulfilling ARA criteria. Cognitive impairment (CI) was verified by MMSE scale (Mini Mental State Examination). For all patients expected individual risk of premature death and Charlson index were calculated.

**Results:** Median Charlson comorbidity index in women with OA was 4 (3 / 4). None of the patient had a comorbidity index of 0. The most frequent comorbidities were chronic heart failure (364 women (53.4%) and type 2 diabetes mellitus (180 women, 26.4%).

Charlson index increase was associated with decline of cognitive function (see table 1) with incline of quantity and severity of CI cases.

Abstract AB0960 – Table 1

Charlson Index	n	Age (Me, 25%–75%)	MMSE value	
			(Me, 25%–75%)	Lower limit
1	11	48 (45–49)	28 (28–29)	28
2	102	59 (47–55)	28 (27–29)	24
3	202	54 (51–57)	27 (26–29)	22
4	200	57 (53–60)	26 (25–28)	20
5	119	60 (57–65)	26 (24–27)	21

#### Conclusions:

- Hip and knee joints OA in postmenopausal women is associated with polymorbidity.
- Polymorbidity in OA patients is associated with cognitive impairment.

**Disclosure of Interest:** None declared

#### AB0961 CARDIORESPIRATORY RESPONSE ACCORDING TO BODY WEIGHT SUPPORT AND GAIT VELOCITY VIA ANTI-GRAVITY TREADMILL AFTER BILATERAL TOTAL KNEE ARTHROPLASTY

B.B. Kim. JEU NATIONAL UNIVERSITY HOSPITAL, Jeju, Korea, Republic of Ireland

**Background:** Patients undergoing total knee arthroplasty (TKA) may benefit from early focused postoperative rehabilitation, and progressive weight-bearing activities, such as walking, are routinely recommended during rehabilitation to facilitate return to normal gait function. Not all patients are capable of full weight-bearing activity in the early postoperative period and assistive devices such as walkers, crutches, and canes, are routinely employed. The anti-gravity treadmill, consisting of a treadmill enclosed within an airtight chamber, applies air pressure to a patient's lower body to alter body weight support and can reduce the forces at the knee during weight bearing exercise. The anti-gravity treadmill could be a useful device for early postoperative rehabilitation of TKA, especially for those patients with reduced physical strength and cardiovascular fitness. However, so far, there have been no reported investigations of the physiologic cardiorespiratory responses via anti-gravity treadmill in patients following TKA.

**Objectives:** This study was conducted to investigate cardiorespiratory response according to body weight support and gait velocity elicited using an anti-gravity treadmill during walking and to find specific gait velocity and body weight support combinations early after bilateral TKA.

**Methods:** Twenty five patients who underwent a primary TKA were enrolled in this study. Subjects walked with 2.5 km/h and 3.5 km/h on an anti-gravity treadmill at 3 levels (50%, 75%, 100%) of body weight (BW). Each trial was performed for 2 min with at least 1 min rest between trials. For cardiorespiratory responses, oxygen consumption ( $VO_2$ ), Heart rate, systolic (SBP) and diastolic blood pressure (DBP), respiratory exchange ratio (RER) and rate pulse product (RPP) were measured continuously with average values. The  $VO_2$ , heart rate and RER were measured by using the K4b2 (Cosmed, Rome, Italy), which is a wireless cardiopulmonary diagnostic device, and the values of these exercise variables were defined as the averages of values recorded during the last 30 s of exercise. The RPP was calculated ((heart rate x SBP)/100). In addition, Borg's rating of perceived exertion scale (RPE) and visual analogue scale (VAS) of knee pain were recorded immediately after each condition.

**Results:** There were 20 females and 32 men, with the average age being 71.3 ±5.4 years. In the two-way repeated measures ANOVA,  $VO_2$  levels ( $p<0.01$ ), HR ( $p<0.01$ ), RPP ( $p<0.01$ ), RPE ( $p<0.01$ ), RER ( $p<0.01$ ) and VAS ( $p<0.01$ ) were significantly increased in proportion to 3 levels (50%, 75%, 100%) of BW. In the post-hoc analysis, all other conditions except comparison of RER values between 50% level of BW and 75% level of BW under a speed of 2.5 km/h and a speed of 3.5 km/h were statistically significant. Meanwhile, SBP ( $p=0.65$ ) and DBP ( $p=0.39$ ) were not influenced by difference of BW levels.

While walking with a speed of 3.5 km/h at same fraction of BW level,  $VO_2$  ( $p=0.03$ ), RPE ( $p<0.01$ ) and RER ( $p=0.01$ ) values were statistically greater than 2.5 km/h. In the post-hoc analysis, all other conditions except comparison of RER values between a speed of 2.5 km/h and a speed of 3.5 km/h under 100% level of BW was statistically significant.

In addition, multiple linear regression analysis was performed to defining  $VO_2$  as functions of gait speed and fraction of BW under each condition. Based on BW and gait velocity settings of the LBPP treadmill, the equations were  $VO_2=1.46 v +0.08 BW+3.13$  (adjusted  $F^2=0.34$ )

**Conclusions:** This study demonstrated that cardiorespiratory responses were variably computed by combination of weight support and gait velocity during anti-gravity treadmill walking, and these cardiorespiratory responses and knee pain were more significantly influenced by body weight support than gait velocity. These findings suggest that body weight support and gait speed should be considered for gait training program for cardiovascular fitness early after bilateral total knee arthroplasty.

#### AB0962 IRISIN LEVELS ARE ASSOCIATED WITH EXERCISE, PAIN AND FUNCTION IN PATIENTS WITH KNEE OSTEOARTHRITIS

C. Orellana, J. Calvet, N. Navarro, C. Galisteo, J. Gratacós, M. Larrosa. Rheumatology, Parc Taulí Sabadell Hospital Universitari, Sabadell, Spain

**Background:** Muscle strengthening and aerobic exercise have been shown to improve joint pain and function in patients with knee osteoarthritis (OA). Irisin is a hormone-like myokine synthesized by skeletal muscle and its secretion appears to be related to physical activity in healthy people.

**Objectives:** To determine the levels of irisin synovial fluid and plasma and evaluate their association with exercise level and pain and function in patients with symptomatic knee OA.

**Methods:** Cross-sectional study with systematic inclusion of 108 symptomatic primary knee osteoarthritis patients (VAS>4) with ultrasound-confirmed joint effusion. Age, physical exercise, knee osteoarthritis symptoms duration and different anthropometric measurements were collected. Radiographic severity was evaluated according to Kellgren-Lawrence scale. Physical exercise was categorised as never, occasional (less than 150 min per week) or regular (more than 150 min per week). Pain and disability were assessed by the Lequesne algo-functional questionnaire. Irisin was measured by ELISA in synovial fluid and plasma. Summary of clinical data and laboratory parameters and their association with Lequesne scale were performed using non-parametric methods. Medians and Spearman correlation ( $r$ ) were used for continuous measures, and Mann-Whitney test was applied to categorical variables. This study was approved by the local ethics committee.

**Results:** Plasma and synovial irisin levels were strongly related ( $r=0.7$ ). Plasma and joint irisin levels showed an inversely significant association with the level of exercise in patients with symptomatic knee OA: no exercise 763.3 ng/mL, occasional exercise 631.8 ng/mL and regular exercise 523 ng/mL ( $p<0.01$ ). Patients with severe pain and disability (Lequesne algo-functional score >11) had higher plasma (791.5 vs 680.4 ng/mL,  $p<0.05$ ) and synovial (711.4 vs 468.7 ng/mL,  $p<0.05$ ) irisin levels compared to patients with less disability and pain. No relationship was found between irisin concentration in plasma or synovial fluid and radiographic severity.

**Conclusions:** Irisin levels were associated with pain and function in patients with knee osteoarthritis. Irisin levels were negatively associated with exercise level in this population.

**Disclosure of Interest:** None declared

#### AB0963 CALPROTECTIN AS A USEFUL MARKER OF INFLAMMATION IN KNEE OSTEOARTHRITIS

J. Calvet, C. Orellana, N. Navarro, C. Galisteo, J. Gratacós, M. Larrosa. Rheumatology, Parc Taulí Sabadell Hospital Universitari, Sabadell, Spain

**Background:** Low-grade synovial inflammation is known to be present in many patients with knee osteoarthritis and appears to have clinical and prognostic implications. Calprotectin seems to be more sensitive than CRP to detect minimal inflammatory activity in many inflammatory rheumatic diseases and could be a biomarker in osteoarthritis with inflammatory features.

**Objectives:** To determine the levels of synovial calprotectin in patients with knee osteoarthritis showing inflammatory traits and their relationship with clinical and ultrasonographic features and other proinflammatory markers.

**Methods:** Cross-sectional study with systematic inclusion of 108 symptomatic primary knee osteoarthritis patients (VAS>4) with ultrasound-confirmed joint

effusion. Age, physical exercise, knee osteoarthritis symptoms duration and different anthropometric measurements were collected. Radiographic severity was evaluated according to Kellgren-Lawrence scale. Pain and disability were assessed by WOMAC-pain and WOMAN-function. Calprotectin, TNF- $\alpha$ , IL-6 and high-sensitivity C-reactive protein (hs-CRP) were measured by ELISA in synovial fluid. Summary of clinical data and laboratory parameters and their association with WOMAC scales were performed using non-parametric methods. Medians and Spearman correlation ( $r$ ) were used for continuous measures, and Mann-Whitney test was applied to categorical variables. This study was approved by the local ethics committee.

**Results:** Median higher synovial calprotectin levels were associated with worse WOMAC pain (671.5 vs 431.8 ng/mL,  $p < 0.05$ .) and function (713.4 vs 400.1 ng/mL,  $p < 0.05$ .) scores than patients with inferior levels. Patients with moderate to severe synovial effusion ( $> 8$  mm on midline suprapatellar line) had higher calprotectin levels compared with those with mild effusion (626.1 vs 417.5 ng/mL,  $p < 0.05$ ). Synovial calprotectin levels showed moderate correlations with intra-articular TNF- $\alpha$  levels ( $r = 0.26$ ), hs-CRP ( $r = 0.27$ ) and a high correlation with synovial IL-6 levels ( $r = 0.53$ ).

**Conclusions:** Calprotectin showed association with inflammatory features as measured by ultrasound and inflammatory markers such as hs-CRP, TNF- $\alpha$  and IL-6, and was related to pain and function in patients with knee osteoarthritis with inflammatory features. Calprotectin appears to be a useful marker of inflammation and could be a useful marker for assessing response to treatments targeting inflammation.

#### THE ROLE OF MTOR GENE EXPRESSION, APOPTOSIS AND INFLAMMATION IN OBESE PATIENTS WITH KNEE OSTEOARTHRITIS

E. Strebkova, E. Chetina, L. Alekseeva. NASONOVA RESEARCH INSTITUTE OF RHEUMATOLOGY, Moscow, Russian Federation

**Background:** Metabolic osteoarthritis (OA) has been identified in rheumatology as a specific phenotype due to the growing rates of obesity and other comorbidities, with meta-inflammation as the key factor in its pathogenesis. On the other hand, OA progression is associated with altered regulation of chondrocytes' metabolism, namely, with up-regulated expression of genes encoding m-TOR, apoptosis, cartilage degeneration and inflammation.

**Objectives:** To measure the expression levels of genes encoding mTOR, apoptosis (caspase-3), cartilage destruction (cathepsin K), and inflammation (TNF- $\alpha$ ) in patients with knee OA (KOA) and obesity.

**Methods:** 50 female patients (45–65 y.o.) with Kellgren-Lawrence stage II-III KOA and obesity (BMI  $> 30$  kg/m<sup>2</sup>;) were randomised into 2 groups. Pts in Group 1 ( $n = 25$ ) were administered orlistat as a specific therapy for obesity for the period of 6 months, and life-style modifications including low caloric diet and physical exercises for 12 months, pts in Group 2 were recommended to observe the diet and physical exercises during 12 months. Peripheral blood samples were obtained at Mo12 for PCR evaluation of gene expression.

**Abstract AB0964 – Figure 1.** Body mass dynamics. **Abstract AB0964 – Figure 2.** Gene expression in obese pts with knee OA

**Results:** Following orlistat therapy pts from Group 1 managed to reduce their body weight by 10,07% at Mo 6 ( $p < 0,05$ ), while pts from Group 2 lost only 0,88% ( $p = 0,8$ ) of their body weight versus the baseline values. During the following 6 months pts from Group 2 on life-modifying regimen continued to lose their body weight, achieving 3,5% ( $p > 0,05$ ) weight reduction versus baseline values, while pts from Group 1 gained weight by 5,6% as compared to the values at Mo 6 during the study (figure 1). Expression of genes encoding inflammation, apoptosis and cell proliferation was assessed at Mo12 to evaluate possible correlation with the dynamics of body weight. Up-regulated expression ( $p < 0,05$ ) of genes encoding inflammation (TNF- $\alpha$ ), cartilage destruction (cathepsin K), apoptosis (caspase-3) and cell proliferation (m-TOR) was documented in KOA obese pts from Group 1, gaining body weight during the second stage of the study, as compared to the expression values in pts from Group 2 (figure 1). The analysis demonstrated direct positive correlation ( $p < 0,05$ ) between expression of genes encoding inflammation, cartilage destruction and apoptosis and pain intensity in knee joints assessed by VAS and WOMAC scales.

**Conclusions:** Therefore up-regulation of m-TOR, caspase-3, TNF- $\alpha$  and cathepsin K gene expression is observed in obese pts with KOA following weight gain and worsening of clinical parameters, which is suggestive of aggravated apoptosis, inflammation and cartilage destruction, providing further KOA progression.

#### MEDICAMENTAL AND NON-MEDICAMENTAL THERAPY PREGNANT WOMEN WITH HIP OSTEOARTHRITIS

E. Trofimov, V. Mazurov, A. Trofimova, E. Melnikov, I. Gaydukova. North-West II Mechnikov State Medical University, Saint-Petersburg, Russian Federation

**Objectives:** The management of patients with severe pain caused by primary or secondary osteoarthritis (OA) of the hip joint (TBS) has not been developed. The aim of the present work was to evaluate the impact of NSAIDs, glucocorticoids (GCS), analgesics and non-drug treatment methods on pregnancy outcomes in patients with primary and secondary OA TBS

**Methods:** The study included 99 pregnant women aged 35 to 49 with an intensive pain ( $\geq 4.0$  points for VAS) due to primary or secondary OA TBS. Depending on the form of OA, the severity of the pain and the patient's opinion, the therapy was prescribed – ibuprofen up to 800 mg per day orally ( $n = 31$ ) or paracetamol up to 1000 mg per day orally ( $n = 20$ ) or methylprednisolone up to 12 mg per day orally ( $n = 27$ ) or non-pharmacological methods ( $n = 21$ ). The efficacy of the treatment was evaluated within a month from the start of the therapy, pregnancy outcomes for the mother and fetus and pathology of the child after 12 months after the birth. The factors, associated with low efficacy of treatment, were evaluated.

**Results:** In 50 (51%) women was established primary OA TBS, in 49 (49%) – secondary OA TBS. A decrease of pain in TBS in patients of all treatment groups ( $p < 0.05$  for comparison with baseline) was registered. Patients with secondary OA, who received Methylprednisolone, showed a statistically significant ( $p < 0.05$ ) improvement in pain compared to patients in other clinical groups. A correlation was found between the intensity of pain syndrome (VAS) and BMI.

85 (85%) patients had urgent deliveries, 14 (14%) had premature, natural delivery in 82 (82%) women, and a caesarean section was performed in 29 (29%) cases. The cases of ante- and perinatal fetal death were not recorded.

Pathological conditions were absent in 28 (84.85%) of newborns, whose mothers refused medical treatment, in 28 (90.32%) newborns, who received ibuprofen, in 15 (75%) – paracetamol, and in 23 (85.19%), who were on methylprednisolone therapy (differences between groups are unreliable,  $p \geq 0.05$ ). In 12 months after birth in the group of newborns receiving antenatal ibuprofen, pathological conditions were observed in 3 children, paracetamol – in 5, metiprednisolone – in 4 children who were "without therapy" – in 5 children.

**Conclusions:**

- The use of non-medicamental and medicamental (non-selective NSAIDs or GCS in small doses or analgesics) treatment in pregnant woman with hip osteoarthritis has equal efficiency and safety for the health of the mother and fetus.
- Children, born to mothers with primary or secondary hip osteoarthritis, treated with NSAIDs or analgesics or GCS by medical treatment in age of 12th month do not differ from children, born to mothers with osteoarthritis of hip joints, receiving non-medicamental therapy.
- An increase of the body mass index of a pregnant woman with osteoarthritis of the hip joints is a predictor of refractoriness to any form of drug and non-drug therapy.

### CROSS-CULTURAL ADAPTATION AND VALIDATION OF THE KOREAN VERSION OF THE FUNCTIONAL INDEX FOR HAND OSTEOARTHRITIS (FIHOA)

G.Y. Ahn<sup>1</sup>, S.-K. Cho<sup>1</sup>, S.J. Cha<sup>2</sup>, E. Nam<sup>3</sup>, J.-E. Lee<sup>3</sup>, R.L. Dreiser<sup>4</sup>, E. Maheu<sup>5</sup>, Y.-K. Sung<sup>1</sup>. <sup>1</sup>Rheumatology, Hanyang University Hospital for Rheumatic Diseases; <sup>2</sup>Internal medicine, Hanyang University College of Medicine; <sup>3</sup>Biostatistical Consulting and Research Lab, School of Medicine, Hanyang University, Seoul, Korea, Republic of Ireland; <sup>4</sup>Rheumatology, Bichat Hospital, AP-HP; <sup>5</sup>Rheumatology, Saint-Antoine Hospital, AP-HP, Paris, France

**Background:** Osteoarthritis (OA) is one of the most common type of arthritis and it most frequently involves joints of the hands. Measuring functional ability of hand OA patients is important in terms of assessment of treatment response, patient management and improvement of quality of life. The functional index for hand osteoarthritis (FIHOA) is one of the most frequently utilised questionnaire to assess the physical function of hand OA patients. The FIHOA has been translated into 17 languages, however, no Korean version of FIHOA is yet available.

**Objectives:** To translate the FIHOA into Korean, and establish the reliability and validity of the cross-culturally adapted Korean version of FIHOA (K-FIHOA) in patients with hand OA.

**Methods:** The FIHOA was translated into Korean following cross-cultural adaptation guidelines. The K-FIHOA was pretested in 40 hand OA patients (defined by ACR classification criteria). The adapted K-FIHOA was then administered to 100 consecutive hand OA patients together with the modified Health Assessment Questionnaire (mHAQ) and visual analogue scale (VAS) for hand pain. The test-retest reliability of each item and total scores were assessed using Spearman's correlation coefficient and intraclass correlation coefficient (ICC). The internal consistency reliability was evaluated as the Cronbach's alpha. The external construct validity was assessed using correlation between K-FIHOA and mHAQ and hand pain VAS.

**Results:**

Abstract AB0966 – Table 1

K-FIHOA items	Test-retest reliability			Internal consistency			
	Test	Retest	Spearman's correlation coefficient	ICC	Adjusted item-total Correlation	Item-item correlation	Cronbach's alpha if item is deleted
Item 1	0.19 ±0.54	0.20 ±0.55	0.63	0.58	0.37	0.20–0.36	0.88
Item 2	0.25 ±0.59	0.25 ±0.59	0.58	0.54	0.51	0.26–0.48	0.88
Item 3	0.22 ±0.60	0.25 ±0.61	0.73	0.74	0.52	0.31–0.60	0.87
Item 4	0.35 ±0.66	0.30 ±0.59	0.62	0.58	0.59	0.33–0.52	0.87
Item 5	0.83 ±1.06	0.74 ±1.04	0.76	0.74	0.70	0.33–0.62	0.87
Item 6	0.40 ±0.85	0.40 ±0.88	0.66	0.75	0.63	0.22–0.73	0.86
Item 7	0.43 ±0.88	0.32 ±0.74	0.70	0.71	0.70	0.32–0.73	0.86
Item 8	0.19 ±0.53	0.13 ±0.37	0.62	0.56	0.47	0.25–0.60	0.87
Item 9	1.10 ±1.16	1.07 ±1.16	0.81	0.79	0.74	0.28–0.62	0.88
Item 10	0.43 ±0.79	0.39 ±0.69	0.85	0.80	0.44	0.20–0.52	0.88

Values are given as mean ±standard deviation.

Abbreviations: K-FIHOA, the Korean version of functional index of hand osteoarthritis; ICC, intra-class correlation coefficient.

The mean total score of the K-FIHOA was 4.39 [Standard deviation (SD)=5.56] in the first assessment and 4.04 (SD=5.22) in the second assessment. The test-retest reliability for the total score was strong ( $r=0.87$  and  $ICC=0.75$ ). Spearman's rho for single item correlation ranged from 0.58 to 0.85 and ICC between single items were good or excellent (0.54–0.80). Cronbach's alpha was high (0.88) suggesting a strong internal coherence in the items of the questionnaire. We identified significant correlations between K-FIHOA and hand pain VAS ( $r=0.53$ ,  $p<0.01$ ), mHAQ ( $r=0.52$ ,  $p<0.01$ ), and mHAQ hand function score ( $r=0.57$ ,  $p<0.01$ ).

Abstract AB0966 – Figure 1. External construct validity of K-FIHOA with hand pain VAS, mHAQ, mHAQ hand function.

**Conclusions:** The K-FIHOA is a reliable and valid instrument for evaluating functional disability in Korean hand OA patients.

**Disclosure of Interest:** None declared

AB0967

### IS THE ICOAP A VALID TOOL FOR MEASURING PAIN AND FUNCTION IN PATIENTS WITH KNEE OA AND RA IN CLINICAL PRACTICE?

J. Obire, A. Harrison, N. Sofat. St Georges University of London, Tooting, UK

**Background:** Osteoarthritis (OA) is primarily managed in general practice however, care is provided on an ad hoc basis, and a structured approach to continuing care is not offered. Studies have demonstrated the high prevalence of secondary OA of the knee in patients with RA, however, about 52% of these cases are under-reported or under graded by general radiological reports. With its increasing prevalence, it is important to use valid and responsive instruments to evaluate the effectiveness of interventions and to understand the pathology's impact on functioning and general health status.

**Objectives:** We hypothesised that the ICOAP can accurately measure the severity of pain in patients with OA in the clinical setting and can equally detect secondary OA in patients with pre-existing RA.

**Methods:** Patients with longstanding knee OA or RA from outpatient rheumatology clinics alongside GP surgeries were recruited. The ICOAP's formatting was modified and brief abstract was added to the top of the questionnaire to aid patient comprehension. After its modification, it was tested for internal consistency, reliability and construct validity by correlating its yield with other disease activity parameters including the WOMAC and DAS. To examine the test-retest reliability patients were asked to fill out the ICOAP questionnaire again after two weeks.

**Results:** The study included 57 patients with OA and 45 with RA. Total ICOAP-C was 42 with patients with OA compared to 56 in patients with RA while ICOAP-I was 49 in patients with OA compared to 53 in patients with RA. Subgroup analysis of ICOAP-C and ICOAP-I identified that while intermittent pain had a greater impact on QOL in patients with OA, constant pain had a greater impact on OA patient QOL. Patients with RA for more than 10 years had more similar results to patients with OA.

**Conclusions:** The ICOAP questionnaire is easy to use clinically, with the majority of patients approached willing to participate. Respondents with both OA and RA also commented on the lack of complication and ease of understanding of questions. It was responsive to changes in management, proving to be a useful tool in general practice to follow disease progression. The findings demonstrate that the ICOAP has a potentially wider clinical utility in measuring pain in patients with both OA and RA. The similarities in responses of the majority of respondents with knee OA and long-standing RA also strongly suggest that ICOAP might be likely detecting under-reported secondary OA. Future research will examine the effects of variables like pain catastrophizing on pain perception and response.

**AB0968 EVALUATION OF OSTEOARTHRITIS OF TEMPOROMANDIBULAR JOINT BY COMPUTED TOMOGRAPHY, CLINICAL FEATURES AND CORRELATIONS**

M. Salokhiddinov, G. Haydarova. TASHKENT MEDICA ACADEMY, Tashkent, Uzbekistan

**Background:** Osteoarthritis (OA) of the temporomandibular joint is a unilateral, degenerative disease of the jaw joint. It is characterised by breakdown of the articular cartilage, architectural changes in bone, and degeneration of the synovial tissues causing pain and/or dysfunction in functional movements of the jaw

**Objectives:** To determine the prevalence and relationship between clinical signs, symptoms and computed tomography (CT) manifestations of temporomandibular joint (TMJ) osteoarthritis

**Methods:** The study included 56 patients with osteoarthritis of the TMJ, included 25 unilateral and 31 bilateral lesions, a total of 87 joints with degenerative changes. Clinically, there was a significant restriction of the movement of the lower jaw and chewing efficiency and a significant increase in articular sounds and general complaints of pain

**Results:** CT data of the most frequent bone changes were erosions of the joint surfaces of the condyles (70 joints, 81%), osteophytes (73 joints, 87%), then their smoothing (67 joints, 77%), hypoplasia (24 joints, 27.6%), sclerosis (6 joints, 6.8%) and subchondral cysts (4 joints, 4.6%). Smoothing of the joint elevation and pneumatization were observed in five joints. Thirty-one patients had bilateral degeneration. In 25-one-sided degeneration. Hypermobility is found in 37 degenerative joints. Chewing efficiency was negatively correlated both with the degree of smoothing of condyles. Sclerosis and the general complaints of pain positively correlated with the smoothing of condyles

**Conclusions:** Conjunctural erosion, flattening, osteophytes, revealed with CT, along with pain, noise in the joint, restriction of the jaw movement and deterioration of the chewing movement were characteristic signs of the TMJ. A correlation was found between bone changes and the severity of the clinical signs and symptoms of the TMJ. CT is a powerful diagnostic tool for the diagnosis of TMJ osteoarthritis

**AB0969 CONVENTIONAL AND BIOLOGIC DISEASE MODIFYING ANTI-RHEUMATIC DRUGS FOR OSTEOARTHRITIS: A META-ANALYSIS OF RANDOMISED CONTROLLED TRIALS**

M.S.M. Persson<sup>1,2</sup>, A. Samanova<sup>1,2</sup>, M. Doherty<sup>1,2</sup>, W. Zhang<sup>1,2</sup>. <sup>1</sup>Academic Rheumatology; <sup>2</sup>Arthritis Research UK Pain Centre, University of Nottingham, Nottingham, UK

**Background:** The role of inflammation in osteoarthritis (OA) is controversial. Some perceive OA as a reparative process where modest inflammation is secondary to largely biomechanical insult.<sup>1</sup> In contrast, others believe synovial inflammation to be a central driver of OA pain and progression.<sup>2</sup> This has encouraged randomised controlled trials (RCTs) of conventional and biologic disease modifying anti-rheumatic drugs (DMARDs) in OA. However, it is unknown whether these treatments that are primarily used for rheumatoid arthritis are effective for OA.

**Objectives:** To examine the efficacy of DMARDs, including biologics, in people with symptomatic OA.

**Methods:** A systematic literature search was conducted (to November 2017) for placebo-controlled RCTs of DMARDs in OA. Data extraction and Cochrane's risk of bias assessments were conducted independently by two reviewers (MP, AS). Pain relief at treatment peak time-point was combined using a random-effects meta-analysis. All DMARDs were pooled and sensitivity analysis was undertaken for high-quality trials and subgroup analyses for DMARD type, biologic target, joint site, OA subtype, and publication type.

**Abstract AB0969 – Table 1.** Subgroup analysis

**Abstract AB0969 – Figure 1.** Meta-analysis of DMARDs. ADA: adalimumab; ANK: anakinra; ETN: etanercept; HCQ: hydroxychloroquine; MTX: methotrexate; N: number of participants

**Results:** Eleven RCTs (n=1205), including six (n=757) for conventional and five (n=448) for biologic DMARDs, were included in the meta-analysis (7 full texts, 4 abstracts). Overall, conventional and biologic DMARDs were marginally superior to placebo. However, statistical superiority was not observed in high-quality studies (table 1) or subgroup analysis for conventional or biologic DMARDs separately (figure 1). Furthermore, no differences were observed between erosive versus non-erosive hand OA, hand versus knee OA, anti-IL1 versus anti-TNF biologics, or full text versus abstract-only publications (table 1).

**Conclusions:** No significant pain relief was observed from either conventional or biologic DMARDs compared to placebo. Combining all DMARDs gave statistical separation from placebo, but this was below the minimal clinically important difference threshold (0.5 SD) used in the UK.<sup>3</sup> Furthermore, the analysis is based on peak time point for the intervention, so even at their most effective timepoints these treatments do very little over placebo. Lack of efficacy of DMARDs supports the perspective that inflammation is not an important driver for OA pain and differs fundamentally from that in rheumatoid arthritis.

### INVESTIGATION OF THE EFFECTS OF BALANCE TRAINING ON BALANCE AND FUNCTIONAL STATUS IN PATIENTS WITH TOTAL HIP ARTHROPLASTY DUE TO OSTEOARTHRITIS: A RANDOMISED CONTROLLED PILOT STUDY

N. Elilbol<sup>1</sup>, B. Unver<sup>2</sup>, V. Karatosun<sup>3</sup>. <sup>1</sup>Physiotherapy and rehabilitation, European of Lefke University; <sup>2</sup>Physiotherapy and rehabilitation; <sup>3</sup>Orthopaedics, Dokuz Eylul University, Izmir, Turkey

**Background:** Osteoarthritis (OA) of the hip is one of the most common disorders in musculoskeletal system. The hip osteoarthritis is painful and this pain causes disability of various degrees, postural and gait disorders.<sup>1</sup> Total hip arthroplasty (THA) has been to one of the most frequent elective surgical procedures that can effectively reduce pain and improve the function in patient with hip OA.<sup>2</sup> It was reported that patients with coxarthrosis and THA have decreased proprioception with motor control and balance disorders, compared to healthy subjects.<sup>3</sup>

The purpose of current study was to investigate the effects of balance exercises on balance and functional level with objective assessment methods until the 26th week of surgery in patients with THA.

**Objectives:** The purpose of our study is investigating of the effects of balance training on balance and functional status in patients with THA.

**Methods:** Sixteen patients with unilateral elective THA were randomised to 2 groups: conventional rehabilitation (CR, n=8) or conventional rehabilitation plus balance training (CR + BT, n=8) groups. The CR group completed typical surgery-specific joint range-of-motion and muscle strengthening exercises, while the CR + BT group completed the CR plus balance exercises during 6 weeks. The patients were evaluated by single leg stance test, Tetrax balance system, Harris hip scoring, lower extremity function scale, 5 times sit to stand test and 50-foot timed walk test preoperatively and 8, 14, and 26 weeks after THA.

**Results:** While there was significant improvement, in terms of on the right extremity eyes closed single leg stance test in the CR group ( $p<0.05$ ), there was no significant difference in terms of other assessment parameters between CR and CR +BT groups ( $p>0.05$ ). There were significant improvement after THA surgery in both groups ( $p<0.05$ ).

**Conclusions:** The results of our study indicate that there were similar improvements in the balance and functional parameters in the CR and CR +BT groups. There was no additional benefit of the balance exercises in balance in the 14 and 26 weeks after THP. Significant differences could be found between groups by continuing balance training with more patients for 1–2 years following THA.

### COMBINATION OF HYALURONATE AND SODIUM SUCCINATE IN TREATMENT OF KNEE OSTEOARTHRITIS

O. Burianov<sup>1</sup>, L. Khimion<sup>2</sup>, T. Omelchenko<sup>1</sup>, H. Havryliuk<sup>2</sup>. <sup>1</sup>Traumatology and Orthopedics, Bogomolets National Medical University; <sup>2</sup>Family Medicine, Shupyk National Medical Academy of Postgraduate Education, Kyiv, Ukraine

**Background:** At present hyaluronic acid (HA) is rather widely used in treatment of patients with osteoarthritis (OA). HA normalises the properties of the synovial fluid; has a protective effects; promotes the cartilage nutrition and so improves the signs of OA and function of the joints. To the contrary the effects of sodium succinate (the salt of the succinic acid) are not investigated but can be promising in OA treatment due to its known anti hypoxic and energetic properties.

**Objectives:** To investigate the clinical efficacy of combination of hyaluronate and sodium succinate in OA treatment in early stages.

**Methods:** The study included 126 patients with knee OA (stages I-II, Kelgren and Lawrence), mean age (54.3±2.7) years, among them – 75 women(60%) and 51 men(40%). All enrolled patients had OA exacerbation (without clinically evident synovitis) and received standard OA treatment (NSAIDs, exercises, orthopaedic devices) for 15 days; Gr.1 patients (58) also got 5 intra-articular injections of 1.1% hyaluronic acid, stabilised with sodium succinate (2 ml, once a week); patients of Gr.2 (68) in addition to standard treatment received 5 intra-articular injections of 1,1% solution of non-stabilised HA (2 ml, once a week). Clinical observation and

evaluation of the results were performed at the beginning of the treatment, at 6th, 12th and 24th week after the study beginning

**Results:** During the treatment period, patients in both groups showed the positive changes in clinical signs and symptoms of OA. The VAS score in both groups indicated a significant pain reduction, but the stability and duration of the clinical effect in the groups was different. In patients of Gr.1, the pain syndrome continued to decrease after 12 weeks till 24th week, whereas in Gr.2 after the treatment course there was no significant changes in further pain regression after 6th week point. The general WOMAC index was decreased from (78.3±4.1) in Gr. 1 and (75.4±3.8) in Gr. 2 at the beginning of the study to (27.9±2.6) and (29.8±1.9) accordingly at week 12,  $p<0.05$ . The changes in Lisholm score were also significantly better in Gr.1 than in Gr. 2 (before treatment (21.7±4.6) and (22.6±5.3), at week 6 – (86.4±5.7) and (71.3±4.8), at week 12 – (87.6±6.2) and (63.8±5.3), respectively,  $p<0.05$ ).

**Conclusions:** Combination of the hyaluronic acid and sodium succinate in early stages of knee OA (as intra-articular injections) allows to increase the treatment efficacy. Add of sodium succinate to hyaluronic acid achieve better pain control and longer remission.

**Disclosure of Interest:** None declared

AB0972

### THE EFFECTIVENESS OF PHYSICAL ACTIVITY INTERVENTIONS FOR PEOPLE WITH OSTEOARTHRITIS AND OBESITY: A META-ANALYSIS

S. Mckeivitt, C. Jinks, E.L. Healey, J.G. Quicke. *Primary Care and Health Sciences, Keele University, Keele, UK*

**Background:** Osteoarthritis (OA) is one of the diseases with the highest prevalence of comorbidity. Clinical guidelines recommend physical activity (PA) for people with OA irrespective of comorbidity. Research investigating the effectiveness of PA interventions in OA and comorbidity is needed.

**Objectives:** To synthesise existing evidence investigating the effectiveness of PA interventions in adults with OA and obesity.

**Methods:** A systematic review with meta-analysis was conducted (PROSPERO Registration: CRD42017055582). Six electronic databases; MEDLINE, EMBASE, AMED, CINAHL, SportDiscus and CENTRAL were searched for studies from their inception to 29.03.17. Inclusion criteria were: randomised controlled trials (RCTs) comparing the effectiveness of any PA intervention to non-PA control group; including adults aged 45 years old and over with clinical or radiographic OA at any site; at least one of the comorbidities of interest (COPD, depression, diabetes, hypertension, obesity, T2DM); and measuring pain, physical function, quality of life, global health post intervention and adverse events. Included study risk of bias (ROB) was assessed using the Cochrane risk of bias tool. Two reviewers screened titles, abstracts and full text articles, checked data extraction, and carried out ROB assessment. Random-effects model meta-analysis pooled outcomes from sufficiently homogeneous studies to calculate effect sizes (Standardised Mean Difference (SMD) with 95% confidence interval (CI)). Meta-analysis findings of the OA and obesity subgroup are reported.

**Results:** The literature search retrieved 8171 citations of which 14 studies (n=4224 participants) were included in the full review, with 9 (n=1382 participants) analysed in the OA and obesity subgroup. PA interventions included: aquatic, aerobic, strengthening and functional activity; of 1–18 months in duration.

Four studies of OA and obesity measuring either Western Ontario Osteoarthritis Index (WOMAC) pain, WOMAC function or Six Minute Walking Test (6MWT) and were included in three meta-analyses. Best estimates showed PA to improve WOMAC pain (n=3 studies; n=547 participants; SMD=–0.09 (95% CI) –0.65, 0.47), improve WOMAC function (n=3 studies, n=415 participants; SMD=–0.35 (95% CI) –0.89, 0.18) and the 6MWT (n=4 studies, n=573 participants; SMD=–0.93 (95% CI) –0.49, 2.35). However, results were not statistically significant. There was substantial between-trial outcome heterogeneity ( $I^2=89.4%$  ( $p=0.000$ ); 77.5% ( $p=0.012$ ); 97.8% ( $p=0.000$ ); respectively); results should be interpreted with caution.

ROB domain judgements were generally either low or unclear. A small minority of judgements were at high risk of bias.

**Conclusions:** Best estimates suggest small beneficial effects of physical activity on WOMAC pain, WOMAC function and the 6MWT. Mixed effectiveness among individual RCTs was likely due to heterogeneous intervention types, intensity and duration.

### THE EFFICACY OF ELECTROMYOGRAPHIC BIOFEEDBACK ON PAIN, FUNCTION AND MAXIMAL THICKNESS OF VASTUS MEDIALIS OBLIQUE MUSCLE IN PATIENTS WITH KNEE OA; A RANDOMISED CLINICAL TRIAL

L. Sedighipour<sup>1</sup>, S.A. Raeissadat<sup>1</sup>, S.M. Rayegani<sup>2</sup>, Z. Bossaghzadeh<sup>1</sup>, M. H. Abdollahzadeh<sup>1</sup>, F. Malay<sup>3</sup>. <sup>1</sup>Physical Medicine and Rehabilitation, Modarres hospital; <sup>2</sup>Tajrish square; <sup>3</sup>Physical Medicine and Rehabilitation, Shohada hospital, Tehran, Iran, Islamic Republic of Ireland

**Background:** Isometric exercises play important role in treatment of Knee OA and are easy to do by the growing elderly population. Electromyographic (EMG) biofeedback devices are designed to enhance patient's participation in these exercises by giving them feedback signals of visual or auditory nature, so that it can affect the subject's voluntary activity.

**Objectives:** The aim of this survey was to study the effect of EMG biofeedback on pain, function, thickness of the vastus medialis oblique muscle and maximal electrical activity of this muscle in isometric contraction, in patients with knee OA.

**Methods:** In this single-blinded clinical trial, 46 patients aged between 45 to 70, referring to Shohadaye Tajrish and Shahid Modarres hospitals with diagnosis of knee OA, were recruited. Patients were randomly assigned to two groups of case (23 patients), with EMG biofeedback associated exercise, and control (23 patients), with sham biofeedback associated exercise. The exercise program includes 12 sessions of 15 min isometric quadriceps exercise. Data were gathered via VAS score, the Persian version of WOMAC and Lequesne questionnaires, ultrasonography of VMO muscle and surface electromyography of this muscle at baseline and at the end of 2 months period of this study. Variables compared before and after exercises program in each group and between the two groups.

**Results:** At the end of the study, there were no significant differences between the two groups regarding VAS score, VMO muscle electrical activity, maximal VMO muscle thickness, WOMAC and Lequesne questionnaires scores including overall scores and scores in each subcategories. Although all assessed parameters, except for VMO muscle thickness, were found to be improved significantly in each group, the changes were not more significant in case group except for the VAS score. VMO muscle thickness didn't change significantly after 12 sessions of exercise in either of the groups.

**Conclusions:** Isometric exercises accompanied by EMGBF and the same exercises with sham biofeedback for 2 months both lead to significant improvements in pain, and function of patients with knee OA. Real EMG biofeedback was not superior to sham biofeedback. The only parameter found to be improved to a greater extent in the EMGBF group was the subjective measure of VAS score.

### THE EFFICACY AND SAFETY OF INTRA-ARTICULAR BOTULINUM TOXIN INJECTION IN KNEE OSTEOARTHRITIS

S.M. Rayegani<sup>1</sup>, S.A. Raeissadat<sup>2</sup>, E. Enayati<sup>1</sup>, S. Rahimi Dehgolan<sup>1,1</sup>. <sup>1</sup>Physical Medicine and Rehabilitation, Shohada-e-Tajrish Hospital, Shahid Beheshti University of Medical Sciences, Tehran, Iran; <sup>2</sup>Physical Medicine and Rehabilitation, Clinical Development Research Center of Shahid Modarres Hospital, Physical Medicine and Rehabilitation Research Center, Shahid Beheshti University of Medical Sciences, Tehran, Iran, Islamic Republic of Ireland

**Background:** Osteoarthritis (OA) is a common disease that has a great burden through pain and decreased functional capacity. Botulinum toxin-A (BTA) injection has been recently proposed for knee OA patients to reduce pain and disability.

**Objectives:** In this study we evaluate BTA injection efficacy and safety among non-advance knee OA participants in a before-after trial.

**Methods:** This trial was conducted on knee OA patients presented to our PM and R clinic. Thirty participants aged 40–75 years who had radiographic OA grades of II and III KLS were included. Single intra articular injection of half of a 500<sup>U</sup> vial BTA was applied for all participants. Patients were prospectively evaluated at baseline and then at 8 and 24 weeks after injection using the visual analogue scale (VAS) for pain and Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC) in three subscales: pain, stiffness and function.

**Results:** Both main outcome measures of this trial (VAS and WOMAC) significantly improved after 24 weeks follow up. About two third of final VAS improvement was achieved in the first week after injection (from 7.2 to 4.5, MD%=36%, p value=0.008); then at 8 and 24 weeks post injection VAS reached 3.8 and 3.3, respectively. Almost 81%–77% of patients had more than 30% decline in their baseline VAS at 8th and 24th week visits, respectively. Also a similar pattern was observed for WOMAC index of sixth month (from 56.7 to 31.0, Mean Difference=-25.7 [MD%=45%], p value=0.005), with more remarkable changes in function subscale (MD%=46%). In this study no major adverse events were noted.

Measure	Before	After	Mean Diff (SD)	P value
WOMAC	10.62 (3.31)	6.00 (1.78)	4.62 (2.35)	0.000
<b>Pain</b>				
WOMAC	5.08 (1.41)	2.85 (1.19)	2.23 (0.90)	0.000
<b>Stiffness</b>				
WOMAC	41.08 (9.52)	22.15 (4.83)	18.92 (7.88)	0.000
<b>Function</b>				
WOMAC	56.77 (13.03)	31.00 (6.96)	25.7 (10.22)	0.000
<b>Total</b>				

Abstract AB0974 – Figure 1

**Conclusions:** BTA showed promising effects in improving knee pain, ROM and functional status. Therefore this single session method could be considered as an alternative to other intra articular injections in knee OA patients who did not response to preliminary conservative treatments. Further data is necessary to assess long-term effects and cost-benefit analysis of BTA against other similar choices.

### DOES PLATELET RICH PLASMA CHANGE THE VOLUMETRIC FINDINGS OF MRI IMAGING? (A RANDOMISED CLINICAL TRIAL)

S.A. Raeissadat<sup>1</sup>, E. Ghorbani<sup>1</sup>, M. Sanei<sup>2</sup>, S.M. Rayegani<sup>1</sup>, M. Babae<sup>1</sup>, R. Soleimani<sup>2</sup>. <sup>1</sup>PHYSICAL MEDICINE AND REHABILITATION RESEARCH CENTER, SHAHID BEHESHTI UNIVERSITY OF MEDICAL SCIENCES; <sup>2</sup>Radiology Department, Shahid Beheshti university of medical sciences, Tehran, Iran, Islamic Republic of Ireland

**Background:** Several studies have shown the effect of platelet rich plasma (PRP) on knee osteoarthritis. Most of these studies have focused on subjective and clinical symptoms effect of PRP and fewer papers have studied its objective effect on cartilage. MRI is the gold standard imaging for cartilage lesion.

**Objectives:** In this study, we investigated the effect of PRP on cartilage characteristics by special MRI sequencing.

**Methods:** In the double blind randomised clinical trial, patients with grade 1, 2 and 3 of osteoarthritis were included in this study. All of the knees divided to groups randomly and exercise was prescribed for all of knees. Beside, PRP was injected 2 courses with 4 weeks interval in PRP group. For all of patients before and 6 months after treatment VAS (visual analogue scale) and WOMAC (Western Ontario and McMaster Universities Arthritis Index) were fulfilled and MRI was performed. Sequencings of MRI were PD fat saturated (coronal and sagittal) and transverse TRUFISP 3D. Imaging was scored according to 4 cartilage's characteristics including, Patellofemoral cartilage volume, Subarticular bone marrow abnormality, Medial and lateral meniscal disintegrity and Synovitis.

**Results:** 23 knees in case group and 23 knees in control group were studied. All of patients were female with mean age 57.57±5.9 years old and mean BMI 28.49 ±3.24 (Kg/m<sup>2</sup>). 52% of knees had grade 2 of osteoarthritis. Mean total WOMAC and VAS changes before and after treatment in control group were 11.61±1.3 and 8.5±1.1 respectively. In PRP group, mean total of WOMAC and VAS changes showed better improvement with 20±3.2 and 12.3±1.6 respectively (P-Value<0.05). In PRP group all of the radiologic variables except subarticular bone marrow abnormality had significantly improvement (P-Value<0.05). In comparison between 2 groups, Patellofemoral cartilage volume and synovitis had significantly changes in PRP group (P-Value<0.05).

**Conclusions:** In this study, in addition to the effect of PRP on VAS and WOMAC, there is effect on radiologic characteristics (Patellofemoral cartilage volume and synovitis) significantly. For more evaluation, Study with more sample size is recommended.

**AB0976 EFFICACY OF INTRA-ARTICULAR INJECTION OF PRP-DRIVEN GROWTH FACTOR (PRP WITHOUT PLATELET AND WBC) VERSUS HYALURONIC ACID ON PAIN AND FUNCTION OF PATIENTS WITH KNEE OSTEOARTHRITIS: A SINGLE-BLINDED RANDOMISED CLINICAL TRIAL**

S.A. Raeissadat, A. gharooee ahangar, S.M. Rayegani. *physical medicine and rehabilitation, shahid beheshti university of medical science, tehran, Iran, Islamic Republic of Ireland*

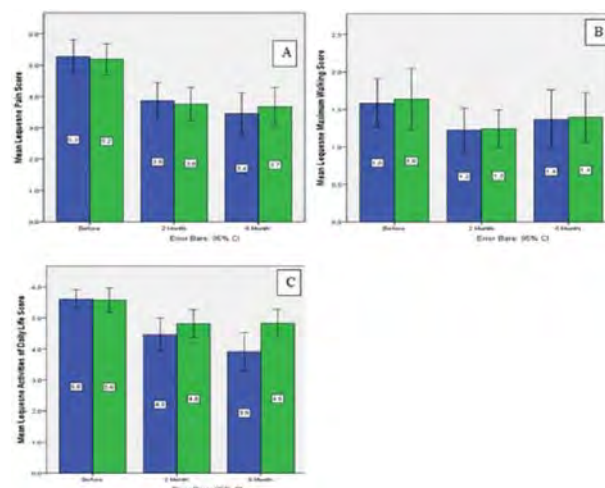

**Background:** Knee osteoarthritis is the most common joint disease.  
**Objectives:** We aimed to compare the efficacy and safety of intra-articular injection of PRP-driven growth factor versus hyaluronic acid (HA) on pain and function of patients with knee osteoarthritis.  
**Methods:** In this single-blinded randomised clinical trial, patients with symptomatic osteoarthritis of knee were assigned to receive 2 intra-articular injections of PRP-driven growth factor in 3 weeks or 3 weekly injections of HA. Our primary outcome was the mean change from baseline until 2 and 6 months post intervention in scores of visual analogue scale, Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC), and Lequesne index.  
**Results:** A total of 69 patients entered final analysis. The mean age of patients was  $58.2 \pm 7.41$  years and 81.2% were women. Total WOMAC index decreased from  $42.9 \pm 13.51$  to  $26.8 \pm 13.45$  and  $24.4 \pm 16.54$  at 2 and 6 months in the PRGF group (within subjects  $p = 0.001$ ), and from  $38.8 \pm 12.62$  to  $27.8 \pm 11.01$  and  $27.4 \pm 11.38$  at 2 and 6 months in the HA group (within subjects  $p = 0.001$ ), respectively (between subjects  $p = 0.631$ ). There was no significant difference between PRP-driven growth factor and HA groups in patients' satisfaction and minor complications of injection, whereas patients in HA group reported significantly lower injection-induced pain.

**Abstract AB0976 – Figure 1**

**Conclusions:** In 6 months follow up, PRP-driven growth factor and HA, both are effective options to decrease pain and improvement of function in patients with mild to moderate knee osteoarthritis.

**AB0977 CORRELATION OF THE LEVEL OF C-REACTIVE PROTEIN AND BONE MINERAL DENSITY IN PATIENTS WITH GONARTHROSIS**

T. Tarasenko. *Polyclinic, Regional Clinical Hospital named after I.I. Mechnikov, Dnipro, Ukraine*

**Background:** The results of recent studies also indicate a link between loss of bone mineral density (BMD) and progressive loss of articular cartilage in patients with knee joint osteoarthritis (OA). The presence of correlation of changes in bone tissue and degradation of cartilage in OA is due to the possible presence of common pathogenesis chains, including activation of proinflammatory mediators.  
**Objectives:** Determine the relationship between the level of C-reactive protein (CRP) and the level of BMD in patients with gonarthrosis.  
**Methods:** We conducted a cross sectional study including confirmed radiographic knee osteoarthritis according to Kellgren-Lawrence scale, with normal and reduced BMD according to the classification of Report of a WHO Study Group. The structural and functional status of bone tissue in patients was

evaluated using the method of ultrasonic densitometry and DEXA at the beginning of treatment and 12 months. The CRP level was determined at the beginning of the observation and after 1, 3, 6, 9 and 12 months. The two groups were compared on the level of BMD, radiological grade, the level of CRP and WOMAC function after adjusting for significant covariates. Multiple regression analysis was used to identify the independent effects to each specific component for level of CRP on knee osteoarthritis parameters.

**Results:** One hundred forty women were included. The mean age was 55.28  $\pm$  0.80<sup>37-75</sup> years. Overweight had 86.42% of patients. The body mass index averaged 30.18  $\pm$  0.43<sup>23-37</sup> kg/m<sup>2</sup>. According to Kellgren-Lawrence classification, 55% of patients had II and 45% of patients – III radiological stage of gonarthrosis. 55.7% of knee OA patients had reduced bone mineral density. Multiple regression analysis showed, after adjusting for significant covariates, that the CRP level was significantly higher ( $p < 0.0001$ ) in patients with reduced BMD compared to normal (6.32  $\pm$  1.67 mg/L and 4.74  $\pm$  0.75 mg/L respectively), an average of 33, 3%.

**Conclusions:** It was found that in patients with gonarthrosis with reduced BMD, a higher level of CRP was observed at 33.3%, which was associated with a more severe course of the disease.

#### DECREASED PAIN AND IMPROVED DYNAMIC KNEE INSTABILITY MEDIATE THE BENEFICIAL EFFECT OF WEARING A SOFT KNEE BRACE ON ACTIVITY LIMITATIONS IN PERSONS WITH KNEE OSTEOARTHRITIS

T. Cudejko<sup>1</sup>, M. van der Esch<sup>2</sup>, J. van den Noort<sup>1</sup>, J. Rijnhart<sup>1</sup>, M. van der Leeden<sup>1</sup>, L.D. Roorda<sup>3</sup>, W. Lems<sup>1</sup>, J. Harlaar<sup>1</sup>, G. Waddington<sup>4</sup>, J. Dekker<sup>1</sup>. <sup>1</sup>VU University Medical Center; <sup>2</sup>De Boelelaan 1117, Afdeling revalidatiegeneeskunde; <sup>3</sup>Amsterdam Rehabilitation Research Center Reade, Amsterdam, Netherlands; <sup>4</sup>University of Canberra, Canberra, Australia

**Background:** We have previously shown that wearing a soft knee brace reduced activity limitations in persons with knee osteoarthritis (OA).<sup>1</sup> Several underlying mechanisms have been proposed via which a soft knee brace reduces activity limitations in persons with knee OA.<sup>2</sup> However, to our knowledge, no study has identified mechanisms explaining this effect.

**Objectives:** The aim of the study was to identify mechanisms explaining the beneficial effect of wearing a soft knee brace on activity limitations in persons with knee OA.

**Methods:** This was an exploratory analysis of data from 44 participants with knee OA from Amsterdam Osteoarthritis cohort, who enrolled in a single-session within-subject cross-over design study, comparing a soft brace with no soft brace, and comparing a non-tight soft brace with a tight soft brace (GENUTEX A2, Human I). A mediation analysis was performed and the mediation effect was calculated based on the product of coefficients approach. Confidence intervals were calculated with a bootstrap procedure. The outcome measures were activity limitations assessed with the 10-metre walk test and the Get up and Go test. The studied mediators were the changes in: knee joint proprioception, pain, pressure pain threshold (PPT) and objective dynamic knee instability. Knee joint proprioception was assessed by the active movement extent discrimination assessment; pain with the Numeric Rating Scale (NRS); PPT with a hand-held pressure algometer, and dynamic knee instability with the Perturbation Response i.e. a measure reflecting deviation in the mean knee varus-valgus angle after a controlled mechanical perturbation on the treadmill, in respect to level walking.

**Results:** Both a decrease in pain during walking and a decrease in dynamic knee instability mediated the association between wearing a soft knee brace and reduction in time to complete both 10 m walk test and the GUG test ( $p < 0.05$ ). Changes in proprioception and PPT did not mediate these associations ( $p > 0.05$ ). Magnitudes of the mediation effects were similar for a non-tight and a tight soft knee brace.

**Conclusions:** The decrease in activity limitations in persons with knee OA who wear a soft knee brace might be explained by a decrease in self-reported pain and a reduction in dynamic knee instability.

#### ULTRASOUND-MEASURED RADIAL DISPLACEMENT OF THE MEDIAL MENISCUS AS AN INDIRECT SIGN OF MRI-DETECTED CARTILAGE DAMAGE IN PATIENTS WITH MEDIAL TIBIOFEMORAL OSTEOARTHRITIS

T.A. Georgiev<sup>1,2</sup>, M. Ivanova<sup>1,2</sup>, M. Penkov<sup>3</sup>, R. Rashkov<sup>1,2</sup>, R. Stoilov<sup>1,2</sup>. <sup>1</sup>Rheumatology clinic, University Hospital "St. Ivan Rilski"; <sup>2</sup>Medical Faculty, Medical University – Sofia; <sup>3</sup>Radiology department, University Hospital "St. Ivan Rilski", Sofia, Bulgaria

**Background:** Extrusion of the medial meniscus is a consequence of the complex interactions among joint structures and altered tissue mechanics involved in the osteoarthritis (OA) process.<sup>1</sup> Potential contributing factors are cartilage loss, meniscal tears, obesity and knee malalignment<sup>2-4</sup> – features strongly associated with knee OA. Ultrasound (US) measurement of medial meniscus radial displacement (MRD) is an easy to implement procedure that may serve as a starting point for assessment of the cartilage loss in patients with knee osteoarthritis.

**Objectives:** The aim of the study was to investigate the correlation between ultrasound-measured MRD and magnetic resonance imaging (MRI)-detected cartilage damage, as a referent method, in patients with medial femorotibial knee OA

**Methods:** 60 osteoarthritic knees of 48 patients (83% female) aged 40 to 80 years, meeting the ACR criteria for knee osteoarthritis, were included in the study. Patients with severe malalignment (varus or valgus deformity  $\geq 20$  degrees) were excluded. Radiographic stage was assessed according to the Kellgren-Lawrence (KL) grading system, as only KL I-III knees were included. MRD was measured in millimetres using diagnostic US with patients in the supine (non-weight-bearing) position. Magnetic resonance images were acquired by using 1.5 T MRI and were evaluated by a trained radiologist using Whole-Organ Magnetic Resonance Imaging Score (WORMS) for cartilage abnormalities of the medial femorotibial joint (MFTJ) and medial meniscal tears.

**Results:** There was a significant difference in values of MRD among studied radiographic groups ( $p < 0.001$ ). The mean (SD) levels of MRD were 2.70 (1.43) mm, 3.97 (1.25) mm and 6.03 (1.30) mm for KLI, KLII, and KLIII, respectively. All knees that were KLII/KLIII ( $n=41$ ) had MRD higher than 1.8 mm (range 1.8–8.7 mm). MRD correlated significantly and positively with WORMS grades for cartilage abnormalities of MFTJ ( $p < 0.001$ ,  $r=0.758$ ), WORMS grades for medial meniscal tears ( $p < 0.001$ ,  $r=0.576$ ), and body mass index (BMI) ( $p=0.011$ ,  $r=0.315$ ). Correlation between MRD and MRI-detected cartilage damage remained significant after adjustment for age, BMI and medial meniscal tears score.

**Conclusions:** Joint space narrowing (KL  $> 2$ ) on radiography is associated with higher level of meniscal extrusion. Higher values of measured MRD by ultrasound may be indicative of greater cartilage damage of MFTJ.

**FACTORS ASSOCIATED WITH LOSS OF CARTILAGE IN KNEE OSTEOARTHRITIS**

V. Vardanyan<sup>1</sup>, V. Mukuchyan<sup>2</sup>, A. Kirakosyan<sup>2</sup>. <sup>1</sup>Internal Medicine, Yerevan State Medical University; <sup>2</sup>Rheumatology, "Erebouni" Medical Center, Yerevan, Armenia

**Background:** Osteoarthritis (OA) is one of the leading causes of pain and disability worldwide. The structural changes in knee OA are characterised mainly by the progressive loss of cartilage, which is associated with additional structural changes such as subchondral bone lesions and alterations in the menisci. Unfortunately, these changes cannot be effectively treated conservatively. Further determination of modifiable risk factors of cartilage loss is extremely important for improvement of OA management.

**Objectives:** The main objective of the study was the determination of factors associated with loss of cartilage in knee OA.

**Methods:** 294 patients (277 female, 17 male, mean age 55, 09±8,56 years) with newly diagnosed mild to moderate primary knee osteoarthritis were investigated. X-ray and ultrasound examinations of knee joints were performed. The thickness of cartilage and synovial layer, as well as presence of synovitis, tendinitis, osteophytes, Baker's cysts, tear of meniscus were determined. For determination of factors associated with loss of cartilage both univariate and multivariate analyses were performed. The data is introduced as odds ratios (OR) with 95% confidence interval (CI). The results were considered significant when  $p < 0.05$ .

**Results:** Expressed thinning of cartilage ( $\leq 2$  mm) was observed in 216 (73,5%) patients, abnormal thickening of synovial layer ( $\geq 3$  mm) – in 76 (25,9%), synovitis – in 88 (29,9%), tendinitis – in 38 (12,9%), osteophytes – in 273 (92,9%), Baker's cysts – in 93 (31,6%), tears of meniscus – in 93 (31,6%) patients.

Univariate analysis had shown that loss of cartilage ( $\leq 2$  mm) was significantly ( $p < 0,05$ ) associated with age  $> 55$  (OR/95% CI= $2,0/1,3-3,4/$ ,  $p < 0,05$ ), thickening of synovial layer (OR/95% CI= $2,9/1,5-6,2/$ ,  $p < 0,01$ ), synovitis (OR/95% CI= $2,6/1,3-5,0/$ ,  $p < 0,01$ ) and osteophytes (OR/95% CI= $14,8/4,8-45,5/$ ,  $p < 0,01$ ). Following factors were then stepwise included in the model of multivariate logistic regression: age  $> 55$ , thickening of synovial layer and osteophytosis. According to results of analysis, age  $> 55$  had lost its significance, was evaluated as confounding factor (OR/95% CI= $1,2/0,7-2,2/$ ,  $p = 0,4$ ) and excluded from the model. Finally, loss of cartilage (thickness  $\leq 2$  mm) was found to be significantly and independently associated with abnormal thickening of synovial layer (OR/95% CI= $2,8/1,3-6,0/$ ,  $p < 0,05$ ) and osteophytosis (OR/95% CI= $12,8/3,9-41,6/$ ,  $p < 0,01$ ).

**Conclusions:** A positive association of cartilage loss with abnormal thickening of synovial layer (with further development of synovitis) and presence of osteophytes was determined. While cartilage loss and meniscal damage are not yet clearly treatable, treatments targeting inflammation within the joint are available. Thereby, forehanded treatment of secondary inflammatory conditions of joint, as well as strategies, directed toward dissection of osteophytes, can decrease cartilage loss and structural damage in OA.

**PRIORITIES FOR OSTEOARTHRITIS RESEARCH SHOULD BE DONE IN CHINA**

Y. Mei<sup>1</sup>, S. Guan<sup>1</sup>, Y. Shi<sup>1</sup>, D.J. Hunter<sup>2</sup>, Z. Zhang<sup>1</sup>. <sup>1</sup>the First Affiliated Hospital of Harbin Medical University, Harbin, China; <sup>2</sup>University of Sydney, Sydney, Australia

**Background:** Osteoarthritis(OA) exacts a tremendous toll on patients and society due to limited treatment options and unclear pathological mechanism. Furthermore, rising rates of obese and senior population are predicted to increase the prevalence of OA in the coming years in China. With the development of economy, Chinese government increasingly encourage researches for prevention and treatment of chronic diseases including OA. However, the studies of OA in China remain inadequate.

**Objectives:** This study was designed, in collaboration with Chinese rheumatologists, to investigate key priorities for OA in the next five years to make use of limited funding and resource in China. In addition, it will also help researchers, especially Chinese rheumatologists, to get more support from the government, which will push OA studies faster towards elusive breakthroughs. Therefore, it will improve prognosis and health and quality of life for OA patients.

**Methods:** The study comprised 4 stages, including 1) Identify research priorities for the next five years that match the strengths and expertise of Chinese OA

researchers at the OA potential priority-setting summit. 2) Initial ranking of suggested research priorities using 1000Minds software prior to the summit. 3) Discussion and selection of top five thematic priorities from the original list of 10 priorities at the final OA priority-setting summit. 4) Final ranking of five research priorities by all attendees at the summit and design experimental aims and approaches for the priorities. Finally, the top three priorities from five prioritised topics were selected.

**Results:** 39 Chinese rheumatologists attended stage one and identified 10 priorities in the next five years. There were 313 Chinese rheumatologists invited to participate in stage two, among them, 104 rheumatologists finished the process and identified the initial prioritised rankings of the research topics. 29 Chinese rheumatologists attended the final OA priority-setting summit. Through these multistage processes, three key topics about OA were identified as essential and were prioritised. These three priorities include targeting inflammation should be a focus of research in osteoarthritis, seeking biomarkers for osteoarthritis diagnosis and monitoring, research into early OA would be expected to understand OA across disease development and translate to better therapy. Experimental aims included to detect inflammatory in OA pathology, to identify well-established criteria for early OA, to protect and repair chondrocytes and cartilage, and the approaches included longitudinal study, placebo-controlled randomised controlled trial, animal experiments.

**Conclusions:** Chinese rheumatologists identified OA priorities for the first time, and these key topics would have guiding effect significantly on Chinese OA research in the future.

**PREVALENCE OF OSTEOARTHRITIS IN HIGH ALTITUDE AREA OF TIBET**

Y. Liang, Y. Mei, S. Guan, W. Sun, W. Wang, F. Teng, X. Han, Z. Zhang. *the First Affiliated Hospital of Harbin Medical University, Harbin, China*

**Background:** Osteoarthritis is a degenerative joint disease; the specific etiology and pathogenesis are unclear. The prevalence of osteoarthritis of subtypes of joints is different, whereas the most common osteoarthritis occurs in knees. In China, the prevalence of osteoarthritis is about 15%, the prevalence of the patients over 40 years old is 10%~17%, and 50% over the age of 60, while over 75 years old was as high as 80%. Few data exist regarding the prevalence of OA in plateau in China.

**Objectives:** To investigate the prevalence of osteoarthritis(OA) in Jiuhue village, which is located about 3.5 kilometres high of Qonggyai County of Tibet and the associated factors in order to provide the guidance for the prevention and treatment of OA.

**Methods:** The participants in this analysis were all the resident people aged 50 years and above in Jiuhue village, Qonggyai County of Tibet. All subjects were invited to completed a questionnaire, physical examination and radiographic examination. The questionnaire included sex, age, body mass index(BMI) and dietary habit.

**Results:** A total of 136 participants aged 50–86 years were enrolled, including 47 males with mean age of 62.00±9.11 years, and 89 females with mean age of 61.30±9.52 years. Altogether 102 knee OA can be diagnosed, the total prevalence of knee OA was 75.00%. Knee OA occurred in 78.72% of male and 73.03% of female. The prevalence of knee OA combined with hand OA was 19.12%, and 21.28% for male and 17.98% for female. The prevalence of knee OA combined with hand OA increased with age in the female, no such trend was observed in male or in only knee OA patients. No significant difference was found about sex, BMI, drinking between the OA patients and the controls.

**Conclusions:** The prevalence of osteoarthritis in Jiuhue village, plateau of Tibet was significantly high. The prevalence in male is higher than that in female. The prevalence of knee OA combined with hand OA increased with age in the female.

**Background:** Intra-articular injections of hyaluronan represent one of the well-accepted standard of care for treating symptomatic knee osteoarthritis (OA). Until now, not much is known about the structural-modifying effect of this treatment justifying this pilot study.

**Objectives:** This exploratory non-controlled study aims to study effects of HYMOVIS on imaging, biological and clinical variables.

**Methods:** Forty six patients with symptomatic knee OA (mean age 61.4 years [min.35-max.80; 67.4% female; Kellgren and Lawrence grade II and III (63% and 37%, respectively); mean BMI 30.6 kg/m<sup>2</sup>] were enrolled in this open-label, prospective, multicenter, pilot study. Patients received two treatment cycles of intra-articular injections (3 mL) of Hymovis (8 mg/mL of the 500–730 kDa hyaluronic acid hexadecylamide) at 6 months interval. Each treatment cycle corresponded to two intra-articular injections one week apart. All patients had MRI of the target knee at baseline and 1 year, and blood samples (D30, D90, D180, D210 and D360) to assess joint biomarkers. The primary outcome was the change in type II collagen-specific biomarkers (Coll2–1, Coll2–1NO2 and CTX-II) after Hymovis treatment versus baseline. Secondary endpoints included levels changes in AGG, COMP, PIINP, MMP-3, MPO and IL-6 serum biomarkers, the ratio Coll2–1/PIINP, CTX-II/PIINP, MRI cartilage volume and KOOS index.

**Results:** Coll2–1 serum levels significantly increased overtime (0.05<P<0.001) while Coll2–1NO2 levels was only increased at D360 (p<0.05). Serum PIINP levels also progressively and significantly enhanced with time (p<0.001). In contrast, other serum biomarker levels including CTX-II, AGG, COMP, MMP-3, MPO or IL-6 did not change significantly overtime. Interestingly, the ratios Coll2–1/PIINP and CTX-II/PIINP decreased (p<0.005), indicating a decrease of cartilage catabolism. Compared to baseline value, MRI cartilage volume increased in lateral femoral and lateral trochlea compartments (p<0.05) and not in medial compartment. Interestingly, WOMBS effusion score, an indicator of synovitis, significantly decreased (p<0.016). Finally, global KOOS score and subscales significantly increased overtime (p<0.001) while pain at rest, walking pain and patients or investigators global assessment of disease activity decreased (p<0.001). The safety profile was favourable with a low incidence of injection-site pain.

**Conclusions:** Hymovis, a well-tolerated intra-articular treatment, significantly enhanced type II collagen turnover as suggested by the increase in Coll2–1 and PIINP levels and cartilage volume observed by MRI in lateral knee compartment. Importantly, this study highlighted the potential symptomatic benefit of Hymovis on pain and function and provides critical information for the design of a larger phase III clinical trial.

### CADMIUM TOXICITY AS A PROBABLE CAUSE OF SMOKING INDUCED BONE LOSS

A.A. Elbeily<sup>1,2</sup>, H.A. Eldosouky<sup>1</sup>. <sup>1</sup>Rheumatology, Al-Azhar Faculty of Medicine, Cairo, Egypt; <sup>2</sup>Rheumatology, St Thomas Hospital, London, UK

**Background:** Cigarette smoking supposed to be a risk factor for osteoporosis. There is an inverse relationship between smoking and both bone mass and fracture risk. Tobacco smoking is the most important single source of cadmium exposure in the general population. The absorption of cadmium from the lungs is much more effective than that from the gut.

**Objectives:** This study was designed to evaluate the effect of cigarette smoking on bone mineral density, due to cadmium toxicity.

**Methods:** This study was carried on 100 persons, selected from AL-Azhar university hospital and divided into three groups: group I: included 40 persons with active smokers; group II: included 40 persons with passive smokers and group III included 20 nonsmokers. All persons were subjected to full history taking,

thorough clinical examination, routine lab tests, serum and urinary cadmium and lead, and bone mineral density was measured by DEXA.

**Results:** Serum and urinary cadmium and lead were statistically significantly higher in group I in comparison to groups II or III and in group II in comparison to group III. Also, there was statistically significant decrease of BMD in group I in comparison to either group II or group III and in group II in comparison to group III. There was an inverse statistically significant correlation between serum and urinary cadmium and bone mineral density.

**Abstract AB0984 – Table 1.** Comparison between studied groups as regard serum and urinary cadmium levels

		Mean	S. D	Minimum	Maximum	F	P
Serum cadmium (µg/l)	Group I	0.449	0.287	0.18	1.80	27.92	<0.001(S)
	Group II	0.232*	0.040	0.16	0.32		
	Group III	0.094*	0.047	0.01	0.16		
Urinary cadmium (µg/l)	Group I	0.555	0.304	0.30	2.00	27.16	<0.001(S)
	Group II	0.335*	0.042	0.26	0.42		
	Group III	0.181*	0.052	0.11	0.26		

\*=statistically significant decrease in comparison to group I or group II

#=statistically significant decrease in comparison to group I

**Conclusions:** Results of the present study revealed that: there are harmful effects of smoking on the bone mineral density and it may be occurred by direct (increased blood and urinary levels of both cadmium and lead) or indirect effects (effects of both renal and liver functions) of cadmium and lead.

### PERSISTENCE AND ADVERSE EVENTS IN PATIENTS TREATED WITH DENOSUMAB

A. Lopez, I. Janta, J.C. Nieto, J. Martinez Barrio, B. Serrano, F. Garcia, J. C. Sanchez, C. Garaballu, T. Del Rio, C. Gonzalez, J. Lopez Longo, I. Monteagudo. *Rheumatology, Hospital Gregorio Marañón, Madrid, Spain*

**Background:** Denosumab (DNS) is a human monoclonal antibody directed against RANKL, which blocks the maturation of the osteoclast, inhibiting bone resorption. The binding of DNS to RANKL suppresses bone resorption mediated by osteoclasts and decreases bone turnover.

**Objectives:** To evaluate the survival rate of DNS, adverse events and reasons for the DNS discontinuation.

**Methods:** This was a prospective observation study in patients with OP which initiated treatment with DNS between January 2013 and December 2017. Patients included were followed up in the Rheumatology Nurse Clinic every six months. Demographics data, disease features, concomitant disease and treatments, adverse events and reasons for discontinuation were collected.

**Results:** We included 220 patients (80.5% women) with a mean age (range, SD) of 67.19 (30–89, 11.2) years. In average (range, SD), patients received 3.85 (1–11, 2.2) doses of DNS, with a mean duration of treatment (range, SD) of 23.03 (6–66, 13.3) months. 191 (86.8%) patients received also treatment with calcium and vitamin D supplements. Before the start of the treatment with DNS, 123 (55.9%) patients had received another specific treatment for OP with mean previous treatment duration of 51.6 months. Previous fragility fractures were reported in 150 (68.1%) patients, of whom 91 (41.3%) patients had two or more fractures before starting treatment with DNS.

Of all included the patients, 108 (49%) patients had an inflammatory autoimmune disease (IAD) diagnosed. In addition, 100 (45.4%) patients had concomitant biological and/or synthetic treatment and 77 (35%) patients received concomitant treatment with corticosteroids.

During the treatment with DNS, 30 (13.6%) patients had new fractures, 5 (2.3%) patients had 2 fractures. Eleven fractures were vertebral, 3 of femur, one of radius and 21 other locations. There were no differences between patients with or without glucocorticoid treatment (0.234).

The most frequent adverse events (AE) were infections in 88 (40%) patients, muscle pain in 15 (0.6%) patients, fatigue in 7 (0.31%) patients, itching, heat and fever in 2 (0.9%) patients and osteonecrosis of the jaw in 2 (0.9%) patients. The 2 patients with osteonecrosis of the jaw had previous treatment with bisphosphonates for more than 24 months.

At 60 months, 185 (84.1%) patients continued with DNS. In 37 (1.6%) patients, DNS was discontinued; in 4 patients DNS was restarted. The reasons for suspension were hypercalcaemia 1 (0.04%), hypocalcaemia 1 (0.04%), local hypersensitivity reactions 4 (0.18%), normalisation of BMD 5 (0.2%), dental problems 11 (0.4%) and others 17 (0.7%). The mean (SD, 95% CI) of DNS survival was 51.2 (1.9; 47.3–55.1) months. There are no differences in the survival rates of DNS between patients with and without concomitant biologic therapy ( $p=0.995$ ).

**Conclusions:** The majority of patients who started treatment with DNS continue the treatment with good tolerance. The most frequent adverse effects were infections but they have not led to suspension of treatment.

#### MANAGEMENT OF OSTEOPOROSIS AFTER MAJOR FRACTURE IN A COHORT OF WOMEN AGED OVER 50 IN A REAL LIFE SETTING

A. Nutz<sup>1</sup>, S. Bastide<sup>2,3</sup>, F. Flaisler<sup>1</sup>, C. Gaujoux-Viala<sup>1,2</sup>. <sup>1</sup>Rheumatology, Nîmes University Hospital, NîMES; <sup>2</sup>EA2415, Montpellier University, MONTPELLIER; <sup>3</sup>Biostatistics, Epidemiology, Public Health and Innovation in Methodology (BESPIM), Nîmes University Hospital, NîMES, France

**Background:** Osteoporosis is the most common metabolic bone disease. Fractures constitute a major health concern because prior fractures are associated with an increased risk of subsequent fracture. Moreover, osteoporotic fractures have been associated with increased mortality risk.<sup>1</sup> Hence secondary fracture prevention is recommended. Anti-osteoporotic drugs are available, but in the last decade an alarming decrease of anti-osteoporotic therapy use was observed.<sup>2</sup>

**Objectives:** The objective of this study was to analyse the management of osteoporosis after major fracture (hip, vertebral and humerus fractures) in women aged over 50 in a real life setting.

**Methods:** We conducted an observational study on all women over 50 years of age who experienced a major fracture at Nîmes University Hospital in 2015 identified by informatic codes. Only fragility fractures were included. Data collected prospectively in the computerised medical files were extracted: prescription of a postmenopausal osteoporosis therapy; therapy initiation; prescription and completion of generalised bone mineral density testing; and prescription and completion of blood sample tests to look for secondary osteoporosis. We also recorded the department in which the hospitalizations occurred and the fracture localization.

**Results:** Of 375 women over 50 with a registered fracture in 2015, 264 were included. The exclusion criteria were women with traumatic fracture or minor

osteoporotic fracture. The median age was 84 years old. The most common major fractures were hip (52.3%), humerus (20.8%) and spine (18.9%).

Forty-five (17.0%) patients had experienced a fracture prior to the 2015 fracture.

Only 12 patients (4.5%; IC95%[2.4–7.8]) had an anti-osteoporotic drug prescription at the end of the hospitalisation and only 45 women (17%) had anti-osteoporotic drug prescription planned later. The median period until anticipated prescription was 9 days and the median period until prescription in practice was 18 days.

Assessment of bone mineral density was planned later in only 23 patients (8.7%; IC95% [5.6–12.8]). Blood sample tests were realised in 49 women (18.6%; IC95% [14.1–23.8]).

In surgical department, anti-osteoporotic drug prescription was planned in only 3 women (1.5%) compared with 40 women (56.3%) in medical departments.

**Conclusions:** A large majority of women with osteoporotic major fracture are not receiving appropriate therapy and recommended management in 2015 in Nîmes University Hospital. The rate is dependent on the department in which patients are hospitalised.

The results of our study highlight the urgent need for optimisation of osteoporotic fracture management, especially in the surgical department.

#### FREQUENCY OF UTILISATION OF THE CENTRAL DXA BONE DENSITOMETRY IN PATIENTS WITH MULTIPLE SCLEROSIS

A.N. Klimo. *Specialized hospital of rehabilitation "Banja Kanjiža", Kanjiža, Serbia*

**Background:** Multiple sclerosis patients can have a higher risk from occurrence of osteoporosis. Reduced bone mass density can be related to a cumulative effect of different factors, most common ones being physical inactivity, reduced intake of vitamin D and use of medications such as glucocorticoids.

**Objectives:** The aim of this research was to explore the level of awareness in patients and physicians on the significance of the utilisation of DXA bone densitometry in patients with multiple sclerosis.

**Methods:** The observational analytical cross-section study included 366 multiple sclerosis patients on stationary treatment at the Special rehabilitation hospital "Banja Kanjiža" in Kanjiža in the period between 2013 and 2017. The following parameters were observed in patients: sex, age, duration and form of basic disease, the level on the Kurtzke Expanded Disability Status Scale, utilisation of glucocorticoids, occurrence of pathological fractures and intake of vitamin D, i.e. of medication for the treatment of osteoporosis in order to determine their impact on the frequency of the low bone mineral density (BMD). Statistical data processing and analysis was conducted in the SPSS ver 20.0 program by IBM corporation.

**Results:** In the period in question, an average of 128 multiple sclerosis patients were treated, out of those 62.3% (n=228) with relapsing-remitting type of disease, and n=366 first time patients. Within the given period, 36% more women than men were rehabilitated (f=249 vs. m=117). During the five-year long period of observation of said patients, only 8.5% (n=31) of patients with different levels of bone metabolic disorders established underwent central DXA bone densitometry. Pathological fracture on a small trauma was suffered in 6.8% (n=25) patients. Of the abovementioned parameters, only the female sex ( $X^2=84.492$ ;  $p<0.001$ ) and age ( $t=2.100$ ;  $p=0.036$ ) statistically significantly influenced the occurrence of low bone mineral density.

**Conclusions:** It is necessary to increase the level of health education of multiple sclerosis patients on the consequences of low bone mineral density. The highest risk of osteoporotic fracture is in older women suffering from multiple sclerosis.

**AB0988** **BONE QUALITY EVALUATION USING THE NEW TRABECULAR BONE SCORE (TBS) TOOL IN RHEUMATOID ARTHRITIS PATIENTS SUPPLEMENTED WITH VITAMIN D**

A. Casabella<sup>1</sup>, S. Paolino<sup>1</sup>, B. Ruaro<sup>1</sup>, A. Sulli<sup>1</sup>, C. Pizzorni<sup>1</sup>, E. Alessandri<sup>1</sup>, D. Fasciolo<sup>1</sup>, C. Serio<sup>2</sup>, L. Molfetta<sup>2</sup>, P. Odetti<sup>2</sup>, B. Serio<sup>2</sup>, M. Cutolo<sup>1</sup>.

<sup>1</sup>Department of Internal Medicine, Di.M.I. Polyclinic Hospital, San Martino, University of Genoa, Genoa Italy, Research Laboratory and Academic Division of Clinical Rheumatology; <sup>2</sup>Department of Internal Medicine, Di.M.I. Polyclinic Hospital, San Martino, University of Genoa, Genoa Italy, Osteoporosis, Bone and Joint Disease Research Center, CROPO, Genoa, Italy

**Background:** Patients affected by Rheumatoid Arthritis (RA) show an increased risk of low bone mass, as a result of multi-systemic disorders including toxic drug, low vitamin D levels, use of glucocorticoids and physical inactivity. Trabecular Bone Score (TBS), is an index extracted from the dual-energy X-ray absorptiometry (DXA) images, that provides an indirect measurement (Score) of bone axial microarchitecture and allows to get information about bone quality.<sup>1,2</sup>

**Objectives:** The aim of this investigation was to evaluate by TBS the bone quality in RA patients (high risk population) receiving vitamin D supplementation from at least 3 months (1000 IU/die).

**Methods:** 108 female patients (mean age 61±8 years) affected by RA and 60 age- matched controls (CNT) (mean age 64±11 years) were analysed in winter time. Bone Mineral Density (BMD, g/cm<sup>2</sup>) of the lumbar spine (L1-L4) was analysed using a DXA scan (GE, Lunar Prodigy). Lumbar spine TBS (TBS iNsite Medimaps) was derived for each spine DXA examination. All patients were evaluated for serum 25 hydroxyvitamin D (25(OH)D) serum concentrations.

**Results:** RA patients showed lower 25(OH)D concentrations (18.4±1.3 ng/ml) than CNT (26.2±0.9 ng/ml; p<0.04) possibly due to low dosage and short treatment. Seventy-eight RA patients (80% of study population) presented a bone loss that was significant when compared to the control group (p<0.001). In particular, BMD was found significantly lower in RA patients compared with matched control group (respectively, Lumbar spine: 0.862±0.194 g/cm<sup>2</sup> vs 1.240±0.932 g/cm<sup>2</sup>; Femoral neck: 0.668±0.141 g/cm<sup>2</sup> vs 0.845±0.164 g/cm<sup>2</sup>; Ward: 0.486±0.221 g/cm<sup>2</sup> vs 0.657±0.106 g/cm<sup>2</sup>; Trochanter: 0.598±0.231 g/cm<sup>2</sup> vs 0.725±0.143 g/cm<sup>2</sup>; Total hip: 0.764±0.244 g/cm<sup>2</sup> vs 1.033±0.161 g/cm<sup>2</sup>, all p<0.001). Likewise, lumbar spine TBS score was found significantly lower in RA patients when compared with CNT (0.904±0.148 vs 1.361±0.126, both p<0.001)

**Conclusions:** This study shows in RA patients a reduction of TBS values that seem placed side by side with reduced BMD values and in presence of serum 25 (OH)D insufficiency. A more careful analysis of the clinical status/treatments should let to better identify RA patients at higher risk of bone loss.

**AB0989** **THE IMPACT OF A LOW-COST DIGITAL AND PRINT AWARENESS CAMPAIGN ON PATIENT BEHAVIOUR IN RELATION TO PERSONAL RISK OF OSTEOPOROSIS AND FRAGILITY FRACTURE**

H. Mace, C. Bovey, H. Arden, T. Jones. *National Osteoporosis Society, Bath, UK*

**Background:** The National Osteoporosis Society (NOS) 'Stop at One' campaign aims to encourage people who are over 50 and have broken a bone to find out, by taking an online quiz, if they are at risk of osteoporosis and to take action to reduce their risk of further fractures. A low-cost marketing intervention was trialled making printed campaign materials available direct to patients at the point of care (fracture clinic).

**Objectives:** The analysis sought to establish whether the marketing intervention increased take up of the online quiz, and to what extent taking the quiz influenced people's behaviour with regard to their bone health.

**Methods:** Between May and October 2017, the NOS placed Stop at One printed campaign materials encouraging people to take the online bone health quiz at 8 sites across the UK covering 13% (16/124) of UK postcode areas. 7 sites had no enhanced provision for secondary fracture prevention such as a fracture liaison service, 1 had a partial service. People who took the online quiz were sent a follow-up survey one month later.

**Results:** Up to 1st, <sup>January 2018</sup> 1909 people took the quiz:

- 89% (1699) of these were over 50
- 95% (1814) were female.
- 21% (443) of these lived in postcode areas of the pilot sites.
- 1359 people were sent a follow up survey one month after taking the online quiz, and 10% (142) completed it. 27%<sup>39</sup> of these were individuals living in the postcode areas of the pilot sites.
- When surveyed, of the 142 respondents:
  - 50% (71) of respondents had broken a bone in the previous ten years.
  - 73% (104) thought they were at risk of osteoporosis after taking the test.
  - 24%<sup>34</sup> had either booked or attended an appointment with their GP to discuss their possible risk of osteoporosis.
  - A further 10%<sup>14</sup> planned to book a GP appointment to discuss their risk.
  - 31%<sup>43</sup> had made changes to their exercise habits.
  - 33%<sup>45</sup> had made changes to their diet.

**Conclusions:** Digital activity (patients accessing website) and the electronic patient survey show meaningful changes in patient behaviour to reduce their fracture risk. Visibility of the awareness campaign at the point of care increased uptake of the quiz and subsequent survey.

**Disclosure of Interest:** None declared

**AB0990** **THREE YEARS IMPROVEMENT IN OSTEOPOROSIS TREATMENT ADHERENCE FOLLOWING A THERAPEUTIC PATIENT EDUCATION (TPE) PROGRAM**

D. Poivret<sup>1</sup>, V. Noirez<sup>1</sup>, C. Goetz<sup>1</sup>, C. Wilcke<sup>2</sup>. <sup>1</sup>CHR METZ THIONVILLE; <sup>2</sup>URPS Grand Est, Metz, France

**Background:** The management of osteoporosis requires a restrictive drug treatment over several years and lifestyle changes: maintaining a suitable physical activity, a sufficient calcium intake and maintenance of ground balance. Unfortunately, treatment adherence at one year doesn't exceed 50%. The education of the patient allows to take care of himself in his therapeutic approach but requires a relay to continue the follow-up over several years.

**Objectives:** To improve the follow-up of the patient, we created a cooperation between the doctor and the pharmacist.

**Methods:** We suggested to patients treated for osteoporosis by diphosphonate, denosumab or teriparatide to participate at two half-day TPE sessions, one year apart. It's taught that osteoporosis requires at least 5 years of treatment, and must be associated with the absorption of three daily dairy products, maintaining physical activity and preventing falls.

A follow-up notebook that contains 6 doctor and 6 pharmacist questionnaires is given to each patient participating in a TPE session. The patient sends his book to the doctor, and then to the pharmacist twice a year for three years. The pharmacist questionnaire explains the drug intake. The doctor questionnaire evokes lifestyle changes. This one is completed by the patient in the waiting room and is discussed with the doctor during the consultation. Each completed questionnaire provides a financial compensation to the health professional.

The program is funded by the Regional Health Agency of Lorraine and by the Regional Union of Health Professionals (doctors and pharmacists). Inclusions started in January 2013. We studied the results of the 3 year questionnaires for 94 patients included in 2013 and 2014.

**Results:** Among the 94 patients, only 49 continue their treatment at 3 years. Patients who stopped treatment, 4 died, 1 presented an atypical fracture of the femoral shaft, 6 stopped due to dental treatment, 4 had a contraindication to any anti-osteoporosis treatment, 1 stopped treatment due to multiple sclerosis 11 left the program, 2 had poorly tolerated the infusion and 1 discontinued treatment because of improved bone mineral density (BMD). Among the 49 patients who continue their treatment, 13 returned a doctor and pharmacist questionnaire at 3 years. There are 4 doctors and 2 pharmacists who refused to fill out the questionnaire, 20 patients didn't agree to respond to our request for news about their health condition and 4 patients lost to follow-up.

The study of 13 questionnaires received shows that at 3 years, 38% of patients continue to consume 3 daily dairy products against 56% at 6 months. Nearly 70% of patients maintained their physical activity, 8% improved and 8% decreased it. It also shows that 46% of patients walk more than 30 min per day. The ground balance is satisfactory for 62% of patients compared to 71% at 6 months. Regarding compliance, at 6 months and 3 years, only 69% of patients never forget their treatment and 15% wanted to stop it. During the 3 years of follow-up, all patients were re-contacted at least once.

**Conclusions:** 52% of patients included continue the treatment at 3 years. 21% refuse to participate in the program. The doctor/pharmacist collaboration around the patient requires time and understanding. Patients recall and their participation in a research program improves their adherence to treatment and lifestyle changes.

**OSTEOPOROSIS AND FRACTURES IN PATIENTS WITH CIRRHOSIS. CAN FRAX BE USEFUL FOR SCREENING?**

E. Casado<sup>1</sup>, M. Arévalo<sup>1</sup>, J. Profitós<sup>2</sup>, A. Lira<sup>3</sup>, L. Del Río<sup>4</sup>, O. Valero<sup>5</sup>, M. Larrosa<sup>1</sup>, J. Sánchez-Delgado<sup>3</sup>, J. Gratacós<sup>1</sup>. <sup>1</sup>Rheumatology, University Hospital Parc Taulí, I3PT. UAB. Sabadell, Sabadell; <sup>2</sup>Gastroenterology and Hepatology, Consorci hospitalari de Terrassa, Terrassa; <sup>3</sup>Gastroenterology and Hepatology, University Hospital Parc Taulí, I3PT. UAB. Sabadell, Sabadell; <sup>4</sup>Radiology, CETIR Centre Mèdic, Barcelona; <sup>5</sup>Statistics, Universitat Autònoma Barcelona (UAB), Bellaterra, Spain

**Background:** Osteoporotic fractures are a serious complication in patients with cirrhosis. In addition to the high morbidity and mortality of the patients who suffer them, fragility fractures represent a high cost for Healthcare systems.

However, there are very few studies that evaluate the prevalence of osteoporosis and fractures in patients with liver cirrhosis different than primary biliary cirrhosis (non-PBC cirrhosis). There are also no clinical guidelines with recommendations for osteoporosis screening in these patients.

**Objectives:** To assess the prevalence of osteoporosis and fragility fractures in patients with non-PBC cirrhosis in our environment, and the associated risk factors.

To analyse if the FRAX tool can be useful in the diagnostic screening of these patients.

**Methods:** From November 2015 to September 2017, outpatients older than 40 years diagnosed with non-PBC cirrhosis (any Child stage) were randomly included.

Demographic, clinical and analytical data (calcium, phosphorus, 25-hydroxyvitamin D and PTH) were collected from all patients. A bone densitometry, GE, Lunar Prodigy (DXA) and vertebral fracture assessment (VFA) were also performed, for the diagnosis of osteoporosis (T-score  $\leq -2.5$ ), and vertebral fracture. The 10 year absolute fracture risk was calculated using FRAX (<https://www.sheffield.ac.uk/FRAX/tool.aspx?country=4>).

A descriptive statistic of the main variables was carried out, with univariate and multivariate analysis to assess which predictive factors could be related to the presence of osteoporosis and/or fragility fractures.

**Results:** Ninety-two patients were included (71% male and 29% female). Age 63  $\pm 11$  years. The etiology of cirrhosis was: alcohol (52%), hepatitis C virus (27%) and alcohol +hepatitis C virus (9%). Stage: Child A (80.4%), B (17.4%) and C (2.2%). Mean 25-hydroxyvitamin D was 18.5 $\pm$ 9.8 ng/ml and PTH 51.8 $\pm$ 23.0 pg/ml.

16 patients (17%) had osteoporosis by DXA, 54 patients (59%) osteopenia and 22 (24%) had a normal bone mineral density (BMD). 8 patients (9%) had suffered some fragility fracture (vertebral fracture in 6 cases).

The 10 year absolute risk for major fracture (vertebra, humerus, femur or radius) by FRAX without BMD was 5.7 $\pm$ 4.5; and with BMD 4.7 $\pm$ 4.9.

Age and female sex were associated with the presence of osteoporosis, and a BMI higher than 30 was found to be a protective factor. A BMD in the range of osteoporosis was the only factor associated with fracture.

FRAX for major fracture without BMD higher than 6.6% in this population had a high sensitivity (69%) and specificity (85%) for the diagnosis of osteoporosis, which implies a negative predictive value of 93%. Using this FRAX cut-off for indicating DXA in cirrhotic patients could expect a saving of 76% of DXA scans.

**Conclusions:** The prevalence of osteoporosis and fractures in patients with non-PBC cirrhosis, even in mild stages, is higher than in the healthy population, being more frequent in women and older patients.

The FRAX tool can be useful in the selection of patients with cirrhosis to be assessed by a bone densitometry.

**BONE REMODELLING BIOMARKERS IN HIV INFECTED PATIENTS**

E. López<sup>1</sup>, J. Loarca<sup>1</sup>, C. Sobrino<sup>1</sup>, J.L. Casado<sup>2</sup>, M. Vázquez<sup>1</sup>. <sup>1</sup>Rheumatology Department, <sup>2</sup>Infectious Diseases Department, Ramon y Cajal University Hospital, Madrid, Spain

**Background:** Bone metabolism is an equilibrium of resorption and growth, maintained by many regulating factors. Several molecules have been identified that estimate bone turnover, being P1NP and b-CTX the most commonly used. Many studies have shown a relationship between their levels and metabolic bone disease, and possibly with risk of fracture.

Human Immunodeficiency Virus (HIV) infected patients have lower bone mineral density (BMD), as documented on many studies. An increased incidence of

fractures has been noted as well, probably due to predisposing factors related to HIV infection, apart from the traditional risk factors.

**Objectives:** To assess the relationship between mean values of bone biomarkers P1NP and b-CTX and incidence of vertebral fractures (VF) in a HIV infected population; and compare such values with those of a Spanish healthy population of reference.

**Methods:** We performed a cross-sectional study with HIV infected patients followed up in the Infectious Diseases Department of our centre from 2014 to 2016. P1NP and b-CTX values were determined and lumbar and thoracic spine radiographs made to assess presence of VF (Genant grading scale). Other clinical and demographic data were collected retrospectively. P1NP and b-CTX values in the presence (VF group) and absence of fractures (non-FV group) were compared. Mean values were also compared with the Camargo cohort, comprised of 1080 healthy postmenopausal Spanish women, used as reference. Statistical analysis were made with STATA. All patients signed and informed consent, previously approved by the Hospital's Ethics Committee.

**Results:** A total of 144 patients were included, 38 were women with a mean age of 56,4 years old<sup>45-77</sup> and 106 men with mean age of 56,5 years old.<sup>45-86</sup> 27 of the patients had at least one VF. No statistically significant differences were found between P1NP mean levels in the FV and the non FV groups, with values of 45,30 ng/ml ( $\pm 17,59$  ng/ml) and 49,48 ng/ml ( $\pm 32,92$  ng/ml) respectively, ( $p=0,52$ ). Mean levels of b-CTX were 0,38 ng/ml ( $\pm 0,18$  ng/ml) in the VF group and 0,43 ng/ml ( $\pm 0,22$  ng/ml) in the non-FV group, again without significant differences ( $p=0,35$ ).

Mean general b-CTX values in our population were 0,41 ng/ml ( $\pm 0,21$ ); 0,46 ng/ml ( $\pm 0,20$ ) in women and 0,39 ng/ml ( $\pm 0,20$ ) in men. Higher levels were found in HIV infected women than in the Camargo cohort (0,38 $\pm$ 0,19 ng/ml), with statistical significance ( $p=0,03$ ). Mean general P1NP values were 48,34 ng/ml ( $\pm 29,47$ ), 58,63 ng/ml ( $\pm 32,9$ ) in women and 44,95 ng/ml ( $\pm 27,56$ ) in men, with no statistically significant differences found when HIV infected women were compared with those of the Camargo cohort, (47,7 $\pm$ 19,9 ng/ml) ( $p=0,06$ ), although a trend towards higher levels in HIV infected women was observed.

**Conclusions:** In the present study no correlation between P1NP and b-CTX levels in HIV infected patients and incidence of vertebral fracture was found.

P1NP and b-CTX mean values in HIV infected women in our study are higher than those of healthy postmenopausal Spanish women, which means a higher bone turnover in this population. More studies are needed to clarify the extent and clinical impact of this finding.

**PAIN RELIEF MANAGEMENT OF ACUTE OSTEOPOROTIC VERTEBRAL FRACTURE IN A REAL LIFE STUDY**

E. Bertoldo<sup>1</sup>, G. Gandolini<sup>2</sup>, A. Venturin<sup>3</sup>, C. Cisarì<sup>4</sup>, R. Lovato<sup>5</sup>, M. Longhi<sup>6</sup>, S. Farina<sup>7</sup>, E. Bertoldo<sup>8</sup>, R. Nuti<sup>9</sup>, on behalf of Servatius GISMO study group.

<sup>1</sup>Internal Medicine, University of Verona, Verona; <sup>2</sup>rheumatology, IRCCS Don Gnocchi, Milan; <sup>3</sup>Rheumatology Unit, University of Padua, Padua; <sup>4</sup>Orthopedic Unit, University of PO, Novara; <sup>5</sup>Internal Medicine, Villa Berica Hospital, Vicenza; <sup>6</sup>Orthopedic Unit, Galeazzi Institute, Milan; <sup>7</sup>Rheumatology Unit, Crema Hospital, Crema; <sup>8</sup>Rheumatology Unit, University of Verona, Verona; <sup>9</sup>Internal Medicine, University of Siena, Siena, Italy

**Background:** Among all osteoporotic fractures the painful vertebral fractures (PVF) are the minority and their management is challenging for the clinician because the evidences about the best approach are conflicting and of low quality. Moreover there are no guidelines or consensus of experts. A real life picture of the management of the PVF is lacking in the literature.

**Objectives:** The primary end point of the study is to describe the pharmacological and non-pharmacological management of PVF through the record of use of individual classes, associations and sequences of drugs or procedures. Secondary end point is the outcome of treatment in term of pain, disabilities and quality of life.

**Methods:** We present the interim analysis results of a multicentric cross-sectional observational study. 400 interviews will be collected consecutively about pain, disability, pharmacological, spinal orthoses and orthopaedic surgery after the diagnosis of PVF in postmenopausal women treated by orthopaedics, endocrinologists, geriatricians, physiatrists, neurosurgeons and E.R. physicians. Pain and disability were quantified by NRS scale and by QUALEFFO-41. Data collected from the first 100 patients have been analysed.

**Results:** One hundred postmenopausal women aged 73.1 $\pm$ 7.49 y.o (age of menopause 48.6 $\pm$ 3.9 years, L1-L4 T-score  $-2.75\pm 0.92$ , Total hip T-score  $-2.35\pm 0.98$ ) with a new or first PVF were recorded. About 49% of them had a previous vertebral fracture and 22% a previous non-vertebral fragility fracture, 27% was not on osteoporosis treatment. The interviews were collected 135 $\pm$ 114 days from diagnosis of PVF, 174 $\pm$ 141 days from onset of pain. 92.3 $\pm$ 12% of subjects were treated for pain relief for a mean time of 98 $\pm$ 12 days. Only 1.6% of cohort

underwent to percutaneous vertebroplasty while 84.6%±17.1% had spinal orthoses. Pharmacological treatment for pain was prescribed to 98.2±7.1% of subjects: acetaminophen (42%), tapentadol (24%), opioids (24%), NSAID (6%) and codeine with acetaminophen (4%). In 95% of patients with spinal orthoses drugs for pain were assumed. In about 40% of cases NSAID was switched to acetaminophen, in 18% opioid and tapentadol switched to NSAID or acetaminophen. Only a few titration of opioids/tapentadol were reported. Not adequate pain relief (NRS scale 6.2±3.1; QUALEFFO-41 pain score 70±14.2) and impairment quality of life (mean total QUALEFFO-41 score 65.1±20.1) were reported.

**Conclusions:** With the limits of the study design and low number of cases, preliminary data seem to confirm an inadequate pain relief in PVF. The emerging critical issues crossing all categories of physicians are the lag of diagnosis, the inappropriate use of acetaminophen, the missing titration of opioids or tapentadol. A definition of optimal management of acute vertebral fracture is missing due to conflicting and scarce evidences in this field predisposing to chronic pain and disability.

**AB0994** **IMPACT ON THE ADHERENCE AND PERSISTENCE OF DENOSUMAB VS WEEKLY BISPHOSPHONATE IN HEALTH-RELATED QUALITY OF LIFE IN POSTMENOPAUSAL OSTEOPOROSIS**

G. Carlino<sup>1</sup>, R. Cinzia<sup>1</sup>, R. Maggio<sup>2</sup>. <sup>1</sup>Rheumatology, ASL LE, Casarano; <sup>2</sup>Internal Medicine, "Veris Delli Ponti" Hospital, Scorrano, Italy

**Background:** Long term adherence and persistence in patients undergoing treatment for postmenopausal osteoporosis remains poor despite the proven efficacy of the therapy.

**Objectives:** In this study, we evaluated whether greater adherence and persistence in treatment can lead to an improvement in the quality of life.

**Methods:** A cohort of 268 patients, all women, in postmenopausal osteoporosis divided into two groups was evaluated: "DEN Group" (DEN) in treatment with denosumab (n=131) and "BIS Group" (BIS) in treatment with bisphosphonates (n=137). Table 1 shows demographic and clinical data. Patients were followed for 3 years with baseline, 6 month, 18 month, and 36 month evaluation. The evaluation criteria were the persistence in therapy and the self-related treatment compliance, as well as the quality of life assessed with the 41-item Quality of Life questionnaire for osteoporosis (QUALEFFO-41) performed at baseline, at 18 and at 36 months.

**Results:** Table 2 shows the percentage of patients who abandoned treatment at different times with a statistical significance towards both 18 and 36 months. In the BIS the main reason for abandonment were the adverse events (gastrointestinal, dental interventions, etc.), in the DEN the abandonment was due to drop-out. [In BIS, the most frequent reason for non-compliance with therapy was oversight, and most patients who continued treatment always used the drugs regularly on the recommended days and dosages.] In the period of time considered the majority of patients both BIS and DEN said they were satisfied with the treatment and wanted to continue it. The QUALEFFO scores (Fig 1) of patients from the baseline visit were significantly improved in the 36 month visit (BIS 79.6±25.4 vs 65.4±14.6; DEN 80.2±18.5 vs 55.6±16.4 (\*p<0.001); the difference was not significant between BIS and DEN groups at both baseline visit and 36 month visit, but in the DEN group there was significance between baseline and 36 month visit.

**Abstract AB0994 – Table 1.** Baseline characteristics (Mean±SD)

OC=Osteocalcin, CTX=C terminal telopeptide, PTH=parathyroid hormone, 25OHD=25 hydroxyvitamin D;

**Abstract AB0994 – Table 2.** Percentage of patients who abandoned.

**Abstract AB0994 – Figure 1.** Qualeffo-41 Score (\* see text)

**Conclusions:** In conclusion, the observation, although numerically limited, notes that the use of denosumab in patients with postmenopausal osteoporosis leads to a greater persistence in treatment and a statistically significant adherence to therapy, which allows to obtain the maximum therapeutic effect of the therapy, also determining in 36 months of treatment an improvement in the quality of life, which is not achieved in subjects treated with bisphosphonates.

**AB0995** **VERTEBRAL FRACTURES CASCADE: POTENTIAL ETIOLOGIES AND RISK FACTORS**

H. Che<sup>1</sup>, V. Breuil<sup>2</sup>, B. Cortet<sup>3</sup>, J. Paccou<sup>3</sup>, L. Chapuis<sup>4</sup>, F. Debais<sup>5</sup>, R.M. Javier<sup>6</sup>, N. Mehsen Centre<sup>7</sup>, S. Loiseau Peres<sup>8</sup>, T. Thomas<sup>9</sup>, C. Roux<sup>10</sup>, K. Briot<sup>10</sup>. <sup>1</sup>CHU Lapeyronie, Montpellier; <sup>2</sup>CHU Nice, Nice; <sup>3</sup>CHU Lille, Lille; <sup>4</sup>CH du Vitre, Vitre; <sup>5</sup>CHU Poitiers, Poitiers; <sup>6</sup>CHU Haute-pierre, Strasbourg; <sup>7</sup>CHU Bordeaux, Bordeaux; <sup>8</sup>CHR Orleans, Orleans; <sup>9</sup>CHU Saint Etienne, Saint Etienne; <sup>10</sup>CHU Cochin, Paris, France

**Background:** Vertebral fracture (VF) is the most common osteoporotic fracture, and a strong risk factor of subsequent vertebral fracture. Prospective studies have shown that a recent VF increases an imminent risk of a subsequent one, and attention has been paid recently to a possible cascade phenomenon i.e. the occurrence of multiples VFs in less than one year.

**Objectives:** This cascade could have severe consequences, and we prompted a study to identify potential causes of osteoporosis and risk factors.

**Methods:** Vertebral fractures cascade (VFC) observations were collected retrospectively between January 2016 and April 2017. VFC was defined as the occurrence of at least 3 vertebral fractures within one year. Patients with other etiologies than osteoporosis (i.e. malignant or traumatic VFs) were excluded. The cause of osteoporosis associated with VFC was the one retained by the physician at the time of diagnosis.

**Results:** Ninety-five observations of VFC (80% of women, mean age of 71 years) were collected in 10 centres (9 tertiary centres and 1 outpatient centre). The median number of incident VFs over 1 year was 4.3-11. Forty-five patients (45.9%) had a previous major fracture before the VFC and 65 (70.7%) had densitometric osteoporosis (T-Score ≤ -2.5 SD either at lumbar or femoral site). Eighteen (19%) patients currently received oral glucocorticoids treatment at the time of VFC, with a mean daily dose of 20 mg. Thirty-three (35.1%) patients received systemic glucocorticoids in the past. The main comorbidities were history of cancer (n=19) and chronic inflammatory diseases (n=21) including asthma (n=7), chronic obstructive pulmonary disease (n=7) and rheumatoid arthritis (n=7).

A secondary osteoporosis associated with the cascade was diagnosed in 54 patients (54.5%) with the following causes: glucocorticoid-induced osteoporosis (n=22, 23.7%), benign hemopathies (mastocytosis, MGUS) (n=7, 7.1%), use of aromatase inhibitors (n=3, 3.1%), anorexia nervosa (n=3, 3.1%), alcoholism (n=3, 3.1%), pregnancy and lactation-associated osteoporosis (n=2, 2.1%), primary hyperparathyroidism (n=2, 2.1%) and hypercorticism (n=1, 1.1%). In addition, 11 cases (11.3%) were reported following a vertebroplasty procedure.

Primary either postmenopausal or idiopathic osteoporosis was diagnosed in 48 patients (51.6%). A total of 29 (29.6%) patients previously received an anti-osteoporotic treatment. In six patients (6.3%), VFC occurred early (in the year) following discontinuation of an anti-osteoporotic treatment: 5 after denosumab and one 12 months after an infusion of zoledronic acid.

**Conclusions:** The results of this retrospective study show that almost half of VFC occurred in patients with secondary osteoporosis. While they suggest that a careful management has to be given to these patients in order to prevent VFC in these circumstances, prospective studies are needed to further explore the determinants of such a severe complication of osteoporosis.

**AB0996** **BONE MINERAL DENSITY AT DIFFERENT SITES AS A PREDICTOR OF RIB FRACTURES: A CASE-CONTROL STUDY**

H.L. Wu, M. Bukhari. Rheumatology, University Hospitals of Morecambe Bay NHS Foundation Trust, Lancaster, UK

**Background:** Rib fractures commonly occur as a result of direct trauma, though pathological causes have also been identified. Literature on the specific risk factors of rib fractures is scarce. There was an American prospective cohort study

which highlighted the relationship between risk factors of osteoporosis and rib fractures in older men aged 65 or above.<sup>1</sup> It was observed that the incidence of rib fractures was 3.5/1000 years. Only 3% of rib fractures occurred with absence of trauma. Bone mineral density (BMD) is an important measure for predicting various bone fractures.<sup>2</sup> However, prediction of rib fractures using BMD measurement in different body sites is not reported.

**Objectives:** To determine if reduction in femoral neck and lumbar spine BMD are predictive of rib fractures.

**Methods:** Patients referred from primary care to a DEXA scanner in the north west of England between January 2006 and December 2016 were used in this study. Patients with a history of rib fractures at first scan were matched with controls who did not have any indication for scanning. Cases and controls were matched for age and gender. Differences in BMD at L1-L4 spine and the femoral neck were analysed using two-sample t test. Logistic regression models were fitted to analyse the association between lumbar spine and femoral neck BMD and rib fracture occurrence. The fit of each model was compared using receiver operating characteristic (ROC) curves.

**Results:** A total of 1554 patients were included in the study (777 cases of rib fractures and 777 controls). Mean age for both cases and controls were 62.5 years (SD 12.0). 605 patients (77.9%) were female in both the case cohort and the controls. The mean T score in the lumbar spine is 1.00 in cases versus 1.10 in controls (diff 0.100 95% CI 0.0488, 0.142 p<0.001). The mean T score in the femoral neck is 0.812 in cases versus 0.935 in controls (diff 0.123 95% CI 0.108, 0.137 p<0.001). The odds of lumbar spine BMD and femoral neck BMD were 0.111 (95% CI 0.0640, 0.194, p<0.001) and 0.00209 (95% CI 0.000903, 0.00485, p<0.001) respectively. The areas under ROC curve (AUC) for lumbar spine BMD and femoral neck BMD were 0.623 and 0.733.

**Conclusions:** This study demonstrated that reduction in BMD at the lumbar spine and femoral neck positively correlated to the risk of rib fractures. Reduction in femoral neck BMD is a stronger predictor of the two. Prediction of rib fractures could be affected by other factors influencing lumbar spine and femoral neck BMD. Further work in different demographic groups should be done for comparison and analysis.

### CLINICAL CHARACTERISTICS OF NON-RESPONDER TO DENOSUMAB TREATMENT FOR POSTMENOPAUSAL OSTEOPOROSIS IN JAPANESE WOMAN

I. Yoshii. *Orthopaedics, YOSHII HOSPITAL, Shimanto City, Japan*

**Background:** Denosumab (d-mab), an anti-receptor activator of nuclear factor kappa-B ligand (RANKL) monoclonal antibody, is now widely used in postmenopausal osteoporosis (OP) treatment. It can attain reliable increase of bone mineral density (BMD) despite any OP drugs previous used, and that can be predicted in a long period. However, sometimes we observe BMP decrease. Factor that suppresses BMD gain is still unclear.

**Objectives:** This study investigates non-responder to d-mab, and attempted to evaluate factors that concerns non-responder in clinical practice retrospectively.

**Methods:** 212 postmenopausal OP patients have been treated with d-mab continuously for more than two years under vitamin D supplement and calcium since June 2013. These patients were enrolled, and their clinical background (CBs) such as age at start of d-mab, past history of bone fragility fracture, alcohol habitat, current smoking, being treated for rheumatoid arthritis (RA), glucocorticoid steroid thrown, OP drug naive, length of administration (LA), concurrence of lifestyle disease (LSD) such as diabetes mellitus, hypertension, and chronic obstructive lung disease, and number of comorbidity (N.Com), were investigated (table 1a). BMD of lumbar spine (LS), femoral neck (FN), greater trochanter (GT), and whole femur (WF) at the start and every six months thereafter were measured. Tartrate-resistant Acid Phosphatase 5b (TRACP5b) and total dose of type-one pro-collagen -N-pro-peptide (P1NP) at the same time of BMD measurement, and reduction ratio (RR) of them compared to the first shot were calculated. Patients were divided into two groups whether BMD increased. BMD in each part at final measurement relative to that at start was compared statistically with paired T-test. CBs were statistically evaluated between the two BMD groups (Res and n-Res; Responder and non-Responder) with Mann-Whitney U-test (MWT), and then correlation between the BMD groups and factors of CB that had demonstrated significantly difference,

and TRACP5b and P1NP was also evaluated statistically with Binary Logistic Analysis (BLR). Statistical significance was set less than 5%.

**Results:** For all patients, BMD in LS, WF, and GT demonstrated significant increase at final measurement than at start (p<0.001), while FN demonstrated no significant increase. However, n-Res counted 30, 89, 46, and 44 for LS, FN, WF, and GT, respectively. LA demonstrated negative significant correlation for being n-Res in all part, while LSD, N.Com, TRACP5b at start, and RR of TRACP5b at second shot and last shot, demonstrated significant positive correlation in LS with MWT. However, with BLR, only RR of TRACP5b at second shot demonstrated significant negative correlation with n-Res in LS (OR:0.0702, 95% CI:0.0051–0.9655) with 0.39 cut-off index (COI), while no other factors but LA demonstrated significant negative correlation with n-Res in WF (OR:0.9669, 95% CI:0.9433–0.9911) and GT (OR:0.9632, 95% CI:0.9391–0.9878) with 26 and 24 months COI, respectively (table 1b).

Table 1a Patient's background. Age at Start, Length Administered, Number of Chronic Comorbidities, and Bone Mineral Density, show average value and standard deviation. The other parameters show numbers.%YAM:% of young adult mean value. LS: lumbar spine, FN: femoral neck, WF: whole femur, GT: greater trochanter, SERM: selective oestrogen receptor modulator.

Table 1b Parameters that demonstrated significant difference between responder and non-responder to denosumab, and their p-values, and results of these parameters with binary logistic regression analysis. LS: lumbar spine, FN: femoral neck, WF: whole femur, GT: greater trochanter, LSD: concurrence of lifestyle disease, LA: length of administration, N.Com: number of concurrent comorbidities, TRACP5b at start; tartrate-resistant acid phosphatase 5b (TRACP5b) at start of administration, rTRACP5b@1stP: reduction ratio of TRACP5b of second shot compared to the first, rTRACP5b@LT: reduction ratio to TRACP5b of last shot compared to the first, Drug Naive: initial drug as osteoporosis treatment, PINP: total dose of type-one pro-collagen -N- pro-peptide.

Patient's Background		In Mann-Whitney U-test		In Binary Regression Analysis	
Part	Parameters	p-value	Odds Ratio	95% CI	
Age at Start (year-old)	79.66, 9.47				
Alcohol Habitat	LS	LSD	0.021700	7.228	0.5880-8.886
	LA	LA	0.001700	1.026	0.9708-1.084
	N.Com	N.Com	0.000117	0.9291	0.7201-1.199
Operation Experienced	TRACP5b at start	0.002894	0.995	0.9897-1.0000	
	rTRACP5b@1stP	0.001247	0.97015	0.905096-0.9665	
Rheumatoid Arthritis	rTRACP5b@LT	0.004489	2.913	0.3290-2.580	
	LA	0.026510	0.9969	0.9465-1.050	
Lifestyle Disease	Drug Naive	0.016500	1.026	0.2346-4.572	
	P1NP at start	0.000030	1.031	0.9546-1.037	
Glucocorticosteroid	P1NP at second shot	0.000006	0.9872	0.9877-1.007	
	P1NP at last shot	0.000045	1.014	0.9857-1.043	
Vitamin-D3 Supplemental	210				
Length Administered (year)	TRACP5b at start	0.000013	1.002	0.9985-1.006	
	LA	0.007389	0.9669	0.9433-0.9911	
Number of Chronic Comorbidities	WF	0.003872	0.9632	0.9391-0.9878	
	LA	0.003872	0.9632	0.9391-0.9878	
Bone Mineral Density (NYAM) at start in LS	66.95, 15.81				
Bone Mineral Density (NYAM) at start in FN	60.96, 11.47				
Bone Mineral Density (NYAM) at start in WF	62.56, 11.94				
Bone Mineral Density (NYAM) at start in GT	63.43, 14.44				
Drug Naive	95				
Previous Drug					
Biphosphonate	54				
SERM	22				
Tartrate	19				

**Conclusions:** These results suggest that non-responder to d-mab exists. Length of administration works for BMD to increase in femur, and concurrence of LSD, and N.Com are suggested to be risk factors in LS. Less reduction ratio of TRACP5b at second shot is referred for prediction of non-responder. However, there is no parameter that predicts non-responder before administration.

### OSTEOPOROSIS PREVALENCE IN POST-MENOPAUSAL PATIENTS TREATED WITH AROMATASE INHIBITORS USING BONE MINERAL DENSITY VALUES FROM A SPANISH POPULATION

J. Loarce-Martos<sup>1</sup>, W.A. Sifuentes-Giraldo<sup>1</sup>, L.V. Maldonado-Romero<sup>2</sup>, M. Ahijón-Lana<sup>1</sup>, C. Velázquez-Arce<sup>1</sup>, N. Martínez-Jañez<sup>3</sup>, M. Vázquez-Díaz<sup>1</sup>.

<sup>1</sup>Rheumatology, Ramon y Cajal University Hospital, Madrid, Spain;

<sup>2</sup>Rheumatology, Hospital Teodoro Maldonado Carbo, Guayaquil, Ecuador;

<sup>3</sup>Oncology, Ramon y Cajal University Hospital, Madrid, Spain

**Background:** The majority of cases of breast cancer (BC) are hormone receptor positive and are sensitive to antiestrogen therapy. For postmenopausal women, adjuvant hormonal therapy with an aromatase inhibitor (AI) is the standard of care, and is associated with greater prevalence of osteoporosis (OP)<sup>1</sup>. Definition of osteoporosis is made depending on the T-Score value, which is calculated according to the bone mass peak obtained from a reference population; in our country, BMD reference values in clinical practice are obtained from the National Health and Nutrition Examination Survey cohort (NHANES III) for femoral neck (FN) and those proportionated by the commercial brand Hologic for lumbar spine (LS), which may not be representative of our population and could be distorting the assessment of OP in our patients.

**Objectives:** To assess the prevalence of OP in Spanish postmenopausal patients diagnosed with BC and treated with AI using BMD values obtained from a local cohort for T-Score calculation.

**Methods:** We performed a cross-sectional study with postmenopausal women diagnosed with BC and treated with AI attended in our hospital between August 2011 and December 2014. We estimated BMD for LS and FN using dual X-Ray absorptiometry. The prevalence of OP in our cohort was assessed using BMD reference values from the Spanish cohort of Diaz-Curiel<sup>2</sup>, which included a group of 2442 healthy patients from both genres stratified by age, and compared it with OP prevalence obtained using clinical practice reference values applied in our country (NHANES III/Hologic).

**Results:** A total of 54 patients were included. The mean age at diagnosis was 61.50±6.50 years. The AI used in both groups was letrozole. For LS we didn't find statistically significant differences between both groups. For FN we found 13 patients (24%) with OP according to NHANES/Hologic, and 8 patients (14.8%) according to Diaz-Curiel values. These values are summarised in the table.

Abstract AB0998 – Table 1

	(NHANES/ Hologic)	Number of patients (%)	(Diaz Curiel cohort)	Number of patients (%)	p- value
<b>Lumbar spine (L2-L4)</b>	Normal	10 (18.6%)	Normal	10 (18.6%)	0.110
	Osteopenia	16 (29.6%)	Osteopenia	15 (27.7%)	
	<b>Osteoporosis</b>	<b>28 (51.8%)</b>	<b>Osteoporosis</b>	<b>29 (53.7%)</b>	
	Mean T-score=-2.16		Mean T-score=-2.28		
<b>Femoral neck</b>	Normal	17 (32%)	Normal	15 (27.8%)	0.018*
	Osteopenia	24 (44%)	Osteopenia	31 (57.4%)	
	<b>Osteoporosis</b>	<b>13 (24%)</b>	<b>Osteoporosis</b>	<b>8 (14.8%)</b>	
	Mean T-score: -1.77		Mean T-score: -1.57		

**Conclusions:** In our study, we observe statistically significant differences in osteoporosis prevalence for FN, and around 10% of patients could be reclassified using our local BMD values, which highlights the relevance of the use of BMD values obtained from local population for T-score calculation.

#### AB0999 OPPORTUNISTIC SCREENING FOR OSTEOPOROSIS USING THORACO-ABDOMINO-PELVIC COMPUTED TOMOGRAPHY FOR ASSESSMENT OF VERTEBRAL DENSITY IN RHEUMATOID ARTHRITIS PATIENTS

J. Perrier-Cornet<sup>1</sup>, I. CHARY-VALCKENAERE<sup>1</sup>, D. LOEUILLE<sup>1</sup>, A.Y. OMOROU<sup>2</sup>.  
<sup>1</sup>Rheumatology, <sup>2</sup>INSERM CIC-1433 Clinical Epidemiology, CHU NANCY, NANCY, France

**Background:** Screening for osteoporosis is crucial in rheumatoid arthritis (RA) patients. Computed tomography (CT) attenuation assessment has been proved to be of interest in general population for detection of osteoporosis.

**Objectives:** To assess the value of thoraco-abdomino-pelvic CT-derived bone mineral density (BMD) in L1, compared with dual energy X-ray absorptiometry (DXA) for osteoporosis screening in rheumatoid arthritis patients.

**Methods:** Consecutive RA patients who underwent a CT-scan and a DXA within a two-year period are retrospectively included. CT sagittal images are evaluated from T4 to L5 for vertebral fractures according to Genant classification. CT attenuation values (in Hounsfield units [HU]) of trabecular bone in L1 are measured on axial images and compared to DXA results.

**Results:** One hundred and five patients (mean age 61.1 years (±9.5), 78.1% women) were included. Twenty-eight patients (26.7%) have DXA-defined osteoporosis and 32 (30%) have osteoporotic fractures (vertebral and/or non-vertebral). According to CT assessment, mean (SD) vertebral L1 attenuation is 142.2 HU (±18.5). The diagnostic performance for vertebral CT-attenuation measurement was good, with an AUC of 0.67 for predicting osteoporotic fractures and of 0.69 for predicting vertebral fractures. Among 31 patients with osteoporotic fractures, 23

(74%) patients are categorised as osteoporotic with L1 CT-attenuation of 135 HU or less, whereas only 13 patients (42%) with DXA.

**Conclusions:** This technique offers a combined opportunistic screening for osteoporosis by assessing both vertebral fractures and bone density on routine CT-scans. This seems of particular interest in RA patients who are at high risk for osteoporosis.

#### AB1000 ASSOCIATION OF SERUM URIC ACID LEVEL WITH BONE MINERAL DENSITY AND OSTEOPOROSIS IN POSTMENOPAUSAL WOMEN WITH RHEUMATOID ARTHRITIS

J.H. Koh<sup>1</sup>, S.-G. Lee<sup>1</sup>, H.-N. Lee<sup>1</sup>, E. Kim<sup>1</sup>, D.H. Sohn<sup>2</sup>, Y. Kim<sup>3</sup>, G.-T. Kim<sup>3</sup>.  
<sup>1</sup>Internal Medicine, Pusan National University School of Medicine, Pusan National University Hospital, Busan; <sup>2</sup>Microbiology and Immunology, Pusan National University School of Medicine, Yangsan; <sup>3</sup>Internal Medicine, Kosin University College of Medicine, Busan, Korea, Republic of Ireland

**Background:** Previous studies have reported that higher serum uric acid (SUA) levels are associated with higher bone mineral density (BMD) in men and postmenopausal women, and lower risk of fragility fracture in men. However, whether this association is also present in patients with rheumatoid arthritis (RA) has not yet been investigated.

**Objectives:** To examine the association of SUA levels with BMD and osteoporosis in postmenopausal women with RA.

**Methods:** We retrospectively evaluated 447 postmenopausal female RA patients (mean age 61.1 years) who underwent measurement of L1–4, femoral neck, and total hip BMD using dual energy X-ray absorptiometry, in addition to SUA levels at a university rheumatology centre in South Korea between 2004 and 2017. Osteoporosis was defined as a T-score of ≤-2.5 according to the World Health Organization classification.

**Results:** The median (interquartile range) SUA level was 4 (3.3–4.8) mg/dL. The mean (±SD) L1–4, femoral neck, and total hip BMD were 0.93±0.16 g/cm<sup>2</sup>, 0.75±0.12 g/cm<sup>2</sup>, and 0.81±0.12 g/cm<sup>2</sup>, respectively, and the frequencies of osteoporosis in the spine, hip, and either site were 25.6%, 15.9%, and 32.5%, respectively. SUA levels were positively correlated with L1–4 ( $\rho=0.102$ ,  $p=0.032$ ), femoral neck ( $\rho=0.123$ ,  $p=0.01$ ), and total hip BMD values ( $\rho=0.146$ ,  $p=0.002$ ) and body mass index ( $\rho=0.231$ ,  $p<0.001$ ), and negatively correlated with glomerular filtration rate ( $\rho=-0.363$ ,  $p<0.001$ ) in Spearman correlation analysis. In multivariable linear regression models adjusted for confounding factors, SUA levels showed a significant positive association with femoral neck BMD ( $\beta=0.0099$ ,  $p=0.015$ ) and total hip BMD ( $\beta=0.0118$ ,  $p=0.01$ ) but not with L1–4 BMD ( $\beta=0.0086$ ,  $p=0.159$ ) as shown in table 1. In addition, multivariable logistic analysis revealed that the third (OR=0.44,  $p=0.038$ ) and fourth SUA quartiles (OR=0.37,  $p=0.021$ ) were associated with lower risk of hip osteoporosis, as compared with the first SUA quartile. However, this association was not observed in lumbar spine osteoporosis.

Abstract AB1000 – Table 1. Linear regression models evaluating the association between serum uric acid levels and bone mineral density in postmenopausal women with rheumatoid arthritis

Independent variables	Dependent variables	Univariable model		Multivariable model	
		Unstandardized $\beta$ (SE)	p-value	*Unstandardized $\beta$ (SE)	p-value
Serum uric acid, mg/dL	Femoral neck BMD	0.0125 (0.0045)	0.006	0.0099 (0.004)	0.015
Serum uric acid, mg/dL	Total hip BMD	0.0138 (0.0048)	0.004	0.0118 (0.0045)	0.01
Serum uric acid, mg/dL	L1–4 BMD	0.0127 (0.0063)	0.044	0.0086 (0.0061)	0.159

\*Estimated using stepwise multivariable linear regression models adjusting for age, BMI, DAS28-ESR, cumulative GCs dose, disease duration and eGFR

**Conclusions:** Higher SUA levels were associated with a reduced risk of low BMD and osteoporosis at hip in postmenopausal women with RA, but no significant association between SUA levels and lumbar spine BMD was found. Our data suggests that uric acid may act as a protective factor against hip bone loss in RA patients.

### MANAGEMENT OF GLUCOCORTICOID-INDUCED OSTEOPOROSIS IN RHEUMATOID ARTHRITIS: THE EXAMPLE OF THE "RIC NORD DE FRANCE" COHORT

J. Corli<sup>1</sup>, G. Baudens<sup>2</sup>, R.-M. Flipo<sup>1</sup>, B. Cortet<sup>1</sup>, on behalf of RIC-Nord de France. <sup>1</sup>Rheumatology, CHRU Lille, Lille; <sup>2</sup>Rheumatology, Valenciennes, Valenciennes, France

**Background:** Glucocorticoid-induced osteoporosis (GIOP) is the most common cause of secondary osteoporosis. Patients followed for Rheumatoid Arthritis (RA) are particularly exposed to OP and have a greater risk of fracture, which must be prevented. The newest French guidelines for GIOP management were published in 2014 and it is not known yet how they are applied in real life.

**Objectives:** The objective of our study was to investigate the treatment of glucocorticoid-induced osteoporosis in the Rhumatismes Inflammatoires Chroniques – Nord de France (formerly known as RIC-NPC) network in 2016 for patients with rheumatoid arthritis (RA).

**Methods:** In this observational study, the patients studied were followed in the RIC network for RA from 2004 until June 2016, had at least one bone mineral density (BMD) assessment and glucocorticoid therapy during follow-up. Demographic characteristics of patients, BMD results, fractures and treatments implemented were collected from network data completed during consultations by practitioners.

**Results:** 647 patients were enrolled, including 511 women (79%). The average age of patients was 65.5 years (SD=12) with a mean DAS28 of 3.91 (SD=1.44), mean dose of steroid of 7.6 mg (SD=6.6) and a mean duration of treatment of 49 months (SD=53.7). The average T-score at the first BMD assessment was -0.99 at the spine and -1.03 at the total hip. 298 patients received an anti-osteoporotic treatment (46%). Treated patients were older ( $p<0.0001$ ), with lower weight ( $p=0.001$ ) and had a lower T-score at both the spine and the total hip ( $p<0.0001$  for both sites). They most often underwent a prior fracture ( $p<0.0001$ ), and an initial T-score less than -1.5 SD ( $p<0.0001$ ).

**Conclusions:** Our study has the advantage of reflecting the management of GIOP in a "real life" cohort. Almost half of our patients followed for RA who received corticosteroids had received treatment. According to French guidelines the number of patients requiring an anti-osteoporotic treatment should be higher.

### DIFFERENCES IN BONE METABOLISM BETWEEN INTERMITTENT AND CONTINUOUS TREATMENT WITH LHRH AGONISTS IN PROSTATE CANCER PATIENTS

K.R. Arevalo<sup>1,1</sup>, J. Ivorra<sup>1</sup>, C. Vera<sup>2</sup>, E. Grau<sup>1</sup>, I. Chalmeta<sup>1</sup>, L. Gonzalez<sup>1</sup>, R. Negueroles<sup>1</sup>, C. Alcañiz<sup>1</sup>, I. Canovas<sup>1</sup>, C. Feded<sup>1</sup>, J.J. Frago<sup>1</sup>, R. Gonzalez<sup>1</sup>, E. Labrador<sup>1</sup>, I. Martinez<sup>1</sup>, C. Najera<sup>1</sup>, J.E. Oller<sup>1</sup>, F.M. Ortiz<sup>1</sup>, E. Vicens<sup>1</sup>, M. De la Rubia<sup>1</sup>, D. Hervas<sup>3</sup>, J.A. Roman<sup>3</sup>. <sup>1</sup>Rheumatology Department, <sup>2</sup>Urology Department, HUP La Fe; <sup>3</sup>Biostatistical Unit, IIS La Fe, Valencia, Spain

**Background:** Prostate cancer is an hormone dependent neoplasia, therefore androgenic inhibition by LHRH agonists is the mainstay of treatment. There are different treatment regimen options: continuous or intermittent in order to decrease side effects. As for the bone effects, therapy with LHRH agonists increases bone resorption and decreases bone mineral density (BMD) all together increasing the risk of fracture. The influence of the different treatment regimen in bone metabolism has not been studied enough.

**Objectives:** To evaluate the effect of the LHRH agonists therapy different regimens on bone metabolism in prostate cancer patients, and whether antiresorptive treatment influences the evolution of BMD according to LHRH agonists treatment regimen.

**Methods:** We recruited patients from the Prostate Cancer Protocol of Osteoporotic Risk Assessment in our institution. The patients were evaluated in a basal visit (month 0) and 6–12–18–24 months after basal evaluation. Data of bone metabolism biomarkers, BMD values, LHRH agonists regimen and antiresorptive treatment was collected. Biostatistical analysis with software R was performed.

**Results:** We reviewed 69 patients and 52 prostate cancer patients without bone metastasis with 12 months follow up were selected. The mean age at cancer diagnosis was 68.92 (8.44) years old, with a mean Gleason score of 7.<sup>1</sup>

81% of patients had LHRH agonists active treatment, 81% of them were under continuous treatment scheme. 39% of patients initiated antiresorptive therapy, 24% with intermittent LHRH agonists and 76% with continuous LHRH agonists. At the basal evaluation 12% of patients had osteoporosis and the 32% had osteopenia. 43% of patients displayed vitD values under 20 ng/mL.

Antiresorptive treatment influenced lumbar spine, femoral neck and hip BMD values ( $p<0.001$ ). In patients with antiresorptive treatment, LHRH agonists intermittent scheme did not have an independent effect in any locations of BMD. In patients without antiresorptive therapy, intermittent LHRH agonists regimen have a positive effect on BMD in total hip and lumbar spine increasing their values compared to those on continuous LHRH agonists regimen. The effect in lumbar spine depends on the time of the intermittency. LHRH agonist intermittent therapy showed no significant influence on T score values of femoral neck, this effect was independent of antiresorptive therapy. In patients without antiresorptive treatment elevated beta-CTX levels were related to a decrease of BMD values ( $p=0.017$ ). No fractures were reported during the follow up period.

**Conclusions:** In our patients there is a high prevalence of vitD deficiency. Antiresorptive therapy had a positive effect in the BMD on both LHRH agonists treatment schemes. Patients without antiresorptive treatment under an intermittent LHRH agonists scheme display a better evolution in BMD values compared to those under a continuous scheme. In patients without antiresorptive treatment the evolution of BMD values was related to beta-CTX levels during follow up.

### USEFULNESS OF DOPPLER ULTRASOUND EXAMINATIONS FOR DETECTING DEEP VENOUS THROMBOSIS DURING THE PERIOPERATIVE PERIOD IN PATIENTS WITH OSTEOPOROTIC FRACTURES OF THE PROXIMAL FEMUR

K. Nakaseko, N. Mayumi. Department of Orthopaedic Surgery and Rheumatology, KUWANA CITY MEDICAL CENTER, Kuwana Mie, Japan

**Background:** Deep venous thrombosis (DVT) can lead to a venous thromboembolism and increase the risk of a pulmonary thromboembolism (PE). PE is one of the most common causes of death in hospitalised surgical patients.

Although there have been some prospective studies regarding the prevalence of DVT on Doppler ultrasound examinations of the lower extremities, there have not been any prospective studies in which three consecutive Doppler ultrasound examinations were performed to detect DVT during the perioperative period.

The purpose of the present study was to prospectively evaluate the occurrence of DVT in patients with osteoporotic fractures of the proximal femur, based on the results of examinations involving three consecutive ultrasound scans. In addition, the usefulness of the d-dimer level as a predictor of DVT was investigated.

**Objectives:** This study was a single-centre prospective study. One hundred-five patients (18 males and 87 females) between the ages of 46 and 97 years with osteoporotic fractures of the proximal femur were enrolled. All patients were asymptomatic in terms of their clinical DVT findings.

**Methods:** Three Doppler ultrasound examinations of the lower extremities were conducted in each case: on admission, one day before surgery, and one week after surgery. The period from admission to surgery ranged from 2 to 8 days (mean: 5.4 days). The d-dimer level was measured at one week after surgery and its relationship with the presence/absence of DVT was evaluated by calculating sensitivity, specificity, positive predictive, and negative predictive values.

**Results:** DVT was detected in 20 patients (2 patients on admission, 9 patients one day before surgery, and 9 patients one week after surgery). The overall prevalence of DVT in the perioperative period was 19.0% (20/105). As for the characteristics of the patients that did and did not develop DVT, there were no significant differences between the two groups. When the d-dimer cut-off level was set at 4.3 µg/ml, the sensitivity and negative predictive value reached 100%, while the specificity was 16.5%, and the positive predictive value was 22.0%. A receiver operating characteristic (ROC) curve was drawn, and the optimal d-dimer cut-off level was examined. The ROC curve was closest to the upper left corner when the d-dimer cut-off level was 12.2 µg/ml. At that point, the sensitivity, specificity, positive predictive value, and negative predictive value were 55.0%, 69.4%, 28.9%, and 86.8%, respectively.

Abstract AB1003 – Figure 1

**Conclusions:** In this prospective study, DVT was detected in 2 patients on admission, 9 patients one day before surgery, and 9 patients one week after surgery. As DVT can occur at any moment, performing repeated Doppler ultrasound examinations in the perioperative period is useful for quickly detecting DVT, which can cause PE. As for the d-dimer level, its sensitivity and negative predictive value reached 100% at a cut-off level of 4.3  $\mu\text{g/ml}$ . Therefore, d-dimer assays could be a useful screening tool for DVT and might be a suitable substitute for Doppler ultrasound examinations.

#### AB1004 OSTEOPOROSIS SCREENING IN A TERTIARY RHEUMATOID ARTHRITIS CLINIC. WHO'S SCREENING NOW?

L. Kyi<sup>1</sup>, T. Kovitwanichkanont<sup>1,2</sup>, D. Wang<sup>3</sup>, N. Walpola<sup>3</sup>, S. Raghunath<sup>1,3</sup>, S. Pignataro<sup>1</sup>, S. Morton<sup>1</sup>, M. Leech<sup>1,3</sup>. <sup>1</sup>Rheumatology, Monash Health, Melbourne; <sup>2</sup>Sydney School of Public Health, University of Sydney, Sydney; <sup>3</sup>Department of Medicine, Monash University, Melbourne, Australia

**Background:** Osteoporosis is a complication of rheumatoid arthritis (RA) due to inflammatory disease and treatment with glucocorticoids<sup>1</sup>. Screening and management of osteoporosis (OP) is shared amongst General Practitioners (GP) together with subspecialists including rheumatologists<sup>2</sup>.

**Objectives:** To assess the adequacy of osteoporosis screening in a tertiary RA clinic in Melbourne, and to determine where most screening is occurring.

**Methods:** A cross-sectional study of patients at a tertiary RA clinic was undertaken. Osteoporosis screening, therapy and related factors were evaluated. This was compared to best practice screening ACR/GIOP guidelines.

**Results:** 116 RA patients, 66% female (median age 58 years) were included. OP screening occurred in 61.2% of patients with 40.5% and 20.7% performed by their rheumatologist and by the GPs respectively. The remainder 38.8% of patients recalled no recent screening.

36.2% of patients were taking prednisolone, while 74% reported prior exposure. 58.6% of patients had prednisolone for over 3 months. Calcium or vitamin D supplementation was noted in 62% of the population. 21.6% reported a history of minimal trauma fracture and alarmingly only 10% reported currently taking anti-resorptive therapy.

47% of patients had a DEXA scan performed within the last 3 years. Of the 53% that did not have a recent DEXA scan, three quarters had indications for osteoporosis screening based on the 2010 ACR/GIOP guidelines. 35 patients had indications based on age, 11 patients based on glucocorticoid exposure and 1 patient based on history of minimal trauma fracture.

#### Osteoporosis Screening

#### DEXA Scans

Abstract AB1004 – Figure 1

**Conclusions:** One third of at-risk patients in this sub-cohort are not screened for osteoporosis. More patients are currently screened for osteoporosis by their rheumatologist than their GPs. Underscreening and treatment of osteoporosis in this clinic could be addressed by clearer GP-rheumatologist shared treatment model.

#### AB1005 RELATIONSHIP BETWEEN AUTOIMMUNITY AND OSTEOPOROSIS IN

#### RHEUMATOID ARTHRITIS

M.C. Carrasco Cubero<sup>1</sup>, S.M. Rojas Herrera<sup>2</sup>, J. Malave Calzada<sup>2</sup>, P. Pérez David<sup>2</sup>, I. Braña Abascal<sup>2</sup>, E. Chamizo Carmona<sup>2</sup>. <sup>1</sup>Rheumatology, CHU de Badajoz, Badajoz; <sup>2</sup>Rheumatology, Hospital de Mérida, Mérida, Spain

**Background:** Osteoporosis (OP) is more prevalent in patients with rheumatoid arthritis (RA) than in the general population. Positive anti citrullinated peptide antibody (ACPA) has been related with juxta-articular OP, but their relationship with systemic OP in RA is controversial.

**Objectives:** To determine if RA autoantibodies (RF and ACPA) are associated with bone mineral density (BMD) in a cohort of patients with established RA diagnosed following the <sup>ACR</sup> 1987 criteria.

**Methods:** Observational study. We analysed the relationship between RF and/or ACPA with the DXA BMD values of the femoral neck (FN) and lumbar spine (LS) (GE LUNAR Prodigy). We perform the analysis using logistic regression, bi and multivariate models, and correlation models. The control variables were sex, body mass, age, duration of RA, prednisone and vitamin D.

**Results:** We included 294 patients with RA who had all the tests, with a mean age of 63.4 ( $\pm 10.9$ ) years and duration of RA of 9.8 ( $\pm 7.9$ ) years. There were 229 (77.9%) women, 229 (77.9%) positive-RF, 196 (66.7%) positive-ACPA, 109 (37.1%) deficient in 25-OH cholecalciferol ( $< 20$  ng/ml) and 59 (20.1) smoker patients. They received corticosteroids at low doses 207 (70.4%) and suffered some bone fracture 42 (14.3%) patients. In the BMD, 226 (76.9%) patients had a T-score  $< -1$ , of who 86 (27.6%) reached a T-score  $< -2.5$  in LS and/or in FN.

Lumbar OP was associated with the female sex (OR=3.6). The FN T-score (and, to a lesser extent, lumbar T-score), showed a correlation with age ( $r=-0.515$ ,  $p<0.01$ ). No differences were found in the mean values of BMD, T-score y Z-score of FN and LS between positive or negative patients for FR or ACPA (t-student), neither between their possible combinations (one-way ANOVA). Association between positivity of RF, ACPA or their combinations and T-score  $<-1$  (osteopenia) or T-score  $<-2.5$  (OP) in LS or FN were not found. A negative weak correlation was found between the RF and lumbar BMD values ( $-0.121$ ,  $p=0.04$ ) and a positive weak correlation between ACPA and FN (0.136 with BMD, 0.131 with T-score and 0.138 with Z-score;  $p<0.05$  for all).

	Patients n (%)	BMD FN g/cm <sup>2</sup> mean(SD)	BMD LS g/cm <sup>2</sup> mean(SD)	T-score <-1 n (%)	T-score <-2,5 n (%)
Total	291	0805 (0,16)	1063 (0,21)	226 <sup>(76,9)</sup>	81 <sup>(27,6)</sup>
FR+	229	0806 (0,15)	1061 (0,21)	175 <sup>(76,4)</sup>	62 <sup>(27,1)</sup>
ACPA+	194	0808 (0,15)	1065 (0,21)	151 <sup>(77,0)</sup>	49 <sup>(25,0)</sup>
FR+y ACPA+	185	0813 (0,14)	1065 (0,22)	143 <sup>(76,5)</sup>	48 <sup>(25,7)</sup>
FR+ ó ACPA+	51	0767 (0,21)	1049 (0,20)	40 <sup>(78,4)</sup>	15 <sup>(29,4)</sup>
FR- y ACPA-	56	0815 (0,16)	1074 (0,18)	43 <sup>(76,8)</sup>	18 <sup>(32,1)</sup>

**Conclusions:** OP was very common in our RA population, especially in women and elderly. Any association was demonstrated between OP and the presence/titer of autoantibodies (RF and ACPA) and low dose of corticosteroids treatment.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.5631

#### AB1006 BONE STATUS OF PATIENTS TREATED WITH ANTI-AROMATASE: RESULTS AT ONE YEAR

M. Djennane, C. Sedkaoui, F. Bouzar. *Medecine, University of Medicine Mouloud Mammeri, Tizi Ouzou, Algeria*

**Background:** First cancer in Algeria, first cause of cancer mortality in women. One in 10 women will develop breast cancer in her lifetime. Its incidence is increasing with 55.8/100000 inhabitants. The majority of these cancers are hormone-dependent. The bone loss induced by anti-aromatase (AA) leads to an increase in bone resorption with bone loss 2 to 4 times greater than the physiological loss. Randomised controlled trials (RCTs) including women under AA for 5 years have suggested an increased risk of fracture of 18% to 20% ie 1 in 5 women will experience this risk.

**Objectives:** The aim of our work is to describe the initial bone status and after one year of follow-up in patients starting an anti-aromatase.

**Methods:** Three hundred and twenty seven (327) patients were recruited from the oncology department of Tizi Ouzou University Hospital, 292 patients were analysed in the initial phase of the study and only 250 patients were evaluated at one year. Of these patients, 157 non-osteoporosis patients received calcium and vitamin d-related health care and 93 patients were osteoporotic and treated with calcium and vitamin D bisphosphonates. - Inclusion criteria: Women with oestrogen receptor breast cancer Treatment with anti-aromatase indicated: a- Immediately after conventional breast treatment b- Tamoxifen relay- Criteria for non-inclusion: Bone metastases

**Methods:** Clinical evaluation: screener risk factors for osteoporosis and fractures. Biological Evaluation: Calcium, Phosphoremia, 25 Hydroxy Vitamin D. Radiological assessment: chest radiograph (profile) or IVA (vertebral fracture assessment) looking for vertebral fractures Lumbar and femoral bone densitometry (HOLOGIC QDR)

**Results:** The mean age of the patients is 56.8±7.3 years, mean body mass index is 27.4±2.8 kg/m<sup>2</sup>. 48% of patients received chemotherapy. The anti-aromatases were given as follows: Anastrozole in 64%, Letrozole in 14% and Exemestane in 11%. At baseline assessment n=292, 31.6% of patients had densitometric osteoporosis (T score  $<-2$ ) in the lumbar spine and 9.5% in the femoral neck. 37 patients have a history of peripheral fracture. Six patients have at least one vertebral fracture. The average level of vitamin D is 15.2±3.5 ng/L. 6 - 29 283 patients or 97% have a deficiency in vit D ( $<30$  ng/L). After one year of follow-up, patients without osteoporosis (n=157), annual bone loss is 1.5% at the lumbar spine and 1.24% at the hip. 16 patients became osteoporotic. Four patients developed a new vertebral fracture. The one-year follow-up result in osteoporotic patients treated with bisphosphonates with calcium and vitamin D (n=93) had stable bone mineral density (0.3% non-significant bone loss). 57% of patients still have vitamin D insufficiency and two patients had a new vertebral fracture.

**Conclusions:** Antiaromatases lead to an increased risk of osteoporosis. It is important to evaluate the fracture risk of breast cancer patients through a rheumatology consultation to find all the risk factors, to detect frequent calcium and vitamin D deficiencies and to treat osteoporosis.

**DOI:** 10.1136/annrheumdis-2018-eular.5557

#### AB1007 SEASONAL VARIATIONS OF 25-HYDROXYVITAMIN D3 LEVELS AND ITS RELATION TO PARATHYROID HORMONE LEVELS

M.A. Teran Tinedo, P. Cristina. *HOSPITAL RAMON Y CAJAL, MADRID, Spain*

**Objectives:** To analyse the relationship between 25-hydroxyvitamin-D3 and parathyroid hormone levels and to determine its variation between the different seasons of the year.

**Methods:** An observational descriptive study was carried out, collecting and analysing 25-hydroxyvitamin-D3 (25OH-D3) and parathyroid hormone (PTH) serum levels of patients from January to December of 2017. The frequencies distribution analysis of both variables was compared and Pearson's correlation coefficient (PCC) was used to analyse linear relationship between them. The results were classified by date in four seasons: winter, spring, summer, and autumn, assessing the mean seasonal oscillations of each variable and calculating correlation in each case. Different levels of 25OH-D3 were evaluated in order to identify differences in the grade of correlation.

**Results:** Serum samples from 6265 patients were recollected. 59% of the patients had 25OH-D3 levels lower than 25 ng/ml. Pearson's correlation coefficient between both variables was  $-0.159$  ( $p<0.01$ ). The mean values of 25OH-D3 were calculated for each seasonal period, establishing a mean level of 23 ng/ml for winter, 25 ng/ml for spring, 31 ng/ml for summer and 29 ng/ml for autumn. Regarding PTH levels, the mean values for each season were 108 pg/ml, 101 pg/ml, 86 pg/ml and 84 pg/ml from winter to autumn respectively. PTH/Vitamin D correlation was also assessed for each period: Pearson's correlation coefficient during winter was  $-0.08$  ( $p<0.01$ ), for spring  $-0.249$  ( $p<0.01$ ), for summer  $-0,21$  ( $p<0.01$ ) and for autumn  $-0,19$  ( $p<0.01$ ). At last, correlation calculated with deficiency levels of 25OH-D3 ( $<30$  ng/ml) was  $-0.18$  ( $p<0.01$ ), and with levels inferior than 10 ng/ml was  $-0.12$  ( $p<0.01$ ).

Abstract AB1007 – Figure 1

**Conclusions:** Linear correlation between levels of 25OH-D3 and PTH could not be established in our study, not even using levels classified as vitamin D deficiency. 25OH-D3 levels tended to increase from winter to summer whereas PTH levels decreased inversely during these seasons, without any linear correlation.

#### AB1008 COMPARISON OF BONE MINERAL DENSITY BETWEEN RHEUMATOID ARTHRITIS PATIENTS AND HEALTHY INDIVIDUALS OVER SEVEN YEARS FROM THE TOMORROW STUDY

M. Tada<sup>1</sup>, K. Inui<sup>2</sup>, Y. Sugioka<sup>3</sup>, T. Okano<sup>2</sup>, Y. Yamada<sup>2</sup>, K. Mandai<sup>2</sup>, K. Mamoto<sup>2</sup>, T. Koike<sup>2</sup>, H. Nakamura<sup>2</sup>. <sup>1</sup>Orthopaedic Surgery, Osaka City General Hospital; <sup>2</sup>Orthopaedic Surgery; <sup>3</sup>Center of Senile Degenerative Disorders, Osaka City University Graduate School of Medicine, Osaka, Japan

**Background:** Despite advances in treatment, rheumatoid arthritis (RA) remains a key cause of secondary osteoporosis and is also a risk factor for fragility fracture. We have previously reported that bone mineral density (BMD) was lower in patients with RA than in healthy individuals (HI) and examined changes in BMD over 3 years<sup>1</sup>.

**Objectives:** To observe BMD changes over 7 years and identify factors that affect BMD changes in patients with RA.

**Methods:** We analysed data from the TOMORROW study (UMIN000003876), a prospective cohort for patients with RA and age- and sex-matched HI. BMD was measured at three parts (whole body, lower limb, lumbar spine) using dual-energy X-ray absorptiometry (DXA). We compared the percentage change in BMD (%Δ BMD) at the three parts in RA and HI from 2010 to 2017. Factors affecting %Δ BMD in RA were analysed.

**Results:** Participants comprised 172 HI and 119 RA, after excluding those who dropped out (HI, n=21; RA, n=19) or underwent implant surgery (HI, n=12; RA, n=60). Height and weight reduced significantly over 7 years ( $p<0.001$  each) in both groups (table 1). The  $\Delta$ BMDs of RA were  $-2.6\%$  (whole body),  $-3.6\%$  (lower limb), and  $1.8\%$  (lumbar spine), compared to  $-2.0\%$ ,  $-2.7\%$ , and  $0.6\%$ , respectively, for HI. No significant differences in BMD for the whole body or lower limb were seen during 7 years, while BMD of the lumbar spine was significantly increased in both groups ( $p<0.0001$ ). No significant differences between groups were identified. In patients with RA, DAS28ESR improved significantly over 7 years ( $p=0.008$ ; table 1) and  $\Delta$ BMD of the lumbar spine correlated significantly with cumulative period of treatment for osteoporosis ( $r=0.341$ ,  $p<0.001$ ). The cumulative period of osteoporosis treatment was identified as a regulatory factor for increasing BMD of the lumbar spine (odds ratio: 1.36;  $p=0.003$ ) adjusted by age and sex (table 2). However, cumulative period of biologics, change of glucocorticoid and DAS28ESR were not detected as factors affecting BMD by logistic regression analysis.

**Abstract AB1008 – Table 1.** Changes in characteristics over 7 years

Parameter	Total population (n=291)	Healthy individuals (n=172)	Patients with RA (n=119)	P value
Age 2010	56.6±12.7	57.1±12.3	55.9±13.3	0.431
Height 2010 (cm)	157.3±7.8	157.9±7.1	156.4±8.7	0.107
Height 2017 (cm)	156.1±8.1	156.8±7.3	155.2±9.1	0.107
Body weight 2010 (kg)	56.1±10.0	56.5±10.3	55.6±9.7	0.418
Body weight 2017 (kg)	55.1±10.4	55.8±10.7	54.0±9.9	0.145
DAS28 ESR 2010	-	-	3.17±1.27	-
DAS28 ESR 2017	-	-	2.86±1.24	-

**Abstract AB1008 – Table 2.** Factors associated with increased BMD of the lumbar spine in patients with RA

Factor	Odds ratio	95% CI	P value
Period of osteoporosis treatment	1.36	1.11–1.66	0.003
Period of biologics	1.02	0.92–1.13	0.683
Change of glucocorticoid	1.01	0.83–1.23	0.933
Change of DAS28ESR	1.04	0.76–1.44	0.798

**Conclusions:** BMD of the whole body and lower limb tended to decrease slightly over 7 years in both groups. However, BMD of the lumbar spine increased significantly. Continued osteoporosis treatment is important for increasing BMD at the lumbar spine in patients with RA.

#### AB1009 CONCORDANCE BETWEEN VERTEBRAL FRACTURE ASSESSMENT AND CONVENTIONAL RADIOGRAPHY IN DETECTION OF VERTEBRAL FRACTURE

M. Brahem, N. ElAmri, K. Baccouch, S. Belghali, R. Mlayah, H. Zeglaoui, E. Bouajina. *rheumatology, tarhat hached hospital sousse, sousse, Tunisia*

**Background:** Vertebral fractures (VFs) are considered as severe fractures, but often asymptomatic. The VFA (Vertebral Fracture Assessment) performed at the same time as the bone mineral density (BMD) measure, allows the detection of these fractures. Nevertheless, standard radiography remains the reference technique in the diagnosis of VFs.

**Objectives:** Our objective is to compare the contribution of VFA and the standard thoraco-lumbar spine X-ray in the diagnosis of VFs in patients at risk.

**Methods:** This is a cross sectional study, including women referred in rheumatology department for measure of bone mineral density (BMD). During the same exam, we practiced a vertebral fracture assessment (VFA) image. An X-Ray of dorsal and lumbar spine was done. The interpretation of the two methods was to diagnose asymptomatic vertebral fractures (VFs) which are defined according to Genant's semi-quantitative classification.

**Results:** The mean age of our patients (31 patients) was  $61.3\pm 11.3$  years<sup>38–82</sup> with an average body mass index (BMI) of  $27.65\pm 4.8$  Kg/m<sup>2</sup>; [17.8–40.1]. According to the WHO classification, 17 women (54.8%) had osteoporosis, 10 (32.3%) had osteopenia and 4 (12.9%) had normal BMD. The indications for VFA practice were: age over 60 years with T score  $\leq -2$  SD, historical height loss  $\geq 4$  cm, a

history of VF, a long-term corticosteroid therapy, and aromatase inhibitors therapy in 25.8%, 12.9%, 6.5%, 45.2% and 9.7% respectively.

VFA objectified 15 VFs in 6 women (19.4%) which were grade 1, 2 and 3 in respectively 2, 5 and 8 vertebrae. However plain X ray showed 21 VFs in 10 women (32.2%) which were grade 1, 2 and 3 in respectively 5, 7 and 9 vertebrae. The concordance between the two methods was found in 87.1% of cases, with a coefficient of Cohen (kappa) at 0.76 (strong agreement). A significant correlation ( $p=0.000$ ) was found between the two methods concerning the detection of VFs grade II and III.

**Conclusions:** Our study proved the good agreement between the VFA and the standard X-ray in the detection of VFs. This shows the sensitivity of this technique which has the advantages of low cost and less irradiation.

**Disclosure of Interest:** None declared

#### AB1010 RISK OF INFECTION IN PATIENTS WITH RHEUMATOID ARTHRITIS TAKING DENOSUMAB CONCURRENT WITH BIOLOGIC THERAPY

M. Zabihyeganeh<sup>1</sup>, A.M. Mirzaei<sup>1</sup>, S.A. Jahed<sup>2</sup>. <sup>1</sup>Rheumatology, Bone and Joint Reconstruction Research Center, Shafa Orthopedic Hospital, Iran University of Medical Sciences; <sup>2</sup>Endocrinology, Diabetes Advisory Committee, Gabric Diabetes Education Association, Tehran, Iran, Tehran, Iran, Islamic Republic of Ireland

**Background:** Apart from Denosumab effects on bone, there are some promising data on its inhibitory effect on structural damages in patients with Rheumatoid Arthritis (RA).<sup>1</sup> Despite some clinical concerns on its potential harm for increasing risk of infections, Denosumab is officially approved for the treatment of postmenopausal osteoporosis. Still there are even greater debates on its use and predisposing patients to infection in cases receiving immunosuppressive therapy.<sup>2</sup> Considering the importance of infection in such cases, lack of sufficient convincing safety data has prevented, at least in part, the current guidelines to recommend Denosumab in treatment of osteoporosis in patients on immunosuppressive agents.<sup>3</sup>

**Objectives:** We aimed to compare the infection risk in patients with RA taking biologic Disease Modifying Anti Rheumatic Drugs (bDMARDs) alone or concurrent with Denosumab.

**Methods:** Using records from the files covering January 2013 to May 2016, a retrospective comparative study was performed on two groups of postmenopausal RA patients, group A including 40 patients receiving Denosumab+bDMARDs (Etanercept, Rituximab, Adalimumab), and group B consisting of 44 patients receiving bDMARDs alone. Patients were included if the current therapeutic regimen was used for at least one year. All patients were also on a daily dose of prednisolone (2.5–7.5 mg) and folic acid, and a weekly dose of Methotrexate. Occurrence of serious bacterial or viral infections was extracted from recorded files of the patients' routine visits.

**Results:** The mean age of the patients was  $63.1\pm 12$  years and  $62.6\pm 11.7$  years in group A and B, respectively ( $p=0.42$ ). The mean disease duration was  $7.2\pm 1.9$  years and  $7.1\pm 1.6$  years in group A and B, respectively ( $p=0.39$ ). The mean duration of biologic use was  $15.4\pm 3.2$  months and  $15.8\pm 4.6$  months in group A and B, respectively ( $p=0.28$ ). Type 2 diabetes mellitus was present in four and five patients of group A and group B, respectively ( $p=0.35$ ). In total, four infections occurred in our study groups, two in each group ( $p=0.94$ ). In group A, the first one was an osteomyelitis of the first metatarsal bone in a diabetic patient receiving Etanercept+Denosumab. The second one was a herpes zoster infection in a patient receiving Adalimumab+Denosumab. In group B two cases of herpes zoster were recorded in two patients receiving Adalimumab.

**Conclusions:** This study showed that the potential infection risk of concurrent use of Denosumab and bDMARDs was not significantly different from using bDMARDs alone. Based on this finding, Denosumab seems safe in the treatment of osteoporosis in RA patients receiving bDMARDs.

**Background:** Osteoporosis (OP) is a systemic bone disease characterised by decreased bone mass and deterioration of bone microarchitecture with increased brittleness and fracture risk. It associates high morbidity and mortality for patients and has a high impact on health expenditure. Bone marrow stromal mesenchymal stem cells (BM-MSC) give rise to osteoprogenitor cells and osteoblasts and influence bone homeostasis. However after their intravenous (i/v) infusion their osteotropism is limited. Our group has demonstrated that the exofucosylation of the CD44 membrane antigen in MSC improves their homing to bone tissue and that the infusion of these cells is safe in a murine model.

**Objectives:** To evaluate the safety of i/v infusion of fucosylated BM-MSC in patients with OP, and secondarily assess their ability to improve the course of the disease

**Methods:** 10 women between 50 and 75 years old diagnosed with osteoporosis with a low impact fracture will be included and treated i/v with autologous fucosylated BM-MSC. The first 4 patients were treated with a dose of  $2 \times 10^6$  cells/kg body weight and the other 6 with  $5 \times 10^6$  cells/kg body weight. A 24 month follow-up will be conducted to evaluate the rate of severe and non-serious adverse events and secondary endpoints (decreased fracture rate, pain scores, functional status and quality of life, biochemical indexes of bone metabolism, quantitative computed tomography for morphometric and mechanical analysis of bone quality, densitometry, and histomorphometry)

**Results:** Seven patients have been recruited to date. Two left the study for lack of cell proliferation and appearance of a complex form in karyotype during the cell culture, respectively. The first 4 patients were successfully infused, and after a median follow-up of 3 months no related adverse effects have been observed, no new osteoporotic fractures have appeared, and the analogue pain scale score (EVA) shows a tendency to decrease of pain in 3 of the 4 patients.

**Conclusions:** Our preliminary data indicate that clinical and GMP-grade production of BM-MSC is feasible. We have not observed any short-term adverse effects associated with treatment in infused patients.

### BONE MASS CHANGES CORRELATE WITH DISEASE ACTIVITY IN NON-ARTHRITIC PSORIATIC PATIENTS

S. Paolino, E. Gotelli, G. Pacini, E. Alessandri, A. Casabella, M. Ghio, F. Cattelan, F. Goegan, M. Patané, M. Cutolo. *Department of Internal Medicine, Research Laboratory and Academic Division of Clinical Rheumatology, Department of Internal Medicine, University of Genova, Genoa, Italy, Genoa, Italy*

**Background:** Psoriasis is a chronic inflammatory skin disease, and as all inflammatory processes, it could induce osteoclast activation<sup>1</sup> ending up with osteoporosis. It is well known that a recognised contributing factor to bone strength, independent from bone mass, is micro-architectural damage; therefore, evaluation of microarchitecture seems to be necessary to get adequate information about bone quality health. Trabecular bone score (TBS) is a new tool to assess bone quality.<sup>2</sup> To date, studies on TBS assessment in psoriasis are lacking, even if it was suggested to be correlated with inflammation and metabolic parameters.<sup>3</sup>

**Objectives:** The aim of the study was to investigate bone quality and bone quantity in psoriatic patients without arthropathic involvement and its relationship with dermal disease activity (PASI).

**Methods:** Thirty-five psoriatic patients and thirty-four healthy controls were enrolled. We first assessed Body Mass Index (BMI), Bone Mineral Density (BMD)

and Trabecular Bone Score (TBS) in both patients and healthy control. The Bone Mineral Density (BMD) (g/cm<sup>2</sup>) was analysed by dual-energy X-ray absorptiometry scan (Lunar Prodigy) and, using same machine, anteroposterior spine analysis was performed to evaluate TBS for L1-L4 using TBS insight Medimaps software. TBS >1.350 units was considered normal. Psoriatic patients were also divided in two subgroups according to skin lesion presentation (plaque psoriasis and guttate psoriasis) and dermal disease activity was measured by Psoriasis Area and Severity Index (PASI).

**Results:** In the psoriatic cohort (mean age 62.8±12.6 years, BMI 27.8±3.4 g/m<sup>2</sup>, disease duration 18.6±11.9 years, PASI 8.3±7.6) 36% of patients showed low bone mass, particularly, 33.3% showed osteopenia and 2.7% osteoporosis. There was not significantly statistical difference between mean BMD and TBS in psoriatic patients when compared to the healthy control group. However, in psoriatic patients a negative correlation between neck-BMD and PASI (p=0.003) was detected independently of sex and age. Conversely, TBS was not statistically correlated with PASI or with BMI. It was interesting to verify that the plaque psoriasis group showed a positive correlation between PASI and age (p=0.01). Conversely, PASI was negatively correlated with lumbar spine T-score (p=0.01) and both lumbar spine and femoral neck BMD (p=0.04 and p=0.02 respectively).

**Conclusions:** This pilot study suggests that in psoriasis, particularly in the plaque subgroup, the severity of skin involvement might correlate with bone mass but not with bone quality (TBS). Despite previous evidences, we can't assess any correlation between TBS and metabolic parameters. Further studies with larger cohorts are needed on this topic.

### PREDICTION OF BONE MINERAL DENSITY CHANGES IN PATIENTS WITH RHEUMATOID ARTHRITIS

T. Tomizawa<sup>1</sup>, H. Ito<sup>1</sup>, M. Furu<sup>1</sup>, M. Hashimoto<sup>2</sup>, M. Tanaka<sup>2</sup>, T. Mimori<sup>2</sup>, S. Matsuda<sup>1</sup>. <sup>1</sup>Orthopedic Surgery; <sup>2</sup>Rheumatology and Clinical Immunology, Kyoto University Graduate School of Medicine, Kyoto-City, Japan

**Background:** Osteoporosis and its related fractures is one of the most dominant, troublesome complications in rheumatoid arthritis (RA). Newly-introduced drugs such as methotrexate and biological and targeted synthetic disease modifying anti-rheumatic drugs have decreased disease activity drastically, but the improvement of osteoporosis remains to be investigated.

**Objectives:** To find useful factors for bone mineral density (BMD) management of RA patients under the current treatment.

**Methods:** We consecutively recruited 370 RA patients treated at Kyoto University Hospital in 2012. We prospectively collected the BMD values of the lumbar spine and the distal forearm measured by dual-energy X-ray absorptiometry (DXA), blood sampling test, urinalysis including bone metabolic biomarkers and clinical parameters of the RA patients in 2012 and 2014. Multivariate regression analysis was performed after adjustment by age, sex, body mass index (BMI), steroid use, anti-osteoporosis medication. We set the annualised BMD change as an outcome variable and allotted the other parameters as explanatory variables by a stepwise procedure.

**Results:** The average values (minimum-maximum value) of age and BMI were 63.3 (32–85) years and 22.1 (12.3–30.0), respectively. Female patients and steroid users accounted for 91.1%, and 41.0%, respectively. Coincidentally, anti-osteoporosis drug-user also reached 41.0%. User of biological accounted for 30.8%. The averages of disease activity score (DAS) 28-erythrocyte sedimentation rate, Health Assessment Questionnaire was 2.6 (0.1–5.9) and 0.8 (0–2.9), respectively. The average of total Sharp score was 122.6 (0–443). Laboratory data showed serum tartrate-resistant acid phosphatase (TRACP)–5b, serum homocysteine, serum undercarboxylated osteocalcin, bone specific alkaline phosphatase, and urinary pentosidine were 320.0 (68–877) mU/dl, 9.7 (3.2–28) nmol/ml, 4.8 (0–23) ng/mL, 15.6 (5.8–43.6) µg/L, and 50.0 (11.5–561) pg/ml, respectively. Next, we describe by the result of multiple regression analysis. The levels of serum homocysteine ( $\beta=-0.19$ ; 95%CI: 0.24 to 1.75; p=0.01) and anti-osteoporosis drug ( $\beta=-0.19$ ; 95%CI: -0.26 to -0.04; p=0.009) were consistently significant predictive variables of annualised BMD change of the lumbar-spine. On the other hand, serum TRACP-5b ( $\beta=-0.28$ ; 95%CI: -0.005 to -0.001; p=0.002) was significant predictive one for the distal forearm.

**Conclusions:** Anti-osteoporosis medication may be particularly important for lumbar spine BMD for RA patients, regardless of steroid-use. Specific biomarkers would be useful such as homocysteine as lumbar spine BMD and TRACP-5b as

the forearm BMD. These findings would be helpful for osteoporosis management in RA patients.

#### EPIDEMIOLOGICAL FEATURES OF PERIPHERAL FRAGILITY FRACTURES IN WOMEN IN REPUBLIC OF MOLDOVA

V. Cazac, L. Groppa, E. Russu, L. Rotaru, L. Chislari. *Rheumatology and Nephrology, State University of Medicine and Pharmacy "Nicolae Testemitanu", Chisinau, Moldova, Republic of*

**Background:** Osteoporosis is a disease which is frequently asymptomatic until fragility fractures occur. The study of risk factors in osteoporosis is continuously developing, considering that there is a tremendous geographic variety in osteoporosis occurrence. We present the results of an epidemiological study of fragility fracture cases in Republic of Moldova, trying to underlie differences in fragility fracture epidemiology, based on residence region, and possibly lifestyle factors, in a female population.

**Objectives:** The purpose of the study was to determine the incidence and prevalence of fragility fractures in women, with comparison of epidemiological indexes between urban and rural areas in Republic of Moldova.

**Methods:** Approximately 6% of the state population was included in the study. Data regarding peripheral fragility fracture cases was collected from all specialised and primary medical institutions from the defined area. Fragility fractures of proximal humerus, distal forearm, proximal femur and distal calf, in women aged over 40 years old were collected. Using population statistics provided by the National Bureau of Statistics, epidemiological indexes regarding fracture incidence and prevalence were derived, with further comparison of derived epidemiological indexes for urban and rural areas, as well as separate epidemiological indexes for the four fracture regions.

**Results:** A general incidence of 1033.4 peripheral fragility fractures per 1 00 000 female population >40 years was determined, with a significantly higher incidence in urban areas (1216.7 vs 980.1,  $p<0.05$ ). The incidence of proximal humerus fracture was 149 per 1 00 000 female population >40 years, with a small, but significantly higher incidence in urban areas (159.5 vs 145.9,  $p<0.05$ ). The incidence of distal forearm fractures was 393.4 per 1 00 000 population >40 years, significantly higher in urban areas (528.5 vs 354.1,  $p<0.05$ ). The incidence of proximal femur fracture was 208.5 per 1 00 000 population >40 years, significantly higher in urban areas (227.9 vs 202.9,  $p<0.05$ ). The incidence of distal calf fractures was 282.5 per 1 00 000 population >40 years, with a small, but significantly higher incidence in urban areas (300.7 vs 277.2,  $p<0.05$ ).

**Conclusions:** There was an overall higher incidence of fragility fractures in the urban female population compared to the rural one, with a similar relationship in all four fracture groups. The association between urban residence and increased incidence of fragility fractures in women, could be attributed to a less active physical lifestyle (known risk factor in osteoporosis) in urban areas. Distal forearm fractures showed a greater prevalence both in urban and in rural areas, compared to other fracture types. Moreover, the incidence difference between urban and rural areas was most prevalent in the distal forearm fracture group. The latter observation was not determined in a similar study in men, in the same population and period of time.

#### BONE MINERAL DENSITY IN PATIENTS WITH CHRONIC KIDNEY DISEASE

V. Vasilkova<sup>1</sup>, T. Mokhort<sup>2</sup>, N. Filiptsova<sup>3</sup>, A. Naumenka<sup>3</sup>. <sup>1</sup>GOMEL STATE MEDICAL UNIVERSITY, Gomel; <sup>2</sup>Belarusian State Medical University, Minsk; <sup>3</sup>The Republican Research Center for Radiation Medicine and Human Ecology, Gomel, Belarus

**Background:** Chronic kidney disease (CKD) is commonly associated with disorders of mineral and bone metabolism.<sup>1</sup> However, the relationship between renal function and bone mineral density (BMD) is controversial.<sup>2-3</sup>

**Objectives:** We aimed the relationship between markers of renal function and BMD in patients with CKD.

**Methods:** 95 patients both sexes with CKD aged 55.49±10.07 years were studied. Control group included 84 healthy subjects the same age. Standard laboratory analyses were performed in all patients. Renal function was assessed by the estimated glomerular filtration rate (eGFR), which was calculated using an equation based on creatinine (eGFRcr) and cystatin C (eGFRcys\_c). Osteoporosis was defined as a femoral neck BMD T-score below -2.5.

**Results:** The serum cystatin C level was negatively correlated with BMD and T-score right and left femoral neck ( $p<0.05$ ), but not with BMD T-score lumbar spine. The level of creatinine was negatively correlated only with BMD and T-score right femoral neck ( $r=-0.653$ ,  $p<0.05$ ). Higher cystatin C levels were associated with a higher prevalence of osteoporosis in CKD patients (OR 3.54; 95% CI 1.63-7.85;  $p=0.002$ ). In logistic regression analysis, after adjusting for age, body mass index, calcium, only cystatin C showed a negative correlation with femoral BMD. In addition, the eGFRcys\_c showed a stronger positive correlation with femoral BMD than the eGFRcr.

**Conclusions:** Our findings suggest that serum cystatin C level could be a marker for femoral BMD and might help identify patients with osteoporosis who are susceptible to fractures.

#### OSSEOINTEGRATED IMPLANTS FOR LOWER LIMB AMPUTEES: EVALUATION OF BONE MINERAL DENSITY

S. Thomson<sup>1</sup>, W. Lu<sup>1</sup>, M. Al Muderis<sup>1,2,3</sup>. <sup>1</sup>The Osseointegration Group of Australia; <sup>2</sup>Macquarie University; <sup>3</sup>The University of Notre Dame, Sydney, Australia

**Background:** The use of dual-energy X-ray absorptiometry (DXA) is a standard clinical procedure for the evaluation of bone mineral density (BMD). Amputee patients are known to have decreased BMD and an increased risk of osteoporosis in the affected proximal femur and hip region. The major cause of these issues in these patients is the absence adequate loading leading to bone resorption in accordance to Wolff's law.

**Objectives:** In this paper, we present a prospective study reporting changes in BMD among amputees who received osseointegrated implants to determine if the loading through the Osseointegrated implant can overcome the bone resorption issues.

**Methods:** This is a prospective study of 33 patients, consisting of 24 males and 9 females, aged 22-77 (mean=51.0±2.0) years with one and two-year follow-up. Selection criteria included age over 18 years, unilateral amputees with socket-related problems. All patients received osseointegrated implants press-fitted into the amputated limb. BMD was assessed using DXA in the femoral neck (operative and contralateral) and lumbar spine (L2-L4) regions, and corresponding Z-scores were generated. DXA scans were taken preoperatively as well as one-year and two-years following osseointegration surgery.

**Results:** Mean BMD and Z-scores of spine, and operative and contralateral sides were generated for all patients. Dependent t-tests were used to test for significant differences ( $p<0.05$ ) preoperative, one-year, and two-years for mean changes in BMD and Z-Scores following surgery. Analysis of the BMD and Z-scores indicated that patients showed improvements at one-year post-surgery.

**Conclusions:** These results suggest that osseointegrated implants are effective at encouraging bone growth and restoring BMD levels for amputees within a short period of time post-surgery. Osseointegrated implants therefore have the potential to address stress distribution issues associated with socket prostheses and restore the normal bone loading regime in lower limb amputees.

**AB1017 VERTEBRAL FRACTURES ARE LIKELY TO OCCUR IN LUMBAR VERTEBRA IN PATIENTS WITH OSTEOPOROSIS AND EVEN IN OSTEOPENIA**

Y. Jiang, D. Lin, X. Guo, M. Zhao, L. Fang, Z. Chen, X. Li, X. Zheng, Z. Liao, J. Gu. *Rheumatology, THE THIRD AFFILIATED HOSPITAL OF SUN YAT-SEN UNIVERSITY, Guangzhou, China*

**Background:** Osteoporosis is a common disease, which can lead to fracture. New diagnosis includes fracture of the vertebral bodies and hips, T-scores of bone mineral density (BMD) less than 2.5 or osteopenia together with humeral, forearm or the pelvis fracture. Vertebral assessment should be considered in some conditions.<sup>1</sup>

**Objectives:** Our study was to investigate the condition of osteoporosis in patients who underwent bone mineral density in our hospital and fracture status according to lateral X-ray of cervical, thoracic and lumbar vertebra.

**Methods:** Patients were enrolled from September to December in 2017 in the Third Affiliated Hospital of Sun Yat-sen University. Demographic information, past medical history, and clinical information were collected by two rheumatologists. Bone mineral density measured by Dual Energy X-ray Absorptiometry was performed based on clinical needs. Patients with osteoporosis or osteopenia were asked to have X-ray scan of cervical, thoracic and lumbar vertebra. The Statistical Package for Social Sciences (SPSS) software version 21 was used for all data management and analysis.

**Results:** Of all the 210 patients, 60 (28.6%) were male patients. 59.5% of female patients were in post-menopause stage. Mean age was 57.60±13.17 years. 124 patients were asked to perform BMD by the rheumatologists. 20 patients did the test after they saw an endocrinologist. 40 patients did the test after they saw an orthopedist. 102 patients had T-scores less than 2.5. 61 patients had osteopenia according to BMD. 22 patients had fracture according to past history or X-ray scans' findings. 10 patients had multiple fractures. The most frequent fractures were located in L1 (nine patients) and L2 (four patients). The other parts included L3, L5, C7, T12, T6, T8, and T9. Two patients had ankle or humeral fractures before because of injury. Vertebral fractures were founded in 5 (8.2%) of the patients with T-scores of -2.5 to -1 during this study.

**Conclusions:** Lateral X-ray scans of the vertebra can detect vertebral fractures in patients with osteopenia according to BMD scores, even in patients less than 50-year-old. Osteoporosis could be underestimated without measurement of the vertebra. The most frequent vertebra fracture happens in L1.

**AB1018 INTRAVENOUS NERIDRONATE IN THE TREATMENT OF BONE MARROW OEDEMA SYNDROME: EFFICACY AND SAFETY OF TWO DIFFERENT TREATMENT SCHEDULES**

A. Lurati<sup>1</sup>, A. Laria<sup>1</sup>, P. Faggioli<sup>2</sup>, M. Marrazza<sup>1</sup>, D. Mazzocchi<sup>1</sup>, A. Gilardi<sup>2</sup>, A. Tamburello<sup>2</sup>, L. Castelnovo<sup>2</sup>, K.A. Re<sup>1</sup>, A. Mazzone<sup>2</sup>. <sup>1</sup>*Rheumatology Unit, FORNAROLI HOSPITAL*; <sup>2</sup>*MEDICINA INTERNA, ASST OVEST MILANESE – OSPEDALE CIVILE DI LEGNANO E CUGGIONO, LEGNANO, Milan, Italy*

**Background:** Bone Marrow Oedema Syndrome (BMES) is a severely disabling pain syndrome without a definite treatment well established.

**Objectives:** The aim of this monocentric prospective trial was to test the efficacy and the safety of the amino-bisphosphonate neridronate in patients with BMES administered in two different schedules.

**Methods:** one hundred seventy-three patients with BMES at various joints were consecutively assigned to I.V. infusion of 100 mg neridronate given four times over 10 days (Group A) or alternatively to I.V. infusion of 100 mg every 21 days over 63 days (Group B). At baseline (T0) and after 90 days from the first infusion we performed a MRI (T2). We assessed a 0–100 mm pain VAS in each patient at T0, at the day of the last infusion (T1: day 10 for group A and day 63 for group B)

and at T2. Primary outcome was to evaluate the MRI changes, secondary endpoint was the VAS change.

**Results:** we observed a significant improvement in MRI with the resolution of bone marrow oedema present at T0 ( $p < 0.01$ ), without a significant difference between Group A and Group B. Visual analogue scale (VAS) score decreased significantly during the study in both groups ( $p < 0.05$ ) without a significant difference between the two treatment groups ( $p > 0.1$ ).

**Conclusions:** In patients with BMES, the infusions of neridronate 100 mg every 21 days over 3 months or alternately every 3 days over 10 days are associated with clinically relevant and persistent benefits without significant differences between the two treatment-schedules. These results provide conclusive evidence that the use of bisphosphonates, at appropriate doses, is the treatment of choice BMES

**AB1019 PATIENTS COMPLIANCE TO CHRONIC GOUT THERAPY WHEN ADMINISTERED BY DIFFERENT MEDICAL PROFESSIONALS**

A. Sarapulova<sup>1</sup>, O. Teplyakova<sup>1</sup>, A. Popov<sup>1</sup>, T. Popova<sup>2</sup>, P. Palabugina<sup>1</sup>. <sup>1</sup>*URALS STATE MEDICAL UNIVERSITY*; <sup>2</sup>*City Clinical Hospital 40, Ekaterinburg, Russian Federation*

**Background:** in everyday practice chronic gout patients are frequently consulted by general practitioners, surgeons, cardiologists and other specialists. In general, chronic gout patients have been reported to be quite incompliant, but it remains unclear whether low compliance depends on the speciality of the prescribing physician.<sup>1</sup>

**Objectives:** to compare the clinical course of gout in patients consulted by different specialists and to identify factors of low patients' compliance in Russia.

**Methods:** cross-sectional study included 56 chronic gout patients aged 31 to 82 (median 54 years). Average gout symptoms duration was 6.8 years, average attacks frequency was 6.4 per year. Tofi were present in 21.4% of patients. All subjects were divided into three groups: Group 1 consisted of treatment naive patients at primary rheumatologist visit, Group 2 and Group 3 included patients who had previously been treated. Group 2 subjects were visiting both non-rheumatologists and rheumatologists. Group 3 were managed by rheumatologists strictly according to the EULAR evidence-based recommendations.<sup>2</sup>

**Results:** Group 1 primary consulted rheumatologists at the age of 47.3±14.5, Group 2 patients were assessed at the age of 58.4±15.2, and Group 3 were aged 51.2±13.5. Disease symptoms duration was maximal in Group 2 (10.6±10.6 years) while 5 years in Groups 1 and Group 3. Flares frequency was the lowest in Group 3 (2.2±1.8 per year), while in Group 2 it was extremely high – (10.58±10.56 per year). The incidence of tofi and urolithiasis was lowest in the Group 3 whereas every third treatment naive patient had tophi or/and urolithiasis. To relieve gouty arthritis vast majority of patients used NSAIDs, though at 50% strength of the recommended dose. Only 9%–14% of flares were controlled by colchicine in Groups 2 and 3. Colchicine prevention of flares was prescribed only in 45% of cases by rheumatologists. The most frequent urate-lowering therapy (ULT) was allopurinol, it was taken only by 63% of patients of the third group and 35.7% in the second group. While patients in the third group took the drug daily, the other patients did not follow the administration scheme. Serum creatinine level was the lowest (87.5 ±16.8 μmol/L) in Group 3, being the highest in treatment of naïve patients (102.7 ±30.0 μmol/L). Serum uric acid target level was achieved only in the compliant Group 3 patients (343 μmol/L), while Group 2 levels varied between 462–546 μmol/L, being the highest (625 μmol/L) in treatment naïve Group 1.

Low compliance risk factors were: age under 45, absence of comorbidity and long term multiple drugs consumption.

**Conclusions:** chronic gout patients' compliance and quality of patient management can be assessed as alarmingly low. Rheumatologists adhering to EULAR evidence-based approach to gout management can actually achieve recommended treatment targets. Both general practitioners and other specialists are in need of consistent educational program on gout management. Younger and comorbidity-free gout patients should be encouraged to follow attending physician's recommendations.

**AB1020** **PILOT ASSESSMENT OF CURRENT CHRONIC GOUT TREATMENT IN RUSSIA**

A.A. Popov<sup>1</sup>, O.V. Teplyakova<sup>2</sup>, T.A. Popova<sup>3</sup>, A.V. Sarapulova<sup>2</sup>, P. A. Palabugina<sup>1</sup>. <sup>1</sup>Hospital Therapy Dept; <sup>2</sup>Outpatient Therapy Dept., URALS STATE MEDICAL UNIVERSITY; <sup>3</sup>Rheumatology Dept., City Clinical Hospital 40, Ekaterinburg, Russian Federation

**Background:** In 2016 EULAR evidence based clinical guidelines on Gout treatment have been updated.<sup>1</sup>

**Objectives:** to assess current daily practice physicians' approach to management of chronic gout patients

**Methods:** a cross-sectional anonymous survey had been offered to hospital and outpatient departments physicians dealing with gout patients resulting in 97 backfeed replies yielded. This publication deals with chronic gout treatment practice.

**Results:** all survey participants were divided into 3 groups. Group 1 consisted of 18 rheumatologists (professional experience median 19.6 years, range 1 to 43), group 2 included 60 general practitioners (GP, professional experience 27; 4–47), group 3 included other specialists (cardiologists, surgeons etc.) who reported frequent contacts with gout patients (professional experience 16.5; 1–44). Rheumatologists reported to contact median 15 (range 2–40) gouty subjects per month, while group 2 reported to see 3<sup>1–10</sup> and group 3 consults 4<sup>1–12</sup> patients per month. All rheumatologists and 45 GPs reported initiation of allopurinol or febuxostat after gouty arthritis resolution, while 11 general practitioners did not start antihyperuricemic drugs in subjects with kidney and/or cardiovascular comorbidities. In Group 3 only 6 responders had experience of antihyperuricemic drugs administration, but 3 of them reported allopurinol initiation during gout flare. Only 2 rheumatologists and 2 GPs were aware of gout flare low dose colchicin prophylaxis during allopurinol dose adjustment. Administration of maximal allopurinol daily maintenance doses over 300 mg was reported only by 7 rheumatologists and 7 GPs. Other specialists did not have any personal experience of allopurinol dose adjustment. By responders' assessment every 2–3 patient continues to experience gout flares in spite of prescribed treatment

**Conclusions:** intensive educational intervention is urgently required to change current practice of chronic gout treatment in Russia.

**AB1021** **ANEURYSMAL BONE CYSTS OF THE SPINE: 4 CASE REPORTS AND REVIEW OF LITERATURE**

A. Romdhane, N. Karmani, J. Kallel, I. Ben Said. *Neurosurgery, National Institute of Neurology, Tunis, Tunisia*

**Background:** Aneurysmal bone cysts (ABC) are rare, benign, highly vascular pseudotumors of unknown cause. It most often affects individuals during their second decade of life.

**Objectives:** Our goal was to document the clinical characteristics, diagnostic modalities and treatment results of ABCs.

**Methods:** We reviewed our institution's database over a period of 15 years to identify patients diagnosed with aneurysmal bone cysts of the spine. Four patients underwent surgery in our department (2 men and 2 women). For those four patients, we tabulated the clinical characteristics, location, diagnostic modalities and treatment.

**Results:** The clinical manifestations were gait disturbance in 2 patients and leg-pain in the other two. The tumour occurred in the dorsal spine in 2 cases and in the lumbar spine in the other two. All patients underwent surgical resection with total removal in only 2 patients. Postoperatively, clinical signs improved in all patients. Only one case presented tumour recurrence requiring second intervention and instrumentation.

ABCs constitute approximately 1.5% of spinal bone tumours. They usually affect the posterior elements of the spine. MRI is the most useful modality for preoperative planning. It also helps to evaluate the fluidfluid level, which is characteristic for ABC on MRI. The differential diagnosis is mainly with giant cell tumours and osteoblastomas. The primary option for treatment is surgery. Instrumentation is sometimes necessary because of the increased risk of postoperative instability, especially in cervical spine surgery. The recurrence rate is 20% to 30% in case of incomplete resection.

**Conclusions:** ABCs are benign lesions. Surgical resection en bloc has the lowest recurrence rate. Instrumentation is sometimes necessary because of the increased risk of postoperative instability.

**AB1022** **EFFICACY AND TOLERANCE OF SODIUM THIOSULFATE INJECTION IN CALCIFIC TENDINOPATHY OF THE ROTATOR CUFF**

C. Darrieurtort-Laffite<sup>1</sup>, T. Garraud<sup>1</sup>, A. Bertrand-Vasseur<sup>2</sup>, B. Le Goff<sup>1</sup>. <sup>1</sup>RHEUMATOLOGY UNIT; <sup>2</sup>RADIOLOGY UNIT, HOPITAL HOTEL DIEU/HME, NANTES CEDEX 1, France

**Background:** Calcific tendinitis of the rotator cuff is one of the most common causes of shoulder pain. Ultrasound guided percutaneous lavage of calcific tendinopathy (UGPL) is indicated when conservative treatments have failed. It has been shown that dense calcifications are associated with a higher risk of treatment failure. Sodium thiosulfate (STS) has recently been used with success in the treatment of tumoral calcinosis. We hypothesised that STS lavage could be of interest in the treatment of dense calcification of the rotator cuff.

**Objectives:** To evaluate the tolerance and efficacy of sodium thiosulfate lavage in the treatment of calcific tendinitis

**Methods:** This was a prospective phase II open label study. We included only patients with a type A calcification according to the Molé classification. Patients were treated with a US-guided single needle technic. When backflow of calcific material could be identified in the syringe, lavage of the deposit was performed using STS 25% until the backflow becomes clear followed by the injection of 1 mL (250 mg) of STS inside the calcific deposit. Finally, 1.5 mL of cortivazol was injected in the subacromial bursa. All patients had follow-up visits at 1 week, 1 month and 3 months after intervention. At each time point, VAS pain at rest and during activities was recorded and US and X-ray were performed. Our primary outcome was the percentage of patients with more than 50% of decrease of the calcification size at 1 month. Based on our experience and on the literature, we expected that more than 60% of the patients should have more than 50% of decrease in their calcification for the results to be significant.

**Results:** A total of 17 patients were included. Mean age was 50±11 years. There were 9 female (52.9%). Baseline VAS at rest and during daily activities was a mean 40.2±25.9 and 65.5±21.6 (27–91) respectively. Calcification involved the supraspinatus in 12 cases (70.6%) and the infraspinatus in 5 cases (29.4%). Mean surface on radiography was 80.7 mm<sup>2</sup> ±52.4 and the calcification longest size was 18.8±7.1 mm. All patients underwent the entire procedure with no adverse event apart of a mild and transient vasovagal reaction. Calcium backflow could be obtained in 15 patients (88.2%) with a small amount of calcium in 8 cases (53.3%) and a large quantity in 7 cases (46.7%). We found that 5 patients (30%) had more than 50% decrease of their calcific deposit at 1 month and 8 (47%) patients at 3 months. VAS pain during activities and at rest decreased significantly from 65±22 and 40.2±26 at baseline to 37.8±31 and 24.1±24 at 3 month respectively (p=0.0004; p=0.001)

**Conclusions:** Overall, our study is the first to evaluate the tolerance and efficacy of sodium thiosulfate for the treatment of the calcifications of the rotator cuff. We could not demonstrate a significant effect of one STS lavage and injection in patients with dense calcification. This treatment was well tolerated with no side effect occurring during the procedure and the follow-up. New studies using larger volume and repeated injections of STS will be needed to definitely conclude on the interest of this molecule in the treatment of calcific tendinopathies.

**AB1023** **ENHANCED RENAL TRANSPORTER ACTIVITIES OF OAT1 AND OAT3 BY KEISHIBUKURYOGAN (K-06) AND IN VIVO URIC ACID MODULATING EFFECT AT POTASSIUM OXONATE-INDUCED MOUSE SETTING**

D.-S. Oh<sup>1</sup>, H.J. Shin<sup>2,3</sup>, S.H. Lee<sup>1</sup>, S.-M. Oh<sup>1</sup>. <sup>1</sup>The K-herb Research Centre, Korea Institute of Oriental Medicine, Daejeon; <sup>2</sup>Department of Pharmacology and Pharmacogenomics Research Centre, College of Medicine, Inje Univ; <sup>3</sup>DMPK, SPMED, Busan, Korea, Republic of Ireland

**Background:** Studies on renal solute carrier transporters have made the renal pathophysiology be in progress towards more mechanistic and the knowledge on renal drugs including drug-drug interaction be more evidentiary. Among the evidence, uricosuric phenomenon has been known that rodent experimental model is also useful for predicting human uricosuria.

**Objectives:** The aim of this study was to assess the substrate uptake at the over-expression of renal transporters, OAT1, OAT3 and URAT1 at kidney proximal tubular cell lines with or without a commercial herbal medicine, Keishibukuryogan (K-06) and to further measure serum and urinary uric acid concentrations in the setting of potassium oxonate (PO)-induced ICR mouse model with or without K-06.

**Methods:** The transporter-expressed HEK293-OAT1 and HEK293-OAT3 cells were seeded on BD poly-d-lysine microplates to uptake the [<sup>3</sup>H] estrone sulfate for 5 min in absence or presence of K-06. URAT1 was overexpressed using Xenopus oocytes being injected with *in vitro*-copied RNA of URAT1, and then to measure the uptake of [<sup>14</sup>C] uric acid with/without K-06. Total radioactivity was measured using a liquid scintillation counter. Serum and urinary uric acid was measured in PO ICR mice after three-day intake of K-06. They were assigned by 4 per each group; 1) control group, 2) PO-induced group, 3) PO-induced with allopurinol 50 mg/kg/day intake group and 4) PO-induced with allopurinol plus K-06 300 mg/kg/day intake group.

**Results:** To determine the kinetic parameters of concentration-dependent uptake of overexpressed OAT1 and OAT3 transporters in HEK293 cells, the K-06 inhibitory parameters on OAT1 and OAT3 were presented with the IC<sub>50</sub> values of 49.3 and 31.5 µg/mL, respectively. The K-06 inhibited URAT1 with IC<sub>50</sub> of 59.3 µg/mL. The K-06 (300 mg/kg) reduced serum levels of uric acid approximately 30% compared to that of PO-control group (p=0.039) and K-06 showed the slight elevation of urinary uric acid by 12% compared to that of PO-control group with no statistical significance.

**Conclusions:** The present findings demonstrated that the K-06 modulated basolateral and apical renal transporters and the K-06 showed the slight increased uric acid excretion and the uric acid lowering effect in experimental mouse setting.

**AB1024** **RISK OF DRUG INDUCED LIVER INJURY FROM NSAIDS IN PATIENTS WITH GOUT**

E. Mikhnevich<sup>1</sup>, T. Pavlovich<sup>1</sup>, T. Rayeuneva<sup>1</sup>, E. Mytnik<sup>2</sup>, E. Leonchik<sup>3</sup>, V. Tettegah<sup>4</sup>. <sup>1</sup>Department Of Internal Medicine, UNIVERSITY OF MEDICINE; <sup>2</sup>Department Of Rheumatology, Diagnostic Center; <sup>3</sup>Emergency Department, Hospital #5; <sup>4</sup>UNIVERSITY OF MEDICINE, Minsk, Belarus

**Background:** Drug Induced Liver Injury (DILI) in patients under nonsteroidal anti-inflammatory drugs (NSAIDs) is more frequently presented by hepatocellular damage when serum alanine aminotransferase (ALT) level exceeds 2 times (or more) the upper limits of norms.<sup>1</sup> The value of minimal hypertransaminasemia (MHTE) (when serum ALT exceeds the upper limit of normal up to twice) is still not clear today.

**Objectives:** To define the terms of DILI development and the value of MHTE in patients with gouty arthritis (GA) under NSAIDs.

**Methods:** 189 patients (25.6%) of 738 with GA<sup>ACR, 1977</sup> were included in our retrospective study. At the onset of gout attack, all patients had normal basal serum ALT, which elevated after starting NSAIDs therapy. Pre-existing liver impairment was not registered. Patients were divided into 2 groups according to the changes in serum ALT after NSAIDs treatment: patients with MHTE (n=101) and those with

DILI (n=88). The mean age of 55<sup>49–60</sup> years and 54<sup>44–59.5</sup> years as well as the sex distribution (men 90,1% and 93,3%, respectively) were compatible in both the groups (p<0,05). In DILI group, elevated serum ALT exceeded 2–3 times the upper norms in 81,8% (n=72) of patients; 3–5 times in 14,8% (n=5); more than 5 times in 3,4% (n=3) with the mean serum ALT being of 89<sup>75–108.5</sup> U/L. In MHTE group, serum ALT exceeded the upper norms by more than 50% in 50,5% (n=51) of cases. After NSAIDs therapy, the mean serum ALT of 51<sup>(47–57)</sup>U/L was revealed.

**Results:** The mean duration of NSAIDs therapy in the groups made 8<sup>5–10</sup> days in MHTE group and 10<sup>6–14</sup> days in DILI group. Statistically significant difference (U=3236, p<0,001) was revealed between the groups when comparing the duration of NSAIDs treatment. In addition, in DILI group, 97,7% of patients received NSAIDs in high doses (χ<sup>2</sup>=19,4; p<0,001) during all period of treatment. ROC analysis showed that the probability of DILI development decreased in patients with GA taking NSAIDs in high doses during less than 11 days (AUC=0,64±0,04, p=0,010, S=47,7%, Sp=82,2%, OR=4,21, 95% CI – 3,38–5,24).

**Conclusions:** 25,6% of patients with GA have demonstrated elevated serum ALT after NSAIDs therapy: MHTE developed in 13,7% of cases, DILI in 11,9%. Our study showed that MHTE developed in the period less than 11 days of high dose NSAIDs treatment with DILI being likely to occur during more prolonged treatment. MHTE group may be considered as a risk group for DILI development.

**AB1025** **MONOSODIUM URATE CRYSTAL FORMATIONS FROM TOPHI IN SYNOVIAL FLUID**

E. Pascual<sup>1</sup>, M. Andrés<sup>2,3</sup>, F. Sivera<sup>4</sup>. <sup>1</sup>Emeritus Professor, Universidad Miguel Hernández; <sup>2</sup>Seccion de Reumatología, Hospital General Universitario De Alicante-Isabiel; <sup>3</sup>Dpt Medicina Clínica, Universidad Miguel Hernández; <sup>4</sup>Seccion De Reumatología, Hospital General Universitario de Elda, Alicante, Spain

**Background:** At the joints MSU crystals form primarily at the cartilage surface; on occasions also tophi form at joint margins. Most often monosodium urate (MSU) crystals at the synovial fluid (SF) are found isolated. In tophi MSU crystals often show as spherulitic formations, fanning away from a central point<sup>1</sup> (Figure 1, 200x, polarised light). We have detected in synovial fluid formations of MSU crystals with an organisation indicative that they formed in tophi, draining later to the fluid. The formations also help to understand how crystals formed in tophi.

**Methods:** Our photographic archive of SF has been reviewed.

**Results:** Two types of formations are found. A) A spherulitic formation where the crystals fan radially as in the segment of a sphere (Figure, middle, 600x, polarised light). B) Paired crystals bound longitudinally to each other (Figure, right, 600x, phase contrast).

**Abstract AB1025 – Figure 1**

**Conclusions:** At tophi spherulitic crystal formations are usual (figure 1) in which MSU crystals radiate as in a fan. A) Pieces of these same formations, seen as the segment of a sphere, are occasionally seen in SF (Figure 2), usually containing a large number of crystals and suggesting that they have drained from a tophus. Likely to build these formations, the initial crystals served as a template on which successive crystals formed by epitaxia, – the crystal formation method of least energy requirement –, explaining the rapid growth that tophi can present. Their unimpeded migration to the joint cavity suggest that they formed freely and unconnected to any organic structure within the tophus. B) In SF containing large numbers of crystals, paired crystals – two crystals lying side by side and usually of similar length and width – are also found. Their paired position likely indicates that one served as template to the other, or that they grew together sharing a crystal net – twin crystals. In all, these MSU crystal formations appear to indicate that besides the crystals formed in the surface of joint cartilages, the content of tophi can drain into the joint fluid, also contributing to the presence of crystals in it; the

periarticular tophi frequently seen in ultrasound appear as the likely source for these formations.

#### CLINICAL CHARACTERISTICS AND RISK FACTORS FOR GOUT ATTACK DURING THE POSTSURGICAL PERIOD

H. Jeong<sup>1</sup>, Y.H. Eun<sup>2</sup>, E.-J. Park<sup>3</sup>, H. Kim<sup>2</sup>, J.Y. Chai<sup>4</sup>, J. Lee<sup>2</sup>, C.H. Jeon<sup>1</sup>.  
<sup>1</sup>Soonchunhyang University Hospital, Bucheon; <sup>2</sup>Samsung Medical Center, <sup>3</sup>National Medical Center, Seoul; <sup>4</sup>Bundang Jesaeng Hospital, Seongnam, Korea, Republic of Ireland

**Objectives:** To evaluate the clinical features and risk factors for gout attack during the postsurgical period in patients with gout.

**Methods:** Seventy patients who had histories of gout and had been consulted to rheumatologic clinic before surgery under general anaesthesia at a single tertiary hospital were included. Clinical characteristics of patients who developed postsurgical gout attack were compared with patients who did not developed gout attack.

**Results:** Among 70 patients, 31 (44.3%) patients developed gout attack during postsurgical period. Mean time of gout attack after surgery was 3.7±4.9 days. Most of attacks involved lower extremity joints (83.9%) and tended to monoarticular involvement (61.3%). Knee joint (26%) and foot except 1st metatarsophalangeal (MTP) joint (26%) were more frequently involved than 1st MTP joint (13%). Uric acid levels before surgery (OR 1.46, 95% CI 1.13–1.88, p=0.004) and amount of uric acid changes between before and after surgery (OR 1.62, 95% CI 1.21–2.18, p=0.001) were risk factors for postsurgical gout attack. Taking medications for gout including uric acid lowering agents and/or colchicine reduced the risk of postsurgical gout attack (OR 0.11, 95% CI 0.04–0.32, p<0.001). Operation time, amount of blood loss during surgery, amount of fluid administration during surgery, and surgery site were not significantly associated with postsurgical gout attack.

**Conclusions:** Adequate uric acid control and taking medications for gout could prevent the postsurgical gout attack.

#### THE PREDICTIVE VALUE OF CYSTATIN C FOR GOUTY NEPHROPATHY

D. Rekalov, I. Daniuk, G. Medvedchuk. *Internal diseases-3, Zaporizhzhia State Medical University, Zaporizhzhia, Ukraine*

**Background:** Gout is the most common cause of an inflammatory arthritis in men elder than 30 years, varies up to 1,7% of the total morbidity. One of the most common complication of chronic gout is gouty nephropathy with the morphological signs of kidney damage, even in the early stages.<sup>1</sup>

It's well known, that urine albumin and glomerular filtration rate (GFR) are the generally accepted markers of nephropathy. But, recent data has shown, that the informative and obtainable new biomarkers of the kidney function are still needed. Thus, evaluation of the pathogenic role in the renal failure of cystatin C could be a "clue". The dozen trials have shown that an increasing of ranges cystatin C in serum could be tested at the stage of subclinical reduction of GFR with normal level of creatinine.<sup>2;3</sup>

**Objectives:** To determine the serum ranges of cystatin C and creatinine as the markers of nephropathy in patients with gout.

**Methods:** The main group was the 80 males with primary gout (average age – 53,4±8,2 years), with the disease duration from 3 up to 25 years. The second group – 20 healthy men (49,5±4,5). We determined the concentration of serum uric acid, serum cystatin C, creatinine, calculate the GFR using CKD-epi formula. For urine albumin evaluation we used the albumin/creatinine ratio in the morning urine portion.

**Results:** e determined that the main group identified by more significant violations of renal function. In the main group was found the statistically significant increase of the serum creatinine (97±18 μmol/l) and decrease of GFR (73<sup>64; 94</sup> ml/min<sup>2</sup>.

The serum cystatin C concentration in the main group was (1,7<sup>1,4; 1,9</sup> mg/l which was the significantly larger than in the comparison group (0,8 [0,7; 0,92] mg/l, p<0,001).

The albumin/creatinine ratio was statistically higher in the main group (26<sup>14; 56</sup> mg/g than in comparison (0,8 [0,7; 0,92] mg/l, p<0001). Also the patients with gout are characterised by the larger concentration of uric acid in the serum (530±74) μmol/l than healthy men (347±75) μmol/l and negative correlation between uric

acid level and GFR (r=-0,4, p<0,05) which explain the increase of uric acid concentration in the serum.

We determined the correlation between level of urine albumin and creatinine concentration (r=+0,5, p<0,05) in the main group, but concentration between albuminuria and cystatin C was stronger (r=+0,6, p<0,05). We detected that cystatin C level had a greater accuracy for the diagnosis of albuminuria than creatinine according to the ROC-analysis. These facts show that serum concentration of cystatin C more closely connected with the renal function than creatinine.

**Conclusions:** 1. The increase of serum cystatin C level can be identified before the clinical manifestation of renal dysfunction while the serum creatinine remain relatively normal.

2. Serum ranges of cystatin C more closely correlate with elevation of urine albumin than creatinine.

#### ACTH VS BETAMETHASONE FOR THE TREATMENT OF ACUTE GOUT IN HOSPITALISED PATIENTS

#### AN OPEN LABEL, COMPARATIVE STUDY

P. Kordas<sup>1</sup>, I. Antonopoulos<sup>2</sup>, D. Velissaris<sup>1</sup>, D. Daoussis<sup>2</sup>. <sup>1</sup>Internal Medicine; <sup>2</sup>Rheumatology, University of Patras Medical School, Rio, Patras, Greece

**Background:** The management of gout can be problematic in the hospital setting; hospitalised patients usually have significant comorbidities and receive multiple medications which leads to a high frequency of contraindications to established gout therapies. We have previously shown the ACTH is a safe and fast acting therapeutic option for acute gout in hospitalised patients in a large scale retrospective study.<sup>1</sup>

**Objectives:** To directly compare the efficacy of ACTH vs betamethasone for the treatment of acute gout in hospitalised patients in a prospective manner.

**Methods:** Hospitalised patients with acute gout, fulfilling the ACR criteria, were treated with an IM injection of either 100 IU of ACTH (Synachten Depot) or 6 mg of betamethasone (Celestone Chronodose-the most widely use IM steroid formulation in our country) on an alternate 1/1 basis. Clinical efficacy was assessed at 24, 48, 72 hour and 5 days as follows: a) Intensity of pain using a Visual Analogue Scale (VAS 0–10), b) physician global assessment (0–10) and c) swelling, redness and warmth (0–3 scale). Pain VAS was also self reported by the patient at 6 and 12 hour. Comorbidities representing contraindications to established gout therapies were recorded. Primary outcome of the study was the change in pain VAS at 24 and 48 hour. Secondary outcomes were changes in physician global assessment and changes in objective signs of inflammation.

**Results:** This is a 6 month interim analysis of an ongoing investigator initiated clinical study. Twelve patients (8 male) with a mean ±SD of 66.9±12.3 years were recruited and treated with ACTH or betamethasone on an alternate basis (6 in each treatment group). In most cases (n=11) the attack was monoarticular. The majority of patients had multiple comorbidities with the commonest being hypertension (9/12). Both treatments were effective. ACTH led to a significant decline in pain VAS at 24 hour compared to baseline (mean ±SEM: 2.33±1.21 vs 7.66 ±0.81 respectively, p=0.0002) and at 48 hour (1.40±1.14, p=0.0011 compared to baseline). Betamethasone was also effective with an improvement in pain VAS at 24 hour compared to baseline (mean ±SEM: 1.83±0.98 vs 5.33±2.16 respectively, p=0.0024) and at 48 hour (0.75±0.95, p=0.02 compared to baseline). However, direct comparison between treatment arms showed that ACTH treated patients exhibited a higher change in pain VAS at 24 hour compared to betamethasone treated patients (mean ±SEM: 5.5±0.5 vs 3.5±0.61 respectively, p=0.03). At the 48 hour time point ACTH treated patients still showed a higher change in pain VAS (mean ±SEM: 6.4±0.6 vs 4±0.91 respectively, p=0.056). A trend favouring ACTH was already evident at the 12 hour time point; the change in pain VAS was 4±1.54 vs 3.1±1.47 for ACTH vs betamethasone, respectively, p=ns). No changes in physician global assessment and objective signs of

inflammation was found at 24 and 48 hour between treatment groups. Treatment was well tolerated in both groups.

**Conclusions:** Both steroids and ACTH are effective in the treatment of gout in hospitalised patients but ACTH is faster acting. ACTH may be an attractive therapeutic choice in patients with multiple comorbidities that cannot receive standard treatment.

#### ALLOPURINOL AND CARDIOVASCULAR OUTCOMES IN PATIENTS WITH ISCHAEMIC HEART DISEASE (ALL-HEART) STUDY: BASELINE CHARACTERISTICS OF THE RANDOMISED PATIENT POPULATION

I. Mackenzie<sup>1</sup>, I. Ford<sup>2</sup>, C. Hawkey<sup>3</sup>, A. Begg<sup>4</sup>, J. Taggar<sup>3</sup>, A. Struthers<sup>5</sup>, L. Wej<sup>6</sup>, A. Avery<sup>3</sup>, A. Walker<sup>7</sup>, S. Duce<sup>1</sup>, R. Barr<sup>1</sup>, J. Dumbleton<sup>3</sup>, T. MacDonald<sup>1</sup>, on behalf of the ALL-HEART study group. <sup>1</sup>MEMO Research, University of Dundee, Dundee; <sup>2</sup>The Robertson Centre for Biostatistics, University of Glasgow, Glasgow; <sup>3</sup>University of Nottingham, Nottingham; <sup>4</sup>Townhead Medical Practice, Montrose; <sup>5</sup>University of Dundee, Dundee; <sup>6</sup>University College London, London; <sup>7</sup>University of Glasgow, Glasgow, UK

**Background:** Allopurinol is licensed for the prevention of gout. In recent years, several studies have suggested that allopurinol may have beneficial effects on cardiovascular parameters. The ALL-HEART study is a large outcome trial designed to investigate whether allopurinol improves cardiovascular outcomes in patients with ischaemic heart disease<sup>1</sup>. It is a multicentre, controlled, prospective, randomised, open-label, blinded endpoint trial of allopurinol (up to 600 mg daily) versus no treatment added to usual care in patients aged 60 and over with ischaemic heart disease. Patients are followed up by electronic record-linkage and annual questionnaires. Patient recruitment to the trial started in 2014 and completed in 2017 and follow-up is ongoing.

**Objectives:** To describe the baseline characteristics of the patients randomised into the ALL-HEART study.

**Methods:** The primary endpoint of the ALL-HEART study is the composite of non-fatal myocardial infarction, non-fatal stroke or cardiovascular death. Secondary outcomes include all-cause mortality, quality of life and cost-effectiveness of allopurinol. The study will end when 631 adjudicated primary outcomes have occurred.

**Results:** 5938 patients from the UK have been randomised into the ALL-HEART study. The mean age at randomisation was 72.1±6.8 (SD) years. 75.2% of participants are male. 56.5% are former smokers and 9.4% current smokers. Mean systolic blood pressure was 133±18 mmHg and mean diastolic blood pressure 72±11 mmHg. Mean body mass index was 28.9±5.3 kg/m<sup>2</sup>. The average duration of ischaemic heart disease was 11.5±7.9 years. 47.4% of participants had a history of previous myocardial infarction, 64.2% a history of angina, 56.4% a history of coronary revascularisation and 69.3% had other evidence of ischaemic heart disease. 57.6% had a history of hypertension. 3.9% had a history of previous cerebrovascular accident, 7.6% of peripheral arterial disease, 21.8% of diabetes mellitus, 8.9% of chronic obstructive pulmonary disease and 5.2% of heart failure.

**Conclusions:** This large ongoing trial will determine whether allopurinol improves major cardiovascular outcomes in patients with ischaemic heart disease.

#### FEBUXOSTAT VERSUS ALLOPURINOL STREAMLINED TRIAL (FAST): BASELINE CHARACTERISTICS OF THE RANDOMISED PATIENT POPULATION

I. Mackenzie<sup>1</sup>, T. MacDonald<sup>1</sup>, I. Ford<sup>2</sup>, G. Nuki<sup>3</sup>, on behalf of the FAST steering committee. <sup>1</sup>MEMO Research, University of Dundee, Dundee; <sup>2</sup>The Robertson Centre for Biostatistics, University of Glasgow, Glasgow; <sup>3</sup>Centre for Genomic and Experimental Medicine, University of Edinburgh, Edinburgh, UK

**Background:** The Febuxostat versus Allopurinol Streamlined Trial (FAST) is a prospective, randomised, open-label, blinded endpoint trial comparing the cardiovascular safety of allopurinol and febuxostat in patients with symptomatic hyperuricaemia.<sup>1</sup> The trial includes patients aged over 60 years who are taking chronic allopurinol therapy at baseline and have at least one additional cardiovascular risk factor. After up-titration on allopurinol to reach EULAR urate targets, patients are randomised to febuxostat or allopurinol then followed up for events. Patient recruitment to the trial completed in late 2017 and follow-up is ongoing.

**Objectives:** To describe the baseline characteristics of the patients randomised into the FAST study.

**Methods:** The primary endpoint of the FAST study is the composite of non-fatal myocardial infarction, non-fatal stroke or cardiovascular death. The primary analysis is a non-inferiority analysis with a non-inferiority upper limit for the hazard ratio for the primary outcome of 1.3.

**Results:** 6142 patients from UK, Denmark and Sweden have been randomised into the FAST study. The mean age at randomisation was 71.0±6.4 (SD) years. 85.3% of participants are male. 57.3% are former smokers and 7.9% current smokers. Mean systolic blood pressure was 138±18 mmHg and mean diastolic blood pressure 75±12 mmHg. Mean body mass index was 31.1±5.2 kg/m<sup>2</sup>. 10.7% of participants had a history of previous myocardial infarction, 5.0% a history of previous cerebrovascular accident and 4.8% a history of peripheral arterial disease. 22.5% had a history of diabetes mellitus and 4.6% a history of heart failure. 78.0% had a history of high blood pressure. 33.3% had a history of any cardiovascular disease (defined as history of myocardial infarction, cerebrovascular accident, transient ischaemic attack, acute coronary syndrome, coronary revascularisation, angina pectoris or heart failure). The mean baseline urate at study entry (screening) was 297±47 umol/L. The mean allopurinol dose being taken at study entry (screening) was 225±106 mg daily. 2206 patients (35.9%) had at least one up-titration of allopurinol dose prior to randomisation.

**Conclusions:** This ongoing European trial will report on the cardiovascular safety of febuxostat versus allopurinol in patients with symptomatic hyperuricaemia.

#### ANALYSIS OF MECHANISM OF TRANSIENT INCREASE IN PLASMA URATE LEVELS INDUCED BY FRUCTOSE IN RATS

K. Ichida<sup>1</sup>, M. Nagamura<sup>1</sup>, R. Tanino<sup>1</sup>, W. Yoshioka<sup>2</sup>. <sup>1</sup>Department of Pathophysiology, Tokyo University of Pharmacy and Life Sciences; <sup>2</sup>Department of Public Health and Environmental Medicine, The Jikei University School of Medicine, Tokyo, Japan

**Background:** Hyperuricemia induces gout and kidney stones and accelerates the progression of renal diseases. Hyperuricemia is a common multifactorial disorder having several environmental factors such as sex, diet, alcohol consumption, and obesity. The increasing prevalence of hyperuricemia in recent years is thought to be due to environmental factors, particularly diet. Based on the reported association between sugar-sweetened beverages and hyperuricemia in epidemiological studies, it has been hypothesised that fructose, the primary sweetener in sugar-sweetened beverages, directly increase plasma urate levels.

**Objectives:** The aim of this study was to investigate whether and how fructose induces an increase in plasma urate levels.

**Methods:** Urate in plasma and urine were measured after fructose, glucose, or water was administered to Sprague-Dawley rats at doses of 2.5 or 7.5 g/kg at a time. Intestinal closed loops were made using approximately 10 cm of ileum. Phosphate buffered saline was injected into each intestinal loop. After 4 hours, urate levels in the loops were measured.

**Results:** Plasma urate level was significantly increased within 15–30 min by oral administration of fructose, without an increase in urinary and intestinal urate excretion, and a decreasing tendency of urate clearance was observed. These actions were evident at a dose of 7.5 g/kg body weight. The absence of an increase in urinary and intestinal urate excretion indicated that an increase in urate production did not result in the increase in plasma urate level. In the meantime, a decrease in urate clearance was suggested to cause the increase in plasma urate level.

**Conclusions:** The present study demonstrated that oral intake of fructose induces an increase in plasma urate level within a short time and that a decrease in renal urate clearance could mainly work for that.

**Disclosure of Interest:** None declared

### HIGHER BODY FAT IS AN INDEPENDENT RISK FACTOR FOR METABOLIC SYNDROME IN GOUT

J.-J. Liang<sup>1</sup>, S.-T. Ao<sup>2</sup>, Q.-H. Li<sup>1</sup>, Y.-H. Xu<sup>1</sup>, X.-Y. Du<sup>1</sup>, K.-M. Yang<sup>1</sup>, J.-Z. Lin<sup>1</sup>, Y.-Q. Mo<sup>1</sup>, L. Dai<sup>1</sup>. <sup>1</sup>Department of Rheumatology, Sun Yat-Sen Memorial Hospital, Sun Yat-Sen University; <sup>2</sup>Zhongshan School of Medicine, Sun Yat-Sen University, Guangzhou, China

**Background:** The development of gout is associated with obesity and metabolic syndrome (MS). Obesity is defined by body mass index (BMI). However, BMI has been challenged for the limitation of not distinguishing different comprising tissues of the body. Body composition (BC) has been frequently recommended to assess metabolic status and will eventually replace BMI as a more reliable measure.

**Objectives:** To investigate the characteristics of BC in gout patients and their significance with disease characteristics.

**Methods:** BC was assessed in 180 consecutive gout patients and 1,860 control subjects (white-collar employees in Zhangjiang Innopark of Shanghai) by bioelectric impedance analysis. Overfat was defined by body fat percentage (BF%) as  $\geq 25\%$  for men and  $\geq 35\%$  for women. Demographic and clinical data as well as comorbid diseases were collected simultaneously. For the significant differences in the proportion of gender and age between two groups, the age- and gender-matched control subjects were randomly selected with the ratio of 1:1 for further statistics.

**Results:** (1) Among 180 gout patients recruited, the mean age was  $42.5 \pm 15.5$  years, mean serum uric acid (sUA) was  $9.0 \pm 2.4$  mg/dl and 17.2% of patients presented tophi. The mean BMI was  $25.4 \pm 3.5$  kg/m<sup>2</sup> with 44.4% overweight and 25.6% obesity. The mean BF was  $26.2 \pm 6.6\%$  with 50.5% overfat. (2) Compared with control subjects, gout patients were characterized by higher BMI ( $25.4 \pm 3.5$  kg/m<sup>2</sup> vs.  $24.3 \pm 3.3$  kg/m<sup>2</sup>), fat mass ( $19.3 \pm 6.9$  kg vs.  $16.5 \pm 6.2$  kg), trunk fat mass ( $10.2 \pm 5.4$  kg vs.  $8.4 \pm 3.4$  kg), BF ( $26.2 \pm 6.6\%$  vs.  $22.4 \pm 6.2\%$ ), proportion of overfat ( $50.5\%$  vs.  $27.2\%$ ), but lower lean mass ( $53.0 \pm 7.7$  kg vs.  $55.6 \pm 7.7$  kg, all  $p < 0.05$ ). (3) Compared with normal fat patients ( $n=89$ ), gout patients with overfat ( $n=91$ ) presented higher duration of gout, the count of affected joints, flare times in the past year, family history and presence of tophi (all  $p < 0.05$ , table 1). Overfat gout patients also exhibited higher BMI, more obesity, hyper-low density lipoproteinemia, MS and fatty liver (all  $p < 0.05$ ). (4) There were 9 (17.3%) overfat gout patients in 53 normal weight patients who presented more hypercholesterolemia ( $55.6\%$  vs.  $13.3\%$ ), hyper-low density lipoproteinemia ( $55.6\%$  vs.  $17.8\%$ ) and fatty liver ( $77.8\%$  vs.  $35.6\%$ ) and less skeletal muscle mass index (SMMI,  $8.3 \pm 0.5$  kg/m<sup>2</sup> vs.  $9.7 \pm 0.7$  kg/m<sup>2</sup>) than those patients with normal fat and weight (all  $p < 0.05$ ). Meanwhile, there were 44 (34.9%) gout patients with normal fat among 126 overweight and obesity patients who had less MS ( $40.9\%$  vs.  $63.4\%$ ) and more SMMI ( $11.1 \pm 0.9$  kg/m<sup>2</sup> vs.  $10.6 \pm 1.1$  kg/m<sup>2</sup>) than overfat patients (both  $p < 0.05$ ). (5) Overfat was a risk factor for MS [OR 3.4 (1.8, 6.4),  $p < 0.001$ ] after adjusted by age and gender.

**Abstract AB1032 – Table 1.** Comparison of disease characteristics between gout patients in BF subgroups

Clinical characteristic	all gout patients (n=180)	over fat group (n=91)	normal fat group (n=89)	p
Male, n (%)	168 (93.3)	85 (93.4)	83 (93.3)	1.0
Age, years	42.5±15.5	42.8±15.5	42.3±15.6	0.804
Duration of gout, years	3.0 (1.0,8.0)	5.0 (2.0,9.0)	3.0 (1.0,5.0)	0.005
Count of affecting joints	3.0 (2.0, 6.0)	4.0 (2.0, 8.0)	2.0 (1.0, 4.0)	<0.001

### COMORBIDITIES AND METABOLISM INDEXES IN PATIENTS WITH HUA COMPARED WITH NORMAL URIC ACID: A DATA FROM 33319 PATIENTS BETWEEN 2014 AND 2015

L. Xu, H. Zhu, Y. Su. Dept of Rheumatology and Immunology, Peking University People's Hospital, Beijing, China

**Objectives:** To investigate and compare the differences in Comorbidities and metabolism indexes between peoples with high and normal uric acid.

**Methods:** All the outpatients were enrolled in this cross-sectional study from September 2014 to September 2015 in Peking University People's Hospital. The patients were divided into high uric acid (HUA) and normal uric acid according to the international definition of HUA. The distribution characteristics of UA level and correlations between UA level and prevalence rate of comorbidities and metabolism indexes, including glutamic-pyruvic transaminase, glutamic-oxalacetic transaminase, serum total cholesterol (TC), triglyceride (TG), low density lipoprotein cholesterol (LDL-C), high density lipoprotein cholesterol (HDL-C), blood glucose, creatinine (CRE), carbonyldiamide, estimated glomerular filtration rate (eGFR) were analysed.

**Results:** (1) Among 33 319 outpatients, with an average age of 56.4, 44.4% were men with a higher uric acid level than women ( $368 \pm 113.1$  umol/L vs  $300 \pm 95.5$  umol/L,  $p < 0.001$ ). In all patients, 25.6% had HUA and the sex ratio was about 1:1, while 50–59 age were most common in men and women with 60–69 age were the most. (2) Both the levels of uric acid in males and females had a significant relationship with the metabolism indexes above-mentioned. However, the levels of uric acid in females had a positive correlation with age and blood glucose, the levels of uric acid in males were negative correlated with age and blood glucose. And the uric acid levels in females displayed a higher relationship with carbonyldiamide and eGFR. (3) The prevalences of common chronic metabolic disorders, were significantly increased in HUA patients than those with normal uric acid, such as hypertension, hypertensive renal disease, hyperlipidemia, diabetes mellitus (DM), diabetic nephropathy (DN), chronic renal failure. And male patients with HUA had higher prevalence of gout than females (10.76% VS 2.58%,  $p < 0.001$ ). In patients with normal uric acid, the prevalence of DM and DN in males was higher than females. In contrast, the prevalence of DM and DN in males was lower than females in the patients with HUA (25.7% VS 57.1%,  $p < 0.05$ ; 6.52% VS 41.76%,  $p < 0.001$ ).

**Conclusions:** The prevalence of HUA in females was showing an increasing trend and the uric acid level in females had more influence in blood glucose and renal function than males.

**Disclosure of Interest:** None declared

**AB1034 THE URATE-LOWERING EFFECT OF FEBUXOSTAT 80 MG AND 40 MG (80 MG FILM-COATED TABLETS SPLIT IN HALF) IN GOUT PATIENTS IN DAILY CLINICAL PRACTICE**

M. Flendrie<sup>1</sup>, B. van den Bemt<sup>2</sup>, V. Huiskes<sup>2</sup>, M. Hoefnagels<sup>1</sup>, F. van den Hoogen<sup>1</sup>.  
<sup>1</sup>Rheumatology, <sup>2</sup>Pharmacy, Sint Maartenskliniek, Nijmegen, Netherlands

**Background:** In Europe, the urate-lowering drug febuxostat for gout is registered in two strengths, 80 mg and 120 mg, but not 40 mg. Starting 40 mg can sometimes be considered desirable, for instance for safety reasons. Splitting an 80 mg film-coated tablet in half is an option, but is off-label and might violate coating function and influence effectiveness and safety.

**Objectives:** To investigate the urate-lowering effect and safety of starting febuxostat at 40 mg once daily (80 mg film-coated tablet split in half) in gout patients compared to 80 mg once daily.

**Methods:** Single-centre retrospective study on all gout patients starting febuxostat 80 mg or 40 mg (80 mg film-coated tablets split in half). Patients characteristics were collected, as well as starting dose and starting date of febuxostat, follow-up time, adverse events (AEs), stop date and reason, serum urate (sU) and creatinine (sCreat) over time and relevant comorbidity.

Patient characteristics were compared by Chi-square or T-test. Mean sU, percentage change from baseline and percentage of patients reaching targets (sU <0.36 or 0.30 mmol/L) were tested using the appropriate t-test.

**Results:** 36 gout patients started febuxostat between April 1st 2012 and July 1st 2017. Twenty-three started on 80 mg and 13 on 40 mg once daily. Patient characteristics are shown in table 1. Table 2 shows mean sU at baseline and after start, percentage change in sU and percentage of patients reaching targets.

Median follow-up time was 1.6 years (range 0–6.7); 1.4 y (0–6.7) resp. 1.9 (0.4–5.5) for 80 mg resp. 40 mg group. Figure 3 shows mean sU per group in the first year.

5 of 36 (14%) stopped during follow-up, all within 8 weeks after start and all because of AEs: diarrhoea (n=2, 40 mg and 80 mg), coronary syndrome (n=1, 80 mg), erectile dysfunction (n=1, 40 mg) and gout attacks (n=1, 40 mg). Other possible related AEs were dry mouth (n=1, 80 mg), elevated liver enzymes (n=1, 40 mg) and flushing (n=1, 40 mg).

**Abstract AB1034 – Table 1.** Patient characteristics

renal impairment (GFR 30–59 ml/min/1.73 m <sup>2</sup> ), n(%) <sup>§</sup>	16 (44%)	7 (30%)	9 (69%)	<0.05
other relevant comorbidity <sup>#</sup> , n(%)	30 (81%)	19 (83%)	11 (85%)	ns

\*tophi information missing in 2. <sup>§</sup>Lowest GFR was 30 ml/min/1.73 m<sup>2</sup>. <sup>#</sup>DM, obesitas, hypertension, hyperlipidemia, cardiovascular disease

**Abstract AB1034 – Table 2.** Febuxostat effect on sU within 12 weeks

	Total group, n=36	80 mg starting dose, n=23	40 mg starting dose, n=13	p-value
sU at start, mean (SD)	0.55 (0.11)	0.53 (0.10)	0.59 (0.10)	ns
sU within 12 weeks*, mean (SD)	0.35 (0.12)**	0.31 (0.10)**	0.39 (0.10)**	<0.01
% on target<0.36 mmol/L	68%	76%	57%	ns
% on target<0.30 mmol/L	36%	50%	8%	<0.01
% change in sU, mean (SD)	35 (18)	40 (18)	32 (17)	ns

\*available in resp. 33, 21 and 12. \*\*p-value within groups<0.001 compared to baseline

**Abstract AB1034 – Figure 1.** mean serum Urate over time after start of febuxostat

**Conclusions:** Both daily dosages febuxostat of 80 and 40 mg (80 mg film-coated tablets split in half) result in significant decline in sU levels within 12 weeks. A starting dose of 80 mg febuxostat appears more effective in reducing sU levels. Selection bias may be a problem.

**AB1035 ULTRA-LOW DOSE ANTI-INTERLEUKIN1 IN CHRONIC GOUT: A SAFE AND SUCCESSFUL COMBINATION THERAPY WITH LOW DOSE COLCHICINE AND URATE LOWERING AGENTS**

M. Capassoni, F. Galluccio, M. Matucci Cerinic. *AOUC Careggi, Reumatologia, Firenze, Italy*

**Background:** Gout is the most common inflammatory arthritis in humans; is caused by deposition of monosodium urate (MSU) crystals within and around joints. Left untreated, a more chronic course may develop, characterised by persistent inflammation and visible MSU deposits (tophi), bone erosion, irreversible joint damage, and significant disability.<sup>(1)</sup> Management is based on two strategies: treating pain and inflammation with NSAIDs, steroids and colchicine and preventing flares and urate deposition with urate-lowering therapy.<sup>(2)</sup> For many patients, standard treatments are ineffective or contraindicated, mainly due to comorbidities.<sup>(3)</sup> The main mechanism of crystal-induced inflammation is interleukin 1 $\beta$  (IL-1 $\beta$ ),<sup>(4)</sup> which strengthens the relevance of targeting IL-1 $\beta$  in patients with crystal-induced arthritis. Selective blockade of IL-1 $\beta$  has shown to drastically reduce pain, inflammation and risk of flares. Three biologic therapies inhibit IL-1 $\beta$  and have been studied for difficult to treat acute gouty arthritis flares: anakinra, rilonacept and canakinumab.<sup>(5–6)</sup>

**Objectives:** Evaluate the efficacy of low dose anti-IL1 inhibitors administered by sublingual route in gout arthritis with remitting course that cannot be completely controlled with standard therapy regimens

**Methods:** Inclusion criteria was diagnosis of chronic gouty arthritis with remitting course (acute flares in patients with chronic gout and no inter-critical period), high CRP levels and need of chronic assumptions of NSAIDs or steroids, with flare at suspension. 20 patients fulfilled the criteria (exclusion criteria: intolerance to the study drug, poor compliance to therapies or diet, hyperuricemia, end stage renal disease) The study consist of two consecutive parts. An observational part were patients are treated for 6 months with 0.5–1 mg/daily of colchicine and 300 mg/daily of allopurinol. They performed visits at baseline, 3 and 6 months and we collected data about blood tests, VAS score, number of flares, compliance to therapy and adverse events. An experimental part were we added GUNA anti-IL1 (an infinitesimal dilution of anakinra that has a concentration of 10 fg/mL) 20 drops administered SL. Again patients performed visits at baseline (which coincides with the last visit of the observational phase), 3 and 6 months and we collected the same kind of data.

**Results:** At 6 months after introduction of GUNA anti-IL1 all patients, except 1, experienced no flares of disease, levels of CRP became negative and VAS pain scale was significantly reduce (CRP level p<0.0001; VAS p<0.0001). NSAIDs and steroid consumption was significantly reduced. No adverse events happened

**Conclusions:** Ultra-low dose of anti-IL1 agents added to standard therapy is an effective and safe way to achieve disease remission

### FEATURES OF KIDNEY FUNCTION AND URODYNAMICS AT PATIENTS WITH CHRONIC GOUT BASED ON COMPLEX RENAL SCINTIGRAPHY DATA

M. Gromova<sup>1</sup>, O. Kislyak<sup>1</sup>, V. Tsurko<sup>1</sup>, A. Kashkadayeva<sup>2</sup>, S. Averinova<sup>2</sup>, S. Shiryayev<sup>2</sup>. <sup>1</sup>PIROGOV RUSSIAN NATIONAL RESEARCH MEDICAL UNIVERSITY (RNRMU); <sup>2</sup>N.N.Blokhin National Medical Research Center, Moscow, Russian Federation

**Background:** One of the frequent manifestations of gout is the gout nephropathy. For assessment of the urinary system functional reserves and the risk of renal failure routine analyses of urine in combination with a sonography are often not enough. Modern technology of the systemic examination of nephrourological status based on complex renal scintigraphy (SENS-CRS) was developed in the laboratory of radioisotope diagnosis in «N.N. Blokhin National Medical Research Centre» and realised as an automated workplace. SENS-CRS technology is designed for assessment of the urinary system functional reserves and the risk of renal failure at all macrostructural levels, and allows lowest radiation doses (0.6 mSv for one patient).

**Objectives:** To define features of kidney function and urodynamics at patients with chronic gout based on the complex renal scintigraphy (CRS) data.

**Methods:** 59 medical records of patients with gout (2007–2011) were analysed retrospectively. Most of the patients (95%) were men, average age was 54.4±9.5 years. Duration of the disease was 8<sup>4–11</sup> years. All patients had chronic gouty arthritis, 28% of patients had tophuses. The CRS tests was carried out on a two-detector gamma camera with simultaneous 2 projections recording. <sup>99m</sup>Tc-technephore was used, a Russian radiopharmaceutical (RP) from the group of bisphosphonates that has hemodynamics of a glomerulotropic product, concentrating mainly in the nephrons via filtration, with partial (10%–15%) involvement of secretion. Working protocol consisted of a base 21 min (1 min angiophase) study with administration of RP and a delayed 21 min study without administration of RP, but after taking 200–300 ml of water and/or an antispasmodic or diuretic drug to identify persistent urodynamic dysfunction. The interpretation of CRS data is based on a concentrational-hydrodynamic model of urinary excretion and SENS-CRS software. The Statistica 10.0 software was used too.

**Results:** According to CRS tests patients with gout had, on average, the level of blood cleansing from RP reduced slightly with a trend to a moderate level, and buffer retention of RP labelled blood in extrarenal structures increased. The signs of a relative hemostasis were found against the background of fast excretion accelerated by taking hypotensive drugs. Quantitative analysis of CRS data allows to estimate sustainability of relative urine delays in the pyelocaliceal system (PCS): in 70% of patients residual urostatics in the renal parenchyma and groups of calyx remained relatively stable, and the urostatics signs in the renal pelvis were disappearing. This result means that there could be a latent increased residence time of substances such as uric acid as well as nephrotoxic drugs in the kidney parenchyma. This requires control of correct drugs dosage and when prescribing repeated therapy courses.

**Conclusions:** The SENS-CRS technology provides the quantitative assessment of kidney blood cleansing from RP and concentrational function of parenchyma as well as unique quantitative indicators of urodynamic delays in all parts of urinary tract. This kind of functional diagnostics allows to monitor parenchyma and urinary tract condition promptly and with lowest radiation doses, apply therapeutic measures to prevent more severe kidney dysfunction and refer patients to a specialist consultation.

AB1037

### RELATIONSHIP BETWEEN CALCIUM PYROPHOSPHATE DIHYDRATE CRYSTAL AND OPERATED KNEE OSTEOARTHRITIS-GENDER SPECIFIC ANALYSES-

M. Nishikawa, K. Takami, H. Owaki, T. Fuji. *Orthopaedic Surgery, JAPAN COMMUNITY HEALTHCARE ORGANIZATION OSAKA HOSPITAL, Osaka City, Osaka, Japan*

**Background:** Calcium pyrophosphate dihydrate (CPPD) crystal deposition disease is a common arthritic disorder in mainly elderly patients. CPPD crystals are found in multiple joints in association with severe cartilage degeneration in osteoarthritis (OA). The knee is a key target site for both CPPD crystals and OA. CPPD crystals are also one of the common types of crystals causing crystal-induced inflammatory arthritis. There is a need to elucidate factors that can cause progression of knee OA. To address this question, we investigated the relationship between CPPD crystals and operated knee OA.

**Objectives:** We investigated the relationship between CPPD crystal and operated knee OA separated by gender.

**Methods:** Three hundred sixty-six unicompartmental knee arthroplasty (UKA), total knee arthroplasty (TKA) and high tibial osteotomy (HTO) (average age 73.3: male 59: female 307) were performed for over grade III knee OA classified by Kellgren-Lawrence grading scale from 2010 to 2017. At the operation, joint fluids

were collected and elucidated the CPPD crystal using polarising microscope. We evaluated the relationship between CPPD crystals, and age, body mass index (BMI), C-reactive protein (CRP), erythrocyte sedimentation rate (ESR), matrix metalloproteinase-3 (MMP-3) at the operation. We defined the osteophyte formation degree (OFD) as grade 0–3<sup>1</sup>. We also defined the lower extremity alignment as varus (femorotibial angle: FTA ≥180°), neutral (170°≤FTA<180°) and valgus (FTA <170°). The relationship between CPPD crystals, and osteophyte formation and lower extremity were also evaluated.

**Results:** CPPD crystals were detected from 101 Knee OA (27.6%). CPPD(+) rate in female (30.0%: 92/307) was significantly higher than that in male (15.3%: 9/59). There was a significant difference between CPPD(+) and (-) in male about only FTA (186.9°/182.0°). There were significant differences between CPPD(+) and (-) in female about age (76.3/72.4), FTA (182.7°/183.2°), BMI (24.9/26.6). The more severe OFD became, the higher CPPD(+) rate was in female, significantly. CPPD (+) rate in valgus knees (60.9%) was higher than that in varus knees (29.6%) in female significantly.

**Conclusions:** The European League Against Rheumatism (EULAR) reported that female gender was not a risk factor associated with CPPD crystals<sup>2</sup>. In contrast, a recent study using a relatively large sample size of Japanese cadaveric knees showed a significant correlation for CPPD crystals and female gender<sup>3</sup>. Our data also showed a significantly high CPPD(+) rate in females. Because our data were based on Japanese patients only, Japanese ethnicity may influence the gender difference in the CPPD(+) population. In addition, the significantly different items in male and female were different. These results may suggest that the mechanism of CPPD deposition may be different by gender.

### PHARMACOKINETICS, PHARMACODYNAMICS AND SAFETY OF NC-2500, A NOVEL XANTHINE OXIDOREDUCTASE INHIBITOR, IN HEALTHY JAPANESE MALE SUBJECTS

M. Hirano<sup>1</sup>, S. Kobayashi<sup>2</sup>, E. Miyayama<sup>2</sup>, T. Ohta<sup>1</sup>, M. Yamamoto<sup>2</sup>, T. Yamakawa<sup>1</sup>. <sup>1</sup>Discovery Research Laboratories, Nippon Chemiphar Co., Ltd., Misato, Saitama Prefecture; <sup>2</sup>Development Planning Department, Nippon Chemiphar Co., Ltd., Tokyo, Japan

**Background:** Gout flare due to rapid urate reduction after initiating urate-lowering therapy (ULT) is one of the major issues in the therapy, which impairs patients' quality of life and adherence. For the prevention of it, the guidelines in the ACR, the EULAR and Japan recommend initiating ULT with a low starting dose followed by adequate titrations, however it is rare in clinical settings. NC-2500 is a novel orally active xanthine oxidoreductase (XOR) inhibitor in development for the treatment of gout/hyperuricemia. Preclinical studies showed that multiple doses increase the plasma concentration and enhance the urate-lowering effect of NC-2500, suggesting that NC-2500 may decrease the risk of gout flare when initiating the treatment.

**Objectives:** The aim of this study was to evaluate the pharmacokinetics, pharmacodynamics and safety of NC-2500 in healthy Japanese male subjects.

**Methods:** A Phase 1, randomised, single-blind, placebo-controlled, single and multiple ascending dose study was conducted. Each cohort consisted of 8 subjects, with 6 receiving NC-2500 and 2 receiving placebo orally. A total of 5 cohorts were studied in the single-dose study (10 mg to 160 mg, fasted conditions) and 4 cohorts were studied in the multiple-dose study (10 mg to 80 mg, fed conditions). The levels of NC-2500 and urate in plasma/serum and urine were assayed at pre-determined time points. Safety and tolerability were assessed by physical examination, vital signs, electrocardiography, clinical laboratory tests and adverse events (AEs).

**Results:** Following single oral doses of NC-2500, maximum plasma concentration (C<sub>max</sub>) and area under the plasma concentration-time curve (AUC) increased approximately in a dose-proportional manner except that the increase in the C<sub>max</sub> at 160 mg was less than dose proportional. The time to reach the C<sub>max</sub> (T<sub>max</sub>, median) was at 2.0–3.5 hours post dose and food intake delayed the T<sub>max</sub> by 1 hour. In the presence of food, NC-2500 absorption appeared to decrease slightly or not be affected. Plasma NC-2500 concentration increased

with multiple doses and the Cmax and AUC on Day 7 at 80 mg were 1.4–1.5 times higher than those on Day 1. NC-2500 was hardly excreted into the urine. Effects of NC-2500 on serum urate (sUA) levels were approximately dose-dependent. The sUA level in the single 160 mg dose cohort decreased by 1.03 mg/dL. Moreover, in the subjects receiving multiple doses of 80 mg, the sUA level decreased gradually over the 7 days with a decrease from baseline of 1.93 mg/dL. The incidence of AEs was similar between NC-2500 and placebo treatments and all AEs were mild in severity.

Abstract AB1038 – Figure 1

**Conclusions:** From the results, NC-2500 is expected to have potential to resolve the issues of current ULT by its unique urate-lowering property to decrease acute flare, with no or minimal titrations. As for safety, NC-2500 was considered safe and well-tolerated. Furthermore, NC-2500 was hardly excreted through the kidneys, which can be a favourable profile for patients with renal impairment, frequently observed in gout.

### AB1039 DIET MAY PLAY ESSENTIAL ROLE FOR THE SUCCESS OF THE URATE LOWERING THERAPY IN GOUT

N.B. Kalkan<sup>1</sup>, M.E. Tezcan<sup>2</sup>. <sup>1</sup>Family Medicine, <sup>2</sup>Rheumatology, University of Health Sciences, Kartal Dr. Lutfi Kirdar Training and Research Hospital, Istanbul, Turkey

**Background:** Chronic deposition of monosodium urate crystals, in case of hyperuricemia, is the main cause of the gout.<sup>1</sup> Furthermore, lowering uric acid to the targeted levels is the main therapeutic objective in chronic gout treatment. Uric acid lowering treatment (ULT) has three main arms: Practicing lifestyle modifications, pharmacologic ULT and targeting co-morbid illnesses.<sup>2</sup> Thus, patients' medical and therapeutic properties may have a role in successful ULT.

**Objectives:** We evaluated the demographic and therapeutic properties; co-illnesses and disease features of the patients that would relate with the success of ULT. Then, we compared these parameters between the gout patients with successful ULT and inadequate ULT.

**Methods:** 66 gout patients on pharmacologic ULT were enrolled to the study. Non-adherence to pharmacologic ULT was accepted an exclusion criteria. Demographic and therapeutic features; co-illnesses and disease features of the patients were obtained during the study. Then, we compared these parameters between the patients with successful ULT and inadequate ULT.

**Results:** Adherence to diet was found different between groups (OR, 7.00; CL% 95 2.27–21.56). All other features including maximum allopurinol dosage were similar. Only one patient from successful ULT group and none of the patients in inadequate group had an drinking habit.

Abstract AB1039 – Table 1. Demographic properties, therapeutic features and laboratory values of the patients

	Successful ULT n=32	Inadequate ULT n=34	p
Gender (M/F)	29/3	28/6	0.47
Age	60.3±13.1	55.8±11.8	0.14
Body mass index	27.2±9.8	27.8±8.9	0.32
Diabetes mellitus n(%)	7 (21.9)	11 (32.4)	0.24
Hypertension n(%)	19 (59.4)	18 (52.8)	0.39
Chronic cardiac disease* n(%)	9 (28.1)	6 (17.6)	0.23
Hyperlipidemia n(%)	1 (3.1)	2 (5.9)	0.52
Chronic kidney disease n(%)	6 (18.8)	3 (8.8)	0.20
ACE inhibitors/AT II blockers n (%)	18 (56.3)	13 (38.2)	0.14
Beta-blockers n(%)	5 (15.6)	4 (11.8)	0.72
Diuretics n(%)	5 (15.6)	5 (14.7)	0.91
Acetylsalicylic acid n(%)	5 (15.6)	3 (8.8)	0.46

Abstract AB1039 – Table 2. Disease and treatment features of the patients

	Successful ULT n=32	Inadequate ULT n=34	p
Pretreatment SUA (mg/dL)	9.47±1.6	8.8±1.6	0.18
Maximum allopurinol dosage (mg)	290.6±92.8	313.8±134.8	0.75
Adherence to diet n(%)	26 (81.2)	13 (38.2)	<0001
Chronic gout arthritis n(%)	8 (25.0)	11 (32.3)	0.56
Tophus n(%)	5 (15.6)	2 (5.8)	0.25
Erosion n(%)	7 (21.8)	7 (20.5)	1.00

**Conclusions:** We found that diet was the only factor that relate with success of ULT while patients were on pharmacologic ULT. So, clinicians should emphasise the importance of all part of ULT including diet with informing patients about the nature of disease and benefits of ULT during visits.

### AB1040 IS GOUT A CHRONIC INFLAMMATORY DISEASE OF A LOW LEVEL OF ACTIVITY?

M.M. Basaric, N. Damjanov, M. Perovic-Radak. *Institut of rheumatology, Belgrade, Serbia*

**Objectives:** To determine the presence of physical, laboratory and ultrasound (US) signs of inflammation on the affected joints, but also on the joints that in the clinical sense never showed an inflammatory reaction in the intercritical gout period.

**Methods:** This prospective study included 43 patients (pts.) with diagnosis primary gout (20 with and 23 without acute gout attacks). The research included: demography; medical history; laboratory analyses: sedimentation of erythrocytes (ESR), C reactive protein (CRP), and serology; physical: detect tender and swollen joint; and US examination detect synovial fluid and hypertrophy, Power Doppler (PD) signal and "double contour" sign on the wrist, first metatarsal joint (MTP1), tibiotalar (TT) joint and knee.

**Results:** A physical examination showed presence of 78% tender and 43% swollen joints in the group pts. with acute gout attack, but also 23% pts. had painful and 10% swollen joints in the group without acute gout attack (p<0.001). In the group with acute gout attacks the mean ESR was 32.80 mm/L, value CRP was 8.20 mg/L and leukocytes (Le) (9.09 × 10<sup>9</sup>/L), and in the group without acute gout attacks SE was 21.60 mm/L median CRP was 6.40 mg/L and also a higher average Le (8.39 × 10<sup>9</sup>/L). So we found that there was no statistical difference (p>0.5) in the laboratory parameters (ESR, CRP and Le) between the groups. There was also no statistically significant difference in the findings of US signs of "double contour" (p>0.5), synovial fluid and hypertrophy (p>0.05), per group, but the presence of PD signal statistics was more often observed in a group of patients in an acute gout attack (p<0.05), table 1.

**Abstract AB1040 – Table 1.** US signs in groups; Group I- pts.with acute gout attacks; II- pts.without acute gout attacks

Joint	"Double contour",N (%)		Synovial fluid, N (%)		Synovial hypertroph,N(%)		PD signal,N(%)	
	Group		Group		Group		Group	
	I	II	I	II	I	II	I	II

### AB1041 OCCURRENCE OF MAJOR CARDIOVASCULAR EVENTS IN PATIENTS WITH GOUT TREATED WITH FEBUXOSTAT

N. Quilis<sup>1</sup>, M. Andrés<sup>2,3</sup>. <sup>1</sup>Seccion De Reumatologia, Hospital Universitario del Vinalopó, Elche; <sup>2</sup>Dpt Medicina Clínica, Universidad Miguel Hernández; <sup>3</sup>Seccion De Reumatologia, Hospital General Universitario De Alicante-ISABIAL, Alicante, Spain

**Background:** Controversy persists regarding the use of febuxostat (FBX) in patients with gout and the development of cardiovascular (CV) events. In both APEX<sup>1</sup> and FACT<sup>2</sup> trials a higher risk was identified in those on the FBX arm compared to those on allopurinol, but this was later not confirmed in CONFIRMS trial<sup>3</sup> and the extension phases. Recently, the FDA has published a warning on the risk of CV death in relation to FBX, based on preliminary data of a safety study enrolling 6000 participants.<sup>4</sup>

**Objectives:** To assess the occurrence of CV events in patients with gout after been prescribed with FBX in clinical practice.

**Methods:** Retrospective review of patients with crystal-proven gout enrolled in an inception cohort since January 2014. Epidemiological (age, gender), clinical (CV risk factors, CV disease background), and laboratory variables (serum urate – SU –, glomerular filtration rate – GFR) were registered. The primary endpoint was the occurrence of CV events (death, coronary heart disease (CHD), congestive heart failure (CHF), stroke, peripheral artery disease (PAP)) developed during treatment with FBX. A comparison on secondary study variables regarding the development of CV events was performed by Mann-Whitney's U, chi-square and Fisher's exact tests.

**Results:** In the cohort, 43 patients were treated with FBX, but three were excluded (two early stopped FBX because of rash, and one was lost of follow-up), so finally 40 patients were analysed. Their median age was 76 years (p25-p75 70–79), being 24 of them men (60%). CV risk factors were prevalent, especially hypertension (87.5%), and 20 of them (50%) had established CV disease. Median time since first gout attack was 1.5 years (p25–75 0.0–9.5) and 14 patients (35.0%) were tophaceous. After initiating FBX, 7 cases (17.5%, 95% CI 5%–30%) of CV events were identified: three of CHF (7.5%), two of CHD (5.0%) and one stroke (2.5%), with no PAP events. Five CV-related deaths (12.5%) were noted. The occurrence of CV events significantly associated with an older age and background of established CV disease (table 1).

**Abstract AB1041 – Table 1**

	No CV events	CV events	<b>p</b>
<b>AGE*</b>	74 (67–79)	80 (78.2–81.0)	<b>0.049</b>
<b>HT*</b>	28 (84.8%)	7 (100%)	0.565
<b>DM*</b>	14 (42.4%)	3 (42.9%)	1.000
<b>DLP*</b>	21 (63.6%)	4 (57.1%)	1.000
<b>SMOKING*</b>	12 (38.7%)	3 (42.9%)	0.711
<b>PRIOR CV DISEASE*</b>	13 (39.4%)	7 (100%)	<b>0.008</b>
<b>BASELINE GFR*</b>	37.4 (20.7–53.1)	28.0 (22.5–37.3)	0.530
<b>BASELINE SU*</b>	8.9 (7.7–10.7)	10.7 (8.4–14.6)	0.147
<b>GOUT DURATION*</b>	2.5 (0–10)	1 (0–8)	0.147
<b>TOPHI*</b>	12 (38.7%)	2 (40.0%)	1.000

\*median (p25–75);+n(%)

**Conclusions:** In our cohort, about one on six patients treated with FBX suffered from a CV event, some being fatal. The development associated with older age and CV disease background, so it merits a cautious use in this setting, although whether these CV events are directly related to FBX needs further clarification.

### AB1042 PATHOLOGIC MUSCULOSKELETAL ULTRASOUND FINDINGS IN PATIENTS WITH CHRONIC KIDNEY DISEASE ON DIALYSIS- A PILOT CONTROLLED STUDY

R.D. Decianu<sup>1</sup>, M. Bojinca<sup>2</sup>, C.A. Capusa<sup>3</sup>, A. Zugravu<sup>3</sup>, V.C. Bojinca<sup>1</sup>. <sup>1</sup>Internal Medicine and Rheumatology, Sf. Maria Clinical Hospital; <sup>2</sup>Internal Medicine and Rheumatology, Dr I. Cantacuzino Clinical Hospital; <sup>3</sup>Nephrology, Carol Davila Clinical Hospital, Bucharest, Romania

**Background:** There are numerous studies about the musculoskeletal abnormalities associated with dialysis, but most of them target osteoporosis and the bone metabolism. While this is, in fact, of great importance, we consider that the abarticular anomalies should also be taken into account. Because of the pain they cause and the quality of life impairment in patients already affected in this domain, suffering from depression or at its' edge.

**Objectives:** We aimed to detect the dialysis associated soft tissue abnormalities, using musculoskeletal ultrasound(MSUS) scanning of patients diagnosed with late-stage chronic kidney disease(CKD) on dialysis. In order to achieve this, we compared the data obtained from this group, to a control group of pre-dialysis late-stage CKD.

**Methods:** Over the last 8 months, we ran a prospective study including 102 patients. The study group included 52 patients with stage G5D (GFR <15 ml/min/1.73 m<sup>2</sup>, on dialysis – hemodialysis (HD)/peritoneal dialysis (PD)), while the control group included 50 patients with stage G5 (GFR <15 ml/min/1.73 m<sup>2</sup>, pre-dialysis). Each patient had 68 joints scanned with a Samsung HM70A machine, by the same ultrasonographer, in order to avoid the inter-observer variability. Also, each patient completed a visual analogue scale (VAS) for evaluating pain.

Sex study group: M: 30 (57.69%) F: 22 (42.3%)

Sex control group: M: 28 (56%) F: 22 (44%)

Age (years) study group: 62,52<sup>30–82</sup>

Age (years) control group:64,1 (33–84)

HD/PD study group: HD: 46 (88.46%) DP: 6 (11.53%)

Time on dialysis (years) study group: 6,41 (0,5–22)

**Results:** The findings included median nerve entrapment (71.1% – study group, 18% – control group), tendon calcifications (61.5% – study group, 38% – control group), degenerative abnormalities (57.6% – study group, 50% – control group), synovitis (32.6% – study group, 22% – control group) and tenosynovitis (13.4% – study group, 8% – control group). There were no particular abnormalities found only in the study group, but the percentages of the common findings were significantly higher.

The VAS results were split in three groups: low, moderate and high. Among the patients on dialysis, 46.1% declared a low VAS, 36.5% moderate and 17.3% a high VAS, while in the control group the distribution according to VAS was 46% in the low lot, 34% in the moderate and 20% in the high lot.

**Conclusions:** We detected soft tissue abnormalities in an important percentage of patients on dialysis, but the results were disproportionate to the algo-functional symptoms. We found a higher percentage of low VAS then we were expecting. Considering the results, we plan to continue our study, aiming to create a rehabilitation programme adapted to the needs of the dialysed patient.

**AB1043 THE CLINICAL PROFILE OF GOUT SIGNIFICANTLY DIFFERS BETWEEN MALE AND FEMALE**

B. te Kampe<sup>1</sup>, C. van Durme<sup>1</sup>, M. Janssen<sup>2</sup>, A. Boonen<sup>1</sup>, T. Jansen<sup>2</sup>.  
<sup>1</sup>Rheumatology, Maastricht University Medical Center, Maastricht; <sup>2</sup>Rheumatology, VieCuri Medical Center, Venlo, Netherlands

**Background:** Gout, the most common type of inflammatory arthritis, is considered as a predominant male disease. Notwithstanding, there is an increased risk of gout in female after the menopause.

**Objectives:** Our objective was to assess differences in the clinical features between female and male patients.

**Methods:** Data of newly diagnosed gout patients attending the rheumatology out-patient clinics of one secondary and one tertiary i.e. university centre in the south of the Netherlands were used. We compared baseline characteristics of males and females regarding to demographics, BMI, presence of tophi, medication use (diuretics, prophylaxis of gout and uric acid lowering drugs), serum and urine concentration of uric acid and creatinine, and comorbidities. Additional, fractional excretion of uric acid (FEUa), calculated as (urinary uric acid x serum creatinine)/(serum uric acid x urinary creatinine), was compared. FEUa gives the percentage of uric acid renally filtered and thus excreted in the urine (normal range 7%–12%). Independent t-tests and chi square were used to assess differences between females and males statistically.

**Results:** 66 female (16.6%) and 331 male (83.4%) patients with gout (MSU crystals 60.6 vs 68.6%, respectively) were included. At baseline, females compared to males had a significantly higher age (73±12 vs 63±13 years, p<0.001), BMI (30.1±5.2 vs 28.7±4.7 kg/m<sup>2</sup>, p=0.034) and diuretic use (63.6 vs 27.8%, p<0.001). Females had also a significantly higher percentage of comorbidities, including hypertension (77.3 vs 59.5%, p=0.003), diabetes (48.5 vs 22.7%, p<0.001) and chronic kidney disease (eGFR of 46.4±24.2 vs 62.5±22.9, p<0.001). There was no significantly difference in serum and urine uric acid concentration, current urate lowering and prophylactic medication, presence of tophi and nephrolithiasis. Also, the FEUa was similar in females vs males (5.1±3.0 vs 4.4%±1.7%, p=0.201).

**Conclusions:** The clinical profile of gout in females significantly differs compared with males: significantly older, more advanced decrease in renal function and higher prevalence of hypertension in the females. As Dutch guidelines recommend starting with a diuretic for the treatment of hypertension in patients aged 70 +; this may have a role in explaining the higher numbers of females using diuretics. The start of diuretics has previously been associated with hyperuricemia and increases the risk of gout in the female population. Although diuretic use has proven to be a safe and effective first-line treatment for hypertension, our results suggest that diuretic use in combination with a decreased renal function is associated with an increased risk at developing gout in females, and possibly needs reconsideration. Furthermore, despite the fact that the FEUa was similar distributed between genders, females did seem to have a lower urinary uric acid excretion. However, the number of patients with tophi and nephrolithiasis and the serum uric acid level are comparable between the genders. This suggests that the urate burden is similar but that the clinical profile for the development of gout differs due to the uric acid production vs excretion. In depth analysis of our population underlines the differences in female and male gout patients which highlight the need for more research into pathophysiology and management of gout between sexes.

**AB1044 THE EDUCATION OF PATIENTS WITH GOUT IMPROVES THE EFFECTS OF TREATMENT**

S.-J. Yoo, S.W. Kang, S.C. Shim, J. Kim, I.S. Yoo, C.K. Park. *Internal Medicine, CHUNGNAM NATIONAL UNIVERSITY SCHOOL OF MEDICINE, Daejeon, Korea, Republic of Ireland*

**Background:** The recent studies about gout demonstrated the correlation between gout and cardiovascular disease (CVD). The urate lowering therapy (ULT) ameliorates the outcomes of CVD. The poor adherence with ULT in patients with gout is the main obstacle. It is induced mainly due to a lack of adequate information about the efficacy of ULT.

**Objectives:** This study was performed to analyse the effects of the education for patients with gout.

**Methods:** 116 patients with gout were enrolled and categorised by two groups, education and non-education. The face to face education was conducted by the specially educated nurse. And all participants in two groups received an leaflet about general information of gout including lifestyle advice, nutrition and drugs of ULT. The patients in non-education group were also educated by nurse on their

second visit (after two or three month from first visit). The score of patients' satisfaction using the visual analogue scale (from 0 to 100 mm) and questionnaire about satisfaction and questionnaire of patients' knowledge about disease (gout) were assessed. And we analysed patients' serum uric acid level and drug compliance.

**Results:** A total of 116 patients were randomised to education or non-education group equally. Patients' satisfaction in visual analogue scale was significantly higher in education group (education group: 82.7±21.0 mm, vs. non-education group: 72.8±20.7 mm, p<0.001).

Patients' satisfaction questionnaire was significantly higher in education group (education group: 3.89±0.5, vs. non-education group: 3.69±0.4, p=0.017). The level of knowledge about gout was higher in education group (education group: 7.4±2.0, vs. non-education group: 6.2±2.3, p=0.004). The serum uric acid level on second visit is decreased after education (baseline: 5.97±1.93 mg/dL, vs. second visit: 5.32±1.35 mg/dL, p=0.001). Besides drug compliance on second visit is improved after education (baseline: 89.6%±16.4%, vs. second visit: 94.3%±9.9%, p=0.018).

**Conclusions:** The face to face education for gout improved the patients' satisfaction, drug adherence and serum uric acid level. The education is very important part in treatment of gout.

**AB1045 MICROPROTEINURIA AS A MARKER OF SUBCLINICAL GOUTY NEPHROPATHY**

S. Smiyan, M. Franchuk, R. Komorovsky. *Internal medicine №2, I. Horbachevsky Ternopil State Medical University, Ternopil, Ukraine*

**Background:** The prevalence of kidney damage in patients with gout ranges from 30% to 70%. Currently the concept of "gouty nephropathy" (GN) comprises all renal pathologies due to gout. There is no clear opinion whether hyperuricemia is a marker of renal dysfunction or risk factor. It is important to identify the early stages of GN as its course is subclinical for a long period of time. Microproteinuria is the first harbinger of kidney damage. However, predictors of GN have not been established for today.

**Objectives:** To establish predictors of GN.

**Methods:** A total of 103 patients with chronic gouty arthritis were examined in rheumatology department of Ternopil University Hospital. All patients had no history of any kidney disease. ELISA method was used to determine microproteins in urine. Subsequently, patients were divided into 2 groups: I (n=58) – patients with subclinical gouty nephropathy, abnormal microproteins level (56.3%), II (n=45) – control group, patients without kidney damage, normal microproteins level (43.7%). Statistical analysis was performed with STATISTICA software.

**Results:** Patients with subclinical gouty nephropathy had a higher prevalence of arterial hypertension and metabolic syndrome. The prevalence of osteoarthritis, diabetes mellitus and dyslipidemia was the same in both groups. Also, group I patients showed longer duration of the disease, greater radiologic changes, higher levels of hyperuricemia, tophi, work incapacity, greater number of affected joints and more frequent changes in urinalysis than the control group.

**Conclusions:** Formation of GN is asymptomatic, causing delays in early diagnosis, but can be suspended timely. Gouty nephropathy develops in 56.3% of patients with chronic gout arthritis, and manifestes by microproteinuria in the early subclinical stages. Duration of the disease, obesity, presence of tophi, arterial hypertension, hyperuricemia, increased triglycerols and low-density lipoproteins levels were found to be predictors of gouty nephropathy.

**AB1046 ALLOPURINOL USE IN CHRONIC KIDNEY DISEASE- IS THERE A DIFFERENCE IN ACHIEVING TARGET URIC ACID?- A RETROSPECTIVE STUDY**

V.R. Mehta<sup>1</sup>, R. Peredo-Wende<sup>2</sup>, R. Peredo-Wende<sup>2</sup>. <sup>1</sup>*Rheumatology*; <sup>2</sup>*ALBANY MEDICAL CENTER, Albany, USA*

**Background:** Patients with gout are recommended to treat to target uric acid level of 6 mg/dL in absence of tophi, and <5 mg/dL if tophi present. A case-controlled retrospective analysis by Stamp et al of allopurinol hypersensitivity reaction confirmed that the highest risk of severe hypersensitivity reaction is in the first few months of therapy and thus a low starting dose is recommended (as low as 50 mg in stage 4 chronic kidney disease and worse). Due to concerns related to adverse effects from Allopurinol, we hypothesised that allopurinol use would be less aggressive in terms of achieving target uric acid.

**Objectives:** We aim to compare the frequency of achieving target uric acid level in patients with glomerular filtration rate (GFR) of less than 60 and more than 60.

**Methods:** We reviewed charts of patients in a large private practice who were prescribed Allopurinol. Patients who had at least two office visits and had been on Allopurinol at least six months were included in the study. Charts were reviewed of patients for uric acid level, Allopurinol dose, GFR and any major adverse events. Major allopurinol related adverse event was defined as any adverse event leading to hospitalisation or cessation of medication.

**Results:** Mean Allopurinol dose for patients with GFR of more than 60 was 244. There were no major adverse events and 52 out of total 103 patients (50.5%) had achieved goal uric acid.

Mean Allopurinol dose for patients with GFR of less than 60 was 238. There were no major adverse events and 19 out of total 38 patients (50%) had achieved goal uric acid.

**Conclusions:** There was no difference noted in patient with GFR less than 60 or more than 60 in terms of achieving goal uric acid level. No major adverse events were noted in either group.

**Disclosure of Interest:** None declared

## Infection-related rheumatic diseases

**AB1047 CERVICAL POTT'S DISEASE: 5 CASE REPORTS AND REVIEW OF LITERATURE**

A. Romdhane, N. Karmani, J. Kallel, I. Ben Said. *Neurosurgery, National Institute of Neurology, Tunis, Tunisia*

**Background:** Spinal tuberculosis (Pott's disease) is the most common as well as one of the most dangerous forms of skeletal tuberculosis and accounts for 50% of all cases of skeletal tuberculosis. Pott's disease is still common in developing countries. Although the thoracolumbar junction seems to be the most common site of the spinal column involvement, cervical localization is scarce and accounts for 2% to 5% of spinal tuberculosis. Furthermore, the incidence of neurologic complications in spinal tuberculosis varies from 10% to 43%.

**Objectives:** The purpose of this study was to perform an updated review and present our experience with 5 cases of tuberculosis of cervical spine, including clinical characteristics, diagnostic modalities and management of spinal tuberculosis.

**Methods:** A review of 5 cases of cervical Pott's disease collected at the Department of Neurosurgery of National Institute of Neurology of Tunis over a period of 2 years, between 2011 and 2012 and an updated literature review.

**Results:** The average age of our patients was 35 years old with extremes ranging from 16 to 63 years old. There is a slight male predominance. The diagnostic delay is on average 6 months. The clinical manifestations were dominated by cervical pain (4 cases) and progressive spinal cord compression syndrome (3 cases). The biological inflammatory syndrome is found in only one patient. The intra-dermal reaction to tuberculin is positive in 4 patients. X-ray of the cervical spine, CT scan and magnetic resonance imaging were performed in all patients. All patients underwent a surgical resection. The medical treatment was administered to all our patients. The evolution was favourable, clinically and biologically, under anti tubercular treatment.

Tuberculous spondylodiscitis remains a major global public health problem in endemic countries that affects mostly young adults in their most productive years. Thoracolumbar junction seems to be the most common site of the spinal column involvement in spinal tuberculosis (95%) and cervical spine is concerned in only 5% of cases. The delayed diagnosis, between 3 and 20 months, explains the frequency of neurological deficits which are found in proportions of 20% to 40%. For the diagnosis of spinal tuberculosis, magnetic resonance imaging is more sensitive imaging technique than x-ray and more specific than computed tomography. Antituberculous treatment remains the cornerstone of treatment. Surgery may be required in selected cases. With early diagnosis and early treatment, prognosis is generally good.

**Conclusions:** Cervical Pott's disease is a rare localization. The diagnosis is easy in front of the cervical signs. The conservative management of cervical spine immobilisation and antitubercular chemotherapy remains a sufficient attitude to healing. Surgery is reserved in case of neurological aggravation or spinal instability.

**AB1048 EVOLUTION OF INFECTIOUS SACROILIITIS ACCORDING TO THE GERM**

H. Ben Abla<sup>1,2</sup>, S. rekik<sup>2</sup>, S. boussaid<sup>2</sup>, H. ajlani<sup>2</sup>, H. sahil<sup>2</sup>, I. cheour<sup>2</sup>, M. elleuch<sup>2</sup>. <sup>1</sup>*rheumatology department*; <sup>2</sup>*rheumatology departement, la rabta hospital, tunis, Tunisia*

**Background:** infectious sacroiliitis is a rather rare rheumatological emergency that has a misleading semiology because of the deep condition of the joint, the germ responsible plays an important role in this semiology and in its evolution

**Methods:** This is a retrospective study of 42 patients who have been hospitalised in the LA Rabta for Infectious Sacroiliitis from 1999 to 2017. the epidemiological data (age/sex) were recorded as well as the clinical radiological and biological data (symptoms, inflammatory assessment, x-rays, CT scan and/or IRM, biopsy).

**Results:** forty two patients were included in this study. the average age is 36,7 years old, sex distribution is: 19 women 23 men.

banal sprouts are responsible in 48.15% of cases: *Staphylococcus aureus* 28.7% *Escherichia coli* 17.07% and 2.38% streptococcus. the progression was favourable in 87.4% of the cases under appropriate antibiotic therapy for the rest: 2.38% deaths, 2.38% state of septic shock, 7.84% of complication inherent to the treatments. tuberculosis is responsible for 37.2% of infectious sacroiliitis with a favourable evolution in 77.6%, a complication related to treatment is noted in 17.64%, a subcutaneous abscess 2.34%, multifocal bone tuberculosis 2.38%. brucellosis sacroiliitis is diagnosed in 14.65% of cases, the evolution is favourable in 7.51%, in 4.76% a rapid progression towards ankylosis was noted despite appropriate antibiotic therapy, 2.38% a progression towards brucellosis chronic

**Conclusions:** common germs are most responsible during infectious sacroiliitis and seem to have the best prognosis, tuberculosis is responsible for various complication and its treatment is at high risk of iatrogenic which limits the therapeutic choice of the clinician. chronicity is the most feared development during *Brucella sacroiliitis* as antibiotic therapy is no longer effective

**Disclosure of Interest:** None declared

**AB1049 RHEUMATOLOGICAL MANIFESTATIONS DURING CHRONIC HEPATITIS C**

H. Kchir<sup>1</sup>, D. KAFFEL<sup>2</sup>, H. Dabbebi<sup>1</sup>, D. ISSAOUI<sup>1</sup>, H. Sahli<sup>3</sup>, W. Hamdi<sup>2</sup>, M. Elleuch<sup>3</sup>, M.M. Kchir<sup>2</sup>, R. Debbeche<sup>4</sup>, N. Maamouri<sup>1</sup>. <sup>1</sup>*Gastroenterology, La Rabta Hospital, Tunis*; <sup>2</sup>*Rheumatology, Kassab, Manouba*; <sup>3</sup>*Rheumatology, La Rabta Hospital*; <sup>4</sup>*Gastroenterology, Charles Nicolle Hospital, Tunis, Tunisia*

**Background:** Chronic hepatitis C (CHC) is assimilated to a systemic disease because of his multiple extrahepatic manifestations notably rheumatological.

**Objectives:** The aim of this study was to determinate the prevalence and the characteristics of rheumatological manifestations (RM) associated with CHC.

**Methods:** A retrospective study including all patients suffering from CHC followed over a period of 11 years (2002–2012). Were excluded all patients co-infected by hepatitis B virus or by human immunodeficiency virus and those having decompensated cirrhosis. Different RM were collected and analysed according to the epidemiological, clinico-biological, immunological, virological and histological data of the CHC.

**Results:** Two hundred and four patients affected by CHC were included, mainly aged by 52 years [22–66 years]. The sex-ratio was 0,46. MR were noted in 76 patients (37,25%) dominated by inflammatory polyarthralgia of big joints (88,25%). Non erosive arthritis was observed in a woman and was localised to the proximal interphalangeal articulation of the index. Myalgia were noted in 11 cases (14,47%) among them, 2 appeared under antiviral treatment. Sicca Syndrome was observed in 17 cases (22,36%). RM were associated to other extrahepatic manifestations of CHC in 69,7% of cases, notably to mixed cryoglobulinemia (MC) (60%) and to antinuclear antibodies (21,6%). Anti DNA, anti SSA, anti SSB, rheumatoid factor and anti CCP were absent in all cases. A partial to total amelioration of RM was noted in almost patients under antiviral treatment and sometimes associated to symptomatic measures. In univariate analyse, only femal sex and presence of MC were significantly correlated to the presence of MR.

**Conclusions:** During CHC, MR are frequent, dominated by arthralgia, myalgia and sicca syndrome. Authentic arthritis are rare and constitute a diagnostic problem essentially when they inaugurate the disease. MC is the immunological factor the most associated with RM. Treatment of MR still antiviral.

#### AB1050 REACTIVE ARTHRITIS DUE TO PARVOVIRUS B19 MAY BE OVERLOOKED IN ADULT RHEUMATOLOGY

K. Hutton<sup>1</sup>, K.M. Carlsen<sup>2</sup>. <sup>1</sup>Department of Dermatology, Bispebjerg University Hospital, Copenhagen; <sup>2</sup>Copenhagen Centre for Arthritis Research, Rigshospitalet Hillerød, Hillerød, Denmark

**Background:** In 1991 parvovirus B19 analyses, for the 5th disease of childhood, were established in Denmark, revealing the first epidemic. Prior to this, erythema infectiosum, "slapped cheek appearance" and reactive arthritis were only clinical diagnoses. A project in the PhD thesis Human Parvovirus B19 Erythrovirus – Methods established for *Virological and Diagnostic Aspects 2006* APMIS 120;114:1–121, revealed that 35.4% of 3.628 pregnant women were susceptible to parvovirus B19 infection.

**Objectives:** To present manifestations of parvovirus B19 in a susceptible adult population

**Methods:** During the years 2011 2014 and 2017 the following patients were admitted.

**Case 1:** A 61-year-old woman with rash and thrombocytopenic purpura in April 2011. Routine blood tests, RF, anti-CCP, tuberculosis, ANA and anti-ds DNA, serological tests for viral and autoimmune hepatitis were performed. Also ECG and finally, parvovirus B19 IgM and IgG, PCR for Parvovirus B19 was performed, June 2011

**Case 2:** A 52-year-old woman with rash, swollen joints and pericarditis in May 2011

**Case 3:** A 45-year-old woman with swollen joints, March 2011

**Case 4:** A 45-year-old woman with swollen joints and rash, November 2014

**Case 5:** A 68-year-old man admitted to the Department of Dermatology and diagnosed with Sweet's Syndrome, severe anaemia and swollen joints, September 2014

**Case 6:** A 62-year-old woman transferred due to parvovirus B19 positive IgM and IgG antibodies with reactive arthritis and itching skin rash, June 2017

All six patients were tested as mentioned above in Case 1.

**Results:** In all 6 patients, routine tests were normal. HBV, STD, ANA, anti-dsDNA, TB, RF and anti-CCP were negative. Parvovirus DNA by PCR, IgM and IgG antibodies were positive except for the last patient, who did not have PCR but a punch biopsy of her maculo-papular rash performed. Ultrasound revealed oedema and synovitis in the patients.

The 1st patient contracted parvovirus B19 from her 4-year-old grandchild, the 2nd during work in a daycare. They both had self-limiting infections and pericarditis resolved without treatment. The 3rd patient was also infected from daycare and her persistent synovitis, required DMARDs and biologic treatment.

The 4th patient was treated with DMARDs for one year. The 5th patient had severe anaemia for ½ year, almost overlooked due to Sweet's syndrome but his anaemia (due to replication of the parvovirus in erythroblasts) was finally diagnosed. The patient continues treatment for Sweet's Syndrome at the Department of Dermatology.

The 6th patient slowly recovered from her skin rash and reactive arthritis.

**Conclusions:** The 5th disease of childhood was almost overlooked in 6 patients probably due to their ages. Therefore, clinicians must be aware of the need for parvovirus B19 analyses in seronegative RA patients. Parvovirus B19 occurs as epidemics approximately every 3rd year as an occupational risk, jeopardising

patients' female family members who may be pregnant and develop foetal hydrops and anaemia necessitating intrauterine blood transfusion at a Foetal Medical Centre.

#### AB1051 BRUCELLOSIS IN RHEUMATOLOGY: A STUDY OF 27 CASES IN TUNISIA

K. Saadaoui, H. Sahli, S. Rekiq, H. Ajlani, M. Mariem, T. Aissaoui, S. Boussaid, E. Cheour, M. Elleuch, on behalf of CHU LARABTA. *Rheumatology, CHU LA RABTA, Tunis, Tunisia*

**Background:** Brucellosis is an endemic zoonosis in the Mediterranean basin. The osteo articular localization, although rare, remains redoubtable.

**Objectives:** The aim of our work is to study the characteristics of osteoarticular brucellosis in Tunisia.

**Methods:** This is a descriptive retrospective study including 27 cases of osteoarticular brucellosis, collected in a rheumatology department over a period of 12 years (2006–2017)

**Results:** The Sex Ratio Female/male was 1.07 with an average age of 50.9 years.<sup>15–76</sup> Diagnosis delay was 5.9 months [0.3–13]. The diagnosis of spondylo-discitis was retained in 23 patients (85.2%) and sacroiliitis in 4 cases (14.8%). Spinal or sacroiliac pain was found in all patients. Fever was present in 22 patients, sweat in 11 patients, loss of weight or appetite were respectively found in 16 and 12 patients. Eleven patient reported fatigue.

Laboratory examination found high erythrocyte sedimentation rate in 23 patients with an average of 69.4 mm.<sup>10–120</sup> CRP was elevated in 26 patients with an average of 59.6 mg/L [3.3–237], the WBC average was 9451 elements/ml [5550–14 000]. Wright serology was positive in all cases, Rose Bengal was positive in 15 cases, and IFI was positive in 3 cases. *Brucella melitensis* was isolated in blood cultures in 3 cases.

Standard X Rays showed disk involvement in 21 patients, vertebral lesions in 20 cases and sacroiliitis in 4 patients. Sectional imaging (MRI or CT) was performed for all patients confirming standard X rays data and showing abscess in 13 patients and epiduritis in 7 patients.

The most affected spinal segment was the lumbar one (13 cases), cervical localization was found in 5 cases and thoracic in only 1 case. The spondylitis was multifocal in 2 cases.

Spinal disc biopsy was performed in only 4 cases, neither anatomopathologic nor bacteriological examination were conclusive.

The treatment was based on the cycline and rifampicin combination for an average duration of 4.5 months.<sup>3–9</sup>

The evolution was favourable in the majority of the cases with a relapse in only 2 cases.

**Conclusions:** Osteoarticular brucellosis is a focal form of brucellosis, the most frequent location is spinal and whose adequate treatment allows a favourable evolution.

**Disclosure of Interest:** None declared

#### AB1052 COMPARISON OF SEVERAL BIOMARKERS (MMP-2, MMP-9 AND ITS INHIBITOR TIMP-1, CTX-II, CALPROTECTIN AND COMP) IN THE SYNOVIAL FLUID AND SERUM OF PATIENTS WITH AND WITHOUT SEPTIC ARTHRITIS

M. Couderc<sup>1,2</sup>, C. Peyrode<sup>2</sup>, B. Pereira<sup>3</sup>, E. Miot-Noirault<sup>2</sup>, S. Mathieu<sup>1</sup>, M. Soubrier<sup>1</sup>, J.-J. Dubost<sup>1</sup>. <sup>1</sup>Rheumatology, CLERMONT FERRAND UNIVERSITY HOSPITAL; <sup>2</sup>Imost, UMR 1240/INSERM/UCA; <sup>3</sup>biostatistic unit, CLERMONT FERRAND UNIVERSITY HOSPITAL, Clermont-Ferrand, France

**Background:** Diagnosing septic arthritis (SA) is an emergency, and for a diagnosis to be made a microorganism must be found in the synovial fluid or blood culture. Besides direct bacteriological examination, which is positive in only 25% to 50% of cases, no laboratory examination can differentiate SA from other forms of arthritis.

**Objectives:** To assessed the performances of several serum and synovial biomarkers (matrix metalloproteinase [MMP]–2, MMP-9, the metalloproteinase inhibitor [TIMP]–1, cartilage oligomeric matrix protein [COMP], C-terminal telopeptide of type II collagen [CTX-II], and calprotectin [CALP]) for discriminating between septic and non-SA in a population of patients with suspected SA.

**Methods:** Using the ELISA technique, a number of potential biomarkers (MMP-2, MMP-9, TIMP-1, COMP, CTX-II, and CALP) were measured in the synovial fluid and serum of 39 patients with suspected SA (of whom 21 had SA and 18 non-SA). The levels of the various markers were compared on univariate and then multivariate analysis using logistic regression.

**Results:** The two groups were similar in terms of age, gender, history of diabetes and type of joint affected. SA patients had higher whole blood white blood cell counts ( $p=0.03$ ) but similar C-reactive protein levels. Synovial fluid was more frequently turbid in septic cases than in non-septic ones.

Serum TIMP-1 ( $p=0.003$ ), synovial MMP-9 ( $p=0.002$ ), serum ( $p=0.03$ ) and synovial CTX-II ( $p=0.004$ ), and serum ( $p=0.04$ ) and synovial CALP ( $p=0.03$ ) were significantly higher in the septic group than in the non-septic group. The AUCs for diagnosing SA of synovial MMP-9, serum TIMP-1, synovial CTX-II, and serum and synovial CALP were, respectively, 0.84, 0.79, 0.81, 0.7 and 0.72.

A combination of serum TIMP-1 and synovial CTX-II led to 75% sensitivity and 94% specificity for diagnosing SA (AUC 0.89) and correctly classified patients in 86% of cases.

Serum TIMP-1 and synovial CTX-II did not correlate with each other ( $r=0.1$ ) and did not correlate with C-reactive protein ( $r=0.4$  and  $r=0.25$ , respectively) or synovial white blood count ( $r=-0.04$  and  $r=0.27$ , respectively).

**Conclusions:** The combination of two laboratory measurements, serum TIMP-1 and synovial CTX-II, may make it possible to differentiate SA from other forms of arthritis in 86% of cases. These results need to be confirmed in larger samples of patients.

AB1053

#### ADVERSE EFFECTS AND THEIR CONSEQUENCES IN PATIENTS WITH CHRONIC INFLAMMATORY ARTHROPATHIES IN TREATMENT WITH BIOLOGICAL THERAPY

N. Martínez-Lopez De Castro<sup>1,2</sup>, A. Martín-Vila<sup>1</sup>, M. Alvarez-Payero<sup>1</sup>, M. Samartín-Ucha<sup>1</sup>, G. Piñeiro-Corrales<sup>1</sup>, J.M. Pego-Reigosa<sup>2</sup>. <sup>1</sup>Pharmacy; <sup>2</sup>Institute of Biomedica investigation of South Galicia, University Hospital of Vigo, Vigo, Spain

**Background:** The introduction of biological therapies (BT) for the treatment of chronic inflammatory arthropathies (CIA) has improved the prognosis of these diseases and the quality of life of patients. However, the safety of these drugs in the long term continues to be an aspect of interest.

**Objectives:** This study aims to review the safety of BT in patients with CIA and the consequences of these adverse effects for patients and the health system under daily clinical practice conditions.

**Methods:** A descriptive, observational and retrospective study was performed. All patients with CIA: rheumatoid arthritis (RA), ankylosing spondylitis (AS) and psoriatic arthritis (PsA) who started BT (abatacept, adalimumab, certolizumab, etanercept, golimumab, infliximab, tocilizumab and ustekinumab) from January 2009 to January 2017 in the Rheumatology Department of the Sanitary Area of Vigo (Spain) were included. Demographic variables (age, sex), variables related to CIA and their comorbidities: clinical and analytical data (CRP, ESR, haemoglobin, DAS and BASDAI) and years of disease evolution and variables about BT: concomitant treatment (glucocorticoids, methotrexate and leflunomide), persistence, adherence and number of lines were collected. Variables about the adverse effects (AEs) of BT: type and clinical consequence, requirement for additional visits to the Rheumatology clinic, visits to the Emergency Department or need for hospital admission was also collected.

**Results:** Three hundred sixty-two patients and 478 BT lines (250 lines in patients with RA, 119 with AS and 109 with PsA) were analysed (mean  $\pm$ SD of BT lines:  $1.7 \pm 1.1$  per patient). In 301 (63.0%) BT lines, some AEs occurred. In total, 683 AEs were detected (0.57 AEs per patient and year of treatment). The most frequent types of AEs were: bacterial infection (0.39 events per year of BT), viral infections (0.04 events per year of BT), fungal infections (0.04 events per year of BT), reactions related to the administration of BT (0.03 events per year of BT) and cardiovascular alterations (0.02 events per year of BT). Certolizumab and abatacept were the drugs that were more associated with bacterial infections: 0.82 and 0.69 per year of BT, respectively. Infliximab was the BT that was less associated with bacterial infections: 0.24 per year of BT. There were 7 deaths in probable relation with the AEs (4 bacterial infections, 1 cardiovascular event and 2 solid tumours). The AEs caused 71 hospital admissions (668 days of hospital stay), 113 hospital emergency room visits and 42 urgent visits to the Rheumatology Department. Sixty percent of the AE were managed from Primary Care without having to go to the hospital. The AEs caused a definitive interruption of BT in 51 episodes and a switch to a different BT in 52 episodes.

**Conclusions:** In our setting, patients with CIA on BT have an incidence of 0.57 AE per patient and year of BT. Infection (particularly bacterial) is the most frequent AE. Although more than 50% of these AEs are managed from Primary Care, they imply a high consumption of hospital resources.

**Disclosure of Interest:** None declared

AB1054

#### FACTORS ASSOCIATED WITH TUBERCULOSIS IN RHEUMATOID ARTHRITIS

O. Saidane, M. Sellami, I. Mahmoud, A. Ben Tekaya, H. Ajlani, R. Tekaya, L. Abdelmoula. *Rheumatology, Charles Nicolle Hospital, Tunis, Tunisia*

**Background:** Rheumatoid arthritis (RA) is associated with infections that are favoured by the disease itself or by its treatments. Tuberculosis (TB) is a severe infection that can occur in patients with RA, especially with the use of anti TNF.

**Objectives:** We aimed to estimate the incidence of TB in RA patients and identify factors associated with TB during RA.

**Methods:** This is a retrospective study of RA patients according to ACR/<sup>EULAR</sup> criteria<sup>2010</sup> collected in rheumatology department during the period from April 2010 to April 2015. Diagnosis of latent or patent TB was made as part of the pretreatment screening (biotherapy) or if signs of infection occurred.

**Results:** During the study period, 150 RA patients (124 women and 26 men) were enrolled. The mean age was 57.09 years.<sup>25-85</sup> Mean disease duration was 7.52 years.<sup>1-26</sup> Rheumatoid Factor was positive in 79% of cases. Eighty eight per cent of patients received corticosteroids with a mean dose of 10 mg/day.<sup>5-20</sup> All patients were treated with at least one conventional synthetic disease-modifying antirheumatic drug (methotrexate, sulfasalazine and leflunomide in respectively 87%, 37% and 7% cases) and only 36 (24%) patients received biotherapy. A history of patent TB treated appropriately and prior to RA, was found in 5 patients (3%): 3 pulmonary TB and 2 lymph node forms. The pretreatment test showed 11 cases of latent TB (30%). No relapsed TB was reported on RA treatment. Nine cases (25%) of new active TB were noted during biotherapy: 5 pulmonary TB (under infliximab, adalimumab and tocilizumab), 2 lymph nodes TB (under infliximab) and 2 urogenital TB (under infliximab). In our study, factors associated to TB infection were an advanced age, high level of C-reactive protein, a history of diabetes, dose of steroids  $\geq 7.5$  mg/day and dose of Infliximab  $> 3$  mg/kg (table 1).

**Abstract AB1054 – Table 1.** Factors associated to TB in RA patients

Factors	Odds ratio	P
Age	1.7	0.02
Sex: male/female	0.3	0.5
Diabetes	1.6	0.04
Erythrocyte sedimentation rate (mm)	0.6	0.7
C reactive protein(mg/l)	1.5	0.03
RA duration	0.95	0.31
Corticosteroid duration	0.9	0.45
Dose of steroid $\geq 7.5$ mg/day	11	0.01
Dose of methotrexate	0.5	0.64
Dose of Infliximab $> 3$ mg/kg	1.7	0.04
Infliximab	0.95	0.34
Adalimumab	0.9	0.72
Tocilizumab	0.8	0.25

**Conclusions:** Our study showed that RA patients were exposed to a higher risk of TB, especially when using anti TNF therapy with increased incidence of extra pulmonary TB. Understanding associated factors with TB may lead to establish a continuous monitoring in order to improve the quality of care.

**Disclosure of Interest:** None declared

#### BRUCCELLAR SPONDYLODISCITIS: DO MRI SIGNS OF SEVERITY INFLUENCE THE DURATION OF THE TREATMENT

O. Saidane, I. Oueslati, R. Tekaya, A. Ben Tekaya, I. Mahmoud, L. Abdelmoula. *Rheumatology department, Charles Nicolle hospital, Tunis, Tunisia*

**Background:** Brucellar spondylodiscitis is rarely associated with neurological involvement. Magnetic resonance imaging has high sensitivity for detecting the paravertebral and epidural extension

**Objectives:** The purpose of this study was to determine the influence of the MRI severity signs on the treatment duration

**Methods:** A retrospective study of 27 patients with Brucellar spondylodiscitis during a period of 17 years [2000–2016] was performed. Diagnosis was made on clinical presentation, laboratory findings, radiographic evidence and Brucellar seroagglutination tests. Three patients underwent CT scans and a spinal MRI was carried out for 24 patients. All of them received antibiotic treatment based on a combination of Rifampicin and Doxycycline of varying duration

**Results:** Ten women and 17 men were included. The mean age was 54 years. Twenty-six patients suffered from spinal pain (96.3%) and 12 patients had radiculargia (44.4%). The lumbar spine was the most frequently involved region (59.3%), followed by the dorsal spine (18.5%) and the cervical spine (11.1%). The

neurological examination showed no abnormalities. Spinal MRI showed paravertebral abscess in 56.5% of cases. Seventeen patients (73,9%) had epiduritis and 9 patients (39,9%) had spinal cord compression on the MRI. An abnormal signal of the spinal cord was observed in 2 cases (8,7%). All patients received a combination of Rifampicin and Doxycycline. The mean duration of the antimicrobial treatment was 8 months. There was no statistically significant association between the occurrence of abscesses, epiduritis, spinal cord compression, abnormal signal of the spinal cord on the MRI and the duration of treatment ( $p=0.935$ ,  $p=0.929$ ,  $p=0.379$ ,  $p=0.889$  respectively).

**Conclusions:** MRI of the spine frequently revealed signs of severity in brucellar spondylodiscitis patients, although without clinical expression. Despite their severity these signs did not result in a longer period of antibiotic therapy

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.5892

AB1056

#### DIAGNOSIS VALUE OF PERCUTANEOUS SPINAL NEEDLE BIOPSY IN BRUCELLAR SPONDYLODISCITIS

*Q. Saidane, I. Oueslati, I. Mahmoud, A. Ben Tekaya, R. Tekaya, L. Abdelmoula. Rheumatology department, Charles Nicolle hospital, Tunis, Tunisia*

**Background:** spondylodiscitis is a serious condition with a large variety of infectious etiology. Vertebral biopsy is needed to perform the microbiologic diagnosis when no causative organism is identified. CT-guided percutaneous spinal biopsy (CTSB) may reduce the risk of contamination and complications.

**Objectives:** The aim of this study is to determine the contribution of CTSB to the diagnosis of Brucellar spondylodiscitis.

**Methods:** we conducted a retrospective study on 27 patients admitted for Brucellar spondylodiscitis over a 17 years period [2000 to 2016]. The etiological diagnosis was based on Brucella agglutination test which was positive for all patients. Twelve patients had a CTSB with cyto-bacteriological and histological tests.

**Results:** twenty seven patients (17 men and 10 women) with a mean age of 54 years were included. Twenty six patients (96,3%) reported a spinal pain. This pain involved the lumbar spine (59,3%), the dorsal spine (18,5%) and less frequently the cervical spine (11,1%). Eight patients reported lombosciatica (29,6%). An etiological doubt subsisted in 12 cases and a CTSB was performed. Culture results were negative for 11 biopsy samples and one culture was positive to Staphylococcus in a case of a co-infection. The results of the histological examination showed chronic non-specific inflammation in 92,3% of cases. An infectious etiology was suspected histologically in 53,8% of cases and particularly of a pyogenic germ (23,1%). The biopsy was not contributive in one case

**Conclusions:** Our results suggest that CT-guided spinal biopsy is not useful to diagnose Brucellar spondylodiscitis. However, the absence of tubercloid granuloma and caseous necrosis helped ruling out the tubercular origin

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.5933

AB1057

#### BRUCELLAR SPONDYLODISCITIS: THE IMAGING FINDINGS

*Q. Saidane, I. Oueslati, R. Tekaya, A. Ben Tekaya, I. Mahmoud, L. Abdelmoula. Rheumatology department, Charles Nicolle hospital, Tunis, Tunisia*

**Background:** Brucellar spondylodiscitis is an important complication of brucellosis that can cause neurologic involvement and spinal deformities if not appropriately treated. Imaging examination is a major key in diagnosis

**Objectives:** The aim of this study was to report the imaging findings in brucellar spondylodiscitis

**Methods:** We performed a retrospective study including 27 patients with Brucellar spondylodiscitis over a period of 17 years from 2000 to 2016. Diagnosis was made on clinical presentation, laboratory findings, radiographic evidence and Brucellar seroagglutination tests. All patients underwent X-rays of the involved spine levels. Spinal computed tomography (CT) was carried out in 13 cases and spinal MRI in 24 cases

**Results:** seventeen men and 10 women aged from 33 to 75 years were included. Plain radiographs showed a disc space narrowing for 26 patients (96,3%) and an irregularity of the vertebral end plate in 16 cases (59,3%). A paravertebral abscess formation was detected for 3 patients. No obvious abnormalities were found in one case. CT scans of most patients revealed signs of spondylodiscitis (92,3%). This examination showed an erosion of the vertebral end plates (69,2%), intervertebral disc space narrowing (61,5%) and bone destruction (38,5%). The severity signs detected on the CTs were the soft tissue thickening (46,2%), abscesses formations (7,4%), epiduritis (30,8%) and one patient had a spinal cord compression. The 24 MRIs realised exhibited a signal abnormality of the vertebral body (95,7%) and the intervertebral disc (47,8%) in addition to disc space narrowing (73,9%) with erosions of the vertebral end plates (56,0%). The contrast enhanced T1-

weighted images showed marked enhancement of affected vertebrae and disc (78,3%). Thirteen patients had abscesses formations (56,5%), 17 had epiduritis (73,9%) and 9 patients (31,9%) presented a spinal cord compression on MRI. Brucellar spondylodiscitis involved one spinal level in 23 cases whereas multilevel involvement was found in the 4 others

**Conclusions:** plain radiographs and spinal CT scans lack sensitivity in diagnosing brucellar spondylodiscitis and spinal MRI remains the referential imaging modality to recognise early bone infection, allowing complete lesion topography and identifying the complications.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.5913

AB1058

#### IS HEPATITIS B SURFACE ANTIGEN (HB S AG) ENOUGH ALONE AS A SCREENING TEST FOR HBV INFECTION IN RHEUMATIC DISEASE PATIENTS BEFORE STARTING IMMUNOSUPPRESSIVE THERAPIES?

*R.A. Abdel Noor<sup>1</sup>, M. Watany<sup>2</sup>, S. Abd-Elsalam<sup>3</sup>, W. Elkhawany<sup>3</sup>, S. Soliman<sup>4</sup>, R. Badawi<sup>3</sup>. <sup>1</sup>Internal Medicine and Rheumatology; <sup>2</sup>clinical pathology; <sup>3</sup>Tropical Medicine, Faculty of Medicine, Tanta University, Tanta; <sup>4</sup>public health and community medicine, Faculty of Medicine, Menofia university, Menofia, Egypt*

**Background:** Prevalence of hepatitis B virus in patients with rheumatic diseases has been reported differently among studies. The loss of immune control in these patients may result in the reactivation of HBV replication within hepatocytes. Considering the lifelong use of multiple anti-rheumatic drugs, screening for HBV is recommended before starting immunosuppressive or immunomodulatory therapy.

**Objectives:** The aim of this study was to select the best and simplest test for screening of HBV in rheumatic patients in Egypt.

**Methods:** This cross sectional study was carried out on 102 patients with different rheumatic diseases. Screening to all patients by hepatitis B surface antigen (HBsAg), hepatitis C virus (HCV) and human immune deficiency virus antibodies (HIV) were done. HBV core antibodies and real time PCR to detect HBV DNA were done.

**Results:** The mean age of the patients was  $37.18\pm 12.37$ . 3.9% of them were males and 96.1% were females. We found that HBsAg was positive in two patients (2%) and negative in 100 patients (98%). HbCAb was positive in 24 patients (23.5%) and negative in 78 patients. however PCR for hepatitis B DNA was positive in 2 patients (2.0%) only who were positive for both HBsAg and HbC Ab. HBsAg had 100% Sensitivity, 100% Specificity, 100% PPV, 100% NPV and 99.0% accuracy. While antiHbC had 100% Sensitivity, 78% Specificity, 8% PPV, 100% NPV and 78% accuracy in screening of HBV.

**Abstract AB1058 – Table 1.** Serological diagnosis of HBV in rheumatic disease patients

	Negative No%	Positive No%	Total (n=102) No%
Anti-HBc:	78 76.5	24 23.5	102 100.0
HBs Ag	100 98.0	2 2.0	102 100.0
PCR	100 98.0	2 2.0	102 100.0

**Abstract AB1058 – Table 2.** The validity of HBsAg and HbCAb in relation to HBV DNA by PCR

validity of HBs-Ag in relation to PCR in diagnosis of HBV				
Sensitivity	Specificity	PPV	NPV	Accuracy
100.0%	100.0%	100.0%	100.0%	99.0%
validity of AntiHbC Ab in relation to PCR in diagnosis of HBV				
Sensitivity	Specificity	PPV	NPV	Accuracy
100.0%	78.0%	8.0%	100.0%	78.0%

**Abstract AB1058 – Figure 1.** Receiver operating characteristic (ROC) plot for "HBs Ag in relation to PCR in diagnosing HBV" on the left side & "HBc Ab in relation to PCR" on the right side.

**Conclusions:** We can conclude that screening for hepatitis B virus is essential for all patients with rheumatic diseases before starting therapies either steroids, immunosuppressive therapies or biologics. For financial issues especially in developing countries screening by HBsAg may be enough as an initial test especially if non biological therapies are used as it is superior to anti HBc for screening for HBV infection.

#### CONTRIBUTION OF CT-GUIDED DISCOVERTEBRAL BIOPSY DURING INFECTIOUS SPONDYLODISCITIS

S. Lataoui<sup>1</sup>, S. Belghali<sup>1</sup>, H. Zaghouni<sup>2</sup>, S. Sridi<sup>2</sup>, K. Baccouche<sup>1</sup>, S. Majdoub<sup>2</sup>, N. Elamri<sup>1</sup>, F. Bouzayene<sup>2</sup>, H. Zeglaoui<sup>1</sup>, D. Bakir<sup>2</sup>, E. Bouajina<sup>1</sup>. <sup>1</sup>Rheumatology, <sup>2</sup>Radiology, FARHAT HACHED HOSPITAL, Sousse, Tunisia

**Background:** Infectious spondylodiscitis is an infection involving the vertebral endplates and the intervertebral discs. The diagnosis is based on a combination of clinical symptoms, biological and radiological findings. Identifying the causative germ is sometimes difficult and a CT-guided discovertebral biopsy (DVB) might be of help, with varying success rates.

**Objectives:** The aim of this study was to assess the contribution of CT-guided DVB in the diagnosis of infectious spondylodiscitis in a rheumatological environment in Tunisia.

**Methods:** A retrospective study including patients diagnosed with infectious spondylodiscitis in the rheumatology department of Farhat Hached hospital, Sousse, Tunisia, between 1998 and 2017. Only patients who underwent a DVB for etiologic diagnosis of infectious spondylodiscitis were included in this study.

**Results:** Thirty five patients, with 12 (34.3%) women, were included. The mean age was 57.31±19.14 years [15–83 years]. All patients presented with back pain for 83.06±73.32 days [10–330 days], seven (20%) patients had fever and six (17.1%) patients had abnormal neurological signs on examination. The mean WBC, CRP and ESR levels were respectively 8170.83±3476.94 elements/mm<sup>3</sup>, 50.22±59.22 mg/L and 86.85±50.74 mmh1. The affected levels were the lumbar in 23 (65.7%) cases and dorsal spine in 9 (25.7%) cases. Three patients (8.6%) had both dorsal and lumbar spondylodiscitis.

First DVB was contributive in 11 (31.4%) cases. Isolated germs were staphylococcus aureus in 4 (36.4%) cases, tuberculosis in 3 (27.3%) cases, and brucellosis, coagulase negative staphylococcus, enterobacter cloacae, streptococcus oralis in one case each. Only one patient underwent a second DVB attempt, which was contributive, isolating a staphylococcus aureus. The rest of patients were treated based on late bacteriological findings (2 cases of brucellosis, 2 cases associated with Escherichia coli urinary infection and 1 case with pulmonary tuberculosis), or presumption arguments (6 cases treated as pyogenic infection and 12 cases as tuberculosis).

**Conclusions:** DVB remains essential for the positive diagnosis of infectious spondylodiscitis. Nevertheless, its bacteriological insufficient contribution should not delay therapeutic management based on presumption arguments.

#### WHIPPLE DISEASE WITH INITIAL PRESENTATION AS NON-EROSIVE SERONEGATIVE POLYARTHRITIS: A CASE REPORT FROM A SINGLE CENTRE

V. Korendovych<sup>1</sup>, J. Schoenherr<sup>1</sup>, T. Duerdoth<sup>1</sup>, F. Schumann<sup>2</sup>, D. Blendea<sup>1</sup>, D. Spiridon<sup>1</sup>, H. Abdellatif<sup>1</sup>, M. Sarholz<sup>1</sup>. <sup>1</sup>Department of Rheumatology, St. Marien-Hospital Vreden, Academic Educational Hospital of the University Duisburg-Essen, Vreden; <sup>2</sup>Rheumatology, Praxis Center Reken, Reken, Germany

**Background:** Whipple disease (WD) is a rare disease caused by the bacterium *Tropheryma whippelii* (TW), which manifestations may range from joint and GI-tract involvement to severe neurological complications.

**Objectives:** To present a clinical case of WD with non-erosive seronegative polyarthritis, sacroiliitis, abdominal and CNS involvement, and immune reconstitution inflammatory syndrome after antibiotic therapy.

**Methods:** Case report. Prospective follow-up of the patient E. with WD, who was diagnosed HLA-B27-negative nonerosive seronegative rheumatoid arthritis in 2013. The disease was partially responsive to glucocorticoids with temporary effect to different DMARDs (MTX, leflunomid, etanercept, abatacept, tocilizumab either as monotherapy or in combination).

**Results:** A 54 y.o. male patient E. was admitted to the Rheumatological department with complaints of joint swelling, low back pain, weight loss, diarrhoea, headache and low grade fever. Peripheral joint arthritis appeared about 4 years ago with progressive worsening of general condition and development of additional complaints during the past year. From 2013 to 2017 the patient received in-hospital and outpatient treatment because of active seronegative polyarthritis without sufficient effect. On admission: clinical examination and joint ultrasound (US) investigation revealed the signs of polyarthritis. Neurological evaluation showed organic psychiatric disorder with signs of pseudodementia, bradykinesia without focal neurological deficits.

Because of both incomplete responsiveness to DMARD-therapy and suspicion of chronic infection or malignant neoplasm, abdominal US and transthoracic echocardiography, gastroscopy, colonoscopy, immunofixation, bone marrow biopsy, chest X-ray and bone scintigraphy, tests for viral hepatitis (B,C), HIV, Lues and QFT-Tb were performed, however without objective evidence of the cause. PET-CT was performed as well, but showed no signs of malignancy or infection. MRI revealed bifrontal brain atrophy, low-grade bilateral sacroiliitis and degenerative changes of the cervical spine.

For differential diagnosis PCR stool investigation for TW was performed and was positive. Upon the suspicion of WD duodenoscopy with duodenal biopsy were done. Histological examination showed PAS-positive macrophages, typical for WD. Immunohistochemical analysis also supported the diagnosis. PCR investigation of liquor and synovial fluid from ankle joint for TWi were also positive. Antibiotic treatment using a 2 week course of parenteral Ceftriaxon 2 g/day was initiated. On the third day of the treatment the patient developed immune reconstitution inflammatory syndrome with febrile temperature and increased inflammatory markers. The symptoms regressed after additional prednisolon 20 mg/day prescription. Because of organic brain syndrome, administration of Co-trimoxazole was recommended. Under the antibacterial therapy the patient had rapid positive response. PCR stool test in October 2017 didn't detect TW.

**Conclusions:** This presentation emphasises the importance of excluding a rare infection as a cause of atypical inflammatory arthropathy. In patients with seronegative rheumatoid arthritis or axial and peripheral spondyloarthritis, who don't adequately respond to immunosuppression, Whipple disease should be taken into account.

#### MULTIFOCAL SPONDYLODISCITIS IN IMMUNOCOMPETENT PATIENTS

W. Hamdi, S. bouden, H. riahi, K. Maatallah, M.D. Kaffel, M. bouaziz, M. ladeb, M. M. Kchir. *Institut Kassab, tunis, Tunisia*

**Background:** The prevalence of Infectious spondylodiscitis (SPD) has decreased recently with the development of effective means of prevention. Multifocal forms are more common in immunocompromised persons, but may be seen in immunocompetent ones. They are severe, and fortunately remain rare.

**Objectives:** The aim of our study was to report the clinical, biological, radiological and therapeutic features of multifocal SPD in immunocompetent patients.

**Methods:** A retrospective study was performed including patients hospitalised in the department of rheumatology between January 2007 and December 2017. Clinical data, laboratory findings and radiologic features were evaluated.

**Results:** Six patients were included. Their mean age was 53 years.<sup>34-81</sup> No comorbidities were found in all patients. The interval between the beginning of the symptomatology and the diagnosis was 3 to 6 months. Fever was noticed in 4 cases. All the patients had inflammatory spinal pain. Two patients had neurologic deficiency: one spinal compression and one root compression. The localization of the infection was lumbar and thoracic in 3 cases, cervical in 1 case and lumbar in 2 cases. MRI showed epiduritis in 3 cases and paravertebral abscess in 1 case. The infectious agent was identified by blood cultures in 1 case (*Staphylococcus Aureus*), by disco vertebral biopsy in 3 cases (tuberculosis) and by brucella serology in 2 cases. All patients underwent antibiotic therapy and immobilisation with a good outcome, only one patient needed surgery aiming to decompress the spinal cord. Investigation for immunodeficiency was negative in all patients.

**Conclusions:** Multifocal SPD in immunocompetent patients remains rare. Its etiology is dominated by tuberculosis. The most frequent localizations are lumbar and thoracic spine.

**AB1062 RISK FACTORS FOR MORTALITY AFTER TUBERCULOUS ARTHRITIS**

Y.-C. Chen. *Rheumatology, Kaohsiung Chang Gung Memorial Hospital, Kaohsiung, Taiwan, Province of China*

**Background:** Tuberculosis arthritis is an emerging international problem despite advances in the methods of diagnosis and treatment; it is still prevalent in developing countries and on the increase in developed ones.

**Objectives:** Patients with tuberculous (TB) arthritis increase mortality This study investigated to search for the risk factors of mortality in TB arthritis.

**Methods:** We retrospectively reviewed patients with TB arthritis who admit to Kaohsiung Chang Gung Memorial Hospital January 2001 to December 2015. The long-term outcomes of the patients were analysed.

**Results:** A total of 281 patients (124 females and 17 males; mean age: 64.86 ±14.51 years) were enrolled. At the end of the study, 229 patients were alive and 52 had died. The mean follow up period were 8.31±4.52 years. The patients who were old age (p=0.004, HR=1.038, 95% CI 1.012–1.065), liver disease (p=0.036, HR=2.571, 95% CI 1.062–6.224) and underlying cancer (p=0.001, HR=3.640, 95% CI 1.725–7.679) had a significantly higher mortality rate than others.

Abstract AB1062 – Table 1

	Regression coefficient	SE	P value	HR	95.0% CI for HR	
					Lower	Upper
Age	0.037	0.013	0.004	1.038	1.012	1.065
Gender	-0.057	0.320	0.859	0.945	0.505	1.769
BMI	-0.025	0.044	0.573	0.976	0.896	1.063
cancer	1.292	0.381	0.001	3.640	1.725	7.679
Steroid use	-0.173	0.398	0.664	0.841	0.385	1.836

**Conclusions:** When we treat TB arthritis, old age and underlying liver and cancer history should paid more attention to decrease the risk of mortality.

**Fibromyalgia**
**AB1063 SWALLOWING DIFFICULTY IN FIBROMYALGIA: REAL OR MYTH?**

E. Umay, E. Gurcay, O. Karaahmet, A. Hasturk, D. Dulgeroglu Erdogdu. *University of Health Sciences Ankara Yildirim Beyazit Education and Research Hospital, Ankara, Turkey*

**Background:** Fibromyalgia Syndrome (FMS) is a chronic disease that the most common disease in medical practice. This syndrome is including some general symptoms such as chronic pain, fatigue, tenderness and sleep disturbance, that can be seen in many disorders. Other than these, there are symptoms such as dysphagia, which are reported less frequently but have serious consequences such as aspiration. Studies in literature have been reported that this may not be a real swallowing difficulty and may be a symptom of somatization or may be due to adverse events such as drug side effects.

**Objectives:** This study was aimed to reveal the presence of dysphagia with objective diagnostic tests in FMS patients.

**Methods:** This study was conducted on 165 subjects. Patients (n=83) with FMS regardless of whether the complaint is difficulty swallowing as well as had ages between 18–65 were included in the study. Healthy volunteers (n=82) consisting of hospital staff and relatives of patients and sex, age and body mass index-matched with patients were included as control group.

Demographic and disease characteristics were recorded. Fibromyalgia Impact Questionnaire (FIQ) was used to assess severity of disease, functional disability and specific quality of life of patients. Also, the general quality of life of patients was evaluated with Short Form-36 (SF-36). All subject were evaluated with clinical screen test (10-item eating assessment tool=Eat-10) flexible fiberoptic endoscopic evaluation of swallowing (FEES) and electrophysiologic evaluation (EE) as well as ultrasonography (US).

The patients were divided into two groups according to the presence of complaints of difficulty in swallowing, which was taken with eat-10 as group 1 (with dysphagia) and group 2 (with normal swallowing). Patients ve healthy volunteers (group 3) were compared in terms of swallowing evaluation methods.

**Results:** Twenty-one (25.3%) of the 83 patients were defined with dysphagia (group 1) as well as 62 (74.7%) patients with normal swallowing (group 2) according to the eat-10 scale. The groups were similar in terms of demographic characteristics (p>0.05).

The mean disease severity of the all patients was between moderate and severe levels as well as there was a mild impact on quality of life. Disease severity and quality of life by using FIQ and SF-36 were significantly worse in patients with dysphagia (group 1) compared with normal swallowing patients (group 2) (p<0.05).

None of the subjects had dysphagia with endoscopic evaluation. All subjects could drink 20 ml of water which normal dysphagia limit.

Swallowing intervals in patients groups were significantly prolonged compared to healthy volunteers (p<0.05). There was no significant difference between the patient groups in swallowing intervals (p>0.05).

Ultrasonographic measurement results in healthy subjects were higher than patient groups (p<0.05). But ultrasonographic values of patients groups were similar (p>0.05).

**Conclusions:** Swallowing functions and structures are affected in patients with FMS, even though there are no symptoms of swallowing difficulty. Hence, while the main symptoms such as pain, fatigue and sleep disturbance are being questioned, a detailed evaluation including swallowing should be performed.

**AB1064 EXPLORING CEREBROSPINAL FLUID PROTEOME IN FIBROMYALGIA**

E. Ossipova<sup>1</sup>, P. Emami Khoonsari<sup>2</sup>, J. Lengqvist<sup>1</sup>, E. Kosek<sup>3</sup>, D. Kadetoff<sup>3</sup>, P.-J. Jakobsson<sup>1</sup>, K. Kultima<sup>2</sup>, J. Lampa<sup>1</sup>. <sup>1</sup>Medicine, Karolinska Institutet, Stockholm; <sup>2</sup>Medical Sciences, Uppsala University, Uppsala; <sup>3</sup>Clinical Neuroscience, Karolinska Institutet, Stockholm, Sweden

**Background:** Fibromyalgia (FM) is a heterogeneous disease of unknown etiology characterised by chronic widespread pain that affects up to 4% of population. Overlapping and heterogeneous symptoms of various chronic pain conditions complicate their diagnosis, emphasising the need for more specific biomarkers to improve the diagnosis and understand the disease mechanisms. Cerebrospinal fluid (CSF) flows in the ventricles within the brain and diffuses over the brain and spinal cord. Due to direct contact of CSF with CNS, content of CSF reflects biochemical changes in CNS making it an excellent source for biomarker discovery.

**Objectives:** In current study we aim to explore CSF proteome of FM patients utilising quantitative proteomics method based on stable isotope labelling of CSF peptides combined with multivariate data analysis (MVDA) in order to monitor the dynamics of the proteome while comparing to the CSF proteomes in patients with rheumatoid arthritis (RA) and other neurological diseases (OND) and define the potential biomarker candidates in FM. We also investigate, which protein products have been found in human CSF with respect to known "pain" genes,<sup>1</sup> human CSF proteome explored if these proteins represent any clear subgrouping of "pain proteins".

**Methods:** CSF samples from patients with FM, RA and control OND group were collected by lumbar puncture and equal aliquots were subsequently reduced, alkylated and digested by trypsin. Obtained peptides were labelled by stable isotopes and mixed prior sample fractionation. The degree of sample complexity was reduced by off-line peptide separation using HPLC instrumentation. Obtained 80 peptide fractions were combined into 10 fractions across the gradient area. Fractions were analysed by LC-MS/MS, proteins in acquired data were identified and quantified, and data was analysed using MVDA.

**Results:** Out of the 1422 proteins identified, 855 proteins were included in the quantitative data analysis. Comparing FM, RA and OND groups to each other using univariate testing we found 53 statistical significant proteins (q-value <0.05). Six out of these have been reported as "pain proteins" (Complement C4-A, Prostaglandin-H2 d-isomerase, Apolipoprotein D, Granulins, Pro-cathepsin H, and BMP and activin membrane-bound inhibitor homolog).

**Conclusions:** We have employed quantitative proteomics methods combined with extensive bioinformatics data analysis to investigate differences in proteome profiles in CSFs obtained from patients with FM, and identified six differentially expressed pain proteins of various functions in CSF of FM patients. The involvement of these proteins in the disease pathogenesis as well use of the identified proteins as potential biomarkers should be investigated.

**PRELIMINARY FINDINGS OF A 2-MONTHS ACUPUNCTURE INTERVENTION ON SYMPTOMATOLOGY AND QUALITY OF LIFE IN PATIENTS WITH FIBROMYALGIA**

M. Di Carlo, G. Beci, F. Salaffi. *Rheumatological Clinic, Università Politecnica delle Marche, Jesi, Italy*

**Background:** Acupuncture is frequently used in the treatment of different chronic pain conditions. In Fibromyalgia (FM) the evidences available are somewhat conflicting, and the correct positioning of such kind of therapy has not yet precisely defined.

**Objectives:** To assess the response to a single course of acupuncture in patients with FM non-responsive to the usual pharmacological treatment.

**Methods:** Consecutive FM patients with unsatisfactory response or intolerance to the pharmacological treatment (duloxetine and/or pregabalin) were involved in this study. Unsatisfactory response was defined by the presence of a revised Fibromyalgia Impact Questionnaire (FIQ-R) total score  $\geq 40$  and of a Patient Health Questionnaire 15 (PHQ15)  $\geq 5$  after 3 months of stable pharmacological treatment. Acupuncture treatment consisted in 8 weekly sessions. The acupuncture formula, according to the Traditional Chinese Medicine indications, included the following points: LV3 +LI4 (to move Qi), ST36 +CV6+CV12 (to tonify Qi and Blood), GV20 (to raise Qi), and Ex-HN-3 (Yintang) (to calm the Shen), with acupuncture needle 0.25 x 25 mm with guide tube (Huanqiu). For each session needles were retained for 30 min. At baseline (before the first session) and at the end of the treatment course (after the eighth session) were collected the number of tender points (TP) and patient-reported outcomes (PROs). Differences between baseline and end of the acupuncture treatment were evaluated through the Wilcoxon test, results expressed in median values with 95% confidence interval (CI).

**Results:** Thirty-four subjects were enrolled in the study. Thirty-two patients (29 women, 3 men, mean age 49 years, range 18–72 years) completed the acupuncture treatment. In two patients (one woman and one man) the acupuncture therapy was stopped at the second session for poor tolerance to the needles. Eleven patients were in pharmacological therapy with pregabalin, nine with duloxetine, while 12 resulted intolerant both to pregabalin and duloxetine. From baseline, after the 2 months of acupuncture treatment, different parameters showed a significant improvement. Particularly, it has been observed a significant reduction in the TP number (17 [95% CI 16–18] to 10 [95% CI 8–12];  $p < 0.0001$ ), in the somatic symptoms assessed with the PHQ15 (13.5 [10.0–17.0] to 7.0 [6.0–10.0];  $p < 0.0001$ ), but also in the FIQ-R total score (61.5 [39.8–70.3] to [30.2–66.5];  $p = 0.0029$ ), in the Fibromyalgia Activity Score (FAS) (6.7 [4.8–7.7] to 4.6 [CI 3.2–6.1];  $p = 0.0017$ ), and in the Self-Assessment Pain Scale (SAPS) (4.5 [3.8–5.6] to 3.2 [2.9–4.2];  $p = 0.0192$ ). Interestingly, acupuncture revealed a good effect even in the neuropathic-like features of pain, measured by the painDETECT questionnaire (19.0 [15.0–25.0] to 14.5 [10.9–17.0]).

**Conclusions:** A 2 months acupuncture treatment provides an important global improvement in the health status in FM patients refractory/intolerant to the pharmacologic therapy. The strongest ameliorations are represented by the reduction in the TP number and in the somatic symptoms.

AB1066

**DIABETES MELLITUS TYPE 2 RISK ASSESSMENT IN FIBROMYALGIA WOMEN**

O.V. Dzekan<sup>1</sup>, M. Stanislavchuk<sup>2</sup>. <sup>1</sup>Rheumatology, Vinnytsya Regional Clinical Hospital; <sup>2</sup>Internal Medicine, National Pirogov Memorial Medical University, Vinnytsya, Ukraine

**Background:** Fibromyalgia (FM) female are less physically active than sedentary healthy women.<sup>1</sup> Low physical activity (PA) is among the leading causes of the major noncommunicable diseases, including diabetes mellitus type 2 (DM2).<sup>2–3</sup> An increased prevalence rate of FM in DM2 patients was revealed.<sup>4–5</sup> Risk of the development of DM2 in FM is unknown.

**Objectives:** The purpose of this study was to assess the risk of DM2 development in FM women.

**Methods:** The study involved 67 FM women<sup>ACR 1990 and 2010</sup> criteria) aged 42.6  $\pm$  7.8 (M $\pm$ SD) yrs without known diabetes, and 51 healthy controls (HCs) (all women) aged 44.8 $\pm$ 7.3 years. All participants were asked to complete a modified version of the Finnish Diabetes Risk Score (FINDRISC), which evaluates age, body mass index, waist circumference, current antihypertensive medication, frequency of fruit and vegetable consumption, physical activity, personal history of high blood glucose, and family history of DM2.<sup>6</sup> Fasting plasma glucose (FPG), oral glucose tolerance test (OGTT) and/or glycated haemoglobin (HbA1C) values were collected from all subjects to determine their glucometabolic state. Prediabetes was diagnosed by the presence of impaired FPG ( $\geq 100$  mg/dL to  $< 126$  mg/dL), impaired OGTT ( $\geq 140$  mg/dL to  $< 200$  mg/dL) and/or impaired HbA1c ( $\geq 5.7\%$  to  $\leq 6.4\%$ ).<sup>7</sup>

**Results:** According to the FINDRISC questionnaire low risk of DM2 in the next 10 years was found in 14.92% of FM women, intermediate risk—in 22.39%, moderate risk—in 29.85%, high risk—in 23.88%, a very high risk—in 8.96% of patients. In the group of HCs low risk of DM2 was found in 19.61% of women, intermediate risk—in 39.22%, moderate risk—in 21.57%, high risk—in 15.68%, a very high risk—in 3.92% of subjects. Therefore, in most of FM female (53,73%) risk of DM2 was detected as moderate-to-high, while in the majority of HCs (60.79%) it was detected as intermediate-to-moderate. Prediabetes was diagnosed in 11.94% of FM female compared to 5.88% among healthy women.

**Conclusions:** FM women are found to have increased risk of DM2 development compared to healthy women.

**PREVALENCE OF FIBROMYALGIA IN PATIENTS WITH PAINFUL KNEE OA**

O.V. Dzekan<sup>1</sup>, M. Stanislavchuk<sup>2</sup>. <sup>1</sup>Rheumatology, Vinnytsya Regional Clinical Hospital; <sup>2</sup>Rheumatology, National Pirogov Memorial Medical University, Vinnytsya, Ukraine

**Background:** Fibromyalgia (FM) has been conceptualised as a central nervous system (CNS) disorder, characterised by augmented sensory processing and inability to modulate pain effectively.<sup>1</sup> Global mean prevalence of FM is 2.7% with female/male ratio of 4:1. Several studies highlight the importance of central sensitisation (CS) as a significant manifestation of neuropathic pain symptoms in knee osteoarthritis (OA).<sup>2–3</sup> Possible similar mechanisms of chronic pain maintenance in OA – structural pathology, and FM – central sensitivity syndrome, provoke

further interest in investigation of any links between these conditions. Therefore, prevalence of FM in patients with painful knee OA is of considerable interest.

**Objectives:** The purpose of this study was to evaluate the prevalence of fibromyalgia (FM) in patients with painful knee OA.

**Methods:** The study involved 92 patients (63 females and 29 males) with painful knee OA<sup>ACR 1986 Osteoarthritis Knee Criteria</sup> with non-surgical management aged 59.4±14.3 (M±SD) yrs.<sup>4</sup> Radiographic findings for OA were classified according to Kellgren-Lawrence scale grading.<sup>5</sup> FM was diagnosed in these subjects if both <sup>ACR 1990</sup> and <sup>2010</sup> criteria were met.<sup>5-6</sup>

**Results:** FM was diagnosed in 21 painful knee OA patients (22.83%). Among female patients FM was confirmed in 19 from 63 subjects (30.16%) compared to 2 from 29 male patients (6.90%). No relationship was found between the radiologic stage of the knee OA and FM prevalence in the investigated subjects.

**Conclusions:** FM prevalence is relatively high in painful knee OA patients, mostly female. Further studies investigating possible FM impact on pain modulation, functional disability and quality of life in painful knee OA are needed.

#### PAIN, FATIGUE AND FUNCTIONAL IMPAIRMENT IN FIBROMYALGIA PATIENTS MAY BE REDUCED BY ADDING A CYCLE OF HYPERBARIC OXYGEN THERAPY (HBOT) TREATMENT

P. Sarzi-Puttini<sup>1</sup>, R. Casale<sup>2</sup>, A. Batticciotto<sup>1</sup>, R. Talotta<sup>1</sup>, M. Gerardi<sup>1</sup>, I.F. Masala<sup>3</sup>, F. Salaffi<sup>4</sup>, F. Atzeni<sup>5</sup>. <sup>1</sup>Rheumatology Unit, L. Sacco University Hospital, Milan; <sup>2</sup>Pain Rehabilitation Unit, Habilita Care and Research Rehabilitation Hospitals, Zingonia di Ciserano, Bergamo; <sup>3</sup>Orthopedic and Trauma Unit, Santissima Trinità Hospital, Cagliari; <sup>4</sup>Department of Rheumatology, Polytechnic University of the Marche Region, Ancona; <sup>5</sup>Rheumatology Unit, University of Messina, Messina, Italy

**Background:** Fibromyalgia Syndrome (FM) is a persistent and debilitating disorder estimated to impair the quality of life of 2%–4% of the population. FM is an important representative example of central nervous system sensitisation and is associated with abnormal brain activity. The syndrome is still elusive and refractory. Hyperbaric oxygen therapy (HBOT) can rectify abnormal brain function underlying the symptoms of FM patients. Increasing oxygen concentration by HBOT may change the brain metabolism and glial function to rectify the FM-associated brain abnormal activity.<sup>1</sup>

**Objectives:** To evaluate the effect of HBOT on clinical symptoms in FM resistant to the usual pharmacological treatment

**Methods:** Thirty female patients, aged 21–67 years and diagnosed with FM at least 2 years earlier, and resistant to any pharmacological treatment were assigned to be added on with HBOT. The treated group patients were evaluated at baseline and after 10 and 20 HBOT sessions. Evaluations consisted of physical examination, including tender point count, extensive evaluation of quality of life. Study endpoints included assessments of pain (VAS), the FACIT Fatigue Scale which is a short, 13-item, that measures an individual's level of fatigue during their usual daily activities over the past week. A validated Italian version of the Fibromyalgia Impact Questionnaire (FIQ-R) was used to evaluate the level of functional impairment as well as the FAS index which is a short and easy to complete self-administered index combining a set of questions relating to non-articular pain, fatigue and the quality of sleep that provides a single composite measure of

disease activity ranging from 0 to 10. The HBOT protocol comprised 20 sessions, 3 days/week, 90 min, 100% oxygen at 2.5 ATA.

**Results:** The effect of the hyperbaric oxygen treatment on the clinical symptoms are summarised in table 1. HBOT treatments of treated group led to statistically significant improvements in the mean scores of pain and fatigue (FACIT) after 10 and 20 HBOT sessions (mean change of pain after 20 sessions  $-1.76 \pm 2.5$ ,  $p < 0.001$ ) (mean change of fatigue after 20 sessions  $5.93 \pm 2.10$ ,  $p < 0.001$ ) The FIQ-R score significantly improved following HBOT in the treated group (mean change after 20 sessions  $-12.89 \pm 17.04$ ,  $p = 0.001$ ). The FAS score showed a positive trend after 10 sessions and a significant improvement after 20 sessions (mean change  $-2.02 \pm 3.14$ ,  $p = 0.006$ ).

**Abstract AB1068 – Table 1.** Clinical data at baseline and after HBOT treatment

	Baseline	Follow up (10 sessions)	Paired samples t-test	Follow up (20 sessions)	Paired samples t-test
VAS PAIN	8.11±1.81	6.84±2.07	p=0.0062	6.32±2.58	p=0.0023
FACIT	20.42 ±7.06	23.76±6.82	p=0.0836	26.36±8.25	p=0.0069
FIQ-R total	68.04 ±3.90	59.83±4.41	p=0.0090	55.56±5.19	p=0.0019
FAS total score	8.14±0.47	7.07±0.50	p=0.0928	5.99±0.49	p=0.0065

**Conclusions:** These preliminary data show that HBOT may determine a significant clinical improvement in patients affected by FM and resistant to the common pharmacological treatment. However, further studies of large numbers of patients are required in order to confirm this preliminary finding and modify treatment strategies accordingly.

#### CHRONIC WIDESPREAD PAIN, SLEEP PROBLEMS AND PRESSURE PAIN THRESHOLDS IN A POPULATION SAMPLE

S. Bergman<sup>1,2,3</sup>, E. Haglund<sup>3,4</sup>, K. Aili<sup>3,5</sup>, C. Olsson<sup>2</sup>, A. Bremander<sup>1,3,4</sup>. <sup>1</sup>Department of Clinical Sciences, Section of Rheumatology, Lund University, Lund; <sup>2</sup>Primary Health Care Unit, Department of Public Health and Community Medicine, Institute of Medicine, The Sahlgrenska Academy, University of Gothenburg, Gothenburg; <sup>3</sup>RandD centre Spenshult; <sup>4</sup>School of Business, Technology and Science, Halmstad University, Halmstad; <sup>5</sup>Unit of occupational medicine, Institute of Environmental Medicine, Karolinska Institutet, Stockholm, Sweden

**Background:** Chronic musculoskeletal pain is common in the general population and 11% report chronic widespread pain (CWP). A sensitisation of the nociceptive system has been proposed to be one possible mechanism behind CWP, a prerequisite for fibromyalgia (FM). A reduced pressure pain threshold (PPT) has been reported in subjects with FM, but also as an effect of bad sleep.

**Objectives:** The aim was to study pain thresholds in people with CWP in comparison with those having no chronic pain (NCP) or chronic regional pain (CRP), but also in relation to self-reported sleep problems.

**Methods:** From a 21 year follow-up of the Swedish population based Epipain cohort (n 1321), 146 subjects, with and without a report of chronic pain, were invited to a clinical assessment including measurement of PPT. Subjects were classified as having NCP, CRP or CWP, according to the definition of CWP in the <sup>ACR 1990</sup> criteria for FM, based on a pain mannequin presenting 0–18 body regions. Sleep problems (initiating sleep, frequent awakenings, not feeling rested, early awakening) were reported by Uppsala Sleep Inventory (four items scored from 1–5, best to worst). PPTs were measured in kPa at eight different anatomical sites representing upper, lower, left and right side of the body using the AlgoMed Computerised Pressure Algometer FPIX (Medoc Ltd. Advanced Medical Systems, Israel). A mean was calculated from all eight points to create a global pressure pain threshold (PPTg), where a lower PPTg indicated a higher sensitivity to pain. ANCOVA regression analysis was performed to study associations between PPTg and reports of chronic pain and sleep problems, controlled for age and gender.

**Results:** Out of 146 subjects, 89 (61%) were women. Mean age was 64.6 (SD 12.7) years. This sub-population from the Epipain cohort reported a high prevalence of CWP without significant difference between men and women (33.9% vs 44.9%;  $p = 0.411$ ). Women had lower PPTg than men (345.0 kPa vs. 563.9 kPa;  $p < 0.001$ ). Subjects classified as CWP had lower PPTg than those classified as NCP (362.0 kPa vs. 479.9 kPa;  $p = 0.003$ ). A report of CRP did not affect PPTg in

comparison with those reporting NCP (471.8 kPa vs. 479.9 kPa;  $p=0.855$ ). The number of reported pain regions correlated negatively with PPTg in women ( $r=-0.384$ ;  $p<0.001$ ) but not in men ( $r=-0.195$ ;  $p=0.149$ ). Subjects having a score of  $\geq 4$  for the sleep problem "frequent awakenings" had lower PPTg than those with a lower score (332.9 vs. 464.7;  $p<0.001$ ). This was also true, but with less difference, for the sleep problems "not feeling rested" (335.7 vs. 449.1;  $p=0.023$ ), and "early awakening" (353.0 vs. 452.6;  $p=0.020$ ), but not for "initiating sleep" (361.5 vs. 436.8;  $p=0.199$ ). In the ANCOVA analysis both a higher number of painful regions ( $B=-9.2$ ;  $p=0.016$ ) and more problems with frequent awakenings ( $B=-40.1$ ;  $p=0.003$ ) were associated to a lower PPTg, controlled for age and gender.

**Conclusions:** Subjects with CWP according to self-reported pain distribution were more sensitive to pain pressure than those with CRP and NCP, and so were also subjects reporting problems with sleep. In the clinic, self-report of CWP can be used as an indicator of pain sensitivity, but it is also important to assess sleep problems, and especially frequent awakenings and reports of not feeling rested.

### VARIATIONS IN THE LENGTH OF MUSCULOSKELETAL TEMPORARY WORK DISABILITIES IN PATIENTS INCLUDED IN AN EARLY INTERVENTION PROGRAM

A. Lois Iglesias, C. Bejerano, F.J. de Toro Santos. *Hospital Universitario A Coruña, A Coruña, Spain*

**Background:** Musculoskeletal disorders cause in Spain 23% of temporary work disability (TD) and they are the first cause of permanent work disability (PD). A study of early intervention (early assessment and immediate treatment by a rheumatologist) reduced TD days (39%) and evolution to PD (50%)<sup>1</sup>. Using the "Fit for Work" European coalition led by AbbVie, the program is implemented nationwide.

**Objectives:** The aim of this study is to analyse the variation in the number of days of sick leave in the patients included in an early intervention program comparing to usual average.

**Methods:** Observational cross-sectional study of a hospital cohort of outpatients referred during 18 consecutive months. The patients were referred for the first time to the Rheumatology Early Intervention consultation program because of temporary work disabilities due to musculoskeletal disorders. All of them received medical treatment; and underwent joints ultrasound, joint injections and learned exercises when needed. Patients whose disabilities were due to trauma or surgery were not included in the study.

**Results:** We evaluated 270 patients with a mean age of 48.9 years. 64% were women. The most frequently reported diseases were lumbar/sciatic pain (28.5%), shoulder pain (20%), neck pain (8%), knee pain (5.6%) and other arthralgias and tendinopathies (20%).

All patients received medical treatment, 38.5% underwent ultrasound examination and 19.2% received joint injections.

The pathologies with longest lengths of TD after the first visit to the rheumatologist were lumbar/sciatic pain (mean 40.6 days), neck pain (mean 33 days) and shoulder pain (mean 23.8 days). If we compare this data with the existent control group from San Carlos Hospital (Madrid), we can see a decrease of the days in sick leave of 29.5% in lumbar/sciatic pain (from 57.6 to 40.6 days), 11.7% in neck pain (from 37.4 to 33 days) and 36.3% in shoulder pain (from 37.4 to 23.8 days).

**Conclusions:** Early intervention by rheumatologists in patients with temporary work disability due to musculoskeletal disorders reduces the length of sick leaves. A quick diagnosis and assessment by specialists can improve the patient outcomes saving costs to health system.

AB1071

### WHAT FACTORS AFFECT THE EFFECTIVENESS OF NSAIDS FOR ACUTE LOW BACK PAIN?

A. Karateev, E. Pogozheva, A. Lila, V. A. Nasonova *Research Institute of Rheumatology, Moscow, Russian Federation*

**Background:** Nonsteroidal anti-inflammatory drugs (NSAID) are the main instruments for acute LBP (LOW BACK PAIN) treatment. However, up to now, factors that influence the effectiveness of NSAIDs have not been determined fully.

**Objectives:** To assess effects of some clinical and anamnestic factors on NSAIDs effectiveness in acute LBP.

**Methods:** The study group comprised 2078 patients (46.3±13.4 years, women 56.6%) with acute LBP treated in real clinical practice. 34.8% had first episode of LBP, 65.2% had second episode (an average of 2.6±1.4 episodes a year). Numerical rating scale (NRS) of 0–10 points estimated the level of pain. Initially, the pain level was 6.69±1.65, 57.0% of patients had severe pain ( $\geq 7$  NRS). Pain remained at rest in 32.0%, at night in 19.0%, stiffness was noted in 60.7%, radiating leg pain in 28.2%, sciatica at 9.6%. NSAIDs used 70.2% of patients in the history of LBP, 28.0% rated their effectiveness as good, 54.6% as moderate and 17.4% as low. Meloxicam 15 mg once daily was prescribed for a period of up to 2 weeks for all the patients. 86.1% of patients received meloxicam intramuscular injection (i/m) for 2 days, then per os, 13.9% only per os. 52.3% received muscle relaxants, 17.4% – B vitamins, per os or i/m. 21.6% of patients received PPI for the prevention of gastrointestinal complications. The study evaluated the frequency of LBP complete relief with NSAIDs for up to 2 weeks.

**Results:** The complete pain relief was in 75.2% of patients, the average NSAID use duration before pain ceased was 8.6±5.5 days. 83.7% of patients rated the effect of treatment as "good" or "excellent." Adverse reactions were noted only in 4.6% of patients, there were no serious complications. Female sex and the use of B vitamins did not influence the outcome of the treatment: odds ratio (OR, 95% confidential interval) 0.967 (0.795–1.177),  $p=0.763$  and 0.917 (0.804–1.1201),  $p=0.452$ . Age <65 years, the first episode of LBP and a good effect of NSAIDs in a history were associated with the best result of treatment: OR 2.053 (1.592–2.642),  $p=0.000$ ; 1.415 (1.09–1.836),  $p=0.009$ ; 1.937 (1.513–2.481),  $p=0.000$ . Severe pain ( $\geq 7$  NRS), pain at rest and at night, radiating leg pain and especially sciatica were associated with worse results: OR 0.599 (0.487–0.737),  $p=0.000$ ; 0.481 (0.393–0.588),  $p=0.000$ ; 0.559 (0.441–0.709),  $p=0.000$ ; 0.511 (0.413–0.631),  $p=0.000$ ; 0.346 (0.256–0.466),  $p=0.000$ . The combination of NSAIDs and muscle relaxants, in comparison with the monotherapy of NSAIDs, was associated with a lower incidence of pain: OR 0.827 (0.594–0.889),  $p=0.02$ .

**Conclusions:** Meloxicam 15 mg/day dosage is effective and safe for treating acute LBP. The sex of patients does not affect the outcome of treatment. Age <65 years, first episode of LBP and a good "response" to NSAIDs in history are associated with better treatment outcomes. Severe pain, the pain at rest and pain at night, radiating leg pain and sciatica are associated with the worst result. The combination of NSAIDs with muscle relaxants and B vitamins did not improve the outcome of the treatment.

### THE MEDIAN NERVE CROSS-SECTIONAL AREA MAY BE A PARAMETER OF FOLLOW- UP AFTER TREATMENT IN PATIENTS WITH CARPAL TUNNEL SYNDROME?

B. Mansiz-Kaplan<sup>1</sup>, I. Yagci<sup>2</sup>, G. Akyuz<sup>2</sup>. <sup>1</sup>Department of Physical Medicine and Rehabilitation, University of Health Sciences, Ankara Training and Research Hospital, Department of Physical Medicine and Rehabilitation, Ankara, Turkey, Ankara; <sup>2</sup>Department of Physical Medicine and Rehabilitation, Marmara University School of Medicine, Department of Physical Medicine and Rehabilitation, Istanbul, Turkey

**Objectives:** Carpal tunnel syndrome (CTS) is the most common entrapment neuropathy in general population. Diagnosis of CTS depends on clinical symptoms, physical examination and electrophysiological findings. In recent years, diagnostic value of median nerve ultrasonography has increased particularly for the CTS. To aim of this study compare the electrophysiological and ultrasonographic findings at CTS patients who treated with splinting at night during three months.

**Methods:** The patients, who were diagnosed with mild or moderate CTS, received a fabricated night orthotic which held the wrist in a neutral position during three months. All patients were evaluated clinically, electrophysiologically, and ultrasonographically before treatment and at 3 months by blind physicians. Pain was evaluated using Visual Analogue Scale (VAS) Boston Carpal Tunnel Questionnaire was used to evaluate symptom severity and functional capacity. In electrophysiologic evaluation median nerve conduction studies was recorded. Median nerve cross-sectional areas (M-CSA) were measured by ultrasonography at the level of radio-ulnar joint, pisiform bone, and hook of hamate. After treatment, 68

patients were divided into two groups according to whether there was a 50% reduction in VAS.

**Results:** The study was completed with 68 patients and 114 hands. While in group 1, in which VAS reduction was less than 50%, there were 38 hands; in group 2, in which VAS reduction was more than 50%, there were 76 hands. There were no differences improvement of symptom severity, nerve conduction studies parameters, M-CSA at the level of radio-ulnar joint between groups. Improvement of functional capacity and decrease of M-CSA at the level of pisiform bone and hook of hamate were significantly better in group 2 ( $p < 0.05$ ).

**Conclusions:** After conservative treatment, while M-CSA was consistent with clinical findings, this consistency has not been observed with nerve conduction studies. M-CSA may be used to follow-up after receiving conservative treatment in patient with CTS.

#### AB1073 THE EFFECTS OF LYMPHEDEMA SEVERITY ON DYNAMIC SCAPULAR CONTROL

E. Baran, T.I. Yildiz, C. Orhan, E. Üzelpasacı, S. Özgül, I. Düzgün, T. Akbayrak.  
Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences, Ankara, Turkey

**Background:** Women with mastectomy are reported to have altered dynamic scapular control compared to the asymptomatic healthy individuals. However, the effects of breast cancer related lymphedema (LE) on scapular control has not been fully understood yet.<sup>1,2</sup>

**Objectives:** The aim of this study was to determine the impact of LE severity on scapular kinematics in breast cancer patients with moderate LE, severe LE and without LE.

**Methods:** 67 women who have undergone radical or modified radical mastectomy as part of the breast cancer treatment were included in the study. The study was approved by the local ethics committee of the university and all participants provided written informed consent. Individual's demographic and medical characteristics were recorded. By volumetric measurement, women were divided into 3 groups. Between the affected and non-affected extremities; the non-LE group (group 1,  $n=22$ ) had 0 and 200cc difference, the moderate LE group (group 2,  $n=18$ ) had 250–500cc difference, and the severe LE group (group 3,  $n=27$ ) had a difference of 500cc or more. 3-D analysis of the scapula was performed during the bilateral upper extremity elevation in the scapular plane with the 3D Motion Monitor-Electromagnetic System. Scapular kinematics in the scapular plane were recorded at 30°, 60° and 90° (during elevation and lowering phases) of the arm elevation in the affected side. Each measurement was repeated 3 times and the mean of 3 repetitions were recorded. Patient characteristics and scapular kinematics were analysed by Kruskal Wallis test and two-way repeated measures of ANOVA test, respectively.

**Results:** There was no significant difference between groups in terms of age (mean ages; group 1: 45.54±5.88, group 2: 52.05±6.63, group 3: 56.37±8.24 years) ( $p=0.08$ ). Regarding the Body Mass Index (BMI) (group 1: 25.57±2.92, group 2: 25.95±2.35, group 3: 28.93±1.02 kg/m<sup>2</sup>), it was found that group 3 had higher BMI scores than group 1 and 2 ( $p < 0.001$ ). The duration of LE (group 2: 22.38±23.1, group 3: 42.29±31.85 months) was higher in group 3 than the group 2 ( $p=0.004$ ). There were significant interactions for scapular upward rotation between groups ( $F_{4,11, 131,51} = 3.09, p=0.015$ ). It was observed that group 1 had higher scapular upward rotation at 60° and 30° of the lowering phase of the arm elevation trials than group 3 ( $p=0.013, p=0.004$ ). There was no significant interaction in terms of the scapular internal rotation ( $F_{4,37, 139,9} = 0.59, p > 0.05$ ) and posterior tilt ( $F_{5,05, 161,8} = 1.02, p=0.4$ ) among groups during the arm elevation in scapular plane.

**Conclusions:** The results of this study revealed that scapular upward rotation could be reduced by LE severity. LE severity might also be associated with BMI and LE duration. Further studies comparing LE patients with healthy individuals are needed to better understand the effects of LE severity on scapular kinematics.

#### AB1074 IN DEGENERATIVE SPINE DISEASE REGULAR SHORT COURSES OF NSAIDS USE ARE ASSOCIATED WITH GREATER KIDNEY INJURY, COMPARED WITH CONTINUOUS NSAIDS INTAKE AND WITH ABSENCE OF NSAIDS TREATMENT

I.Z. Gaydukova<sup>1</sup>, D. Bichurina<sup>2</sup>, A. Rebrov<sup>3</sup>. <sup>1</sup>Therapy and Rheumatology, North-Western State Medical University n.a.II Mechnikov, St Petersburg; <sup>2</sup>Bolshaya Kazachia, 112; <sup>3</sup>Saratov State Medical University na VI Razumovskyy, Saratov, Russian Federation

**Background:** Nephrotoxicity in short-term or continuous NSAIDs administration is well-known problem of anti-inflammatory treatment. However, data about kidney injury in case of repeated short-term courses of NSAIDs treatment are limited. **Objectives:** of the present study was to evaluate the kidney functions in patients with degenerative spine disease (DSD), taking NSAIDs in repeated short courses, compared with kidney function of patients with constant NSAIDs intake and to the healthy individuals.

**Methods:** The study included 137 patients, taking NSAIDs for DSD. 97 patients used NSAIDs in repeated short-term courses (3–5 courses per year, 7–14 days each course). 40 patients had continuous NSAIDs intake (5 and more days per week during the 1 year before the study). In the control group were involved healthy persons, did not treated with NSAIDs during the last year ( $n=40$ ). Controls were sex- and age-matched with the DSD patients. Glomerular filtration rate (GFR) was calculated using CKD-EPI calculator. Albumin,  $\alpha$ 1-microglobulin and creatinine levels of urea were measured; albumin/creatinine and  $\alpha$ 1-microglobulin/creatinine ratios were calculated.

**Results:** Kidney function in DSD patients with NSAIDs intake and in healthy controls are presented in table 1.

**Abstract AB1074 – Table 1.** Kidney function in patients with short-term and continuous NSAIDs use and in healthy controls

Kidney function parameter	NSAIDs short courses, n=97	NSAIDs continuous intake, n=40	Controls, n=40
GFR, ml/min/1.73 m <sup>2</sup>	77.5 [68.0; 89.0]	86 [68.0; 92.2]	82.5 [70.8; 90]
Albumin/creatinine, mg/g	57.1 [33.8; 82.4]*#	32 [21.0; 44.4]*	25.0 [17.5; 32.9]
$\alpha$ 1-microglobulin/creatinine, mg/g	134.7 [77.5; 197.7]*#	66.0 [41.0; 112.3]*	12.9 [0.5; 18.1]

\* $p < 0.000$  for the difference with controls; # –  $p < 0.000$  for the difference with NSAIDs' continuous intake.

In patients with DSD and short NSAIDs' use a decrease in GFR of less than 90 ml/min/1.73 m<sup>2</sup> was evaluated in 61 (62.9%) of cases, GFR less than 60 ml/min/1.73 m<sup>2</sup> was detected in 11 (11.3%) patients. In patients with DSD and continuous NSAIDs use a decrease in GFR of less than 90 ml/min/1.73 m<sup>2</sup> was evaluated in 34 (85%) of cases, GFR less than 60 ml/min/1.73 m<sup>2</sup> was detected in 2 (12.5%) patients,  $p < 0.01$ , compared with controls and  $p > 0.05$  compared with short-term use. GFR less than 60 ml/min/1.73 m<sup>2</sup> was found in 11 (11.3%) patients with DSD and short NSAIDs intake and in 0 (0%) of healthy volunteers ( $p=0.026$ ). Albumin/creatinine ratio  $\geq 30$  mg/g was found in 74 (76.3%) patients with DSD with short-term NSAIDs use, in 22 (55%) patients with constant NSAIDs intake, and 9 (22.5%) healthy individuals ( $p < 0.01$  for all intergroup differences). An increased level of microglobulin/creatinine ratio was found in 66% patients with DSD (in 82.4% cases of short-term and in 25% of continuous NSAIDs use,  $p < 0.01$ ) and in 3 (7.5%) healthy individuals,  $p < 0.0001$ .

**Conclusions:** Decrease of the GFR less than 60 ml/min/1.73 m<sup>2</sup> and subclinical kidney injury in patients, treated with NSAIDs, was found frequently, than in healthy persons never treated with NSAIDs. The subclinical glomerular and tubular damage in patients with short-term courses of NSAIDs use exceeded glomerular and tubular changes in patients with constant NSAIDs use.

#### AB1075 RELATIONSHIP OF SERUM CHOLECALCIFEROL (VITAMIN D3) LEVEL WITH MUSCULOSKELETAL SYMPTOMS

M.A. Razaque<sup>1</sup>, G. Dewan<sup>2</sup>, R.S. biswas<sup>3</sup>, M.N. karim<sup>2</sup>, I. sultan<sup>4</sup>, on behalf of research only. <sup>1</sup>pharmacology; <sup>2</sup>medicine, Rangamati Medical college; <sup>3</sup>medicine, chittagong ma o shishu medical college; <sup>4</sup>medicine, cmc, chittagong, Bangladesh

**Background:** Patients suffering from generalised aches and pains, not adequately responding to treatment are usually considered as fibromyalgia, depression, chronic fatigue syndrome etc. But those patients need further

evaluation and low vitamin D is often the underlying cause. Both clinical and sub-clinical low level vitamin D is common.<sup>1</sup>

**Objectives:** To assess the relationship between musculoskeletal complaints and serum vitamin D<sub>3</sub>(cholecalciferol) level.

**Methods:** This prospective cross-sectional descriptive study was conducted during July 2017 to December 2017 in Chittagong, Bangladesh. Patients with common musculoskeletal complaints were enrolled. Each patient was screened to exclude common possibilities. Serum cholecalciferol was measured for each patient. Race, occupation, skin complexion, body mass index, sunlight exposure, covering of body with clothing's and use of sunscreen were taken under consideration in final analysis. Visual analogue scale (VAS; 1–10) was used to quantify all complaints. Correlation of serum cholecalciferol level with VAS score of individual complaints was analysed.

**Results:** A total of 110 patients (79 Female and 31 Male) were enrolled after screening 165. All of them were Bangladeshi of multi-ethnic Asian origin. Mean age was 46.5±12.8 years. Their skin complexions were pale white to white skin 45.5%, light brown 30%, moderate brown 11.8% and dark brown 12.7%. Most had (90.9%; n=100) inadequate sunlight exposure and 77.2% (n=61) women used Burkah (full covered dress). Mean vitamin D<sub>3</sub> level was 25.2±7.3 ng/ml. Vitamin D deficiency was (mean 17.3±2.8 ng/ml) observed in 30 (27.3%), insufficiency (mean 25.1±2.7 ng/ml) in 62 (56.4%) and normal level (mean 34.8±4.4 ng/ml) in 18 (16.4%). After classifying Vitamin D level in relation to symptoms it was found that majority of patients (81.2% to 90.3%; depending on complaints) had insufficient or deficient cholecalciferol level (table 1).

**Abstract AB1075 – Table 1.** Serum cholecalciferol status in different musculoskeletal complaints

Complaints Vit D <sub>3</sub>	Normal (≥30 ng/ml)		Insufficiency (20-<30 ng/ml)		Deficiency (<20 ng/ml)	
	n	%	n	%	n	%
	Myalgia (n=104; 94.5%)	16	15.4	60	57.7	28
Muscle cramp (n=104; 94.5%)	18	17.3	60	57.7	26	25.0
Generalised weakness (n=99; 90.0%)	18	18.2	56	56.5	25	25.2
Difficulty in climbing stairs (n=89;80.9%)	14	15.7	50	56.2	25	28.1
Fatigue (n=87; 79.1%)	13	8.1	51	58.6	23	26.4
Difficulty in squatting (n=84; 76.4%)	9	10.7	49	58.3	26	30.9
Pain in weight bearing joints (n=80; 72.7%)	11	3.7	49	61.2	20	25.0
Bone pain (n=73; 66.4%)	8	10.9	43	58.9	22	30.1

Significant negative correlation was found between the serum cholecalciferol level and VAS for difficulty in getting up from squatting position ( $r=-0.253$ ,  $p=0.008$ ) and positive correlation was found for muscle cramps ( $r=0.220$ ,  $p=0.021$ ). Correlations with remaining symptoms were not statistically significant.

**Conclusions:** Vitamin D status directly and indirectly influences musculoskeletal health. Hypovitaminosis D should consider in every patient with muscle cramp.

#### AB1076 COMPLEX REGIONAL PAIN SYNDROME TYPE 1: WHICH TREATMENT?

M. Sghir<sup>1</sup>, S. Salah<sup>2</sup>, A. Haj Salah<sup>1</sup>, W. Kessomtini<sup>1</sup>, Z. Ben Salah<sup>2</sup>. <sup>1</sup> Rehabilitation department, University Hospital Tahar Star, Mahdia; <sup>2</sup> Rehabilitation department, University Hospital Fattouma Bourguiba, Monastir, Tunisia

**Background:** The treatment of Complex Regional Pain Syndrome Type 1 (CRPS-I) is multidisciplinary.<sup>1</sup> It aims to minimise symptoms, pain, preserve functional ability and professional activity. Unfortunately, therapeutic possibilities are still very limited and there is no Gold standard.

**Objectives:** The purpose of our work is to evaluate the efficiency of four therapeutic modalities in the management of CRPS-I.

**Methods:** Retrospective study of 60 patients (21 men and 39 women) treated for CRPS-I. Four groups were identified according to therapeutic modalities used: rehabilitation alone (16 patients), Calcitonin associated with rehabilitation (15 patients), Bisphosphonates (BP) (Sodium Risedronate, 1 tablet per week, over an average duration of 1 month) associated with rehabilitation (20 patients) and Calcitonin in combination with BP and rehabilitation (9 patients).

**Results:** The mean age of the patients was 51±16.5 years. The average time of treatment was 2 months and the average duration of follow-ups was 7 months. Traumatic origin was found in 88.3% of cases. Distal radius fractures (DRF) were the most incriminated (40% of cases). The evolution was judged on pain reduction, vasomotor signs and on functional improvement.

For all etiologies combined, no statistically significant difference was found between the different groups ( $p=0.462$ ).

For patients with a DRF, a favourable outcome was noted in the BP group associated with rehabilitation in 85.7% of cases while it was only 42.9% for rehabilitation alone.

**Conclusions:** Our study concludes that the different therapeutic modalities evaluated for the treatment of CRPS-I had an efficiency close to each other with a superiority of BP. Oral Sodium Risedronate could therefore be proposed as a treatment for CRPS-I without marketing authorisation (MA).

#### AB1077 INVESTIGATION OF FRAILTY, MOBILITY AND DAILY LIFE ACTIVITY IN ELDERLY

U.K. Sahin, A. Demircioglu, N. Kirdi. *Physical Therapy and Rehabilitation, Hacettepe University, ANKARA, Turkey*

**Background:** There are many factors that affect negatively mobility and daily life activity of older people. Frailty is one of these. frailty is a state of decline in physiologic reserve capacity and resiliency due to impairment in multiple physiologic systems, thereby causing vulnerability to death and adverse health outcomes.

**Objectives:** The aim of this study was to analyse gender differences in frailty, mobility and daily life activity score.

**Methods:** The study included 173 women, 124 men total 197 persons aged 65 years and older. The demographic information including age, height and weight, the individuals marital status, educational state, chronic diseases were taken. Elderly Mobility Scale (EMS), Edmonton Frail Scale (EFS) and KATZ were used to evaluate mobility, frailty and daily life activities level, respectively. Individuals were divided into groups according to their gender.

**Results:** There was significant difference between women and men in EMS ( $p=0.001$ ), EFS ( $p<0.001$ ) and KATZ scores (0.048). Frailty score were lower, mobility score and daily life activity score higher than women in men. In both men and women were found positively a relation between mobility and daily life activity ( $p<0.001$ ), were found negatively a relation between frailty and mobility, daily life activity ( $p<0.001$ ).

**Conclusions:** It was seen that female gender affected mobility, frailty and daily life activity. It is important that Strategies for preventing or delaying the predisposing factor of frailty need to address gender differences and determinants among women.

## Paediatric rheumatology

AB1078

**APPLICABILITY OF THE CASPAR CRITERIA OF PSORIASIC ARTHRITIS IN A COHORT OF CHILDREN PATIENTS FOLLOWING IN A PAEDIATRIC RHEUMATOLOGY UNIT OF A TERTIARY HOSPITAL**

A. Alía Jiménez, A. Lucica Boteanu, B.A. Blanco Cáceres, M. Blázquez Cañamero. *Rheumatology, Hospital Ramón y Cajal, Madrid, Madrid, Spain*

**Background:** The ILAR consensus establishes classification criteria, dividing the JIA into 7 subcategories, with juvenile psoriatic arthritis (APsJ) being one of them. In the adult population, the CASPAR classification criteria are usually used to classify a patient with psoriatic arthritis. However, the two classifications have some differences that sometimes produce confusion

**Objectives:** To assess the applicability of the CASPAR classification criteria in a series of patients previously diagnosed in paediatric age of JPAs or undifferentiated arthritis by exclusion criteria to be male >6 years old and HLA B27 positive, comparing these with the ILAR classification criteria, through the study of clinical features

**Methods:** Retrospective cross-sectional observational study. Clinical, epidemiological, sociodemographic and analytical variables were collected from 30 patients previously diagnosed with JPAs (<16 years) or undifferentiated arthritis by exclusion criteria age >6 years in HLA B27-carrying male. It was assessed whether the patients met the ILAR classification criteria as well as the CASPAR classification criteria, which, unlike the previous ones, did not exclude HLA B27 positive patients, considered the family history of the 2nd degree and added a test radiographic

**Results:** The mean age at diagnosis was 11.23±4.6 years; 15 of them being women and 15 men. 15 (15/30) patients presented cutaneous psoriasis at some point during the follow-up, in 5/15 patients psoriasis began before arthritis while 7/15 patients were previously diagnosed with arthritis than cutaneous psoriasis; in 3/15 patients the diagnosis was simultaneous during the medical visit. 9 (9/30) patients presented a family history of 1st degree cutaneous psoriasis and 7/30 of them had a family history of 2nd grade psoriasis. Of the total number of patients, 10 of them would not meet the ILAR classification criteria, 8 because they presented as exclusion criteria being male, HLA-B27 positive and >6 years of age, among which, 7/8 would fulfil CASPAR criteria, and 2 other patients who were not classified according to ILAR criteria, did meet the CASPAR classification criteria, given the presence in these criteria of negative RF, family history of the 2nd degree and typical radiological alterations, which are not present in the ILAR criteria. 1 (1/30) patient did not meet CASPAR criteria, and belonged to the group of patients excluded from the ILAR criteria for being male >6 years HLA-B27 +.

If we did not take into account the negative FR of the CASPAR criteria, 14 patients would not meet these criteria and if we eliminated the 2nd grade AF, 5 patients would not be classified (among them 2 who meet CASPAR and do not ILAR)

**Conclusions:** In our series of patients despite the fact that the presence of current skin psoriasis contributes 2 points in the CASPAR criteria, only 1 patient would not meet the CASPAR criteria, since the majority of patients present other clinical or analytical manifestations, such as the presence of negative rheumatoid factor or 2nd degree family history. Patients who do not meet criteria for PsA by exclusion criteria, practically all of them would be diagnosed with psoriatic arthritis by CASPAR criteria.

AB1079

**TRANSITION CARE OF PATIENTS WITH CHILDHOOD ONSET CHRONIC RHEUMATIC DISEASE IN A TERTIARY MEDICAL CENTRE IN TURKEY**

A. Adrovic<sup>1</sup>, E. Pehlivan<sup>1</sup>, O. Kul<sup>1</sup>, S. Sahin<sup>1</sup>, K. Barut<sup>1</sup>, S. Ugurlu<sup>2</sup>, H. Ozdogan<sup>2</sup>, O. Kasapcopur<sup>1</sup>. <sup>1</sup>*Pediatric Rheumatology*, <sup>2</sup>*Rheumatology, Istanbul University, Cerrahpasa Medical School, Istanbul, Turkey*

**Background:** Transitional care is a purposeful, planned movement of adolescence and young adults with chronic condition from childhood- to adult-oriented health care systems. Well-organised, systematic transitional health care is of high importance for providing the continuous medical treatment and for reaching optimal outcomes. Up to date, there is no unique, consensus-based model for patients' transition from childhood- to adult oriented health care centres in Turkey.

**Objectives:** We aimed to assess the transitional care among patients with juvenile onset rheumatologic disease in referral tertiary centre in Turkey.

**Methods:** The transitional polyclinic is held once per month at the department for paediatric rheumatology, consisting of 2 adult and 4 paediatric rheumatologist. A total of 147 patients have undergone the transitional care in the time period from May 2014 to December 2017. Patients were called by telephone, by two different investigators (EP, OK). Thirty-three (22%) patients were not reached and 17 (11%) of them were excluded from the study due to short post-transitional period

(<6 months). Consequently, 97 (66%) patients have been reached and included in the study. Data on demographic, clinical and socio-economic features and experience with transitional practice were collected by using a structured questionnaire, which was fulfilled during the phone conversation between investigator and patient.

**Results:** A total of 147 patients (79 (54%) females) underwent transition process and 97 of them were included in the study. There was no statistically significant difference between different patients groups regarding the age of transition. The education levels of patients were as following: university 60 (61.9%), high-school 21 (21.6%), middle-school 13 (13.4%), primary school 3 (3.1%). Majority of patients was single at the time of study (79 (81.4%) patients) while only 18 (18.6%) patients were married; half of them being child owner. At the time of study, 44 (30%) patients were employed and mean age at employment was 19.06±3.1 years. Most of patients had health insurance at the time of study (94 (96.9%)). Seventy-one (73.2%) patients continued their regular follow up at adult department while 26 (25.8%) patients discontinued medical treatment. The most common reasons for cessation of follow up were the work/school absence (20 (76.9%)), followed by patients' personal reasons (2 (7.6%)) and dissatisfaction with adult clinic services (4 (15.5%)). Most of patients reported satisfaction with transition process: 96 (99%).

**Abstract AB1079 – Table 1**

	n=97
Female, n (%)	58 (59.7%)
Age at transition, mean±SD	21.4±1.4 years
Age at study mean±SD	22.8±1.8 years
JIA	26 (26.8%)
FMF	60 (61.8%)
Connective Tissue Disease	7 (7%)
Vasculitis	4 (4%)

**Conclusions:** This is the first Turkish model of transitional care among patients with chronic rheumatic disease. Well-organised transitional health care is of crucial importance for the continuous and optimal health care of adolescents and young adults with chronic rheumatic disease. Further studies with higher number of patients would reveal the relevance of described transitional care model.

**NEUROLOGICAL EVALUATION OF CHILDHOOD-ONSET CRYOPYRIN-ASSOCIATED PERIODIC SYNDROMES-A PRELIMINARY REPORT**

H. Kilic<sup>1</sup>, S. Sahin<sup>1</sup>, C. Duman<sup>1</sup>, A. Adrovic<sup>2</sup>, K. Barut<sup>2</sup>, O. Kasapcopur<sup>2</sup>, S. Saltik<sup>1</sup>. <sup>1</sup>*Pediatric Neurology*, <sup>2</sup>*Pediatric Rheumatology, Istanbul University, Cerrahpasa Medical School, Istanbul, Turkey*

**Background:** The cryopyrin-associated periodic syndrome (CAPS) is a treatable autoinflammatory disease that encompasses familial cold autoinflammatory syndrome (FCAS), Muckle-Wells syndrome (MWS), and chronic infantile, neurologic, cutaneous, and articular syndrome (CINCA), which are quite different in severity. Early diagnosis of CAPS and prompt initiation of IL-1 blockers have significant effect on the neurologic prognosis of CAPS. Although neurologic complications of CINCA are well-known, there are scarce data regarding neurologic features of milder phenotypes.

**Objectives:** We aimed to review the neurologic features in detail and summarise the other CAPS-related manifestations in 9 children.

**Methods:** All children with CAPS that have been followed-up from paediatric rheumatology outpatient clinic, were enrolled to the study. In addition to the neurologic examination, magnetic resonance imaging (MRI) of brain, electroencephalography, eye examination, hearing test and neuropsychiatric tests were done. Demographic, clinical features, genetic analysis and laboratory tests were noted from patient records and hospital database.

**Results:** The median age of the subjects was 6 years (range 2–14 years), with a female-to-male ratio 4/5. Most frequently noted neurologic clinical manifestations during the disease course were papilledema (3/9) and epilepsy (3/9), followed by neurodevelopmental delay (2/9), aseptic meningitis (2/9), upper motor neuron

**Abstract AB1080 – Table 1.** Demographic, clinical, electroencephalography and neuroimaging features of CAPS patients

	Patient 1	Patient 2	Patient 3	Patient 4	Patient 5	Patient 6	Patient 7	Patient 8	Patient 9
Age (years)	10	2	6	4	3	13	6	12	14
NLRP3 gene analysis result	Q703K	Negative	G569R	Q705K	Negative	T433I	Negative	T436A	A242A
Sensorineural hearing loss	No	No	Yes (Bilateral)	No	No	No	No	No	No
Uveitis or conjunctivitis	No	No	No	No	No	No	No	Yes	Yes
Papilledema	Yes	No	No	No	Yes	No	No	No	Yes
Optic atrophy	No	No	No	No	Yes	No	No	No	No
Headache	Yes	No	No	No	No	Yes	No	No	Yes
Seizure	Yes	No	Yes	No	Yes	No	No	No	Yes
Mental retardation	No	No	Yes	No	Yes	No	No	No	No
Aseptic meningitis	No	No	Yes	No	Yes	No	No	No	No
EEG	Normal	Normal	Focal epileptiform activity	Normal	Generalised fast rhythm and sharp-wave activity	Normal	Normal	Normal	Neuronal hyperexcitability in left temporal lobe
Cranial MRI	normal	normal	Diffuse parenchymal atrophy, hydrocephalus	normal	Global cortical atrophy, sequela lesions	normal	normal	normal	Normal

findings (2/9), ocular symptoms/signs (2/9), sensorineural hearing loss (1/9), optic atrophy (1/9) (table 1). MRI of the brain was abnormal in two patients.

**Conclusions:** Increased understanding and awareness of this rare but treatable syndrome among neurologists is essential, since the disease could manifest with neurologic manifestations such as seizure, papilledema, sensorineural deafness and aseptic meningitis. If remains untreated and recognised, this autoinflammatory syndrome could lead to significant morbidity and mortality. Hence, early treatment with anti-interleukin-1 therapy provides complete resolution of symptoms and, also prevent progression of neurologic findings when initiated in the late stage of the disease.

#### AB1081 FIRST TRANSITION CLINIC OF ADOLESCENTS WITH RHEUMATIC DISEASES IN MÉXICO, A PILOT STUDY

N.E. Rubio-Pérez<sup>1</sup>, A.C. Arana-Guajardo<sup>2</sup>, F. García-Rodríguez<sup>1</sup>, A.V. Villarreal-Treviño<sup>1</sup>, M.D. Torres-Made<sup>3</sup>, J.A. López-Rangel<sup>4</sup>, O. Salas-Fraire<sup>5</sup>, P. Ancer-Rodríguez<sup>6</sup>, M.E. Corral-Trujillo<sup>7</sup>, D.A. Galarza-Delgado<sup>2</sup>. <sup>1</sup>Servicio de Reumatología Pediátrica, Departamento de Pediatría; <sup>2</sup>Servicio de Reumatología, Departamento de Medicina Interna, Hospital Universitario "Dr. José Eleuterio González". Universidad Autónoma de Nuevo León; <sup>3</sup>Servicio de Reumatología Pediátrica, Departamento de Pediatría, Hospital Universitario "Dr. José Eleuterio González". Universidad Autónoma Nuevo León; <sup>4</sup>Departamento de Psiquiatría; <sup>5</sup>Departamento de Medicina del Deporte y Rehabilitación; <sup>6</sup>Departamento de Nutrición, Hospital Universitario "Dr. José Eleuterio González". Universidad Autónoma de Nuevo León, Monterrey; <sup>7</sup>Servicio de Psicología Clínica, Hospital Universitario "Dr. José Eleuterio González". Universidad Autónoma de Nuevo León, Monterrey, Mexico

**Background:** The adolescence is a critical period when different process are made, as identity, cognitive changes, enhance of autonomy, etc. Besides that, an adolescent with rheumatic disease has to front facing the disease acceptance. Already, different Transition Programs are made around the world. In México does not exist this important project yet.

**Objectives:** Provide and uninterrupted, multi-disciplinary and coordinated, properly developed health system with a comprehensive and psychosocial background.

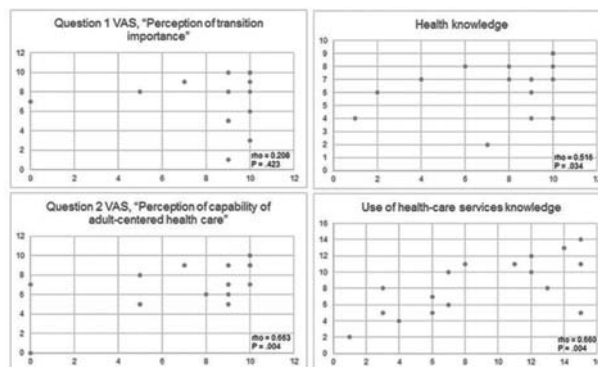

**Methods:** We included rheumatologist, rehabilitation specialists, psychiatrist, nutritionist, clinical psychologist, nurse and social services. Got Transition Questionnaire (GOT) in Spanish version was used to evaluated patients and parents to evaluated the knowledge in transition process. We implemented the beginning of the clinic last July. We included patients with established rheumatic diseases, older than 16 years old. We use descriptive statistics with measures of central tendency or frequencies depending on variable characteristics. We use Spearman's correlation test to evaluated concordance of answers in GOT between parents and patients.

**Results:** We made a systematic evaluation program of all patients. Nineteen patients had already seen at the clinic, most of them are female, the rest of clinical

variables are shown in Table 1. Even though we found a positive Spearman's coefficient ( $\rho$ ), and significant difference in answers related with "Perception of capability of adult-centred health care", "Health knowledge", and "Use of health-care services knowledge", GOT results demonstrate weak of correlation between answers from patients and their parents. Correlation plots from GOT results are shown in figure 1.

**Abstract AB1081 – Table 1.** Clinical and demographic characteristics

Variables	n=19
Age, years, mean±SD	18±1.4
Female gender (%)	15 (79)
Rheumatic diagnosis (%)	JIA SLE Inflammatory Myopathy Scleroderma Episcleritis
BMI, median (min – max)	20.3 (15.7–41.5)
BMI based classification (%)	Underweight Normal weight Overweight Obese
Any limited joint mobility and other musculoskeletal problems (%)	18 (95)
Psychiatric assessment abnormal (%)	14 (74)

**Abstract AB1081 – Figure 1.** GOT Transition correlations between parents and patients.

**Conclusions:** In this pilot study, we shown a high prevalence of psychiatric, nutritional, and mobility problems among adolescents, adding the non-concordance of transition abilities perception in GOT answers between parents and patients. These results encourage the need of an organised, specialised, multidisciplinary, and integrated clinic in which the patient could adapt to adult care centres.

**CHARACTERISATION OF A GROUP OF PATIENTS WITH IGG4-RELATED DISEASE: SINGLE CENTRE EXPERIENCE**

A. Kozlova<sup>1</sup>, V. Burlakov<sup>2</sup>, D. Abramov<sup>2</sup>, A. Laberko<sup>2</sup>, G. Sagoyan<sup>2</sup>, A. Shcherbina<sup>2</sup>. <sup>1</sup>Immunology, National Medical Research Center of Pediatric Hematology, Oncology and Immunology named after Dmitry Rogachev Moscow, Russia; <sup>2</sup>Immunology, National Medical Research Center of Pediatric Hematology, Oncology and Immunology named after Dmitry Rogachev Moscow, Russia, Moscow, Russian Federation

**Background:** Immunoglobulin G4-related disease (IgG4-RD) is a chronic systemic inflammatory condition with an unclear pathophysiology and IgG4-positive plasma cells infiltration of various organs and parts of the body. If untreated, the disease can lead to fibrosis and irreversible organ damage. IgG4-RD mostly has been described in adults, hence it is generally unknown among paediatricians.

**Objectives:** We conducted a retrospective analysis of clinical features and response to therapy of five patients (one female, four males, median age 13.6 years) with IgG4-related disease, treated in our Centre.

**Methods:** The diagnosis was confirmed by detection of lymphoplasmacytoid infiltration with >30% of cells expressing IgG4 in all, and elevated IgG4 serum concentration in 4 cases.

**Results:** Three patients had localised lesions (orbit, hip muscle, peripancreatic tissue, respectively), two – multi-organ disease with polylymphadenopathy, pulmonary, renal and hepatic foci, dacryoadenitis with oedema of the eyelids. Auto-immune thrombocytopenia ( $70 \times 10^9/l$ ), neutropenia ( $0,79 \times 10^9/l$ ) were present in one patient. Rituximab therapy was successful in 2 cases (one patient received monotherapy with rituximab, another one – Rituximab and Sirolimus). Two other patients received JAK inhibitor therapy (ruxolitinib) with good effect. No side effects were noted. One patient underwent surgery – the infiltration in the abdominal cavity was removed with positive effect without specific therapy.

**Conclusions:** IgG4-RD symptoms can be diverse and sometimes atypical, so dealing with this pathology requires physician's awareness. Rituximab was effective in patients with multi-organ manifestations, and JAK inhibitor (Ruxolitinib) was effective in patients with mono-focal disease. Steroids are routinely used in IgG4-RD as a first line of treatment with significant side effects. We propose that alternative drugs could be used in IgG4-RD, especially in paediatric patients to achieve fast remission with significant morbidity.

AB1083

**CLINICAL AND DENSITOMETRIC CHARACTERISTICS IN PAEDIATRIC POPULATION WITH RISK FACTORS TO DEVELOP LOW BONE MASS/OSTEOPOROSIS**

B. Magallares López<sup>1</sup>, J. Betancourt<sup>1</sup>, G. Fraga<sup>1</sup>, E. Quesada-Masachs<sup>2</sup>, M. López – Corbeto<sup>2</sup>, M. Torrent<sup>1</sup>, A. Marin<sup>1</sup>, S. Herrera<sup>1</sup>, E. Carreras<sup>1</sup>, J. Casademont<sup>1</sup>, H. Corominas<sup>1</sup>, J. Malouf<sup>1</sup>. <sup>1</sup>Santa Creu i Sant Pau Hospital; <sup>2</sup>Vall d'Hebron Hospital, Barcelona, Spain

**Background:** Low Bone Mass (LBM)/Paediatric Osteoporosis (Ped OP) is a disorder of unknown prevalence, partly due to the lack of diagnosis, associated with the absence of clinical manifestations of the disease until patients develop complications such as fractures, deformities or pain

**Objectives:** To describe the clinical and densitometric characteristics of the paediatric population with risk factors to develop LBM/Ped OP

Abstract AB1083 – Table 1

Age group	N,% age group	Average calcium intake (mg/d)±SD	Recommended Daily Amount (RDA) (mg/d)	% that reach RDA
Preschooler (2–3 y)	8, 8.9%	847±271	700	50%
Scholar age (4–9 y)	29, 32.2%	671±238	1000	27.6%
Teenagers (10–17y)	47, 52.2%	660±348	1300	8.7%
Young (18–20 y)	6, 6.7%	726±156	1100	0%

**Methods:** We collected prospectively demographic and clinical data of patients aged 2 to 20 years, referred for bone health assessment due to the presence of a risk factors for LBM/Ped OP, including: inflammatory diseases, immunosuppressants and/or corticosteroids, malabsorptive diseases and chronic systemic

disorders. We evaluated daily calcium intake and Bone Densitometry (DXA) was performed. We did also a vertebral morphometry

**Results:** Data were collected from 90 patients, with an average age of 9.9 years, 53% female, 82% Caucasian. The age distribution and calcium intake by age can be seen in table 1.

There was a significant decrease in the compliance of the RDA with calcium with increasing age ( $p=0.01$ ). No differences were found in the average daily calcium intake between the different diagnostic groups.

The most frequent diagnoses were: Malabsorption:44.4%, JIA:20%, Nephropathies:17.8%, Haematological diseases:7.8% and Vasculitis: 4.4%.

18% of the sample had had a fracture (Fx), 44% of them had more than one, being the adolescents the group of greater prevalence. 3 cases met the criteria for fragility Fx (vertebral Fx).

20% of the patients were on systemic corticosteroids, with an average dose of 5.9 mg of prednisone (or equivalent)/day, and another 20% had previously received them. The total cumulative average corticosteroid dose in both groups was: 7 grams of prednisone, with an average exposure of 37 months. 29 patients (32%) received immunosuppressive treatment, of which 20% were methotrexate (alone or in combination with biological DMARD).

Only 7% had supplements with Calcium and 14% with Vitamin D.

100% had a normal calcium, 82% a normal phosphate (rest slightly increased) and 11% were deficient in Vitamin D

13% of the sample had a LBM for their age assessed by DXA. The densitometric results can be seen in Table 2.

Abstract AB1083 – Table 2

DXA results	Max Z score	Min Z score	% with Z score≤-2
Vertebral Z score	-3	2	13.3%
Whole body Z score	-3	1.8	9.2%
Total femoral Z score	-4.8	2.3	10.7%
Femoral neck Z score	-4.8	3	12%

**Conclusions:** Calcium intake in children and young with at least 1 risk factor for LBM/Ped Op is lower than recommended, especially in the groups with the highest requirements.

Up to 13% of this population have a BMO for their age and a 3'3% meets Ped OP criteria.

Larger studies are needed to help us to identify paediatric patients who are candidates for bone health screening

**PRELIMINARY RESULTS OF THE USE OF SERUM CALPROTECTIN (MPR8/MPR14) IN CLINICAL PRACTICE IN PAEDIATRIC RHEUMATOLOGY**

B. Magallares López<sup>1</sup>, L. Martínez-Martínez<sup>2</sup>, M.C. Hernandez Lafuente<sup>2</sup>, E. Molto Lacosta<sup>2</sup>, Y. Alvaro Gargallo<sup>2</sup>, H.S. Park<sup>1</sup>, I. Castellví<sup>1</sup>, M. Millán Arciniegas<sup>1</sup>, C. Diaz-Tomé<sup>1</sup>, P. Moya<sup>1</sup>, A. Laiz<sup>1</sup>, J. Casademont<sup>2</sup>, H. Corominas<sup>1</sup>, E. Carreras<sup>4</sup>, C. Juarez<sup>2</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Immunology; <sup>3</sup>Internal Medicine; <sup>4</sup>Pediatrics, Santa Creu i Sant Pau Hospital, Barcelona, Spain

**Background:** Serum Calprotectin is a new biomarker of clinical activity in Rheumatology, especially in Juvenile Idiopathic Arthritis (JIA)

**Objectives:** To assess the use of serum Calprotectin in paediatric patients with inflammatory/Rheumatic diseases in clinical practice

**Methods:** We retrospectively collected Demographic and Clinical data from patients of our Paediatric Rheumatology Clinic, in which serum Calprotectin levels were determined.

The determination of serum Calprotectin was carried out using the ELISA technique.

Diagnostic and Inflammatory activity data were also collected: RCP, ESR and Clinical Assessment of the patients

**Results:** We present 28 patients, 61% females, with an average age of 11 (3–23 years)

The diagnoses were as follows: 16 JIA (57% of the total), of which 8 were of the Oligoarticular type, 3 were Polyarticular, 3 were Arthritis related to Enthesitis, 1 was Psoriatic and 1 Systemic. Other diagnoses were: Behçet, <sup>1</sup>Autoinflammatory Diseases: 4 (2 ADA2 Deficit, 1 Familial Mediterranean Fever, 1 PFAPA) and 7 patients had suspected rheumatological/inflammatory diseases in study

17 patients were considered clinically inactive, 6 with inflammatory activity and 3 doubtful at the time of blood test. The mean values of Calprotectin, RCP and ESR can be seen in Table 1.

Abstract AB1084 – Table 1

	Calprotectin (µg/mL) (range)	PCR (mg/dL) (range)	ESR (mmHg) (range)
Active	3,43 <sup>1.80</sup> – 5.31	4,27 (0,7–11,6)	16,86 <sup>3–51</sup>
Inactive	2,15 (0,78–4,06)	1,83 (0,7–4,6)	13,11 <sup>3–43</sup>

Calprotectin was statistically correlated with Clinical Activity ( $p=0.018$ ), however, neither ESR ( $p=0.539$ ) nor RCP ( $p=0.059$ ) did, although in RCP there was a clinical trend, (ANOVA)

Calprotectin, RCP and ESR were negative in 91%, 80% and 76% respectively of Inactive patients; and positive in 43%, 100% and 33% of the Active ones

The analysis of the ROC curves in our sample showed that the value that allows to discriminate between active and non-active disease with a Sensitivity of 80% and a Specificity of 69% is 2'07 µg/mL

Serum Calprotectin was 2 points higher in the group of patients with Autoinflammatory diseases than in the group of JIA, with a mean of 4.91 compared to 2.90 ( $p=0.002$ ). However, since it is a retrospective study, we must bear in mind that this can be influenced by the reasons for the test request, being in the group of Autoinflammatory Disease the suspicion of active disease, and in the AIJ simply monitoring or assessment of treatment optimisation.

It should be noted that, in the patients in diagnostic process that did not present any rheumatological disease (final diagnoses of: arthralgias in 3 cases and glomerulonephritis not associated to rheumatologic/autoimmune disease in 1), serum Calprotectin did not exceed in any case the 1.15 µg/mL

**Conclusions:** Serum Calprotectin is emerging as a useful marker, not only in the field of JIA, but also in other diagnostic groups such as Autoinflammatory Diseases.

Prospective and larger studies are needed to determine its role

**Disclosure of Interest:** None declared

#### AB1085 THE FACTORS AFFECTING REMISSION IN JIA PATIENTS, SINGLE CENTRE RESULTS

B. Sozeri<sup>1</sup>, T. Demircan Bilen<sup>1</sup>, D. Kurtulus<sup>2</sup>, I. Islek<sup>1</sup>. <sup>1</sup>*Pediatric Rheumatology, <sup>2</sup>Physical Medicine and Rehabilitation, University of Health Sciences, Istanbul, Umraniye Training and Research Hospital, Istanbul, Turkey*

**Background:** Juvenile idiopathic arthritis (JIA) is the most common rheumatic disease in childhood. Nowadays, in the management of JIA, clinical remission is the accepted goal. However, remission is much associated with the JIA subtype and inversely with suggested predictors for poor outcome.

**Objectives:** The aim of the study is to evaluate the predictors of clinical outcome in patients with juvenile idiopathic arthritis

**Methods:** This was a single-centre, an observational study including children diagnosed with JIA at Health Sciences University Istanbul, Umraniye Education and Research Hospital, Turkey, between June 2016 and January 2018. All patients were evaluated at the time of diagnosis, and at 3 months of their disease. We routinely collected the patients' baseline profile which included the age of disease onset, gender, number of active joints, patients' and physicians' global assessment of disease activity (PGA, range from 0 to 10 mm; 0 is the best score), the JADAS 27 score, and therapy. Patients were identified through the divisional database which includes all patients seen in the rheumatology clinic.

**Results:** A total of 141 JIA patients were included in the analysis. The mean follow-up duration of these patients was 23.36 months (range from 12 to 156 months). We examined 71 joints in all patients. At the time of diagnosis, it was seen that they were frequently in knee joint (61.7%) and sacroiliac joints (34.8%). The rate of improvement of joints in the last visit was found to be metatarsophalangeal joints (100%), sacroiliac joints (79%) and knee joints (44.8%), respectively. The non-systemic group ( $n=133$ ) was evaluated for initial steroid use, among the patients, 54 (% 41) had steroid therapy at the time of diagnosis. There was seen that 29 of the 141 patients (20.6%) were in the remission in 3 months of follow-up. According to subtype of JIA patients, systemic patients (62.5%) were frequently in remission at 3 months. At the end of the study, of the 141 patients, 72 (51.1%) achieved remission and were assigned to the remission group. Among the patients in the remission group, 44 (49.4%) had episodes of disease flares. The other 30 (40.5%) patients did not have disease flares. Comparing the baseline

data in the remission group and non-remission group, there was no difference between these two groups in disease onset age, gender, JIA subtypes, number of active joints at disease onset and JADAS 27 scores and used steroid therapy.

We also analysed whether each group used biological drugs and analysed the duration of starting biologic therapy. Among 72 patients achieved remission, 17 (23.6%) patients had at least one biological drug. There was no difference between two groups. The median time of biologic drug starting was 12 (interquartile range (IQR), 12) months. There was longer time of biologic drug starting in non-remission group than remission group ( $32.3\pm 36.2$  vs  $25.0\pm 31.4$ ,  $p>0.05$ ). We determine that in systemic and poli JIA patients who were used biological therapy were found to have a high percentage of achieved to remission

**Conclusions:** JIA is a heterogeneous disease with significant variability in course and long-term outcome. No parameter could be used as a single predictor of long-term outcomes. Standardised baseline work-up, disease activity evaluation and a definition of a treat to target approach will result in better health outcomes for JIA patients

#### AB1086 A 6-MONTH, MULTICENTER, OPEN-LABEL, EXPLORATORY STUDY OF FIXED DOSE NAPROXEN/ESOMEPRAZOLE IN ADOLESCENT PATIENTS WITH JUVENILE IDIOPATHIC ARTHRITIS (JIA)

D.J. Lovell<sup>1</sup>, J.A. Dare<sup>2</sup>, J. Ball<sup>3</sup>, M. Francis-Sedlak<sup>3</sup>, B.D. LaMoreaux<sup>3</sup>, R.J. Holt<sup>3,4</sup>. <sup>1</sup>*Cincinnati Children's Hospital Medical Center, Cincinnati*; <sup>2</sup>*Arkansas Children's Hospital, Little Rock*; <sup>3</sup>*Horizon Pharma USA, Inc., Lake Forest*; <sup>4</sup>*University of Illinois-Chicago, College of Pharmacy, Chicago, USA*

**Background:** JIA is an inflammatory arthritis of unknown etiology, which lasts for greater than 6 weeks with onset before 16 years of age.<sup>1</sup> Per the ACR guidelines, JIA is the most common chronic rheumatic disease in children.<sup>3</sup> NSAIDs have been the mainstay of initial management with naproxen being commonly used, but they can cause serious side effects such as gastritis. Herein, we report the results of a clinical trial in JIA patients receiving one of 3 fixed doses of naproxen/esomeprazole magnesium (nap/eso) given BID (table 1).

**Objectives:** To evaluate the signs/symptoms of JIA, safety and tolerability of nap/eso in adolescents age 12 to 16 years.

**Methods:** Forty-six children and adolescents with JIA by ILAR criteria, mean age of 13.6 years, from 18 US sites were prospectively enrolled over 2 years and treated for up to 6 months. Mean number of active joints at baseline was 3.1. Doses were based on baseline weight (table 1). Disease activity was assessed with the ACR Pediatric-30, -50, -70, -90 Response and the Childhood Health Assessment Questionnaire (CHAQ) discomfort and functional scores at months 1, 3, and 6 as change from baseline. Occurrence and causality were assessed for treatment emergent AEs (TEAEs) and discontinuations were monitored monthly.

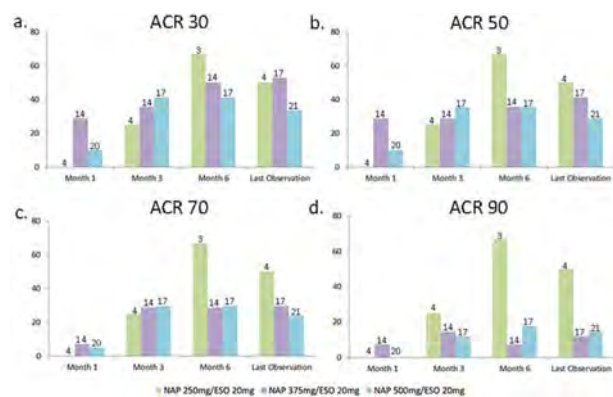

**Results:** Forty-six patients received at least 1 dose of study drug and 36 completed the trial. The % of patients achieving ACR Paediatric response increased over time (figure 1). CHAQ discomfort improved at each assessment and functional scores improved at all assessments for 'Arising, Walking, and Activities' with several improved for 'Dressing and Grooming, Eating, Hygiene, and Grip'. There was no indication of a dose-related efficacy effect. Thirty-seven (80.4%) had at least 1 TEAE. Frequent TEAEs ( $\geq 5\%$ ) were upper respiratory tract infection, upper abdominal pain, sinusitis, diarrhoea, headache, nausea, and ligament sprain. Eleven (23.9%) had at least 1 TEAE considered to be related to study drug. Most frequent study drug-related TEAE ( $\geq 5\%$ ) was upper abdominal pain. Four (8.7%) discontinued due to a TEAE.

Abstract AB1086 – Table 1. Minimum and Maximum Study Drug Dose (nap/eso) by Weight Group

Weight at Enrollment (kg) <sup>1</sup>	Minimum Dose <sup>2</sup>	Maximum dose <sup>2</sup>
<38	250 mg/20 mg	250 mg/20 mg
38 –<50	250 mg/20 mg	375 mg/20 mg
50 –<75	375 mg/20 mg	500 mg/20 mg
$\geq 75$	500 mg/20 mg	500 mg/20 mg

<sup>1</sup> Based on typical day-to-day fluctuations in body weight,  $\pm 3\%$  window was permitted and used at the discretion of the Investigator when assigning the initial dose group. <sup>2</sup> Study drug dose, given twice daily.

Abstract AB1086 – Figure 1

Note: the number above each bar represents the number of patients at that dose. The ACR Pediatric-30, -50, -70, and -90 responses were defined as an improvement of at least 30% (or 50%, 70%, 90% respectively) from baseline in at least 3 of the 6 signs and symptoms variables, with no more than 1 of the remaining variables worsening by >30%. JIA signs and symptoms variables: physician's global assessment of disease activity, CHAQ disability index score, CHAQ global assessment of well-being, number of joints with active arthritis, number of joints with limited range of motion, serum CRP or ESR.

**Conclusions:** Improvement in JIA signs and symptoms occurred at most assessments and by month 6, the percentage of patients with an ACR Pediatric-30, -50, -70, and -90 Response was 47.1%, 38.2%, 32.4%, and 17.6%. No new safety signals were identified for the well-characterised components of this fixed dosed JIA treatment, which was developed to reduce the risk of gastric ulcers.

#### AB1087 PROLONGED RESPONSE WITH TUMOUR NECROSIS FACTOR ALFA INHIBITION IN A 5 YEAR OLD BOY WITH SEVERE MANIFESTATIONS OF IL-36 RECEPTOR ANTAGONIST DEFICIENCY (DITRA)

D. Clemente<sup>1</sup>, J.C. López Robledillo<sup>1</sup>, A. Torrolo<sup>2</sup>, A. Hernández<sup>2</sup>, E. Villalobos<sup>3</sup>.  
<sup>1</sup>Pediatric Rheumatology Unit; <sup>2</sup>Pediatric Dermatology; <sup>3</sup>Pediatrics, Hospital Niño Jesús, Madrid, Spain

**Background:** Deficiency of the interleukin (IL)–36 receptor antagonist (DITRA) is an autosomal recessive autoinflammatory syndrome caused by mutations in the IL36RN gene. Clinical manifestations of DITRA include recurrent episodes of generalised skin postulation, fever, systemic inflammation and leukocytosis. An uniformly effective treatment for DITRA has not yet been identified.

**Objectives:** We present a case of a 5 year old patient with DITRA with prolonged response with tumour necrosis factor alfa inhibition with adalimumab.

**Methods:** A five-year-old came to our dermatology clinic after worsening of a previous diagnosed plaque psoriasis, with an erythematous scaly dermatitis that extended throughout the trunk. Treatment with acitretin and cyclosporin were not effective and patient developed in few weeks a generalised erythroderma with

pustules covering almost every part of his body, including palms and soles. He was admitted for the onset of fever and irritability due to painful rubbing of the skin. Family history of recurrent fevers or psoriasis were not revealed. Parents were not consanguineous.

Complete blood count showed leukocytosis with neutrophilia and thrombocytosis, with an erythrocyte sedimentation rate (ESR) of 6 mm/hr and a C-reactive protein (CRP) of 8,4 mg/dl. Biochemistry panel revealed a mild elevation of liver enzymes without other abnormalities. Antinuclear antibody (ANA) and rheumatoid factor were negative with normal serum immunoglobulin and complement. Blood culture grew *E. Coli*, *S. Maltophilia* and *S. epidermidis*. Skin biopsy showed acanthosis and papillomatosis with perivascular polymorphous inflammatory cells. Genetic analyses showed a homozygous mutation in the IL36RN gene (pSer113Leu). No mutations were detected in IL1RN and CARD 14 genes.

**Results:** Treatment was initiated with intravenous methylprednisolone 2 mg/kg/day and subcutaneous anakinra 2 mg/kg/day. Cefotaxime and co-trimoxazole were added until blood cultures were negative. Although skins lesions improved during the following days and patient was finally discharged, symptoms reappeared when decreasing the steroid dose. Three months later adalimumab and methotrexate were started, allowing the patient to end treatment with corticoids without evidence of activity of the disease.

Abstract AB1087 – Figure 1

**Conclusions:** After incomplete response with anakinra, inhibition of tumour necrosis factor alfa resulted in a prolonged response in our patient with deficiency of the interleukin (IL)–36 receptor antagonist (DITRA).

**Disclosure of Interest:** None declared

#### AB1088 CAPILLARY HEMOSIDERIN DEPOSITS OR EXTRAVASATIONS: A SUBTYPE OF HAEMORRHAGETHAT ACQUIRES SEPARATE ATTENTION IN QUANTITATIVE ANALYSIS OF NAILFOLD CAPILLAROSCOPY IN CHILDHOOD-ONSET SLE

D. Schonenberg-Meinema<sup>1</sup>, M. van den Berg<sup>1</sup>, A. Nassar-Sheikh-Rashid<sup>1</sup>, M. Boumans<sup>2</sup>, M. Cutolo<sup>3</sup>, T. Kuijpers<sup>1</sup>, V. Smith<sup>4</sup>, on behalf of EULAR study group on microcirculation in rheumatic diseases. <sup>1</sup>Pediatric Hematology, Immunology, Rheumatology and Infectious diseases, Emma Childrens Hospital, Academic Medical Center (AMC); <sup>2</sup>Department of Clinical Immunology and Rheumatology, Academic Medical Center (AMC), Amsterdam, Netherlands; <sup>3</sup>Research Laboratory and Academic Unit of Clinical Rheumatology, University of Genova, Genova, Italy; <sup>4</sup>Department of Rheumatology, Ghent University Hospital, Ghent, Belgium

**Background:** Quality of images in nailfold capillaroscopy has improved in the last years by introduction of videocapillaroscopy. Microangiopathy, as observed in capillaroscopy of SLE-patients,<sup>1–3</sup> can now be described by more detailed quantitative analysis. Recently, in a small cohort (n=22) of childhood-onset SLE (cSLE), we described capillary bleedings by two different subtypes: large haemorrhages and small point-shaped haemorrhages with a total count of resp. 0.2/1.5 per

analysed image per patient.<sup>4</sup> These small point shaped haemorrhages have also been described as hemosiderin deposits.<sup>5</sup>

**Objectives:** To describe the reliability of assessment of two subtypes in capillary haemorrhages by inter-observer agreement.

**Methods:** Three observers, DS (paediatric rheumatologist with experience in capillaroscopy), AN (fellow paediatric rheumatology without experience in capillaroscopy) and MB (trainee in adult rheumatology with experience in capillaroscopy), scored capillaroscopy images from patients with Raynaud's phenomenon and with cSLE. The observers were blinded for patient name and diagnosis. The number of haemorrhages were scored per subtype. Hemosiderin deposits were defined as small point-shaped extravasations surrounding the capillary apex (see image). Large haemorrhages were defined according to the Atlas of Capillaroscopy.<sup>6</sup> Reliability was calculated by the intra-class correlation coefficient (ICC) with 95% confidence interval (CI). Statistical analyses was performed by IBM SPSS Statistics version 24.

**Results:** Two-hundred images from 50 patients (diagnosed with Raynaud's phenomenon and/or cSLE) were scored by the three independent observers. ICC for the number of capillaries with hemosiderin deposits was 0.77 (95% CI 0.69–0.82). ICC for the number of large capillary haemorrhages was 0.97 (95% CI 0.96–0.98).

Abstract AB1088 – Figure 1

**Conclusions:** Reliability of the observation 'hemosiderin deposits' in nailfold videocapillaroscopy was good with an ICC of 0.77. This study shows that capillary haemorrhages can be described in 2 subtypes: 'large haemorrhages' and 'hemosiderin deposits' which are small point-shaped extravasations surrounding the capillary apex.

AB1089

#### INVESTIGATION OF THE EFFICACY AND SAFETY OF SECUKINUMAB TREATMENT IN JUVENILE IDIOPATHIC ARTHRITIS SUBTYPES OF JUVENILE PSORIATIC AND ENTHESTITIS-RELATED ARTHRITIS: DESIGN OF A RANDOMISED, DOUBLE-BLIND, PLACEBO CONTROLLED, MULTICENTER STUDY

D. Foell<sup>1</sup>, J.A. Veit<sup>2</sup>, E. Ilsley<sup>3</sup>, K. Abrams<sup>4</sup>, on behalf of CAIN457F2304 Study Group. <sup>1</sup>Klinik für Pädiatrische Rheumatologie und Immunologie, Universitätsklinikum Münster, Westfälische Wilhelms-Universität, Münster, <sup>2</sup>Clinical Research Immunology and Dermatology, Novartis Pharma GmbH, Nürnberg, Germany, <sup>3</sup>Novartis Pharma AG, Basel, Switzerland, <sup>4</sup>Novartis Pharmaceuticals Corporation, New Jersey, USA

**Background:** Secukinumab (AIN457), a fully human anti-interleukin-17A monoclonal antibody, has demonstrated a significant clinically meaningful efficacy on signs and symptoms, structure and function in adults with ankylosing spondylitis (AS)<sup>1</sup> and psoriatic arthritis (PsA)<sup>2</sup>, both approved indications. These data support the proposed study in children with enthesitis-related arthritis (ERA) and juvenile psoriatic arthritis (JPsA).

**Objectives:** This phase 3 study will investigate the efficacy and safety of secukinumab in children  $\geq 2$  to  $< 18$  years with active JPsA or ERA. The primary objective is to demonstrate that the time to flare in a double-blind placebo control treatment withdrawal part of the trial is longer with secukinumab than placebo.

**Methods:** Eighty biologic-naïve children with active ERA or JPsA (active  $\geq 3$  active joints and  $> 1$  site of enthesitis at baseline or documented by history) will enrol into treatment period 1 and receive weekly open label s.c. secukinumab 75 or 150 mg, based on their body weight ( $< 50$  kg or  $\geq 50$  kg) to maintain secukinumab blood levels equivalent to the adult 150 mg dose, for the first month then every 4 weeks thereafter. At week 12, responders (minimum JIA ACR Pedi 30 response) enter treatment period 2 and will be randomised to receive secukinumab or a matching placebo every 4 weeks. Patients enter treatment period 3 if they experience a disease flare or when the treatment period 2 closes for the entire study because the target number of flares has been reached. Upon entering treatment period 3, patients receive open-label secukinumab every 4 weeks until week 100 and then followed until week 112.

**Results:** The primary efficacy endpoint will be time to flare in treatment period 2. Key secondary endpoints include JIA ACR 30/50/70/90/100 response rate, total dactylitis and enthesitis counts at week 12. Safety and tolerability will be assessed throughout the study.

**Conclusions:** The efficacy of Secukinumab in the approved adult indications of PsA and AS support the current study design to evaluate the efficacy and safety of secukinumab treatment in children with active JPsA or ERA. The primary efficacy endpoint will be time to flare in treatment period 2. Key secondary endpoints include JIA ACR 30/50/70/90/100 response rate, total dactylitis and enthesitis counts at week 12. Safety and tolerability will be assessed throughout the study.

AB1090

#### ANALYSIS OF A COHORT OF PATIENTS ATTENDING A COMBINED OPHTHALMOLOGY- RHEUMATOLOGY CLINIC IN A TERTIARY REFERRAL CENTRE IN EGYPT

E. Abd El Latif, soliman Mahmoud Street, cleopatra, Alexandria, faculty of medicine, alexandria university, Alexandria, Egypt

**Background:** Paediatric rheumatologic diseases may have sight-threatening ocular complications including uveitis, scleritis, and retinopathy. Conversely, children presenting with uveitis, scleritis, episcleritis, or optic neuritis may have an underlying rheumatologic disease. Combined ophthalmology-rheumatology clinics can facilitate the comprehensive management of these patients.

**Objectives:** To describe the demographic characteristics, paediatric rheumatologic diseases distribution, paediatric ocular manifestations distribution, and active treatments in a combined ophthalmology- rheumatology clinic in a tertiary referral centre in Egypt.

**Methods:** We included all new patients who attended a combined ophthalmology–rheumatology clinic at a tertiary referral hospital from the 1st of October 2015 to the 30th of November 2017. We analysed their demographic, clinical, laboratory, and treatment characteristics. Patients were considered to have activity according to the joint opinion of the ophthalmic and rheumatologic consultants.

**Results:** We included 538 new patients. 331 were female (61.5%) and the median age (range) was 8.1 years (1.1–17.3). 59.5% of the patients had juvenile idiopathic arthritis (JIA), whereas patients with SLE, Behçet's disease, dermatomyositis, scleroderma, and juvenile ankylosing spondylitis represented 8.6%, 8.1%, 7.2%, 4.7%, and 4.3% of the studied cohort respectively.

Of the patients with juvenile idiopathic arthritis, 56.7% had not developed ocular manifestations by the end of the study, while 27.3% suffered from uveitis that was controlled by methotrexate, 7.4% suffered from uveitis that was controlled by both methotrexate and adalimumab, and 8.6% suffered from uveitis that was still active by the end of the study period.

72.3% of the patients with Behçet's disease had uveitis, of which 34.6% suffered profound diminution of vision in the affected eye(s) despite receiving anti TNFs. Other medications that were given were prednisolone, azathioprine, cyclosporine, and cyclophosphamide.

Smaller percentages of patients with dermatomyositis, scleroderma, and juvenile ankylosing spondylitis, developed ocular manifestations, and the vast majority were systemically and ophthalmologically quiescent by the end of the study duration.

**Conclusions:** More than half the patients attending the combined clinic during the period of the study had JIA. A greater percentage of patients with uveitis due to JIA could be controlled medically than of patients with uveitis due to Behçet's disease. A multidisciplinary clinic can save patients with rheumatologic diseases and uveitis precious time.

#### AB1091 TOLERABILITY OF VACCINATION OF 13 PCV IN PATIENTS WITH JIA, WITHOUT SYSTEMIC MANIFESTATIONS

E. Alexeeva<sup>1,2</sup>, T. Dvoryakovskaya<sup>1,2</sup>, M. Soloshenko<sup>1</sup>, R. Denisova<sup>1</sup>, K. Isaeva<sup>1</sup>, A. Mamutova<sup>1</sup>, N. Mayansky<sup>1</sup>, N. Tkachenko<sup>1</sup>, I. Zubkova<sup>1</sup>, T. Kaluzhnaya<sup>1</sup>, A. Gayvoronskaya<sup>1</sup>, M. Broeva<sup>1</sup>, M. Fedoseenko<sup>1</sup>. <sup>1</sup>National Medical Research Center for Children's Health; <sup>2</sup>Sechenov First Moscow State Medical University (Sechenov University), Moscow, Russian Federation

**Background:** Juvenile idiopathic arthritis (JIA) is one of the most frequent and most disabling rheumatic diseases in children. Children with JIA receiving immunosuppressive and genetically engineered biologic drugs belong to the high-risk group for the development of bacterial and viral infections, including those administered by preventive vaccines.

**Objectives:** Our aim was to evaluate the tolerability of the pneumococcal 13-valent conjugate vaccine (PCV) in children with JIA.

**Methods:** In a prospective cohort study, 3 groups were formed: children with JIA in the remission phase on methotrexate or etanercept (group I), with JIA in the active phase prior to the appointment of methotrexate or etanercept (group II), control group (conditionally healthy children). 0.5 ml of the 13-valent PCV was administered once subcutaneously during therapy in patients in the remission phase or 3 weeks before the appointment of methotrexate or etanercept in patients in the active phase.

**Results:** At this stage of work, the tolerability of the 13 PCV vaccine was evaluated in patients with JIA, without systemic manifestations. In our study, the post-vaccination period was asymptomatic in 58% of the children in Group I, 66% in children in Group II, and in 60% in the control group. Most often in the postvaccinal period, local reactions were noted, which were painful at the place of administration of the vaccine in 6% of the children in group I, 8% in group II, and 24% in the control group, respectively. Less developed oedema and hyperemia at the

injection site – in 12% of children in group I, 6% in group II, in 8% of children in the control group. There was no significant difference in the incidence of local reactions to vaccination of 13 PKV in patients with JIA and in children of the control group. Analysis of the time of occurrence and duration of local and systemic reactions to vaccination of 13 PKV showed that the maximum severity of symptoms was noted in the first day, by the 2–3 day of observation, complaints and fever disappeared. The increase in local reactions was noted 2 days after immunisation, followed by extinction to 3–4 days of follow-up. There were no serious adverse events in the post-vaccination period.

**Conclusions:** Vaccination with the 13-valent PCV in children with JIA is safety and is not accompanied by the development of serious adverse events.

#### AB1092 AN AUDIT ON PAEDIATRIC UVEITIS IN THE GREATER GLASGOW AND CLYDE (GGC) SERVICE: GUIDELINE ADHERENCE AND IMPACT ON PATIENT OUTCOMES

E. Parmar<sup>1</sup>, J. Waddell<sup>1</sup>, J. Gardner-Medwin<sup>2</sup>. <sup>1</sup>School of Medicine; <sup>2</sup>Department of Rheumatology, University of Glasgow, Glasgow, UK

**Background:** 2010 guidelines from the Scottish Paediatric and Adolescent Rheumatology Network (SPARN) and the Scottish Uveitis Network (SUN) outlined management pathways for paediatric uveitis. Given the time since its establishment and last review, an audit on the GGC service's adherence to the guidelines as well as patient outcomes was conducted.

**Objectives:** To determine the service's compliance to the SPARN/SUN guidelines for the management of paediatric uveitis, in addition to establishing patient outcomes and identifying current shortcomings and areas for improvement in future practice. We also aimed to provide data to inform the revision and updating of the guideline for the year 2018.

**Methods:** This retrospective audit was conducted by collecting data from patients within the GGC's Royal Hospital for Children's joint rheumatology and ophthalmology service who were diagnosed with uveitis between the 1st of January 2008 and the 31st of December 2017. The data was then compared to the guidelines set by SPARN/SUN, in addition to a study conducted by this service prior to the guideline's development.

**Results:** 39 suitable patients were identified from the list of 253. From these patients, 92 separate events of uveitis were recorded – 84 of which ended in remission within the audit period. 17 events (20%) remained active after 7 months and required ongoing treatment, falling out with the guideline's standards. Time to remission was further stratified by modality of treatment. Of the 78 eyes evaluated, 7 eyes in 5 patients were found to have had cataracts. This comprises 12.8% of patients, an improvement from the 29% of the previous study. Notably, 5 of the 7 eyes had cataracts detected at the first appointment with the service. An additional 7 eyes across 6 patients (15%) were recorded to have had cystoid macular oedema, which is comparable to the previous study's 11%. A majority of these (4 of 7 eyes, or 57%) were again discovered to already be present at the first appointment.

**Conclusions:** Guideline adherence was commendable, though improvement is needed in treatment escalation to decrease the time taken for patients to achieve remission. There exists a tendency to maintain patients on topical steroid therapy due to relapsing and remitting disease activity, though given the high risk of glaucoma, consideration should be given to quickly progressing these patients up the treatment ladder. A large proportion of patients with severe complications of uveitis appear to have developed these prior to their first attendance at the service, suggesting a need for more stringent screening processes for early detection. Overall, outcomes in terms of the number of patients affected by complications of uveitis appear to have improved when compared to the study previously conducted by the service, implying a beneficial effect from adherence to the implemented guidelines.

AB1093

#### CAN DMARDS THERAPY MODIFY CLINICAL HISTORY OF OLIGOARTICULAR JUVENILE IDIOPATHIC ARTHRITIS (JIA)?

E. Bertoldo<sup>1</sup>, C. Mansoldo<sup>2</sup>, F. Martinis<sup>1</sup>, G. Dallagiocoma<sup>1</sup>, D. Biasi<sup>1</sup>, M. Rossini<sup>1</sup>, S. Pieropan<sup>1</sup>. <sup>1</sup>Rheumatology Unit, <sup>2</sup>Ophthalmology Unit, AOUI Verona, Verona, Italy

**Background:** Therapy of oligoarticular JIA is based on intra-articular injections of steroids, methotrexate and biotechnological therapy. ANAs-positive oligoarticular JIA patients with an early onset of disease have a consistent risk to develop uveites.

**Objectives:** The primary aim of this study is to evaluate longitudinally the effect of non-systemic therapy and of systemic immunomodulating drugs (e.g MTX) on ANAs in JIA patients; secondary occurrence of iridocyclitis was evaluated.

**Methods:** Monocentric retrospective not randomised study of 40 patients affected by oligoarticular JIA (ILAR classification) with ANA positivity at the baseline (T0, time of diagnosis). Patient of Group 1 received only intra-articular infiltrations or NSAID. Patients of Group 2 were treated with DMARDs (most of them with subcutaneous MTX 15 mg/m2/week) or MTX +biotechnological therapies. The assay for ANAs (I.I.F.) was assessed in all patients at T0, at T1 (12 months) and T2 (24 months). At 24 months was also recorded the occurrence of uveitis during the follow up. Exclusion criteria were the ANAs negativity at T0 and other subgroups of JIA.

**Results:** Twenty-one patients (52.5%) were treated with non-systemic therapy (Group 1), and nineteen (47.5%) with systemic immunomodulating therapy (Group 2). In Group 2 fifteen subjects were treated with MTX, one with MTX plus cyclosporine, one with only cyclosporine, two with MTX plus biotechnological agent (etanecept and adalimumab). At T1, in Group 1 only one patient out of 20 (4.8%) became ANAs negative versus 42.1% (8/19) of patients in Group 2 (p 0.0033). At T2 the incidence of ANAs positivity did not change in Group 1 (only 1/21 ANAs negative), while 42.1% of patients treated with systemic therapies were ANA negative (p 0.006). Three patients were lost at the follow up. The two patients who received bDMARDs in addition to MTX remained ANAs-positive both in T1 and T2. At the end of follow-up period eight uveitis have occurred, six in ANAs positive patients of Group 1 (6/21, 28.5%) and two in ANA negatives patients in Group 2 (2/19, 10.5%).

**Conclusions:** ANAs-positive patients treated with methotrexate seems to have higher possibility to become ANAs-negative versus patients treated with non-systemic immunomodulating therapy. It's known that MTX might prevent onset of uveitis in JIA, as shown in our results. Demonstrating a negativization of antinuclear antibodies using MTX therapy could help to add a role of this drug in the disease history of the oligoarthritiis.

#### ACUTE RHEUMATIC FEVER: NEW ASPECTS OF AN OLD DISEASE

F. Martinis<sup>1</sup>, S. Pieropan<sup>1</sup>, G. Dallagiocoma<sup>1</sup>, E. Bertoldo<sup>1</sup>, S. Picassi<sup>2</sup>, D. Biasi<sup>1</sup>, M. Rossini<sup>1</sup>, M.A. Prioli<sup>3</sup>. <sup>1</sup>Rheumatology, <sup>2</sup>Paediatrics, <sup>3</sup>Cardiology, AOUI VERONA, Verona, Italy

**Background:** Acute rheumatic fever is a nonsuppurative sequela that occurs two to four weeks following group A beta-hemolytic Streptococcus (GABHS) pharyngitis. Despite its decline in incidence in Europe, rheumatic fever still represents a serious healthcare concern. The most common manifestations are arthritis and carditis, followed by chorea, erythema marginatum, and subcutaneous nodules. The diagnosis of ARF is clinical and requires satisfaction of revised Jones criteria as well as evidence of a recent streptococcal infection.

**Objectives:** Aim of this study was to highlight new emerging features of disease clinical presentation.

**Methods:** Data regarding patients who fulfilled the Revised Jones Criteria for acute rheumatic fever were retrospectively collected from January 1996 and July 2017. The following clinical and demographic data were obtained: patient sex, birth date, age at presentation, clinical manifestations, evolution of cardiac involvement after therapy.

**Results:** 35 patients (19 males, 16 females) were included. The mean age at diagnosis 7.9±4 years (range 2–17). Carditis was the most frequent manifestation, occurring in 31 patients (89%). Other common symptoms were fever (91%), arthritis (43%) or arthralgias (54%) and chorea (20%). In 6 out of 7 patients chorea occurred together with carditis. Cardiac auscultation revealed new pathologic

murmurs only in 49% of cases. Echocardiography detected cardiac involvement in the absence of auscultatory findings (subclinical carditis) in 11 patients at the time of diagnosis. In 3 cases ultrasound examination became positive within 4 weeks. Throat cultures were negative in 37% of cases. Anti-streptolysin O (ASO) and anti-desoxyribonuclease B (ADB) antibodies titers did not bear correlation with the severity of cardiac involvement.

**Conclusions:** In our casistic, carditis was the most common and worrisome manifestation of ARF. Detection of cardiac involvement is still challenging and echocardiography testing should be performed even in the absence of abnormal auscultation findings. If the initial ultrasound is negative but clinical suspicion remains high, US investigation should be repeated, given that rheumatic carditis can evolve over weeks to months. Early detection and treatment of manifestations improves outcome as in all the cases of this series.

Streptococcal serology is most helpful in the diagnosis of ARF because culture or detection of the organism is usually no longer possible by the time ARF presents. The severity of clinical manifestations, particularly of carditis, does not correlate strictly with ASO and ADB titer.

Sydenham chorea, which usually has a longer latent period (up to 6 months), tends to occur earlier in the disease course, presenting in the acute phase in this series.

#### LONG-TERM IMPACT OF JUVENILE IDIOPATHIC ARTHRITIS ON QUALITY OF LIFE OF ADULT PATIENTS IN GREECE

G.C. Paskalis<sup>1</sup>, D. Dimopoulou<sup>2</sup>, M. Trachana<sup>3</sup>, C.C. Theocharidou<sup>1</sup>, P. Pratsidou-Gertsis<sup>3</sup>, T. Oikonomou<sup>2</sup>, T. Dimitroulas<sup>2</sup>, A. Garyfallos<sup>2</sup>. <sup>1</sup>Aristotle University, Thessaloniki, Greece; <sup>2</sup>4th Department of Internal Medicine; <sup>3</sup>1st Department of Pediatrics, Pediatric Immunology and Rheumatology Referral Centre, Aristotle University, Thessaloniki, Greece

**Background:** Juvenile Idiopathic Arthritis (JIA) is the most common rheumatic disease in childhood and affects negatively both physical and psychosocial functioning.

**Objectives:** To explore the long-term impact of JIA on quality of life of adult patients in Northern Greece.

**Methods:** Adult patients with a definite diagnosis of JIA were assessed by the SF-12v2 questionnaire in the outpatient transition (from Paediatric to adult Rheumatology) clinic of Hippokratio Hospital of Thessaloniki. SF-12 questionnaire is a quality of life assessment tool and consists of a Physical Component Summary (PCS) and a Mental Component Summary (MCS). PCS and MCS of the patient group were compared to an age-matched control group, using *t-test* or *Mann-Whitney U test*, as appropriate. Moreover, percentages of patients and controls who were severely affected (<45 points in PCS or MCS) were compared, using *Chi-squared test*. Finally, correlation between the two summary components of SF-12 of patients was measured, using *Spearman's rho*. Statistical analysis was done using SPSS software. Level of statistical significance is p<0.05.

**Results:** A total of 50 patients and 135 controls were enrolled in the study. The median (IQR) patient age was 32<sup>10</sup> years and disease duration was 24<sup>9.5</sup> years. PCS scores of patients group were statistically significantly lower compared to control group (p=0.021) and more patients than controls scored low values (<45) in PCS (22% versus 6.7%, odds ratio, 4.0 [95% CI, 1.5, 10.2]; p=0.007). MCS scores of patients were slightly better than scores of controls (mean difference, 3.67 [95% CI, 0.44, 6.90]; p=0.026), but the severely affected were similar in both groups (odds ratio, 0.6 [95% CI, 0.3, 1.2]; p=0.174). No correlation between PCS and MCS was found (p=0.48).

**Conclusions:** There is an apparent impact of JIA on many patients' quality of life, specifically in terms of their physical health, that persists for many years after disease onset, which is in line with studies from other countries. This could be related to disease severity, disease subtype and duration, socioeconomic status and availability of treatment options. Interestingly, JIA wasn't found to affect the patients' mental health. A more specific psychometric test would be appropriate for in-depth analysis and confirmation of this result. Study design did not allow subgroup analysis according to JIA subtype, disease severity or duration, highlighting the need for long-term outcome studies focusing on the risk factors which may be involved.

**AB1096** **OBSERVATIONAL SAFETY STUDY OF GOLIMUMAB IN TREATMENT OF POLYARTICULAR JUVENILE IDIOPATHIC ARTHRITIS USING THE GERMAN BIOLOGICS JIA REGISTRY**

G. Horneff<sup>1,2</sup>, A. Klein<sup>1</sup>, on behalf of BIKER registry working group. <sup>1</sup>ASKLEPIOS, Sankt Augustin; <sup>2</sup>University of Cologne, Cologne, Germany

**Background:** Golimumab (GLM) received European marketing authorisation for treatment of polyarticular JIA (pJIA). The long-term safety of GLM in clinical practice has not been characterised.

**Objectives:** The aim of the present project is to conduct a post-authorisation safety study to monitor long-term safety of subcutaneous GLM in the treatment of pJIA in routine clinical practice setting.

**Abstract AB1096 – Table 1**

<b>Baseline Disease Activity</b>					
Active joints, median [IQR]	5 [2;6]	4 [2;9]	9 [7;13]	3 [1;7]	3 [2;7]
Phys Global, median [IQR]	37 [19;56]	33 [24;49]	59 [43;75]	48 [26;71]	43 [24;67]
JADAS <sub>10</sub> , median [IQR]	12 [6;16]	12 [8;16]	21[18;24]	13 [8;18]	13 [8;18]

**Methods:** Monitoring of GLM in 200 pts with polyarticular JIA (cohort 1) in clinical practice will be performed by the German BiKeR Registry compared to a concurrent cohort 2 with 400 pts newly treated with alternative (approved) TNF-inhibitor, a concurrent cohort 3 with 500 pts newly starting methotrexate, a historic cohort 4 of patients treated with TNF-inhibitors and a historic cohort 5 never exposed to biologics but treated with methotrexate. Efficacy will be assessed by single disease activity markers and JADAS10, safety will be assessed by adverse event reporting and monitoring with a special interest on serious infections including opportunistic infections and TB, malignancies, autoimmune processes and exposure during pregnancy.

**Results:** Recruiting of three new cohorts 1–3 started in July 2017. Historic control cohorts 4 and 5 were obtained from the BIKER data base. Cohort 4 was recruited from 2006 to 2016, cohort 5 from 2005 to 2011. Baseline patients' characteristics

are outlined in table 1. So far, patients of the GLM cohort 1 were older, had a much longer disease duration and received pre-treatment with other biologics more often. All patients in this cohort received combination with methotrexate. Since so far GLM is approved for children with body weight of at least 40 kg and in combination with methotrexate, differences were expected. Baseline disease activity indicators are within the range of alternative TNF inhibitors and the historic cohort 4 while patients of the concurrent methotrexate cohort receiving their first treatment approach had the highest baseline disease activity.

**Conclusions:** The BiKeR registry has been collecting data from JIA patients treated with approved biologics in routine clinical practice since 2001. To provide context for interpreting long-term safety and effectiveness of data for GLM, analysis will also include data from contemporary pJIA patients treated with alternative TNF inhibitors and methotrexate.

**Acknowledgements:** This project of the BIKER registry is supported by an unrestricted grant from MSD, Germany

**AB1097** **PROGRESSIVE PSEUDORHEUMATOID DYSPLASIA (PPRD) IN SIBLINGS MIMICKING INFLAMMATORY ARTHROPATHY**

S. Khan<sup>1</sup>, Z. Afridi<sup>2</sup>, I. Malik<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Pediatrics, Lady Reading Hospital, Medical Teaching Institution, Peshawar, Pakistan

**Background:** Progressive pseudorheumatoid dysplasia is a rare condition with an incidence of 1 in 1 million.

**Objectives:** Keeping in mind rare disorders when dealing with children in rheumatology clinics.

**Methods:** A 12 years old girl was referred to rheumatology by general practitioner. Her main complaint was difficulty walking, standing up from sitting position, short stature and nodulosis of interphalangeal joints. Initially she had muscle weakness which was thought to be contributing to her gait problem and difficulty standing.

Investigation revealed myopathic changes on electromyography though her CK was entirely normal. Other investigations including routine bloods and inflammatory markers were normal. Immunology was negative. X-rays revealed reduced joint spaces in interphalangeal joints and epiphyseal dysplasia in elbows and hips. On examination there was no evidence of any synovitis. The child was of short stature i.e less than the 3rd percentile on growth chart. She had a waddling gait. There was nothing in the history to suggest previous or current inflammatory arthropathy.

Interestingly this child had another younger sibling, 7 years old girl who had similar changes in her hands.

**Results:** Based on history, investigations, examination and familial characteristic we felt that these two kids (siblings) had PPRD. It usually happens at the age of 3 to 8 years. Walking pattern, fatigue, weakness and intermittent episodes of stiffness are the common symptoms. Other feature is reduced joint spaces in knees and hips. At birth kids are usually of normal height but by adulthood they are short statured. They also can have calcium deposition around the joints. PPRD is caused by mutation in WISP3 gene which is responsible for bone growth and cartilage maintenance and is inherited in an autosomal recessive pattern.

**Abstract AB1097 – Figure 1**

**Conclusions:** Kids can have a variety of musculoskeletal disorders. We feel that management of rheumatological conditions in kids need to be approached in a multidisciplinary way. Genetic disorders mimicking inflammatory conditions need to be considered all time. In those places particularly where paediatric rheumatologists are not available, involvement of paediatricians may be useful. In terms of PPRD, it is commonly mistaken as juvenile rheumatoid arthritis, however there is no inflammatory process going on in PPRD.

#### EARLY PROSTHESIS IMPLANTATION IS POSSIBLE IN PATIENTS AFFECTED BY JUVENILE IDIOPATHIC ARTHRITIS, TREATED WITH BIOLOGICS: A MONOCENTRIC EXPERIENCE OF 160 PROSTHESIS FROM THE LAST TWENTY YEARS

L. Pontikaki<sup>1</sup>, M. Truzzi<sup>2</sup>, T. Ubiali<sup>3</sup>, L.M. Argolini<sup>3</sup>, S. De Martinis<sup>2</sup>, F. Campanaro<sup>3</sup>, R. Viganò<sup>2</sup>. <sup>1</sup>Unit Of Pediatric Rheumatology-Department Of Rheum; <sup>2</sup>Surgery of Rheumatic diseases SC; <sup>3</sup>Rheumatology, Gaetano Pini Institute, Milan, Italy

**Background:** The main reasons for prosthesis implantation in a young patient are post-traumatic osteoarthritis, congenital dysplasia and autoimmune diseases involving joints, like Juvenile Idiopathic Arthritis (JIA). Often, related to particular anatomic conditions and severe grade of deformity, there may be a need for special (custom made or revision) components of prosthesis. Biologic therapy in severe, refractory JIA has permitted to obtain a better control of the disease so as to proceed with prosthesis implantations (hip, knee, ankle).

**Objectives:** The aim of the study was to present a monocentric experience of a transitional care centre for JIA and the outcome of early prosthesis implantation in patients treated with biologics.

**Methods:** 160 prosthesis implantation (72 Hip arthroprosthesis, 71 Knee arthroprosthesis and 17 Ankle arthroprosthesis) were performed between 1999 and 2017. It was defined a wash-out period from the biologic therapy depending on the half-life of the medication. The survival of the implant was evaluated for a period of 10 years. We evaluated the different type of implants and it was proposed a radiographic classification for every type of implant.

**Results:** All patients included in the study were treated with biologics. A long-term analysis of the following ten years of follow-up proved an average survival of 95.5% of the prosthesis and good results in term of function and comfort for the patients. Complications in 2% (two trochanter detachment, two sepsis and one peri-operative haemorrhage).

**Conclusions:** Prosthesis implantation for JIA patients is a complicated and difficult procedure in comparison with the traditional approach used in patients affected by osteoarthritis. This is related to the management of the biologic therapy, the low quality of the bone, the remarkable stiffness and deformity of the joints. Long-term results were good, even in patients with severe arthritis. There was a drastic reduction of articular pain and an improvement of functionality. Prosthesis implantation in patients with active disease and mild or bad response to the biologics had a worse outcome. The use of not cement-retained implants doesn't influence the long-term survival at ten years, similar to that of the adult patients affected by osteoarthritis.

#### AN AUDIT ON THE SCREENING GUIDELINES FOR UVEITIS IN CHILDREN WITH JUVENILE IDIOPATHIC ARTHRITIS WITHIN THE ROYAL HOSPITAL FOR CHILDREN, GLASGOW

J. Waddell<sup>1</sup>, E. Parmar<sup>1</sup>, J. Gardner-Medwin<sup>2</sup>. <sup>1</sup>School of Medicine; <sup>2</sup>Department of Rheumatology, University of Glasgow, Glasgow, UK

**Background:** Juvenile Idiopathic Arthritis (JIA) defines many arthropathies occurring in children which persist for at least 2 weeks. All JIA patients are at risk of developing uveitis, an inflammatory condition of the eye which poses a risk to visual impairment. The British Society of Paediatric and Adolescent Rheumatology outline guidelines for the screening of these patients. Given the time since publication, an audit on the adherence to said guidelines, as well as patient outcomes, was conducted.

**Objectives:** Our aim was to identify adherence to the screening guidelines within the RHC, Glasgow; and to what extent adherence to these guidelines prevented the occurrence of uveitis. We aimed to identify areas which could be improved within the Glasgow service itself, as well as providing data for the revision of the guidelines.

**Methods:** We performed a clinical audit of all JIA patients diagnosed between 1st January 2008 and 31st December 2017, analysing the frequency and adherence of appointments, as well as medication use. Data was gathered from patient medical files and collected into a database for analysis.

**Results:** 97 of 115 JIA patients entered the screening programme. 72 patients had their initial eye screen within the appointed guidelines of 6 weeks, and 13 of the patients were examined under anaesthetic, with a mean time to examination of 3.31 weeks (0–7.14).

15 patients were seen according to the two-monthly guidelines for the first 6 months of diagnosis. Following this 6 month period, it is suggested patients are screened every three to four-months. 463 out of 641 (72.2%) appointments met this guideline.

After stopping immunosuppressive therapy, it is advised to screen at two-monthly intervals. 97 patients were treated with immunosuppressants, with 10 patients stopping whilst still in the screening service. 9 continued to be seen on a three to four-month basis as before, 1 patient was not screened at all, but no patients were screened according to the guidelines.

**Conclusions:** Adherence to the screening service could be improved, with 75% of patients having had their first screen within the guideline criteria, and 72% seen within the guidelines following the initial 6 months. It seems that improvement mainly needs to be focussed on the methods of appointment rearrangement.

There is believed to be a 6 month high-risk period of developing uveitis following cessation of immunosuppressants, thus increased screening is suggested. This was not adhered to well in the Glasgow service, but there was no increased risk of uveitis development found, suggesting the need for alteration to the guidelines.

#### EPIDEMIOLOGY AND MANAGEMENT PRACTICES FOR CHILDHOOD-ONSET SYSTEMIC LUPUS ERYTHEMATOSUS PATIENTS: A SURVEY IN LATIN AMERICA

J.C. Ferreira<sup>1</sup>, V.C. Trindade<sup>1</sup>, G. Espada<sup>2</sup>, Z. Morel<sup>3</sup>, E. Bonfa<sup>4</sup>, C. Saad-Magalhães<sup>5</sup>, C.A. Silva<sup>1</sup>. <sup>1</sup>Pediatric Rheumatology Division, Children's Institute, Hospital das Clinicas HCFMUSP, Faculdade de Medicina, Universidade de Sao Paulo, São Paulo, Brazil; <sup>2</sup>Pediatric Rheumatology Division, Hospital de Niños Dr Ricardo Gutierrez, Buenos Aires, Argentina; <sup>3</sup>Pediatric Rheumatology Division, Pediatric Service, Hospital de Clinicas, Universidad Nacional De Asuncion, Asucion, Paraguay; <sup>4</sup>Division of Rheumatology, Hospital das Clinicas HCFMUSP, Faculdade de Medicina, Universidade de São Paulo, São Paulo; <sup>5</sup>Pediatric Rheumatology Division, São Paulo State University (UNESP) – Faculdade de Medicina de Botucatu, Botucatu, Brazil

**Background:** Two groups have reported data focused on epidemiology, clinical and laboratorial features of childhood-onset systemic lupus erythematosus (cSLE) patients in Latin America (LA): BRAC-SLE (Brazilian Childhood-onset SLE Registry Group) and GLADEL (Grupo Latino Americano De Estudio del Lupus). However, to the best of our knowledge, epidemiology and management of cSLE based on LA Paediatric Rheumatologists (LAPR) were not carried out.

**Objectives:** Therefore, the objective of the present cross-sectional survey study was to assess LAPR reports of cSLE patients regarding epidemiology, classification criteria, disease activity and other instruments used in clinical practices, laboratory and other exams availability, general supportive care, drugs availability, infections, non-live vaccines, issues observed in adolescents, reproductive health issues and transition-focused program to adult care.

**Methods:** A cross-sectional study was performed in 288 LAPR based on online survey about cSLE practices, which included 21 countries. All physicians are members of Pan-American League of Association for Rheumatology (PANLAR).

**Results:** The response rate of web-based survey by LAPR was 170/288 (59%) and the majority worked in University Hospitals (63%). The ACR and/or SLICC classification criteria (99%) and disease activity tools (97%) were almost universally used by LAPR, whereas damage index (70%) and CHAQ (58%) instruments were less frequently used. Laboratory exams, diagnostic imaging and biopsies were generally available (>75%), however low availability for densitometry (66%). Drug access was excellent for the most common prescribed medications (>75%), except for belimumab (11%). Endemic illnesses were reported by LAPR in at least one cSLE patient during the previous year: tuberculosis (16%) and Hansen disease (2%). Emerging mosquito-borne diseases were also reported: dengue (20%), Chikungunya (11%) and Zika (8%). Groups were further divided in two, according to the number of cSLE patients followed by LAPR in the last year: group A ( $\geq 25$  patients) and group B (<25 patients). Frequencies of condom in combination with other contraceptive methods were significantly higher in group A than B (69% vs. 48%,  $p=0.01$ ). The frequencies of reported pregnancy (50% vs. 16%,  $p<0.001$ ) and non-adherence to therapy were significantly higher in group A (100% vs. 93%,  $p=0.023$ ). Alcohol intake (42% vs. 21%,  $p=0.004$ ) and illicit drug use (19% vs. 5%,  $p=0.007$ ) were also reported more frequently by LAPR of group A in at least one cSLE patient.

**Conclusions:** This first large web-based survey demonstrated an overall excellent access for diagnosis and therapy by LAPR, probably related to their high rate of practices in tertiary care of University Hospitals. Adherence to therapy, pregnancy and substance abuse were identified as major challenges in this population, particularly in larger centres.

## AB1101 THE DEVELOPMENT OF A PALATABLE, STABLE ORAL METHOTREXATE SOLUTION

J.-A. Penton, J. Winslade, D. Roberts, S. Conroy. *Therakind Ltd, London, UK*

**Background:** Methotrexate is used in the treatment of Rheumatoid Arthritis, Juvenile Idiopathic Arthritis and other conditions such as Acute Lymphoblastic Leukaemia and psoriasis. It can be administered orally or by injection. With oral administration, methotrexate's bitter taste may not be masked, particularly when tablets are crushed to facilitate dosing in paediatrics or patients who have difficulty swallowing tablets.<sup>1</sup> This can lead to long term treatment adherence issues and inaccurate dosing, putting patients at risk of adverse reactions or inadequate efficacy. A palatable oral liquid presentation of methotrexate would facilitate more accurate dosing and potentially improve treatment adherence; however, methotrexate is difficult to formulate as an oral liquid due to taste, solubility and stability challenges. Despite these difficulties, a palatable, stable oral methotrexate solution has been developed.

**Objectives:** To develop a palatable, stable, oral methotrexate solution, which complies with EU requirements for development of paediatric products,<sup>2</sup> to aid accurate dosing and treatment adherence.

**Methods:** During each of two single-dose (10 mg and 2.5 mg) bioequivalence studies of the test 2 mg/ml methotrexate oral solution with licenced tablets, 24 healthy male subjects were asked to comment on the oral solution's taste, indicating whether it was: Bitter, Sour, Salty, Sweet, or No Obvious Taste and they could also leave a remark. In parallel to clinical studies, long term ICH stability studies at ambient conditions (25°C/60%RH) and in-use shelf life studies were conducted.

**Results:** All subjects in the 10 mg dose study reported the oral solution as sweet tasting. One subject also reported an aftertaste and strange smell. In the 2.5 mg dose study, all subjects except one reported the solution as sweet tasting. The remaining subject reported a 'soothing' taste. One subject reported it was also sour and another reported an aftertaste. Two subjects additionally commented that they liked the taste. Both studies demonstrated bioequivalence and a similar safety profile between the oral solution and tablets. The stability studies illustrated that the oral methotrexate solution utilised in these clinical studies was stable at ambient conditions for up to 20 months, including a 3 months in-use period. The oral solution has recently been granted a European Union marketing authorisation and is the first methotrexate oral solution to be authorised for treatment of polyarthritic Juvenile Idiopathic Arthritis in Europe.

**Conclusions:** A 2 mg/ml oral methotrexate solution, developed to improve treatment adherence and dose accuracy, is reported to have a palatable, sweet taste and can be stored long term at ambient conditions with a 3 months in-use period.

## AB1102 KAWASAKI DISEASE AND GIANT ANEURYSM IN MEXICAN CHILDREN: EVOLUTION AND CLINICAL CHARACTERISTICS: A 5-YEAR EXPERIENCE

M.T. Brana<sup>1</sup>, S. Osorio<sup>2</sup>, L. Aparicio<sup>2</sup>, A. Rodriguez<sup>1</sup>, E. Faugier<sup>2</sup>, R. Maldonado<sup>2</sup>.  
<sup>1</sup>Pediatric Rheumatology, <sup>2</sup>Hospital Infantil de Mexico, Federico Gomez, Hospital Infantil de Mexico Federico Gomez, Mexico, Mexico

**Background:** Kawasaki disease (KD) is an acute, self-limited, systemic vasculitis, predominantly involving medium-sized arteries. It mainly affects children younger than five years and it is the leading cause of acquired heart disease in children in developed countries. Of unknown pathogenesis, KD severe complication is the occurrence of coronary artery lesions. Without early treatment, there is a 15% to 25% incidence of coronary artery lesions. Management with intravenous immunoglobulin (IVIG), combined with aspirin, effectively decrease the incidence of this lesions to a 4%. The long-term prognosis is determined by the initial and current level of coronary artery involvement. Methods to predict which children are at higher risk for coronary aneurysms have been sought to determine prognosis and select patients for more rigorous treatment and follow-up.

**Objectives:** To describe the clinical presentation and evolution in addition to laboratory findings in Mexican paediatric population who developed giant aneurysms diagnosed with KD during the past 5 years. By identifying mayor risk factors in our population, an effective score could be used to select children for evaluation of additional therapies to prevent coronary artery aneurysms that occur despite treatment with IVIG.

**Methods:** Retrospective cohort study of the Children's Hospital of Mexico Federico Gomez, last 5 years. We reviewed the data from the clinical archives of the patients who developed giant aneurysms after the diagnosis of KD from 2011 to 2016. A total of 84 patients with KD, 7% developed giant aneurysms. The variables analysed, apart from the typical clinical and laboratory findings of KD, include size and Z score of the aneurysms, involution through follow up, cardiac morbidity and mortality, and treatment strategy.

**Results:** Results: The mean age of patients at diagnostic was 17 months, and 84% were males. Only 33% of the patients developed complete KD, while 66% were diagnosed as incomplete. All patients presented with a positive Harada score. IVIG was administered in 83% of the patients, and a second dose was needed in 33%. Infliximab was used in 33% of the patients. One patient died due to cardiogenic shock. Results from echocardiography in the follow-up show that 33% of the patients have evolved to even larger aneurysms and 50% present no changes. Of the patients with a longer follow-up, 4 years after diagnostic, 33% have developed arrhythmias and 16% myocardial infarction. All are at high risk of sudden death.

**Conclusions:** The late diagnosis is the characteristic present in all patients which developed giant aneurysms, making imperative to identify clinical and laboratory findings that will help identify KD in Mexican paediatric population to avoid cardiac complications.

**AB1103 SEVERE PULMONARY ARTERIAL HYPERTENSION AS THE INITIAL MANIFESTATION OF SYSTEMIC LUPUS ERYTHEMATOSUS IN A 7-YEAR-OLD MALE PATIENT: A CASE REPORT**

M.T. Brana<sup>1,1</sup>, S. Osorio<sup>2</sup>, L. Aparicio<sup>2</sup>, A. Rodriguez<sup>1</sup>, E. Faugier<sup>2</sup>, R. Maldonado<sup>2</sup>.  
<sup>1</sup>*Pediatric Rheumatology*; <sup>2</sup>*Hospital Infantil de Mexico, Federico Gomez, Hospital Infantil de Mexico Federico Gomez, Mexico, Mexico*

**Background:** Pleural pulmonary manifestations in patients with systemic lupus erythematosus are reported in approximately 5% of cases. Presenting as pleural effusion, alveolar haemorrhage, diffuse interstitial lung disease, pulmonary infections and pulmonary arterial hypertension, among others, they are a manifestation difficult to diagnosis. Pulmonary arterial hypertension is a rare condition, usually occurring 3 to 5 years after the diagnosis of systemic lupus erythematosus.

**Objectives:** We report the case of a 7-year-old male patient who presented with pulmonary arterial hypertension as the initial manifestation of systemic lupus erythematosus.

**Methods:** Case report

**Results:** A 7-year-old male patient who was admitted to the Pneumology Department at Children's Hospital of Mexico Federico Gómez due to respiratory distress. In emergency assessment, pulmonary arterial hypertension of 66 mmHg was identified, of unknown cause. The patient did not have significant medical background, having enjoyed of good health up to 6 months prior to his admission. He presented with a history of non-quantified fever, as well as episodes of fatigue and dyspnea. Two months before admission, chest pain was added, exacerbated with inspiration. On admission, transthoracic echocardiography revealed severe dilatation of right cavities, moderate tricuspid insufficiency, with left ventricular ejection fraction of 56% and arterial pulmonary pressure of 66 mmHg. The diagnostic approach is initiated. Due to a history of pulmonary tuberculosis in the patient grandmother, the patient was studied with BAAR and cervical lymph node biopsy, ruling out the diagnosis. Infectious process causing the manifestations was also ruled out. The patient was discharged with medical treatment, requiring readmission in for 7 days, with facial oedema and in lower extremities, generalised pallor, asthenia, adynamia and 4 days before a decrease in urinary volumes and frequency. On admission, right heart failure, secondary to increase of pulmonary hypertension for discontinuation of diuretic administration. A renal biopsy was performed, which was reported as class IV lupus nephropathy, with an index of activity and chronicity of 0. The diagnosis of systemic lupus erythematosus is integrated based on the ACR criteria. Induction of remission of lupus nephropathy based on the CARRA protocol. As treatment was administered the patient showed important clinical improvement.

**Conclusions:** Pulmonary arterial hypertension is a rare condition, usually occurring 3 to 5 years after the diagnosis of systemic lupus erythematosus. In paediatric population, it is reported as a lupus complication in 5% to 14% of patients, and less than 1% as an initial manifestation. It is a clinical complication that gives the patient a high risk of morbidity and mortality. It is important to acknowledge that pulmonary arterial hypertension can be the initial manifestation of lupus in paediatric population. A prompt identification assures a prompt treatment and a better prognosis.

**AB1104 MALIGNANCY-RELATED ARTHROPATHIES IN PAEDIATRIC PATIENTS SEEN IN A TERTIARY HOSPITAL**

M.A. Bayo-Ang, C.B. Bernal, M.T.M. Collante. *Pediatric Rheumatology, University of Santo Tomas Hospital, Manila, Philippines/Philippine Rheumatology Association, Manila, Philippines*

**Background:** Along with constitutional symptoms such as fever, fatigue, and weight loss, childhood malignant diseases often also present with various musculoskeletal symptoms and findings, prompting consult or referral to a paediatric rheumatology clinic.

**Objectives:** The study described the characteristics of patients seen at the paediatric rheumatology clinic who were eventually diagnosed with malignancy.

**Methods:** Medical records of 35 children diagnosed with hematologic or solid malignancy who were seen at the paediatric rheumatology clinic from August 2013 to December 2017 because of with joint pains or difficulty in ambulation were reviewed.

**Results:** Twenty of the 35 patients (57.1%) were males and 15 (42.9%) were females. The mean age at diagnosis was 7.3 years old  $\pm 4.1$  (range 2.5–17.0). The time of diagnosis from the onset of symptoms has a mean of 4.5 months  $\pm 7.4$ . Fever was the most common constitutional symptom (82.8%), followed by pallor (45.7%) and weight loss (37.1%), while the most common musculoskeletal symptom or finding was joint pains (100%), followed by difficulty in ambulation (40%), joint swelling (37.1%) and nocturnal pains (31.4%). Mean haemoglobin level was 93.9 g/L  $\pm 18.9$ . Mean white cell count was 11.9  $\times 10^9/L \pm 7.1$ , mean segmenters was 41.6%  $\pm 21.7$ , and mean lymphocytes was 53.0%  $\pm 24.2$ . Mean platelet count was 294.0  $\times 10^9/L \pm 220.5$ . Mean ESR was 99.6 m/h  $\pm 33.7$  at baseline. Radiographic evaluation done were all normal. Peripheral blood smears and bone marrow aspiration study were done in all patients. Thirty-three patients (94.2%) were diagnosed with acute leukaemia, 18 of which was acute lymphocytic leukaemia, 14 acute lymphocytic leukaemia pre-B, and 1 acute myelogenous. One patient had Non-Hodgkins Lymphoma and 1 patient had hemoblastoma.

**Conclusions:** Children with joint pains associated with findings atypical of a rheumatologic disorder presentation should be further investigated for the possibility of malignancy.

**AB1105 INFLUENCE OF JUVENILE IDIOPATHIC ARTHRITIS ON THE QUALITY OF LIFE OF YOUNG ADULTS IN THE TRANSITION PERIOD TO ADULT RHEUMATOLOGIC CARE IN UKRAINE**

M. Dzhus<sup>1</sup>, Y. Boyko<sup>2</sup>. <sup>1</sup>*Internal Medicine*; <sup>2</sup>*Bohomolets National Medical University, Kyiv*; <sup>2</sup>*Clinical Immunology, LVIV Medical University, Lviv, Ukraine*

**Background:** Young adults with juvenile idiopathic arthritis (JIA) often have an active disease with significant functional impairment in adulthood that can affect their physical and mental functions.

**Objectives:** The aim of the study was to determine the impact of JIA on quality of life, mental and physical health in young adults with JIA during the transition healthcare in Ukraine.

**Methods:** The cross-sectional study of 89 young adults aged 16 to 22 years with a history of JIA and 25 age- and sex-matched controls (without rheumatic disease) were included. The study was performed at the Aleksandrivsky Central Clinical Hospital, Kyiv, Ukraine in the period between April 2015 and February 2017. There was performed an evaluation of the disease activity by JADAS, received therapy, quality of life by the SF36, the functional activity (HAQ), long-term JIA damage indices JADI-A and JADI-E, PHQ-9, Beck depression scale.

**Results:** Patients with JIA had worse ( $p < 0.001$ ) physical health in comparison with the control group. Physical ( $p < 0.001$ ) and role ( $p < 0.05$ ) functioning and bodily pain ( $p < 0.001$ ) in JIA patients were decreased, compared with the controls. However, the indicators responsible for psychological function in patients with JIA did not differ from the controls. The analysis of functional activity revealed a strong negative effect of the disease on physical role functioning ( $p < 0.001$ ), bodily pain ( $p < 0.001$ ), general health ( $p < 0.001$ ), vitality ( $p < 0.001$ ), social role functioning ( $p < 0.001$ ), and mental health ( $p < 0.001$ ), which are included in physical ( $p < 0.001$ ) and mental ( $p < 0.05$ ) health. HAQ had strong negative effects on physical functioning ( $r = -0.56$ ,  $p < 0.001$ ), role function ( $r = -0.33$ ,  $p < 0.001$ ), bodily pain ( $r = -0.60$ ,  $p < 0.001$ ), general health ( $r = -0.40$ ,  $p = 0.01$ ), vitality ( $r = -0.46$ ,  $p < 0.001$ ), social functioning ( $r = -0.48$ ,  $p < 0.001$ ) and mental health ( $r = -0.42$ ,  $p < 0.001$ ). Articular long-term damages (JADI-A) have a predominantly negative effect on the patient's physical health ( $r = -0.27$ ,  $p < 0.05$ ) and on the indices associated with it: physical functioning ( $r = -0.24$ ,  $p < 0.05$ ), bodily pain ( $r = -0.24$ ,  $p < 0.05$ ), general health ( $r = -0.24$ ,  $p < 0.05$ ), vitality ( $r = -0.19$ ,  $p < 0.05$ ), social functioning ( $r = -0.27$ ,  $p < 0.05$ ), mental health ( $r = -0.22$ ,  $p < 0.05$ ). While the extra-articular long-term damages – JADI-E also have a predominantly negative effect on the patient's physical health ( $r = -0.22$ ,  $p < 0.05$ ) and on the indexes associated with it: physical functioning ( $r = 0.28$ ,  $p < 0.05$ ), bodily pain ( $r = -0.20$ ,  $p < 0.05$ ), general health ( $r = -0.23$ ,  $p < 0.05$ ), mental health ( $r = -0.23$ ,  $p < 0.05$ ), as well as a positive association with Beck depression scale ( $r = 0.28$ ,  $p < 0.05$ ) and PHQ-9 ( $r = 0.28$ ,  $p < 0.05$ ).

**Conclusions:** In our transitional cohort of Ukrainian patients at the era of biological therapies, juvenile idiopathic arthritis had a larger effect on the physical than mental SF-36 subscale. Pain was the main factor influencing quality of life. Extra-articular long-term JIA damages have impact on physical and mental health of young adults. Additional evaluation of mental health by PHQ-9 and Beck depression scale is recommended for evaluation signs of depression in Ukrainian young adults in transition period.

**AB1106 DEPRESSION AND ANXIETY IN PAEDIATRIC SYSTEMIC LUPUS ERYTHEMATOSUS. A SYSTEMATIC REVIEW**

M.C. Quilter<sup>1,2</sup>, D. Korczak<sup>1,2</sup>. <sup>1</sup>Department of Psychiatry, The Hospital For Sick Children; <sup>2</sup>University of Toronto, Toronto, Canada

**Background:** Depression and anxiety are common and treatable childhood mental health disorders that have been reported to impact outcomes for individuals with childhood-onset Systemic Lupus Erythematosus (cSLE)<sup>1</sup>. Research into the prevalence of depression/anxiety and cSLE comorbidity has reported conflicting results, and to our knowledge, no previous review of these data has been undertaken.

**Objectives:** To synthesise current knowledge regarding the association of depression and anxiety disorders with cSLE among paediatric patients.

**Methods:** Studies were identified through a comprehensive search of MEDLINE, EMBASE, PsychINFO, LILACS and Web Of Science (from database inception – July 2017) using MESH headings and Keywords for 'lupus erythematosus', and 'depression' or 'anxiety'. Included studies measured depression and/or anxiety symptoms prospectively among children and youth 8 to 21 years of age with a diagnosis cSLE. Data were extracted by two independent coders and where discrepancies occurred, agreement was reached by consensus.

**Results:** Sixty-two studies met criteria for full text review, and of these, 13 studies were included in the final analysis. The majority (80%) of studies were of cross-sectional design, with sample sizes ranging from 14 to 100 (mean=47) participants. The mean age of participants was 15.6 years and participants were predominantly female. Prevalence rates for depression ranged from 6.7% to 54%. Anxiety symptom prevalence was 20% to 34%. All studies employed self-report instruments to assess depression and anxiety; none of the studies utilised semi-structured diagnostic interview to make psychiatric diagnoses. Significant heterogeneity precluded meta-analysis of the data.

**Conclusions:** Depression and anxiety may be common comorbidities of cSLE however current research is limited by a paucity of studies, small sample sizes and an inability to confirm psychiatric diagnoses. Future research addressing these limitations is needed.

**AB1107 TRANSITION FROM PAEDIATRIC TO ADULT RHEUMATOLOGY SERVICES IN NEWCASTLE TRUST HOSPITALS**

M. Obayi<sup>1</sup>, M. Lee<sup>2</sup>, A. Krishnakumar<sup>2</sup>. <sup>1</sup>Newcastle University; <sup>2</sup>Newcastle-Upon-Tyne Hospitals, Newcastle, UK

**Background:** Transitional care is defined as “the purposeful, planned movement of adolescents and young adults with chronic physical and medical conditions from child-centred to adult-oriented healthcare systems.”<sup>1</sup>

In 2016, EULAR produced recommendations on how this transition process should occur within rheumatology.<sup>2</sup>

**Objectives:** To audit the Newcastle-Upon-Tyne Hospitals rheumatology transitional care service against EULAR recommendations.

**Methods:** EULAR recommendations were adapted into a questionnaire, which was reviewed and edited by several Young Adults (YAs) with Juvenile Idiopathic Arthritis (JIA) attending clinics.

Patients attending specialist YA/JIA clinics between November 2017 and January 2018 were asked to complete the questionnaire; responses were audited against EULAR recommendations.

**Results:** 28 YAs with JIA completed the audit questionnaire (10 males and 18 females, age range 16–25). Not all questions were answered by all YAs.

Of the 17 patients with 'childhood-onset disease' (onset ≤age 10) 12% (2/17) had their transition started by age 14 ('essential' recommendation) and none by age 11 (the 'ideal' recommendation). Of the 11 patients with 'adolescent-onset

disease' (onset >age 10) 18% (2/11) had their transition started at the time of diagnosis (EULAR recommendation 2).

63% (17/27) of patients had ≥1 'direct' contacts with adult and paediatric rheumatology via a joint appointment (EULAR recommendation 3).

11% (3/28) of patients were aware of a documented individual transition plan (EULAR recommendation 4).

40% (6/15) were able to list ≥3 multidisciplinary team (MDT) members that had positively impacted their care. 54% (15/28) were able to provide the name of a transition coordinator (EULAR recommendation 6).

81% (21/26) of respondents 'agreed or strongly agreed' that they had been signposted to information on their condition, 48% (12/25) to peer support groups, mentoring schemes and charities, and 25% (6/24) to information sources on careers and finance. 64% (of patients were consulted on how they would like their parent/carer to be involved in their care during and after their transition (EULAR recommendation 7).

82% (23/28) of respondents reported having copies of letters concerning their care and transition (EULAR recommendation 8).

**Conclusions:** Newcastle-upon-Tyne hospitals transition services are in line EULAR recommendations in terms of MDT involvement in the transition process and addressing the medical needs of patients during transition, whilst signposting them to other agencies and ensuring they have copies of communication.

The audit also identified areas for improvement including: the need for a single named coordinator for all patients; ensuring discussions with patients about the transition process begin at an earlier age, and making sure patients are aware of and able to contribute to their documented and individualised transition plan.

**AB1108 THE EFFICACY AND SAFETY OF TREATMENT OF 152 NON-SYSTEMIC JUVENILE IDIOPATHIC ARTHRITIS PATIENTS WITH ETANERCEPT: FACTORS ASSOCIATED WITH ACHIEVEMENT REMISSION AND RISK OF FLARE**

M. Kostik, I. Chikova, E. Isupova, M. Likhacheva, T. Likhacheva, M. Dubko, V. Masalova, L. Snegireva, E. Gaidar, O. Kalashnikova, V. Chasnyk. *Saint-Petersburg State Pediatric Medical University, Saint-Petersburg, Russian Federation*

**Background:** Juvenile idiopathic arthritis (JIA) is the most frequent chronic inflammatory joint disease in childhood, required biologics administration if the previous therapy fails. Etanercept is the most worldwide biologic using in JIA patients.

**Objectives:** The aim of our study was to evaluate the efficacy and safety of etanercept in children with non-systemic categories of JIA and determine predictors of achievement of the remission and risk of flares.

**Methods:** In the retrospective observational study were included 152 children with non-systemic categories of JIA, treated with etanercept. Standard JIA measures and outcomes were utilised, remission was based on C. Wallace criteria (2004). We used descriptive statistics,  $\chi^2$ -test, Fisher's exact test, Mac-Nemar test, Mann-Whitny, Wilcoxon, Friedmann and log-rank tests, AUC-ROC analysis, odds ratio and relative risk calculation with Cox regression models.

**Results:** The cumulative remission was achieved in 58.8% patients during the trial. The maximum remission rates (80%) were in children with treatment duration near the 5 years and increased from year to year. Patient who achieved remission had less JIA onset age ( $p=0.015$ ), age of inclusion in the study ( $p=0.004$ ) and age of etanercept administration ( $p=0.00007$ ). The main predictors of achievement remission were JIA onset age  $\leq 7.8$  years (OR=4.3 (95%CI: 1.9–9.8),  $p=0.0003$ ), age of inclusion in the study  $\leq 14.0$  years (OR=2.85 (95%CI: 1.4–5.9),  $p=0.00007$ ), age of etanercept administration  $\leq 10.0$  years (OR=3.5 (95%CI: 1.7–7.2),  $p=0.0007$ ), time before etanercept administration  $\leq 2.4$  years (OR=2.7 (95%CI: 1.3; 5.5),  $p=0.0007$ ). In Cox regression model ( $p=0.007$ ) HLA B27 positivity (RR=2.15 (95%CI: 0.98; 4.75),  $p=0.06$ ) and time before etanercept administration  $\leq 2.4$  years (RR=2.4 (95%CI: 1.4; 4.4),  $p=0.003$ ) were main predictors of remission achievement. Polyarticular JIA increased the risk of flare compare to oligoarticular (RR=2.7 (95%CI: 0.9; 8.2),  $p=0.08$ ), then concomitant methotrexate decreased the risk of flare (RR=0.32 (0.1; 1.15),  $p=0.05$ ) in Cox regression model. During the

study etanercept was discontinued due to primarily or secondary inefficacy (9.2%), new onset of uveitis (5.2%) and other reasons (4.0%), including injecting site reaction. No serious adverse events, including severe infections, required hospitalisation were observed during the study.

**Conclusions:** Etanercept enables of induction of remission in JIA patients less than 10 years, with JIA duration less than 2.4 years, and whome have HLA B27-antigene. More stable effect was observed in oligoarticular JIA patients and who received concomitant methotrexate treatment.

**Acknowledgements:** Etanercept enables of induction of remission in JIA patients less than 10 years, with JIA duration less than 2.4 years, and whome have HLA B27-antigene. More stable effect was observed in oligoarticular JIA patients and who received concomitant methotrexate treatment.

### MISSED CASES OF MACROPHAGE ACTIVATION SYNDROME IN JUVENILE IDIOPATHIC ARTHRITIS (RETROSPECTIVE STUDY)

M.G. Zaki, A.Z. Elyasaki, D.S. Al-Zifaf, A.H. Safar. *physical medicine, rheumatology and rehabilitation, ain shams university, cairo, Egypt*

**Background:** Macrophage activation syndrome (MAS) is a complication of JIA which elevates morbidity and mortality. Early recognition, differentiation from activity of JIA itself and the subsequent introduction of aggressive treatment contributes to better prognosis.

**Objectives:** A retrograde study to investigate the occurrence of missed MAS among JIA patients to assess the extent of the problem among those patients.

**Methods:** The study included 100 JIA patients registered in paediatric departments over 2 years in urban areas of Cairo. All JIA subtypes where included. MAS was diagnosed according to preliminary diagnostic guidelines for MAS complicating sJIA.<sup>Ravelli et al., 2005</sup> JIA patients who had history of recent infection, hepatitis or other liver disease, malignancy and pancytopenia were excluded. The hospital registry for JIA patients was scanned for medical history with special attention for records of history suggestive of MAS. Clinical examination, Laboratory investigations and radiological data. Complementary investigations were done when needed.

**Results:** Among the studied 100 JIA patients, 14% of patients fulfilled the criteria and were diagnosed awith MAS. Mortality rate was 2% of all JIA patients and 14% of JIA cases with MAS. Regarding gender, there were 10 females (71%) and 4 males (35%). Their age ranged from 3.5 to 18 years old (median 8 years). The disease duration ranged from 0.1 to 6 years (median 1.5 years). Ferritin level was elevated in all MAS patients. Renal affection was present in 10 MAS patients (71%) in the form of elevated serum creatinine level. In contrast to uncomplicated JIA where there was no significant renal involvement.

**Table 1** Frequency of clinical manifestations of MAS among the studied patients

Clinical manifestations	JIA with MAS (n=14)	JIA without MAS (n=86)
Fever	14 (100%)	2 (2.3%)
Central nervous system manifestations	3 (21%)	-
Haemorrhage	1 (7.1%)	-
Hepatomegaly	9 (64%)	3 (3.4)%
Splenomegaly	6 (42%)	1 (1.1%)
Generalised lymphadenopathy	5 (35%)	-
Cardiovascular system manifestations	1 (7.1%)	7 (8.1%)

**Table 2** Laboratory results among studied patients

Parameter	JIA with MAS	JIA without MAS
	Mean±SD	
R red blood cells (10 <sup>9</sup> /mm <sup>3</sup> )	3.4±0.6	4.66±0.73
Haemoglobin(gm/dl)	9.04±1.39	11.8±1.87
Platelets (10 <sup>9</sup> /mm <sup>3</sup> )	124.29±85.8	299±90.053
WBCS (10 <sup>9</sup> /mm <sup>3</sup> )	6361.43±3937.7	11989.6±6056.3
Aaspartate transaminase(u/l)	90.14±93.1	29.5±23.084
Creatinine (mg/dl)	2.19±0.91	0.73±0.2
International normalised ratio	2.04±0.6	1.07±0.14
Fibrinogen(mg/L)	203.5±86.02	317.86±67.39
Eerythrocyte sedimentation rate(mm/h)	28.29±13.12	17.56±2.83
C – reactive protein(mg/dl)	60.71±52.21	7.49±7.48

**Conclusions:** MAS is a potentially fulminant disorder whose incidence has increased due to raised manifestations awareness. It may be a complication of any JIA subtype but primarily systemic onset subtype. The diagnosis of MAS should be considered in presence of continuous fever, CNS, renal or haemorrhagic manifestation in JIA.

### LIPID ABNORMALITIES IN CHILDREN AND ADOLESCENTS WITH JUVENILE IDIOPATHIC ARTHRITIS JIA

L.F. Bogmat<sup>1,2</sup>, N.S. Shevchenko<sup>1,3</sup>, V.V. Nikonova<sup>1</sup>, I.M. Bessonova<sup>1,2</sup>, M. V. Demjanenko<sup>1</sup>. <sup>1</sup>department of cardioreumatology, Institute of Children and Adolescents Health Care; <sup>2</sup>department of pediatrics; <sup>3</sup>department of pediatrics No 2, V. N. Karazin Kharkiv National University, Kharkiv, Ukraine

**Background:** Atherosclerosis and its complications are known that one of the causes of lethality in rheumatic diseases. The risk of cardiovascular catastrophes increases not only with the prolongation of pathological process, but also in young patients, who are seropositive to rheumatoid factor and antinuclear antibodies in the early years of the disease.

**Objectives:** The study of lipid blood spectrum in patients with JIA with the definition of its clinical significance for the course of the disease was conducted.

**Methods:** 97 children (5–18 years) of patients with JIA were examined. The first group consisted of 38 children (39.2%) without symptoms of comorbidity, the second group, with signs of comorbidity, included 59 children (60.8%). The age of the debut of the disease in the first group was 6.3 years, and in the second group – 5.9 years. The duration of the disease at the time of the survey was 71 and 61 months. General clinical trials included the complex included autoantibodies, disease activity, drugs. Total cholesterol (TCh), triglycerides (TG), high density lipoprotein cholesterol, low-density lipoprotein cholesterol, apolipoprotein B, ApoA-I and lipoprotein-α were evaluated. The state of the blood coagulation system was also studied: fibrinogen of the blood, prothrombin index (PTI), thrombin time (TrT), active partial thrombin time, d-dimer, international normalised ratio.

**Results:** It was established that the parameters of the lipid blood spectrum changed in the presence of an increase in the level of fibrinogen. Patients with comorbidity had higher rates of low-density lipoprotein cholesterol (2.55 mmol/L versus 3.16 mmol/L; p<0.03), TG (0.99 mmol/L versus 1.04 mmol/L, p<0.03); the coefficient of atherogeny (3,10 mmol/L versus 3.24 mmol/L, p<0.03).

In the group of children with signs of comorbidity, there was a certain increase in the PTI and probable prolongation of the TrT (p<0.03), compared with the group without comorbid diseases. Children with JIA coagulation system parameters were also studied in a group of patients with signs of kidney damage. There is a probable increase in the PTI (p<0.05), which may indicate a predisposition to thrombosis.

It was found that in children with JIA with the presence of atherogenic changes in the lipid blood spectrum, there are signs of the hypercoagulation with parameters of the PTI (89,70±0,74% vs. 94,05±3,11%, p<0.05); fibrinogen (3.55±0.25 vs. 3.96±0.21 g/L, p<0.05) and the level of d-dimer (0.25±0.08 units versus 0.82 ±0.13 units), p<0.01).

Thus, in children with JIA, with signs of comorbidity, signs of hypercoagulation are established, especially in the presence of violations of the lipid profile of the blood. Regression analysis has shown that the greatest interaction exists between atherogenic dyslipidemia (the coefficient of atherogenicity) and d-dimer.

**Conclusions:** The obtained results confirm that the formation of comorbid pathology in children with JIA takes place against the backdrop of a close relationship between atherogenic changes in the lipid blood spectrum (the coefficient of atherogenicity) and signs of hypercoagulation (TG, d-dimer).

**AB1111 ARTHRITIS IS NOT A PREREQUISITE DISEASE MANIFESTATION FOR THE DIAGNOSIS OF SYSTEMIC JIA: RESULTS OF A PROSPECTIVE COHORT TRIAL USING RIL-1RA AS FIRST LINE TREATMENT WITH LONG TERM FOLLOW-UP**

N.M. Terhaar<sup>1</sup>, A. Leek<sup>1</sup>, A. El Idrissi<sup>1</sup>, J.F. Swart<sup>1</sup>, J. van Loosdregt<sup>2</sup>, N. Wulfraat<sup>1</sup>, S. de Rook<sup>1</sup>, S. Vastert<sup>1</sup>. <sup>1</sup>*Pediatric Rheumatology and Immunology*; <sup>2</sup>*Laboratory for Translational Immunology, University Medical Center Utrecht, Utrecht, Netherlands*

**Background:** Systemic onset juvenile idiopathic arthritis (sJIA) is a multifactorial disease, characterised by arthritis, spiking fever, skin rash, lymphadenopathy, hepatosplenomegaly and/or serositis, in combination with increased inflammatory parameters as erythrocyte sedimentation rate (ESR), C-reactive protein (CRP) and ferritin. sJIA is nowadays seen as a complex autoinflammatory disorder. However, in the current ILAR classification, sJIA is still classified under the umbrella of JIA. The past decade has learned that the mechanisms underlying the systemic inflammation in sJIA differ in important aspects from the other subtypes like polyarticular JIA.

**Objectives:** Here we compare disease characteristics, manifestations and response to treatment of ILAR-criteria fulfilling sJIA (n=30) and 'sJIA without arthritis' (n=12), in order to evaluate whether arthritis should still be a prerequisite for the diagnosis of sJIA.

**Methods:** We included 30 consecutive diagnosed and prospectively followed new onset sJIA patients as well as 12 'sJIA without arthritis' from our paediatric rheumatology clinic from 2008 until 2017. The 'sJIA without arthritis' patients underwent extensive diagnostic procedures to exclude infections (PCR, blood cultures, serology etc), malignancies (bone marrow punctures, PET scans etc) and other diagnoses.

All patients followed a standardised treatment protocol, starting with rIL-1RA (2 mg/kg) as 1st line treatment (without steroids), as previously described.<sup>1</sup> In case of partial response, rIL-1RA dose was raised to 4 mg/kg with a maximum of 200 mg/day. If that failed, corticosteroids were added and/or patients switched to alternative biologicals as canakinumab or tocilizumab. If patients had inactive disease at 3 months after start of rIL-1RA treatment, rIL-1RA was tapered for a month (alternate day regimen) and subsequently stopped.

Peripheral blood samples were taken before initiation of rIL-1RA and at all follow-ups for routine lab measurements. For biomarker analyses, serum was isolated at disease onset and at three months after initiation of rIL-1RA.

**Results:** There were no differences in disease manifestations like skin rash, serositis, hepatosplenomegaly or symptoms like arthralgic (painful) joint count between sJIA and 'sJIA without arthritis' patients at diagnosis. Nor was there a difference in the levels of CRP, ESR, ferritin or IL-18 at start of therapy.

Importantly, also the response to rIL-1RA treatment did not differ between sJIA and 'sJIA without arthritis' patients in our cohort. At last follow-up (median 5.8 years, IQR 2.9–7.6 years), 95% of patients had inactive disease, of which 72% off medication.

**Conclusions:** Based upon disease manifestations and inflammatory parameters in patients with confirmed sJIA and 'sJIA without arthritis' at disease onset and on excellent treatment responses to a standardised treatment protocol with rIL-1RA as 1st line treatment, we conclude that arthritis should not be a prerequisite disease criterion in the next classification criteria of sJIA.

**AB1112 AUTOANTIBODIES IN CHILDREN WITH JUVENILE ARTHRITIS ON BIOLOGICAL THERAPY**

O.A. Oshlyanska. *connective tissue disorders in children, State Institute of Pediatrics, Obstetrics and Gynecology, Academy of Medical Sciences of Ukraine, Kyiv, Ukraine*

**Background:** Antinuclear antibodies (ANA) are described as initial serological findings in juvenile idiopathic arthritis (JIA). SLE-like syndromes with ANA seroconversion have been described in the patients on biological therapy, including JIA children. Biologicals have been used in Ukraine since 2011. In 459 of 2,542 JIA cases registered in 2016, patients were on biologicals. According to the data of the Ukrainian Registry of Patients Receiving Biologicals, autoimmune diseases as complications of biological therapy have not been registered in Ukraine so far.

**Objectives:** To study the ANA dynamics in JIA children on biologicals.

**Methods:** There was conducted a retrospective observational study which involved 138 JIA patients, including 44 children with the biologicals as follows: TOZ 12, ADA 29, ETA 3. JIA markers (HLA B27 (PCR), RF (ELISA), aCCP

(immunosorption), ANA (IFT and ELISA (10 subtypes) were determined in patients at the disease onset and after 1, 2, 5 years of biologicals medication.

**Results:** Among all JIA patients, ANA were detected in 54% of oJIA, 47% of pJIA, 7% of all spondyloarthropathy (spA) cases. At the beginning of biologicals, only 22% children were ANA-positive, 66% of them being female, mean age at the disease debut was 6.9±3.81 y. The median of the time from the disease onset to the initiation of biologicals was 4.2±3.2 y. The mean age at biologic therapy start was 10.3±4.18 y. At the time of the examination, the mean duration of biologicals was 2.4±1.46 y. In pJIA onset ANA were detected in 62% of patients, in oJIA with uveitis in 75%, in spA in 14.2%; in sJIA ANA were not identified. RF and aCCP were found in 2 pJIA children; HLA B27 was detected in 1 child with uveitis and in 64.2% of patients with spA. The data obtained showed that ANA were found more often in patients on biologicals than in general JIA population (pJIA, p=0.04, oJIA, p=0.02), RF was lower (4.5%) (p=0.001). The relationship with the sex was not seen (r=0.19). 21.4% of patients had been ANA positive before ADA therapy initiation. Reverse seroconversion was seen in most patients after a year of ADA therapy (3.5% remained ANA+, reduced ANA titer). After 2 year medication, ANA were detected by IFT in 3 seronegative at the disease debut patients (7.1%). They had negative antibodies to histones and aDNAII (ELISA). After 5 y, 2 patients on ADA remained ANA+. Among patients on ADA, who had ANA as a new phenomenon there were 2 female and 1 male teens in disease remission. They had no clinical manifestations of secondary autoimmune pathology. All the patients continued methotrexate, corticosteroids were discontinued in 2 of them. All patients were on isoniazid medication for over a year. In RF +patients on ADA, the RF was not detected a year later, after 2 y it was revealed in 1 pJIA patient who was RF-neg (aCCP neg). There was 1 RF +case at pJIA debut with TOZ, after the therapy it was not detected. Two paediatric patients on TOZ (16.6%) were ANA +at the debut, but the subsequent dynamics studies did not detect ANA (TOZ vs ADA, p=0.04). Patients treated with ETA were observed for less than 1 year.

**Conclusions:** ANA types which are detected at JIA debut and after initiation of biologic treatment may differ. It is suggestive of the biologicals potential to modify the immune response, thus increasing the risk of overlap-syndromes. Therefore, it is advisable to monitor autoantibody titers in JIA children on biologic treatment.

**AB1113 PREVALENCE OF GENERALISED JOINT HYPERMOBILITY IN THE CHILDREN POPULATION OF ORDU; TURKISH STUDY**

Ö.F. Barçak<sup>1\*</sup>, S.S. Dedeoğlu<sup>2</sup>. <sup>1</sup>*Physical Medicine and Rehabilitation, Özel Ünye Çakırtepe Hastanesi, Ordu*; <sup>2</sup>*Orthopedics and Traumatology, Okmeydanı Training and Research Hospital, İstanbul, Turkey*

**Background:** Generalised Joint hypermobility (GJH) is a clinical conditions that may cause common musculoskeletal pain during childhood. In our study, we aim to show the prevalence of GJH in children of 11–18 age group, and to provide guiding information for rheumatologists and paediatricians who are interested in this subject.

**Objectives:** Our study aimed to evaluate the frequency of GJH in children aged 11–18 years in the province, Ordu.

**Methods:** This cross-sectional study was performed with 410 students aged 11–18 years who receive education in the province, Ordu. Questionnaire forms were filled in, and each student was examined. The children, who reported to have any disease, were excluded from the study. GJH was diagnosed according to criteria of Beighton diagnosis.

**Results:** A total of 410 students, 210 of whom were girls (51.3%) and 200 (48.7%) of whom were boys, participated in the study. The subjects' mean age was 13.7±1.7 years for girls and 13.1±1.79 years for boys. The body mass index (BMI) of the girls was 21.5±3.4 kg/m<sup>2</sup> and of the boys were 22±3.8 kg/m<sup>2</sup>. 160 (39%) of the students participated from the city centre and 250 (61%) from the district centres. The presentations of the students to the health institution due to any complaint in 1 year were examined. The students participating in the study were questioned in terms of presence and time of previous joint complaints. Accordingly, the number of participants who previously had a joint-related complaint was found to be 155 (37.8%). 40 (10.7%) of these participants had a joint-related complaint 3 months ago, 18 (4.3%) had it 6 months ago, 40 (9.7%) had it 1 year ago, and 47 (11.4%) had it more than one year ago. The frequency of GJH was 8.7%. 24 of 36 participants in whom GJH was detected and had a Beighton score of 5 and above consisted of girls; and this was 11.4% of the girls. The number of male participants in whom GJH was detected, was found to be 12; and this was 6% of the boys. There was a significant difference between female and male participants in terms of the frequency of GJH (p=0.021). A statistically significant and highly negative correlation was found between age and Beighton score (r=-0.182, p<0.001). A statistically significant and highly negative correlation was found between body mass index and Beighton score (r=-0.092, p<0.05).

**Conclusions:** One of the most common complaints seen during the childhood is musculoskeletal system pain. As shown by various studies performed, one of the significant reasons of extremity pain is GJH.<sup>1</sup> In our study, no significant correlation was found between GJH and joint pain. GJH is a disease that may cause musculoskeletal system pain during childhood. In our study which investigates the frequency of GJH in our region, we detected the GJH prevalence as 8.7. GJH is a clinical syndrome that is characterised with the fact that the joints have a range of motion above normal levels without a correlation with any systemic rheumatismal disease. The specific definition of GJH was shown by Kirk et al. in 1967.<sup>2</sup>

#### AB1114 SYSTEMIC JUVENILE IDIOPATHIC ARTHRITIS: A SINGLE CENTRE EXPERIENCE

K. Barut, G. Tarcin, G. Tahaoglu, S. Sahin, A. Adrovic, O. Kasapcopur. *Pediatric Rheumatology, Istanbul University, Cerrahpasa Medical School, Istanbul, Turkey*

**Background:** Juvenile idiopathic arthritis (JIA) is the most common chronic rheumatic disease in childhood, divided into several subgroups. The sJIA could be presented by monocyclic, polycyclic or persistent polyarticular clinical course. Macrophage activation syndrome (MAS) represents the most devastating complication that could appear during the disease course. Studies on follow up, treatment response and disease complications of the sJIA patients are sparse and rare.

**Objectives:** To evaluate demographic and clinical characteristics and to explore the long-term treatment response and disease complications in a large cohort of sJIA patients from the single centre.

**Methods:** Demographic and clinical features of the sJIA patients were reached from the patients's archives. The frequency of disease flares, treatment response and side effects were recorded for each patient.

**Results:** A total of 168 sJIA patients were included in the study: 87 (51.8) female, 81 (48.2) male. The clinical features are shown in table 1. Fifty-three (31.5) patients had monocyclic while 23 (13.7) patients had polycyclic clinical course (mean recurrence of attacks 2.5±2 (IQR:1–4)); in 38(.42) Polyarticular course was present in 92 (54.8) patients. Initially diagnosis of patients were: infection in 86 (51.1), sJIA in 34 (20.4), acute rheumatic fever in 19 (11.3), urticaria in 10 (5.9), Kawasaki disease in 4 (2.4) and juvenile systemic lupus erythematosus in 2 patients.

The most common disease complications were: MAS in 20 (11.9), growth retardation in 19 (11.3) and vertebral fracture due to osteoporosis in 3 (1.9) patients. Gastrointestinal symptoms secondary to methotrexate intolerance that led to cessation of treatment were present in 9 (7.1) patients. Among 5 (2.9) patients that developed tuberculosis, 4 (2.3) were under etanercept treatment.

All of the patients were treated with corticosteroids: a doses of 2 mg/kg/day in 118 (70.2) patients and pulse steroids in 50 (29.8) patients with severe clinical presentation. The methotrexate was used in 126 (75), leflunomide in 5 (3), cyclosporine A in 29 (17.3), intravenous immunoglobulin in 19 (11.3), anakinra in 27 (16.1), canakinumab in 27 (16.1), tocilizumab in 18 (10.7), etanercept in 50 (29.8) and adalimumab in 7 (4.2) patients. The median time to remission after the initial treatment with corticosteroids was 4 (IQR:2–4) months. The remission off medications was achieved in 82 (48.8) while remission on medications was achieved in 83 (49.4) of patients.

Table: Demographic, clinical features of sJIA

Female/male	87 (51.8)/81 (48.2)
Mean age at disease onset	76.7±54.5 months (IQR: 28–118)
Mean age at diagnosis	79.7±54.5 months (IQR: 33–121)
Clinical features, n(%)	
- Typical fever	160 (95.2)
- Typical rash	99(59)
- Lymphadenopathy	45 (26.8)
- Hepatosplenomegaly	70 (41.7)
- Arthritis/arthralgia	143 (85.1), 25 (14.9)

**Conclusions:** Systemic JIA is a subtype of JIA characterised by significant morbidity and mortality rate with macrophage activation syndrome being the most severe disease complication. Corticosteroids represent the main treatment modality. Biological agents should be considered in the steroid-resistant patients.

The clinical remission could be achieved and chronic arthritis sequelae could be prevented in a majority of patients with biological agents.

#### AB1115 SYSTEMIC LUPUS ERYTHEMATOSUS IN PAEDIATRIC POPULATION- A SINGLE CENTRE STUDY FROM INDIA

P.P. Giri<sup>1</sup>, P. Pal<sup>2</sup>. <sup>1</sup>pediatrics; <sup>2</sup>ich, kolkata, India

**Background:** systemic lupus erythematosus is an autoimmune disease that can be manifest in paediatric population in various ways. It is characterised by widespread inflammation of the blood vessels and connective tissues with positive autoantibodies. Though it is a chronic disease it can be fatal at times.

**Objectives:** 1. To study the diversity in clinical and laboratory profile in paediatric systemic lupus erythematosus patients at a tertiary care centre in Kolkata.

2. To identify the poor prognostic factors at the time of admission to the hospital.

3. To quantify the drug related adverse effects in follow up.

**Methods:** Both old known cases and newly diagnosed cases of paediatric SLE who presented to our rheumatology follow up clinic over last 18 months were retrospectively reviewed for their clinical and immunological presentation. SLICC diagnostic criteria has been applied to define a positive case.

**Results:** A total number of 64 patients were evaluated, among which 54 were girls and 10 were boys with a sex ratio of 5.4:1 favouring girls. Mean age on presentation was 9.9 years with a range of 2.5 to 16 years. Among the clinical presentation fever (72%) was the most common symptom, followed by skin manifestation (68.8%), musculoskeletal involvement (53.1%), haematological involvement (37.5%). Renal involvement was seen in 35.9%, among which 59.1% had stage IV lupus nephritis, and central nervous system involvement was observed in 10.9%. Among immunological profile, ANA was positive in 95.3%, anti-double-stranded DNA was positive in 92.1% and low complement levels were seen in 92.1%. Antiphospholipid antibody was seen in 7

patients (n=21) and anti-Smith antibody in 3 (n=4). All the patients required therapy with steroids and hydroxychloroquine. Steroid sparing agents like azathioprine (54.7%), cyclophosphamide (28.1%), mycophenolate mofetil (23.4%), methotrexate (18.7%), and rituximab (10.9%) were also used.

**Conclusions:** Paediatric SLE has got a varied presentation, and a high index of suspicion is needed for early diagnosis and timely management with multiple drugs of this dreadful disease

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.3921

#### AB1116 MACROPHAGE ACTIVATION SYNDROME: AN EXPERIENCE FROM A TERTIARY PAEDIATRIC CARE SETTING IN EASTERN INDIA

P.P. Giri, P. PAL, J. bhatia. *pediatrics, institute of child health, Kolkata, India*

**Background:** Macrophage activation syndrome (MAS) is a rare but potentially fatal complication of systemic inflammatory disorders occurring most commonly in Systemic arthritis(SJIA) but also being increasingly reported in SLE, Kawasaki disease and Periodic Fever Syndromes. We present a series of 29 cases of MAS encountered in the last 9 years in a tertiary paediatric care setting in eastern India.

**Objectives:** The objective of this study is to evaluate the clinical features, laboratory findings and outcome in MAS; to assess the treatment response to different therapies and to identify the poor prognostic factors.

**Methods:** It is a prospective analysis of data of patients diagnosed as having MAS, between July 2008 and April 2017, admitted in the Department of Paediatrics at Institute Of Child Health, Kolkata.

All patients with Haemophagocytic Lymphohistiocytosis (HLH) secondary to autoimmune or inflammatory connective tissue diseases were included whereas HLH secondary to infections were excluded. Diagnosis of HLH was based on the HLH 2004 criteria. MAS diagnostic criteria for SJIA was laid down in 2014. <sup>Post 2014</sup> we used those criteria in SJIA patients.

The data noted were the clinical and laboratory features, treatment details, the response to therapy and outcome.

**Results:** Twenty nine (n=29) patients were found to have MAS with the primary illness being SJIA in 24 (83%), SLE in 4 (14%) and Kawasaki Disease in 1 (3%). The mean age at presentation was 5 years 3 months. The male female ratio was 1.2:1. Neurological, cardiac, renal and pulmonary involvement was seen in 21 (72%), 14 (48%), 6 (20%) and 5 (17%) patients respectively. Pulse methyl

prednisolone (30 mg/kg) for 3 days was given in 27 patients. Two patients received hydrocortisone in SJIA MAS secondary to infections (chickenpox, Hepatitis A). In patients unresponsive to steroids IVIG and/or cyclosporine was used. 19 (65%) patients survived whereas 10 (35%) died. Of the 10 who succumbed, the HLH 2004 protocol (including etoposide) was used in 2 who were refractory to pulse methylprednisolone +cyclosporine +IV Ig, but without any success. 2 patients on Tocilizumab had silent MAS.

Ferritin >50000 ng/ml was seen in 11 patients of which 8 died. Chi square test of significance was done and p value (0.001) was significant for mortality in patients with ferritin >50000 ng/ml, with a positive correlation (0.613).

Patients with cardiovascular involvement especially pericardial effusion in SJIA was observed to have higher mortality but no statistical correlation could be made. **Conclusions:** MAS is a fatal complication with a high mortality rate of 35% in our series. Ferritin levels >50,000 ng/ml was associated with high mortality. Early and aggressive intervention with optimal intensive care support maybe life saving.

**Disclosure of Interest:** None declared

### AB1117 ISOLATED CERVICAL ARTHRITIS AS THE SOLE MANIFESTATION OF FAMILIAL MEDITERRANEAN FEVER: A CASE REPORT

R. Dagher<sup>1</sup>, M. Samarani<sup>1</sup>, A. Chelala<sup>2</sup>, M.C. Fadous Khalife<sup>1</sup>. <sup>1</sup>pediatrics; <sup>2</sup>radiology, Notre Dame de Secours University Hospital, Byblos, Lebanon

**Background:** Familial Mediterranean Fever (FMF) is an autosomal recessive disease affecting mainly eastern Mediterranean populations. Fever and Abdominal pain are the 2 most prevalent features. The most common arthritic manifestation of FMF is acute self-limiting monoarthritis. 5% of FMF patients develop chronic erosive arthritis. FMF mutation M694V has been associated to an increased risk of spondylarthropathy.

**Objectives:** We report the case of a child with cervical spine inflammation as the sole presentation of FMF.

**Methods:** A boy born to non-consanguineous parents presented at the age of 4 with complete blockage of his neck. He was described to have experienced progressive neck stiffness since the age of 3 years. His history is notable for intermittent limp at the age of 1 with complete spontaneous remission, and possible recurrent fever in the first 2 years of life. Family history is negative.

His physical exam revealed a painful and completely blocked neck in all movements, and stubby fingers. He had failure to thrive and a big belly without hepatosplenomegaly. Cognitive development was normal.

Laboratory tests revealed increased inflammatory markers. Other biological tests were insignificant. ANA, RF, anti-CCP and HLA B27 were negative. Lysosomal enzyme activities were normal ruling out mucopolysaccharidosis, mucopolidoses and multiple sulfatase deficiencies. Work-up for failure to thrive was noncontributory. Ophthalmic screening showed no abnormalities.

Cervical spine plain radiographs were normal. Cervical MRI showed global contrast enhancement of cervical vertebrae and joints with blurring of the osseous contours and synovial inflammation; bone oedema was noted and involved some posterior arcs, spinous processes and pedicles. Sacro-iliac MRI was normal.

The child was treated with oral steroids along with methotrexate and etanercept secondarily due to steroid dependence. Inflammatory markers normalised and clinical improvement was noted as the range of motion of neck increased and pain subsided. Repeated MRI after 6 months showed an almost normal image.

**Results:** Given this atypical isolated inflammation of the cervical spine, genetic testing for FMF was conducted. We identified 2 typical mutations (M694V and M694I) confirming the diagnosis of FMF. Colchicine treatment was started.

Abstract AB1117 – Figure 1

**Conclusions:** To the best of our knowledge, this is the first report of FMF masquerading as neck arthritis. Early spondylarthropathy is a possibility, but this

unusual neck inflammation might be an isolated arthritis associated to FMF. Based on this clinical presentation, in the setting of atypical arthritis, diagnosis of FMF is to be raised in at-risk ethnicities, even in the absence of familial history and common clinical signs.

### AB1118 PROCALCITONIN DIFFERENTIATES INFECTION FROM ACTIVE DISEASE IN PATIENTS WITH JUVENILE IDIOPATHIC ARTHRITIS (JIA)

R. Trachtman<sup>1</sup>, E.T. Murray<sup>2</sup>, N. Pan<sup>1</sup>, S.S. Toussi<sup>1</sup>, M.E. Nellis<sup>3</sup>, J. Szymonińska<sup>2</sup>, S.F. Taber<sup>1</sup>, A.B. Adams<sup>1</sup>, K.B. Oneil<sup>1</sup>, L.A. Mandl<sup>1</sup>. <sup>1</sup>Hospital for Special Surgery/Weill Cornell Medicine; <sup>2</sup>Hospital for Special Surgery; <sup>3</sup>Weill Cornell Medicine, New York, USA

**Background:** Patients with JIA often present with signs and symptoms suggestive of infection. However, differentiation of infectious from non-infectious presentation in routine clinical care is challenging. Procalcitonin (PCT) is a serum biomarker elevated in the setting of bacterial infection, but whether it can reliably differentiate infection from disease flare in patients with JIA is unknown. [1]

**Objectives:** To test the hypothesis that PCT levels will differ between active JIA, quiescent JIA, bacteremic patients and healthy controls.

Abstract AB1118 – Table 1. Patient Characteristics

	Active Untreated JIA (n=12)	Quiescent JIA (n=15)	Healthy Controls (n=16)	Bacteremic Patients (n=5)
Age, years (median, IQR range)	9.0 [2.4–12.8]	14.5 [9.9–17.4]	14.4 [13.9–15.5]	1.1 [0.8–1.8]
Male Gender	5 (41.7%)	3 (20.0%)	6 (37.5%)	3 (60.0%)
Race				
Caucasian/White	7 (58.3%)	14 (93.3%)	12 (75.0%)	2 (50.0%)
AA/Black	1 (8.3%)	0 (0.0%)	3 (18.8%)	1 (25.0%)
Asian	3 (25.0%)	1 (6.7%)	0 (0.0%)	1 (25.0%)
Other	1 (8.3%)	0 (0.0%)	1 (6.3%)	0 (0.0%)
Hispanic Ethnicity	2 (16.7%)	2 (13.3%)	1 (6.3%)	1 (20.0%)
Private Insurance	7 (58.3%)	14 (93.3%)	14 (87.5%)	4 (80.0%)

Abstract AB1118 – Table 2. Laboratory Data

	Active Untreated JIA (n=12)	Quiescent JIA (n=15)	Healthy controls (n=16)	Bacteremic patients (n=5)	p-value
WBC (mean, SD)	8.9±4.4	7.7±1.6	6.7±1.7	13.1±12.1	0.06
ESR (median, IQR)	6.0 [4.0–46.0]	8.0 [5.0–10.0]	8.0 [5.0–10.0]	43.0 [20.0–66.0]	0.18
CRP (median, IQR)	0.27 [0.12–6.48]	0.31 [0.16–2.65]	0.44 [0.12–1.85]	16.63 [7.76–25.68]	0.067
PCT (median, IQR)	0.00 [0.00–0.00]	0.00 [0.00–0.00]	0.00 [0.00–0.00]	5.78 [4.26–52.00]	<0.001

**Methods:** From 10/16–4/17, consecutive children 6 months – 18 years with a) active untreated JIA b) quiescent JIA and c) healthy pre-surgical candidates were recruited from a musculoskeletal specialty hospital. JIA was defined according to ILAR criteria. Patients with active JIA despite treatment were excluded, to avoid

confounding by treatment. Consecutive bacteremic patients were identified from an associated paediatric intensive care unit over the same period. Descriptive statistics and univariate logistic analyses were performed as appropriate.

**Results:** Patient characteristics are summarised in Table 1; bacteremic patients were younger. PCT was elevated in bacteremic patients, and was undetectable in all other subjects (Table 2). There were trends towards higher ESR and CRP in bacteremic patients, but these were not statistically significant.

**Conclusions:** Serum PCT levels appear to be a reliable biomarker to distinguish infection vs. active JIA at presentation, and can aid in directing therapy. However, PCT does not appear useful to assess disease activity in JIA. Further studies are needed to assess utility of serum PCT measurement in differentiating JIA flares from less severe infections.

#### CLINICAL, THERAPEUTIC CHARACTERISATION AND TIME TO ACHIEVE REMISSION ANALYSIS OF A COLOMBIAN COHORT WITH JUVENILE IDIOPATHIC MYOPATHY

R. Fuentes<sup>1</sup>, M. Cañola<sup>1</sup>, J.C. Diaz-Coronado<sup>2</sup>, A. Rojas-Villarraga<sup>2</sup>, D. Hernandez-Parra<sup>2</sup>, P. Perez-Estrada<sup>2</sup>, J.C. Salazar-Urbe<sup>3</sup>, R. Pineda-Tamayo<sup>2</sup>. <sup>1</sup>Rheumatology Department; <sup>2</sup>Clinical Research, Artmedica; <sup>3</sup>National University of Colombia, Medellin, Colombia

**Background:** The clinical characteristics of paediatric patients with idiopathic inflammatory myopathies differ from adults in several aspects. Its clinical presentation can include amyopathic onset and the skin involvement has different characteristics

**Objectives:** To describe a Colombian cohort with Juvenile Myositis (JM) recruited in a rheumatology facility.

**Methods:** A cross-section retrospective research with data collected between 2014 and 2017 from a population diagnosed before 16 years of age with Idiopathic Myopathy according to Peter and Bohan criteria and followed up for at least six months. Kaplan-Meier curves were performed to analyze time to achieve remission.

**Results:** Out of 37 patients, one was excluded for having a dystrophy myopathy gene, 73% fulfilled definitive and 16% probable Bohan and Peter criteria; most patients were female 75.8%,<sup>26</sup> with mean age of onset 7.2 years, and clinical remission was achieved on average at 4 years of disease. There was high prevalence of Gottron's sign and papules (89%), Heliotrope rash (62%) and Calcinosis (37%). Other involvements are described in Table 1. Antinuclear antibodies were positive in 52%. Electromyography (EMG) was positive for myopathy in 39% of the patients. Biopsy was compatible with myopathy in 10% and was negative in 32% of the patients. The most common treatment was methotrexate (91%) followed by antimalarials (72%) and corticoids (56.7%). Medication used in severe forms included Cyclophosphamide (5%), Rituximab (16%) and IV Immunoglobulin (5%). Kaplan-Meier curves showed an earlier time to remission in patients with Gottron sign compared to patients without them (HR:8.25 HR CI95%IL:1.076–63.3;p=0.042 and in childrens younger than 15 years compared to older patients (HR: 2,529 HR95%IL: 1,084–5,901, p: 0,039).

**Abstract AB1119 – Table 1.** Clinical characteristics of Colombian patients with JM.

Characteristics in JM n=37	N	%
Symmetrical muscle weakness	27	72,97
Gottron's papules	33	89,19
Heliotrope rash	23	62,16
Calcinosis cutis	14	37,84
Gastrointestinal involvement	6	16,22
Pulmonary involvement	4	10,81
Articular involvement	9	24,32
Amyopathic	9	24,32
ANA(+)	14/ 27	37,84
EMG Myopathic changes	9/23	24,32
Biopsy-proven myopathy		
Positive	4	10,81
Negative	12	32,43

**Conclusions:** Our results agreed with those obtained in other multi-centred studies including latin america that evaluated clinical and therapeutic characteristics in children with myopathy, Gottron's sign and papules being the most common findings and with high rates of calcinosis and joint involvement. There was a significant difference between remission lapse in patients younger than 15 years compared to older ones.

AB1120

#### THYROID HORMONE CONCENTRATIONS IN CHILDREN WITH JUVENILE IDIOPATHIC ARTHRITIS FROM A SINGLE TERTIARY REFERRAL CENTRE

R. Eremciuc<sup>1,2</sup>, N. Revenco<sup>1,2</sup>. <sup>1</sup>Paediatric Department, State University of Medicine and Pharmacy "Nicolae Testemitanu"; <sup>2</sup>Paediatric Rheumatologic Unit, Scientific Research Institute for Mother and Child Health Care, Chisinau, Moldova, Republic of

**Background:** Despite mounting evidence linking both endocrine disorders and rheumatic diseases, there is a lack of studies investigating any association between the prevalence and clinical characteristics of thyroid disorders and juvenile idiopathic arthritis (JIA).

**Objectives:** The aim of this study is to assess the prevalence of abnormalities in thyroid function in patients with JIA, and to investigate the possible association between this endocrine disorders and specific disease activity markers.

**Methods:** Thirty patients diagnosed with JIA according to the International League of Association for Rheumatology were screened for thyroid diseases. We performed stratified analyses by sex, age, subtype of JIA, disease duration, the Juvenile Arthritis Disease Activity Score (JADAS-71), clinical peculiarities, laboratory values and ultrasound examination of thyroidal gland.

**Results:** Our results revealed that 67% of patients were girls. The mean age of the studied group was 127,56±8,8 months, the median age at diagnosis was 74,33±8,49 months and the median disease duration was 50,83±9,33 months. The most frequent types of JIA were oligoarticular (40%), polyarticular negative RF (34%) and systemic (20%). The median JADAS-71 score was 16,91±1,64 [range values from 5 to 34]. The status of the thyroid function in those patients was euthyroidism. Contrary to other findings in the literature, a high free triiodothyronine was recorded in 33% of cases. However, specific antibodies as antithyroglobulin and antithyroid peroxidase were not detected in any patients. The ultrasound examination of thyroidal gland revealed abnormalities in 30% cases, most of them cystic changes (26,6%) and hypo-echogenicity (23,33%). In 2 cases were detected 2 thyroid nodules. Furthermore, 2 patients presented mean thyroid volume above 2SDS according their age reference values. An increased vascular flow pattern on Doppler examination of thyroidal gland was found in 10% cases. Correlation and regression analysis showed low age at diagnosis and JADAS-71 score (more than 20) to be predictors for those thyroid disorders.

**Conclusions:** The goal of early identification of endocrine comorbidities in rheumatic diseases is to prevent and limit the clinical disease impact. The identification of autoimmune diseases in preclinical stage secondary to juvenile idiopathic arthritis allow a better disease control and quality of life.

AB1121

#### EVALUATION OF CASES DIAGNOSED WITH CRMO; SINGLE CENTRE EXPERIENCE

S. Cekic, Y. Karali, S.S. Kilic. *Uludag University, Bursa, Turkey*

**Background:** Chronic recurrent multifocal osteomyelitis (CRMO); is a rare auto-inflammatory bone disease characterised by recurrent, sterile inflammatory

lesions occurring primarily in children and adolescents. Symptoms of presentation may range from mild unspecific bone pain, local swelling and warmth to severe pain, malaise, fevers and even fractures.

**Objectives:** In this study, we aimed to evaluate our patients who had a diagnosis of CRMO, retrospectively.

**Methods:** Six patients who were diagnosed with CRMO between 2010–2017 years were included in the study. The CRMO diagnosis was based on characteristic clinical features and magnetic resonance imaging findings. The clinical data were obtained from the records of electronic files.

**Results:** The female to male ratio of the cases was 4/2 and the median age was 11.15 years.<sup>6–12</sup> The age of diagnosis was 10.35 years (4–12.5), the median period for diagnosis delay was 3 years (0.75–8). The most common complaint was localised pain (n=6, 100%). Accompanying diseases were detected in 3 patients; 1 case had inflammatory myositis, 1 case had PFAPA syndrome and 1 case had selective IgA deficiency. Multifocal bone involvement was present in 4 (66%) cases and unifocal bone involvement in 2 (33%) cases. The most common site of disease was femur. Acute phase reactants were high most of the cases; elevated erythrocyte sedimentation rate (ESR) in 5 cases (83.3, n=6), elevated c-reactive protein level in 4 cases (66.6%, n=6), elevated serum amyloid A level in 3 cases (60%, n=5), and elevated fibrinogen in 2 cases (50%, n=4) were present. ANA was found positive at low titer in only 1 case, whereas rheumatoid factor was negative in all cases. Non-steroidal anti-inflammatory drugs were prescribed in all cases and anti TNF drugs in 3 (Etanercept in 2 cases and adalimumab in 1 case). Clinical characteristics of the patients are given in Table 1.

**Abstract AB1121 – Table 1.** Clinical findings of the cases

Initial complaints of cases	n	%
Pain	6	100
Walking abnormality	4	66.7
Swelling on bone	1	16.7
Weight loss	1	16.7
<b>Distribution of involved bones</b>		
Femur	4	66.7
Iliac bone	2	33.3
Tibia	2	33.3
Calcaneus	1	16.7
Vertebral column	1	16.7
Acetabulum	1	16.7
<b>Treatment</b>		
Ibuprofen	3	50
Naproxen Na	2	33.3
Aspirin	1	16.7
Indomethacin	1	16.7
Adalimumab	1	16.7
Etanercept	2	33.3

**Conclusions:** The diagnosis of CRMO is difficult and no consensus exist on diagnosis and treatment. Multifocal bone lesions with characteristic radiological findings are very suggestive of CNO. The first line treatment is usually NSAIDs, however, anti TNF treatment are needed in some patients to achieve for remission. Our case is the second one who had inflammatory myositis and CRMO according the literature.

**Disclosure of Interest:** None declared

#### AB1122 DIALYSIS TREATMENT OF SYSTEMIC VASCULITIS IN PAEDIATRIC PATIENTS

P. Miteva<sup>1</sup>, D. Roussinov<sup>1</sup>, R. Shumaliev<sup>2</sup>, S. Monov<sup>2</sup>. <sup>1</sup>Department of Pediatrics, Clinic of Pediatric Nephrology and Dialysis; <sup>2</sup>Department of Internal Medicine, Clinic of rheumatology, Medical University – Sofia, Sofia, Bulgaria

**Background:** Childhood-onset systemic vasculitis is a rare but serious condition with high mortality rate even with proper treatment. Renal involvement at presentation is a high risk for end stage renal disease (ESRD).

**Objectives:** The aim of our study was to review the results of the dialysis treatment in paediatric patients with systemic vasculitis in a single dialysis centre for children in Bulgaria.

**Methods:** For a period of 20 years we observed 9 clinical cases of systemic vasculitis – 5 cases of Goodpasture syndrome (GPS) – 4 girls and 1 boy from 6 to 17 years old; one 6 year old girl and one 12 year old boy with Granulomatosis with polyangiitis (GPA); an 8 month old boy with microscopic polyangiitis (mPAN), and one 8 year old girl with Takayasu arteritis. Seven of the children were treated by hemodialysis because of progressive kidney failure leading to ESRD, one of them was treated by continuous ambulatory peritoneal dialysis (CAPD) and one conservatively.

**Results:** In the GPS group one of the girls still continues on hemodialysis with no pulmonary symptoms for more than 14 years follow-up. The second girl was treated with immunoadsorption after which reminded antibody negative. On the follow-up she is managed conservatively for chronic kidney disease. Two of the girls died because of severe pulmonary bleeding caused by exposure to fragrant smoke during incense. The boy was treated conservatively because of mild pulmonary and kidney involvement and died from pulmonary bleeding caused by smoke. In the GPA group the girl underwent kidney transplantation and died one month later, and the boy died because of severe pulmonary bleeding. The 8 month old boy with mPAN was treated by dialysis with some clinical improvement but after six months died because of thrombus in the right atrium. The girl with Takayasu arteritis was treated with CAPD but died because of cardiopulmonary complications.

**Conclusions:** End stage renal disease is poor prognostic factor for survival in paediatric patients with systemic vasculitis. 75% of the children died in a period of 5 months after initiation of dialysis treatment.

**Disclosure of Interest:** None declared

#### AB1123 DO CHILDREN WITH JUVENILE IDIOPATHIC ARTHRITIS PLAY AN ACTIVE ROLE IN THEIR TREATMENT ADHERENCE? FIRST RESULTS OF THE RUMAJI STUDY

G. MONTAGU<sup>1</sup>, E. Mevel<sup>1</sup>, L. Rossi Semerano<sup>2</sup>, E. Solau Gervais<sup>3</sup>, S. Trope<sup>4</sup>, J.-D. Cohen<sup>5</sup>, on behalf of ANDAR patient organisation. <sup>1</sup>Sociology and research, Unknowns; <sup>2</sup>Kremlin Bicêtre Hospital, Paris; <sup>3</sup>Hospital, Poitiers; <sup>4</sup>ANDAR, PARIS; <sup>5</sup>Hospital, Montpellier, France

**Background:** Adherence to DMARDs such as methotrexate and biologics is critical for patients with Juvenile Idiopathic Arthritis (JIA). Notwithstanding, few studies exist on that topic and we lack information to understand the grounds for adherence.

**Objectives:** The RUMAJI study aims, among others, to understand and decipher the parents and children adherence mechanisms and practices.

**Methods:** Qualitative methods were chosen in order to investigate parents' and children's everyday life with JIA and its treatment. An ethnographic study was designed by a multidisciplinary team including rheumatologists, paediatricians, patient associations members and anthropologists. The study involved 15 families (enough to reach saturation), recruited from 5 centres by diversity of clinical and sociological profiles. The panel included 17 children with JIA, 11 girls and 6 boys, median age 10,<sup>3:17</sup> median disease duration 2.5,<sup>1:15</sup> 4 children were treated with conventional DMARDs in monotherapy, 4 with biologic DMARDs in monotherapy, 5 with cDMARD-bDMARD association and 4 with NSAIDs only.

Interviews were conducted by anthropologists at family's home using in-depth semi directive and biographic methods. 3 fields were explored: organisation of everyday life with JIA, treatment practices, impact on school and social activities. Interviews were recorded and transcribed for analysis.

**Results:** Adherence results from an appropriation process of the JIA and treatment that require both an active role from parents and children, even before the transition. This active role played by children could be either stimulated or inhibited at home according to the family's structure, social background and parents' attitudes toward their child (participation to the decision, explanation of the disease).

Children's active role includes in particular: 1) negotiations with parents and physician, 2) experiments with the treatment (forgetting or involuntary switch from the parents, changing the dosage on their own initiative) and 3) participation to the treatment administration and ritualization.

The manner children consider and manage their DMARDs is the result of an arbitration depending on the positive (a) and side effects (b) they felt in their body and the effects noted by the doctors (c) during the examinations and test results. Dealing with these 3 dimensions requires to link together both a theoretical and practical knowledge of JIA. Thus, children build their own and singular knowledge of their disease and treatment, which is a source of control of their body and their life.

**Conclusions:** Qualitative methods, through an ethnographic study starting from children's point of view, underline the active role they play in their care. Adherence to DMARDs could be improved by supporting children's implication as soon as the beginning of JIA.

**Acknowledgements:** This work was supported by an institutional grant from NORDIC Pharma to ANDAR. All medical and patient experts volunteers.

**AB1124 A UK STUDY: VOCATIONAL EXPERIENCES OF YOUNG ADULTS WITH JUVENILE IDIOPATHIC ARTHRITIS**

L.E. Lunt<sup>1,2</sup>, M. Bezzant<sup>3</sup>, A. Bosworth<sup>3</sup>, J.E. McDonagh<sup>1,2</sup>, K. Hyrich<sup>1,2</sup>, W. Thomson<sup>2,4</sup>, S. Verstappen<sup>1,2</sup>, <sup>1</sup>Arthritis Research UK Centre for Epidemiology, Centre for Musculoskeletal Research, Manchester Academic Health Science Centre, The University of Manchester; <sup>2</sup>NHRR Manchester Biomedical Research Centre, Manchester University NHS Foundation Trust, Manchester Academic Health Science Centre, Manchester; <sup>3</sup>National Rheumatoid Arthritis Society (NRAS), Maidenhead; <sup>4</sup>Arthritis Research UK Centre for Genetics and Genomics, Centre for Musculoskeletal Research, The University of Manchester, Manchester, UK

**Background:** Little is known about the experiences of young adults living with Juvenile Idiopathic Arthritis (JIA) preparing for employment and career development.

**Objectives:** The purpose of this study was to understand the impact JIA has on career planning and early employment experiences of young adults (16–30 years).

**Methods:** Using existing literature (including grey literature), an online survey (consisted of 152 questions, 29 items related to young adults two of which were free text questions) was developed and sent to UK National Rheumatoid Arthritis Society (NRAS) members and distributed to non-members via social media tools including Facebook, Twitter and HealthUnlocked. Data collected included views and experiences in career planning and employment. The data pertaining to young adults are presented here.

**Results:** Of 1241 respondents 19 were young adults with JIA (range 16–30 years), 89% were female and 84% had university or equivalent qualifications. Due to incomplete responses there is missing data on all 19 young adults. 4/13 young adults were studying at university, 9/13 were in paid employment. 9/17 respondents reported their school did not offer additional work-related activities to students with disabilities and/or additional needs. 10/14 young adults felt their school did not provide advice about coping with possible limitations on placements/traineeships due to their arthritis. 11/14 respondents did consider their condition when thinking about future career plans e.g. "I wanted to work as a ranger or similar for the National Trust but it's a fairly physically demanding job and I knew my joints would suffer so I changed track slightly". However, 8/14 felt their career advisors at school/university did not take their arthritis into account e.g. "I had to cease my physiotherapy master's degree as my arthritis got too bad to continue and change career choice. I wish there would have been more discussion about it not being a reasonable choice for me at the time as we just didn't have the information then". 8/14 young adults changed their career plans because of their arthritis with managing JIA symptoms and a physically demanding role, as well as wanting to stay healthy, being the main reasons for changing career. Important aspects of employment included: "good relationships with your line manager, work you like doing and a job you can use your initiative".

**Conclusions:** Despite small numbers these results highlight potential current unmet vocational needs of young adults with JIA in the UK and the need for further research with this age group. There appears to be a lack of structured support within schools and universities offered to students with disabilities and/or additional needs, about work-related activities and careers. Young adults with JIA actively consider their condition whilst thinking about career opportunities and value a productive and challenging job with a good working environment, including relationships with colleagues and supervisors.

**AB1125 URINARY SOLUBLE CD25 AS A BIOMARKER OF ACTIVE LUPUS NEPHRITIS IN EGYPTIAN CHILDREN WITH JUVENILE SYSTEMIC LUPUS ERYTHEMATOSUS**

W.A. Hassan<sup>1</sup>, M.Y. Mahgoub<sup>1</sup>, E.G. Behiry<sup>2</sup>. <sup>1</sup>Rheumatology and Rehabilitation; <sup>2</sup>Clinical and Chemical Pathology, Benha University, Benha, Egypt

**Background:** Lupus nephritis (LN) is more prevalent and severe in children than adult and considered a major predictor of poor outcome. Thus, early diagnosis and treatment is associated with better outcome. Soluble CD25 (sCD25), also known as Interleukin-2 receptor alpha chain, is a type I transmembrane protein present on activated T lymphocytes that play important role in the pathogenesis LN.<sup>1</sup>

**Objectives:** This study aimed to measure urinary levels of sCD25 in children with juvenile systemic lupus erythematosus (JSLE) and to investigate its role as a potential biomarker of activity in LN.

**Methods:** We measured sCD25 using enzyme-linked immunosorbent assay in urine samples from 53 JSLE patients and in urine samples from 30 healthy controls and these levels were normalised to creatinine excretion in urine. All JSLE patients underwent thorough clinical examination and disease activity assessment using Systemic Lupus Erythematosus Disease Activity Index (SLEDAI).

Systemic Lupus International Collaborating Clinics (SLICC) renal activity score<sup>2</sup> was used to assess activity of LN.

**Results:** Urinary sCD25 normalised levels were highly significantly increased in JSLE patients (278.38±133.68 pg/mg) compared to urinary level in the healthy controls (187.33±83.59 pg/mg), p<0.001. Also, patients with active LN had significantly higher normalised urinary sCD25 levels (402.69±139.58 pg/mg) compared to urinary level in active JSLE patients without LN (262.18±98.35 pg/mg), p=0.002 and inactive JSLE patients (192.7±66.4 pg/mg), p<0.001. In JSLE patients, urinary sCD25 normalised levels significantly correlated with SLEDAI (r=0.48, p<0.05), renal SLEDAI (r=0.61, p<0.001), SLICC renal activity score (r=0.68, p<0.001) and C3 (r=-0.48, p<0.001).

**Conclusions:** JSLE patients have significantly increased urinary levels of sCD25 especially in those with active LN. Urinary sCD25 levels are remarkably correlated with the renal disease activity scores suggesting that it could be a useful marker to reflect active renal involvement in JSLE patients.

**Background:** Juvenile idiopathic arthritis (JIA) is characterised by chronic inflammation of the joints which can lead to structural bone damage.

**Objectives:** The objective of this study was to evaluate the response of new onset JIA patients to an early targeted treatment by conventional radiography.

**Methods:** JIA patients participating in the BeSt for Kids study (NTR 1574) were eligible in case of wrist involvement at inclusion and if conventional radiographs were available at baseline or within 6 months before or after study inclusion. Follow-up radiographs of hands and wrists after 12–36 months were available for comparison. Radiographic bone damage as reflected by carpal length was assessed using the Poznanski score<sup>1</sup>, providing 'Z' as indication of the deviation from a healthy population as measured by radiometacarpal length relative to the second metacarpal length (RM/M2). BoneXpert method<sup>2</sup> was used to automatically determine bone age and bone mineral density (BMD) of the wrist.

Abstract AB1126 – Table 1

	Baseline Z-score (95% CI)	Compared to healthy population	Follow-up Z-score (95% CI)	Compared to healthy population	Change in Z-score
<b>Poznanski score</b>	0.047 (-0.32 to 0.41)	p=0.795	0.055 (-0.28 to 0.39)	p=0.744	p=0.937
<b>BMD</b>	-0.71 (-1.12 to -0.30)	p=0.001	-0.44 (-0.75 to -0.12)	p=0.008	p=0.032
<b>Bone age</b>	-0.08 (-0.44 to 0.28)	p=0.651	-0.25 (-0.59 to 0.09)	p=0.574	p=0.092

**Results:** Forty JIA (27 female) patients were evaluated for Poznanski score and BMD (mean age 7.2±3.4 years), 26 patients (15 female) were evaluated for bone age (mean age 9.3±2.2 years). Assessed by the mean Z-score of RM/M2, we did not detect wrist damage at baseline nor at follow-up. Assessed by the mean Z-score of the bone age, we did not detect deviating bone age at baseline nor at follow-up. At baseline BMD was significantly diminished compared to healthy

controls (Z-score  $-0.71$ , 95% CI  $-1.12$  to  $-0.30$ ). BMD at follow-up improved significantly (Z-score  $-0.44$ , 95% CI  $-0.75$  to  $-0.12$ ,  $p=0.032$ ). Results are summarised in table 1.

**Conclusions:** In this cohort of JIA patients treated early and targeted at inactive disease, we have detected no radiographic wrist damage at baseline or follow-up as detected by Poznanski score. BMD was significantly diminished at baseline but improved significantly after follow-up.

### AB1127 PULMONARY ARTERIAL HYPERTENSION AND POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES) IN A PATIENT WITH ADULT ONSET STILL'S DISEASE

A. Khan, K. Bhamra, S. El-Ghazali, M. Adler. *Rheumatology, Wexham Park Hospital, Frimley Health Foundation Trust, Slough, UK*

**Background:** Pulmonary arterial hypertension is a rare complication of AOSD and there are only a limited number of case reports in the literature.

PRES is a rare acute neurological condition characterised by rapid onset of headache, seizures, altered consciousness, visual disturbances and usually very high blood pressure. Brain imaging characteristically shows high signal change in the subcortical white matter, predominantly in the posterior lobes which normalises within days to weeks. There are rare case reports of seizures and other neurological manifestations associated with AOSD but no published case reports of classic PRES.

**Objectives:** To share this interesting case with our rheumatology colleagues.

**Methods:** We present a case of 24 year old Afro-Caribbean lady, diagnosed with AOSD in December 2015, presenting with recurrent fevers, weight loss, polyarticular synovitis, small volume lymphadenopathy, evanescent urticarial rash, hyperferritinemia (3700 ug/L) and raised CRP (146 mg/L). Rheumatoid factor, ANA, CCP, ENA and ANCA were negative. Infection screen was negative including blood-borne viruses and whole-body imaging was normal.

She was initially treated with pulsed Methylprednisolone 1 g IV for 3 days followed by 40 mg oral prednisolone. She had a good initial response (ferritin 1700 ug/L, CRP 36 mg/L), but subsequently we were unable to reduce her prednisolone below 35 mg due to recurrence of symptoms.

She had quite a stormy course over the rest of the year with a number of hospital admissions and her ferritin running as high as 35,000 ug/L and CRP more than 200 mg/L.

In February 2017 she had a further severe flare and was started on Anakinra. She initially responded well (Ferritin 400 ug/L, CRP 3 mg/L), but four months later started to flare again, requiring a further admission, treated with IV Methylprednisolone.

She was switched from Anakinra to Tocilizumab but was stopped after 4 doses due to poor response.

Following development of exertional dyspnoea, echocardiography and right heart catheter studies demonstrated a raised mean pulmonary artery pressure of 42 mmHg with severe TR, right sided volume overload and a BNP of 8741 ng/L warranting referral to the regional PAH centre.

She also developed peripheral sensorimotor neuropathy in her lower limbs confirmed by NCS.

**Results:** In December 2017 she was admitted with severe shortness of breath, hypoxia and a ferritin of over 15,000 ug/L. She developed seizures with status epilepticus, very high blood pressure and ended up requiring mechanical ventilation. MRI and CT brain were suggestive of PRES with subcortical high signal change and symmetrical vasogenic oedema in occipital and parietal lobes. She was treated in Neuro ITU with anti-epileptics, anti-hypertensives, IV hydrocortisone and Anakinra was restarted. She made a rapid and full neurological recovery with resolution of changes on her brain scans.

She continues Anakinra, and Cyclosporine 2 mg/kg body weight has been added since. She has also been started on Tadalafil 20 mg BD for her pulmonary arterial hypertension.

Prednisolone has been tapered to 15 mg and she is clinically well with a CRP of 26 mg/L and ferritin of 2600 ug/L.

**Abstract AB1127 – Figure 1**

**Conclusions:** We present a case of life threatening AOSD complicated by pulmonary arterial hypertension, PRES and peripheral neuropathy.

She has unusually severe disease, which is quite refractory to treatment and has been associated with rare manifestations.

### AB1128 EVALUATION OF SERUM VERSICAN LEVELS IN PATIENTS WITH FAMILIAL MEDITERRANEAN FEVER (FMF)

M.E. Derin<sup>1</sup>, I. Karadağ<sup>1</sup>, A.C. Urhan<sup>1</sup>, G. Toksoylu<sup>2</sup>, G. Asan<sup>3</sup>, M. Bayram<sup>3</sup>, H. O. Doğan<sup>4</sup>, M. Şahin<sup>4</sup>, A. Şahin<sup>1</sup>. <sup>1</sup>Rheumatology – Internal Medicine; <sup>2</sup>Internal Medicine; <sup>3</sup>Internal Medicine; <sup>4</sup>Biochemistry Department, Cumhuriyet University Medical Faculty, Sivas, Turkey

**Background:** Familial Mediterranean fever (FMF) is an autoinflammatory disease which has self-limiting inflammatory attacks placing in polyserositis.<sup>1</sup> Versican is an extracellular proteoglycan which interacts with receptors that regulate immune system.<sup>2</sup>

**Objectives:** The aim of this study is to measure serum versican levels between FMF and control group.

**Methods:** Between June 2017 – , September 2017 thirty-seven FMF patients with attack-free period that following-up at Cumhuriyet University Faculty of Medicine Department of Internal Medicine Rheumatology and thirty-five healthy volunteers without any rheumatic, systemic and metabolic diseases were enrolled in this study. Clinical findings of all patients were recorded. Blood tests were examined by Elisa method in Cumhuriyet University Department of Biochemistry.

**Results:** The median age of the FMF patients was 33<sup>(19–64)</sup> years. Of the FMF patients, twenty-one (56.8%) were female and sixteen (43.2%) were male. The median age of control group was 26<sup>(18–38)</sup> years. Of the control group fourteen (40%) were female and twenty-one (60%) were male. The median versican level was measured as 18.3 ng/ml in FMF group and 23 ng/ml in healthy group ( $p<0.05$ ). There was no correlation between eritrosit sedimentation rate (ESR), CRP, fibrinogen, serum amyloid-A (SAA) protein other clinical manifestations, medications and versican levels (table 1).

**Abstract AB1128 – Table 1.** Subgroup analysis in patients with FMF.

	Serum Versican Levels ng/ml (median)	P value
ESR>20 mm/h n=25	20.03	
ESR<20 mm/h n=2	16.5	.597
CRP>10 mg/L n=25	19.2	
CRP<10 mg/L n=12	16.5	.713
Fibrinogen>200 mg/dl n=9	18.2	
Fibrinogen<200 mg/dl n=28	18.7	.986
>40 years n=15	18.2	
<40 years n=22	19.5	.591

**Abstract AB1128 – Figure 1.** Serum Versican levels between FMF and Control groups

**Conclusions:** Serum versican level was statistically significant lower in FMF group than in control. On the other hand, there was no statistically significant correlation between versican levels and other parameters in FMF patients with attack-free period. Clinical trials including FMF patients with attack-period, attack-free period and amyloidosis would be designed in order to investigate the possible role of versican.

#### AB1129 EPIDEMIOLOGICAL AND CLINICAL PROFILE OF PATIENTS WITH PARANEOPLASTIC RHEUMATOLOGIC SYNDROMES IN A SPANISH TERTIARY HOSPITAL

A. Briones-Figueroa, W.A. Sifuentes-Giraldo. *Rheumatología, Hospital Ramón y Cajal, Madrid, Spain*

**Background:** Paraneoplastic rheumatic syndromes (PRS) are defined as rheumatic symptoms caused by a malignancy, but which are not caused directly by the tumour or metastasis. PRS are characterised by a close temporal relationship with an underlying malignancy and fast regression of the symptoms after the treatment of the primary tumour.

**Objectives:** To describe the epidemiological and clinical profile of patients diagnosed with PRS in a Spanish tertiary hospital.

**Methods:** A retrospective observational study was performed, which included all patients who were diagnosed of PRS in our centre during the period 1985–2017. The demographic, clinical and outcome data were obtained from their medical records.

**Results:** During the study period 48 patients with suspected paraneoplastic syndrome were identified, but diagnosis was confirmed in 14 of them, 7 women (50%), with a mean age at diagnosis of 69.8±14.5 years. 42.9% of patients were smokers, 14.3% reported alcohol consumption, 35.7% and 7.1% had personal and family history of neoplasia, respectively; no patient reported personal or family history of autoimmune disease. The comparison between patients with and without PRS is shown in the table, but no significant differences were identified. The most common neoplasm was breast cancer (28.6%). 21.4% of the cases of PRS appeared as a consequence of a tumour recurrence. In 42.9% of patients the diagnostic of the tumour was concomitant to PRS, while the remaining 57.1% SPR was previous. The most frequent paraneoplastic syndrome was polymyalgia rheumatica (42.9%), followed by dermatomyositis (28.6%) and paraneoplastic polyarthritis (28.6%). The most common musculoskeletal manifestation was shoulder girdle pain and stiffness (35.7%) followed by polyarthritis and proximal

muscular weakness (28.5%). 85.7% of the patients had high erythrocyte sedimentation rate and C-reactive protein levels with a mean value of 60.2±39.4 mm/h and 77.6±9.5 mg/L, respectively. Antinuclear antibodies were positive in 7 patients (50%), while rheumatoid factor, anti-CPP and anti-RNP were positive in 1 patient each (7.1%). The response of PRS to the treatment of the tumour was available in 9 patients, of which 6 (66.7%) presented remission of the PRS. Regarding mortality, 5 patients (35.7%) died due to complications associated with the primary tumour.

**Abstract AB1129 – Table 1**

	PRS (n=14)	NO PRS (n=34)	P-value
Age (years)	69,78±14,57	73,23±10,81	0534
Sex (Male)	7 (50%)	14 (41,17%)	0575
Personal history of malignant neoplasm	5 (35,71%)	16 (47,05%)	0471
Personal history of autoimmune disease	0 (0%)	4 (11,76%)	0180
Family history of malignant neoplasm	1 (7,14%)	0 (0%)	0115
Family history of autoimmune disease	0 (0%)	1 (2,94%)	0115
Smoking	6 (42,86%)	13 (38,24%)	0766
Alcoholism	2 (14,29%)	4 (11,76%)	0810

Comparison of the demographic characteristics of patients with and without a diagnosis of paraneoplastic rheumatic syndrome.

**Conclusions:** Polymyalgia rheumatica was the most frequent PRS in our study, in contrast to several published series where other PRS are more common such as hypertrophic osteoarthropathy, polyarthritis and dermatomyositis/polymyositis. The laboratory data and response to treatment of the tumour were similar to those reported in the literature. The mortality in our series was high, but in none of the cases was related directly to PRS.

#### AB1130 LATE ONSET TUMOUR NECROSIS FACTOR RECEPTOR (TNFR)–ASSOCIATED PERIODIC SYNDROME (TRAPS) CAUSED BY SOMATIC TNFRSF1 MOSAICISM

A. Kontzias<sup>1</sup>, S. Zarabi<sup>1</sup>, C. Calabrese<sup>1</sup>, Y.-W. Cheng<sup>2</sup>. <sup>1</sup>Rheumatology and Immunology, <sup>2</sup>Molecular Pathology, Cleveland Clinic, Cleveland, USA

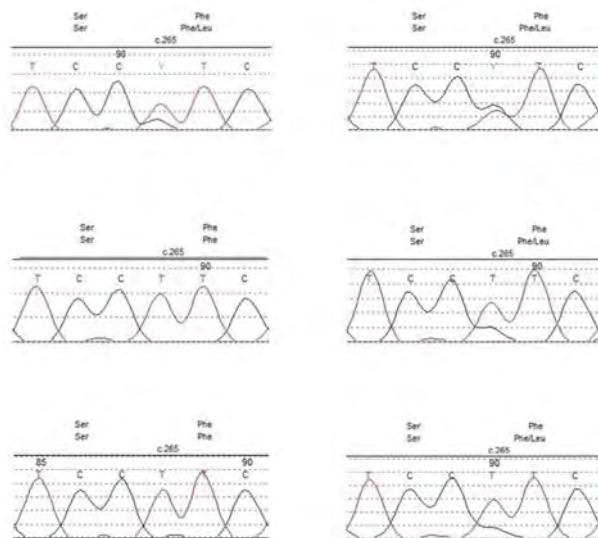

**Background:** Tumour necrosis factor receptor (TNFR)–associated periodic syndrome (TRAPS) is an autosomal-dominant disease caused by gain-of-function mutations in the TNFRSF1A gene, which encodes the 55-kd TNFR type I (TNFRI) protein. Mosaicism has been identified in a single patient. A 60 year old male presented with a 6 year history of intermittent fever as high as 103.5, lasting 3–4 weeks with associated peritoneal symptoms, arthralgias, myalgias, lymphadenopathy, bilateral episcleritis, erythematous rash in his torso. Prednisone up to 60 mg daily and colchicine was ineffective where he responded fully to canakinumab at a dose of 150 mg every 4 weeks.

**Objectives:** To identify the extent of mosaicism in a patient with adult onset TRAPS phenotype.

**Methods:** DNA was extracted from the patient's whole blood, saliva and hair root. The TNFRSF1A gene was analysed by Sanger sequencing in all tissues, whole blood and fractionated cell subsets. *In silico* molecular modelling was performed to predict the structural and functional consequences of the tumour necrosis factor receptor (TNFR) type I protein mutation.

**Results:** Sanger sequencing revealed differential tissue and hematopoietic cell presence of a missense mutation at c.265 T>C p.Phe89Leu (F89L) Chr12 (GRCh37):g.6442960A>G ex3 rs104895245. The mutant allele was present in whole blood and buccal mucosa and absent in hair root, supporting the presence of somatic TNFRSF1A mosaicism. Additionally, quantitative analysis revealed allele frequency of 50% in B cells, 30% in NK cells and 30% in neutrophils. The mutation was absent in T cells and monocytes. *In silico* prediction modelling with SIFT and PolyPhen2 suggested that this mutation led to numerous structural rearrangements which resulted in changes in the protein surface profile.

Abstract AB1130 – Figure 1

**Conclusions:** This is the second reported case of TNFRSF1A mosaicism in a patient with TRAPS, which was attributable to a *de novo* mosaic missense mutation in the TNFRSF1A gene. (c.265 T>C) p.Phe89Leu (F89L). Our results point to a late-onset mutational event at the level of a multipotent hematopoietic stem cell.

#### AB1131 IL-33, A NOVEL CYTOKINE FOR FMF? HOW IS IT RELATED WITH DISEASE PATHOGENESIS?

A.B. Kelesoglu Dincer, E.G. Aydemir Gülöksüz, M. Torgutalp, M.E. yayla, E. uslu yurteri, S. sezer, I.E. okatan, G. Kınıklı, T.M. Turgay, A. Ates, *Rheumatology, ANKARA UNIVERSITY FACULTY OF MEDICINE RHEUMATOLOGY DEPARTMENT, ankara, Turkey*

**Background:** Familial Mediterranean Fever (FMF) is an autosomal recessive inherited autoinflammatory disease characterised with unpredictable attacks of fever, polyserositis and arthritis. The disease is associated with MEFV gene mutation causing dysfunction of pyrin protein. This dysfunction of pyrin is related with aberrant production of proinflammatory cytokines, especially IL-1 $\beta$  and IL-18. IL-33 is a novel proinflammatory cytokine that belongs to interleukin (IL)-1 superfamily. When released from epithelial, endothelial and fibroblasts, it binds to its specific receptor ST2 and induces the production of inflammatory cytokines. IL-33/ST2 pathway has been recently shown to be related with several rheumatological diseases such as rheumatoid arthritis, systemic lupus erythematosus.

**Objectives:** As it is well known that inhibition of IL-1 pathway is the cornerstone of FMF treatment, the aim of this study was to evaluate the role of IL-33, a member of IL-1 family, in the pathogenesis of FMF.

**Methods:** Seventy-six FMF patients and 30 sex-age matched healthy controls were enrolled in the study.

**Results:** The demographic data of FMF patients and healthy controls are demonstrated in Table 1. Serum IL-33 and its soluble receptor ST2 (sST2) were analysed with ELISA. There was no statistically significant difference between IL-33 and sST2 levels in FMF and control groups ( $p=0.687$  and  $p=0.054$ , respectively) (table 1). FMF patients were grouped as active and inactive disease according to Autoinflammatory Disease Activity Index (AIDAI) for the past 31 days and  $\geq 9$  was accepted as active disease. The serum IL-33 and sST2 levels were similar in both active and inactive groups ( $p=0.362$  and  $p=0.706$ , respectively). In active group, C-reactive protein and serum-amyloid A levels were significantly higher than inactive group. ( $p=0.01$ ,  $p=0.015$  respectively) (table 2).

**Abstract AB1131 – Table 1.** The table that shows the characteristics of FMF patients and healthy controls

	FMF (n=76)	Control (n=30)	p
Age (years)	33.8 $\pm$ 11.8	37.0 $\pm$ 8.4	0.123
Female, n (%)	56 (73.7)	18 (60)	0.167
IL-33	3.88 $\pm$ 2.04	3.71 $\pm$ 1.36	0.687
sST2	2756.8 $\pm$ 411.0	2828.0 $\pm$ 118.8	0.054

**Abstract AB1131 – Table 2.** The table that shows the characteristics of active and inactive FMF patients

	Active <sup>24</sup>	Inactive (52)	p
Age (years)	31.8 $\pm$ 10.8	34.8 $\pm$ 12.2	0.310
Female, n (%)	17 (70.8)	39(75)	0.701
IL-33	4.26 $\pm$ 2.73	3.70 $\pm$ 1.64	0.362
sST2	2730.4 $\pm$ 426.8	2769.0 $\pm$ 407.1	0.706
Attackno/year (IQR)	4 (5)	2 (4)	<b>&lt;0.001</b>
AIDAI score(IQR)	16 (16)	0 (3)	<b>&lt;0.001</b>
ESR	17.7 $\pm$ 12.1	12.8 $\pm$ 8.1	0.108
CRP	22.5 $\pm$ 31.3	4.4 $\pm$ 7.7	<b>0.01</b>
Fibrinogen	3.5 $\pm$ 1.3	3.6 $\pm$ 3.3	0.896
SAA	29.9 $\pm$ 41.7	5.4 $\pm$ 8.2	<b>0.015</b>

**Conclusions:** In this study, significant differences were not found in serum IL-33 and sST2 levels neither in FMF vs control nor active vs inactive FMF groups. This may be because of, unlike the other members of IL-1 superfamily, IL-33 mainly induces T helper (Th)2 immune responses. On the other hand, the pathogenesis of FMF is mainly dependent on Th17 cell activation and Th1 cell differentiation via IL-18 induction. As a result, it can be concluded that even if IL-33 is a component of IL-1 family, it has no role in the pathogenesis of FMF. As far as we know, this is the first study in the literature. Therefore, further studies with larger sample size are needed to confirm this result.

#### AB1132 PANNICULITIS IN RHEUMATOLOGY PRACTICE: SPECIFIC FEATURES OF CLINICAL COURSE AND OUTCOMES

B. Belov, N. Savushkina, O. Egorova. V. A. Nasonova *Research Institute of Rheumatology, Moscow, Russian Federation*

**Background:** Panniculitis (Pn) is a heterogenic group of inflammatory diseases with predominant involvement of subcutaneous adipose tissue and may occasionally be seen in clinical practice by many specialists. Although, fever, skin symptoms and joints involvement alongside with pronounced rise of acute phase inflammation reactants are the reasons for referral to a rheumatologist. At the same time absence of clear diagnostic algorithm would result in delayed diagnosis and, consequently, inadequate treatment.

**Objectives:** To assess clinical course and clinical outcomes of panniculitis in current rheumatology practice.

**Methods:** The study included 209 pts on the record at VA Nasonova Research Institute of Rheumatology during 2009–2016 yy. (185 females and 24 males, aged 17–80 years) with referral diagnosis “Erythema nodosum. Non-differentiated panniculitis» and disease duration from 1 week to 25 years. Patients' assessment included general clinical examination, serological and immunological tests, histological and immunohistochemical analyses, chest CT scan, Doppler ultrasonography of the lower extremity veins, and tuberculin skin test. Outcomes were evaluated in 1–6 years.

**Results:** Secondary to underlying non-rheumatic condition Pn was identified in 23 pts. The most prevalent Pn types in remaining 186 cases were: erythema nodosum (EN) (121pts), lipodermatosclerosis (LDS)<sup>38</sup> and Weber-Christian disease (WCD).<sup>18</sup> Symmetrical distribution of nodules over upper and lower extremities (ULE) was characteristic for 93% of all EN cases. In LDS populations 68% cases had increased mean body mass index (BMI), 79% – chronic venous insufficiency (CVI), 60% – asymmetric distribution of lesions, mostly over medial leg (92%). In WCD patients the nodules were covering all ULE surfaces, and in 14 nodules were found on the trunk. The three Pn types had certain differences in the clinical course: high clinical and lab activity was documented in *Löfgren syndrome* and WCD pts. Asymmetric distribution of nodules on the legs was characteristic for LDS, nodules on the trunk were specific for WCD. The highest recurrence rate was documented in WCD pts (39,7 per 100 patient-years), the lowest—in *Löfgren*

*syndrome pts* (15,3 per 100 patient-years). The probability of EN recurrence in *Löfgren syndrome pts* was significantly higher in subjects older than 40 y (OR 3,81;  $p=0,03$ ), in subjects with late ( $\geq 3$  months from EN onset) initiation of treatment (OR 8,94;  $p=0,0008$ ) and in subjects with indurations  $>5$  cm in size (OR 3,65;  $p=0,03$ ). The probability of LDS recurrence was significantly higher in pts with confluent nodules, forming conglomerate masses (OR 4,33;  $p=0,037$ ), and pts taking hydroxychloroquine at  $\leq 200$  mg/day during  $\geq 6$  months (OR 5,25;  $p=0,019$ ).

**Conclusions:** Comprehensive examination is needed to identify the clinical type of Pn. Symmetrical involvement of all extremities is characteristic for EN in young subjects. Asymmetric nodular rash over lower extremities in subjects with abnormal BMI and CVI is specific for LDS. CWD usually presents with nodular rash on the trunk. Identified risk factor for EN and LDS recurrence should be taken into consideration while writing a treatment plan.

#### AB1133 ROLE OF THE RHEUMATOLOGIST IN A REGIONAL REFERENCE HAEMOPHILIA UNIT

C. Aguilera Cros<sup>1,1</sup>, M. Arcila Durán<sup>1</sup>, L. Mendez Díaz<sup>1</sup>, A. Ruiz Román<sup>1</sup>, N. Garrido Puñal<sup>1</sup>, R. Nuñez Vázquez<sup>2</sup>, J. Povedano Gómez<sup>1</sup>. <sup>1</sup>Rheumatology, <sup>2</sup>Haematology, University Hospital Virgen del Rocío, Seville, Spain

**Background:** Haemophilia is an X-linked hereditary bleeding disorder caused by deficiency in coagulation factor VIII (FVIII), in haemophilia A (HA), and factor IX in haemophilia B (HB).

They are classified as severe, moderate or mild, depending on the level of coagulation factor deficiency. Men are affected clinically by the disease, and women, who are carriers, usually remain asymptomatic.

HA is more common than HB (from 80% to 85% of all cases).

Their bleeding complications primarily affect the musculoskeletal system. Hemarthrosis is the major haemophilia-related complication, responsible for a particularly debilitating chronic arthropathy, in the long term, affecting mainly the load joints (knees, ankles and elbows).

In addition to clotting factor concentrates, usually prescribed by the haematologist, The management of acute hemarthrosis and chronic arthropathy requires a close collaboration with rheumatologists. This collaboration is the key to effectively preventing hemarthrosis, managing acute joint bleeding episodes, assessing joint function, and actively treating chronic arthropathy.

**Objectives:** To analyse the clinical characteristics, extent of joint involvement and associated comorbidity of a cohort of patients with hemophilic arthropathy.

**Methods:** This is a retrospective study, carried out in the Haemophilia Unit of our hospital (regional reference), in patients with moderate to severe haemophilia A and B, with hemophilic arthropathy, seen in consultation with episodes of joint bleeding (2007–2017). Severity of haemophilia was defined based on determined by the percentage of FC activity (VIII and IX), moderate from 1% to 5%, severe  $<1\%$ . The number of episodes of hemarthrosis was collected in the 3 months before and after the radioisotopic synoviorthesis (intra-articular injection of a colloidal suspension of particles marked with a radioisotope, whose objective is the destruction of the synovial membrane).

**Results:** We included 88 patients (87 men and 1 symptomatic carrier woman with decreased levels of factor VIII), mean age  $31 \pm 17$  years. HA (severe 56%, moderate 26%), HB (severe 14%, moderate 1%). The target joint: knee 51%, followed by ankle 26%, elbow 13% and other 7% (5 shoulders and 2 wrists). In 61 patients, magnetic resonance imaging (MRI) was performed: synovial hypertrophy 9%, hemosiderin deposits (in acute stage of joint bleeding) 2% and structural alteration (erosions and subchondral cysts, loss of focal cartilage) 68%. A radioisotope synoviorthesis was made to 18 patients: 12 with sulfide 186 Re colloidal (5 ankles, 4 knees, 2 elbows) and 6 with 90 Y coloidal citrate (4 knees, 3 ankles), having a decrease of 74% (range 59%–100%) in the number of hemarthrosis in the 3 subsequent months. Total knee replacement was needed in 13% of the patients (7 with HCV liver disease and in 6 HCV liver disease and coexistence with HIV). They have infection due to HCV 33%, HIV 25% and HBV 6%.

**Conclusions:** This study highlights the extent of joint damage in haemophilic patients as well as the high comorbidity of HCV and HIV infections.

The experience of a monographic Haemophilia consultation, with the participation of different specialties (being fundamental the rheumatologist), benefits the multidisciplinary approach of these patients, being the results obtained in our series concordant with the described in the literature.

#### AB1134 DETERMINING FACTORS OF SEVERITY IN HEMOPHILIC ARTHROPATHY

C. Aguilera Cros<sup>1</sup>, L. Méndez Díaz<sup>1</sup>, M. Arcila Durán<sup>1</sup>, A. Ruiz Román<sup>1</sup>, M. J. Valenzuela Porcel<sup>1</sup>, N. Garrido Puñal<sup>1</sup>, J.P. Sanchez Serrano<sup>2</sup>, R. Nuñez Vázquez<sup>3</sup>, J. Povedano Gómez<sup>1</sup>. <sup>1</sup>Rheumatology, University Hospital Virgen del Rocío, Seville; <sup>2</sup>Animal Breeding and Genetics, IRTA Caldes de Montbui, Barcelona; <sup>3</sup>Haematology, University Hospital Virgen del Rocío, Seville, Spain

**Background:** In patients with haemophilia, the development of inhibitors to factor VIII/IX (Haemophilia A and B, HA/HB), prevents adequate replacement therapy and results in increased risk of serious bleeding episodes, poor control of joint bleeding, and progressive, debilitating joint disease.

**Objectives:** To describe, according to the Arnold-Hilgartner scale (AHRS), the radiological findings in a cohort of hemophilic arthropathy (HArth) patients and to analyse the relationship that may exist between the degree of joint involvement and HA/HB, severity, age and presence or absence of inhibitor.

**Methods:** This is a retrospective study, carried out in the Haemophilia Unit of our hospital, in patients with HArth (2007–2017). Severity of haemophilia: percentage of coagulation factor (CF) activity, moderate (1%–5%) and severe  $<1\%$ . The AHRS includes 5 levels.

For the study of the association of the type and degree of haemophilia; and the presence of inhibitor, with the level in the AHRS, a linear model was used. The significance in this regard of the linear contrasts of interest was studied using F tests, defining the first species error at 0.05.

**Results:** We included 88 patients. Characteristics of the patients in the attached chart. No significant association was detected between the type and severity of haemophilia with the development of inhibitor.

The results of the linear model only showed association ( $p=0.01$ ) between the severity of haemophilia and AHRS, patients with moderate haemophilia presented a least square mean for the AHRS of 2.6 (0.3), whereas the serious ones had a value of 3.4 (0.2). The least squared means for patients with HA and HB were 2.9 (0.2) and 3.1 (0.4) respectively, the contrast did not reach statistical significance ( $p>0.1$ ), and the same occurred between patients who had generated or not inhibitor 2.8 (0.2) Vs 3.1 (0.3). Apart from the severity of haemophilia, the other factor that showed a significant and significant effect ( $p<0.001$ ) on the AHRS values was age. The estimated value for the regression coefficient of age on the radiological status was 0.05 (0.009).

#### Abstract AB1134 – Table 1

Type of Haemophilia	
Haemophilia A n (%)	73 (82%)
Haemophilia B n (%)	14 (15%)
Severity of Haemophilia	
Haemophilia A severe n (%)	50 (56%)
Haemophilia A moderate n (%)	23 (26%)
Haemophilia B severe n (%)	13 (14%)
Haemophilia B moderate n (%)	1 (1%)
Age m (SD)	31 (17)
Development of inhibitors to factor VIII/IX n (%)	16 (18%)
Haemophilia A severe with inhibitors n (%)	10 (11%)
Haemophilia A moderate with inhibitors n (%)	3 (3%)
Haemophilia B severe with inhibitors n (%)	3 (3%)
AHRS scale 1 n (%)	18 (20%)
AHRS scale 2 n (%)	17 (19%)
AHRS scale 3 n (%)	18 (20%)
AHRS scale 4 n (%)	15 (17%)
AHRS scale 5 n (%)	19 (21%)

**Conclusions:** Contrary to what has been observed in other studies, in our cohort it does not seem that the presence of inhibitor or the type of haemophilia has a negative effect on the severity of the radiological findings. The age and severity of haemophilia do seem to influence the radiological stage.

#### AB1135 CARDIAC MAGNETIC RESONANCE FINDINGS IN PATIENTS WITH BIOPSY-PROVEN VIRUS-NEGATIVE LYMPHOCYTIC MYOCARDITIS

C. Campochiaro, G. De Luca, S. Sartorelli, C. Candela, G. Cavalli, L. Dagna. *Unit of Immunology, Rheumatology, Allergy and Rare Diseases, IRCCS San Raffaele Hospital, Milan, Italy*

**Background:** Cardiac magnetic resonance (CMR) is considered to be useful for non-invasive myocarditis diagnosis. Lake Louise Criteria (LLC) has been proved to have moderate accuracy in the diagnosis of acute or chronic myocarditis.

**Objectives:** to describe the CMR findings in patients with virus-negative lymphocytic myocarditis (VNLN) from a large monocentric Italian cohort.

**Methods:** CMR findings in 40 patients (mean age 45.43±14.7 years; male:female ratio 1:1) diagnosed with endomyocardial biopsy-proven VNLM at our Centre from January 2015 to December 2017, were retrospectively evaluated. CMR was performed at time of clinical presentation and before EMB. At contrast-enhanced CMR we analysed: ventricular function, T2-weighted sequences, short inversion time inversion recovery sequences (STIR), early (EGE) and delayed gadolinium enhancement (LGE). Demographic, clinical and histological data were correlated with CRM findings.

**Results:** Mean left ventricular (LV) ejection fraction (EF) was 52.5%±10.8%. 50% of patients had reduced LVEF (<55%). Mean right ventricle EF was 55.25%±7.2%. Akinetic or hypokinetic areas were detected in 3 (7.5%) and 17 (42.5%) patients, respectively. LLC were identified in 39 patients (92.5%). LGE was the most common CMR finding. 20 patients (50%) met one LLC, 16 patients (40%) 2 LLCs. 1 patient met all 3 LLCs. STIR abnormalities were identified in the LV lateral wall in 8 (19%), septal wall in 9 (21.4%), LV inferior wall in 9 (21.4%), in the apex in 3 (7.1%), LV posterior wall in 3 (7.1%) and LV anterior wall in 2 (4.8%) patients. Myocardial oedema on T2 images was detectable in 21 (52.5%), EGE in 1 (2.5%) and LGE in 36 (90%) patients. LGE was intramural in 22 (55%), subepicardial in 23 (57.5%) and subendocardial in 4 (10%) patients. Multiple LGE patterns were disclosed in 10 (25%) patients. Pericardial effusion was detected in 9 patients (22.5%). 2 patients did not meet any LLC at CMR. When comparing CMR findings with Holter-ECG tape, clinical presentation, histology, biochemistry and autoimmunity results we found CRM oedema positively correlated with the detection of active myocarditis on EMB (11 vs 4, p=0.027). Serum anti-heart antibodies positively correlated with the detection of pericarditis at CMR (3 vs 1, p=0.050). Patchy/intramural LGE positively correlated with rhythm abnormalities at Holter-ECG tape (12 vs 6, p=0.037).

**Conclusions:** VNLM is an overlooked disease defined by EMB established histological, immunological and immune-histochemical criteria. Although the diagnostic power of CMR needs to be further investigated, it seems to correlate with EMB results and arrhythmic burden.

#### AB1136 CLINICAL FEATURES OF ADULT CHINESE PATIENTS WITH PERIODIC FEVER, APHTHOUS STOMATITIS, PHARYNGITIS, AND ADENITIS: REPORT FROM AN SINGLE CENTRE

D. Wu, M. Shen. *Rheumatology, Peking Union Medical College Hospital, Beijing, China, Beijing, China*

**Background:** Periodic fever, aphthous stomatitis, pharyngitis, and cervical adenopathy (PFAPA) syndrome is a polygenic or multifactorial autoinflammatory disease (AUIDs) with unknown etiology. It mainly affects children, though recently it has been also recognised in adulthood. PFAPA syndrome has not been reported in the Chinese population up till now.

**Objectives:** We aimed to investigate the clinical features, treatment and prognosis of the first cohort of adult Chinese patients with PFAPA syndrome.

**Methods:** We prospectively evaluated clinical data of adult patients (≥14 years) with recurrent fever of unknown origin who were suspected monogenic AUIDs in the period April 2015 to December 2017, at the adult AUIDs centre, Department of Rheumatology, Peking Union Medical College Hospital. Gene tests of AUIDs associated pathogenic genes were examined to exclude monogenic AUIDs. The clinical features were evaluated for patients with PFAPA syndrome, and were compared with a newly reported large Italian cohort of adult patients with PFAPA syndrome.<sup>1</sup>

**Results:** During the study period, a total of 7 adult patients with PFAPA syndrome were diagnosed (table 1), and the male to female ratio was 6:1. All these patients had a disease onset in adulthood, and the mean age of onset was 27±10 years, and the mean time of delay of diagnosis was 4.9±4.0 years. Clockwork periodicity fever was the main feature of PFAPA syndrome, and the median duration of attacks was 3.5 days, and the median interval between attacks was 4 weeks. Pharyngitis, adenitis and aphthous stomatitis were present in 85.7%, 57.1% and 42.9%, respectively. Other common symptoms included fatigue (100%), headache (71.4%), and myalgia (71.4%). The presence of arthralgia/arthritis was less frequent compared to the Italian cohort (p=0.012) (table 2). Corticosteroids given during attacks were effective in 3 patients. NSAIDs were partially effective but tonsillectomy was of no effect. Colchicine was rarely used compared to the Italian cohort (p=0.046).

**Abstract AB1136 – Table 1.** Summary of the clinical characteristics of our patients.

No. of patients	7
Male	6 (85.7%)
Female	1 (14.3%)
Age at onset (years)	27 ± 10 (16-46)
Age at diagnosis (years)	31 ± 11 (17-53)
Delay in diagnosis (years)	4.9 ± 4.0 (1.0-11.0)
Adult onset	7
Positive family history	0
Duration of febrile attacks (days)	3.5 (0.5-7.0)
Duration of attack intervals (days)	4 (1-12)
Frequency of attacks per year	10 (4-20)
Peak temperature (°C)	39.2 ± 0.6 (38.5-40)
Periodic Fever with 3 major clinical features	2 (28.6%)
Periodic Fever with only 2 major clinical features	2 (28.6%)
Periodic Fever with only 1 major clinical features	3 (42.9%)

Clinical features	Ours (n, %) (n=7)	Italian (n, %) (n=30)	p value
Pharyngitis	6 (85.7)	23 (76.7)	0.601
Cervical adenopathy	4 (57.1)	22 (73.3)	0.399

Fatigue	7 (100)	19 (63.3)	0.056
Headache	5 (71.4)	13 (43.3)	0.181
Myalgia	5 (71.4)	16 (53.3)	0.384
Conjunctivitis	2 (28.6)	4 (13.3)	0.325
Arthralgia/arthritis	1 (14.3)	20 (66.7)	<b>0.012</b>
Nausea and vomiting	1 (14.3)	5 (16.7)	0.878
Chest pain	0 (0)	6 (20)	0.196
abdominal pain/diarrhea	0 (0)	8 (26.7)	0.123
Periorbital edema	0 (0)	5 (16.7)	0.245
Rash	0 (0)	5 (16.7)	0.245
Treatment			
Glucocorticoid	3/3 (100)	15/17 (88.2)	0.531
NSAIDs	1/3 (33.3)	10/12 (83.3)	0.080
Colchicine	0/1 (0)	3/3 (100)	<b>0.046</b>
Tonsillectomy	0/2 (0)	1/3 (33.3)	0.361

**Abstract AB1136 – Table 2.** Comparison of with an Italian cohort of adult patients with PFAPA syndrome

**Conclusions:** PFAPA syndrome is one of the main causes of adults Chinese patients with recurrent fever of unknown origin and might be misdiagnosed. Clinicians, not only paediatricians, should take into account this clinical entity, especially for patients with pharyngitis, cervical adenopathy and aphthous stomatitis.

#### AB1137 INFLAMMATORY AND EROSIVE ARTHRITIS, A COMMON UNKNOWN MANIFESTATION OF VOGT-KOYANAGI-HARADA DISEASE (VKHD)

D. Ramos-Bello<sup>1</sup>, A.J. Pedro-Martínez<sup>2</sup>, G. Aguilera Barragán-Pickens<sup>2</sup>, E. S. Acevedo-Castañeda<sup>2</sup>, H. López-Ferretis<sup>2</sup>, G. Martínez-Flores<sup>2</sup>, T.A. Luna-Zúñiga<sup>2</sup>, E. Santillán-Guerrero<sup>2</sup>, R. Moreno-Valdés<sup>2</sup>, M. Saldaña-Baarnard<sup>2</sup>, E. Cuevas-Orta<sup>2</sup>, C. Abud-Mendoza<sup>2</sup>. <sup>1</sup>*Rheumatology*; <sup>2</sup>*UASLP, San Luis Potosí, Mexico*

**Background:** VKHD is a rare cause of bilateral granulomatous panuveitis leading to significant visual loss in patients who present it. VKHD is a multisystemic, autoimmune, inflammatory disease that usually displays extraocular manifestations that include meningismus, vitiligo, poliosis, and hearing loss. Arthritis is an unknown manifestation of the disease. In Mexico, VKHD affect mainly young women and is responsible for 13% to 27% of all uveitis.

**Objectives:** To describe the presence of inflammatory and erosive arthritis in patients with VKHD.

**Methods:** Observational study of patients with established VKHD that fulfilled the 2010 revised diagnostic criteria for VKHD was rolled out. Articular ultrasonography was performed to all patients by a trained rheumatologist in carpal, metacarpophalangeal (MCP) and proximal interphalangeal (PIP) joints evaluating

presence of sinovitis, power Doppler (PD) signal, bone erosions, and cartilage changes; serology and hand x-ray were requested and evaluated.

**Results:** We included 5 women and 1 man, mean age was  $36.2 \pm 10.3$  years, and they all had characteristics of acute (4 patients) or chronic (2 patients) VKHD. They received treatment with intravenous methylprednisolone 1 g/day for 3 days combined with cyclophosphamide and thereafter methotrexate (12.5–17.5 mg/week) for maintenance therapy, scheme with which no ocular recurrences have been presented. Two patients had synovitis on physical examination. All patients had PD signal on the ultrasound and they had involvement of both wrists, MCPs and PIPs joints consistent with polyarthritis pattern; additionally bone erosions were detected in 2 patients. Rheumatoid factor and anti citrullinated peptide antibody were negative in all patients

**Abstract AB1137 – Figure 1.** a) Ocular ultrasonography of patient 1, showing bilateral exudative retinal detachment b) Articular ultrasound of patient 1, showing synovitis with PD signal in both wrists. c) Fundus photographs of the right and left eyes of patient 2 showing exudative retinal detachments d) Articular ultrasound of patient 2, showing synovitis with PD signal in both wrists.

**Conclusions:** The presence of inflammatory and erosive arthritis in patients with VKHD has only been described in one case recently. We propose that polyarthritis is common manifestation of this rare disease, including erosive arthritis, representing part of the spectrum of the disease, processes that share some features of the genetic susceptibility with rheumatoid arthritis as HLA-DR4, CTLA-4 and STAT4.

#### AB1138 HIGH LEVELS OF ANTI-U1RNP AND ANTI-SM IN MIXED CONNECTIVE TISSUE DISEASE PATIENTS

E. Grau García<sup>1</sup>, P. Jover Carbonell<sup>2</sup>, I. Martínez Cordellat<sup>1</sup>, R. Negueroles Albuixech<sup>1</sup>, J.E. Oller Rodríguez<sup>1</sup>, F.M. Ortiz Sanjuan<sup>1</sup>, E. Vicens Bernabeu<sup>1</sup>, C. Alcañiz Escandell<sup>1</sup>, K.R. Arevalo Ruales<sup>1</sup>, I. Chalmeta Verdejo<sup>1</sup>, M. De la Rubia Navarro<sup>1</sup>, C. Fedec Olmos<sup>1</sup>, J.J. Frago Gil<sup>1</sup>, R. Gonzalez Mazarío<sup>1</sup>, L. Gonzalez Puig<sup>1</sup>, J. Ivorra Cortés<sup>1</sup>, E. Labrador Sánchez<sup>1</sup>, C. Najera Herranz<sup>1</sup>, I. Canovas Olmos<sup>1</sup>, A. Cañada Martínez<sup>3</sup>, A. Alba Redondo<sup>4</sup>, M.L. Martínez Triguero<sup>4</sup>, J. A. Roman Ivorra<sup>1</sup>. <sup>1</sup>Rheumatology Department, HUP La Fe; <sup>2</sup>Medical School, UCV; <sup>3</sup>Biostatistics Unit, IIS La Fe; <sup>4</sup>Clinical Analysis Department, HUP La Fe, Valencia, Spain

**Background:** The mixed connective tissue disease (MCTD) is an autoimmune systemic disease characterised by clinical manifestations that are included in systemic lupus erythematosus (SLE), scleroderma (SSc) or rheumatoid arthritis (RA). Moreover the MCTD exhibits anti-U1RNP high-titer antibodies. However, anti-U1RNP antibodies are not specific or exclusive from MCTD, because of can be detected in other systemic autoimmune diseases as SLE, SSc and RA.

**Objectives:** To verify the differentiation of MCTD patients from other systemic autoimmune diseases using anti-U1RNP titers. The secondary objective is to characterise anti-U1RNP titer in other systemic autoimmune diseases with clinical manifestation.

**Methods:** An observational retrospective study of patients with inflammatory autoimmune disease evaluated in the Rheumatology Department from 2012 since 2016 was performed. In all cases a blood-test with anti-U1RNP, anti-Sm, anti-Ro, and anti-La analysis was conducted. Clinical data was registered according to the patients' medical history, with special emphasis being placed on renal affection, vascular affection, pulmonary hypertension, arthritis-synovitis, tendonitis-tenosynovitis, dry eye syndrome and Raynaud's phenomenon. Biostatistical analysis was performed using R.

**Results:** We collected data from 355 patients with a mean age of 50.84 (15.49) years, 98.55% of them were female. 13.8% of patients showed anti-U1RNP high titers (up to 20 pg/mL), and a significant increase of anti-U1-RNP in MCTD patients in contrast to other connective pathologies ( $p < 0.0001$ ) was observed.

Anti-Sm antibody also exhibit significantly higher values in MCTD patients than in RA ( $p = 0.025$ ) or scleroderma ( $p = 0.003$ ). No differences in anti-Ro and anti-La levels among all diagnosis were observed. Patients with the high anti-U1-RNP levels, regardless of the diagnosis, showed more Raynaud's phenomenon and vascular affection. ( $p < 0.001$  y  $p = 0.008$ ). Related to Anti-Ro and anti-La, high titer of these antibodies in patients with Dry eye syndrome was observed ( $p < 0.001$ ).

Specifically in SLE patients, those with the highest levels of anti-U1-RNP exhibit Raynaud's phenomenon ( $p < 0.001$ ), highest levels of anti-La was shown in those patients with renal affection ( $p = 0.02$ ) and the highest levels of anti-Ro and anti-La was shown in those patients with Dry eye syndrome ( $p = 0.002$  and  $p = 0.006$ ).

**Conclusions:** In our patient series anti-U1RNP were significantly elevated in MCTD diagnosis, and in lesser extent anti-Sm antibodies. Anti-Ro and anti-La antibodies are increased in dry eye syndrome patients. In SLE patients, anti-La increased levels were associated to renal affection.

#### AB1139 RITUXIMAB FOR SCLERITIS AND PERIPHERAL ULCERATIVE KERATITIS ASSOCIATED WITH RHEUMATOLOGIC DISEASE

E. Valls Pascual<sup>1</sup>, I. Benítez Hurtado<sup>2</sup>, L. Martínez-Costa Pérez<sup>2</sup>, C. Vergara Dangond<sup>3</sup>, M. Aguilar Zamora<sup>1</sup>, L. Montolio Chiva<sup>1</sup>, A.V. Orenes Vera<sup>1</sup>, A. Ybáñez García<sup>1</sup>, Á. Martínez Ferrer<sup>1</sup>, J.J. Alegre Sancho<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Ophthalmology, HOSPITAL DOCTOR PESET, Valencia; <sup>3</sup>Rheumatology, Hospitales Madrid, Madrid, Spain

**Background:** Some types of ocular surface inflammatory diseases are often related to rheumatic conditions: 37% of scleritis (especially diffuse and necrotizing forms) and 60% of peripheral ulcerative keratitis (PUK). Rheumatoid arthritis (RA) and ANCA-associated vasculitis are the most frequently related conditions. Significant loss of visual acuity can be observed if these ocular diseases are not properly treated. To date, no approved therapies are available. Consequently, the management of these ocular diseases are based on published evidence coming from clinical trials (scarce and often with a low sample size), observational studies and case reports. There are positive efficacy data of rituximab (RTX) for ocular surface inflammatory disease.<sup>1-4</sup>

**Objectives:** To describe our experience with RTX as a therapy for severe ocular surface inflammatory diseases associated to rheumatic conditions.

**Methods:** This is a retrospective observational study. It includes patients with severe scleritis or PUK associated to rheumatic diseases diagnosed and managed at our Multidisciplinary Uveitis Clinic between January 2006 and November 2017. We recorded demographic and clinical variables. As outcome variables we used the

**Abstract AB1139 – Table 1.** RTX for scleritis and PUK

change in visual acuity and the presence of inflammatory activity by biomicroscopy.

**Results:** VA: visual acuity, AE: aduers events, RA: rheumatoid arthritis, GPA: granulomatosis with polyangiitis, RP: relapsing polychondritis, LTI: latent tuberculous infection, DM: diabetes mellitus, CSC: central serous choroidopathy, MPLN: metilprednisolone, PDN: prednisone, DXM: dexametasone, MTX: methotrexate, CS-A: cyclosporine, LFN: leflunomide, IFX: infliximab, ETN: etanercept, AKR: anakinra TCZ: tocilizumab.

**Conclusions:** As previously described we consider rituximab as an effective therapy for severe ocular surface inflammatory diseases related to rheumatic conditions when other immunosuppressant drugs fail or are contraindicated.

#### COMPARISON OF CUT-OFF VALUES FOR FERRITIN TO DISCRIMINATE ADULT ONSET STILL'S DISEASE FROM OTHER CAUSES OF FEVER OF UNKNOWN ORIGIN: RESULTS OF A PROSPECTIVE STUDY

E. Bilgin<sup>1</sup>, A. Erden<sup>2</sup>, B. Armagan<sup>2</sup>, L. Kılıç<sup>2</sup>, A. Sarı<sup>2</sup>, G. Yardımcı<sup>2</sup>, E. Bilgin<sup>3</sup>, A. Akdoğan<sup>1</sup>, Ö. Karadağ<sup>2</sup>, S. Apraş Bilgen<sup>4</sup>, I. Ertenli<sup>2</sup>, S. Kiraz<sup>2</sup>, U. Kalyoncu<sup>2</sup>.

<sup>1</sup>Internal Medicine; <sup>2</sup>Internal Medicine, Division of Rheumatology; <sup>3</sup>Physical Medicine and Rehabilitation, Hacettepe University Faculty of Medicine; <sup>4</sup>Internal Medicine, Division of Rheumatology, HACETTEPE UNIVERSITY, Ankara, Turkey

**Background:** Adult onset Still's disease (AOSD) is a rare, auto-inflammatory disease that commonly presents as fever of unknown origin (FUO). As AOSD can cause complications as reactive lymphohistiocytosis that can be mortal, discriminating AOSD from FUO is important. Ferritin, an acute phase reactant, is commonly high in patients with AOSD as a part of systemic inflammation.

**Objectives:** To determine a cut-off value of ferritin that favours AOSD over FUO.

**Methods:** Data from patients who admitted to Hacettepe University Hospitals, inpatients sections of department of internal medicine with the complaint of FUO collected prospectively during 30 months. Patients with uncertain diagnosis after all diagnostic procedures excluded. AOSD patients followed at Hacettepe University department of rheumatology were included. Of AOSD patients whose initial test ferritin levels were not available also excluded. For determination of cut-off values, receiver operator curve (ROC) analysis were done for each predetermined value. Upper normal level in our laboratory for ferritin is 336 ng/ml.

**Results:** Total 150 patients (n=63, for AOSD; n=87, for FUO) were included. Median ferritin level was significantly higher in AOSD group [1705 (657–6417) ng/ml vs. 424 (141–1188) ng/ml, p<0001]. FUO group were also divided into three subgroups: rheumatologic (n=31, 35.6%), infectious (n=28, 32.2%) and malignant (n=28, 32.2%) causes. Median ferritin levels for these subgroups were 222 (104–1020), 527 (145–1057), 599 (166–2766) ng/ml, respectively. Area under curve

(AUC) 95% confidence intervals, sensitivity and specificity for predetermined cut-off values are given in Table-1. ROC curve for all ferritin levels are given in Figure 1.

**Abstract AB1140 – Table 1**

Cut/off value (ng/ml)	Area under curve (AUC)	Sensitivity, %	Specificity, %	p value	95%, Confidence Interval (CI)
>UNL	0,73	98	49	<0001	0,65–0,81
>3xUNL	0,66	64	68	0001	0,56–0,74
>5xUNL	0,67	52	82	<0001	0,58–0,74
>750	0,69	75	63	<0001	0,60–0,77
>1250	0,66	59	76	0001	0,57–0,75
>2500	0,66	43	85	0001	0,57–0,75

\*UNL: Upper normal limit (for ferritin: 336 ng/ml)

Figure-1: ROC analysis for each ferritin level (AUC 0,77%;95 CI: 0,70–0,84, p<0.001)

**Conclusions:** For each cut-off values for ferritin, test performances were quite well to differentiate patients with AOSD from FUO. While ferritin levels higher than upper normal level have 98 percent sensitivity, ferritin levels higher than 5 times of upper normal level have 82 percent specificity. Large number of patients in each FUO subgroup is needed to determine ferritin test performance for each particular group of patients to differentiate from AOSD.

**AB1141 UTILITY OF MUSCLE BIOPSY WITH NEEDLE IN A RHEUMATOLOGY SERVICE. A 12 YEARS EXPERIENCE**

E. Casado<sup>1</sup>, S. Garcia-Cirera<sup>1</sup>, M.R. Bella<sup>2</sup>, M. Arévalo<sup>1</sup>, M. Larrosa<sup>1</sup>, J. C. Ferreres<sup>2</sup>, J. Gratacós<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Pathology, University Hospital Parc Taulí. I3PT. UAB. Sabadell, Sabadell, Spain

**Background:** Muscle biopsy with needle is presented as a faster and less invasive alternative than conventional open biopsy for the diagnosis of some myopathies. However, its use as a diagnostic technique is still very limited in the Rheumatology services.

**Objectives:** To describe the experience of 12 years and the diagnostic usefulness of needle biopsy in a Rheumatology service.

**Methods:** Descriptive study including all patients who, since 2005, had undergone a needle biopsy in the Rheumatology service of the Parc Taulí University Hospital in Sabadell, as a diagnostic technique for suspected myopathy.

The technique was performed in all cases on the lateral aspect of the thigh, about 10 cm above the knee. After disinfection and local anaesthesia, an incision of 1 cm longitudinal to the thigh was made until reaching a depth of about 3–4 cm, then introducing the Bergstrom needle for the muscle biopsy (about 4–5 muscle fragments of 2–3 mm taken in different directions) from the vast lateral. Finally, the incision was sutured with a single stitch.

In obese patients, a previous ultrasound was performed to exactly knowing the depth at which the muscle sample should be taken.

The collected samples were sent fresh to the Pathology service, wrapped in a gauze moistened with 0.9% physiological saline solution.

**Results:** In these 12 years we have performed a needle biopsy on 49 patients (29 women). Age 52±10 years (range 25–70). The reason for performing the biopsy was always the increase of muscle enzymes, mainly creatine kinase (CK), which in 9 of the cases was isolated, without any underlying disease, myotoxic drugs or other symptoms. Eight patients presented myalgia or weakness as the only symptomatology. Twelve patients had a rheumatic or autoimmune disease, and in 7 of these 12 cases there was a suspicion of antimalarials myopathy. In 6 cases the suspicion was dermatomyositis and in 5 cases of vasculitis. The biopsy was performed in 4 patients with fibromyalgia and in a patient with diabetes. In 4 of the cases, the suspicion was a lipid-lowering drug myopathy.

In 48/49 cases (98%) sufficient muscle sample was obtained. The technique had only to be repeated in one patient due to insufficient or inadequate tissue. Only in 2/49 cases (4%) the histological diagnosis was not concordant with the definitive clinical diagnosis (dermatomyositis), which was confirmed in one patient with open muscle biopsy.

In 31 cases (63%) the biopsy was normal. Among the pathological biopsies, the most frequent histological diagnosis was polymyositis, in 12 cases. In 3 cases a dermatomyositis was confirmed, in 3 cases a vacuolar myopathy by antimalarials and in 1 case a necrotizing myopathy.

As complications, it should be noted that only 2/49 (4%) patients presented moderate pain, which subsided in less than a week with analgesia, and one patient presented a hematoma in the area. No case of wound infection was observed.

**Conclusions:** Muscle biopsy with a needle is a quick, simple, low invasive and safe technique that can be very useful in a Rheumatology department. The incorporation of this technique as a diagnostic tool should be extended to the majority of Rheumatology departments.

**AB1142 REDUCTION OF ABSOLUTE NUMBER OF CD4+CD25+FOXP3+ TREG CELLS IS ASSOCIATED WITH PATHOLOGICAL FEATURES OF PATIENTS WITH IDIOPATHIC INFLAMMATORY MYOPATHY**

H. Zhao, H.Y. Wen, X.F. Li, Y. Liu. *Rheumatology, the Second Hospital of Shanxi Medical University, Taiyuan, China*

**Objectives:** To explore the alterations and their significance of peripheral CD4<sup>+</sup>CD25<sup>+</sup>FOXP3<sup>+</sup>regulatory T cells (Tregs) and Th17 cells in Idiopathic inflammatory myopathy.

**Methods:** Clinical indicators of IIM cases (n=85) and healthy controls(n=60) were enrolled. The absolute number of peripheral Tregs and Th17 cells were analysed by flow cytometry. The clinical features were collected retrospectively. Since the data was disregarded from the normal distribution, the median four quantile method was used for statistical description. Two samples were compared with Mann-Whitney U test, and the correlation between variables was Spearman rank correlation analysis.

**Results:** (1) The absolute number of Treg cells in the patients was significantly lower than that in the control group ( $P<0.05$ ); the ratio of Th17/Treg was also significantly higher than that in the control group ( $P<0.05$ ); (2) Peripheral Treg cells levels were negatively correlated with CRP ( $r=-0.279$ ,  $p<0.05$ ); (3) According to the involvement of important organs was classified into two groups: organ group and non-organ group. The absolute number of Treg cell in organ group is fewer than

that in non-organ group ( $p<0.05$ ), and the ratio of Th17/Treg in organ group was significantly higher than that in non-organ group.<sup>4</sup> The peripheral Th17 cell absolute number in patients with skeletal muscle inflammatory oedema was significantly higher than that of non inflammatory oedema patients ( $p<0.05$ );<sup>6</sup> The levels of Th17, Tregs and ratio of Th17/Treg did not correlated with pathological features of inflammatory infiltration ( $p>0.05$ ).

**Conclusions:** The absolute number of peripheral Treg cells decreased significantly in IIM, and correlated with CRP. Patients with organ involvement had fewer Treg cells, and imbalance between Th17 and Treg. When muscle MRI appeared inflammatory oedema, it has a higher level of Th17 cells. Our results suggest that Treg cells plays an important role in the pathogenesis of IIM and increasing the number of Treg cells and maintaining Th17/Treg immune balance will become a new therapeutic strategy for IIM.

**AB1143 AUTOIMMUNE CHARACTERISTICS IN A COHORT OF 89 PATIENTS WITH PRIMARY BILIARY CHOLANGITIS**

I. Carballo Fernández<sup>1</sup>, B. Sopena<sup>1</sup>, E. Otero<sup>2</sup>, S. Tomé<sup>2</sup>, R. Alende<sup>2</sup>, E. Páez<sup>1</sup>, A. García-Villafranca<sup>1</sup>, A. González-Quintela<sup>1</sup>. <sup>1</sup>Immunopathology Unit, Internal Medicine; <sup>2</sup>Hepatology and Liver transplant Unit, Complejo Hospitalario Universitario de Santiago de Compostela. Universidad de Santiago de Compostela., Santiago de Compostela, Spain

**Background:** Primary biliary cholangitis (PBC) is associated to other autoimmune diseases with an unknown prevalence. Their treatment can prevent progression to liver cirrhosis and other systemic complications

**Objectives:** To describe the clinical and analytical autoimmune characteristics in a cohort of patients with PBC diagnosed and followed in a specific unit of Hepatic Diseases. All patients were also studied in the Autoimmune and Systemic Diseases Unit of our hospital to check for the presence of extrahepatic autoimmune diseases.

**Methods:** We have studied patients with PBC diagnosed in our Service since 1994 who are currently under follow-up. The diagnosis of PBC was made taking into account: the presence of colostasis enzymes with positive anti-mitochondrial antibodies (AMA) and/or compatible liver biopsy

**Results:** We studied 89 patients with PBC. 81 of them were women (female/male ratio 10/1) with a mean age at diagnosis of 56 years (range 23–84 years). The mean follow-up was 106 months (range 9–286). IgM was elevated in 70% of the patients in whom it was found (56/80). The ANA were positive in 71% (61/86) and the AMA in 75% (67/89). 43% of patients AMA-negative PBC had other suggestive antibodies: 7 anti-centromere, 2 AMA-2 and 1 anti-sp-100. A liver biopsy was performed on 75 patients (87%), resulting in a diagnosis of 58% and useful to exclude other pathologies in the rest. In 18 patients (20%) an overlapping condition was diagnosed: PBC +Autoimmune hepatitis. In 11 patients (12%) a Reynolds syndrome was diagnosed: PBC +Scleroderma, in all of them Raynaud phenomenon was present. On another 11 of 41 (27%) Raynaud phenomenon was also present. In 17 patients (19%) there was a history or new diagnosis of autoimmune thyroiditis and in 13 patients (15%) of Sjögren syndrome. None of them was diagnosed of IgG4-related disease. Serum IgG4 was measured in 56 patients (63%) with a mean value of 36.6 mg/dL.<sup>2,8–125</sup>

The patients with pure PBC were treated only with urodeoxycholic acid, with a complete response of 41%, a partial response of 51% and an absence of response of only 6 (7%). There was no difference regarding liver response to treatment among patients with pure PBC and patients with overlapping autoimmune hepatitis, Reynolds syndrome, Raynaud phenomenon, Sjögren syndrome nor autoimmune thyroiditis. Only 3% of patients with complete response and 12% of

those who responded partially evolved to liver cirrhosis, with a similar follow-up time in both groups (105 vs 113 months). 5 of the 6 patients who did not have a biochemical response developed liver cirrhosis. 7 of the 13 patients with cirrhosis (54%) already presented clinical or histological data of cirrhosis in the initial evaluation

**Conclusions:** PBC patients have frequently other autoimmune diseases such as Autoimmune Hepatitis, Sjögren syndrome or Scleroderma so we must actively seek the presence of these pathologies. The treatment with ursodeoxycholic seems to be useful in all patients but it is important to make an early diagnosis

**AB1144 HISTOLOGY OF ROSAI-DORFMAN DISEASE IN A SUBSET OF PATIENTS WITH ERDHEIM-CHESTER DISEASE: A DISTINCT ENTITY MAINLY DRIVEN BY MAP2K1**

J. Razanamahery<sup>1</sup>, E. Diamond<sup>2</sup>, F. Cohen-Aubart<sup>1</sup>, P. Karl-Heinz<sup>3</sup>, F. Charlotte<sup>4</sup>, Z. Helias-Rodzewicz<sup>5</sup>, A. Dogan<sup>6</sup>, O. Abdel-Wahab<sup>6</sup>, B. Durham<sup>6</sup>, N. Ozkaya<sup>6</sup>, Z. Amoura<sup>1</sup>, J.-F. Emile<sup>5</sup>, J. Haroche<sup>1</sup>. <sup>1</sup>Internal medicine, Pitié-Salpêtrière hospital, Paris, France; <sup>2</sup>Neurology, Memorial Sloan Kettering Cancer Center, New York, USA; <sup>3</sup>Neurology, Frankfurt-Cancer-Institute, Frankfurt, Germany; <sup>4</sup>Pathology, Pitié-Salpêtrière hospital; <sup>5</sup>Pathology service, Ambroise Paré hospital, Paris, France; <sup>6</sup>Pathology and Laboratory, Memorial Sloan Kettering Cancer Center, New York, USA

**Background:** Diagnosis of Erdheim-Chester disease (ECD) is based on characteristic imaging of bone, retroperitoneal and/or cardiovascular involvement.<sup>1</sup> Biopsy is mandatory to exclude other diagnoses and confirm infiltration of histiocytes, but histology is not specific.<sup>2</sup> By contrast diagnosis of Rosai-Dorfman disease (RDD), a rare histiocytosis, is based on histology, which is characterised by infiltration by CD68 +CD1 a- S100+ histiocytes with large nuclei and abundant lesions of emperipolesis.<sup>2</sup> Up to 70% of ECD have *BRAF* or *MAP2K1* mutations,<sup>3</sup> which are rare in RDD.

**Objectives:** We investigated patients harbouring an ECD phenotype but RDD histology.

**Methods:** We reviewed records of ECD patients followed in Pitié-Salpêtrière hospital (Paris, France) and Memorial Sloan Kettering Cancer Centre (New-York, NY, USA) between 2007 and 2018. Biopsy samples of the patients were systematically investigated for mutations of genes of MAP kinase pathway.

**Results:** Among 209 patients with ECD, we found 10 (4.7%) patients who had RDD histology. These 10 patients had typical ECD clinical and radiological presentation, in particular bones (n=7), vascular (n=5) and peritoneal (n=6) involvements. Patients also had typical neurological involvement of ECD (n=6). All patients except one had at least one biopsy with a compatible histology of ECD at diagnosis. ECD biopsies showed non-specific fibrosis (n=5), foamy CD 68 +CD1 a- histiocytes (n=3) and/or Touton cells (n=1). Biopsies disclosing RDD histology were performed during the course of the disease involving testes (n=5), stomach (n=1), tibia (n=2), cheek (n=1) and omentum (n=1). All tissues showed lympho-plasmocytic infiltrate with large histiocytes infiltration. Histiocytes were CD68 +CD1 a- S100 +with large nuclei and abundant lesions of emperipolesis. Five patient harboured *MAP2K1* mutation and one patient had *PIK3CA* mutation. None of the patients had *BRAF* mutation.

**Conclusions:** Some patients with ECD may also present the iconic histological lesions described by Rosai and Dorfman. Overlap forms of such distinct histiocytoses between ECD and RDD is mainly driven by *MAP2K1* but not by *BRAF*.

**AB1145 ACUTE POSTERIOR MULTIFOCAL PLACOID PIGMENT EPITHELIOPATHY: CLINICAL PATTERN AND MANAGEMENT OF 79 PATIENTS**

J. Álvarez Troncoso<sup>1</sup>, A. Schlinker Giraud<sup>2</sup>, F. Arnalich Fernández<sup>1</sup>, Á. Robles. Marhuenda<sup>1</sup>. <sup>1</sup>Internal Medicine; <sup>2</sup>Ophthalmology, Hospital Universitario La Paz, Madrid, Spain

**Background:** Acute Posterior Multifocal Placoid Pigment Epitheliopathy (APMPPE) is an uncommon inflammatory disease causing acute-onset chorioretinal bilateral disease. It typically affects the posterior pole of both eyes leading to visual blurring or scotomas. Although it is thought to be benign, APMPPE has been associated with central nervous system (CNS) manifestations: cerebral vasculitis, meningoencephalitis and cerebral vascular disease.

**Objectives:** The aim of this study was to define clinical features, systemic manifestations, treatment and outcomes of a review of 79 patients with APMPPE.

**Methods:** We retrospectively analysed the epidemiology, potential triggers, prodromes, clinical data, ophthalmological study, extraocular manifestations, treatment and outcomes of 79 patients collected through an extensive review of the literature from the first description of Gass JD up to the present time.

**Results:** A total of 79 patients were reviewed (47 male). Mean age at diagnosis was 30 years (with a range of 8 to 58 years old). 27 patients (34.2%) presented with a previous triggering being flu-like illness the most frequent.<sup>15</sup> However, the complete serological study was only requested in 28 patients (and the immunological study just in 22) Median time from trigger to overt APMPPE was 9 days. Main clinical symptoms were: decreased visual acuity/blurred vision (100%), headache (51.8%) and photophobia (12.2%). Average decreased visual acuity was 13/20. APMPPE is defined by the presence of multiple white-yellowish plaques in funduscopy, and early hypofluorescent areas with late hyperfluorescence in fluorescein angiography. The fundus was pathological and compatible with APMPPE in all cases (100%), as was fluorescein angiography in those that had been performed (59). CNS involvement appeared in up to 50.6% (40 patients). The CNS manifestations were divided into language disorders (11 patients), motor deficit,<sup>20</sup> sensory deficit<sup>20</sup> and other CNS manifestations.<sup>23</sup> The mean time from visual deficit to neurological manifestations was approximately 2 weeks. Cerebrospinal fluid was studied in 37 patients, with a predominance of lymphocytic pleocytosis (mean of 46 cells/mm<sup>3</sup>) and elevated proteins (mean of 111 mg/dl). Within the neuroimaging studies carried out (58) up to 69.7% were pathological. 67 patients (84.8%) received treatment with corticosteroids. 14 patients (17.7%) also received other immunosuppressants (mainly azathioprine and cyclophosphamide), especially if CNS involvement. Regarding the evolution, 55 patients (69.6%) presented improvement, 12 (15.2%) relapsed and 6 (7.5%) died due to APMPPE.

**Conclusions:** APMPPE is a rare inflammatory disease which primarily affects the retina. However, the CNS involvement could be more frequent than what is classically described. Also, it seems that there might be a trigger effect either inflammatory or infectious. Steroids and immunosuppressants should be considered in patients with CNS involvement from the beginning.

**AB1146 THE ASSOCIATION OF COMMON MEFV GENE MUTATIONS WITH AXIAL SPONDYLARTHROSIS IN FMF PATIENTS: A RETROSPECTIVE STUDY**

K. Ayar<sup>1</sup>, E.K. Ozturk<sup>2</sup>, O. Yesiloz<sup>2</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Physical therapy and Rehabilitation, University of Health Sciences, Bursa Yuksek Ihtisas Training and Research Hospital, BURSA, Turkey

**Background:** Familial Mediterranean fever (FMF) is an autoinflammatory disease seen with autosomal recessive inheritance and is characterised by recurrent and self-limiting attacks with peritonitis, pleuritis, arthritis or fever alone. The association of spondylarthrosis and FMF is reported in some studies. There are few studies evaluating the association of MEFV gene mutations with axial spondylarthrosis in FMF patients.

**Objectives:** The aim of this study is to identify patients with FMF associated spondylarthrosis retrospectively and to compare the frequency of common MEFV gene mutations in FMF patients with and without axial spondylarthrosis.

**Methods:** We have reviewed 138 charts of FMF patients. The data of 116 patients (70 female, 46 male) who met the diagnosis of FMF with Tel Hashomer classification criteria and have the results of MEFV gene mutation were examined. Patients' age, sex, MEFV gene mutations were recorded. The presence of

inflammatory back pain (IBP) obtained from rheumatological system questionnaire in the patients' charts were recorded. The x-ray and MR images of sacroiliac joint registered in the PACS system were evaluated by a Rheumatologist. Patients with inflammatory low back pain and sacroiliitis detected by X-ray or MR were included in the FMF with axial spondylarthritis (FMF-SPA) group and others to FMF group. The frequency of MEFV gene mutations were compared between two groups.

**Results:** The frequency of M694V, M680I, V726A, E148Q and R202Q are 82.4%, 19.6%, 16.7%, 10.8% and 16.7% respectively in FMF group and 78.6%, 21.4%, 14.3%, 21.4% and 28.6% respectively in FMF-AS group. There was no significant difference between groups ( $p=0.716$ ,  $p=1.000$ ,  $p=1.000$ ,  $p=0.373$  and  $p=0.279$  respectively). The frequency of M694V homozygotes and heterozygotes mutations were 27.5% and 21.6% respectively in FMF group and 35.7% and 7.1% respectively in FMF-SPA group and difference between groups was not significant ( $p=0.537$ ,  $p=0.296$  respectively).

ND: Not done, IBP: inflammatory back pain

**Conclusions:** The frequency of common MEFV gene mutations in this study is not different between FMF patients with and without axial spondylarthritis. Increased frequency of axial spondylarthritis in FMF patients may not be associated with MEFV gene mutations.

#### AB1147 EVOLUTIONARY STUDY OF 45 CASES OF UNDIFFERENTIATED NEGATIVE HLA B27 SERONEGATIVE OLIGOARTHRITIS

L. Expósito Pérez<sup>1</sup>, J.J. Bethencourt Baute<sup>2</sup>, S. Bustabad Reyes<sup>2</sup>. <sup>1</sup>HOSPITAL UNIVERSITARIO DE CANARIAS, San Cristóbal de La Laguna, Spain; <sup>2</sup>Rheumatology, Hospital Universitario de Canarias, San Cristóbal de La Laguna, Spain

**Background:** The prognosis of patients with undifferentiated arthritis may vary from self-limited to severe destructive rheumatoid arthritis. Early diagnosis is important, specially in seronegative oligoarthritis in order to start a treatment as early as possible.

**Objectives:** To describe the evolution of patients older than 16 years diagnosed with negative HLA B27 seronegative oligoarthritis without axial involvement.

**Methods:** We retrospectively studied 45 patients (23 women, 22 men) with negative HLA B27 seronegative oligoarthritis without axial involvement who debuted between 1985 and 1990 and who did not meet the criteria for any of the rheumatic diseases at the time of debut: rheumatoid arthritis (AR), psoriatic arthropathy (PsA), spondyloarthropathy, enteropathic arthritis, reactive arthritis, microcrystalline arthritis or connective tissue disease.

**Results:** The mean age at onset of oligoarthritis was 42.2 years (range 17–66). The mean follow-up time was 13.7 years (range 1–32). In its evolution, a definitive diagnosis was reached in 21 (46.6%) patients, with the mean time between debut and diagnosis being 5.47 years (range 1–25): 8 AR, 4 APs (3 with involvement) peripheral and 1 mixed), 2 undifferentiated spondyloarthritis, enteropathic arthritis, 5 gouty arthropathies and one SLE. In the case of RA, the diagnosis was made on an average of 4.8 years after the debut (range 1–16); the RF was positive in 4 patients a mean of 7.6 years (range 3–11) after the debut, and the anti-CCP were positive in 3 of the patients with positive RF. Within PsA, one developed skin psoriasis, another psoriatic onychopathy at 4 years after debut and 2 continue without skin involvement but with a family history of psoriasis, all met CASPAR criteria. From the other 24 patients (53.3%), only 3 patients (12.5%) continued to be followed up, with an average of 21.3 years (range 18–26) without meeting the criteria that allow us to define diagnosis. With the rest of the patients (40.8%), followed for an average of 4.5 years, a diagnosis was not achieved by resolution of the clinical picture or loss of follow-up.

**Conclusions:** In our series, 46.6% of the patients with a diagnosis of negative HLA B27 seronegative oligoarthritis began to meet diagnostic criteria for rheumatic disease after a mean time of 5.47 years, with RA being the most frequent diagnosis (38%) after an average of 4.8 years after the arthritis onset.

#### AB1148 BIOLOGICAL TREATMENT OF NON ISCHAEMIC OPTIC NEURITIS ASSOCIATED TO IMMUNE-MEDIATED INFLAMMATORY DISEASES. MULTICENTER STUDY

L.C. Domínguez Casas<sup>1</sup>, V. Calvo-Río<sup>1</sup>, O. Mariz-Alonso<sup>2</sup>, A. Blanco<sup>3</sup>, J. Narvaez<sup>4</sup>, S. Castañeda<sup>5</sup>, E. Vicente<sup>5</sup>, S. Romero Yuste<sup>6</sup>, R. Demetrio-Pablo<sup>7</sup>, N. Vegas-Revenga<sup>1</sup>, M. Gonzalez-Gay<sup>1</sup>, R. Blanco<sup>1</sup>. <sup>1</sup>Rheumatology, HUMV, Santander; <sup>2</sup>Rheumatology; <sup>3</sup>Ophthalmology, H. Donostia, San Sebastian; <sup>4</sup>Rheumatology, H. Bellvitge, Barcelona; <sup>5</sup>Rheumatology, H. La Princesa, Madrid; <sup>6</sup>Rheumatology, H. Pontevedra, Pontevedra; <sup>7</sup>Ophthalmology, HUMV, Santander, Spain

**Background:** Non ischaemic optic neuritis (NION) is a severe inflammation of the optic nerve that may lead to blindness. It can be primary or associated to immune-mediated inflammatory diseases (IMIDs). The treatment of the NION is based on systemic corticosteroids and conventional immunosuppressive drugs.

**Objectives:** To assess the efficacy of the biological treatment in refractory NION to conventional treatment.

**Methods:** Multicenter study of 8 patients diagnosed with NION refractory to systemic corticosteroids and at least one conventional immunosuppressive drug.

The main outcomes were visual acuity (VA) and OCT of the optic nerve and the ganglionar cells. Comparisons were made between baseline and the 1st week, 1st and 6th month and 1st year. (STATISTICA, StatSoft Inc. Tulsa, Oklahoma, USA).

**Results:** We studied 8 patients (12 affected eyes) (4♀/4♂); mean age of 34.37 ±13.30 years. The underlying diseases were SLE (n=1), neuromyelitis optica (n=1), neuroretinitis (n=1), relapsing polychondritis (n=1), idiopathic (n=2) and Behçet's disease (n=2).

Before biological treatment and besides oral corticosteroids patients had received intravenous (IV) methylprednisolone boluses (n=6), cyclosporine A (CyA) (n=1), ciclophosphamide (n=2), micophenolate (n=2), hydroxychloroquine (n=1), methotrexate (MTX) (n=4) and azathioprine (AZA) (n=2).

Biological treatment was based on rituximab (n=2) (2 IV. doses of 1 g/very 2 weeks and every 6 months), adalimumab (n=2) 40 mg/week, tocilizumab (n=2) 8 mg/kg/2–4 weeks and infliximab (n=2) 5 mg/kg at 0, 2 and 6 week and then every 8 weeks.

The characteristics of the 8 patients are shown in the **TABLE**

After biological treatment we observed an improvement in the ocular parameters: VA [0.60±0.33 to 0.76±0.41,  $p: 0.04$ ], OCT of the optic nerve [130.63±60.54 to 102.60±8.17,  $p: 0.1$ ] and OCT of the ganglionar cells [404.60±184.73 to 243 ±18.38,  $p: 0.17$ ] at one year. After a mean follow-up of 27±14.47 months there were no severe adverse effects.

Abstract AB1148 – Table 1

Case	Sex / Age (years)	Underlying disease	Laterality	Immunosuppressive drugs before biologic therapy	Biologic therapy
1	♂ / 25	Behçet's disease	Right	MTX, CyA	ADA
2	♂ / 43	Neuromyelitis optica	Bilateral	AZA	RTX
3	♂ / 14	Neuroretinitis	Bilateral	MTX	ADA
4	♂ / 56	SLE	-	HYDROXYCHLOROQUINE, MMF, CFM	RTX
5	♂ / 29	Idiopathic	Right	AZA	TCZ
6	♂ / 26	Idiopathic	Bilateral	AZA	TCZ
7	♂ / 43	Relapsing polychondritis	Bilateral	MTX, CFM	IFX, TCZ
8	♂ / 39	Behçet's disease	Right	MTX, MMF	IFX

MTX: methotrexate, CyA: cyclosporine A, AZA: azathioprine, CFM: cyclophosphamide, MMF: mycophenolate, ADA: Adalimumab, RTX: rituximab, TCZ: tocilizumab, IFX: infliximab.

**Conclusions:** This study shows that treatment with biologic drugs, including anti-TNF drugs, in NION associated to IMIDs, refractory to conventional treatment, seems to be effective. These results must be confirmed in prospective and randomised trials.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.5485

### AB1149 CYSTIC FIBROSIS AND INFLAMMATORY ARTHRITIS REQUIRING IMMUNOSUPPRESSION: A WORRYING COMBINATION?

M.E.T. Ibrahim<sup>1</sup>, E. Clarke<sup>1,2</sup>, K. Martin<sup>1</sup>, D. Peckham<sup>3</sup>, A. Jones<sup>1</sup>, A. Horsley<sup>1,2</sup>, P. Watson<sup>1</sup>, J.E. Freeston<sup>3</sup>. <sup>1</sup>Manchester University NHS foundation Trust, Manchester, UK; <sup>2</sup>University of Manchester, Manchester; <sup>3</sup>Leeds Teaching Hospitals NHS Trust, Leeds, UK

**Background:** Inflammatory arthritis is a recognised complication of cystic fibrosis (CF) with an estimated prevalence of 2.3<sup>[1]</sup> to 8.5%<sup>[1]</sup> of CF patients. Cystic fibrosis associated arthritis (CFA) constitutes the majority of this, but other there may be other co-morbid rheumatic disease. Concerns about use of immunosuppression in the context of chronic pulmonary infection, and consequent risk of destabilisation, may limit use of these medications when clinically indicated. Immunosuppressive therapy is used in patients with CF lung disease who have inflammatory rheumatic disease, inflammatory bowel disease, or who have had a liver transplant for CF-related liver disease. Some data on those receiving immunosuppression post-transplant has been published and reassuringly reported fewer courses of intravenous antibiotics following transplant.<sup>[1]</sup> Reports of immunosuppressants being used in other contexts, including arthritis, are more sporadic.

**Objectives:** To assess prior use and safety outcomes of immunosuppressant therapy in adults with CF.

**Methods:** A retrospective case note review of patients with CF receiving disease modifying anti-rheumatic drugs from 2 large adult CF centres (total >700 patients) from electronic records spanning 3–10 years.

**Results:** 41 patients were identified: 7 post liver transplant, 1 with inflammatory bowel disease, 1 with IgA nephropathy; 32 with inflammatory arthritis.

Abstract AB1149 – Table 1

Medication	Number of patients	Cumulative months of treatment	Stopped due to side effects
Azathioprine	4	239	0
Hydroxychloroquine	27	726	3
Sulfasalazine	7	98	3
Tacrolimus	7	900	0
Methotrexate	6	192	1
Cyclophosphamide	1	1	0
Etanercept (with methotrexate, sulfasalazine, hydroxychloroquine)	1	7	0

There was one possible case of increased pulmonary exacerbation associated with methotrexate; they remained on treatment at the time of the study. There was no evidence that immunosuppression resulted in a fall in lung function necessitating cessation of treatment in any of these cases. Three patients stopped hydroxychloroquine and 1 patient stopped methotrexate due to non-respiratory side effects. Four of 7 patients responded to treatment with sulfasalazine for inflammatory arthritis, 3 stopped due to non-respiratory side effects.

**Conclusions:** No patients had immunosuppression stopped because of deterioration in lung disease. Steroids were not included in this analysis because duration and dose varied widely. However, it is important to note that they are frequently used in CF (particularly for allergic bronchopulmonary aspergillosis). Indeed 14% of all CF patients in these centres have had steroids in the last 6 months, of whom nearly half received a course of more than 6 months duration.

Whilst our results are reassuring, the numbers remain small. Decisions must be made in conjunction with the multidisciplinary team, but CF in itself should not delay or stop treatment with immunosuppression where it is indicated.

### AB1150 THE EUROPEAN REFERENCE NETWORK ON RARE AND COMPLEX CONNECTIVE TISSUE AND MUSCULOSKELETAL DISEASES: ERN RECONNET

M. Mosca<sup>1</sup>, M. Cutolo<sup>2</sup>, S. Badreh<sup>3</sup>, S. Bombardieri<sup>4</sup>, G. Burmester<sup>5</sup>, J. E. Fonseca<sup>6</sup>, C. Frank<sup>7</sup>, I. Galetti<sup>8</sup>, E. Hachulla<sup>9</sup>, F. Houssiau<sup>10</sup>, U. Müller-Ladner<sup>11</sup>, M. Schneider<sup>12</sup>, V. Smith<sup>13</sup>, J. van Laar<sup>14</sup>, on behalf of ERN ReCONNET Coordinators and HCPs. <sup>1</sup>Azienda Ospedaliero Universitaria Pisana, Pisa; <sup>2</sup>IRCCS AOU San Martino, Genova, Italy; <sup>3</sup>Lupus Europe, Romford, UK; <sup>4</sup>University of Pisa, Pisa, Italy; <sup>5</sup>Charité Universitätsmedizin Berlin, Berlin, Germany; <sup>6</sup>Centro Hospitalar de Lisboa Norte, Lisbon, Portugal; <sup>7</sup>Bindweessel, Koersel; <sup>8</sup>Federation of European Scleroderma Associations (FESCA), Brussels, Belgium; <sup>9</sup>CHRU de Lille, Lille, France; <sup>10</sup>University Hospitals Saint-Luc, Brussels, Belgium; <sup>11</sup>Kerckhoff Klinik, Bad Nauheim; <sup>12</sup>Universitätsklinikum Düsseldorf, Düsseldorf, Germany; <sup>13</sup>University Hospital Ghent, Ghent, Belgium; <sup>14</sup>University Medical Center Utrecht, Utrecht, Netherlands

**Background:** Set up under the European Union (EU) directive on patients' rights in cross-border healthcare (2011/24/EU), European Reference Networks (ERNs) on rare and complex diseases are aimed at connecting healthcare providers (HCPs) across different EU Countries to tackle complex and rare medical conditions that require highly specialised treatment. ERN ReCONNET, endorsed by EULAR, and approved for rare and complex connective tissue diseases (CTDs), aims at developing a framework for the delivery of high quality, innovative, sustainable and equitable standard of care and practice for better access to care of European patients.

**Objectives:** To report the activities of ERN ReCONNET during the first 10 months of work

**Methods:** ERN ReCONNET is composed of 26 HCPs from 8 EU Countries: Belgium, France, Germany, Italy, Netherlands, Portugal, Romania and Slovenia. Patients involvement is ensured by the ERN ReCONNET European Patients Advocacy Group, included in the activities of the ERN. The diseases covered are divided into 3 main thematic areas: rare CTDs (systemic sclerosis, mixed CTD, idiopathic inflammatory myopathies, antiphospholipid syndrome, undifferentiated CTD, IgG4 related diseases, relapsing polychondritis), complex CTDs (SLE, Sjogren's Syndrome), hereditary connective tissue diseases (Ehlers-Danlos syndrome). Senior and Junior Coordinators for each disease were selected. The scientific activities of ERN ReCONNET officially started in Vilnius in March 2017, where the 24 ERNs have been formally launched.

**Results:** The scientific activities of the first year were mainly focused on existing clinical practice guidelines (CPGs). The first phase was aimed at identifying the scientific publications, selecting them by evaluation of titles and abstracts, and by reviewing the full texts. More than 6.000 publications have been screened. The second step was to review critically the articles according to the principles of the AGREEII flow-chart. This work allowed to identify CPG for the majority of the diseases covered by ERN ReCONNET, as well as unmet needs, in particular for the rarest diseases (IgG4 related diseases, relapsing polychondritis, mixed CTD). Good progress has also been made in the field of IT, in which ERN ReCONNET was mainly focused on the use of the Clinical Patients Management System web-platform, designed for the interactive discussion of difficult clinical cases. Notably, the creation of ERN website is being co-designed by all Networks stakeholders.

**Conclusions:** The ERN ReCONNET will significantly improve the clinical approach to rare and complex CTDs, promoting an improvement of the quality of the specialised care provided to patients, of the activity of the physicians, the empowerment of the patients sharing expertise and promoting the interaction among EU HCPs. All these activities are addressed to create a highly specialised network, in which the knowledge travels rather than the patient.

**AB1151 POLYMYALGIA RHEUMATICA. NEW THERAPEUTIC STRATEGY BASED ON LOW DOSE OF METROTEXATE PLUS LOCAL INFILTRATION WITH CORTICOSTEROIDS**

M. Retuerto Guerrero, E. Rodriguez, S. Melchor, N. Costas, J.L. Pablos, P. Fernández Dapica. *Rheumatology, Hospital 12 de Octubre, Madrid, Spain*

**Background:** The polymyalgia rheumatica is a rheumatic inflammatory disease more frequent in the eldest population. The classic therapy is based on medium doses of corticosteroids followed by a maintenance phase of low doses, generally lasting from 1–2 years. Recurrences frequently require an escalation of dose, thus lengthening the treatment time, and that entails important comorbidity. Methotrexate (MTX) has been tested in 3 randomised clinical trials, showing in two of them the efficacy as a steroid sparing agent, but it has never been tested as monotherapy.

**Objectives:** To analyse the results of an alternative therapy in order to avoid the oral corticotherapy through the use of low dose of MTX and joint infiltration with a total duration of 24 months.

**Methods:** A prospective observational study in which patients that had been diagnosed with 2012 EULAR/ACR criteria were evaluated in outpatient medical consultations of Rheumatology at "Doce de Octubre" Hospital between 2015–2017, with the restriction of not having received previous steroid treatment. Right after diagnosis, the treatment with MTX 5–7.5 mg/w plus the infiltration of triamcinolone acetonide in both shoulders begins, being repeated if necessary after 15 or 30 days, or in case of subsequent relapse.

**Results:** 26 patients were included, with an average follow-up 19±5 months.<sup>12–24</sup> The age average at diagnosis was 74±7 years,<sup>55–83</sup> being 56% women. 73% had symmetrical hand arthritis and 27% structural pathology of the rotator cuff. 96% had moderate-severe pain (VAS) in shoulders, 73% in hips and 54% in hands. These percentages after a month of treatment were 15%, 11.5% and 7.7%. From the onset of symptoms until the start of treatment 104±54 days passed,<sup>30–180</sup> applying an initial dose of 5 mg of MTX in half of cases and 7.5 mg in the other half. There are no significant differences between precocity of the treatment or initial dose regarding a faster remission. The average of infiltrations in the shoulder per year is 2±1.4 (1–4). 25% of patients showed reactivation with good response to the MTX dose increase [maximum dose 8±1.7 (5–12.5)] plus/or joint infiltration. The average time until the revision (subjective clinical evaluation, HAQ and APR) was 2.7±1 months,<sup>1–6</sup> being significantly higher ( $p<0.05$ ) in patients with peripheral arthritis 3.3±1.9 vs 1.3±0.7. The change of HAQ, CRP and other variables are indicated in the table.

The treatment was stopped in 12% because of adverse effects (digestive intolerance, alopecia and respiratory infection in a patient with COPD). A patient showed mild plaquetopenia in which not necessary to suspend the treatment with MTX.

8 patients were monitored during ≥2 years, in 87% of them MTX has been removed with an average follow-up after the suspension of 3±1.7 months<sup>1–6</sup> with no need to restart it in any case.

Abstract AB1151 – Table 1

	Start	1 Month	3 Months	6 Months	12 Months
Morning stiffness>1 hour	69%	38%	4%	4%	4%
HAQ	2	0.750	0.300	0.500	0.125
ESR	43,2	20	20	15	13
CRP mg/dl (0–0,5)	4,1	0,81	0,44	0,48	0,47
Peripheral arthritis	77%	23%	7%	11%	7%
Shoulder limitation	100%	69%	26%	23%	20%

**Conclusions:** The use of low dose of MTX and local joint infiltration with corticosteroids (initial and on demand) is an efficient therapeutic strategy with a low complication rate in PMR. All these results must be confirmed with controlled studies and a longer period of follow-up after the suspension of treatment.

**AB1152 MUSCULOSKELETAL MANIFESTATION OF DIABETES MELLITUS IS HIGHLY PREVALENT AND IS ASSOCIATED WITH POOR DIABETIC CONTROL**

K. Khan, K. Ali, S. Farrukh, M. Haroon. *Rheumatology, University Hospital Kerry, Tralee, County Kerry, Ireland*

**Background:** Diabetes mellitus is one of the most common medical conditions all over the world. A variety of musculoskeletal (MSK) conditions have been associated with diabetes mellitus (DM). These MSK symptoms are important to recognise because these can respond to treatment. Estimates of the prevalence of MSK problems in patients with DM vary depending upon the definitions used for the problems and the study population with diabetes, which can range from a primary care cohort to patients with severe diabetes in a specialised referral setting.

**Objectives:** The objectives of our study were: 1) to investigate the prevalence of musculoskeletal complications of diabetes in a consecutive cohort of patients attending a secondary care endocrinology clinic; and 2) to identify clinical associations of such musculoskeletal complications by examining likely contributing features including patient characteristics, life style factors and features of underlying diabetic disease.

**Methods:** The study participants were all consecutive patients attending endocrinology clinics of University Hospital Kerry for the management of their DM. Patients with chronic inflammatory arthritis or chronic autoimmune diseases were also excluded. This was a questionnaire-based study and was carried out in two steps. The first step involved having a short interview and assessment of the patient, and in the second step their clinical records were reviewed to populate clinical parameters. The clinical variables studied were gender, smoking habits, body mass index (BMI), units of alcohol intake per week, smoking habits, type of DM, duration of DM, medications used for DM, employment status and also their current HbA1c blood results. End organ complications of DM were also included. Moreover, personal history of cardiovascular risk factors and diseases were also recorded. Since there is a long list of rheumatologic manifestations which are potentially associated with DM and many of them are less sensitive and specific for DM, we choose to study the 4 common DM-associated rheumatologic presentations (Stiff hands, Carpel Tunnel Syndrome, Charcot joint, bilateral shoulder rotator cuff tendinopathy). Moreover, importantly, only patients with the musculoskeletal symptoms lasting for >3 months were included in the analysis. These 4 DM-associated musculoskeletal diseases are labelled as DM-MSK diseases.

**Results:** A total of 250 patients [mean age 66±16 years; 58% male; mean duration of DM 13±10 years; mean BMI of 27.5±6] were evaluated. DM-MSK diseases were present in 37.6% (n=94) of the entire cohort.

On univariate analysis, patients with older age, type-2 DM, using hypoglycaemic agents, hypertension, ischaemic heart disease, peripheral vascular disease, cerebrovascular accident, congestive heart disease, and patients with renal involvement had significantly higher prevalence of DM-MSK symptoms. However, on multivariate analysis (table-3), poor diabetic control as reflected by higher HbA1c levels, presence of diabetic kidney disease and advancing age were associated with the presence of DM-MSK symptoms.

**Conclusions:** We conclude that MSK manifestations of DM are very common but unfortunately these remain poorly recognised and continue to cause significant disabilities. Similar to the microvascular and macrovascular complications, MSK manifestations are associated with poor diabetic control.

**Disclosure of Interest:** K. Khan: None declared, K. Ali: None declared, S. Farrukh: None declared, M. Haroon Grant/research support from: abbvie, Pfizer, Speakers bureau: abbvie, Pfizer, UCB

**AB1153 IDIOPATIC LOBULAR PANNICULITIS (DISEASE WEBER-CHRISTIAN): CURRENT ASPECTS**

O.N. Egorova<sup>1</sup>, B.S. Belov<sup>1</sup>, S.I. Glukhova<sup>1</sup>, S.G. Radenska-Lopovok<sup>2</sup>. <sup>1</sup> V. A. Nasonova Research Institute of Rheumatology; <sup>2</sup> FSBEIHE I.M. Sechenov Moscow State Medical University, Moscow, Russian Federation

**Background:** Idiopathic lobular panniculitis (ILP) (syn. Weber-Christian disease) is the least studied condition from the group of systemic connective tissue diseases, which is characterised by predominant involvement of subcutaneous fat (SCF) tissue.

**Objectives:** To evaluate the interrelation between clinical signs and lab parameters in ILP patients.

**Methods:** The study evaluated 67 patients (9 males and 58 females) aged 20–76 years with verified ILP diagnosis and mean disease duration of 78.91<sup>48;540</sup> months who were on the record at V. A. Nasonova Research Institute of Rheumatology during 2007–2017 yy. Alfa-1 antitrypsin, liver fractions, amylase, lipase, trypsin, ferritin, creatine phosphokinase (CPK), leptin and TNF- $\alpha$  levels were measured, chest CT and histopathological study of skin and SCF lesions biopsy specimens were made in addition to conventional clinical examination.

**Results:** ILP was found to affect all age groups, with 57% of cases falling on able-bodied adults aged 45–60 yy. Based on clinical manifestations including location, distribution, spatial extent of lesions, and clinical course of the disease, the following 4 clinical forms of ILP were identified: nodular (30 patients), plaque-like,<sup>10</sup> infiltrative<sup>15</sup> and mesenteric.<sup>12</sup> ILP population demonstrated significant ESR ( $p=0,01$ ) and CRP ( $p<0,0001$ ) elevation. ESR elevation correlated with palpatory nodular pain intensity, assessed by visual analogue scale (VAS ( $p<0,05$ ,  $r=0,29$ ), with the amount of affected body surface area (BSA) measured using the hand area surface (HAS) to equal 1% BSA ( $p<0,05$ ,  $r=0,50$ ), with elevation of body temperature ( $p<0,05$ ,  $r=0,68$ ) and CRP ( $p<0,05$ ,  $r=0,68$ ). CRP elevation correlated with pain intensity measured by VAS ( $p<0,05$ ,  $r=0,46$ ), affected BSA ( $p<0,05$ ,  $r=0,61$ ) and presence of stage II nodules ( $p<0,05$ ,  $r=0,41$ ). Histopathologic features of skin and SCF biopsy specimens were studied in 65 patients (97,01%), including antero – and retroperitoneal fat tissue biopsy specimens from 3 patients out of 5 (5,97%)

with mesenteric panniculitis without skin and SCF involvement; the remaining 2 were not biopsied in hard to access areas. Histopathological study ruled out the probability of neoplasms and confirmed the diagnosis of lobular panniculitis in all specimens.

Therapy included such common in rheumatology practice agents as glucocorticosteroids, NSAIDs, cytotoxic drugs, hydroxychloroquine, and oths). Therapeutic success was documented in 62,68% cases, therapeutic failure and disease progression – in 17,91% (12 patients), requiring dose escalation and modification of therapeutic regimen.

**Conclusions:** Identified correlation between clinical features and lab parameters measuring disease activity confirms ILP as a systemic inflammatory disease of the connective tissue. There's a flagrant necessity to improve physicians awareness of ILP, as well as need in future studies to enable earlier ILP diagnosis and identify more effective treatment of the disease.

AB1154

#### INCREASE GENERATION BUT DEFECTS OF SECRETING INF- $\alpha$ PLAY A ROLE IN THE PATHOGENESIS OF IGG4-RD

P. Zhang, W. Zhang. Peking Union Medical College Hospital, Beijing, China

**Background:** IgG4 related disease (IgG4-RD) is a multi-organ involvement, fibro-inflammatory disease of unknown etiology. Both innate and adaptive immunity played vital roles in the pathogenesis of IgG4-RD. Plasmacytoid dendritic cells (pDC) had major roles in antigen presentation and secreting INF- $\alpha$  upon infection. However, the characteristics and relevant function of this cell population in IgG4-RD was poorly understood. So we aim to study the expression and function of pDC in IgG4-RD.

**Objectives:** To study the expression and function of Plasmacytoid dendritic cells (pDCs) in IgG4-RD

**Methods:** Flow cytometry was performed to analyse the expression of pDC cells in untreated IgG4-RD patients (n=12) and healthy controls (n=12). The immunohistochemistry technique was used to assess the location of pDC in the involved tissues of IgG4-RD patients. Furthermore, by cells culture *in vitro*, the abilities of pDC secreting INF- $\alpha$  and the activation of NF- $\kappa$ B signal in IgG4-RD were explored.

**Results:** The frequencies of pDC in the IgG4-RD patients were significantly higher in the peripheral blood and involved tissues compared with healthy controls. The cell surface marker of CCR7 in pDC was lower in untreated IgG4-RD patients, but after treatment, the expression of CCR7 increased. There was on significance of the expression of pDC maturation marker (CD83), activation marker (CD80, CD86), CCR1, CCR2, CCR3, CCR4, CCR5, CCR6, CCR8, CCR9, CCR10, CXCR2, CXCR3 and CX3CR1 compared with healthy controls. Interestingly, the frequencies of CD123hiCD303+cells were also higher in untreated patients, and reduced after treatment, and the cell surface marker CD83 was also elevated. By cell culture *in vitro*, pDC had defects in secreting INF- $\alpha$  of IgG4-RD patients than healthy controls.

**Conclusions:** The excessive infiltration of pDC in peripheral blood and tissue but less CCR7 Defects of secreting INF- $\alpha$  of pDC in IgG4-RD may indicate less function of eliminating infection which may induce constant infection. pDC may played vital roles in the pathogenesis of IgG4-RD,

#### IMMUNOGLOBULIN G4 – RELATED DISEASE, A DIAGNOSTIC CHALLENGE

P. Diéguez<sup>1</sup>, B. Gimena, A. Argibay, C. Vázquez Triñanes, M. Estévez, M. Freire, J. Fernández Martín, A. Rivera. Systemic Autoimmune diseases and Thrombosis Unit, University Hospital Complex of Vigo, Vigo, Spain

**Background:** The IgG4-related disease (IgG4-RD) is a chronic, inflammatory, multi-organic, systemic disease. The pathological assessment is the gold standard for the diagnosis, hallmarked by the lymphoplasmacytic tissue infiltration of mainly IgG4-plasma cells, the storiform fibrosis and the obliterative phlebitis.

**Objectives:** The aim of this study was to analyse the features of IgG4- RD cases followed in a specific autoimmune diseases unit, since 2013.

**Methods:** Descriptive, retrospective study, through the review of clinical charts. Medical records were reviewed for demographics information, clinical

presentation, underlying conditions, laboratory and radiological data, medical and surgical treatments and clinical outcomes. All patients diagnosed by biopsy were included (international consensus pathological criteria of 2012). We excluded the possible cases of IgG4-RD when biopsy was not available or did not meet the criteria previously mentioned.

**Results:** Eight patients with characteristic clinical, histological and laboratory features of IgG4-RD were included. The patients were predominantly male (87.5%), the mean age at diagnosis was 66±11 years.<sup>48–80</sup> 87.5% of the cases were consulted from other hospital Services, mainly surgical: Urology 25% (hydrocele and urinary retention), General Surgery 25% (obstructive jaundice and forearm tumour), Vascular Surgery 25% (abdominal aortic aneurysm), Cardiac Surgery 12.5% (thoracic aortic aneurysm) and Neurology 12.5% (hypertrophic pachymeningitis). The most commonly involved organs were vascular 87.5% (6 aorta, 1 pulmonary veins) and retroperitoneum 75%, followed by renal 37.5%, pancreatic 12.5%, and central nervous system 12.5%. It was found isolated organic involvement in only one patient (autoimmune pancreatitis). Two patients had previous malignancy: renal cells and prostate. Magnetic resonance imaging, computed tomography and FDG-PET were made in 62.5% each of them. Serum IgG4 was determined in all cases, 62.5% of patients had normal IgG4 serum levels (the upper limit of normal for serum IgG4 is 135 mg/dl). Three patients (37.5%) had elevated serum IgG4, the mean level was 188±38 mg/dL (152–266). The pathological findings were dense lymphoplasmacytic infiltrate in 6 cases (75%) with obliterative phlebitis in 5 of them, storiform-type fibrosis in 4 cases (50%) and IgG4/IgG ratio >40% in 75% of the samples. Glucocorticoids treatment was initiated in 75% of patients, 25% were untreated for predominantly fibrotic involvement. There were treatment response in 60% of cases. 25% had a relapse after corticoid withdrawal. Only one patient received a second drug due to lack of response to Prednisone (rituximab).

**Conclusions:** According to the literature, IgG4-RD patients were predominantly male in their sixth and seventh decade of life. The predominant involvement in our serie was vascular and retroperitoneal, with no cases of glandular manifestations. Highlight the high number of cases with normal serum IgG4. Most of our patients responded to corticosteroid therapy.

**Disclosure of Interest:** None declared

AB1156

#### DRESS (DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS): LOOKS MAY BE DECEPTIVE!

R. Mistry<sup>1</sup>, A. Jain<sup>1</sup>, S. Ravi<sup>2</sup>, D. Misra<sup>1</sup>, N. Krishnani<sup>3</sup>, V. Aggarwal<sup>1</sup>. <sup>1</sup>Clinical Immunology and Rheumatology, Sanjay Gandhi Post Graduate Institute, Lucknow, India, Lucknow, <sup>2</sup>Rheumatologist, Apollo BGS Hospital, Mysuru, <sup>3</sup>Pathology, Sanjay Gandhi Post Graduate Institute, Lucknow, India, Lucknow, India

**Background:** Drug reaction with eosinophilia and systemic symptoms(DRESS) is a rare, potentially life threatening multisystem disorder with fever, skin eruptions, lymphadenopathy, eosinophilia and systemic involvement most commonly after a drug exposure. These cases may mimic various rheumatological conditions. We report a series of 14 cases of DRESS who presented to Rheumatology Clinic as suspected connective tissue disease or sepsis in Northern India.

**Objectives:** To highlight DRESS as a common mimic of common rheumatologic conditions and sepsis and report its etiology, characteristics, treatment and prognosis

**Methods:** We manually searched the inpatient records of Immunology Department in SGPGI 2007–18 for the cases discharged with a diagnosis of probable/ probable/definite DRESS. The records of the patients with probable and definite DRESS according to regiSCAR criteria<sup>1</sup> were reviewed.

**Results:** All the 14 patients fulfilled clinical criteria for diagnosis (4 probable, 10 definite). The age of patients ranged from 9–53 years with majority in their 3rd decade. Majority of the patients were referred to us when their counts were rising in the setting of fever and skin rashes with a suspicion of rheumatic disease/sepsis. The clinical and laboratory features of these patients are as follows (table 1):

TLC: Total Leucocyte Count, AEC: Absolute Eosinophil Count, ED: Exfoliative dermatitis, F: facial oedema, M: maculopapular rash, L: Liver, K: Kidney, P: Lung, G: GI, SSZ: Sulphasalazine, HRZE: Isoniazid, Rifampicin, Pyrazinamide, Ethambutol, FU: Follow up

All the patients were treated with oral steroids showing signs of clinical improvement within 4–5 days. Rashes and leucocyte count were first to respond. Transaminitis responded within a week. Mean Followup is 9.3 months. They were gradually tapered off steroids over next 3–4 months except for two patient who were lost to follow up.

Abstract AB1156 – Table 1

Age/ Sex	Drug	Late-ncy (weeks)	Type of rash	Systemic involve- ment	TLC/AEC /cu.mm	ALT/AST IU/L	Score <sup>1</sup>	Initial Suspected Diagnosis	Followup (months)

Abstract AB1156 – Figure 1

**Conclusions:** – Skin rash, arthritis, multi-organ failure of DRESS closely mimic rheumatologic disorders or sepsis (especially with rising TLC)

- As early diagnosis is imperative for successful outcome, low threshold of suspicion is necessary.

#### AB1157 CLINICAL IMPLICATIONS OF ULTRASONOGRAPHY (US) IN MONITORING DISEASE ACTIVITY OF RELAPSING POLYCHONDRIITIS (RP) AND COMPARATIVE INVESTIGATION BY US BETWEEN AURICLE OF RP, REPEATED TRAUMA AND HEALTHY SUBJECT

S. Inotani, Y. Taniguchi, H. Nishikawa, E. Amano, S. Nakayama, Y. Terada.  
*Department of Endocrinology, Metabolism, Nephrology and Rheumatology, Kochi Medical School, Nankoku-shi, Japan*

**Background:** Relapsing polychondritis (RP) is a rare systemic inflammatory disorder and might often be refractory. Therefore, the discovery of more convenient imaging modality than contrast-CT, MRI and FDG-PET/CT would be required on diagnosis and treatment.

**Objectives:** To assess the clinical implications of ultrasonography (US) in monitoring disease activity and diagnosis of relapsing polychondritis (RP).

**Methods:** Firstly, auricular chondritis of patients with RP (n=5) were assessed by US before and after treatments. Second, the relationship between US findings and other serum inflammatory markers were evaluated. Moreover, the comparisons of US findings between the auricle of patients with RP (n=5), repeated trauma (n=5) which is similar to auricle of RP, and healthy subjects (n=5) were also assessed.

**Results:** US finding before treatment showed low-echoic swollen auricular cartilage with increased power Doppler signals (PDS) in all cases of RP. US findings corresponded to biopsy findings. After treatment with prednisolone (PSL) combined with methotrexate, the swollen ear completely resolved. Then, US findings also showed dramatic reductions in swollen cartilage with the decrease in PDS. When serum inflammatory markers completely improved, but US finding remained in 1 of 5 cases, and this case showed flare due to PSL tapering. Finally, RP could be differentiated from the damage of repeated trauma with producing subperichondrial serous effusion.

**Conclusions:** US of auricular cartilage in RP possibly facilitates evaluation of auricular lesions and monitoring of disease activity, especially when we consider the treatment response and the timing of drug tapering.

#### MALIGNANCY IN PATIENTS WITH SARCOIDOSIS: A RETROSPECTIVE COHORT STUDY FROM TURKEY

S. Kobak<sup>1</sup>, F. Yildiz<sup>2</sup>, H. Semiz<sup>3</sup>, M. Orman<sup>4</sup>. <sup>1</sup>*Rheumatology, Istinye University Faculty of Medicine, LIV Hospital, Istanbul;* <sup>2</sup>*Chest Diseases, Medicalpark Hospital;* <sup>3</sup>*Internal Medicine;* <sup>4</sup>*Statistics, Ege University Faculty of Medicine, Izmir, Turkey*

**Background:** The relationship between sarcoidosis and malignancy is not clear yet. There is debate with different speculations in the literature in this regard, that this association may be just a coincidence and/or common pathogenetic link.

**Objectives:** The goal of our study was to evaluate the incidence and characteristics of malignancies in patients with sarcoidosis follow-up in a single centre.

**Methods:** Our study is a retrospective analysis of patients diagnosed with sarcoidosis at the single Rheumatology centre from Turkey. Electronic patient records from the years 2010 to 2016 were screened, and 131 patients with the diagnosis of sarcoidosis were included in the study. Diagnosis of sarcoidosis was either a clinical diagnosis in patients with Löfgren's syndrome or confirmed by tissue biopsy in all other patients. The incidence of malignancies were evaluated in this cohort. Malignant diseases were diagnosed by histopathology. The clinical data of patients with sarcoidosis and malignant diseases were further analysed.

**Results:** A total of 6 patients with malignancy were identified in our cohort of 131 patients with sarcoidosis, representing an incidence of 4.6%. Among them, Hodgkin lymphoma (HL) were detected in three patients, followed by one patient with breast cancer, one patient with thyroid cancer and one patient with testicular cancer. All patients had chronic sarcoidosis with pulmonary involvement, and only 1 patient (with thyroid cancer) had acute sarcoidosis with Löfgren's syndrome. HL developed concomitantly with sarcoidosis in one patient while other two patients developed disease before and after sarcoidosis diagnosis. Two patients with solid tumours (breast Ca, testicular Ca) developed malignancy years before sarcoidosis diagnosis (1 year and 2 year respectively), while one patient developed thyroid cancer during sarcoidosis follow-up. All 6 sarcoidosis-malignancy patients were survived during six year follow-up.

**Conclusions:** We found low incidence of malignancy in patients with sarcoidosis in our small cohort. Malignancy may develop in patients with sarcoidosis. Its may occur before, after, or concurrent with the diagnosis of sarcoidosis. The sarcoidosis-malignancy relationship can only be a coincidence and/or can be explained by

a common pathogenesis. New prospective studies involving large patients series are needed in this regard.

#### VIRUS-NEGATIVE LYMPHOCYTIC MYOCARDITIS: CLINICAL AND DIAGNOSTIC FEATURES FROM A MONOCENTRIC ITALIAN COHORT

S. Sartorelli, C. Campochiaro, G. De Luca, C. Candela, G. Cavalli, L. Dagna. *Unit of Rheumatology, Immunology, Allergy and Rare Diseases (UnIRAR), IRCCS San Raffaele Hospital, Milan, Italy*

**Background:** Virus-negative lymphocytic myocarditis (VNLM) is defined by endomyocardial biopsy (EMB) established histological, immunological and immune-histochemical criteria; it may occur as a distinct disease or in the context of systemic autoimmune or inflammatory disorders.

**Objectives:** To describe the demographic, clinical, histological and immune-histochemical features of VNLM from a monocentric Italian cohort.

**Methods:** 42 patients (mean age 45.57±14.9 years; male to female ratio 1:1) were diagnosed with EMB-proven VNLM at our Centre from January 2015 to December 2017. In all patients, comprehensive demographic, clinical and histological data were collected.

**Results:** The most common initial clinical feature was chest pain (40.5%), followed by palpitations (26.2%) and syncope (23.8%). Aborted sudden cardiac death (SCD) was the first manifestation in 3 cases, while arrhythmias were overall present in 47.6% of patients, being life-threatening in 10 of them. Interestingly, 4 patients had only few constitutional symptoms and 2 patients were completely asymptomatic. The distribution of traditional cardiovascular risk factor reflected that of the general population, apart for a more common familiarity for SCD (31.7%) and for autoimmunity (31.7%). Serum levels of troponin T and NT-proBNP were increased in 40.5% and 30.9%, respectively. Both echocardiography and standard ECG were unremarkable in half of the patients, while nearly all patients (92.5%) had at least one Lake-Louise criterion at cardiac magnetic resonance (CMR) evaluation. The most common CMR finding was delayed enhancement in 90% of cases, while T2-oedema was found in 21 patients (50%). Left ventricular ejection fraction was reduced in 50% of patients; a concomitant pericardial effusion was detected in 22.5% of cases. Abnormalities on 24h-ECG-Holter tape were overall detectable in 20 patients (47.6%), with ventricular ectopic beats and non-sustained ventricular tachycardia being the most common findings.

Despite positivity for ANA in 42.8% patients, only 4 patients could be diagnosed with a systemic autoimmune disease. Anti-heart antibodies (AHA) and anti-intercalated disks antibodies (AIDA) were positive in 21 patients (50%) and 12 (28.6%) patients, respectively.

On EMB, myocarditis was classified as active in 23 cases (54.8%) and as chronic in 18 (42.3%), while 7 patients (16.7%) had evidence of both features. CD3 +T-lymphocytes >7/mm<sup>2</sup> were detectable in 27 patients (64.3%), necrosis in 20 patients (47.6%), oedema in 28 patients (66.7%), while only 4 patients showed signs of vasculitis or thrombotic microangiopathy. At time of diagnosis, myocardial fibrosis was evident in 73.8% of EMBs and dilated cardiomyopathy in 6 patients (14.3%). All patients were treated with steroids and azathioprine as first line therapy, and 17 patients (40.5%) were initially referred for device implantation.

**Conclusions:** VNLM is an overlooked disease characterised by a broad spectrum of clinical features and peculiar immune-mediated hallmarks. The early recognition of myocarditis, allowing a prompt therapeutic intervention, should be a major goal for rheumatologists.

AB1160

#### A SYNDROME OF RECURRENT IDIOPATHIC HYDROPS FETALIS, RESPONDING TO ANTI-PLATELETS/ANTI-COAGULANT PROPHYLAXIS. IS IT A NEW ENTITY OR A PART OF MATERNAL HYPERCOAGULATION STATE; THROMBOPHILIA OR ANTI-PHOSPHOLIPID SYNDROME (APS)?

S. Aamar. *Hadassah Mount Scopus, Hebrew University Medical School, Jerusalem, Israel*

**Background:** Anti-phospholipid (aPL) syndrome (APS) is defined in the presence of anticardiolipin (aCL), anti-β<sub>2</sub> glycoprotein-I antibodies, or lupus anticoagulant (LAC) with hypercoagulability, including arterial/venous thrombosis episode (s), or pregnancy morbidity; early spontaneous abortions, stillbirth or prematurity with (pre)eclampsia. Beside these classification criteria the increased awareness for seronegative APS and non-criteria clinical manifestations, necessitate additional laboratory diagnostics for aPL's. Use of preventive treatment protocol; low-dose (100 mg/d) aspirin (ASA) and/or daily subcutaneous (SC) heparin, is highly effective and improves fetal vitality and pregnancy outcome. Beside APS, stillbirth and fetal loss may result from thrombophilia and Hydrops fetalis (HF). HF is described as fetal pathological fluid accumulation in serous cavities and soft tissues. It is accompanied with placental thickening and hydramnios. Most of the cases refer to non-immune (NIHF), not caused by red cell alloimmunization. Almost third of NIHF are idiopathic (iNIHF). The pathogenesis of tissue hypoxia with capillary leakage remains unclear. With advanced in-utero therapy mortality is still high (50%–95%).

**Objectives:** To describe the entity of recurrent idiopathic NIHF, resulting in habitual miscarriages. To document the use of APS prophylactic regimen for fetal loss, and its effect on iNIHF occurrence.

**Methods:** Data from medical files of women with previous iNIHF, who were treated in the rheumatology clinic, Hadassah Mount Scopus Hospital in Jerusalem, between years 2002–2017 were summarised (table 1).

**Results:** The present series illustrates the impact of the prophylactic regimen of APS in preventing obstetrical morbidities, including miscarriages and fetal death due to Hydrops fetalis (table 1). Thrombophilia and aPL profiles were normal. Five women who had multiple early abortions and 8 pregnancies with iNIHF, following treatment had a total of 12 successful pregnancies with uneventful delivery to healthy babies.

ANA:anti nuclear antibodies, IUFD:intra uterine fetal death, IVF:in vitro fertilisation, CLX:Clexan=Enoxaparin (SC 40 mg/d), HCQ:Hydroxy-Chloroquine (200 mgx 2/d), PRD:Prednisone (10–20 mg/d)

Abstract AB1160 – table 1. summary of cases

patient	Age (yrs)	Pregnancies before prophylaxis	Outcome (mother age, outcome, gestation age wks)	Treatment (Prophylaxis during pregnancy)	Pregnancies on prophylaxis (maternal age)	Outcome	Positive findings
1	38	10(x7 IVF)	x1(21, preterm, 30), x2(22, 23, iNIHF/IUFD, 31), x7 abortions,<10)	CLX, ASA, HCQ	x3 <sup>(25, 27, 29)</sup> Spontaneous (no IVF), on HCQ, PRD 5 mg/d	Uneventful	ANA+, aCL+, LAC+, Raynaud's, Livedo Reticularis
2	43	2	x2(20, 21 IUFD/iNIHF, 27,23)	ASA, PRD	x3 <sup>(23, 26, 29)</sup>	1-mild HF, live birth 34 wks. 2+3 uneventful	Migraine, low platelets
3	31	2	x1(22, abortion, 8), x1(23 IUFD/iNIHF, 24)	ASA, CLX	x2 <sup>(25, 27)</sup>	Uneventful	None
4	27	3	x1(20, IUFD/iNIHF, 25), x1(21, abortion,<10), x1(22 IUFD/iNIHF, 26)	ASA, CLX, PRD	x2 <sup>(23, 25)</sup>	Uneventful	Raynaud's, Alopecia
5	48	4	x1(25 normal, term), x2(26, 27, abortions,<10), x1(29, IUFD/iNIHF, 30)	CLX 60 mg/d	x2 <sup>(30, 33)</sup>	Uneventful	None

**Conclusions:** Idiopathic NIHF, is a very serious condition with high fetal mortality and limited effective therapy, so prevention is very crucial. APS prophylaxis regimen, based on anti-platelets and anti-coagulant therapy during pregnancy, may have promising effects.

**AB1161** **FAMILIAL MEDITERRANEAN FEVER AS AN OUTCOME OF UNDIFFERENTIATED ARTHRITIS**

V. Vardanyan<sup>1</sup>, K. Ginosyan<sup>1</sup>, A. Simonyan<sup>1</sup>, S. Bakhshyan<sup>2</sup>. <sup>1</sup>Internal Medicine, Yerevan State Medical University; <sup>2</sup>"Cito" Medical Centre, Yerevan, Armenia

**Background:** The term «undifferentiated arthritis» (UA) was proposed to emphasise the heterogeneity of unclassifiable arthritides and their potential into a definable form of arthritis. A patient with UA have an early stage of defined arthritis that will meet criteria in time, a forme fruste or partial form of a classifiable disease, an overlap of more than one disease entity, or an arthritis of unknown or in that may (or may not) become differentiated in the future. The heterogeneity associated with the term «UA» emphasises the need for continued follow-up and reassessment of the diagnosis and management of these patients.

**Objectives:** The aim of this study was revelation of MEFV gene mutations in patients with UA.

**Methods:** We have examined 80 patients (34 male, 46 female, mean age 36,4 ±3.4 years) with UA. The patients were observed every 6 months in follow-up period of 5 years. The anamnestic and treatment data were obtained. Joint disease activity scores and presence of extra-articular manifestations were determined. The CBC, urinalysis, serum concentrations of creatinine, bilirubin, transaminases, glucose, CRP were determined every 6 months, X-ray examination and ultrasonography of joints were performed once a year. Molecular-genetic analysis of 12 MEFV-mutations, common for Armenians, were carried out in Medical Genetic Centre of Armenia.

**Results:** From 80 investigated patients with UA 10 had repeated episodes of mono- and oligoarthritis of ankle and/or knee joints with local skin hyperemia and hyperthermia, without subsequent joint deformities, 45 – sacroiliitis (26 bilateral, 19 unilateral), accompanied by enthesopathy, 2 – joint syndrome, resembling rheumatoid arthritis. In 23 patients joint syndrome was accompanied by erythema rash, livedo reticularis, photosensitivity and alopecia. The latter group of patients was diagnosed as SLE-like syndrome. All patients didn't fulfil accepted classification criteria of any autoimmune or autoinflammatory disease. The 80% of investigated patients had no classic febrile attacks of abdominalgia and/or thoracalgia, specific for FMF. In remaining 20% of patients febrile attacks hadn't preceded joint syndrome, but appeared during 5 year follow-up period.

All investigated patients had MEFV gene mutations, which's compositions (homozygous or compound heterozygous) were enough to confirm Familial Mediterranean Fever (FMF). The most common mutations were: M694V–41.2%, V726A–18.8%, M680I–10%. The most common compositions were M694V/M694V, M694V/V726A, M694V/M680I.

**Conclusions:** As FMF is widely distributed in Mediterranean region, and it had changed its phenotype in last decades, as well as taking into account the increasing rate of migration worldwide, every single case of UA, which doesn't fulfil classification criteria of any disease, should be tested for presence of MEFV-mutations. The diagnosis of FMF changes the approach to follow-up, management, outcome and prognosis of UA.

**AB1162** **DIAGNOSTIC UTILITY OF LYMPH NODE BIOPSY IN DIFFERENTIAL DIAGNOSIS OF IGG4-RELATED DISEASE, IDIOPATHIC MULTICENTRIC CASTLEMAN'S DISEASE AND PRIMARY DISSEMINATED MALT-LYMPHOMA**

V. Vasilyev<sup>1</sup>, E. Sokol<sup>1</sup>, S. Palshina<sup>1</sup>, B. Chaltsev<sup>1</sup>, N. Probatova<sup>2</sup>, A. Pavlovskaya<sup>2</sup>, N. Kokosadze<sup>2</sup>, A. Kovrigina<sup>3</sup>, T. Safonova<sup>1</sup>, I. Gayduk<sup>4</sup>. <sup>1</sup>Nasonova Research Institute of Rheumatology, Moscow, Russia; <sup>2</sup>N.N. Blokhin Russian Cancer Research Center; <sup>3</sup>National Hematology Research Center; <sup>4</sup>Moscow State University of Medicine and Dentistry, Moscow, Russian Federation

**Background:** Lymphadenopathy (LA) is a frequent and challenging syndrome in rheumatic patients. It requires comprehensive clinical and expert pathological evaluation. IgG4-related disease (IgG4-RD) combines a group of fibroinflammatory conditions characterised by formation of tumor-like lesions with unique morphological features and hyper-IgG4 secretion in different organs and tissues. LA is frequent in IgG4-RD and doesn't have a unique morphology. Idiopathic multicentric Castleman's disease (iMCD) is a rare lymphoproliferative disorder of a hyper-IL-6 spectrum with obligate lymph nodes (LN) affection and less frequent

extranodal lesions. Pathologic features of the LN in iMCD overlap with IgG4-LA and there can be IgG4 hypersecretion in iMCD patients as well. Primary disseminated MALT-lymphomas (DMALT) are also in the spectrum of differential diagnosis because of the involvement of salivary and lacrimal glands.

**Objectives:** To evaluate the diagnostic utility of LN biopsy in differential diagnosis of IgG4-RD, iMCD and DMALT.

**Methods:** Retrospective study. We reviewed medical records from 2009 to 2017 and identified 13 pts. who were examined in our clinic due to some rheumatological diagnosis suspicion and whose leading symptom at the onset of the disease was LA. All patients had prior multiple LN biopsy (25 LN biopsies in total) which was reviewed by an expert pathologist during our examination. 11 pts. had extranodal lesions and underwent extranodal biopsy.

**Results:** Eight pts. were men, 5 women with average age at the onset 34,7 years (15–71 years). The directional diagnoses established on the LN pathology were as following (in some cases a few diagnosis): iMCD (4 pts), non-Hodgkin lymphoma (3 pts), reactive LN (12 pts). 11 pts. had some extranodal lesions (3,9 per patient, from 1 to 8): orbit – 8, major salivary glands – 8, hepatosplenomegaly – 5, lungs – 5, thyroid – 5, kidneys – 3, sinusitis – 3, skin, cholangitis – 2 each, retroperitoneum, mediastinum, pancreas and soft tissues – 1 each. Due to orbital and major salivary glands involvement some patients had directional diagnosis of Sjogren's syndrome or IgG4-RD. In all 13 pts. the directional diagnosis was changed to some other based on the extranodal biopsy pathology results (in 11 pts) and/or clinical presentation (in 2 pts with isolated LA). LN pathology was not conclusive in all cases. In all cases LN pathology fell into I-IV type of LN morphological picture as reported by J. Ferry et al.<sup>1</sup> Clinical presentation in 13 pts see in table 1. The final diagnosis were: IgG4-RD in 7 pts, iMCD in 2 pts and DMALT in 4 pts.

**Abstract AB1162 – Table 1.** Clinical-laboratory features of patients

	IgG4-RD (n=7)	iMCD (n=2)	DMALT (n=4)

Tissue IgG4+/IgG+ plasma cells > 40%, N (%)	7 (100)	0 (0)	0 (0)

**Conclusions:** It seems to be very challenging to set a reliable differential diagnosis based on the LN pathology thus extranodal biopsy is preferable. Orbital and major salivary glands involvement is a feature of IgG4-RD or DMALT, but not iMCD. Prominent constitutional symptoms with high laboratory inflammatory markers (CRP, IL-6) are characteristic of iMCD.

**AB1163** **MY BEHCET'S DISEASE AND MY MENSTRUATION CYCLE: OBSERVATION FROM AN IRISH COHORT**

W.L. Ng<sup>1,2</sup>, F. Adeeb<sup>1,2</sup>, A. Sebastian<sup>1,2</sup>, A. Anjum<sup>1,2</sup>, M. Brady<sup>1,2</sup>, M. Gillespie<sup>1</sup>, F. Irwin<sup>2</sup>, B. McCarthy<sup>2</sup>, J. Devlin<sup>1,2</sup>, A. Fraser<sup>1,2</sup>. <sup>1</sup>Rheumatology, University Hospital Limerick; <sup>2</sup>Rheumatology, Croom Orthopaedic Hospital, Limerick, Ireland

**Background:** The menstrual cycle is regulated by the rise and fall of sex hormones in the body. Literature has demonstrated anti-inflammatory properties in both progesterone and oestrogen hormones.<sup>1</sup> There has been recent interest to determine the association between Behçet's Disease (BD), a poorly understood autoinflammatory disorder and menstruation.

**Objectives:** The objective of this study was to evaluate the effect of menstruation in triggering exacerbations of Behçet's disease in a Northern European cohort.

**Methods:** 18 female patients from our rheumatology department satisfying the International Study Group for Behçet's Disease (ISGBD) criteria were recruited. A questionnaire was conducted via telephone to determine whether their exacerbations of BD were correlated to their menstrual cycle.

**Results:** All 18 patients responded to the questionnaire, with the mean age of 38.8 years and mean age of menarche of 13 years. Four (22.22%) patients were in menopausal state. Half (nine) of the patients reported that their BD flare ups were correlated to their menstrual cycle. Exacerbations experienced include oral aphthosis (88.9%), arthralgia (55.6%), genital ulcerations (44.4%), lethargy (44.4%), skin lesions (11.1%) and headaches (11.1%). Six of the seven patients (86%) who were on contraception were on a progesterone containing contraception. Four out of nine (44%) who did not notice any exacerbations during menstruation stated that they were on progesterone containing contraceptives. It is noteworthy that 10 patients (55.56%) had previous pregnancies while three patients experienced an episode of miscarriage and 1 had a stillbirth.

**Conclusions:** Our results demonstrated that the disease activity in BD is related to the menstrual cycle, which is contributed by the female sex hormones. The study supports previous hypothesis that the abrupt decline in progesterone during onset of menstruation is associated to disease flare in BD.<sup>2</sup> Studies comprising larger cohorts should be conducted to further support and strengthen this evidence.

#### AB1164 IMMUNOGLOBULIN USE IN GRANULOMATOUS MYOSITIS WITH BACKGROUND OF THYMOMA AND SYSTEMIC LUPUS ERYTHEMATOSUS

*Y.K. Kwok, M.H. Leung. Division of Rheumatology, Department of Medicine, Queen Elizabeth Hospital, Hong Kong, Hong Kong*

**Background:** Contracting granulomatous myositis is rare in clinical practice.

**Objectives:** To report a case with systemic lupus erythematosus presented with contracting granulomatous myositis and previous history of thymoma which responded to intravenous immunoglobulin (IVIG).

**Methods:** A case report from a local hospital in asia

**Results:** A forty-two year old gentleman presented with polyarthralgia, raynaud's phenomenon, photosensitivity with elevated ANA and anti-dsDNA was diagnosed to have SLE in 2014 in rheumatology clinic. His lupus activity was stable on hydroxychloroquine (HCQ) and low dose steroid for the arthritis control. In May 2015, an anterior mediastinal mass was noted on CT thorax for symptoms of chronic cough and chest pain. Operation was performed in Aug 2015 with incomplete excision with invasion into lung, pericardium and nodal metastases. Pathology showed thymoma. Adjuvant radiotherapy 60 Gys in 30frs was given and completed in Dec 2015. He had stable lupus activity all along until Aug 2017. He was hospitalised with sudden onset of proximal muscle weakness which rendered patient unable to walk. Elevated CK level was up to 5354 IU/L. There was no evidence of concurrent infection. Myositis panel showed Strongly positive anti-PM/SCL, borderline positive Anti Mi2 alpha and PM Scl 100. Dysphagia was documented by speech therapist. Muscle biopsy of right quadriceps was performed by neurologist and showed granulomatous myositis. Electromyography (EMG) showed myopathic changes. Lupus myositis was diagnosed with dysphagia. Patient was started on IVIG (0.4 gm/kg/day) for 5 days and high dose steroid (prednisolone 30 mg daily orally) was initiated concurrently. CK showed good response and normalised with improvement in the lower limb power within one month. Patient was able to walk and discharged home. However he was re-admitted one month later for generalised tightening of 4 limbs and contractures over elbows and knee joints with intense pain and limited range of movement. CK level was normal in this admission. PET-CT showed a small (2.2 × 1.4 cm SUV Max5.5) right anterior mediastinum lesion near to surgical site. It was suspicious of local recurrence. Cardiothoracic surgeon was consulted and suggested not for further surgery since of high operative risk. In view of worsening of contractures and weakness over lower limbs, despite normalisation of CK level and quiescent lupus serology,

further courses of IVIG monthly were commenced. Steroid dosage was able to titrate down to prednisolone 9 mg daily orally gradually with improvement in 4 limbs power and halting of further contractures. No more dysphagia was documented afterwards. With the incomplete excision of thymoma, further discussion with oncologist and neurologist on future treatment plan ensued. Role of IVIG in controlling the underlying autoimmune phenomenon attributed by the underlying malignancy was unknown. IVIG was stopped after 6 courses and oncologist proceeded with palliative chemotherapy.

**Conclusions:** IVIG use in contracting granulomatous myositis in a lupus patient with underlying thymoma may be useful.

#### AB1165 MONOCLONAL GAMMOPATHY IN RHEUMATIC DISEASES AND ITS ROLE IN PREDICTING MALIGNANT TRANSFORMATION

*Y. Yang<sup>1</sup>, Y. Liu<sup>2</sup>, L. Chen<sup>3</sup>, Y. Jia<sup>3</sup>, Z. Li<sup>3</sup>. <sup>1</sup>Department of Rheumatology and Immunology; <sup>2</sup>Department of Hematology; <sup>3</sup>Department of Rheumatology, Peking University People's Hospital, Beijing, China*

**Background:** The monoclonal gammopathy (MG) constitutes a group of diseases characterised by the proliferation of a single clone of plasma cells or B-lymphocytes. The spectrum of conditions capable of producing MG mainly includes a premalignant state known as monoclonal gammopathy of undetermined significance (MGUS) and a group of malignant hematologic disorders. In previous studies, significantly increased risk of MG was seen in patients with a history of various rheumatic diseases. We analysed 41 hospitalised patients with underlying rheumatic diseases who were diagnosed with MG at our institute from 2010 to 2017, in order to identify clinical clues for early diagnosis, as well as the risk factors for MG and malignant hematologic neoplasias in patients with rheumatic diseases.

**Objectives:** To analyse the clinical spectrum, laboratory characteristics and outcomes of monoclonal gammopathy (MG) in patients with rheumatic diseases.

**Methods:** Screening for the presence of MG was performed in 872 inpatients with rheumatic diseases from January 2010 to July 2017. A total of 41 patients were enrolled. Their clinical and biological features in addition to outcomes were described. For each patient with primary Sjögren syndrome (pSS), 2 age- and sex-matched pSS patients without MG were selected as controls. Risk factors for the presence of MG and malignant haematological neoplasias were assessed.

**Results:** MG was observed in patients with various rheumatic diseases, with SS the most frequent type. Serum M protein was detected in 37 patients. M components were observed in urine in the other 4 patients. High ESR, albumin/globulin inversion, rheumatoid factor positivity, hypergammaglobulinemia, hypocomplementemia were common features, presented in more than half of the 41 patients. Patients with pSS, when complicated with MG, showed a higher rate of abnormal urine NAG (71.4% vs 15.8%,  $p=0.025$ ), higher levels of ESR [55.0 (53.5) mm/h vs 21.0 (31.8) mm/h,  $p=0.001$ ], ESSDAI [26.0 (25.0) vs 12.0 (9.0),  $p=0.006$ ] and ClinESSDAI scores [24.0 (25.0) vs 10.5 (10.0),  $p=0.011$ ]. Multivariate analysis revealed that the disease activity, assessed by either ESSDAI [adjusted OR 1.127 (95%CI 1.015–1.251),  $p=0.025$ ] or ClinESSDAI [adjusted OR 1.121 (95%CI 1.011–1.242),  $p=0.030$ ], was the only independent risk factor for the presence of MG. During the follow-up, 2 patients had transient serum M protein, 2 had isotype switch, 1 progressed to multiple myeloma (MM) and another 2 experienced renal injuries attributed by monoclonal or polyclonal plasma cell interstitial infiltration. Seven (17.1%) of the 41 MG patients presented haematological neoplasias, 4 with MM, 2 with smouldering multiple myeloma and 1 with B-cell lymphoma of mucosa-associated lymphoid tissue (MALT) type. The presence of light-chain MG was associated with the development of MM [OR 17.5 (95%CI 1.551–197.435),  $p=0.041$ ], but not with an increased risk of lymphoma or SMM.

**Conclusions:** MG was observed in patients with various rheumatic disorders, with SS being the most common type. The presence of MG might associated with higher disease activity. The development of haematological neoplasias including MM and lymphoma was seen in this setting. Therefore, we recommend the screening for MG and close monitoring for potential malignant transformation in patients with rheumatic diseases as needed.

**AB1166 THE ASSOCIATION OF THE EARLY ONSET OF REMITTING SERONEGATIVE SYMMETRICAL SYNOVITIS WITH PITTING OEDEMA (RS3PE) SYNDROME WITH DIPEPTIDYL PEPTIDASE-4 (DPP4) INHIBITOR**

Y. Yoshioka, M. Mitsuhashi, A. Kato, D. Kanai, A. Suda, S. Nagaoka.  
*Rheumatology, Yokohama Minami Kyosai Hospital, Yokohama, Japan*

**Background:** Remitting seronegative symmetrical synovitis with pitting oedema (RS3PE) syndrome is a rare inflammatory arthritis, characterised by absence of rheumatoid factor, symmetrical distal synovitis, pitting oedema of the hands and feet.

In recent years the use of dipeptidyl peptidase-4 (DPP4) inhibitor has increased and some reports have described the association of RS3PE syndrome with DPP4 inhibitor.

**Objectives:** : We have tried to investigate the association of RS3PE syndrome with DPP4 inhibitor in our hospital.

**Methods:** : In Japan DPP4 inhibitor was released in December 2009, so we retrospectively analysed background, treatment and clinical course of 25 patients with RS3PE syndrome diagnosed between <sup>December 2009</sup> and December 2016 in our hospital. We divided them in two groups according to DPP4 inhibitor prescription and compared two groups.

**Results:** : Our cases included 18 males and 7 females, and the mean age of RS3PE syndrome onset was 76 years old. The mean follow-up period was 32.5 months. Six patients had diabetes mellitus and DPP4 inhibitor was prescribed in five of six patients (83.3%). (sitagliptin 3 cases, teneligliptin 1 case, alogliptin 1 case). The duration of RS3PE syndrome onset after DPP4 inhibitor prescription was mean 22.9 months, and two cases developed within a half year, two cases after two years.

Compared with non DPP4 inhibitor group, the mean age of RS3PE syndrome onset was significantly low (70 vs 78.5,  $p=0.023$ ), and HbA1c (NGSP) was high (7.3% vs 6.02%,  $p=0.00022$ ) in DPP4 inhibitor group.

The occurrence of flare was four cases in non DPP4 inhibitor group and zero in DPP4 inhibitor group, but was not statistically different ( $p=0.275$ ). Other clinical features were not significantly different.

**Abstract AB1166 – Table 1.** Clinical characteristics of the patients

Characteristics	DPP-4 inhibitor (N=5)	non DPP-4 inhibitor (N=20)	P value
Mean age – yr	70 (±7.91)	78.5 (±6.61)	0.023
Male sex – no.(%)	5 (100%)	13 (65%)	0.119
CRP, mg/dl	7.97 (±5.08)	7.45 (±5.86)	0.86
HbA1c (NGSP), %	7.3 (±0.68)	6.02 (±0.57)	0.00022
<b>Medications</b>			
<b>MTX</b>			
Patients, no.(%)	2 (40%)	9 (45%)	
Dose, mg/week	8 (±0)	7.33 (±1)	0.081
<b>Oral prednisolone</b>			
Patients, no.(%)	5 (100%)	18 (90%)	
Dose, mg/day	12 (±4.47)	10.8 (±4.62)	0.625
Malignancies – no.(%)	0 (0%)	1 (5%)	0.61
Flare – no.(%)	0 (0%)	4 (20%)	0.275

**Conclusions:** : DPP4 inhibitor group was significantly younger than non DPP4 inhibitor group, and the possibility that DPP4 inhibitor contributed to the early onset of RS3PE syndrome was suggested.

**Diagnostics and imaging procedures**

**AB1167 METHOD COMPARISON OF AESKUSLIDES ANCA FOR THE DIAGNOSIS OF ANCA-ASSOCIATED VASCULITIS**

A. Lerner<sup>1</sup>, T. Matthias<sup>1</sup>, K. Prager<sup>2</sup>, T. Barth<sup>2</sup>, S. Reuter<sup>2</sup>, J. Bär<sup>2</sup>, S. Bush<sup>2</sup>, M. Walle<sup>2</sup>. <sup>1</sup>RandD, AESKU.KIPP Institute; <sup>2</sup>RandD, Aesku. Diagnostics GmbH and Co. KG, Wendelsheim, Germany

**Background:** AESKUSLIDES ANCA is an indirect immunofluorescence assay used to detect anti-neutrophil cytoplasmic autoantibodies (ANCA) in human serum. This *in vitro* diagnostic assay is used as an aid for the diagnosis of ANCA-associated vasculitis (AAV) in conjunction with other clinical and laboratory findings.

**Methods:** A method comparison of ethanol and formalin fixed granulocytes was carried out between AESKUSLIDES ANCA (AESKU. Diagnostics) and the NOVA Lite ANCA of INOVA. 507 clinical serum samples (comprising 135 serum samples from patients with AAV and 375 samples from patients with other diseases) were analysed by standard IFA protocols. Results were obtained by manual processing and reading.

**Results:** In this cohort, AESKUSLIDES ANCA Ethanol slides show higher sensitivities (48.5% vs. 36.4%) and specificities (69.3% vs. 55.2%) compared to INOVA. AESKUSLIDES ANCA Formalin slides show higher sensitivities (50.0% vs. 37.9%) and similar specificities (90.7% vs 91.5%) compared to INOVA.

**Conclusions:** AESKUSLIDES ANCA Ethanol showed higher diagnostic sensitivity (48.5%) and specificity (69.3%) compared to the predicate assay NOVA Lite provided by INOVA (36.4%, 55.2%). This is due to the fact, that AESKU assay detects more positives in the AAV cohort, and less positives in the other disease groups. AESKUSLIDES ANCA Formalin showed a diagnostic sensitivity (50.0%) compared to the predicate assay NOVA Lite provided by INOVA (37.9%). However, the diagnostic sensitivity was comparable between the two (90.7% vs 91.5%).

**AB1168 IS MY CLINICAL EXAMINATION ADEQUATE TO EVALUATE DISEASE ACTIVITY IN CHILDREN WITH JUVENILE IDIOPATHIC ARTHRITIS (JIA)? A COMPARATIVE ASSESSMENT OF CLINICAL AND ULTRASOUND (US) EXAMINATION OF 40 KNEES AND ANKLES IN 10 CHILDREN WITH JIA**

A. Shivpuri, M. Agarwal, S. Sawhney. *PEDIATRIC RHEUMATOLOGY, SIR GANGA RAM HOSPITAL, NEW DELHI, India*

**Background:** JIA is the commonest rheumatologic disease of childhood with a quoted prevalence of 1:1000. Assessment of children with JIA includes: Clinical, laboratory and more recently US evaluation of joints. Rapid attainment of inactive disease is critical for a good long term outcome. There is a debate in the rheumatology community about added advantage of US examination over clinical assessment of joints. This study was done to compare clinical versus US evaluation of knees and ankles in children with JIA.

**Objectives:** 1. To clinically examine and scan knees and ankles of 10 children with JIA

2. To determine sensitivity and specificity of clinical examination of knees and ankles vis a vis US scan findings

3. To compare results of knee and ankle examination both clinical and US

**Methods:** 1. 10 consecutive children with JIA were evaluated for active arthritis of knees and ankles and documented on a pre designed proforma.

2. Children were then examined with US on same day by same observer and joint effusion and or synovitis was captured using an E9/S7 GE machine with a linear transducer 6–15 MHz.

**Results:** 10 children aged 6–16 years, (6F and 4M) who attended the out-patient paediatric rheumatology clinic at our hospital with JIA were clinically evaluated and US examination performed on same day by same examiner with prior consent. Using the standard ESSR protocols, US knee and ankle joints were examined in longitudinal view and if any effusion or synovitis detected was confirmed on transverse view. The presence of grey scale synovial proliferation or anechoic effusion was taken as a positive US finding.

Knee-Sensitivity of clinical examination-100%, specificity-91.7%.

Ankles-Clinically 8 had swollen ankle, On US only 5 children had swollen ankle (tibio talar TT) joint. 3 who had a swollen ankle clinically had no synovial hypertrophy or effusion in the TT joint but had tenosynovitis(TS) of adjacent tendons: 1 each has a TS of the Extensor Digitorum Longus, Tibialis Anterior, Tibialis Posterior. Sensitivity-60% and specificity-66.7%.

**Abstract AB1168 – Table 1.** Clinical & US examination details on knees & ankles of 10 children (40 joints)

Patients	Diagnosis	Rt Knee Clinical	Rt Knee US	Lt Knee Clinical	Lt Knee US	Rt Ankle Clinical	Rt Ankle US	Lt Ankle Clinical	Lt Ankle US
Pt 1	SJIA	+	+	+	+	-	+	+	+
Pt 2	SJIA	-	-	-	-	+	+	-	-
Pt 3	ERA	-	-	-	-	-	-	+	-
Pt 4	ERA	-	-	-	-	-	-	+	-
Pt 5	PJIA	-	-	-	-	-	+	-	-
Pt 6	PJIA	+	+	+	+	-	-	-	-
Pt 7	ERA	+	+	-	-	+	-	-	-
Pt 8	ERA	-	-	-	-	+	-	-	-
Pt 9	PJIA	+	+	+	+	-	-	+	+
Pt 10	PJIA	+	+	+	-	+	-	-	-

**Abstract AB1168 – Figure 1**

**Conclusions:** With gold standard as US for detection of synovitis, sensitivity of clinical examination-100% for knee, specificity-91.7%. For clinical examination of ankles, sensitivity-60% and specificity-66.7% suggesting possibility of mistaking an adjacent tendon sheath swelling for a TT joint disease. This has important implications for systemic therapies and intervention. The US is a valuable addition to clinical examination of the joints. Clinical examination alone in this pilot study of 10 children with JIA is inadequate to assess disease of the ankles. Evidence shows US to be superior to the clinical examination alone, but the lack of validated US findings, scoring systems and treatment algorithms exposes the need for further research.

#### AB1169 CAN ULTRASOUND-DETECTED SYNOVITIS PREDICT RADIONUCLIDE SYNOVECTOMY EFFICACY IN CHRONIC INFLAMMATORY RHEUMATISM?

A.S. Amouzougan<sup>1</sup>, H. Marotte<sup>2</sup>, K. Boussoualim<sup>1</sup>, L. Mijola<sup>1</sup>, P. Collet<sup>1</sup>, B. Pallot-Prades<sup>1</sup>, N. Prévot-Bitot<sup>3</sup>, F.-G. Barral<sup>4</sup>, T. Thomas<sup>2</sup>. <sup>1</sup>Rheumatology, Universital Hospital of Saint-Etienne; <sup>2</sup>Rheumatology, Inserm 1059, Universital Hospital of Saint-Etienne; <sup>3</sup>Nuclear Medecine; <sup>4</sup>Radiology, Universital Hospital of Saint-Etienne, Saint-Etienne, France

**Background:** The better management of inflammatory joint diseases, including biological treatments, has not eliminated in the clinical practice the persistence of chronic inflammatory monoarthritis despite local glucocorticosteroids (GC) injection and optimal systemic treatment. No therapeutic consensus was proposed in this clinical situation. In addition, radionuclide synovectomy (RS) was proposed with no clear benefit-risk effect. However, it has been shown that ultrasound-detected residual synovitis is frequent and predictable to relapse and structural progression in rheumatoid arthritis patients.

**Objectives:** We explored ultrasound-detected synovitis predictive value of response to RS in chronic inflammatory monoarthritis.

**Methods:** A monocentric prospective study was performed including unclassified monoarthritis, rheumatoid arthritis, spondyloarthritis, and lupus between January 2012 and December 2017. All patients already received GC intra-articular injections (GCI) and were treated in particular by cs or bDMARDs. On the day of the RS performed by a radiologist under radioscopy control, all patients had an articular power Doppler (PD;0-3) with greyscale (GS;0-3) ultrasonography with a MyLab 60 – EASAPOTE, by 2 experimented sonographers.

Primary endpoint (EP) was subjective overall improvement  $\geq 50\%$  without of any GCI and/or surgical management at 6 months (M).

Chi-square test was used to check the difference between groups.

**Results:** Data from 23 patients, 17 women and 6 men, with mean age 54 $\pm$ 14 years were analysed. Eleven RA (45.5% RF +or ACPA+), 3 pSpA, 2 axSpA HLA B27+, 1 Lupus, and 6 unclassified monoarthritis (FR and ACPA-). Histological analysis of the synovium in 7 patients concluded to chronic nonspecific synovitis. Twenty eight joints were treated. Of them, 25 were coted US GS  $\geq 2$  and/or DP  $\geq 2$ . None had US GS=0 and DP=0. Effusion on US exam was reported in 24 joints.

On X-ray, 46.4% of patients had joint space narrowing and/or erosion. ESR or CRP increased in 43.5%. Forty five previous GCI were declared (Cortivazol or triamcinolone hexacetonide), with a median at 2.<sup>1-6</sup>

Patients were treated with methotrexate, n=16 (69.6%), hydroxychloroquine, n=1, bDMARDs, n=11 (48%), oral GC, n=8 (35%) and non-steroidal anti-inflammatory drug, n=6 (26%).

At M6 and M12, 64.6% of patients reached the EP. One patient reached the EP only at M12 and another one only at M6. No significant differences were observed between groups in terms of PDUS (DP  $\geq 2$  vs DP  $\leq 1$ ), unclassified monoarthritis, and joint space narrowing and/or erosion.

Only one patient had pain exacerbation 24 hour after RS followed by a quick recovery.

**Conclusions:** In chronic inflammatory monoarthritis, PDUS was not predictive of clinical outcome after RS. However, this intra-articular procedure appeared effective in either unclassified or classified monoarthritis or in presence of radiographic joint lesions.

**Disclosure of Interest:** None declared

#### AB1170 FIRST RESULTS OF THE RHEUMATOID ARTHRITIS HANDSCAN REGISTRY LEEUWARDEN

A. Al Hasan, R. Bos, N. Veeger, D. Zhang, L. Hendriks, F. Wink, A. Schilder, F. Reimann, K. Bergsma. MEDISCH CENTRUM LEEUWARDEN, Leeuwarden, Netherlands

**Background:** The handscan is a new technologic device which uses diffuse optical transmission in combination with blood flow modulation. It is a non-invasive measurement of joint inflammation potentially more sensitive than the clinical evaluation of the joints by a rheumatologist.<sup>1</sup> However, more clinical data is necessary before this new device can be implemented in the daily clinical practice.

**Objectives:** This study investigates the additional value of the handscan in decision making in the daily practice for patients with rheumatoid arthritis.

**Methods:** At our outpatient clinic we started a registry for rheumatoid arthritis patients with a disease duration of at least two years. During this period, a handscan will be made for all patients before every regular visit. Both the patient and the treating rheumatologist will be blinded to the handscan outcome. Primary outcome is the association between DAS28 score and the total optical score (TOS) of the handscan per visit.

**Results:** The study started in December 2017, until now 100 patients are included. The mean age was 61.1 years, the mean disease duration at time of inclusion 11.2 years, 67% were rheumatoid factor positive, 51% were anti-CCP positive. In figure 1 we show the association between DAS28 and the TOS in a linear model.

Currently there is no validated cut off point for the TOS (negative or positive score for inflammation). In our group of 100 patients the median TOS was 10, the most discriminating TOS was found to be 17 using chi-square test as depicted in table 1.

**Abstract AB1170 – Table 1.** Crosstab for total optical score of the handscan versus DAS28

DAS28	TOS<17	TOS≥17	Total	P-value
Mean	2.54	3.07	2.56	<b>0.068</b>
Std	0.90	1.72	1.12	
Median	2.55	3.13	2.61	
N	76	19	95	
	(4missings)	(1missing)	(5missings)	

**Abstract AB1170 – Figure 1**

**Conclusions:** In this preliminary evaluation of the first 100 patients, we observed a limited positive correlation between the total optical score of the handscan and the DAS28. The TOS above 17 associates with moderate to severe disease activity. The definite clinical value of the handscan needs to be determined with longitudinal measurements and its predictive value versus the DAS28. The ongoing current registry aims to answer these questions.

Hamamoto<sup>1</sup>, Y. Tanaka<sup>1</sup>, Y. Tabara<sup>2</sup>, F. Matsuda<sup>3</sup>, S. Matsuda<sup>1</sup>. <sup>1</sup>Department of Orthopaedic Surgery; <sup>2</sup>Department of Genome Informatics; <sup>3</sup>Department of Human Disease Genomics, Kyoto University Graduate School of Medicine, Kyoto, Japan

**Background:** Osteoarthritis (OA) is known as degenerative arthritis. Knee OA is a common disease among aged population and one of the leading causes of disability. Many modalities are used to evaluate bony abnormalities and joint space narrowing for knee OA.

Ultrasound is one of the imaging modalities for evaluating knee joint structures such as cartilage, meniscus, osteophyte and synovium. There are few large-scale

studies focused on ultrasound findings of the knee of the elderly in general population.

**Objectives:** The aim of our study is to evaluate relationship between clinical and ultrasound findings of the elder population.

**Methods:** Two hundred and twenty two participants were recruited from Nagahama residents aged 60 years or older. We evaluated the both knees of participants with ultrasound with a 5MHz transducer. Ultrasound scans were performed and assessed by a standardised protocol of the Outcome Measures in Rheumatoid Arthritis Clinical Trial Guidelines. The symptoms were clinically assessed by using Knee Society Score 2011 (KSS). We statistically examined whether the KSS (symptom) correlated with other clinical parameters and each ultrasonographical findings.

**Results:** Participants were 65 men and 137 women with a mean age of 67±5 years old. The mean body mass index (BMI) was 21.8±2.76 kg/m<sup>2</sup>. The symptom subscale of KSS were significantly associated with age, BMI, knee maximum extension and flexion angle, suprapatellar effusion, medial meniscus protorusion, medial recess synovial hypertrophy, and femoral and tibial medial osteophytes. Multiple regression analysis showed that medial osteophytes was most closely related to the symptom subscale of KSS among the ultrasound findings and demographic data evaluated.

**Conclusions:** The present study showed a strong association between the symptoms of the knee and the medial osteophytes in Japanese elder population.

**AB1172** **DOES ULTRASOUND-SCORED SYNOVITIS DEPEND ON THE PHARMACOKINETICS OF INTRAVENOUS INFLIXIMAB IN PATIENTS WITH RHEUMATOID ARTHRITIS?**

A. Ishchenko<sup>1</sup>, F.E. Lecouvet<sup>2</sup>, P. Durez<sup>3</sup>, M.S. Stoeniou<sup>3</sup>. <sup>1</sup>Rheumatology, Cliniques Universitaires Saint-Luc; <sup>2</sup>Radiology; <sup>3</sup>Rheumatology, Cliniques Universitaires Saint-Luc, Institut de Recherche Expérimentale et Clinique (IREC), Brussels, Belgium

**Background:** Musculoskeletal ultrasound (US) was developed more than four decades ago and gradually made its way to daily rheumatological practice. This dynamic, non-irradiating and relatively inexpensive technique allows detection of synovitis/tenosynovitis as well as quantification of joint inflammation. However, several external factors, such as, joint position, machine settings, sonographer expertise and certain medications can influence the results of the US examination.

**Objectives:** The aim of this study was to investigate whether the pharmacokinetics of intravenous (*i.v.*) infliximab (IFX) influences the grade of US detected synovitis, measured by gray-scale (GS) and colour Doppler (CD) in rheumatoid arthritis (RA) patients.

**Methods:** Inclusion criteria were RA patients with at least one swollen joint, being treated with *i.v.* IFX, who had neither, changes in DMARD therapy nor local corticosteroid injections in the previous 3 months. Patients underwent clinical, laboratory and US assessment at three time points: at trough, peak plasma drug concentration and at mid-cycle. US assessments were performed blindly to the clinical and laboratory data. Twenty-four joints were assessed for the presence and grade (0–3) of GS synovitis and synovial CD signal: elbows, wrists, 2nd-5th metacarpophalangeal (MCP) joints, knees, ankles, 2nd-5th metatarsophalangeal (MTP) joints. A global OMERACT-EULAR synovitis score (GLOESS) as well as the sum of GS and CD scores were calculated for the 24-joint set, for the 12-joint set (Naredo score) and for wrists-MCP-ankles-MTP joints. Several disease activity scores (DAS) [28-joint DAS (DAS28-CRP), Simplified Disease Activity Index (SDAI)] and health assessment questionnaire (HAQ) were assessed in all patients. Trough plasma IFX concentrations were available in 20 patients.

**Results:** Twenty-two RA patients were prospectively recruited from the biologic therapy unit of our hospital. Two thirds of patients were female and mean age was 61 years. The majority of them had long-standing seropositive RA and over 90%

had radiographic damage. The median of IFX treatment duration was 9 years. There were no significant differences between the GS, CD and GLOESS scores at IFX peak time and trough time. US-joint count, GS, CD and GLOESS scores did not significantly differ between peak time and trough time. Patients with long-lasting RA treated with IFX had relatively stable US-detected synovitis and slightly lower clinical scores at 4 weeks after IFX administration as compared to baseline. The DAS28CRP, 28 and 44 swollen joint counts did not correlate with trough serum IFX concentrations. US scores (GS and GLOESS) significantly correlate with trough serum IFX concentrations (Spearman correlation coefficient,  $r=-0.55$ ,  $p<0.01$ ,  $n=20$ ). Patients with low trough IFX levels, especially  $\leq 1 \mu\text{g/ml}$ , had higher US joint count as well as US scores ( $p<0.01$ ).

#### REFERENCE:

- [1] US-scored synovitis is not significantly influenced by pharmacokinetics of IFX in RA patients. US examination can be conducted independently of time of IFX administration i.e. before or after IFX administration in clinical trials. Although there was no correlation with clinical scores, low trough IFX concentration correlated with the degree of US-detected synovitis.

#### AB1173 CORRELATION BETWEEN TRABECULAR BONE SCORE (TBS) AND NAILFOLD VIDEOCAPILLAROSCOPY IN SYSTEMIC SCLEROSIS PATIENTS

A. Casabella<sup>1</sup>, B. Ruaro<sup>1</sup>, S. Paolino<sup>1</sup>, C. Pizzorni<sup>1</sup>, E. Alessandri<sup>1</sup>, C. Serio<sup>2</sup>, D. Fascio<sup>1</sup>, G. Botticella<sup>2</sup>, L. Molfetta<sup>2</sup>, P. Odetti<sup>2</sup>, B. Serio<sup>2</sup>, M. Cutolo<sup>1</sup>.

<sup>1</sup>Department of Internal Medicine, Di.M.I. Polyclinic Hospital, San Martino, University of Genoa, Research Laboratory and Academic Division of Clinical Rheumatology; <sup>2</sup>Department of Internal Medicine, Di.M.I. Polyclinic Hospital, San Martino, University of Genoa, Osteoporosis, Bone and Joint Disease Research Center, CROPO, Genova, Italy

**Background:** Systemic sclerosis (SSc) is associated with an increased risk of altered bone and fractures as a result of multiple factors, including treatment-related side effects, low vitamin D serum concentrations and reduced physical activity.<sup>1</sup> Trabecular Bone Score (TBS) is an index extracted from dual-energy X-ray absorptiometry (DXA) analysis, that provides an indirect measurement of axial bone microarchitecture and bone quality.<sup>2</sup>

**Objectives:** The aim of this study was to evaluate possible correlation between bone quality, by TBS, and different levels of microvascular damage, as evaluated by nailfold videocapillaroscopy (NVC) patterns<sup>3</sup> in SSc patients and to compare the results regarding bone quality with RA patients and healthy subjects (CNT).

**Methods:** Eighty-eight SSc patients, 98 rheumatoid arthritis (RA) patients and 60 CNT were studied. Bone Mineral Density (BMD,  $\text{g/cm}^2$ ) of the lumbar spine (L1-L4) was analysed by dual-energy X-ray absorptiometry (DXA) scan. Lumbar spine bone quality was derived from each spine DXA examination using the TBS analysis. NVC patterns were analysed as previous reported.<sup>3</sup> All patients were subjected to 25 hydroxyvitamin D (25(OH)D  $\text{ng/ml}$ ) serum dosage.

**Results:** TBS values were found statistically higher in SSc with a "Early" NVC pattern, compared to the "Active" or "Late" pattern ( $1.182\pm 0.1$ ,  $1.101\pm 0.8$ ,  $1.074\pm 0.1$  respectively,  $p<0.001$ ). No statistical significant difference was observed in the three groups about DXA values ( $p=0.13$ , for all areas). A total of 56/84 SSc patients (66%) as well as in 78/98 RA patients (80%) showed bone loss at DXA and BMD was found significantly lower than in the CNT ( $p<0.001$ ). Similarly, lumbar spine TBS was found significantly lower in SSc and RA patients than in CNT ( $p<0.001$ ). There was no statistically significant difference in the mean lumbar spine TBS between SSc and RA patients ( $p=0.238$ ). Serum levels of 25 (OH) D were statistically significantly higher in patients with "Early" SSc pattern than in those both "Active" and "Late" pattern ( $19.1\pm 7.5$ ,  $15.1\pm 5.3$ ,  $12.1\pm 7.1$  respectively,  $p=0.002$ ).

**Conclusions:** The bone quality seems lower in SSc patients with more altered microvasculature ("Late" NVC pattern). The data obtained showed also a significantly lower bone quality (lower TBS and BMD) in SSc and RA patients compared to CNT. The association between bone damage and the "Late" advanced NVC

pattern of microvascular damage, may suggest that tissue hypoxia/ischemia related to the diffuse microangiopathy might be a further promoting factor for osteoclastogenesis and bone loss. Our results support the development of a combined approach using both TBS and BMD for the assessment of bone microarchitecture/quality in SSc patients during their disease progression.

#### AB1174 THE INFLAMMATORY CHANGES AT JOINTS AND ENTHESIS IN A COHORT OF PATIENTS AFFECTED BY OCHRONOSIS: AN ULTRASONOGRAPHIC STUDY

A. Adinolfi<sup>1</sup>, V. Di Sabatino<sup>1</sup>, C. Toscano<sup>1</sup>, V. Picerno<sup>2</sup>, M. Bardelli<sup>1</sup>, E. Selvi<sup>1</sup>, A. Santucci<sup>3</sup>, M. Galeazzi<sup>1</sup>, B. Frediani<sup>1</sup>, G. Filippou<sup>4</sup>. <sup>1</sup>Dep of Medicine, Surgery and Neurosciences, University of Siena, Siena; <sup>2</sup>Rheumatology Institute of Lucania (IRel) and Rheumatology Dep of Lucania, San Carlo Hospital, Potenza; <sup>3</sup>Dep of Biotechnology, Chemistry and Pharmacy, University of Siena, Siena; <sup>4</sup>Dep of Medical Sciences, Section of Rheumatology, University of Ferrara, Ferrara, Italy

**Background:** The pathogenesis of Ochronosis, the musculoskeletal manifestation of alcaptonuria (AKU) is still unclear. The joint damage usually described is similar to osteoarthritis, but in some cases the spinal involvement could resemble spondyloarthritis (SpA). These findings suggest that inflammatory changes could be prevalent in some cases while degenerative aspects could be dominant in others.

**Objectives:** To evaluate the prevalence of inflammatory changes in peripheral joints and entheses of a cohort of patients affected by AKU.

**Methods:** Consecutive patients with definite diagnosis of AKU referred to our clinic from 2014 to 2017 were enrolled. All patients underwent an ultrasound (US) exam of the metacarpo-phalangeal joints (MCP), proximal interphalangeal joints (PIP), radiocarpal/mid carpal joints, elbow, gleno-humeral, hip, knee, ankle and metatarso-phalangeal (MTP) joints bilaterally; flexor and extensor tendons of fingers and wrists and the ankle tendons were also examined. Further, the entheses of the rotator cuff of the shoulder, triceps, quadriceps, patellar and Achilles tendons were assessed. Joints and tendons with a synovial sheath were assessed for effusion, synovial hypertrophy and power Doppler (PD) signal while entheses were evaluated for the presence of PD signal, enthesophytes and calcifications. All the US lesions were scored using a dichotomous scale (presence/absence). All US exams were performed by an expert sonographer blind to clinical history, using an Esaote MyLab70 scanner equipped with high resolution linear probes.

**Results:** We enrolled 19 patients (11 women) with a mean age of 53 yo (SD  $\pm 14.69$ ). Only 2 patients didn't show inflammation at any joint or tendon. The most involved joint was the knee (11/19), while regarding entheses, the Achilles tendon (4/19) and the distal patellar tendon insertion were the most frequently involved (6/19). The mean number of joints with effusion or synovial hypertrophy was respectively equal to 2,47 (median 2, range 1–8) and 1,84 (median 2, range 1–7), while 0,21 joints (median 0, range 0–2) presented also PD. The mean of the exudative tenosynovitis was 0,47 (median 0, range 0–3), while for proliferative tenosynovitis was 0,42 (median 0, range 0–2). The PD signal in tendons with sheaths was rare (mean 0,16, median 0, range 0–2). Finally, the mean number of entheses with PD was 0,95 (median 0, range 0–7) while the mean value was 0,37 (median 0, range 0–3) for enthesophytes and 2,63 (median 1, range 0–9) for calcifications.

**Conclusions:** The pathological processes that lead to the typical joint damage in ochronosis are not yet completely clarified. The results of this study showed that articular inflammation is common in these patients, sometimes associated with entheses involvement. The role of inflammation should be further addressed as could be a new therapeutic target for this disease.

**Background:** Enthesitis is regarded the primary lesion in spondyloarthritis (SpA) and MRI allows sensitive visualisation of enthesal inflammation/damage, but no validated, internationally accepted scoring system exists.

**Objectives:** To develop and perform preliminary validation of a novel OMERACT MRI scoring system for assessing ankle enthesitis in SpA patients, and to improve this through iterative multi-reader scoring exercises and calibration sessions.

**Methods:** A systematic literature review of MRI studies on enthesitis in SpA identified key inflammatory and structural pathologies. Definitions were agreed by consensus within the OMERACT MRI in arthritis working group. Then, in a first internet-based multireader exercise the Achilles tendon and plantar fascia entheses in 10 ankle MRIs (sagittal T1W, sagittal and Axial T2W fat suppressed) were scored by 15 readers (3 radiologists and 12 rheumatologists), with varying expertise in ankle MRI, for tendon/fascia thickness/signal change, tendon/peritendon signal alteration, retrocalcaneal bursitis, bone spur, erosion and bone marrow oedema, using semi-quantitative scores (0–3: no/mild/moderate/severe pathology). After a subsequent calibration session leading to minor modifications of assessed parameters, 16 ankle MRIs (specifications as above), were scored by 15 readers in exercise 2 with a modified score sheet. Rules were agreed for scoring pathologies. In both exercises, scores for each reader for individual variables were compared and discussed, and mean scores for each variable were determined using descriptive statistics, as were sum scores. Inter-reader agreement was calculated using two-way consistency single measures intra-class correlation coefficient (ICC 3,1) for inflammatory and structural lesions.

**Results:** Exercise 1: Mean pairwise inter-reader ICC for combined score of inflammatory and structural variables was 0.65 (range 0.10–0.94), with 75% of values being good/very good ( $\geq 0.50$ ). Discussion of results led to minor modifications of parameters to be assessed.

Exercise 2: Inter-reader agreement (ICC) for all inflammatory variables combined ranged from 0.26–0.93 among reader pairs (mean 0.64; median 0.66; IQR 0.46–0.79). For structural variables combined ICC ranged from 0.05–0.91 among reader pairs (mean 0.45; median 0.45; IQR 0.2–0.6).

**Conclusions:** Initial steps in developing an OMERACT MRI heel enthesitis scoring system have demonstrated overall moderate reliability of the proposed variables. Further modification, refinement, calibration and validation (ongoing) are needed before this system is ready for use in SpA clinical trials.

**Disclosure of Interest:** None declared

**AB1176 ULTRASOUND EVALUATION OF ADHESIVE CAPSULITIS OF THE SHOULDER. DESCRIPTION OF A NEW AND SIMPLE DIAGNOSTIC SIGN**

C. Moragues Pastor<sup>1,2</sup>, X. Michelena<sup>2</sup>, I. Morales<sup>2</sup>, P. Juárez<sup>2</sup>, J. Lluch<sup>2</sup>, J. M. Nolla<sup>2</sup>. <sup>1</sup>Rheumatology, Hospital Plató, Barcelona; <sup>2</sup>Rheumatology, Hospital Universitari de Bellvitge, L'Hospitalet del Llobregat (Barcelona), Spain

**Background:** Adhesive capsulitis of the shoulder (ACS) is a common disease that is characterised by a global and progressive loss of mobility of the glenohumeral joint. It is the result of a capsular inflammation, thickening, and fibrosis with subsequent retraction of the joint capsule. Although it is a frequently self-limiting process, it may persist for years and be resolved with a permanent limitation of

glenohumeral mobility. Its diagnosis is based on clinical presentation because the glenohumeral capsule is not visible in simple radiology and the MRI does not offer specific diagnostic findings for ACS.

**Objectives:** To evaluate the specific ultrasound signs to diagnose ACS in patients with clinical suspicion of ACS.

**Methods:** Prospective, non-interventional observational study in consecutive patients with clinical suspicion of ACS referred for an ultrasound evaluation. All patients signed an informed consent before the study. Adult patients with a painful shoulder less than 2 years of evolution with clinical suspicion of ACS were included. We excluded patients with surgery or severe articular trauma in the symptomatic shoulder and patients with ultrasound findings that could explain the painful symptoms of the shoulder due to other causes such as rotator cuff tendinopathy, synovitis or glenohumeral osteoarthritis.

The ultrasound examination was systematically performed by an expert sonographer, using an Esaote MayLab 70 with a linear probe. In the ultrasound examination, the measurement of the joint capsule was performed in the axillary recess in the longitudinal plane (maximum passive abduction of the shoulder). The statistical analysis was carried out comparing the capsule means with the Mann-Whitney test (the variable did not follow a normal distribution verified with the Kolmogorov-Smirnov test).

**Results:** A total of 35 patients were included, with a mean age of 58.27 years, 46–77 17 men and 18 women. Nine patients had both shoulders affected, so a total of 70 shoulders (44 affected shoulders and 26 control shoulders) were studied. The mean time of evolution of the ACS clinic was 5.6 months.<sup>1–18</sup> The 28.57% of the patients were diabetic and 14% had a history of severe cardiovascular disease before the onset of symptoms. The 44% of bilateral ACS cases were diabetic. The totality of the affected shoulders presented in the clinical exploration limitation of the degrees of mobility of the glenohumeral joint; on the other hand, all control shoulders had a preserved mobility. Regarding the sonographic findings, the mean axillary capsular measurement of the affected shoulders was 4,414 mm (SD 0.177) compared to a mean measurement of 2,203 mm (SD 0.165) in the controls with a statistically significant difference between both groups ( $p < 0.001$ ).

**Conclusions:** The glenohumeral capsule is easily visible in the axillary approach by ultrasound and allows thickness measurement, being a feasible test for the diagnosis of ACS.

**Disclosure of Interest:** None declared

**AB1177 A COHORT OF PATIENTS WITH ANTISYNTHEASE SYNDROME EVALUATED IN A MULTIDISCIPLINARY CONSULTATION**

C. Tornero<sup>1</sup>, L. Nuño<sup>1</sup>, G. Bonilla<sup>1</sup>, L. Gomez-Carrera<sup>2</sup>, R. Álvarez-Sala<sup>2</sup>, A. Balsa<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Pulmonology, La Paz Hospital, Madrid, Spain

**Background:** Antisynthetase syndrome (AS) is an uncommon connective tissue disease characterised by the presence of antibodies to anti-aminoacyl t-RNA synthetase (anti-ARS) along with features of interstitial lung disease (ILD), myositis, arthritis and Mechanic's hands.

**Objectives:** To analyse the most common demographic, clinical, radiological, spirometry and capillaroscopic findings in a cohort of patients with AS. As a secondary objective, the association between capillaroscopic findings and diffusion lung capacity for carbon monoxide (DLCO) and the radiologic pattern in the high-resolution computed tomography of the chest (HRCT) was evaluated.

**Methods:** A ten-year (2007–2017) retrospective analysis of patients diagnosed with AS followed in a multidisciplinary consultation with a pulmonologist and a rheumatologist. The nailfolds from 2nd to 5th fingers in both hands were examined in all subjects by using videocapillaroscopy (Mediscope-Optilia).

**Results:** Twenty patients were included, 15 (75%) females and 50% (10/20) non-smokers. Mean age at the clinical debut was 47,5±16 years. Throughout their evolution, 90% of patients (18/20) presented Interstitial Lung Disease (ILD); 70% (14/20), arthritis and 75% (15/20), myositis. Furthermore, 40% (8/20) associated fever, 45% (9/20), Raynaud's Phenomenon and 55% (11/20), Mechanic's hands. Three patients only had ILD and Raynaud's Phenomenon at presentation. In the immunologic assessment, 73,7% (14/19) were positive for anti – Jo-1 antibodies and 26,3%, for anti PL-12. As non-anti-ARS antibodies, 6 had positivity for rheumatoid factor; 3, for ACPA and 5, for antiRo-52 antibodies. Of those 18 diagnosed of ILD, spirometry tests at baseline were available for 13. It was remarkable that 69,23% (9/13) of patients presented a diminished value of DLCO (low in 23% (3/13), moderate in 46% (6/13) and normal in the rest of subjects). The most common ILD pattern was non-specific interstitial pneumonia (55%, 10/18) followed by usual interstitial pneumonia (33,3%, 6/18) and organising pneumonia (11,1%, 2/18). Nailfold capillaroscopy was performed in 16 patients: Scleroderma pattern was observed in 5 (all of them associating Raynaud's phenomenon) and 6 patients showed microangiopathic changes. The most frequent capillaroscopic findings were neoangiogenesis (93,8%) and microhaemorrhagias<sup>68,8</sup> followed by avascular areas (37,5%) and megacapillaries (31%). An association between capillaroscopic findings and reduction of DLCO or the radiologic pattern was not observed,

possibly influenced by the number of patients included. One subject associated Sjögren Syndrome, another one cutaneous Lupus and another patient, morphea. All of the patients included, received steroids and immunosuppressants. Azathioprine was the most frequently used (18/20), followed by Methotrexate (7/20), Rituximab (5/20), Mycophenolate (4/20), Cyclophosphamide (3/20) and Abatacept (1/20).

**Conclusions:** In our cohort with AS, the most common clinical manifestation was ILD, and an important part of the patients showed a decreased DLCO. Capillaroscopy was pathogenic in most of them and could be useful for the diagnosis of AS, specially in those patients presenting solely with ILD at the clinical debut, although its prognostic value is still unknown. Multidisciplinary consultations are useful in the management of these truly challenging patients.

### AB1178 IS ANTI NUCLEAR ANTIBODY TEST REQUIRED CORRECTLY IN DAILY PRACTICE? A CHOOSING WISELY ANALYSIS

D. Üsküdar Cansu<sup>1</sup>, H. Üsküdar Teke<sup>2</sup>, E. Gündüz<sup>2</sup>, C. Korkmaz<sup>1</sup>. <sup>1</sup>Internal Medicine, Rheumatology; <sup>2</sup>Internal Medicine, Hematology, Eskişehir Osmangazi University, Eskişehir, Turkey

**Background:** The most sensitive and gold-standard test used for the detection of antinuclear antibody (ANA) is accepted as the indirect immunofluorescence (IIF) test.<sup>1</sup> International proposals, including the choice of rational examination, referred to as "choosing wisely", include significant efforts to reduce overuse of examinations such as the ANA.<sup>2</sup>

**Objectives:** Our aim was to retrospectively analyse the distribution of the ANA test samples for clinical reasons according to the clinical departments and to determine the most frequently requested reasons and to draw attention to the rational ANA request.

**Methods: Detection of ANA samples.** Between January 2014 and August 2016, the results of the requested ANA test samples were screened for various reasons. The results of the first 4 divisions with the most common ANA test request and the reasons for the test were also analysed in detail (paediatric diseases were excluded). The ANA test was evaluated using the IIF method and the interpretation of the results was done according to the fluorescence intensity observed in the samples (+1 positive, +2 positive, +3 positive and +4 positive).

**Results:** 11407 ANA samples were evaluated. The first 5 sections requiring ANA test most were as follows: Neurology 1917 (24.7%), dermatology 1825 (23.6%), rheumatology 1574 (20.3%), paediatric nephrology 1404 (18.1%) and haematology 1027 (13.3%). In all the sections dealing with children, the ANA test number was 2461 and the mean age of the patients was 12.7 years, while the number of ANA samples required in the entire adult patient group was 8946 and the mean age of the patients was 46.8 years. ANA positivity rates for neurology, dermatology, rheumatology and haematology departments are 14.9%, 15.4%, 32.6% and 14.1%, respectively. The interclinical positivity rate was statistically significant ( $p < 0.0001$ ). Positive +1, +2, +3 and +4 positivity rates were 33.5%, 27.8%, 22.2% and 16.3%, respectively, when all positive ANA results were evaluated in terms of titre. When positivity was evaluated in terms of ANA positivity rates/titre, +4 positivity was found to be the most common in the patients from the rheumatology department (135/262=51.5%) ( $p < 0.0001$ ).

The reasons for ANA requests were determined according to ICD diagnostic codes. According to this; in neurology, headache, cerebrovascular event and multiple sclerosis; in dermatology urticaria, psoriasis and dermatitis; in rheumatology, SLE, arthritis and fibromyalgia; in haematology, anaemia and thrombocytopenia were the most common reasons for ANA requests.

**Conclusions:** Based on specific recommendations and "choosing wisely", the ANA test should be requested in patients with a high pre-test probability for autoimmune diseases. Raising awareness in terms of wisely choosing ANA test is needed in departments outside the rheumatology.

### AB1179 MUSCULOSKELETAL PATTERN OF 18F-FDG UPTAKE IN PATIENTS WITH POLYMYALGIA RHEUMATICA

D. Prieto-Peña<sup>1</sup>, J. Loricera<sup>1</sup>, I. Martínez-Rodríguez<sup>2</sup>, J. Banzo<sup>2</sup>, M. Calderón-Goercke<sup>1</sup>, V. Calvo-Río<sup>1</sup>, C. González-Vela<sup>3</sup>, M. González-Gay<sup>1</sup>, J. Hernández<sup>4</sup>, R. Blanco<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Nuclear Medicine; <sup>3</sup>Pathology; <sup>4</sup>Internal Medicine, Hospital Universitario Marqués de Valdecilla, IDIVAL, Santander, Spain

**Background:** Polymyalgia rheumatica (PMR) is a common inflammatory rheumatic disease of the elderly whose diagnosis is usually based on clinical and ultrasound findings. Recently, <sup>18</sup>F-FDG PET/CT has been proposed as a promising one-step tool for assessing extent and severity of PMR. However, the pattern of <sup>18</sup>F-FDG uptake in PMR is not well established and there is a lack of imaging guidelines.

**Objectives:** Our aim was to describe the musculoskeletal pattern of <sup>18</sup>F-FDG uptake in PMR patients and assess if there were any differences between classic and atypical PMR.

**Methods:** Retrospective study of 75 patients with PMR and their respective PET/CT scans from a referral centre. We considered two groups: **a)** Classic PMR: patients who fulfilled the 2012 EULAR/ACR criteria; and **b)** Atypical PMR: patients with symptoms resembling PMR but did not fulfil the 2012 EULAR/ACR criteria. Distributions of categorical variables were compared by Pearson Chi2 or Fisher exact test as appropriate.

**Results:** We evaluated 75 patients (27 men and 48 women) with a mean age  $\pm$ SD of 68.2 $\pm$ 10.7 years. A PET/CT was performed in all of them. Forty-two (56%) patients classic PMR and 33 (44%) atypical PMR. FDG-PET uptake was observed in the following musculoskeletal regions: in shoulders (n=45), sternoclavicular joints (n=33), hips (n=32), cervical interspinous bursae (n=8), lumbar interspinous bursae (n=29), pubic symphysis (n=4), subtrochanteric bursae (n=20), ischial tuberosities (n=19) and knees (n=33). The comparative study between both groups is shown in the **TABLE**, without observing any statistical significance.

Abstract AB1179 – Table 1

	PMR (N=75)	Classic PMR (N=42)	Atypical PMR (N=33)	P <sup>a</sup>
Sex (women), n (%)	46 (64.0)	29 (69.0)	19 (57.6)	0.30
Age (years), mean $\pm$ SD	68.2 $\pm$ 10.7	73.9 $\pm$ 8.5	61.6 $\pm$ 9.5	0.60
F-FDG uptake		25 (59.5)	20 (60.6)	0.92
Shoulders	45 (60.0)	20 (47.6)	13 (39.4)	0.48
Sternoclavicular joints	33 (44.0)	19 (45.2)	13 (39.4)	0.76
Hips	32 (43.7)	5 (12.0)	3 (9.1)	0.98
Cervical interspinous bursae	6 (10.7)	12 (28.6)	11 (33.3)	0.40
Lumbar interspinous bursae	29 (38.8)	1 (2.4)	3 (9.1)	0.31
Pubic symphysis	4 (5.3)	12 (28.6)	6 (24.3)	0.67
Subtrochanteric bursae	20 (26.7)	12 (28.6)	7 (21.3)	0.47
Ischial tuberosities	19 (25.4)	16 (38.1)	17 (51.5)	0.25
Knees	33 (44.0)	25 (59.5)	20 (60.6)	0.92

# Comparisons between classic and atypical PMR.

**Conclusions:** In patients with PMR, <sup>18</sup>F-FDG uptake seems to be more frequent in shoulders, sternoclavicular joints, hips and knees. In addition, <sup>18</sup>F-FDG uptake can be also detected in lumbar interspinous bursae and less frequently in subtrochanteric bursae, ischial tuberosities, cervical interspinous bursae and pubic symphysis. No differences between classic and atypical PMR patients were seen.

### AB1180 THE INFLUENCE OF MECHANICAL STRESS ON THE HANDS ON ULTRASOUND RESULTS: A PROSPECTIVE STUDY WITH VOLLEYBALL PLAYERS (US-VOLLEY) – PRELIMINARY DATA

D. Scheicht<sup>1</sup>, S. Zeglam<sup>1</sup>, S. Frechen<sup>2</sup>, J. Strunk<sup>1</sup>. <sup>1</sup>Klinik für Rheumatologie, Krankenhaus Porz am Rhein; <sup>2</sup>Independent researcher, Köln, Germany

**Background:** Various imaging studies have found an influence of physical exercise on joint and tendon pathology in ultrasound. It is not clear<sup>1</sup> how specific grey scale and power Doppler changes are in a context of mechanical stress and<sup>2</sup> if a distinction to findings in acute arthritis exists.

**Objectives:** To examine via grey scale and power Doppler ultrasound the acute physiological effects of increased physical stress on the fingers and wrists and their surrounding structures through volleyball training in amateur healthy subjects as a reference to the known pathological findings (effusion, increased perfusion) in acute arthritis.

**Methods:** Examination of 18 healthy amateur volleyball players via musculoskeletal ultrasound before and directly after their routine volleyball practice. Ultrasound assessment included a grey scale and power Doppler examination of the dominant hand (longitudinal planes of the dorsal wrist and dorsal and palmar

planes of MCP II-III and PIP II-III joints). Findings were graded semi-quantitatively from 0 to 3 both in grey scale (effusion) and power Doppler (perfusion). The results of the joint assessment were aggregated in a composite index for grey scale and power Doppler (range 0–54 points). All ultrasound images were graded by two independent raters who were blinded to image acquisition.

**Results:** Volleyball training showed statistically significant effects in the composite index for grey scale and power Doppler scores ( $p=0.004$ ). 16 of 18 players showed a change in their composite index with a median change of 1 and a maximum change of 3 points. Subanalysis revealed that changes were related to grey scale exclusively, with no statistical difference in power Doppler scores.

Abstract AB1180 – Figure 1

**Conclusions:** The results of our study suggest that mechanical stress on the hands leads to changes in grey scale ultrasound in healthy subjects in at least one joint. However, the composite index for changes in grey scale and power Doppler changed 3 points at the most in one subject over various joints. To add, no changes in power Doppler score were observed. While changes in grey scale ultrasound appear to be minor, power Doppler ultrasound appears to be a more robust method and less prone to environmental factors. Power Doppler appears to be able to discriminate between physiological changes due to mechanical stress and acute arthritis and thus, is highly specific.

#### ANTI-RO60 SEROPOSITIVITY DETERMINES EPIPOPE SPECIFICITY OF ANTI-RO52 ANTIBODIES IN PATIENTS WITH AUTOIMMUNE RHEUMATIC AND MALIGNANT DISEASES

A. Gkoutzourelas<sup>1</sup>, C. Liaskos<sup>1</sup>, V. Papadopoulos<sup>2</sup>, M.G. Mytilinaou<sup>1</sup>, K. Christina<sup>1</sup>, T. Scheper<sup>3</sup>, W. Meyer<sup>3</sup>, D.P. Bogdanos<sup>1</sup>, C. Papandreou<sup>2</sup>, L.I. Sakkas<sup>1,3</sup>.

<sup>1</sup>Rheumatology and Clinical Immunology, Faculty of Medicine, School of Health Sciences, University of Thessaly, Larissa; <sup>2</sup>Medical Oncology, School of Medicine, Aristotle University of Thessaloniki, Thessaloniki, Greece; <sup>3</sup>Institute of Immunology, EUROIMMUN, Lübeck, Germany

**Background:** Epitope mapping of anti-Ro52 antibodies (abs) has been extensively studied in patients with Sjögren's syndrome (SjS) and systemic lupus erythematosus (SLE). Comprehensive epitope mapping in systemic sclerosis (SSc) or malignant diseases (MD), also associated with anti-Ro52 abs, has not been performed.

**Objectives:** To fully characterise Ro52 epitopes in anti-Ro52 ab-positive SSc and MDs.

**Methods:** Testing was performed in sera from 95 anti-Ro52 positive patients with various autoimmune diseases (32 SSc, 20 SjS, 28 SLE) and 15 with malignant diseases (MD). Five recombinant Ro52 fragments [Ro52-1 (aa 1–127), Ro52-2 (aa 125–268), Ro52-3 (aa 268–475), Ro52-4 (aa 57–180, partly overlapping Ro52-1 and Ro52-2), and Ro52-5 (aa 181–320, partly overlapping Ro52-2 and Ro52-3)] were tested by line-immunoassay. Anti-Ro60 was tested by ELISA.

**Results:** Overall, reactivity to Ro52-1, Ro52-2, Ro52-3, Ro52-4 and Ro52-5 were present in 35.8%, 100%, 0%, 32.6%, 50.5%, respectively. Patients with SLE more frequently recognised Ro52-1, Ro52-4 and Ro52-5 than patients with SSc and malignant diseases. When epitope mapping was analysed in accordance to Ro60 reactivity, patients were subdivided in 50 Ro52pos/Ro60pos (13 patients with SSc, 14 with SjS, 18 with SLE and 5 patients with MD) and 45 Ro52pos/Ro60neg patients (19 with SSc, 6 with SjS, 10 with SLE and 10 patients with MD) and the following findings were noted: Abs to Ro52-1 were present in 26/50 (52%) Ro52pos/Ro60pos compared to 8/45 (18%) Ro52pos/Ro60neg patients ( $p<0.001$ ); antibodies to Ro52-2 were present in all patients; antibodies to Ro52-3 was totally absent; antibodies to Ro52-4 were present in 23/50 (46%) Ro52pos/Ro60pos compared to 8/45 (18%) Ro52pos/Ro60neg patients ( $p=0.003$ ); antibodies to Ro52-5 were present in 33/50 (66%) Ro52pos/Ro60pos compared to 15/45 (33.3%) Ro52pos/Ro60neg patients ( $p=0.001$ ). Ro52 epitope recognition did not differ between Ro52pos/Ro60pos and Ro52pos/Ro60neg in patients with SLE, SjS and patients with MD. In SSc anti-Ro52-1 reactivity was present in 8/13

(62%) Ro52pos/Ro60pos compared to 0/19 (0%) Ro52pos/Ro60neg patients ( $p<0.001$ ); In SSc, anti-Ro52-5 reactivity was present in 9/13 (69.2%) Ro52pos/Ro60pos and 5/19 (26.3%) Ro52pos/Ro60neg patients ( $p=0.029$ ). Ro52 epitope recognition in Ro52pos/Ro60pos patients did not differ amongst diseases.

**Conclusions:** Ro52-1 (aa 1–127) and Ro52-4, partially overlapping with Ro52-1, (aa 57–180) are dominant epitopes in Ro52pos/Ro60pos patients but not in Ro52pos/Ro60neg patients with autoimmune rheumatic diseases, suggesting that amino acids 57–127 may contain an epitope specifically recognised by the Ro52pos/Ro60pos group. Whether Ro60 is responsible for the unmasking of Ro52 (aa57–127) neoepitope remains to be investigated.

AB1182

#### THE STABILITY OF RHEUMATOID FACTOR AND ANTI-CCP ANTIBODY IN ARCHIVED SAMPLES OF BLOOD

J. Yoo<sup>1</sup>, D. SHEEN<sup>1</sup>, M.-K. LIM<sup>1</sup>, J. SONG<sup>2</sup>. <sup>1</sup>Internal medicine, SCHOOL OF MEDICINE, EULJI UNIVERSITY; <sup>2</sup>Rheumatology, Sun General Hospital, Daejeon, Korea, Republic of Ireland

**Background:** Recently, there has been an increasing demand for analysing a large amount of specimen at the same time and for stably storing those specimens for clinical research. Therefore, the role of the biobank that collects and preserves the samples for research and supplies them stably is very important.<sup>1</sup> Anti-CCP antibody and RF predated the onset of RA by several years, which indicates that citrullination and the production of anti-CCP and RF autoantibodies are early processes in RA.<sup>2</sup> In addition, RA patients with anti-CCP antibody had more swollen joints and more severe radiological destruction.<sup>3</sup>

**Objectives:** The purpose of this study is to evaluate the stability of RF and anti-CCP antibody after preserving the remaining samples for a long time and to determine the usefulness of the remaining samples that were kept for future research.

**Methods:** Serum samples used in this study were collected from 50 patients with RA in Eulji university hospital in 2011. The patients had baseline measurement at the time the samples were obtained and had more than one serum aliquots stored for archived samples. At baseline measurement, rheumatoid factor was quantified with turbid immunometry and anti-CCP was measured by an ELISA analyzer. All specimens were kept in a freezer where temperature monitoring was carried out for 24 hours to keep the temperature below  $-70^{\circ}\text{C}$ . 6 years later, the samples were slowly thawed at  $4^{\circ}\text{C}$  and measured by the same method of the baseline measurement.

**Results:** The mean age for 50 patients from which the samples were collected is 51.22 years. It was an average of 6.0 years (range: 5.6–6.1 years) for the samples to be stored at the biobank. We observed a slight decrease in concentration of RF and anti-CCP. There were significantly difference in concentration of RF and anti-CCP ( $Z=-5.10$ ,  $p\text{-value}<0.001$ ;  $Z=-3.81$ ,  $p\text{-value}<0.001$ ). The correlation between baseline sample and archived sample is strong (RF:  $\rho=0.973$ ,  $p\text{-value}<0.001$ ; anti-CCP:  $\rho=0.938$ ,  $p\text{-value}<0.001$ ).

**Conclusions:** This study assessed the stability of RF and anti-CCP antibody in archived samples of blood. Our results showed that serum concentration of RF and anti CCP antibody remain stable for up to 5 years at  $-70^{\circ}\text{C}$ . There was a slight decreased in the level overtime that was correlated with baseline value. These data indicated that the archived human samples in human cohorts could be used to examine for research and could be estimated according to the regression analysis.

**AB1183** **DIAGNOSTIC VALUE OF SALIVARY CRP AND IL-6 IN PATIENTS UNDERGOING ANTI-TNF-ALPHA THERAPY FOR RHEUMATIC DISEASE**

D. Sikorska, R. Rutkowski, A. Prymas, M. Mrall-Wechta, D. Bednarek-Hatlińska, A. Surdacka, W. Samborski, J. Witowski. *Poznan University of Medical Sciences, Poznan, Poland*

**Background:** Saliva has been increasingly used as a diagnostic medium for disease detection and monitoring. Since saliva contains many of mediators of inflammation, collagen breakdown and/or bone remodelling, they may be of potential use for the rheumatic disease monitoring.<sup>1,2</sup>

**Objectives:** The aim of this pilot study was to investigate whether and how well salivary concentrations of CRP and IL-6 correlate with those in serum and with the clinical course of a rheumatic disease.

**Methods:** The nineteen consenting patients with rheumatoid arthritis or ankylosing spondylitis, newly scheduled for anti-TNF $\alpha$  therapy, were analysed. CRP and IL-6 were measured with high-sensitivity immunoassays before and after 12 weeks of anti-TNF $\alpha$  therapy, according to standard regimens. Disease activity and oral health parameters were also assessed.

**Results:** The patients' baseline characteristics were summarised in Table 1.

**Abstract AB1183 – Table 1.** Patients' baseline characteristics

Demographic and clinical features	
Age (years)	46 (36–61)
Men (%)	10 (53%)
Oral health parameters	
Plaque Index (PLI)	0.7 (0.4–1.0)
Approximal Plaque Index (API) (%)	75.0 (42.9–100.0)
Sulcus Bleeding Index (SBI)	0.0 (0.0–0.3)
Gingival Index (GI)	0.4 (0.0–1.0)
Probing Pocket Depth (PD) (mm)	0.8 (0.6–1.3)
Clinical Attachment Level (CAL)	1.4 (0.6–2.0)
DMFT index	18.5 (15.0–26.0)

The treatment resulted in a significant improvement in the clinical status and standard biochemical parameters in the majority of patients (table 2).

**Abstract AB1183 – Table 2.** Selected parameters before and after treatment.

	Before treatment (n=19)	After 12 weeks of treatment (n=19)	P-value (Wilcoxon-test)
DAS28 <sub>(ESR)</sub> (for RA; n=10)	6.2 (5.5–6.4)	3.5 (2.8–4.5)	<b>0.005</b>
BASDAI (for AS; n=9)	7.9 (6.6–8.6)	2.8 (2.0–4.2)	<b>0.008</b>
ESR (mm/h)	30 (8–70)	6 (4–24)	<b>0.002</b>
WBC (10 <sup>9</sup> /l)	9.3 (8.2–9.9)	8.0 (6.4–9.7)	<b>0.015</b>
Serum CRP (mg/l)	10.24 (4.65–24.31)	1.52 (0.54–4.13)	<b>0.010</b>
Serum IL-6 (pg/ml)	14.23 (5.03–34.61)	2.32 (1.49–25.14)	<b>0.044</b>
Salivary CRP (mg/l)	0.30 (0.02–3.72)	0.05 (0.00–1.87)	0.098
Salivary IL-6 (pg/ml)	1.91 (0.94–2.43)	1.48 (0.98–2.78)	0.811

Concentrations of CRP in saliva correlated significantly with those in serum ( $R=0.62$ ;  $p<0.001$ ) and decreased markedly after successful response to treatment ( $n=15$ ) ( $1.7\pm 0.2$  mg/L vs.  $0.8\pm 1.4$  mg/L;  $p<0.001$ ). In patients with a limited or no response to treatment ( $n=4$ ) salivary CRP levels increased ( $0.4\pm 0.8$  mg/L vs.  $2.6\pm 2.4$  mg/L;  $p=0.250$ ).

In contrast to CRP, the salivary concentrations of IL-6 did not change significantly over the course of therapy and they did not correlate with serum IL-6 concentrations. Salivary levels of neither CRP nor IL-6 corresponded to parameters of oral health and hygiene.

**Conclusions:** These data indicate, that salivary CRP but not IL-6 could be of potential use for monitoring the rheumatic disease activity.

**AB1184** **CORRELATION BETWEEN CLINICAL DISEASE ACTIVITY AND SACROILIAC MRI DETECTION IN AXIAL SPONDYLOARTHROPATHY**

O. Inan<sup>1</sup>, N. sayiner caglar<sup>1</sup>, Y. pekin dogan<sup>1</sup>, I.N. mutlu<sup>2</sup>, K. aydemir<sup>1</sup>, N. oz<sup>1</sup>, E. aytekin<sup>1</sup>. <sup>1</sup>physical medicine and rehabilitation; <sup>2</sup>radiology, health of sciences istanbul training and research hospital, istanbul, Turkey

**Background:** Ankylosing spondylitis (AS), a chronic rheumatic disease affecting young adults, is the prototype of the seronegative spondyloarthropathies (SpA). Magnetic resonance imaging (MRI) has an established role in the diagnosis and monitoring of patients with axial spondyloarthropathies (axSpA). Changes in MRI have shown some correlation with changes in clinical disease activity scores in the setting of biologic trials. MRI of the sacroiliac joints (SIJ) is currently widely used to assess inflammatory activity in AS patients. In general, agreement of status scores was somewhat better than agreement of change scores, and agreement of the comprehensive Spondyloarthritis Research Consortium of Canada scoring system (SPARCC) was somewhat better than agreement of the more condensed systems.

**Objectives:** The aim of this study is to evaluate the correlation between clinical disease activity of axSpA and MRI findings of sacroiliac joints.

**Methods:** Patients who were diagnosed as axSpA according to the Assessment of SpondyloArthritis international Society (ASAS) classification criteria in the our outpatient clinic and followed up routinely between November 2015 and August 2017 were included in this study. 32 patients between 18 and 55 years of age had been referred for routine blood tests and sacroiliac MRI. In this cross-sectional study, VAS, BASDAI, MASES, BASFI, ASDAS-ESR, ASDAS-CRP, ESR and CRP were used as the indicators of clinical activity. MRI of the sacroiliac joint was performed and the SPARCC score was evaluated by a radiologist who was blind to the clinical and laboratory parameters of the patients.

**Results:** The mean age of the patients was  $39.3\pm 9.2$ . 11 of the patients participating in the study were female (34.4%), 21 were male (65.6%). The mean duration of symptom onset was  $9.3\pm 7.7$  years and the mean duration of diagnosis was  $3.6\pm 2.8$  years. HLA-B27 is positive in 16 patients (50%). There is no correlation between SPARCC score and VAS, BASDAI, MASES, BASFI, ASDAS-CRP, ASDAS-ESR, ESR, CRP values ( $p>0.05$ ). In the HLA-B27 subgroup analyses, a statistically significant correlation was found between HLA-B27 negative patients and SPARCC score ( $p=0.008$ ).

**Conclusions:** As a result of this study, we could not find any relationship between other clinical disease parameters and sacroiliac joint imaging findings except for SPARCC score relationship with BASDAI in HLA-B27 negative patients with axSpA. We think that this relationship can be better revealed in future studies.

**AB1185** **ANTINUCLEAR ANTIBODIES (ANA) IN SYSTEMIC LUPUS ERYTHEMATOSUS (SLE): ASSOCIATIONS WITH CLINICAL MANIFESTATIONS AND CYTOKINE PROFILES**

E. Aleksandrova<sup>1</sup>, A. Novikov<sup>1</sup>, Z. Verzhnikov<sup>2</sup>, T. Panafidina<sup>2</sup>, T. Popkova<sup>2</sup>, G. Lukina<sup>1</sup>. <sup>1</sup>A.S. Loginov Moscow Clinical Research and Practical Center, Moscow Healthcare Department; <sup>2</sup>V.A. Nasonova Research Institute of Rheumatology, Moscow, Russian Federation

**Background:** SLE is a multisystem heterogeneous autoimmune disease characterised by production of antibodies to cellular components, innate and adaptive immune alterations and dysregulation of cytokine production. Multiplex immunoassay is a useful tool for the detection of ANA associated with different clinical phenotypes and cytokine profiles in SLE.

**Objectives:** To evaluate the relationship between ANA subpopulations, clinical subtypes and cytokine profiles in SLE.

**Methods:** We studied 61 patients with SLE (2012 SLICC classification criteria) (8M/53 F), median and interquartile range (25th–75th percentile) of age 30.0 (27.0–45.0) years, disease duration 90.5 (12.5–168.0) months, SLEDAI 2K score 8.0

[4.0–16.0]; SLICC damage index score 1.0 (0–2.0) and 28 healthy donors. Serum samples were analysed for SLE-associated ANA (anti-dsDNA, anti-Sm, anti-chromatin, anti-SS-A/Ro 52 kDa and 60 kDa, anti-SS-B/La, anti-RNP-70, anti-ribosomal P – anti-RibP) using multiplex bead-based immunoassay system BioPlex 2200 (ANA Screen; Bio-Rad Laboratories Inc., USA). The levels of cytokines were determined with Bio-Plex 200 technology (Human Grp I Cytokine 27-plex panel; Bio-Rad Laboratories Inc., USA).

**Results:** Serum levels of anti-dsDNA, anti-chromatin, anti-Sm and anti-RibP antibodies were positively correlated with SLEDAI-2K scores ( $r=0.6$ ,  $r=0.7$ ,  $r=0.4$ ,  $r=0.3$ ,  $p<0.05$ ). Antibodies to dsDNA, chromatin, Sm and SS-A/Ro was most often detected in patients with dermatologic (59%, 57%, 32%, 43%), renal (64%, 66%, 36%, 38%) and neuropsychiatric (61%, 61%, 28%, 39%) manifestations of SLE. Increased serum concentrations of IFN-inducible chemokines: IP 10 and MCP1 were associated with high anti-dsDNA ( $r=0.3$ ), anti-chromatin ( $r=0.5$ ), anti-Sm ( $r=0.5$ ), anti-SS-B/La ( $r=0.3$ ), anti-RibP ( $r=0.4$ ) ( $p<0.05$ ) and anti-Sm ( $r=0.3$ ), anti-SS-B/La ( $r=0.3$ ), anti-RibP ( $r=0.3$ ) ( $p<0.05$ ) antibodies levels. Hyperproduction of chemokines RANTES and IL-8/MIP-1 $\alpha$  negatively correlated with anti-dsDNA ( $r=-0.3$ ), anti-chromatin ( $r=-0.3$ ) ( $p<0.05$ ) and anti-SS-A/Ro ( $r=-0.3$ ) ( $p<0.05$ ) antibodies levels, respectively. Low levels of pro-inflammatory cytokines IL-1 $\beta$ , IL-15 were negatively associated with the presence of antibodies to dsDNA and RibP ( $r=-0.3$ ) ( $p<0.05$ ), but a positive correlation was found between the levels of anti-inflammatory cytokines IL-10, IL-1ra and anti-Sm ( $r=0.3$ ), anti-SS-B/La ( $r=0.3$ ), anti-SS-A/Ro ( $r=0.3$ ) ( $p<0.05$ ) antibodies titers. Elevated concentration of GM-CSF was negatively correlated with serum level of antibodies to Sm ( $r=-0.3$ ) ( $p<0.05$ ).

**Conclusions:** These data suggest that the presence of ANA clusters may identify patients with distinct clinical subtypes and cytokine profiles and can reflecting different pathways of immune dysregulation in SLE.

#### DYNAMIC CONTRAST ENHANCED MR IMAGING IN EARLY STAGE KNEE OSTEOARTHRITIS: A TEST-RETEST REPEATABILITY STUDY IN HEALTHY AND MODERATELY DISEASED SUBJECTS

F. Sanaei Nezhad<sup>1</sup>, J. MacKay<sup>2</sup>, J. Kaggie<sup>2</sup>, M. Graves<sup>2</sup>, F. Gilbert<sup>2</sup>, A. McCaskie<sup>3</sup>, H. Flynn<sup>1</sup>, C. Roberts<sup>1</sup>, R. Janiczek<sup>4</sup>, A.R. Morgan<sup>4</sup>, G.J. Parker<sup>1,5</sup>. <sup>1</sup>Bioxydyn, Manchester; <sup>2</sup>Department of Radiology; <sup>3</sup>Trauma and Orthopaedics, University of Cambridge, Cambridge; <sup>4</sup>GSK, Stevenage; <sup>5</sup>Centre for Imaging Sciences, University of Manchester, Manchester, UK

**Background:** Osteoarthritis(OA)in the knee exhibits signs of synovial activation in early phase of disease.<sup>1</sup> DCE-MRI provides quantitative measurement of vascular disruption associated with synovitis<sup>2,3</sup>and has been shown to be sensitive to early treatment-induced changes in small group sizes in multicentre trials.<sup>4</sup>

**Objectives:** 1. Determine the reproducibility of DCE-MRI parameters in the knee. 2. Compare DCE-MRI parameters between participants with mild/moderate OA and aged matched controls.

3. Enable effect and sample size calculations for further studies.

**Methods:** 9 knee OA patients and 4 controls underwent two MRI scans with a month separation. All patients had diagnosis of knee OA as per ACR criteria, with medial compartment predominant disease and Kellgren-Lawrence grade 2/3 on radiographs. 3 pre-contrast injection series were obtained with flip angles 2°,6° and 14°for T1 calculation.35 consecutive phases formed the DCE-MRI series (temporal resolution:14 s). Contrast agent(CA)(Dotarem(0.4 mL/kg))was administered on the 6th phase at the rate 3 mL/s followed by 50 mL saline. All Images were registered together. Here 2 DCE parameters are reported: $K^{trans}(\text{min}^{-1})$ , volume transfer constant for CA between blood plasma and extravascular extracellular space; estimated using the extended Tofts model<sup>5</sup> with population arterial function,<sup>6</sup> and  $\text{IAUC}_{60}(\text{mM}\cdot\text{s})$ , initial area under CA concentration curve over 60 s post-arrival. Manual segmentation was performed by radiologist.

**Results:** Test-retest coefficient of variation(CoV) was lower in controls.  $K^{trans}$  had CoVs of 26/16% in OA patients/controls. An effect size of 30% reduction in  $K^{trans}$ <sup>4</sup> indicates a treatment effect would be observed in a group of 11 patients with 90% power. DCE parameters were generally higher in OA patients than in controls. 4 out of 9 patients (All with KL score 3)demonstrated parameter values outside the healthy volunteer range at  $p<0.01$  level (one sample t-test).

Abstract AB1186 – Table 1

	Age (mean $\pm$ SD)	BMI (mean $\pm$ SD)	#KL-grade 2/3	#MOAKS effusion synovitis grade 0/1/2	#MOAKS Hoffa synovitis grad 0/1
Patient (n=9, 4F)	52 $\pm$ 5.2	30 $\pm$ 4.15	5/4	5/1/3	7/2
control (n=4, 3F)	55 $\pm$ 3.0	30 $\pm$ 3.50	NA	3/1/0	3/1

Abstract AB1186 – Figure 1

**Conclusions:** Higher  $K^{trans}$  and  $\text{IAUC}_{60}$  in patients indicates the potential of revealing microvascular function differences. The fact that this is not observed in all patients could suggest phenotypical variation. High CoV values in patient relative to healthy may be explained in part by fluctuation in disease status. Manual delineation also contributes to this variation.

DCE-MRI measures of vascular disruption associated with synovitis in knee OA are practical and feasible for imaging trials. These measures offer greater insight and sensitivity into the inflammatory component of OA that is not captured using other radiological methods.

#### WHAT IMAGING DETECTED PATHOLOGIES ARE ASSOCIATED WITH SHOULDER SYMPTOMS AND THEIR PERSISTENCE? A SYSTEMATIC LITERATURE REVIEW

G. Tran<sup>1</sup>, P. Cowling<sup>2</sup>, T. Smith<sup>3</sup>, A. Lucas<sup>1</sup>, E. Hensor<sup>1</sup>, A. Barr<sup>1</sup>, S. Kingsbury<sup>1</sup>, P. Conaghan<sup>1</sup>. <sup>1</sup>Leeds Institute of Rheumatic and Musculoskeletal Medicine; <sup>2</sup>LEEDS TEACHING HOSPITAL TRUST, Leeds; <sup>3</sup>Nuffield Department of Orthopaedics, Rheumatology and Musculoskeletal Sciences, Oxford, UK

**Background:** Shoulder pain is a very common musculoskeletal complaint and a significant contributor to disability and morbidity. Recovery can be slow and over 50% continue to have pain at 18 months. Shoulder pain has a significant negative impact on quality of life and poses a significant economic burden, with costs estimated to be € 345 million per year in the UK alone. Modern imaging modalities can accurately detect soft-tissue pathologies and are increasingly used, but the relationship of imaging findings to patient symptoms remain unclear.

**Objectives:** Our aim was to systematically review the literature to determine what imaging features are associated with symptoms and their progression.

**Methods:** A systematic review using Medline, EMBASE, Cochrane and grey literature was conducted to April 2017. The cross-sectional and longitudinal relationships between imaging-detected abnormalities and symptoms were analysed and associations qualitatively characterised by a best evidence synthesis based on study design, covariate adjustment and the Grade of Recommendations

Assessment, Development and Evaluation (GRADE). Modalities included ultrasound, magnetic resonance imaging (MRI), radiographs, positron emission tomography (PET), bone scintigraphy and computerised tomography (CT).

**Results:** 6569 abstracts were screened and 56 papers were included. 50 studies did not adjust for covariates. The majority of studies showed conflicting findings. There was no significant association between most imaging features (rotator cuff tears, tendinopathies, subacromial bursal pathologies, osteoarthritis, calcification, acromial pathologies and adhesive capsulitis) and symptoms amongst high quality, cross-sectional studies. There was low-quality evidence suggesting that enhancement of the joint capsule on MRI and increased uptake of the rotator cuff interval, anterior joint capsule or axillary recess on PET was associated with symptoms in adhesive capsulitis. Based on high-quality, unadjusted longitudinal studies, enlarging rotator cuff tears was associated with an increased incidence of pain. 20 out of 56 studies evaluated more than one pathology, but only one study examined the association of symptoms with a combination of pathologies.

**Conclusions:** There were conflicting results on the association of imaging features with shoulder symptoms and its persistence and the existing evidence was very low in quality. There may be some imaging features associated with adhesive capsulitis symptoms and increasing RC tear may be associated with incident shoulder symptoms. Further high quality studies are required to understand the relationship between imaging and symptoms.

#### AB1188 NAREDO AND BACKHAUS ULTRASOUND SCORES IN TUNISIAN RHEUMATOID ARTHRITIS PATIENTS

S. ZROUR<sup>1</sup>, H. Mouanaa<sup>1</sup>, A. Arfa<sup>1</sup>, H. Hachfi<sup>2</sup>, M. Jguirim<sup>1</sup>, I. bejia<sup>1</sup>, T. Mongi<sup>1</sup>, M. Youness<sup>2</sup>, N. bergaoui<sup>1</sup>. <sup>1</sup>RHEUMATOLOGY DEPARTEMENT OF MONASTIR UNIVERSITY HOSPITAL, monastir; <sup>2</sup>RHEUMATOLOGY DEPARTEMENT OF MAHDIA UNIVERSITY HOSPITAL, Mahdia, Tunisia

**Background:** Ultrasound becomes increasingly important in the diagnosis and management of rheumatoid arthritis (RA).

**Objectives:** Our purposes are to evaluate Naredo (NS) and Backhaus (BS) ultrasound scores of synovitis, performed in daily practice in RA and to study their correlations with clinical assessment and SHARP radiological score modified by Vander Heijde (SS).

**Methods:** This is a cross-sectional study, conducted at the Rheumatology Department of Monastir Teaching Hospital, Tunisia, in 69 consecutive patients with RA. For each patient, clinical and biological evaluation (DAS 28 score), radiological assessment (SS) and ultrasound evaluation (by TOSHIBA machine) to determine NS and BS, were performed.

**Results:** The mean age of our patients was 52.01±10.1 years.<sup>27-78</sup> The women accounted for 89% of patients. The average of disease duration was 121±86 months [1-333]. The mean tender joint count (TJC) was 5.9±5.6 [0-27]. The most frequently hands tender joints were the 5th MCP right, 3rd MCP right and the 1st MCP left and right. The mean swollen joint count (SJC) was 3 [0-22]. The most frequently swollen joints at both hands were the wrists and the 2nd MCP. The overall mean SS score was 105±59 [17-272], the overall mean score for joint erosion was 52±38 [0-166] and narrowing score was 53±26.<sup>3-136</sup> The mean NS was 17±15 [0-64] and BS was 21±10.<sup>2-44</sup> The mean duration of ultrasound assessment for calculating NS and BS was 21±7 min and 17±5 min, respectively. NS was significantly associated with SJC (p<0.000) and DAS 28 (p<0.01) but was not significantly associated with SS nor with its components. The BS was significantly associated with TJC (p<0.000), SJC (p<0.04) and DAS 28 (p<0.02). It was not significantly associated with SS. The number of erosions found by the BS was significantly associated with the erosion score of both hands and overall erosion score found by the SS (p<0.001). Ultrasound shows superiority in detecting erosions than standard radiographs: the number of erosions found by the BS was superior in 91% of cases to the number of erosions found by SS in the same joints.

**Conclusions:** NS and BS are significantly associated with RA disease activity. Ultrasound detects better osteoarticular erosions than radiological assessment. BS, which needs on average 17 min, can be used in daily practice.

#### AB1189 ROLE OF DIFFUSION WEIGHTED IMAGING IN DIABETIC FOOT MAGNETIC RESONANCE IMAGING

H. Zaghouani Ben Alaya<sup>1</sup>, F. Ferhi<sup>2</sup>. <sup>1</sup>departement of radiology; <sup>2</sup>anesthesia and intensive care, university hospital farhat hached susa, susa, Tunisia

**Background:** Differentiation of acute diabetic osteoarthropathy from acute osteomyelitis is one of the most challenging issues in the evaluation of diabetes related foot complications. Early differentiation between these conditions is crucial, as early management of acute diabetic osteoarthropathy could prevent permanent deformity and resultant morbidity and initiation of appropriate treatment for osteomyelitis can reduce the risk of amputations. Acute diabetic osteoarthropathy may mimic osteomyelitis clinically and at different imaging modalities. The current imaging modalities used for assessment for diabetic foot have several limitations

**Objectives:** evaluate the role of diffusion weighted echoplanar MR imaging in differentiation of diabetic osteoarthropathy from osteomyelitis of diabetic foot.

**Methods:** Prospective study was conducted on 37 consecutive patients with diabetic foot. They underwent diffusion weighted MR imaging of the foot using a single shot echo planar imaging with a b-factor of 0,500 and 1000 sec/mm<sup>2</sup>. The scanning parameters were: TR=10000 ms, TE=108 ms, NEX=8-16, bandwidth=125 kHz, slice thickness=4 mm. Apparent diffusion coefficient (ADC) map was reconstructed. The ADC value was calculated and correlated with surgical findings or biopsy. Statistical analysis was done.

**Results:** The mean ADC value of diabetic osteoarthropathy was 0.97±0.13 × 10<sup>-3</sup> mm<sup>2</sup>/sec and of osteomyelitis was 0.121±0.12 × 10<sup>-3</sup> mm<sup>2</sup>/sec. There was statistically difference in mean ADC values between diabetic osteoarthropathy and osteomyelitis (p<0.01). When apparent diffusion coefficient value of 0.77 × 10<sup>-3</sup> mm<sup>2</sup>/sec was used as a threshold value for differentiating of diabetic osteoarthropathy from osteomyelitis, the best result was obtained with an accuracy of 90%, sensitivity 92%, specificity 89%, positive predictive value 88% and negative predictive value of 86%.

**Conclusions:** we concluded that apparent diffusion coefficient value is a new non-invasive imaging parameter that can be used for differentiation of diabetic osteoarthropathy from osteomyelitis. Application Diffusion weighted MR imaging can be added to routine MR imaging of diabetic foot.

#### AB1190 ULTRASONOGRAPHY IN SPANISH RHEUMATOLOGY: A CROSS SECTIONAL SURVEY

J. Uson<sup>1</sup>, E. Naredo<sup>2</sup>, E. de Miguel<sup>3</sup>, J.L. Andreu<sup>4</sup>. <sup>1</sup>Rheumatology, Hospital Universitario Móstoles; <sup>2</sup>Rheumatology, Hospital Fundación Jiménez Díaz; <sup>3</sup>Rheumatology, Hospital Universitario La Paz; <sup>4</sup>Rheumatology, Hospital Universitario Puerta de Hierro de Majadahonda, Madrid, Spain

**Background:** Ultrasonography (US) is the rheumatologists' best tool that must be taught and learnt correctly. The ultrasound school of the Spanish Society of Rheumatology has trained many rheumatologists for more than twenty years. Approximately 75% of the rheumatology departments in Spain use US. However, we lack current views of features related with competency, teaching rheumatology residents, US usage and implementation.

**Methods:** A cross sectional survey was performed using an online standardised questionnaire sent to all members of the SSR in January 2017. The questionnaire was developed by the four authors, corrected for size, style, syntaxes and was piloted on four different aged rheumatologists. Six aspects were studied; general data, US training, rheumatology residents training in US and main uses and applications of US. The questionnaire used either closed or Likert scale answers and took about 20 min to answer. Herein we describe the main results on usage and applications of US.

**Results:** 113 responses: 60% women, 45±12 years old, 73% working in public university hospital with one or more US machines. US is usually used at the time of clinical consultation or at appointment for US. 43% have a specific agenda for US diagnosis and monitoring inflammatory arthritis patients. The 3 principals for using US are: as a problem solving tool in the clinical context; as a diagnostic tool in inflammatory arthritis and; as a tool to guide injections. The table shows the percentage of the responses always and almost always for 10 clinical contexts. As diagnostic tool in rheumatoid arthritis (RA), 66% use US to confirm arthritis when clinical exam is unclear and 33% in patients with inflammatory arthralgia plus high ESR, CRP, RF or anti-CCP. 36% monitor disease activity using a reduced joint assessment; one target joint plus 2,3 MCP and 2,3, 5 MTP joints and 32% use a validated joint count. 66% use US to assess remission in RA all patients (22%), only in those treated with biologic drugs (28%) and in RA patients with poor

prognostic factors (18%). Most use US to confirm clinical enthesitis when a spondyloarthropathy (SpA) is suspected and half consider that a positive enthesal Doppler signal supports more aggressive management. 76% perform real-time guided injections for the following disorders/sites: Baker's cyst, subacromial-subdeltoid bursa, tibionavicular joint, anterior coxofemoral joint, retrocalcaneal bursa and extensor wrist tenosynovitis.

#### Abstract AB1190 – Table 1

	% (Likert 4 +5)
To detect articular or periarticular inflammation when there is a clinical doubt	94
To detect enthesopathy, tendinosis or tendon ruptures when there is a clinical doubt	79
To detect crystal deposits when microcrystalline arthropathy is suspected	48
To detect bone erosions when radiology is obscure	39
To assess skin fibrosis	35
To assess palpable nodules or masses	34
To detect temporal artery vasculitis when it is clinically suspected	20
To detect salivary gland involvement in patients with xerostomy	17
To detect arteriosclerosis in chronic inflammatory patients	13
To assess interstitial lung disease	2

**Conclusions:** Rheumatologist- ultrasonographers in Spain use ultrasonography in a wide spectrum of diseases and clinical contexts mainly to facilitate diagnosis and improve treatment of rheumatic patients.

**Disclosure of Interest:** None declared

#### AB1191 VITAMIN D AND CD34+ CELLS AS BIOMARKERS OF SUBCLINICAL ATHEROSCLEROSIS AND MYOCARDIAL DYSFUNCTION IN INFLAMMATORY JOINT DISEASES

J. Rodríguez-Carrio<sup>1,2</sup>, A. Lo Gullo<sup>3</sup>, F. Savarino<sup>3</sup>, C.O. Aragona<sup>3</sup>, G. Dattilo<sup>3</sup>, C. Zito<sup>4</sup>, A. Suárez<sup>1,2</sup>, S. Loddio<sup>3</sup>, M. Atteritano<sup>3</sup>, A. Saitta<sup>3</sup>, G. Mandraffino<sup>3</sup>.  
<sup>1</sup>Instituto de Investigación Sanitaria del Principado de Asturias (ISPA); <sup>2</sup>Area of Immunology, University of Oviedo, Oviedo, Spain; <sup>3</sup>Department of Clinical and Experimental Medicine, University of Messina, Messina, Italy; <sup>4</sup>Department of Clinical and Experimental Medicine, University of Messina, Messina, Spain

**Background:** increased cardiovascular (CV) risk in inflammatory joint diseases (IJD) such as rheumatoid (RA) or psoriatic arthritis (PsA) is linked to an impaired vascular homeostasis. Chronic inflammation and immune dysregulation prompt endothelial damage and impair reparative mechanisms. Among them, circulating CD34 +bone marrow-derived progenitors are known to participate in endothelial turnover and improve myocardial neovascularization and ventricular remodelling, likely delaying CV disease development. Among factors related to CD34 +cells mobilisation, a role for vitamin D has emerged in other scenarios. Whether impaired CD34 +cells or vitamin D levels underlie endothelial and myocardial dysfunction in IJD patients remains unknown.

**Objectives:** to evaluate the associations between CD34 +cells and vitamin D levels with markers of subclinical atherosclerosis and myocardial functionality in IJD patients.

**Methods:** CD34 +cells counts were assessed by flow cytometry in peripheral blood samples from 41 RA (2010 EULAR/ACR criteria) and 35 PsA (CASPAR criteria) patients recruited at onset and 58 matched healthy controls (HC). Vitamin D levels were quantified in serum by HPLC. PWV and cIMT were evaluated as markers of subclinical atherosclerosis, whereas myocardial dysfunction was assessed by speckle-tracking echocardiography (STE).

**Results:** vitamin D was decreased in RA (23.68±6.42) and PsA (23.53±4.84) compared to HC (31.75±5.05 ng/ml, both p<0.001). Vitamin D was negatively associated with cIMT in HC (r=-0.308, p=0.026) and in PsA patients with low disease activity (DAS28 <2.9, n=11) (r=-0.636, p=0.035), but not in their high disease activity or RA counterparts. CD34 +cells were decreased in RA compared to HC (1.58±0.58 vs 2.35±1.14 cells/ul, p=0.002). CD34 +cells frequency was associated with total- and LDL-cholesterol levels in HC (r=-0.295, p=0.031 and r=-0.354, p=0.011, respectively) but not in IJD. CD34 +cells negatively paralleled DAS28 in PsA (r=-0.338, p=0.047) and RA (r=-0.303, p=0.057). Multivariate regression analyses revealed that vitamin D levels (B=0.019, p=0.009) and DAS28 (B=-0.152, p=0.050) were independently associated with CD34 +counts in PsA, whereas vitamin D (B=0.010, p=0.028) and duration of the symptoms (B=0.016, p=0.010) did in RA. CD34 +cells counts were correlated with GCS (r=-0.291, p=0.068) and GLS (r=-0.301, p=0.057) in RA.

**Conclusions:** vitamin D was negatively associated with cIMT and risk factors in HC and PsA patients with low disease activity, but not in those with active disease or RA. Vitamin D was an independent predictor of CD34 +cell depletion in IJD.

CD34 +cells, negatively associated with risk factors in HC, were altered in RA in relation to disease activity and the duration of symptoms. CD34 +cells were associated with myocardial dysfunction in RA.

#### AB1192 DIAGNOSTIC YIELD OF MUSCLE BIOPSIES PERFORMED OVER A 10 YEAR PERIOD

J.M. Weightman, K.A. Manchegowda, D. Coady. *Rheumatology, Sunderland Royal Hospital, Sunderland, UK*

**Background:** Patients with suspected inflammatory myopathy (IM) are often referred to Rheumatology, where the diagnostic process may include a biopsy of skeletal muscle. A new service was set up in 2007 at Sunderland Royal Hospital, whereby a trained consultant performs open muscle biopsies of vastus lateralis muscle under local anaesthetic within the Rheumatology outpatient department. Samples are sent to a histology laboratory at another hospital site for analysis, which can include electron microscopy. Referrals most commonly come from other consultant Rheumatologists within the team.

**Objectives:** To evaluate the diagnostic yield amongst muscle biopsies performed over a 10 year period. To review the correlation between final clinical diagnosis and investigation results. To identify any complications caused by the biopsy procedure.

**Methods:** Retrospective analysis of medical notes of all patients who were referred for muscle biopsy within the Rheumatology department during 2007 – 2017.

**Results:** The mean patient age was 51 years; 28 patients were female. All procedures were performed or directly supervised by one trained rheumatology consultant. 45 patients were referred for muscle biopsy. 41 patients had elevated creatinine kinase. 2 were unable to tolerate the procedure. 3 samples were either too small for analysis or did not contain skeletal muscle. A total of 40 muscle samples were reviewed.

16 muscle biopsy samples showed histological features of IM (3 polymyositis, 3 dermatomyositis, 6 inclusion body myositis and 4 undifferentiated CTD). 15 samples showed other diagnoses including genetic, neurological and storage disorders. In 9 samples no definite diagnosis could be made on biopsy, despite this 3 patients were diagnosed with IM based on clinical features and other investigations.

Of the 19 patients with a final diagnosis of inflammatory myopathy (clinical and histological), 15 had positive ANA, 3 had negative ANA (1 of which had positive Ro antibodies).

EMG/NCS performed prior to muscle biopsy had a high positive predictive value: all 7 with an IM pattern on EMG had a histological diagnosis of IM. 2 patients with normal EMG had eventual diagnosis of IM.

Complication rates were low. 3 patients had subsequent numbness around the biopsy site and 1 required a compression dressing for increased bleeding during the procedure.

**Conclusions:** Muscle biopsy was successful in achieving a diagnosis in 64% of all patients referred. Out of biopsies taken, 40% of biopsies performed showed IM. 37.5% showed other diagnoses. The total diagnostic yield is therefore calculated as 77.5%. It appears to be a useful diagnostic investigation in patients with suspected myopathies and helps with correct diagnosis and appropriate treatment. Muscle biopsy is relatively safe and can be performed in the outpatient setting. Despite delays in the transfer of 3 specimens, histological analysis was still possible, suggesting that having an off-site histopathology laboratory does not adversely affect outcomes. Further review could focus on the increasing use of MRI scanning in the diagnostic evaluation of these patients, which may in some cases prevent the need for open biopsy.

#### AB1193 AN IMMUNE REFERENCE ATLAS FROM BIRTH TO ADULTHOOD IDENTIFIES KEY DEVELOPMENTAL MILESTONES

J.G. Yeo<sup>1,2</sup>, L. Pan<sup>1</sup>, T. Arkachaisri<sup>1,2</sup>, S.L. Poh<sup>1</sup>, F. Ally<sup>1</sup>, J. Leong<sup>1</sup>, K.T. Yeo<sup>1,2</sup>, L. D/O Thana Bathi<sup>1</sup>, A.Y.J. Tan<sup>2</sup>, S. Albani<sup>1,2</sup>. <sup>1</sup>Translational Immunology Institute, SingHealth-DukeNUS Academic Medical Centre; <sup>2</sup>KK Women's and Children's Hospital, Singapore, Singapore

**Background:** A developmental atlas of the immune system is key to understanding its normal maturation process and identifying the disease-associated cell subsets. The absence of a holistic developmental immune normogram is a critical unmet need.

**Objectives:** To address this need and our hypothesis that age-related immune effector and regulatory cell subsets changes are present, we employ a multi-dimensional approach using mass cytometry to identify the cell subsets that shape the developing immune landscape from birth to adulthood.

**Methods:** We interrogated the peripheral blood mononuclear cells from 126 healthy individuals (cord blood, newborn to adult) with mass cytometry using two extensive antibody panels embracing the most important cell lineages and their function. Quality control and batch effect correction were performed with outliers excluded before dimensional reduction and clustering to identify the unique immune cell subsets. Their frequencies across the age categories were presented as 3-D frequency histograms. Subsequent manual gating was done to further describe these immune cell subsets changes with age using Pearson correlation coefficient.

**Results:** Distinct developmental gradients involving multiple effector and regulatory cell subsets shaped the maturing immune landscape. The naïve TNF $\alpha$ +CD4 +T cells were enriched in the early childhood period and declined with age (Pearson correlation coefficient,  $r=-0.3503$ ,  $p<0.001$ ). In contrast, the memory TNF $\alpha$  +CD4+T cells increased with age ( $r=0.4149$ ,  $p<0.0001$ ). A transitional milestone from naïve to memory TNF $\alpha$ +CD4+T cells was observed after 2 year old. This indicates that an intact CD4 +T cells TNF $\alpha$  effector mechanism is present at birth which progressively mature to involve the memory CD4 +T cells. For another cytokine IL17A, it was secreted solely by the memory CD4 +T cells with its population increasing with age ( $r=0.3753$ ,  $p<0.001$ ). Another distinct maturation milestone was observed in the naïve CD8 +T cell subset where a transition from IL8 to IFN $\gamma$  secretion after 10 year old was observed. The IL8 +and IFN $\gamma$ +naïve CD8+T cell subsets correlated negatively and positively with increasing age respectively ( $r=-0.2661$ ,  $p<0.01$  and  $r=0.2835$ ,  $p<0.01$ ).

For the T regulatory cells, the age related changes were more gradual. The early thymic T regulatory cells (CD3+, CD4+, CD31+, CD45RA+, CD25+, Foxp3+, CD152+) demonstrated a gradual decline with age ( $r=-0.2966$ ,  $p<0.01$ ) while the memory T regulatory cells gradually increased with age (CD3+, CD4+, CD45RO +, CD25+, Foxp3+, CD152+) ( $r=0.2444$ ,  $p<0.05$ ).

**Conclusions:** Key developmental milestones in the T cell compartment were identified and with the other subsets identified, a holistic description of the developing immune landscape was obtained. This atlas has the potential dual translational role of defining the stage of immune maturity and distilling the pathological cell subset in both paediatric and adult immune mediated diseases. The database and the related pipeline to analyse it will be provided as a free reference.

**Background:** Other spectral Doppler parameters can assess joint impairment caused by psoriatic arthritis and psoriasis<sup>1</sup>.

**Objectives:** To detect and compare Doppler velocimetric indexes changes in 3 groups of patients.

**Methods:** Thirty – eight patients were evaluated: 8 in the control group – healthy (52 nail beds); 15 in the psoriasis group (134 nail beds); and 15 in the group with psoriatic arthritis (147 nail beds). "CASPAR" criteria were used to classify the patients. The ultrasound (US) was performed in all patients using Esaote MyLab 50, with high resolution linear probe with a frequency of 18 MHz, it was positioned longitudinally to the nail bed.

**Results:** The psoriasis group of patients included 7 males (46.6%) and 8 females (53.4%); 66.6% were white, 33.4% black.

**Abstract AB1194 – Table 1.** Mean and standard deviations of US, clinical and laboratory variables by clinical group:

	Psoriatic Arthritis	Psoriasis	Control
RI (Resistance Index)	0.58 (0.09)	0.59 (0.10)	0.60 (0.07)
PI (Pulsatility Index)	1.05 (0.31)	1.06 (0.45)	1.12 (0.25)
Acceleration (A=m/s <sup>2</sup> ;	0.37 (0.29)	0.39 (0.47)	0.51 (0.44)
Acceleration Time (AT=ms)	107.30 (37.10)	114.64 (41.14)	113.10 (40.10)
Angle of Insonation ( $\alpha=^{\circ}$ )	18.21 (25.8)	14.76 (24.71)	27.28 (30.10)
Nail bed thickness (T=mm)	1.60 (0.78)	1.68 (0.50)	1.44 (0.40)
VHS	27.5 (24.9)	20.4 (14.9)	-
PCR	0.75 (1.1)	0.54 (0.7)	-

**Abstract AB1194 – Table 2.** Distribution and percentage of individuals according to clinical group and to the PASI, NAPS1 variables:

	Psoriatic Arthritis N(%)	Psoriasis N(%)	Control N (%)
<b>NAPS1</b>			
Normal (=0)	0 (0)	0	8 (100)
Mild (<20)	4 (28.6)	10 (71.4)	0
Severe (>20)	11 (68.7)	5 (31.3)	0
<b>PASI</b>			
Mild (<15)	14 (51.8)	13 (48.2)	0
Moderate <sup>15-25</sup>	1 (50.0)	1 (50.0)	0
Severe (>25)	0	1 (100.0)	0

Statistically significant: Mean age and SD of the psoriasis, psoriatic arthritis and control groups, respectively: 57.13 $\pm$ 14.3 years; 54.66 $\pm$ 10.6 years; 24.87 $\pm$ 2.03 years ( $p<0.05$ ). A statistically significant difference was found in the **NAPS1** variable among all groups ( $p<0.05$ ); in the variable **PASI**, a difference was only found in the control group ( $p<0.05$ ) (Kruskall-Wallis) (table 2); the **A** variable between the psoriasis group and control ( $p<0.001$ ); between the psoriatic arthritis group and control ( $p=0.001$ ), the variable **T** between the psoriasis and psoriatic arthritis groups ( $p=0.006$ ) and between the psoriasis and control groups ( $p=0.001$ ) and the  $\alpha$  variable between control and psoriasis groups ( $p=0.017$ ) (table 1). **Spearman and Pearson correlations** between US variables per group, psoriasis, psoriatic arthritis and control were: **RlxPI**  $r=0.744$  ( $p<0.001$ ), **PD (power Doppler) xT**  $r=0.301$  ( $p<0.001$ ), **RlxPI**  $r=0.914$  ( $p<0.001$ ), **PlxA**  $r=0.46$  ( $p<0.001$ ); **RlxPI**  $r=0.889$  ( $p<0.001$ ), **PDxT**  $r=0.490$  ( $p<0.001$ ) respectively.

**Conclusions:** There are other parameters in spectral Doppler to be validated in order to characterise changes in nail beds.

#### AB1195 DEVELOPMENT AND VALIDATION OF AN ULTRASONOGRAPHIC ACTIVITY SCORE (USAS) FOR RHEUMATOID ARTHRITIS

J.J. De Agustín<sup>1</sup>, A. Erra<sup>2</sup>, A. Ponce<sup>3</sup>, C. Moragues<sup>4</sup>, C. Diaz<sup>5</sup>, P. Moya<sup>5</sup>, D. Reina<sup>6</sup>, P. Estrada<sup>6</sup>, E. Casado<sup>7</sup>, M. Moreno<sup>7</sup>, J. Ramirez<sup>8</sup>, L. Mateo<sup>9</sup>, M. Pujol<sup>10</sup>, S. Ros<sup>11</sup>, P. Santo<sup>12</sup>, E.L. Sirvent<sup>12</sup>, J. Narvaez<sup>13</sup>, R. Sanmarti<sup>14</sup>, M. Garcia Yebenes<sup>15</sup>, L. Carmona<sup>15</sup>, on behalf of ECOCAT GROUP. <sup>1</sup>Rheumatology Unit, Hospital Universitari Vall d'Hebron; <sup>2</sup>Rheumatology, Hospital San Rafael, Barcelona; <sup>3</sup>Rheumatology Unit, Hospital Granollers, Granollers; <sup>4</sup>Rheumatology, Hospital Platon; <sup>5</sup>Rheumatology, Hospital Sant Pau, Barcelona; <sup>6</sup>Rheumatology, Hospital Moises Broggi, Sant Joan Despí; <sup>7</sup>Rheumatology, Hospital Parc Taulí, Sabadell; <sup>8</sup>Rheumatology, Hospital CLinic i Provincial, Barcelona; <sup>9</sup>Rheumatology, Hospital Germans Trias i Pujol, Badalona; <sup>10</sup>Rheumatology, Hospital de Tarrassa, Tarrassa; <sup>11</sup>Rheumatology, Hospital de Viladecans, Viladecans; <sup>12</sup>Rheumatology, Parc Sanitari Sant Joan de Deu, Sant Boi de Llobregat; <sup>13</sup>Rheumatology, Hospital Universitari de Bellvitge, Hospitalet de Llobregat; <sup>14</sup>Rheumatology, Hospital Clinic, BARCELONA; <sup>15</sup>Inmusc, Instituto de Investigacion Musculoesqueletica, Madrid, Spain

**Background:** Composite scores developed in Rheumatoid arthritis (RA) not include all dimensions of disease activity. An index based on essential clinical plus a ultrasound (US) measures, focused on simplicity, with appropriate validation, would allow a better classification at different levels of disease activity than a clinical only or US only index.

**Objectives:** To develop and validate a mixed clinical-US inflammation score in RA for use in clinical practice.

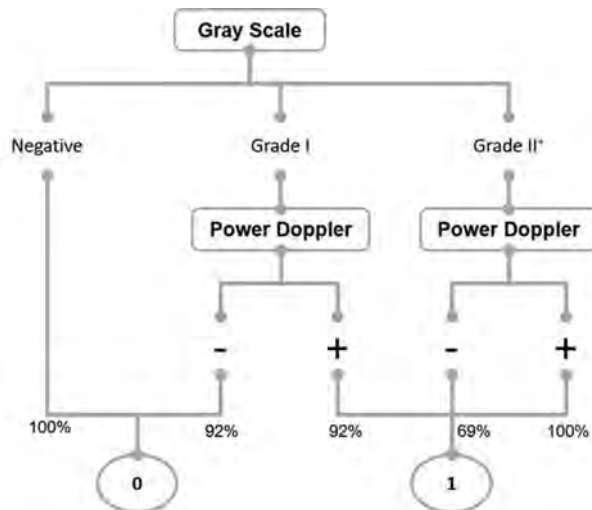

**Methods:** Mixed methods. Experts elicited items reflecting inflammation which were prioritised by Delphi. Patients with RA with various grades of activity underwent clinical [28 swollen and tender joints counts, patient and physician global assessment (PhGA), erythrocyte sedimentation rate, and C-reactive protein (CRP)] and US assessments [synovitis or tenosynovitis by grey-scale (GS) and Power Doppler (PD) of 42 structures], blinded to the clinical assessment. An index was created after supported selection of US structures and scoring method. Construct validity was tested by correlation with DAS28, SDAI, CDAI, and PhGA. Reliability was evaluated in a subgroup of patients with the intraclass correlation coefficient (ICC).

**Results:** US of joints and tendons, CRP, and swollen joints were the items that passed the prioritisation phase. Then, 281 patients were randomly divided into design (n=141) and validation analysis (n=140). The combination of US sites chosen detected the maximum proportion of GS and PD present. Were elected

wrist, 2–3 MCP, Knee, tibio-talar and 2–3 MTP joints, and the following tendons: carpal extensor and flexor tendons, tibial posterior and peroneal. For scoring structures, three methods were tested: semiquantitative (0–3 GS +0–3 PD), dichotomous (0/1 GS +0/1 PD), and qualitative (0/1 based on algorithm [image 1]). All showed strong correlation with activity measures ( $\rho \geq 0.60$ ), and reliability (ICC 0.89 to 0.93). The most feasible index, qualitative, was chosen.

The proposed formula for USAS was: **USAS=N° swollen joints+US score+CRP**

Abstract AB1195 – Figure 1

**Conclusions:** USAS is a valid and reliable measure of inflammation in RA equal to the sum of 28 swollen joint count, a simplified (0/1) US assessment of 11 structures and CRP.

**Disclosure of Interest:** None declared

#### AB1196 ROLE OF CAPILLAROSCOPY IN THE STUDY OF THE RAYNAUD PHENOMENON IN CONDITIONS OF CLINICAL PRACTICE

J. Uceda<sup>1</sup>, R. Hernandez<sup>1</sup>, C. Almeida<sup>2</sup>, J.L. Marenco<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Estadistic, University Valme Hospital, Seville, Spain

**Background:** The Raynaud phenomenon (RP) is very common throughout the world, especially in cold climates, affecting approximately 3%–5% of the population. Most RPs are primary. The risk of the onset of autoimmune disease associated with RP (ADRP) is between 6% and 12%, and the diagnosis is usually made within 2 years of its onset. Capillaroscopy is a simple, innocuous and inexpensive technique that is very useful in the study of RP

**Objectives:** The primary goal was to evaluate the capillaroscopic findings in patients with RF as the only symptom and establish their relationship between the subsequent development of ADRF.

**Methods:** We conducted an observational, descriptive, cross-sectional study of a random sample of 98 patients with RP as the main manifestation, selected from within the capillaroscopy consult of our Unit. The capillaroscope used was a stereomicroscope (Stereoscope), with a triocular head, zoom range from 1x to 4x magnification, with cold light illuminator and high resolution ocular camcorder. Periungual capillaroscopy was performed in 3rd, 4th and 5th finger of the right and left hands in each patient and always by the same rheumatologist. We described the sociodemographic variables of patients, and analytical results of the antinuclear antibodies (ANA). After an initial statistical exploration of the data, the same are described. The quantitative variables are expressed as means and standard deviations and if the distributions are asymmetric with medians and quartiles. The qualitative variables with percentages. To assess the validity of capillaroscopy as a diagnostic test, we determined the sensitivity, specificity, and positive and negative predictive value of the test.

**Results:** 73.5% were women, with an average age of 45.7 years. The median time of evolution of the RP until the capillaroscopy was 2.5 years. 76% of the patients were ANA negative.

The evaluation of the predictive capacity of capillaroscopy for the development of EARP yields the following results:

Abstract AB1196 – Table 1

Sensitivity	83,3% <sup>(62.6–95.2)</sup>
Specificity	78% <sup>(66.8–86.9)</sup>
Predictive positive value	34,1% <sup>(24.5–45.3)</sup>
Predictive negative value	97,1% <sup>(93.3–98.8)</sup>

When analysing the relationship between the presence of ANA and the association with ADRF we found that it was independent ( $p=0.002$ ) of the result of capillaroscopy, being the risk of developing the disease in a patient with positive ANA 8.5 times higher than in an ANA negative patient.

**Conclusions:** Capillaroscopy in patients with RP has a high predictive negative value, which allows us to estimated, with high reliability, the association of this phenomenon with autoimmune disease in patients with normal capillaroscopic patterns. Given the results of our study, capillaroscopy should be protocol in the RP study

#### AB1197 MULTIPARAMETRIC ANALYSIS OF CONNECTIVE TISSUE DISEASE SPECIFIC AUTOANTIBODIES USING A SPOT IMMUNOASSAY (SERASPOF<sup>®</sup>ANA)

K. Conrad<sup>1</sup>, M. Rejzek<sup>1</sup>, M. Aringer<sup>2</sup>, S. Rudolph<sup>3</sup>, L. Unger<sup>4</sup>, K. Lütke<sup>5</sup>, A. Gräßler<sup>6</sup>, N. Röber<sup>1</sup>. <sup>1</sup>Medical Faculty of the TU Dresden, Institute of Immunology; <sup>2</sup>University Hospital Carl Gustav Carus Dresden, Department of Medicine III, Dresden; <sup>3</sup>Immune Center Chemnitz, Chemnitz; <sup>4</sup>Municipal Hospital Dresden-Friedrichstadt, Department of Medicine I; <sup>5</sup>Medical Practice of Internal Medicine and Rheumatology, Dresden; <sup>6</sup>Medical Practice Internal Medicine and Rheumatology, Pirna, Germany

**Background:** Because autoantibody profiling compared to single autoantibody determination is more relevant for diagnostics, differential diagnostics and even prognostics of the different kinds of connective tissue diseases (CTD), cost and time saving multiplex assays are more and more used in routine practice.<sup>1</sup>

**Objectives:** Evaluation of the diagnostic relevance of the *SeraSpot<sup>®</sup>* ANA assay (Seramun Diagnostica GmbH, Heidesee, Germany), a novel spot immunoassay for multiplex analysis of the main connective tissue disease (CTD) specific autoantibodies (AABs) against dsDNA, histone, nucleosome, Scl-70, U1-RNP, Sm, PCNA, RibP, Ro52/TRIM21, Ro60, La/SS-B, CENP-B, Jo-1, PM/Scl-100, and Ku) based on autoantigens immobilised in microtiter plates.

**Methods:** AAB profiles using the *SeraSpot<sup>®</sup>* ANA assay were determined in sera of 381 patients with CTD and 202 apparently healthy individuals (AHI). The CTD patients comprises 105 SLE, 117 systemic sclerosis (SSc), 32 Sjögren's syndrome (SjS), 58 idiopathic inflammatory myopathies (IIM), 5 mixed connective tissue disease (MCTD), and 64 undifferentiated connective tissue disease patients (UCTD).

**Results:** At least one CTD associated AAB was positive in 88.2% of the tested CTD patients. A high diagnostic specificity for CTD above 95% compared to AHI were found for antibodies to dsDNA, RibP, Sm, Ro60, Ro52, CENP-B, Scl70, PM/Scl-100, Ku and Jo-1. Excluding low-titre reactivity, the specificity of U1-RNP, nucleosome, histone and La/SS-B antibodies was also very high (96.5%–98%) regarding CTD diagnosis. The highest specificities vs. AHI were found for anti-Sm, -Ro60, -RibP and -Jo1 antibodies (99.5%), followed by anti-CENP-B (99%), -dsDNA (98.5%), -Ku (98.5%) and -Ro52 antibodies (98%). Regarding SLE, 104 (99%) were positive for SLE-associated AABs. Anti-dsDNA antibodies were most frequently found (88.6%). The highest specificities (98.5%–99.5%) for SLE compared to AHI were found for anti-dsDNA, -RibP, -Sm, and -Ro60 antibodies. SjS relevant AABs against Ro60, Ro52 and La/SS-B were seen in 81.3%, 84.4% and 46.9% of the SjS patients, respectively. The diagnostic specificity of Ro60 antibodies for SLE and SjS compared to other SARD (excluding UCTD) is 96.8% and 99.5%–100% compared to AHI. SSc associated AAB against Scl-70, CENP-B, PM/Scl-100 and -U1-RNP were found in 53.0%, 20.5%, 8.6%, and 13.7% of the included SSc cases, respectively, with diagnostic specificities between 96% and 99%. AABs against Jo-1, PM/Scl-100, U1-RNP, Ro52 and Ku were positive with high specificity (98.4%–99.5%) in 29.3%, 10.3%, 19% (100% of MCTD), 27.6% and 10.3% of IIM patients, respectively.

**Conclusions:** In combination with the HEP-2 cell assay, the *SeraSpot*<sup>®</sup> ANA assay can be used as a novel cost-effective multiplex assay for the serological confirmation of CTDs.

#### THE DIFFERENCES OF THE DISTRIBUTION OF FEEDING VESSELS AND BONE SURFACE IRREGULARITY BETWEEN YOUNG AND ELDERLY ADULTS IN WRIST JOINTS OF HEALTHY VOLUNTEERS BY MUSCULOSKELETAL ULTRASOUND (MSKUS)

K. Misaki<sup>1</sup>, K. Ikeda<sup>2</sup>, K. Inoue<sup>1</sup>, Y. Imaizumi<sup>3</sup>. <sup>1</sup>Department of Rheumatology, KITA-HARIMA MEDICAL CENTER, Ono; <sup>2</sup>Department of Allergy and Clinical Immunology, Chiba University, Chiba; <sup>3</sup>Department of Orthopaedic surgery, Kita-Harima Medical Center, ono, Japan

**Background:** Synovial vascularity as measured by power Doppler (PD) of MSKUS is correlated to rheumatoid arthritis disease activity, and PD signal reveals the prevalence of subclinical synovitis overlooked on physical examination. It is often difficult to distinguish bone erosion from normal concave surface of the bone, and it is necessary for us to be familiar with these normal structures well in evaluating disease activity by using MSKUS. Here we examine the age-specific differences of normal feeding vessels and bone surface irregularity between in wrist joints.

**Objectives:** To elucidate the differences of distribution of feeding vessels and bone surface irregularity in wrist joints both young and older adults among healthy volunteers.

**Methods:** The dorsal side of wrist joints was scanned with 2D-probe in healthy volunteers (young <50 y.o., elder ≥50 y.o). The distribution of feeding vessels in the capsule and the extensor(E.) tendon sheath(TS), and the evaluation of bone surface irregularity at lunate(Lu) were examined. The comparative review between young and elderly adults was validated.

**Results:** The distribution of feeding vessels in younger healthy volunteers (n=30: mean age 32.2±8.0 y.o.) vs elderly healthy volunteers (n=21: mean age 66.0 ±7.2 y.o.) were near-Trapezoid (Rt100.0% vs 100.0%, Lt100.0% vs 100.0%: p=1.00), E.digitum TS (Rt86.7% vs 81.0%:p=0.59, Lt66.7% vs 76.2%:p=0.47), E. digiti minimi TS (Rt30.0% vs 52.4%:p=0.11, Lt30.0% vs 66.7%:p=0.0089), near-Capitate (Rt23.3% vs 42.9%:p=0.14, Lt30.0% vs 47.6%:p=0.21), near-TFCC (Rt16.7% vs 19.0%:p=0.83, Lt30.0% vs 38.1%:p=0.56), distal radial side of radio-carpal joint (Rt20.0% vs 42.9%:p=0.08, Lt23.3% vs 28.6%:p=0.68), distal end of Ulna (Rt10.0% vs 42.9%:p=0.006, Lt16.7% vs 28.6%:p=0.31), feeding vessels from vascular channels were depicted at Lu (Rt53.3% vs 52.4%:p=0.95, Lt46.7 vs 66.7%:p=0.16), Radius (Rt20.0% vs 33.3%:p=0.29, Lt16.7% vs 23.8%:p=0.54), Triquetrum (Rt10.0% vs 42.9%:p=0.0057, Lt16.7% vs 33.3%:p=0.17) and Capitate (Rt6.7% vs 33.3%:p=0.013, Lt10% vs 33.3%:p=0.0395). The bone surface irregularity as a transverse diameter (Mean ±S.D.) at Lu of dominant hand in both groups were 1.26±0.33 vs 1.14±0.2 mm: p=0.21, respectively.

**Conclusions:** The frequency of feeding vessel's distributions in elderly adults were significantly higher at E.digiti minimi TS, distal end of Ulna and Triquetrum/Capitate vascular channels compared to those of younger adults. It is suggested that these differences are crucial to evaluate the age-specific synovitis with ultrasound.

#### DYNAMIC ULTRASOUND FOR MULTILEVEL EVALUATION OF MOTION AND POSTURE IN LOWER EXTREMITY AND SPINE

R.V. Bubnov<sup>1,2</sup>, L. Kalika<sup>3</sup>, L. Babenko<sup>2</sup>. <sup>1</sup>Diagnostic and interventional ultrasound, Clinical hospital "Pheophania"; <sup>2</sup>Interferon, Zabolotny Institute of Microbiology and Virology, National Academy of Sciences of Ukraine, Kyiv, Ukraine; <sup>3</sup>https://nydnrehab.com/, New York Dynamic Neuromuscular Rehabilitation and Physical Therapy, New York, USA

**Background:** Evaluation of motion and posture is a crucial task in management patient with rheumatic diseases and pain. Integrative protocol including multilevel assessment of intrinsic/extrinsic muscles postural imbalance for disease staging and treatment efficacy control has not been finally developed.

**Objectives:** The aim was to study feasibility of multilevel motion and posture analysis using dynamic M-mode ultrasound in foot, ankle, gluteus region, pelvis and spine.

**Methods:** We included 21 patients (13 females, aged 18–52 y.o.) with clinically diagnosed reduced motility in spine, pelvis and lower extremity levels due to detected back leg, pain, muscle spasticity, joints effusion, tissue swelling, etc. Another healthy 20 patients (aged 18–50 y.o.) without movement restriction and pain were controls. We conducted precise physical tests, extensive neuromuscular ultrasound (US) using M-mode to evaluate muscle thickness, CSA and motion in intervertebral spaces, pelvis, intrinsic/extrinsic muscles in foot and ankle gluteus region and pelvis, central and peripheral trigger points identification.<sup>1</sup>

**Results:** We obtained sufficient quality panoramic scans on leg using convex 5–8 MHz probe in 2 approaches to evaluate structure and motion of extrinsic/intrinsic portion of muscles during one session. Thickness measurements of peroneal portion, plantar intrinsic foot muscles on the plantar surface in two transverse positions and one longitudinal using linear probe; contractility using M-mode tested in walking were most representative data. We evaluated different patterns of decreasing motility, contractility (muscle contracted/rested thickness) on M-mode during functional tests and walking in all levels in group 1 (p<0.05). We observed the preliminary correlation between the changes (muscle hypertrophy) in contralateral extrinsics and intrinsic muscles at the same levels, due to biomechanical instability; local areas of spasticity (trigger points) were successfully detected on distal/proximal leg, pelvis and spine. Documented pictures were collected and accessible for telemedical consulting.

**Conclusions:** Extensive evaluation of motion posture in foot, ankle, and gluteus region, pelvis and spine is feasible and informative protocol for patient with pain and rheumatic diseases. Further studies needed to evaluate reliability studies, comparative RCT using US, CAREN, static and dynamic balance tests, pressure analysis, and extensive molecular profiling, to study crosslinks with immune phenotype of the patients; and to develop educational programs.

#### FROM THE CALCANEUS QUANTITATIVE ULTRASONOGRAPHY (QUS) TO THE FEMORAL RADIOFREQUENCY ECHOGRAPHIC MULTI SPECTROMETRY (REMS): NON-INVASIVE APPROACHES TO DIAGNOSIS OSTEOPOROSIS PROPOSED BY F.I.R. M.O. FOUNDATION

L. Cavallari<sup>1,2,\*</sup>, L. Cianferotti<sup>3§</sup>, F. Giusti<sup>§§</sup>, G. Gronchi<sup>3</sup>, P. Pisanì<sup>2</sup>, M.L. Brandi<sup>3</sup>. <sup>1</sup>Department of Surgery and Translational Medicine, University of Florence, Metabolic Bone Diseases Unit, University Hospital of Florence, Firenze; <sup>2</sup>Institute of Clinical Physiology, National Research Council, Lecce; <sup>3</sup>Department of Surgery and Translational Medicine, University of Florence, Metabolic Bone Diseases Unit, University Hospital of Florence, Florence, Italy, Firenze, Italy

**Background:** The high prevalence of osteoporosis and its insidious development, often silent until a fracture occurs, make it necessary to resort to prevention by promoting early diagnosis and educational programmes for a healthy life style.

**Objectives:** To develop screening campaigns of the Italian population for the osteoporosis prevention thanks to the collaboration with F.I.R.M.O. Foundation (Fondazione Italiana Ricerca Malattie Ossee).<sup>1</sup>

**Methods:** An experienced medical staff administered to the afferent people the IOF "One minute risk test" questionnaire, (to detect the presence of clinical risk factors), together with a densitometric examination performed by a portable device aboard a mobile unit, in several Italian cities between 2011 and 2017.

The technique employed to assess bone status in 2011 and 2012 was calcaneus Quantitative Ultrasonography (QUS), applied to a peripheral skeletal site, which has been shown as effective in identifying osteoporotic men or post-menopausal women.<sup>2</sup> Although representing a low-cost and accessible approach, the heel measurement of speed of ultrasound (SOS) can be influenced by foot positioning, oedema and temperature.<sup>3</sup>

Since 2017, a novel non-invasive densitometric technique is available, which allows to evaluate the axial fragile bone sites (spine and femur). It is Radiofrequency Echographic Multi Spectrometry (REMS), that a multicentric clinical study has been shown to provide parameters highly correlated with DXA ones.

**Results:** As measured by calcaneus QUS in 7305 subjects, the prevalence rate of osteoporosis was approximately 18.7%, while the 42.6% had a T-score compatible with osteopenia. People with a QUS T-score <−2.5 was recommended to early undergo a DXA at lumbar and femoral sites and a specialist visit.

On the other hand, REMS examinations at femoral neck, performed on 397 people, revealed that osteoporosis resulted in 25% of the sample and osteopenia in 54%. Also in this case, people with a T-score  $< -2.5$  was suggested to perform a DXA, considering that the accuracy and operator-independent automatic analysis performed by REMS, make more reliable the obtained data.

**Conclusions:** Nowadays, with REMS introduction, F.I.R.M.O. foundation and the health system could avail themselves of a new non-invasive, rapid, easy-to-use and automatized technology for the prevention of osteoporosis.

#### ULTRASONOGRAPHY POWER DOPPLER(PDUS) IN EARLY ARTHRITIS. DOES 44 JOINT COUNT PREDICTE MORE ACCURETLY THE DEVELOPMENT OF RA THAN OTHER ULTRASOUND COUNTS?

L. Mayordomo<sup>1</sup>, C. Almeida<sup>2</sup>, M.C. Jurado<sup>3</sup>, M.L. Velloso<sup>1</sup>, P. González-Moreno<sup>4</sup>, J.L. Marenco<sup>1</sup>. <sup>1</sup>Rheumatology Department; <sup>2</sup>Research and Statistics Unit; <sup>3</sup>Radiology Department, Hospital Universitario Valme; <sup>4</sup>Rheumatology department, HVM, Sevilla, Spain

**Background:** Early rheumatoid arthritis is a diagnostic challenge for the rheumatologist since early treatment may be crucial for reaching remission and low rate of structural damage. Previous correlation studies between different ultrasonographic (US) scores suggested that few joint examination may be equivalent to more comprehensive ones about the inflammatory activity in established rheumatoid arthritis.

**Objectives:** To determine if the presence of basal power doppler US signal in patients with early arthritis by three different US joint counts (12, 28 or 44 joint count) may be equally useful in order to establish the risk of final diagnosis of rheumatoid arthritis (RA) according ACR criteria 1987 at a year of follow up.

**Methods:** We studied the presence of US Power Doppler (PD) signal on 28 joints (shoulders, elbows, wrists, MCPs, PIPs, knees), 44 joints (28 joints and in addition hips, ankles, tarsus and MTP joints) and in 12 joints (elbows, MCFs 2 and 3, wrists, knees and ankles), with a mid-range equipment GE L5 in 70 pacientes with suspected RA. The patients met at least one of the following inclusion criteria: a) Swelling in 2 or more joints b) pain in MCPs, MTPs and/or the wrists c) morning stiffness of more than 30 min with  $< 12$  months of duration of the symptoms and no previous steroid nor DMARDs treatment. At one year of follow-up was established whether patients met ACR 1987 classification criteria for RA or not. PD signal was scored 0–3, and PD score sum index (IPD) was the total sum of scores in each joint for 44, 28 and 12 joint counts. Correlations between 44, 28 and 12 joint US IPDs were studied as well. Statistical study: Chi-square, Fisher exact test, p univariate, Odds Ratio, Spearman correlation.

**Results:** The presence of basal power doppler signal in  $\geq 1$  joint of 44 (PD44) is associated to RA diagnosis at 12 months by ACR 1987 criteria,  $p=0.003$ ,  $OR=5.43^{1.71-17.24}$  but the presence of  $\geq 1$  joint with power doppler signal of 28 joints (PD28) did not ( $p=0.051$ ). The presence  $\geq 1$  joint with basal power doppler signal of 12 joints (PD12) was associated to RA diagnosis at 12 months with  $OR\ 3.11^{1-12-8.6}$   $p=0.026$  as well, so may predict development of RA. However, we missed 6/44 (14%) of patients that were not diagnosed of RA when we evaluate only 12 joints. We found high correlations between IPD44 and IPD28 (0.845), IPD44 and IPD12 (0.807) and between IPD28 and IPD12 sum scores (0.913).

BASAL VARIABLES n=70		RA YES	p (univariate)	OR	95% CI
PD 44	YES	38/52 (73,1%)	0,003	5,43	(1,71-17,24)
	NO	6/18 (33,3%)			
PD 28	YES	35/50 (70%)	0,051	-	-
	NO	9/20 (45%)			
PD 12	YES	32/44 (93,9%)	0,026	3,11	(1,12-8,60)
	NO	14/26 (53,7%)			

Abstract AB1201 – Figure 1

**Conclusions:** The presence of at least one joint with power doppler signal of 44 joints (PD44) on baseline visit may help to predict the RA diagnosis at 12 months of follow up according ACR 1987 criteria in patients with early RA, but PD28 did not. PD12 reduced joint count may help to predict RA as well but missed 14% of RA patients. Odds ratio rendered better information for different PD joint count about early identification of RA, whereas correlations were high between all different US joint scores. Further studies are required to decide the best US joint set for early identification of patients with early rheumatoid arthritis, but inclusion of ankle/foot joints may be important.

AB1202

#### IS FLUORESCENCE OPTICAL IMAGING ASSESSMENT ASSOCIATED WITH ULTRASONOGRAPHY SYNOVITIS IN THE WRIST AND HAND OF RHEUMATOID ARTHRITIS PATIENTS?

M.A. Danielsen, M. Østergaard, L. Terselv, D. Glinatsi. *Copenhagen Center for Arthritis Research, Center for Rheumatology and Spine Diseases, Rigshospitalet, Copenhagen, Denmark*

**Background:** Fluorescence optical imaging (FOI) has been used for assessment of inflammation (i.e. synovitis) in the hands and has in several cross sectional studies been compared with ultrasonography (US) and magnetic resonance imaging (MRI), using different, but not validated scoring systems.

**Objectives:** The primary objective was to examine the association between FOI and US for assessment of synovitis in the rheumatoid arthritis (RA) hands, in a longitudinal study, using a new validated and clinically feasible FOI scoring system.

**Methods:** 46 RA patients, eligible for induction or intensification of conventional synthetic or biological disease modifying anti-rheumatic drugs and with  $\geq 1$  clinically swollen joint in the hand, were included. FOI image-sets of both wrists and hands were obtained at baseline and 6 months' follow-up using a Xiralite system unit (nanoPET Pharma GmbH, Berlin, Germany). The patients received a bolus of i.v. indocyanine green (ICG) pulsion 10 s after starting the examination, which obtained 1 image/second for 6 min.

All FOI images were scored by two readers for synovitis at the wrist, 1st-5th metacarpophalangeal, 1st interphalangeal and 2nd-4th proximal interphalangeal joint levels in both hands, using the novel semiquantitative scoring system. Each joint was scored 0–3 (range 0–66) for synovitis. The readers were blinded to patient data, but not chronology and had previously showed a high intra- and inter-reader agreement (intra-class correlation coefficient (ICC):0.70–0.92).

For ultrasound assessment, a GE Logiq E9 US unit with a high frequency linear 6–15 ML probe and with Doppler settings according to published recommendations was used. Synovitis was scored from 0–3 for grey scale (GS) and Doppler (DP) using the OMERACT US synovitis scoring system by two trained assessors who had previously demonstrated high intra- and inter-reader agreement ( $wKappa:0.88-0.95$ ).

DAS28-CRP and swollen joint count (SJC) in the hand were assessed at both time points.

Descriptive statistics and the Wilcoxon signed-rank test were used to assess change in score over time. Agreement for status and change scores were assessed using single measure ICCs and spearman's correlation (SP). Responsiveness was assessed using standardised response mean (SRM).

**Results:** Median (IQR) total score at baseline was FOI 11.0 (6;19), GS 14.5 (8;22.), DP 8 (3;14), DAS28 5 (4.4;5.4) and SJC 6 (3;8) and improved with  $-7.8$  (-13;-3.5)  $-9$  (-15;-3.5),  $-5.5$  (-11;-0.5),  $-2$  (-2.9;- 0.8) and  $-4$  (-7;-2) at 6 months' follow up, respectively ( $p<0.01$ ). Figure 1 presents the change score and a trend line based on 4 patients' average score.

ICC and SP between FOI and US (GS and DP) total scores were low for both readers at baseline (range 0.3–0.4) ( $p<0.05$ ), and low to moderate (range 0.31–0.54) ( $p<0.01$ ) for change scores. The mean SRM for total change scores between baseline and 6 months' follow-up were good for all parameters (FOI:0.9,

GS:1.0, DP:0.8, DAS28:0.9 and SJC:1.0). The average sum time required to score one patient was 140 s.

**Abstract AB1202 – Figure 1.** Scatterplot for FOI and US changes sum score and 4 patient averages trendlines

**Conclusions:** This study shows a significant correlation and corresponding trendlines between FOI and US for change over time, and good responsiveness using the new FOI scoring system. FOI may therefore be used as an alternative to known imaging modalities for monitoring RA patients in clinical trials, and potentially in the daily clinical practice.

#### AB1203 USE OF MAGNETIC RESONANCE IMAGING OF THE PELVIS TO DESCRIBE INFLAMMATORY CHANGES AT DIFFERENT ANATOMICAL SITES IN THE PELVIS WHICH ARE POTENTIALLY SPECIFIC FINDINGS IN PATIENTS WITH POLYMYALGIA RHEUMATICA

M. Fruth<sup>1</sup>, M. Franklin<sup>2</sup>, B. Buehring<sup>2</sup>, X. Baraliakos<sup>2</sup>, J. Braun<sup>2</sup>. <sup>1</sup>Radiologie Herne; <sup>2</sup>Rheumazentrum Ruhrgebiet, Herne, Germany

**Background:** Pelvic girdle pain is a common clinical symptom of patients with polymyalgia rheumatica (PMR). It also occurs in patients with rheumatoid arthritis (RA). The origin of this characteristic pain is not really clear, even though some imaging findings have been reported. However, this has neither changed pathophysiological thinking nor clinical practice related to diagnosis.

**Objectives:** To describe pelvic structures in PMR patients in detail which show signs of inflammation by magnetic resonance imaging (MRI) in order to find a disease specific pattern.

**Methods:** In a retrospective study we used MRIs of patients who had presented with clinical symptoms suggestive of PMR in our centre between 2015 and 2017. Only patients with complete MRI examinations, including contrast enhanced scans in coronal and transversal planes were included to be carefully examined by an experienced musculoskeletal radiologist (MF). After having first described all findings in much detail we developed a preliminary semiquantitative scoring system that assesses a total of 12 sites which appeared to be frequently involved. A total of 40 patients with pelvic girdle pain and complete data were identified from the hospital records. The median (25th/75th percentiles) age of the patients was 67 (55/73) years, the median symptom duration was 13 (6/22) weeks, 55% were female, the median C-reactive protein measured close to the day of the MRI examination was 1.9 (0.7/4) mg/dl, and the median erythrocyte sedimentation rate was 30 (17/43) after the 1st hour. Only 3 patients were rheumatoid factor positive, and 2 patients had anti-CCP antibodies. Ten patients had a diagnosis of RA (25%) in addition to the leading PMR like symptom.

**Results:** The MRI signal of interest for PMR is a post-gadolinium signal in T1 weighted pelvic images. The most frequently involved anatomic sites were: the hamstring tendon and the M.gluteus medius and minimus tendon near the greater trochanter in all cases, which were found to be bilaterally involved as was the proximal M.rectus femoris in all cases, and the insertion of the adductor muscles, especially the M.adductor longus at the inferomedial pubic symphysis in 90% of cases. Other sites were also, but less frequently, involved. We think that the involvement of 4 sites including either the M.rectus femoris or the M.adductor

longus is rather specific for PMR, see exemplary images below. There was no major difference between patients with and without RA.

**Abstract AB1203 – Figure 1**

**Conclusions:** This study suggests that there may be a MRI pattern specific for PMR. The target structure of the characteristically inflamed anatomic site seems to be the paratenon which implies that the pattern observed in PMR differs from the enthesitis seen in patients with spondyloarthritis. Prospective randomised trials are needed to further test and prove the clinical usefulness of this approach.

#### AB1204 QUANTITATIVE MRI AND DYNAMOMETERS CAN DISTINGUISH MYOSITIS FROM HEALTHY CONTROL MUSCLE

M. Farrow<sup>1,2</sup>, J. Biglands<sup>2</sup>, S. Tanner<sup>2</sup>, M. Buch<sup>1,2</sup>, P. Emery<sup>1,2</sup>, A. Grainger<sup>2</sup>, A. L. Tan<sup>1,2</sup>. <sup>1</sup>Leeds Institute of Rheumatic and Musculoskeletal Medicine, University of Leeds; <sup>2</sup>NIHR Leeds Biomedical Research Centre, Chapel Allerton Hospital, Leeds, UK

**Background:** Myositis is an autoimmune disease which can decrease quality of life and increase mortality. Clinical presentation includes muscle weakness, changes in muscle microstructure, myosteatosis, raised muscle enzymes and myalgia. Diagnosis is reliant on subjective clinical examinations, blood tests and invasive muscle biopsies. Quantitative MRI techniques such as diffusion tensor imaging (DTI) and fat fraction (FF) measurements offer non-invasive measurements, which could improve the understanding of muscle pathology and potentially inform diagnosis. DTI measures water diffusion within tissues which is sensitive to changes in muscle microstructure<sup>(1)</sup>. FF provides a quantitative measure of myosteatosis in muscles<sup>(2)</sup>. The use of these techniques could provide new imaging biomarkers in the diagnosis and management of myositis.

**Objectives:** To evaluate whether fat fraction, mean diffusivity and dynamometer measurements are sensitive enough to detect muscle differences in myositis patients compared to healthy controls.

**Methods:** 10 active myositis patients (6 female, mean age 55±18) diagnosed according to the Bohan and Peter myositis criteria (mean CK 2,015±10,787) and 16 healthy controls (10 female, mean age 44±17), were imaged using STEAM-EPI diffusion and 2-point Dixon to obtain FF measurements. Myositis patients included 5 polymyositis, 3 dermatomyositis and 2 inclusion body myositis. Mean measurements of FF and mean diffusivity (MD) were obtained from regions drawn manually within the individual muscles of the quadriceps and hamstrings (image 1). No distinction was made between affected and unaffected muscles. In addition to MRI, all participants had knee extension and flexion power and torque measured on an isokinetic dynamometer and handgrip measurements on an isometric dynamometer. Differences were assessed using independent T-tests.

**Results:** FF and diffusion measurements were higher in myositis patients compared to healthy controls, whereas muscle power and torque were reduced (table 1). These results were consistent across both quadriceps and hamstrings.

**Abstract AB1204 – Table 1**

		Mean		Mean difference (95% CI)		Significance (p value)	
		Hams	Quads	Hams	Quads	Hams	Quads
FF (%)	Myositis	15.09	14.33	10.08	11.2	<0.001	<0.001
		(-9.21, 39.39)	(-16.95, 45.6)	(5.12- 15.05)	(5.79- 16.61)		
	Healthy	5.0	3.13				
		(-4.89, 14.82)	(-0.28, 6.54)				

		Mean	Mean difference (95% CI)	Significance (p value)			
MD (x10-3mm <sup>2</sup> /s-1)	Myositis	1.31 (1.15-1.47)	1.26 (1.05-1.47)	0.087 (0.00-0.17)	0.02 (-0.05, 0.09)	0.046	0.02
	Healthy	1.22 (0.69-1.75)	1.23 (0.75-1.72)				
Leg power (Watts)	Myositis	34.92 (-14.42, 84.25)	58.2 (-29.39, 145.77)	-25.05 (-43.71, 6.39)	-47.53 (-92.14, 12.92)	0.011	0.010
	Healthy	59.97 (18.88-101.07)	105.72 (18.48-192.96)				
Leg torque (N m)	Myositis	19.66 (-16.29, 55.62)	30.45 (-27.47, 88.36)	-18.01 (-31.7, 4.33)	-33.36 (-56.12, 10.57)	0.013	0.006
	Healthy	37.68 (6.8-68.55)	63.80 (6.98-120.63)				
Handgrip (kg)	Myositis	15.6 (-0.05, 31.25)		-18.74		<0.001	
	Healthy	34.34 (14.94-53.73)		(-25.4, -12.1)			

Abstract AB1205 – Figure 1

a) Sagittal (localiser) image of the thigh used in the planning of the Vibe-Dixon imaging volume (shown by the box). b) Regions of interest were drawn corresponding to the individual muscles of the thigh. c) Stimulated echo acquisition mode-Echo planar imaging (STEAM-EPI) diffusion image

**Conclusions:** MRI based FF and DTI measurements and dynamometer measurements can detect muscle differences between myositis and healthy control groups. These differences are consistent with increased myosteatosis, increased oedema and the effects of muscle fibre plasticity. These measures show potential as novel imaging biomarkers in the diagnosis and management of myositis.

#### AB1205 PRECISION OF SERUM AND PLASMA TESTING IN ANTI-CARDIOLIPIN AND ANTI-B2 GLYCOPROTEIN-1 ANTIBODIES

M.M. Pham<sup>1</sup>, G. Orsolini<sup>2</sup>, C.S. Crowson<sup>3</sup>, M.R. Snyder<sup>4</sup>, R.K. Pruthi<sup>5,6</sup>, K. G. Moder<sup>1</sup>. <sup>1</sup>Division of Rheumatology, Mayo Clinic, Rochester, USA; <sup>2</sup>Department of Medicine, Rheumatology Unit, University of Verona, Verona, Italy; <sup>3</sup>Department of Health Sciences Research, Mayo Clinic College of Medicine and Science; <sup>4</sup>Department of Laboratory Medicine and Pathology; <sup>5</sup>Division of Hematology; <sup>6</sup>Special Coagulation Laboratory, Mayo Clinic, Rochester, USA

**Background:** Anti-cardiolipin (aCL) and anti-β2 glycoprotein-1 (β2GP1) antibody ELISA testing may be performed on serum, plasma, or both in accordance to the manufacturers' suggested protocols. There exists some variability in manufacturers' preference for serum or plasma. Various societal guidelines have published a preference for serum over plasma; however, there is scarcity of data assessing reproducibility between serum and plasma in aCL and β2GP1 testing.

**Objectives:** To determine reproducibility of aCL and β2GP1 testing between serum and plasma samples obtained in a routine clinical setting.

**Methods:** Patients with clinical serum draws for IgG/IgM aCL and β2GP1 antibodies were identified, and same-day, citrated plasma samples were obtained for repeat ELISA testing (QUANTA Lite, INOVA Diagnostics, San Diego, CA). Quantitative levels were determined for each isotype and further stratified into Negative (<15.0 GPL/MPL or U/mL), Weakly Positive (15.0–39.9 GPL/MPL or U/mL), or Positive (≥40.0 GPL/MPL or U/mL) reference categories. Differences were

compared using paired t-tests. Agreement between the reference categories were compared by kappa coefficients.

**Results:** Fifty patients were identified for study with 50 and 40 samples eligible for repeat aCL and β2GP1 plasma testing, respectively. Mean age was 49±18 years. 70% were female, 86% were Caucasian, 22% with systemic lupus erythematosus and 22% with antiphospholipid syndrome. As shown in Table 1, quantitative levels tended to be slightly higher in serum than plasma. Although a statistically significant difference was found for most of the antibodies tested, the difference between serum and plasma values were generally small. There was good agreement in reference category between serum and plasma. Kappa coefficients ranged from 0.70 to 1.00.

Abstract AB1205 – Table 1. – Reproducibility of anti-Cardiolipin and anti-β2 Glycoprotein-1 Testing in Serum versus Plasma

	Quantitative Levels		Agreement to Reference Category	
	N Samples	Mean Difference (sd) <sup>1</sup>	p-value	κ Coefficient (95% CI)
IgG aCL	50	0.4 (14.8) GPL	0.84	0.81 (0.64–0.98)
IgM aCL	50	3.3 (8.5) MPL	0.008	0.73 (0.56–0.91)
IgG	40	1.4 (4.2) U/mL	0.038	1.00 (1.00–1.00)
β2GP1				
IgM	40	4.6 (8.9) U/mL	0.002	0.74 (0.54–0.94)
β2GP1				

1: Serum-Plasma. **Abbreviations:** aCL=anti cardiolipin, β2GP1=anti-β2 glycoprotein 1, sd=standard deviation

**Conclusions:** There appears good reproducibility of IgG/IgM aCL and β2GP1 antibody ELISA results between serum and plasma.

#### AB1206 DYNAMIC CONTRAST ENHANCED (DCE)-MRI IN RELATION TO INFLAMMATORY MARKERS IN SERUM AND JOINT FLUID: INITIAL DATA AND VALIDATION IN FOUR MOST COMMON KNEE ARTHRITIC DISEASES

M. Boesen<sup>1</sup>, O. Kubassova<sup>2</sup>, A. Taylor<sup>3</sup>, R. Riis<sup>1</sup>, L. Hornum<sup>4</sup>, H. Bliddal<sup>1</sup>, C. Ballegaard<sup>1</sup>, E.M. Bartels<sup>1</sup>. <sup>1</sup>The Parker Institute and Department of Radiology, Copenhagen University Hospital, Bispebjerg and Frederiksberg, Copenhagen, Denmark; <sup>2</sup>IAG, Philadelphia, USA; <sup>3</sup>IAG, London, UK; <sup>4</sup>Novo Nordisk A/S, Copenhagen, Denmark

**Background:** Biomarker science has advanced to aid in distinguishing between different forms of arthritis: inflammatory arthritides such as rheumatoid arthritis (RA) and psoriatic arthritis (PsA) and osteoarthritis (OA). Biomarkers are also used to assess disease activity. Diagnostic serum biomarkers such as rheumatoid factor (RF) and cyclic-citrullinated peptide (CCP) and assays of disease activity such as C-reactive protein (CRP), and multi-biomarker assays have utility but lack complete sensitivity and specificity. Increasingly quantitative imaging biomarkers may fill an important gap in disease identification and assessment.

**Objectives:** 1) To investigate the association between imaging measures of inflammation in the synovium of the knee joint and systemic levels of CRP in patients with RA, PsA and OA. 2) Investigate how imaging and clinical markers correlate to IL-6 levels from joint fluid in different patient cohorts.

**Methods:** 38 patients with a flare of pain in the knee were recruited. 12 were diagnosed with RF positive (+) RA, 6 with RF negative (-) RA, 6 PsA, and 14 OA, according to ACR/EULAR criteria. CRP in blood and IL-6 levels from joint fluid were determined. Patients underwent MRI, including Dynamic Contrast Enhanced (DCE)-MRI exam prior to an ultrasound-guided arthrocentesis.

MRI were scored for synovitis<sup>1</sup> and DCE-MRI were quantified using Dynamic Enhanced MRI Quantification (DEMRIQ) method, extracting the volume of enhancing voxels (Nvoxel), Initial Rate of Enhancement (IRE), Maximum Enhancement (ME). Inflammation was quantified as IRExNvoxels and

MExNvoxels.<sup>2</sup> Correlation between all clinical scores and all imaging parameters was done using Spearman rho, with significance levels of  $p < 0.05$ .

**Results:** The imaging markers of perfusion in the synovium of the knee (MExNvoxels and IRExNvoxels) were the only imaging measures, which showed a very high association with CRP in both RF +RA ( $r=0.92/0.97$ ,  $p < 0.05$ ) and PsA patients ( $0.93/0.99$ ,  $p < 0.05$ ), whereas all other imaging markers of inflammation showed no statistical association with blood levels of CRP in these diseases. We found no association between CRP and any imaging assessed scores of inflammation in either RF- RA or OA. In addition, only RF +RA patients showed a positive moderate to high association between MExNvoxels and IL-6 ( $r=0.66$ ,  $p < 0.05$ ) in the knee joint aspirate.

**Conclusions:** Quantitative imaging and blood biomarkers of inflammation, such as DCE-MRI parameters and CRP, appear to relate differently to each other in the four most common knee arthritic diseases, RF +RA, RF- RA, PsA and OA. DCE-MRI may have specific utility in differentiating these conditions and their disease activity.

AB1207

#### CORRELATION BETWEEN CLINICAL FINDINGS AND ULTRASONOGRAPHY IN EVALUATING PAINFUL RHEUMATOID SHOULDER

M. Abdel Zaher<sup>1</sup>, S. Tharwat<sup>1</sup>, A. Abdel khalek<sup>2</sup>, A. Abdel salam<sup>1</sup>. <sup>1</sup>Internal Medicine (Rheumatology, Immunology unit); <sup>2</sup>Radiodiagnosis department, Mansoura University Hospital, Mansoura, Egypt

**Background:** Shoulder pain is one of the most common complaints encountered in patients with rheumatoid arthritis (RA) <sup>1</sup>. In recent years ultrasonography (US) became an essential tool in diagnosing rheumatic diseases <sup>2</sup>. As clinical examination often does not allow an exact diagnosis, the agreement between both methods needs to be discussed to know how much the US add benefits to clinical examination.

**Objectives:** To determine the agreement between clinical examination and ultrasound in evaluating shoulder pain in rheumatoid.

**Methods:** A cross-sectional study including thirty RA patients, meeting the ACR/EULAR classification criteria for RA complaining of shoulder pain. They were recruited from rheumatology outpatient clinic in Mansoura University Hospitals. The sixty shoulders of the thirty patients were examined clinically by inspection, palpation and special tests, then fully examined by ultrasound including biceps tendon, subacromial bursa, rotator cuff tendons and acromioclavicular joint.

**Results:** Agreement among clinical examination and US was examined using Cohen's kappa. There was slight agreement between clinical examination and US regarding biceps tenosynovitis with  $k=0.206$ , fair agreement regarding acromioclavicular osteoarthritis with  $k=0.392$  and SASD bursitis with  $k=0.233$ . There was also moderate agreement between clinical examination and US examination of the shoulder in case of supraspinatus tendinopathy with  $k=0.464$ . Data were statistically significant ( $p < 0.001$ ). The overall agreement between clinical examination and ultrasound was poor.

**Conclusions:** Clinical examination of shoulder pain in rheumatoid arthritis is not accurate, insufficient. It should be confirmed with US examination during the initial evaluation of the shoulder to give reliable data and differentiate between different pathologies.

#### THE ROLE OF ULTRASOUND IN THE DISCOVERY OF INTERSTITIAL CHANGES IN THE LUNGS IN PATIENTS WITH SYSTEMIC CONNECTIVE TISSUE DISEASE

N.L. Roganovic, M. Grujic, G. Radunovic. *Institute of rheumatology, Belgrade, Serbia*

**Background:** Interstitial lung disease (ILD) is one of the most serious lung complications in patients with connective tissue disease (CTD), most commonly in patients with systemic sclerosis (SSc). High-resolution Computed Tomography is a gold standard for assessing ILD. Ultrasound examination of the lungs has been increasingly used lately to evaluate the existence of interstitial changes (B lines) in the lungs.

**Objectives:** To determine whether there is a significant difference in the presence of B lines on lung ultrasound examination in patients with SSc compared to patients with other CTD and healthy controls. Also, to investigate if there is a significant difference in the presence of B lines on lung ultrasound examination in patients with diffuse SSc compared to patients with limited SSc.

**Methods:** The study included 150 people of both sexes, aged between 19 and 81, who were examined at the Institute of Rheumatology in Belgrade. In the first group there were 55 patients with SSc (28 with diffuse and 27 with limited form of SSc), in the second group 45 patients with other CTD (16 with rheumatoid arthritis, 16 with systemic lupus erythematosus lupus and 13 with Sjogren syndrome) and in the third group 50 healthy subjects who were matched by gender and age with other two groups. At the ultrasound examination, the number of B lines was determined in all segments of the lungs. A positive ultrasound finding was considered to be one with 3 or more B-lines in at least two adjacent ultrasound scanning fields or one with more than 5 B-lines in any single field of ultrasound scanning.

**Results:** There was statistically significant difference in positive findings between the group of subjects with SSc and the group of healthy subjects (65,5% vs. 2%;  $p < 0.001$ ) and between the group of subjects with SSc and the group with other CTD (65,5% vs. 13,3%;  $p < 0.001$ ). Also, it was shown that there was statistically significant difference in positive findings between the group of subjects with diffuse SSc and the group with limited SSc (85,7% vs. 44,4%;  $p < 0.001$ ).

**Conclusions:** The conducted study confirmed that the presence of B lines on lung ultrasound examination is significantly more frequent in patients with SSc, especially in the patients with diffuse SSc.

#### USEFULNESS OF IMAGENOLGY TO DIFFERENTIAL DIAGNOSIS IN PATIENTS WITH PRESUMED SERONEGATIVE RHEUMATOID ARTHRITIS AND OTHER ARTHROPATHIES

P. Santos-Moreno<sup>1</sup>, O. Valencia<sup>2</sup>, E. Castillo<sup>1</sup>, S. Farietta<sup>1</sup>, L. Villareal<sup>1</sup>, M. Cabrera<sup>1</sup>. <sup>1</sup>Biomab Center of Rheumatoid Arthritis; <sup>2</sup>Universidad de los Andes, Bogotá, Colombia

**Background:** It is difficult to make a differential diagnosis between seronegative RA and other inflammatory arthropathies. Many patients could be wrong diagnosed followed of expensives treatments.

**Objectives:** To assess the usefulness of X-rays of hands and feet (X-rays), Ultrasound (US) and Magnetic Resonance Imaging (MRI) to discard false positive diagnosis of seronegative RA from real-world evidence.

**Methods:** An analysis from medical records of patients with presumptive seronegative RA diagnosis reportedly seronegative for both rheumatoid factor and anti-cyclic citrullinated peptide antibodies and clinical criteria of RA, in the period between July 2016 and ; June of 2017 who were assessed by imagenology (X-rays, US or MRI) in a centre of rheumatoid arthritis to confirm diagnosis or discard it. Laboratory, and imagenology data was retrospectively analysed and multivariate analysis was performed to determinate the usefulness of imagenology.

**Results:** 360 patients were received in the centre with presumptive diagnosis of RA in the period, mean of age was 58 years, 80,9% females and 19,1% males. X-

rays shows only 3,59% of patients with erosions, 38,6% were positive for Osteoarthritis (OA), and 58,6% of patients without erosions. From patients without erosions, 36% were confirmed for RA and 13,4% for OA by US; on the other hand 37% was confirmed for RA and 20% for OA by MRI. A total of 94 patients (26,1%) had a final diagnosis of seronegative RA, while (261) patients 72,5% were confirmed for Osteoarthritis,<sup>5</sup> 1,4% were classified in other arthropathies.

**Conclusions:** According with our findings the screening by imagenology is a useful tool with low cost to make a differential diagnosis of seronegative RA and other arthropathies. In order to improve outcomes through well-defined treatments and to save high cost treatments for pathologies with more precise diagnoses.

#### ANKLE BRACHIAL INDEX FOR THE DIAGNOSIS OF SUBCLINICAL ATHEROSCLEROSIS USING CAROTID INTIMA MEDIA THICKNESS IN SYSTEMIC LUPUS ERYTHEMATOSUS PATIENT IN SANGLAH HOSPITAL

P.K. Kurniari, G. Kambayana, E. Dharmawan. *Internal medicine, Udayana University/Sanglah General Hospital, Bali, Indonesia*

**Background:** Atherosclerosis and its complications in Systemic Lupus Erythematosus (SLE) patients occurred more rapidly than the general population. Early detection of atherosclerosis is currently a challenge for clinicians. Angiography as a gold standard diagnosis of atherosclerosis is invasive, has a limitation. The surrogate marker carotid intima media thickness (CIMT) examination with B-mode ultrasonography has been used widely and validated. The limitation of this examination is operator dependence. Ankle brachial index (ABI) examination is simpler, cheaper, objective and widely available and is expected to be used for the diagnosis of subclinical atherosclerosis.

**Objectives:** to determine the sensitivity, specificity, positive predictive value and negative predictive values of the ABI to establish the diagnosis of subclinical atherosclerosis in SLE patients.

**Methods:** A cross sectional study was enrolling 56 subjects and was conducted from September 2016 to July 2017 at Sanglah Hospital, Denpasar, Bali, Indonesia. We used 2 × 2 cross table to determine the sensitivity, specificity, positive predictive value and negative predictive values of ABI to establish the diagnosis of subclinical atherosclerosis.

**Results:** Of the 56 samples, 48 people (85.7%) were female. The area under ROC curve was 0708 (70,8%), p=0041. ABI examination to diagnose subclinical atherosclerosis in patients with SLE with a cutoff value of 0.95 has a sensitivity of 70%, specificity of 76.1%, 38.9% positive predictive value, and negative predictive value of 92.1%. The best cut-off value of ABI as a diagnostic tool for subclinical atherosclerosis in SLE patients is <0.95.

**Conclusions:** Examination with ABI can be considered as an alternative diagnostic when CIMT is not available. The diagnostic value of ABI is reliable enough for screening and diagnostic confirmation of subclinical atherosclerosis in patients with SLE.

#### UTILITY OF PET/CT FOR THE DIAGNOSIS AND DISEASE MANAGEMENT: A STUDY OF 88 PATIENTS FROM AN AUTOIMMUNE DISEASES HOSPITAL UNIT IN A 2-YEAR PERIOD

P. Diéguez<sup>1</sup>, A. Argibay, C. Vázquez Triñanes, B. Gimena, M. Estévez, R. Lorenzo, N. Val, M. Freire, A. Rivera. *Systemic Autoimmune diseases and Thrombosis Unit, University Hospital Complex of Vigo, Vigo, Spain*

**Background:** 18F-Fluorodeoxyglucose Positron Emission Tomography/Computed Tomography (18F-FDG PET/CT) is a non-invasive imaging technique commonly used in clinical oncology. 18 F-FDG accumulation is recognised as useful for diagnosing and monitoring the response to therapy in patients with some inflammatory disorders, but the role of the PET/TC in the management of these diseases is debated.

**Objectives:** The aim of this study was to investigate the role of 18F-FDG PET/CT in the diagnosis of the disease and assessing disease activity in an autoimmune diseases unit, and to evaluate if the results of this image technique imply a change in clinical management.

**Methods:** We retrospectively reviewed all 18F-FDG PET/CT requested since August 2015 to August 2017 by our unit. Data collected were: patient demographics, reason for PET request, PET results and change in therapy.

**Results:** PET/CT were performed in 88 patients and were positive in 68 (77,3%) cases. Patients (49 women/39 men) had a mean age of 58,1±15,7 years (range, 27–92 years). The clinical diagnosis at the moment of ordering the PET/CT were: sarcoidosis (n=45), large-vessel vasculitis (LVV) (n=16), immunoglobulin G4-related disease (IgG4-RD) (n=9), collagen-vascular diseases (CVD) (n=7), mesenteric panniculitis (n=4), myopathy (n=4), polymyalgia rheumatica (PMR) (n=2) and ANCA-associated vasculitis (n=1). (See **table 1**).

**Abstract AB1211 – Table 1**

	Sarcoidosis	LVV	IgG4-RD	CVD	Mesenteric panniculitis	myopathy	PMR
n	45	16	9	7	4	4	2
women	27 (60%)	13 (81,2%)	1 (11,1%)	4 (57,1%)	1 (25%)	2 (50%)	1 (50%)
age	50,9 (27–83)	72,5 (29–92)	63,7 (48–80)	53 (30–80)	60,5	66,2	72,5
PET to the diagnosis	9 (20%)	2 (12,5%)	1 (11,1%)	3 (42,9%)	3 (75%)	2 (50%)	2 (100%)
PET to disease activity	36 (80%)	14 (87,5%)	8 (88,9%)	4 (57,1%)	1 (25%)	2 (50%)	0
Positive PET/TC	36 (80%)	11 (68,7%)	6 (66,7%)	6 (85,7%)	3 (75%)	3 (75%)	2 (100%)
Change of therapy	31 (68,9%)	11 (68,7%)	6 (66,7%)	7 (100%)	2 (50%)	3 (75%)	2 (100%)

PET results supported a change in therapeutic management in 71.6% of the cases. In the group of sarcoidosis there was a change in treatment in 68.9% of cases. PET/TC revealed extrapulmonary manifestations in 57,8%. All patients with extracranial manifestations of giant cell arteritis (GCA) showed uptake in PET/TC. That result supported the clinical diagnosis, although negative temporal artery biopsy. PET was useful in the diagnosis and treatment of IgG4-RD in 66,7% of cases. PET scan did not find malignancy in inflammatory myopathies nor mesenteric panniculitis.

**Conclusions:** PET/TC is an increasingly utilised in our patients with inflammatory disorders as a support for the diagnosis and management. PET/TC detection extrapulmonary sarcoidosis may have therapeutic and prognostic clinical implications. PET may be useful in patients with GCA suspicion with negative biopsy and extracranial symptoms. More studies will be necessary to establish the real role of PET/TC in autoimmune and inflammatory diseases.

#### ANALYTICAL VALIDATION OF AN INTERFERON-INDUCIBLE GENE EXPRESSION KIT AS A POTENTIAL DIAGNOSTIC TEST FOR ANIFROLUMAB

P.K. Brohawn<sup>1</sup>, B.W. Higgs<sup>1</sup>, S. Patel<sup>2</sup>, A. Moody<sup>3</sup>, P. Cooper<sup>3</sup>, K. Ranade<sup>1</sup>.

<sup>1</sup>MedImmune LLC, Gaithersburg, MD, USA; <sup>2</sup>AstraZeneca, Cambridge; <sup>3</sup>QIAGEN Manchester Ltd, Manchester, UK

**Background:** Anifrolumab, a fully human monoclonal antibody that binds to the type I interferon receptor, is in Phase III development for moderate to severe systemic lupus erythematosus (SLE). Patients with greater interferon-inducible gene signatures (IFNGS) have enhanced response to anifrolumab treatment.<sup>1</sup>

AstraZeneca and QIAGEN developed an *in-vitro* diagnostic test for interferon-inducible gene expression (IFIGx). Efficacy of anifrolumab will be evaluated in patients with high and low IFNGS.

**Objectives:** We aimed to analytically validate the IFIGx kit for use in a pivotal clinical study and potentially to support future regulatory submission.

**Methods:** The IFIGx kit measures expression of four interferon-inducible genes (IF127, IF114, IF114L and RSAD2) compared with three housekeeping genes. Measurements were performed on mRNA extracted from whole blood from adults with SLE. A score was generated that identified patients as "IFNGS test-high" or "IFNGS test-low." Analytical validation involved six studies measuring lot interchangeability, linearity, repeatability, reproducibility, cross contamination, and system verification.

**Results:** Repeatability was 100%. Reproducibility was >96%. No cross contamination was observed. Results of all studies validated the IFIGx kit (table 1).

#### Abstract AB1212 – Table 1

##### Summary of Analytical Validation of Anifrolumab IFIGx Test

Study	Description	Results
Lot interchangeability	Verification that scores and assay Ct values were robust when different lots of kit components were used Acceptance criterion was <0.58 Ct	<b>Lot interchangeability verified</b> Largest observed change=0.16 Ct
Linearity	Verification, using linear and quadratic regression analyses, that mRNA input concentration (10 ng/μL) is in assay's linear range	<b>Linearity verified</b> Change in score over the concentration range on either side of 10 ng/μL=0.0043 Ct
Repeatability	Verification of Dx result repeatability when the same operator tested 60 random samples using the same kit lot and instrument	<b>Repeatability verified</b> Observed repeatability=100%
Reproducibility	Verification of Dx result reproducibility when multiple operators tested 48 random samples using multiple kit lots and instruments at different sites For verification, overall rate of correct calls must be ≥95%	<b>Reproducibility verified</b> Overall rate=99.7% After six samples with values close to the cut-off were added for further confirmation, overall rate=96.5%
Cross contamination	Investigation of inter- and intra-run cross contamination	<b>No cross contamination</b> No cross contamination found in reverse transcription or PCR steps
System verification	Verification of functionality and utility of the IFIGx software and IFIGx assay package	<b>System verification confirmed</b> Software flags produced as expected

Ct, cycle threshold (PCR cycle at which fluorescence rises above background level); Dx, diagnostic; IFIGx, interferon-inducible gene expression; PCR, polymerase chain reaction; mRNA, messenger ribonucleic acid.

**Conclusions:** The IFIGx kit was shown to be a robust, reproducible diagnostic test for IFNGS. The IFIGx kit has demonstrated value in prior anifrolumab studies,<sup>1</sup> and will be used both for patient stratification in Phase III studies and to support anifrolumab regulatory filings.

##### ULTRASONOGRAPHIC EVALUATION OF THE HIP JOINTS IN PATIENTS WITH AXIAL SPONDYLOARTHRITIS AND PSORIATIC ARTHRITIS: ASSOCIATED WITH CLINICAL AND LABORATORY MARKERS, IMAGING AND FUNCTIONAL OUTCOMES

R. Osipiants<sup>1</sup>, M. Bogdanova<sup>2</sup>, M. Bilinskaya<sup>3</sup>, D. Koshurnikov<sup>4</sup>, A. Baev<sup>5</sup>, T. Tamgina<sup>6</sup>. <sup>1</sup>RUDN University; <sup>2</sup>FSBI "Polyclinic №1" of the ADP RF; <sup>3</sup>PRNM University; <sup>4</sup>Hospital for veterans of wars №3; <sup>5</sup>ICDC of PAO "Gazprom"; <sup>6</sup>JSC "Sogaz – Med", Moscow, Russian Federation

**Background:** The hip joints are frequently involved in spondyloarthritis (SpA). Should ultrasonography (US) be additionally used for clinical assessment of disease in patients (pts) with SpA.

**Objectives:** to detect by US synovitis of the hip joints and to analyse the correlation between US finding and magnetic resonance imaging (MRI) and/or X-ray sacroiliitis, clinical and laboratory markers and functional status in pts with axial SpA (axSpA) and psoriatic arthritis (PsA).

**Methods:** 13 pts (7M/6F) with definite axSpA (7 with ankylosing spondylitis (AS) and 6 with non-radiographic nrSpA:ASAS) and 7 pts (4M/3F) with PsA (CASPAR) of similar age [median (IQR), 44<sup>35–55</sup> vs 42<sup>34–56</sup> years] and disease duration [7 (1–10) vs 9<sup>7–10</sup> years] were enrolled. US examination (Mindray DC-N6, C5–2 MHz probe) included bilateral of the hip joints according to the EULAR US Scanning App ([www.eular.org](http://www.eular.org); <http://ultrasound.eular.org>). MRI of sacroiliac joints (SIJ) was performed on Signa HDxT GE, 1.5 T. The bone marrow oedema on MRI (STIR) considered as active MRI sacroiliitis (MRI-SI).<sup>1</sup> X-ray of SIJs (modified New York criteria), functional status (BASFI), disease activity indices (ASDAS-CRP, DAPSA), laboratory tests (CRP, ESR, HLA-B27) were assessed.

**Results:** History of hip involvement was present in 7/20 (35%) pts who had ≥1 tender hip joint. 9/20 pts (45%) had US – synovitis of the hip joints. All pts were divided into two groups: g1(n=9) – US synovitis «+» (at least one hip joint), g2(n=11) – US -synovitis «-». Pts from g1 had higher CRP and BASFI compared to g2 (table 1). Elevated CRP ≥25 mg/L and ESR ≥30 mm/h, as well as MRI- and X-ray -SI were detected more often in g1pts than g2. But other parameters did not differ between the groups (table 1). US – synovitis of the hip joints was positively correlated with CRP (r=0.489, p<0.05), MRI-SI (r=0.688,p<0.05), X-ray-SI (r=0.634, p<0.05) and BASFI (r=0.541, p<0.05).

#### Abstract AB1213 – Table 1. Association between the US- synovitis of the hip joints and clinical and laboratory markers, imaging and functional outcomes

Parameters	US-synovitis "+" (n=9)	US-synovitis "-" (n=11)	P*
Age, years	44 (26–49)	46 (40–57)	.294
Duration since diagnosis, years	5 (1–10)	9 (7–10)	.551
AS/nrSpA/PsA	4 (57)/3 (50)/2 (28.5)	3 (39)/3 (50)/5 (71)	.411
Male sex	6 (67)	5 (45)	.456
HLA-B27	6 (67)	5 (45)	.456
CRP, mg/l	38 (6.7–51)	7.7 (3–19.2)	.031
Elevated CRP≥25	6 (67)	1 (9)	.031
ESR, mm/h	30 (16–39)	11 (6–25)	.080
Elevated ESR≥30	5 (55.5)	1 (9)	.027
ASDAS-CRP	3.4 (2.1–4.5)	2.7 (1.7–4.2)	.294
DAPSA	33 (19.6–46.4)	12.4 (12.3–12.4)	.190
BASFI (0–10)	5 (4–6)	3 (1.7–4)	.015
BASFI>4	6 (67)	2 (18)	.030
MRI-SI	9 (100)	5 (45)	<0.001
X-ray SI	9 (100)	5 (45)	<0.001

Numbers are medians (IQR) and n (%); \* Mann-Whitney U-test.

**Conclusions:** US – synovitis of the hip joints was associated with CRP, MRI- and X-ray- SI and severe functional disability in SpA pts. US evaluation of the hip joints may be used for identifying SpA pts with high risk of the disease progression at an early stage.

##### BONE MINERAL DENSITY AND T-SCORE EVALUATION IN A GROUP OF PATIENTS WITH RHEUMATOID ARTHRITIS USING A NEW ULTRASOUND METHOD: ECHOS – GENODYNAMIC - A PILOT STUDY –

R.D. Decianu<sup>1</sup>, M. Bojinca<sup>2</sup>, S. Daia-Iliescu<sup>1</sup>, D. Mazilu<sup>1</sup>, M.M. Negru<sup>1</sup>, A. R. Balanescu<sup>1</sup>, D. Opris- Belinski<sup>1</sup>, R. Ionescu<sup>1</sup>, V.C. Bojinca<sup>1</sup>. <sup>1</sup>Internal Medicine and Rheumatology, Sf. Maria Clinical Hospital; <sup>2</sup>Internal Medicine and Rheumatology, Dr. I. Cantacuzino Clinical Hospital, Bucharest, Romania

**Background:** There is a great need of a screening programme for osteoporosis in the general population and even more amongst the rheumatologic patients, with additional risk factors. Although DXA is the gold standard for diagnosing osteoporosis, it is not appropriate for screening, because of its' limitations regarding ionising radiation, but also the massive machine, that needs dedicated spaces and specialised operators, all in all, involving high costs.

**Objectives:** To apply a new method that integrates ultrasonography with radiofrequency signals from an echographic scan, in order to evaluate the bone mineral

density (BMD) and T-scores in patients with rheumatoid arthritis (RA), compared to a control group.

**Methods:** We enrolled 150 menopausal women, 75 diagnosed with RA and 75 age matched controls. The controls were selected considering the lack of both an inflammatory disease and history of corticotherapy.

All patients in the study group were under monotherapy with a conventional synthetic DMARD and they are or have been under corticotherapy during the evolution of RA.

The BMD and T score were evaluated using a quantitative ultrasound Echolight machine. There were two evaluators for both lots, on order to minimise the inter-observer variability.

**Results:**

Abstract AB1214 – Table 1

	Study group	Control group
Age distribution (years)	63,24 <sup>49</sup> – 85	64,19 <sup>41</sup> – 85
Menopause age (years)	46,9 (34–60)	45,78 <sup>30</sup> – 55
BMI (kg/m <sup>2</sup> )	25.97 (15.63–34.86)	26.83 (18.36–33.67)
Period since dg of RA (years)	7.26 (5–12.5)	–

13% of the patients in the study group were under corticotherapy at the moment they were recruited in the study and 87% were treated with cortisone before, at some point during the evolution of RA. The average dose followed for more than 2 weeks was 8.8 (5–15) mg prednisone/day. The average corticotherapy period of 2.6 (0.5–14) months.

For the lumbar vertebrae (L1-L4), the average T score in the study group was –1.81, while the control group had a T score of –1.11. For the femoral neck, the average T score for both hips was –1.73 for the study group and –1.04 for the controls.

The spine average BMD was 0.92 g/cm<sup>2</sup> in the study group, compared to 1.16 g/cm<sup>2</sup> in the control group. For the femoral neck, the study group average BMD was 0.72 g/cm<sup>2</sup>, while in the control group it was 0.94 g/cm<sup>2</sup>.

**Conclusions:** The differences between the two groups were significant, but still in the osteopenia interval. The significance of these results translates into an increased fracture risk and a longer treatment duration in the study group.

At this point, this is a preliminary study, but we plan to continue it by comparing these results to DXA results for the same patients, in order to evaluate the cost-effective superiority of this portable, radiation-free technique, in a screening programme.

#### MINIMAL INVASIVE ULTRASOUND-GUIDED PAROTID GLAND BIOPSY IN CADAVERS DONE BY RHEUMATOLOGISTS

R. Micheroli<sup>1</sup>, U. Wagner<sup>2</sup>, M. Mueller-Gerbl<sup>3</sup>, M. Toranelli<sup>4</sup>, C. Marx<sup>5</sup>, G.A. W. Bruyn<sup>6</sup>, S. Jousse-Joulin<sup>7</sup>, G. Tamborini<sup>5</sup>. <sup>1</sup>Department of Rheumatology, University Hospital of Zurich, Zurich; <sup>2</sup>Pathology, Unilabs Mittelland, Bern; <sup>3</sup>Department of Anatomy; <sup>4</sup>Department of Biomedicine, Musculoskeletal Research, University of Basel; <sup>5</sup>Rheumatology, Ultrasound Center, Basel, Switzerland; <sup>6</sup>Department of Rheumatology, MC Groep Hospitals, Lelystad, Netherlands; <sup>7</sup>Service de Rhumatologie, Hôpital de la Cavale Blanche, CHRU Brest, Brest, France

**Background:** In daily practice, surgical biopsy of minor salivary glands is routinely performed for the diagnosis of Sjögren's syndrome. The classification criteria for Sjögren's syndrome imply specific positive labial salivary gland biopsy findings. Surgical biopsies of the minor labial glands may result in up to 6% of patients in various complications, e.g. numbness of the lower lip. On the other hand, adverse events following core needle biopsies of the parotid gland in non-rheumatological settings were reported as very rare. Even so parotid gland biopsies require a more demanding surgical expertise mainly to protect the facial nerve.

**Objectives:** The objective of this study was to assess the feasibility and to determine the presence of parotid gland tissue in minimally invasive ultrasound-guided

parotid gland biopsies in cadavers performed by rheumatologists using histology as a gold standard.

**Methods:** Two senior rheumatologists obtained under direct ultrasound visualisation in in-plane technique biopsies of 8 parotid glands from 4 different cadavers using a core biopsy needle (core biopsy needle 18G). One biopsy per gland was taken and was subsequently stored. The direction of the bioptic access is shown in Figure 1. The specimen underwent histological examination by an experienced pathologist.

**Results:** All histological exams showed typical parotid gland tissue. Notably, no facial nerve tissue or major vessels could be detected in the biopsy material.

Abstract AB1215 – Figure 1

**Conclusions:** In this cadaveric feasibility study, we demonstrated that minimally invasive ultrasound guided parotid core biopsy is a highly precise and easy method to obtain salivary gland tissue.

#### QUANTITATIVE EVALUATION OF THERAPEUTIC CHANGES IN DIGITAL PSORIATIC ARTHRITIS WITH CONTRAST ENHANCED DUAL ENERGY COMPUTED TOMOGRAPHY IODINE MAP

R. Kawakami<sup>1</sup>, T. Fukuda<sup>1</sup>, S. Ogiwara<sup>1</sup>, M. Momose<sup>2</sup>, T. Tokashiki<sup>1</sup>, Y. Umezawa<sup>2</sup>, A. Asahina<sup>2</sup>, M. Matsushima<sup>3</sup>, H. Nakagawa<sup>2</sup>, K. Fukuda<sup>1</sup>. <sup>1</sup>Department of Radiology; <sup>2</sup>Department of Dermatology; <sup>3</sup>Division of Epidemiology, The Jikei University School of Medicine, Tokyo, Japan

**Background:** Dual Energy Computed Tomography (DECT) iodine map is highly sensitive in depicting the inflammatory changes of psoriatic arthritis (PsA). A modified PsA Magnetic Resonance Imaging Scoring System (mPsAMRIS) was developed to assess the severity of PsA on DECT iodine map<sup>1,2,3</sup>. DECT iodine map also enables the calculation of iodine uptake in the lesion, which provides a more direct measure of disease activity<sup>4</sup>. However, the usefulness of DECT in evaluating the therapeutic effect of PsA by using iodine quantification, is still undetermined.

**Objectives:** To assess the validity of DECT iodine map in evaluating the therapeutic effect of PsA by iodine quantification.

**Methods:** The study included symptomatic PsA patients who underwent two consecutive contrast-enhanced DECT of hand or foot, prior and post medical intervention. All images were independently evaluated by two radiologists. Each symptomatic joint and matched non-symptomatic control joint were scored with mPsAMRIS. To measure the iodine uptake, the region of interest was selected at the level where the joint was most affected. The treatment effect of mPsAMRIS and iodine uptake was calculated by subtracting the results of the matched non-symptomatic joints.

**Results:** The demographics and clinical characteristics of enrolled patients are shown below.

Abstract AB1216 – Table 1

Demographic and patient Characteristics			
Characteristic	All patients	Men	Women
Number of patients	26	17	9
Mean age (yr)	50.6 (22–89)	54.2 (25–89)	45.2 (22–68)
Mean psoriasis duration (yr)	13.1 (0–41)	12.3 (0.5–35)	14.1 (0–41)
Mean current joint symptom duration (mo)	26.9 (1–192)	40.3 (1–192)	4.5 (1–120)
Fulfilled CASPAR criteria	26	17	9
Mean interval between two DECTs (mo)	7.0 (4–12)	7 (4–12)	6.4 (4–11)

Inter-reader agreement for mPsAMRIS was moderate or sufficient (weighted  $\kappa(w)$  =0.57 for pre-treatment; weighted  $\kappa(w)$ =0.70 for post-treatment, respectively). Inter-reader agreement for iodine quantification for pre- and post-treatment showed significant correlation (Spearman's  $\rho$ =0.93  $p$ <0.005, Spearman's  $\rho$ =0.95  $p$ <0.005, respectively).

Both mPsAMRIS and iodine uptake showed significant improvement after treatment for both readers (Wilcoxon signed-rank test:  $z$ =7.37,  $z$ =5.98 for reader 1,  $z$ =7.38,  $z$ =6.20 for reader 2,  $p$ <0.005 for all  $z$ ).

The treatment effect of mPsAMRIS and iodine uptake showed significant correlation (Spearman's  $\rho$ =0.56  $p$ <0.005 for reader 1, Spearman's  $\rho$ =0.57  $p$ <0.005 for reader 2). Graph shows the correlation between change of mPsAMRIS score and iodine uptake.

Abstract AB1216 – Figure 1

**Conclusions:** A significant improvement of inflammatory changes in PsA was confirmed by iodine uptake post-treatment, which was in-keeping with mPsAMRIS, and there was a strong correlation between the mPsAMRIS scoring system and iodine quantification. Therefore, iodine quantification may be useful in evaluating the treatment effect of PsA. Furthermore, changes in iodine uptake were observed even with small changes of mPsAMRIS, thus iodine uptake may provide a more sensitive and detailed measure of inflammatory activity in PsA.

#### AB1217 FLUOROMETRIC IMAGING FOR EARLY DIAGNOSIS AND PROGNOSIS OF RHEUMATOID ARTHRITIS

S.Y. Jung, J.J. Choi, S.-K. Lee. *Division of Rheumatology, Department of Internal Medicine, CHA Bundang Medical Center, CHA University, Seongnam-si, Korea, Republic of Ireland*

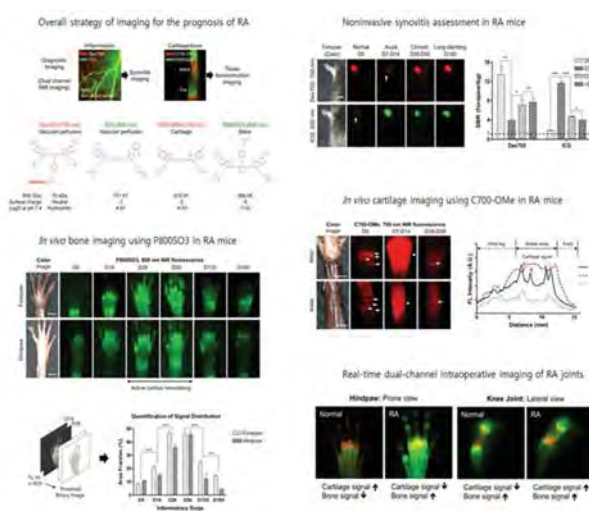

**Background:** Early diagnosis and monitoring of disease progress are of significant importance in the effective treatment of rheumatoid arthritis (RA), because the continuing inflammation can lead to irreversible joint damage and systemic complications. However, using imaging modalities for the prognosis of RA remains challenging, because no tissue-specific guidelines are available to monitor the progressive course of RA

**Objectives:** We report fluorometric imaging of RA for early diagnosis and prognosis, using structure-inherent targeting of the blood vessel, bone, and cartilage

**Methods:** we conducted dual channel near-infrared (NIR) fluorescence imaging, by using NIR light in the wavelength range of 700–800 nm and NIR fluorophores, to monitor the pathophysiologic processes of RA. In RA mice, we intravenously injected two NIR fluorophores—indocyanine green (ICG, 800 nm) and DEX700 (700 nm)—that have the characteristics of vascular perfusion agents in order to identify the severity of joint inflammation and the corresponding changes, on the

basis of differences in fluorescence intensity. In addition, for monitoring the changes in cartilage and bone on the basis of the progression of arthritis, we also intravenously injected C700-OMe (700 nm), a cartilage-targeting NIR fluorophore with an affinity for hyaluronic acid and glycosaminoglycan and P800SO3 (800 nm), a bone-targeting agent that has a strong binding affinity for bone minerals such as hydroxyapatite and calcium phosphate.

**Results:** In the acute inflammatory stage of arthritis, ICG with a lower molecular weight showed a significantly higher signal-to-background ratio (SBR) than DEX700 ( $p$ <0.05). But, in the chronic inflammatory stage, DEX700 showed a higher SBR value than ICG ( $p$ <0.05). The changing tendency of SBR value obtained from ICG showed similar to those of the clinical arthritis score in RA mice. In the fluorescence images of the mouse cartilage with C700-OMe before arthritis induction, very clear and distinct lines were observed in the fore paw and ankle joints. In the images obtained after arthritis was induced, these lines were lost, indicating cartilage destruction due to the progression of arthritis. A fluorescence image of the bone was obtained 24 hour after the injection of P800SO3; in this image, it was difficult to view the bone shape of joints especially in the fore paw before arthritis induction, because of a very low fluorescence intensity, in contrast to the cartilage. However, with the progression of arthritis, the fluorescence image of the bones was dramatically appeared and the SBR value of them increased significantly to clearly display the altered morphology of the joints ( $p$ <0.05). In particular, as it was confirmed that bone-specific NIR fluorophore, P800SO3 went only into the osteoclast cells, it was determined that monitoring of bone remodelling caused by arthritis-induced osteoclastogenesis is possible by using NIR fluorescence images.

**Conclusions:** The fluorometric imaging of RA by using tissue-specific contrast agents plays a key role in the systemic treatment of RA by monitoring structural damage and disease progression

#### AB1218 DIAGNOSIS OF PRIMARY RAYNAUD'S PHENOMENON AND CAPILLAROSCOPY

S. Lambova. *Medical University Plovdiv, Faculty of Medicine, Department of Propaedeutics of Internal Diseases, Plovdiv, Bulgaria*

**Background:** Raynaud's phenomenon (RP) is a clinical expression of recurrent reversible vasospasm of small peripheral arteries and arterioles. It is a common pathology in clinical practice and is classified into two main categories – primary RP in the absence of an underlying disorder and secondary RP that is in the context of another disease. The differential diagnosis is of crucial importance for the practising rheumatologists because the patients with primary RP are with benign course while those with secondary RP require further differentiation and establishment of the precise diagnosis and treatment. Differentiation between primary and secondary RP is based on clinical features, laboratory including immunological investigations and capillaroscopic findings.

**Objectives:** The nailfold capillaroscopy is a key imaging tool for monitoring the RP patients because of the high predictive value of the abnormal capillaroscopic pattern for future development of connective tissue disease. Patients with primary

RP have younger age at onset (<30 years), there are no clinical features of a secondary disease, no trophic changes or abnormal capillaroscopic pattern.

**Methods:** Literature data on quantitative analysis of capillaroscopic parameters in primary RP are limited.

**Results:** In an own study that included 31 patients with primary RP patients, significantly wider arterial and venous capillary diameters as compared with healthy controls was found in 96.6% of cases. The mean arterial capillary diameter (0.018 ± 0.004 mm) in primary RP patients was significantly larger in comparison healthy volunteers (0.012 ± 0.001 mm,  $p < 0.005$ ). The mean venous capillary diameter was also significantly higher in primary RP (0.026 ± 0.006 mm vs 0.017 ± 0.002 mm in healthy controls,  $p < 0.005$ ).<sup>1</sup> Similarly, Bukhari *et al.* (2000)<sup>2</sup> also observed greater diameters of arterial, venous limb and apical loop in comparison with control subjects in 15 primary RP patients, but the difference was not statistically significant.<sup>2</sup> Anderson *et al.* (2005)<sup>3</sup> also found greater capillary diameters in 21 patients with primary RP vs healthy volunteers but the difference was statistically significant only for the arterial capillary limb and the apex loop but not for the venous capillary diameter.<sup>3</sup>

**Conclusions:** These capillaroscopic observations in primary RP patients suggest that the absence of an abnormal capillaroscopic pattern is diagnostic for primary RP but minor capillaroscopic dilation is a frequent microvascular feature in these patients.

#### AB1219 CONTRIBUTION OF MRI TO CERVICAL INVOLVEMENT IN RHEUMATOID ARTHRITIS: PROSPECTIVE STUDY OF 30 CASES

S. rekik<sup>1</sup>, K. Zouaoui<sup>2</sup>, S. boussaid<sup>1</sup>, H. sehli<sup>1</sup>, E. cheour<sup>1</sup>, M. elleuch<sup>1</sup>.

<sup>1</sup>rheumatology, la rabta hospital; <sup>2</sup>rheumatology, charles nicolle hospital, tunis, tunisia, tunis, Tunisia

**Background:** Cervical spine involvement is common during RA and is characterised by its potential severity.

**Objectives:** To determine the prevalence of cervical involvement in RA, to clarify the contribution of MRI to diagnosis and to identify predictive factors for cervical rheumatoid involvement.

**Methods:** Our study included 30 RA patients with a duration of more than 2 years.

**Results:** 16 patients (53%) were assessed on the two imaging methods (standard radiographs in 37% and MRI in 53%), of which 2 cases (7%) were asymptomatic. This cervical involvement was dominated by the C1-C2 pannus objectivated in 50% of cases and AAS. Of the AAS, aAAS was the most frequent with a prevalence of 23%, followed by the pAAS found in 10% of the cases, the vAAS present in 7% of the cases then the IAAS and the rAAS objectivated in 3% each. The ASS was found in 3 cases (10%), odontoid erosion in 11 cases (37%), C1-C2 arthritis in 5 cases (16%) and inflammatory spondylodiscitis in 6 cases (20%). MRI resulted in a better study of the C1-C2 pannus and odontoid erosions as well as the evaluation of the impact of rheumatoid lesions on the neural axis: a medullary imprint was noted in 4 cases (13%). Several factors were associated with cervical rheumatoid involvement: the presence of cervicobrachial neuralgia or bulbomedullary signs, duration of PR ≥ 5 years, HAQ score ≥ 1.1 and positive RF. The search for factors associated with AAS has revealed the duration of the disease, DAS 28 > 3.2 and the presence of a biological inflammatory syndrome.

**Conclusions:** Cervical involvement accompanies the active and destructive forms of RA. It can be asymptomatic, it is the interest to seek it in a systematic way in RA. The standard radiography with dynamic views is to be realised first-line. The MRI must be indicated in order to make an early diagnosis, to carry out an accurate lesional assessment and to guide the therapeutic decision.

#### STUDY OF THE RELATIONSHIP BETWEEN TOE DEFORMITIES IN THE FOREFOOT REGION AND THE FLEXOR TENDONS IN RHEUMATOID ARTHRITIS USING 3D VOLUME RENDERING

T. Kashiwagura<sup>1,1,1</sup>, M. Kobayashi<sup>2</sup>, M. Urayama<sup>3</sup>, N. Konishi<sup>4</sup>, H. Itoh<sup>5</sup>, T. Aizawa<sup>6</sup>, T. Sakuraba<sup>7</sup>, Y. Sugimura<sup>7</sup>, H. Aonuma<sup>3</sup>, H. Aonuma<sup>3</sup>, T. Kawano<sup>6</sup>, N. Miyakoshi<sup>8</sup>, Y. Shimada<sup>8</sup>. <sup>1</sup>Department of Orthopedic Surgery, AKITA CITY HOSPITAL, Akita; <sup>2</sup>Department of Orthopedic Surgery, Hiraka General Hospital, Yokote; <sup>3</sup>Department of Orthopedic Surgery, Ogachi Central Hospital, Yuzawa; <sup>4</sup>Department of Orthopedic Surgery, Akita Kousei Medical Center, Akita; <sup>5</sup>Department of Orthopedic Surgery, Noshiro Kousei Medical Center, Noshiro; <sup>6</sup>Department of Orthopedic Surgery, Kita Akita Municipal Hospital, Kita Akita; <sup>7</sup>Nakadori General Hospital; <sup>8</sup>Department of Orthopedic Surgery, Akita University Graduate School of Medicine, Akita, Japan

**Background:** Multi-slice computed tomography (CT) is frequently used to evaluate the morphology, arrangement, and other characteristics of bone. Three-dimensional volume rendering (3D-VR) has made it possible to three-dimensionally visualise tendons and other structures by arbitrarily changing CT values. In deformities of the forefoot region in rheumatoid arthritis (RA), dislocation of the metatarsophalangeal (MTP) joints results in the formation of painful calluses that require surgery; however, the toes can sometimes be displaced inwards or outwards by this dislocation. MTP joint dislocation also causes the flexor tendons to dislocate from their original positions, although the relationship with toe displacement is unclear.

**Objectives:** We therefore used 3D-VR to examine the relationship between the flexor tendons and toe displacement in the dislocated toes of RA patients.

**Methods:** Thirty-one feet (10 right and 21 left) of 24 patients (5 men and 19 women) were examined. The Tsuboi classification was used to classify MTP joint dislocation into subluxation (Grade 2) or dislocation (Grade 3). CT images taken with no load applied to the feet were used for preoperative evaluation. The mean age of the patients at the time of imaging was 59.0 (36–76) years. A Fujifilm volume analyzer (SYNAPSE VINCENT) was used for 3D-VR reconstruction and CT values were adjusted to visualise the flexor tendons and examine their relationship with the heads of the metatarsal bones. When the flexor tendons were displaced inward or outward from the base of the metatarsal bone head, this was classified as flexor tendon dislocation. Toe displacement was identified when the proximal phalanx was displaced inward or outward from the extended line of the metatarsal axis.

**Results:** MTP joint dislocation was seen in 80 toes (63 cases of dislocation and 17 cases of subluxation). The flexor tendons were dislocated in 27 s toes (15 inward and 12 outward), 27 third toes (21 inward and 6 outward) and 16 fourth toes (15 inwards and 1 outward). Of the cases of MTP joint dislocation, toe displacement was seen in 12 s toes (1 inward and 11 outward), 12 third toes (12 outward) and 2 fourth toes (1 inward and 1 outward). The flexor tendons were dislocated towards the displaced toes in all cases. No flexor tendon dislocation was seen in any of the cases of subluxation.

**Conclusions:** RA is often accompanied by hallux valgus and toe displacement is affected by retraction of the first toe. The results of this study demonstrate that the toes are displaced inwards in some cases and can become dislocated independent of the influence of the first toe. All the toes were displaced towards the dislocated flexor tendons and MTP arthritis had resulted in loosening of the joint capsule and ligaments and dislocation of the flexor tendons, which was likely to cause displacement.

#### THE ASSOCIATION BETWEEN SYNOVITIS IN THE FOOT ON JOINT ULTRASONOGRAPHY AND CLINICAL PARAMETERS IN PATIENTS WITH RHEUMATOID ARTHRITIS

T. Kashiwagura<sup>1</sup>, M. Kobayashi<sup>2</sup>, M. Urayama<sup>3</sup>, N. Konishi<sup>4</sup>, T. Aizawa<sup>5</sup>, H. Itoh<sup>6</sup>, Y. Sugimura<sup>7</sup>, H. Aonuma<sup>3</sup>, T. Kawano<sup>5</sup>, T. Sakuraba<sup>2</sup>, N. Miyakoshi<sup>8</sup>, Y. Shimada<sup>8</sup>. <sup>1</sup>Department of Orthopedic Surgery, AKITA CITY HOSPITAL, Akita; <sup>2</sup>Department of Orthopedic Surgery, Hiraka General Hospital, Yokote; <sup>3</sup>Department of Orthopedic Surgery, Ogachi Central Hospital, Yuzawa; <sup>4</sup>Department of Orthopedic Surgery, Akita Kousei Medical Center, Akita; <sup>5</sup>Department of Orthopedic Surgery, Kita Akita Municipal Hospital, Kita Akita; <sup>6</sup>Department of Orthopedic Surgery, Noshiro Kousei Medical Center, Noshiro; <sup>7</sup>Department of Orthopedic Surgery, Nakadori General Hospital; <sup>8</sup>Department of Orthopedic Surgery, Akita University Graduate School of Medicine, Akita, Japan

**Background:** Treatment of rheumatoid arthritis (RA) has improved dramatically with the widespread use of biological disease-modifying antirheumatic drugs. In this context, the number of RA patients who undergo orthopaedic surgery is reportedly decreasing. However, the number of RA patients who undergo foot surgery is increasing. Joint ultrasonography has been used for early diagnosis and

disease activity assessment in RA, allowing visualisation of synovitis. However, few detailed studies or evaluations of clinical parameters related to synovitis in the foot have been performed.

**Objectives:** This study investigated the association between synovitis in the foot as observed on joint ultrasonography and the degree of disability on the health assessment questionnaire (HAQ) in RA patients.

**Methods:** The study included 79 outpatients (101 feet) with RA. Patients who had undergone surgery were excluded. The mean age was 66.0 years (24–92 years), and the mean disease duration was 13 years and 5 months (ranging from 1 month to 49 years). Joint ultrasonography was performed by the same examiner using the same diagnostic instrument in the same room. Synovitis was defined as a power Doppler score of  $\geq$  Grade 1. The scanning sites were forefoot (metatarsophalangeal joints of toes 1–5), metatarsus (calcaneocuboid and talonavicular joints), and hindfoot (talocrural and subtalar joints, peroneal tendon, posterior tibial tendon). The presence or absence of synovitis was evaluated at each site, and the association with the HAQ score was examined.

**Results:** Synovitis was detected in the forefoot of 40 feet (39.6%), in the metatarsus of 34 feet (33.7%), and in the hindfoot of 63 feet (62.4%). Patients with synovitis in the forefoot (PD+:  $0.41 \pm 0.1$ , PD-:  $0.80 \pm 0.1$ ,  $p=0.018$ ) and hindfoot (PD+:  $0.52 \pm 0.1$ , PD-:  $0.86 \pm 0.1$ ,  $p=0.043$ ) had significantly lower HAQ scores.

**Conclusions:** Given that assessment of foot impairment is not included in the disease activity index for RA, there may be a delay in diagnosis of foot lesions. Our results showed that patients with synovitis in the forefoot and rearfoot had lower HAQ scores (disability measure), suggesting that increased physical activity may be associated with increasing incidence of synovitis in the foot. The ability of RA patients to perform activities of daily living may have improved with advances in pharmacotherapy, leading to increased physical stimulation, resulting in an increased incidence of synovitis of the foot.

#### AB1222 COMPARISON OF QUANTITATIVE MRI FAT-FRACTION MEASUREMENT IN SIJ JOINT ON DIFFERENT SCANNER PLATFORMS

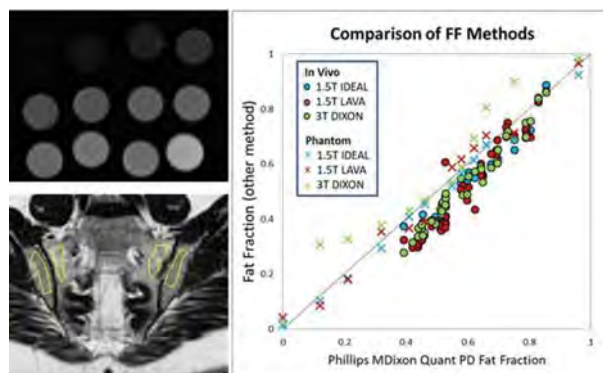

A. Bainbridge<sup>1</sup>, T. Bray<sup>2</sup>, J. Jones<sup>3</sup>, S. Tansley<sup>4</sup>, N. Fulstow<sup>4</sup>, R. Sengupta<sup>4</sup>, M. Hall-Craggs<sup>2</sup>. <sup>1</sup>Medical Physics and Biomedical Engineering, University College London Hospitals NHS Foundation Trust; <sup>2</sup>Centre for Medical Imaging, University College London, London; <sup>3</sup>Radiology, Nuffield Health Hospital, Bristol; <sup>4</sup>Royal National Hospital for Rheumatic Diseases, Bath, UK

**Background:** Quantitative MRI Proton Density Fat Fraction (PDFF) measurement can objectively identify areas of active inflammation and structural damage in spondyloarthritis by identifying oedema and fat metaplasia in bone marrow.<sup>1</sup> PDFF is typically implemented as a 3D multi-echo Gradient-echo protocol and all of the major MRI equipment manufacturers have PDFF imaging products available that combine a complex multi-peak fat-spectrum model with simultaneous determination and correction for T2\* signal decay. However, if the appropriate specialist imaging option has not been purchased, as is commonly the case, then the user may have to rely on simpler base-level protocols for fat-fraction measurement. An important step to implementing quantitative fat-fraction measurement as a clinical tool is to demonstrate that measurements are robust to both scanner platform and measurement technique.

**Objectives:** We aimed to compare quantitative FF measurements obtained using 3 scanners supplied by different manufacturers, and using a range of techniques.

**Methods:** The sacroiliac joints (SIJ) of 10 healthy volunteers (mean age 42 years, range 23–63) were scanned on 3 scanners: a) 3T Philips Ingenia, using MDixon Quant (MDQ) – a specialist PDFF package; b) 1.5T GE Optima MR450W, using IDEAL and LAVA – both base-level options; and c) 3T Siemens Skyra, using DIXON – a base-level option. We also scanned a fat-water phantom constructed using tubes of emulsions of peanut oil and 3% agar. MDQ uses data from 6 different echo-times; IDEAL from 3; and LAVA and DIXON from 2. The excitation flip angle was set to 3 degrees for all acquisitions to minimise the T1 weighting. Each technique yields Fat-only (F) and Water-only (W) images. FF images were calculated using the formula:  $FF = F / (W + F)$ . Regions of interest (ROIs) were drawn in the SIJ as shown in the figure 1. MDQ PDFF was used as the 'gold-standard' measurement for comparison to IDEAL, LAVA and DIXON.

**Results:** The figure shows the results of the ROI analysis. For the phantom measurements, both LAVA and IDEAL correlated well with MDQ, but Siemens DIXON deviated away from the expected linear relationship. The *in vivo* data showed good linear relationships with MDQ for all 3 base-level techniques for FF in the range 0.4–0.8, although all 3 slightly underestimated FF compared to MDQ.

**Abstract AB1222 – Figure 1**

**Conclusions:** A clinically useful quantitative image-analysis tool should be applicable to results obtained from several platforms. FF measurement in the bone marrow of the SIJ is robust to both technique and platform. The slight underestimation of FF values on base-level FF measurements is probably due to the influence of T2\* weighting. However, these variations are smaller than the FF changes observed in areas of oedema or fat metaplasia.<sup>1</sup> FF measurement is a quantitative and widely applicable method for the diagnosis and assessment of spondyloarthritis.

Fujii<sup>2</sup>, T. Mimori<sup>1</sup>. <sup>1</sup>Department of Rheumatology and Clinical Immunology, Kyoto University Hospital; <sup>2</sup>Department of Human Health Sciences, Kyoto University Graduate School; <sup>3</sup>Center for Rheumatic Disease; <sup>4</sup>Department of Orthopedic Surgery, Kyoto University Hospital, Kyoto, Japan

**Background:** Because elbows are important joints for the function of upper limbs, the daily activity of the patients with rheumatoid arthritis (RA) may be impaired by synovitis of elbows. Although elbows are included into the 28 essential joints for evaluation of the disease activity of RA, ultrasonography (US) examination of elbows is not routinely performed and there have been a few surveys on the correlation between US scores of elbows and disease activity.

**Objectives:** To reveal whether there is a correlation between US scores of elbows and disease activity in the patients with RA.

**Methods:** We recruited 198 patients with RA from KURAMA cohort, which is the database of the patients with RA treated in the Kyoto University Hospital, and performed US examination of proximal interphalangeal (PIP) joints, metacarpophalangeal (MP) joints, wrist joints and elbow joints. Synovial hypertrophy is scored semiquantitatively on a scale of 0–3. We analysed correlations between the total scores of each component (PIP, MP, wrist and elbow) and clinical parameters.

**Results:** We found weak correlations between DAS28-ESR and the US scores of PIPs, MPs and wrists ( $\rho=0.25$ ,  $0.21$  and  $0.29$ , respectively) whereas there was little correlation between DAS28-ESR and the US score of elbows ( $\rho=0.16$ ). However, multivariable analysis showed that the US scores of PIPs, wrists and elbows were independently associated with DAS28-ESR ( $p=0.021$ ,  $0.0027$  and  $0.025$ , respectively). US scores of elbows showed little or weak correlations with US scores of PIPs, MPs and wrists ( $\rho=0.23$ ,  $0.16$  and  $0.11$ , respectively).

**Conclusions:** US examination of elbows may be useful to assess the disease activity of patients when combined with US examination of PIPs and wrists although US scores of elbows alone has a weak correlation with DAS28-ESR. US examination of elbows may detect the disease activity which is overlooked by the US examination of joints of hand.

**AB1224 CT PET SCANS IN SUSPECTED LARGE VESSEL VASCULITIS AND GIANT CELL ARTERITIS – AN AUDIT IN THE BELFAST HEALTH AND SOCIAL CARE TRUST (BHSC)**

*U.A. Lavery, E. Banks, M. McHenry. NHS, Belfast, Ireland*

**Background:** British Society of Rheumatology (BSR) guidelines, due to be updated in April 2018, recommend consideration of CT PET when there is suspicion of large-vessel GCA (LV-GCA) in patients with prominent systemic symptoms, limb claudication or persistently high-inflammatory markers despite adequate glucocorticosteroid therapy. Vascular Ultrasound is unhelpful in assessment of the aorta.

**Objectives:** We investigated the use of CT PET in suspected cases of LV-GCA and its impact on management of patients in the BHSC from August 2016 to August 2017.

**Methods:** The IT support team in Royal Victoria Hospital provided a list of CTPET scans requested under the specific code for vasculitis and/or Pyrexia/infection and another code for general. Of the 250 scans identified under these codes, 34 scans were requested by Rheumatology for possible vasculitis following a review of the electronic care records. A proforma was used to aid data collection.

**Results:** Female:Male ratio was 3.25:1, with a mean age of 65. 88% of the scans were requested due to a suspected diagnosis of vasculitis and 12% were for follow up of known vasculitis. 24% of CT PET scans were positive for large vessel vasculitis (LVV). The ESR was greater than 50 mm/hr in 75% of positive scans. Of those patients with a positive CT PET scan, 88% were treated with steroids. Of those patients with a negative CT PET scan, 42% were treated with steroids. It is noteworthy that 29% of patients were on steroids at the time of CT PET which may impact results. 60% of patients who were on steroids at the time of CT PET were on 60 mg of prednisolone daily. 31% of patients with negative scans were on steroids at the time of CT PET. 46% of patients with negative CT PET scans remained on steroid treatment. Steroid treatment was continued in patients with negative scans on basis of active aortic valve histology ±clinical criteria for diagnosis of GCA ±cerebral vasculitis on neuroimaging ±polymyalgia rheumatica evident on CTPET. CT PET changed management in 65% of patients with positive results supporting steroid treatment and negative results guiding withdrawal of steroids.

**Conclusions:** We are fortunate to have access to CT PET in Northern Ireland. CT PET scans changed management in 65% of our patients, despite 29% of patients being on steroid treatment prior to CT PET. We wish to increase awareness of the role CTPET in the diagnosis and management of LVV. We are liaising with radiology colleagues to refine and maximise appropriate referrals for CT PET scans for patients with suspected vasculitis.

**AB1225 ANTIBODIES AGAINST HETEROGENEOUS NUCLEAR RIBONUCLEOPROTEINS (RA33) MAY HAVE A DIAGNOSTIC AND PROGNOSTIC VALUE IN RHEUMATOID ARTHRITIS, PARTICULARLY WHEN OTHER SEROLOGICAL TESTS ARE NEGATIVE**

*V.A. Aleksandrov<sup>1</sup>, L.N. Shilova<sup>2</sup>, A.V. Alexandrov<sup>1</sup>. <sup>1</sup>Federal State Budgetary Science Institution Research Institute for clinical and experimental rheumatology; <sup>2</sup>The Department of Hospital Therapy, The Volgograd State Medical University, Volgograd, Russian Federation*

**Background:** The high frequency of detection of antinuclear antibodies in rheumatoid arthritis (RA), although predominantly in low titres, allows us to consider the possibility of using varieties of these antibodies (primarily antibodies to RA-33) markers of RA especially in the early stages of the disease.

**Objectives:** To study the frequency of occurrence and determine the prognostic significance of antibodies to RA-33 in RA patients.

**Methods:** 57 RA patients were examined (mean age 50.5±10.1 years).

The patients with the developed stage of the disease (47.4%) prevailed, the average activity (DAS28=3.2–5.1) of the pathological process (86%); with the second radiographic stage (42%) and functional class 2 (77%).

The antinuclear factor was determined in the indirect immunofluorescence reaction on the HEp-2 cell line (norm <1:80), IgM-rheumatoid factor by the latex agglutination method (up to 20 IU/ml), antibodies (norm up to 20 U/ml) and antibodies of IgG class to RA33 antigen (norm up to 25 U/ml) by ELISA test.

**Results:** ANF was detected in 18 patients with RA (32%), and in 94.4% of cases (17 patients) a diagnostic titer of 1:80 and a diffuse type of glow of the nucleus were noted. The ANF titres did not correlate either with the activity of the disease or with extra-articular manifestations of RA ( $p>0.1$ ). Anti-RA33 was detected in 20 (35%) RA patients: 18 positive people (90%) had low positive anti-RA33 values (25 to 75 U/ml). In 35 (61.4%) of RA patients, anti-CCP was detected: 19 (33.3%) had low positive values (20 to 60 U/ml), 16 (28%) had highly positive values (more 60 U/ml). IgM-RF was detected in 26 (45.6%) patients in the values>48 IU/ml, as well as in 17 (30%) patients with RA in the values from 24 to 48 IU/ml. 14 people (54%) of patients with high IgM-RF levels had systemic manifestations of RA. It should be noted that anti-RA33 was detected in 9 patients with seropositive for anti-CCP and in 11 patients with seronegative both for anti-CCP and IgM-RF. Thus, when the results of standard serological tests are negative, an additional study of anti-RA33 is recommended to diagnose seronegative RA.

When assessing the prognostic significance of the available clinical and laboratory and instrumental data we have analysed the results of the study of anti-CCP, anti-RA33, as well as all data on the presence of X-ray erosions in patients with RA with magnetic resonance imaging or ultrasound examination of affected joints. The presence of erosion was noted in 23 (40.4%) RA patients. The frequency of detection of anti-CCP in RA patients was significantly higher in the presence of erosive lesions of joints (19 of 35 patients were positive by anti-CCP, compared with 4 of 22 patients, negative for anti-CCP,  $\chi^2=5.89$ ,  $p=0.015$ ). In the RA group of patients positive for a wide range of antibodies (IgM-RF, anti-CCP, anti-RA33), the signs of joint erosion were identified in 22 of 46 patients, and in isolated increase only anti-RA33 – in 1 patient out of 11 people in this group  $\chi^2=4.04$ ,  $p=0.044$ .

**Conclusions:** In the presence of highly positive anti-CCP values, RA patients have a more unfavourable prognosis, while an isolated increase in anti-RA33 is associated with a "milder progression" of the disease and inversely proportional to erosive processes in the joints.

**AB1226 THE DIAGNOSTIC VALUE OF SERUM KL-6 IN CONNECTIVE TISSUE DISEASE ASSOCIATED INTERSTITIAL LUNG DISEASE**

*X. Wu, C.N. Luo, Y.M. Shi, L.J. Wu. Department of Rheumatology and Immunology, People's Hospital of Xinjiang Uygur Autonomous Region, Urumqi, China*

**Background:** The connective tissue diseases is a group of inflammatory, immune-mediated diseases. CTD often leads to autoimmunity and subsequent tissue injury. It is an important contribute to thoracic changes, particularly interstitial lung disease, is are the main causes of mortality and morbidity among patients with connective tissue diseases. Prognosis and response to therapy are the most pressing challenges for connective tissue disease-associated ILD (CTD-ILD).

At present, the basic methods for the diagnosis of various types of ILD includes high-resolution computed tomography, bronchoscopy, and surgical lung biopsy. In addition, continuous lung function tests are commonly used to monitor disease activity and predict the outcome of patients with ILDs. But these tests require specific inspection machines and Repeatability is not good. At present, many biomarkers have been developed to detect ILDs, and the most important biomarkers is KL-6 and lung surface active protein A (SP- A) and surfactant protein D (SP – D) witch secreted by alveolar epithelial type II cells. But Relevant studies have shown that the sensitivity, specificity and accuracy of KL-6 are higher than SP-A and SP-D.

**Objectives:** To evaluate the diagnosis of the serum Krebs von den Lungen-6 (KL-6) for the interstitial lung disease(ILD) associated with connective tissue diseases(CTD).

**Methods:** We retrospectively analysed the medical records of 50 patients with CTD associated ILD,46 CTD patients without ILD. Measurement of serum KL-6 levels and pulmonary function tests performed in parallel were reviewed.T test,  $X^2$  test, non-parametric test, SPSS and correlation analysis were used for data analysis.

**Results:** The significantly higher levels of KL-6 were determined in the CTD-ILD group than in either the CTD without pulmonary involvement group( $P<0.05$ ). Serum KL-6 correlated negatively with forced vital capacity(FVC%) (%predicted), forced expiratory volume in one second (FEV1)(%predicted) and diffusing capacity of the lung for carbon monoxide (DLCO) (% predicted). By the ROC curves of serum KL-6 levels in 96 patients. The optimal cutoff value of serum KL-6

for a diagnosis of CTD-ILD was 500 mg/L, and the sensitivity and specificity were 82.0% and 89.1%, respectively. The area under the curve (AUC) was 0.877. By multivariate analysis, we found only the reduced DLCOsb%, and elevated serum KL-6

**Abstract AB1226 – Table 1.** single factor and multifactor analysis of the risk factors of ILD

Variables	Univariate analysis		Multivariate regression analysis	
	(OR 95% CI)	P	(OR 95% CI)	P
Age	0.956	(0.924, 0.988)	0.008	
VC%	1.051	(1.018, 1.084)	0.002	
FVC%	1.030	(1.004, 1.057)	0.022	
FEV1%	1.032	(1.004, 1.062)	0.026	
TLCOsb%	1.081	(1.042, 1.120)	0.000	1.097 (1.031, 1.168) 0.004
KL-6	0.998	(0.997, 0.999)	0.000	0.997 (0.996, 0.999) 0.000

**Conclusions:** The serum KL-6 is a valuable biomarker for CTD-ILD diagnosis and even as a predictive factor could be used to identify the clinical development of ILD.

**AB1227 INFLAMMATORY FINDINGS ON ULTRASOUND AND MRI CAN PREDICT FUTURE DEVELOPMENT OF RHEUMATOID ARTHRITIS IN PATIENTS WITH SERONEGATIVE, UNDIFFERENTIATED ARTHRITIS**

Y. Kondo<sup>1,2</sup>, Y. Kaneko<sup>2</sup>, Y. Inoue<sup>2</sup>, C. Takahashi<sup>2</sup>, K. Sakata<sup>2</sup>, K. Yamaoka<sup>2</sup>, S. Sato<sup>1</sup>, T. Takeuchi<sup>2</sup>. <sup>1</sup>Department of Internal Medicine, Division of Rheumatology, Tokai University School of Medicine, Kanagawa; <sup>2</sup>Department of Internal Medicine, Division of Rheumatology, Keio University School of Medicine, Shinjuku, Tokyo, Japan

**Background:** The 2010 rheumatoid arthritis (RA) classification criteria has been verified to classify patients early as having RA more efficiently than the 1987 criteria. However, sensitivity of this criteria decreased remarkably in patients whose rheumatoid factor (RF) and anticitrullinated antibodies (ACPA) were both negative. Modern imaging technique including ultrasound (US) and magnetic resonance imaging (MRI) are more sensitive than physical examination for detecting joint inflammation objectively, however, US may offer only slight additional value when assessing patients with positive ACPA and RF. Reliability and value of inflammatory findings detected by US and MRI in seronegative, undifferentiated arthritis (UA) patients are still unclear.

**Objectives:** To clarify benefits of US and MRI for predicting futuristic diagnosis of RA in UA patients with neither ACPA nor RF.

**Methods:** Consecutive, untreated, early arthritis patients who underwent both US and contrast enhanced MRI of 22 sites including bilateral wrists, MCP and PIP joints were enrolled. Synovitis and tenosynovitis were defined as inflammatory findings of US and MRI. Concordance between swollen joint counts (SJC) by experienced physician, inflammatory findings of US and MRI were assessed. We defined UA as non-fulfillment of the 2010 RA classification criteria and the clinical diagnosis of RA as the initiation of disease modifying anti-rheumatic drugs.

**Results:** Seventy one patients were included in the analysis. Fifty eight (82%) were female, the median age was 63 years old, and the mean symptom duration 3 months. Forty eight (67.6%) did not fulfill the 2010 criteria being defined as UA, among which thirty six were seronegative. In all patients, the concordance of detecting inflammation was quite high between MRI and US ( $\kappa$ : 0.67–0.70). In 36 seronegative UA patients, SJC detected by physical examinations were fewer than US or MRI (2.2 vs 3.9,  $p < 0.05$ ) and discrepancy between clinical SJC and inflammatory findings by US/MRI were more frequent in seronegative UA patients ( $\kappa$ : 0.18) compared to the patients who fulfilled the 2010 RA criteria ( $\kappa$ : 0.32). Although only 4 of the seronegative UA patients would have fulfilled the 2010 criteria if inflammation findings by US/MRI were used instead of physical examinations, 21 seronegative UA were diagnosed with clinical RA (sensitivity 19% and specificity 100%). One or more inflammatory arthritis in wrists and MCP joints detected by US or MRI in seronegative patients significantly predicted the development of RA with a good sensitivity of 62% and specificity of 87% (Odds ratio, 10.5).

**Conclusions:** Our study suggested that both US and MRI inflammation findings are reliable with a good concordance and can be useful as predictor for futuristic development of RA in UA patients without ACPA and RF.

**AB1228 SONOELASTOGRAPHY OF QUADRICEPS IS MORE ACCURACY THAN GRIP STRENGTH TO PREDICT LOW MUSCLE MASS**

Y.-C. Chen. *Rheumatology, KAOHSIUNG CHANG GUNG MEMORIAL HOSPITAL, Kaohsiung, Taiwan, Province of China*

**Background:** Reduced muscle mass had associated with higher mortality. So it is mandatory for simple techniques to early detection of sarcopenia. However, some patients with low grip strength had normal muscle mass, especially those with rheumatoid arthritis.

**Objectives:** Our objective was to examine the validity of sonoelastography to predict sarcopenia in osteoporotic patients.

**Methods:** We conducted an observational study in Kaohsiung Chang Gung Memorial Hospital. Low muscle mass was determined using a dual-energy X-ray absorptiometry. Sonoelastography was performed over mid thigh over quadriceps muscle. We measure grip strength and hardness and elastography ratio of quadriceps over subcutaneous fat tissue. Logistical regression was used to find the factors to predict low muscle mass. While ROC analysis was used to find best cut-off point.

**Results:** A total 122 (68 low muscle mass, 54 normal muscle mass) patients were enrolled. The mean age was 79.26±6.77 years in low muscle mass group and 74.7±13.49 in normal muscle mass group ( $p=0.017$ ). Most patients (86.9%) were women. Sonoelastography showed low muscle mass patients had more soft than normal muscle mass patients, furthermore the elastography ratio of quadriceps over subcutaneous tissue was lower than normal muscle mass patients. Using logistical regression, grip strength, sex and age cannot be used to predict low muscle mass, while the hardness and ratio had statistically significant to predict low muscle mass ( $p=0.001$ ). When the cut points determined by receiver operating characteristic (ROC) curve analysis were applied, The best cut-point of hardness was 64.79% (sensitivity, 0.741; 1-specificity, 0.147), while the best cut-point of quadriceps over subcutaneous tissue was 0.81 (sensitivity, 0.815; 1-specificity, 0.118).

**Abstract AB1228 – Table 1**

	Regression coefficient	S.E.	P value	OR
Gender	1.976	1.063	0.063	7.216 (0.899–57.939)
Age	0.043	0.041	0.297	1.043 (0.963–1.132)
Hardness	–4.015	0.897	0.001	0.018 (0.003–0.105)
Ratio	–3.927	0.856	0.001	0.019 (0.004–0.105)
Grip strength	0.218	0.640	0.734	1.243 (0.355–4.356)

**Conclusions:** Our findings indicate that sonoelastography is more accurate to predict low muscle mass. The measurement include quadriceps over subcutaneous tissue and hardness of the quadriceps. Although, grip strength is less expensive for evaluation of muscular weakness, from this findings, it is not a reliable method for evaluation of low muscle mass. The possible reason is that sarcopenia initial occur at thigh muscle and then spread up to upper limb. So grip strength is not an accurate method to screen sarcopenia.

### ASSESSMENT OF ENTHESITIS BY ULTRASONOGRAPHY IN PATIENTS WITH SERONEGATIVE RHEUMATOID ARTHRITIS

Z. Erturk<sup>1</sup>, T. Ozsoy<sup>2</sup>, I. Yagci<sup>2</sup>, Y. Yalcinkaya<sup>1</sup>, Ü. Gazel<sup>1</sup>, P. Atagündüz<sup>1</sup>, H. Direskeneli<sup>1</sup>, N. Inanc<sup>1</sup>. <sup>1</sup>Rheumatology, <sup>2</sup>Physical Therapy and Rehabilitation, Marmara University School of Medicine, Istanbul, Turkey

**Background:** In patients with seronegative rheumatoid arthritis (RA) there is a difficulty to make the differential diagnosis with the spondyloarthropathies.

**Objectives:** To assess the presence of enthesitis in patients with seronegative RA in comparison with the healthy controls (HC), patients with seropositive RA and ankylosing spondylitis (AS).

**Methods:** In this cross-sectional study, seronegative and seropositive RA patients, who fulfilled the 2010 ACR/EULAR criteria, patients with AS and HC have been assessed by grey scale and power doppler ultrasonography for the presence of enthesopathy at the achilles tendon, plantar fascia, proximal patella, distal patella, quadriceps, tibialis anterior, triceps, common flexor and extensor tendons. Clinical assessment of the patient groups included demographic findings, health assessment questionnaire and DAS28.

**Results:** In our study, we recruited age and sex matched 27 seronegative RA, 19 healthy controls, 24 seropositive RA and 23 ankylosing spondylitis patients. We evaluated and analysed both right and left sides of the entheses regions separately which have been indicated in the methods section. The mean DAS28, mean ESR and mean CRP of the patients with seronegative RA were 3.6±1.28, 32.2±21.2 and 12.37±27.77 respectively (table 1).

Median of Madrid sonographic enthesitis index (MASEI) was 5 in patients with seronegative RA. 4 patients have severe scores (MASEI score ≥20). There were significant differences between seronegative RA and healthy controls (MASEI score:3), (p=0.014) but no differences has been observed between seronegative RA with seropositive RA (MASEI score:6) and ankylosing spondylitis (MASEI score:7) in MASEI scores.

In comparison, hypoechoogenicity of quadriceps tendon (16 (29.6%) vs 6 (12.5%), p=0.037), bone erosion at the quadriceps tendon attachment (9 (16.6%) vs 0, p=0.003), calcification at achilles tendon (17 (31.4%) vs 6 (12.5%), p=0.023) have been observed more frequently in patients with seronegative RA than seropositive RA. Significantly higher number of patients with bone erosion at the common extensor tendon (26 (48.1%) vs 3 (6.5%), p<0.001), calcification at achilles tendon (17 (31.4%) vs 2 (4.3%), p=0.024), erosion at triceps tendon (13 (24%) vs 1 (2.1%), p=0.035) have been detected in patients with ankylosing spondylitis than seronegative RA (table 2).

Abstract AB1229 – Table 1

	Seronegative RA	Healthy control group	Seropositive RA	Ankylosing spondylitis
Age, years	51,85±11,49	46,2±6,6	53,12±10,95	43,75±4,1
Women, n (%)	48 (88,9)	38 (100)	44 (91,7)	38 (82,6)
RA duration, year	9,8±6,75	NA	12,29±9,3	NA
RF titre, median	10,77±3,21	NA	323,68 ±372,72	NA
AntiCCP titre, median	3,99±4,13	NA	300,16 ±264,93	NA
DAS28, median	3,6±1,28	NA	3,73±1,45	NA
ESR, median	32,2±21,2	NA	38,73±26,88	38,72±9,16
CRP, median	12,37±27,77	NA	12,73±18,57	10,38±9,3

Abstract AB1229 – Table 2. Assessing patients with seronegative rheumatoid arthritis about enthesopathy by ultrasound- Pathological findings

Pathological finding	Seronegative RA	Healthy control group	Seropositive RA	Ankylosing spondylitis
Bone erosion at the quadriceps tendon, n(%)	9 (16,6) (p=0,003)	0 (p=0,003)	0 (p=0,003)	3 (6,5) (p=0,25)
Hyper-echogenicity in quadriceps tendon, n(%)	38 (70,6) (p=0,006)	2 (5,4) (p=0,006)	8 (13,5) (p=0,017)	2 (4,6) (p=0,12)
Calcification of achilles tendon, n(%)	17 (31,4) (p<0,001)	0 (p<0,001)	6 (12,5) (p=0,023)	0 (0,0) (p=0,238)
Bone erosion at the common extensor tendon, n(%)	26 (48,1) (p=0,001)	0 (p=0,001)	3 (6,5) (p=0,296)	3 (6,5) (p=0,001)
Calcification of achilles tendon, n(%)	17 (31,4) (p=0,001)	0 (p=0,001)	6 (12,5) (p=0,023)	2 (4,6) (p=0,12)
Erosion of triceps tendon, n(%)	13 (24) (p=0,005)	0 (p=0,004)	9 (18,75) (p=0,004)	1 (2,1) (p=0,025)

**Conclusions:** We observed that enthesitis involvement was not seldom in patients with seronegative RA. Furthermore there were also similar frequency of entesis involvement in seropositive patients with RA. The value of enthesitis sites evaluation for the differential diagnosis of patients with seronegative RA should be further investigated and the assessment of enthesitis sites in seronegative and seropositive RA patients can be important to detect active and chronic changes at the enthesitis region.

### PATIENT EMPOWERMENT THROUGH THE USE OF A MOBILE PHONE APPLICATION: THE EXPERIENCE OF RHEUMABUDDY IN ITALY

A. Alunno<sup>1</sup>, L. Andreoli<sup>2</sup>, L. Quartuccio<sup>3</sup>, F. Carubbi<sup>4,5</sup>, on behalf of the Italian Society of Rheumatology Committee for young rheumatologists (SIRyoung).  
<sup>1</sup>Department of Medicine, Rheumatology Unit, University of Perugia, Perugia;  
<sup>2</sup>Department of Clinical and Experimental Sciences, Rheumatology and Clinical Immunology, Spedali Civili and University of Brescia, Brescia;  
<sup>3</sup>Department of Medical and Biological Sciences, Rheumatology Clinic, Azienda Ospedaliero-Universitaria 'S. Maria della Misericordia', Udine;  
<sup>4</sup>Department of Biotechnological and Applied Clinical Sciences, Rheumatology Unit, University of L'Aquila;  
<sup>5</sup>Department of Medicine, ASL 1 Avezzano-Sulmona-L'Aquila, L'Aquila, Italy

**Background:** Patient education and empowerment are cornerstones in the management of rheumatic and musculoskeletal diseases (RMDs). In fact, they improve the physician-patient relationship and ensure a successful shared decision making process. In recent years, the exponential growth of interactive media and the progress of technology led to the parallel development of digital health-care and the evaluation of how tools like mobile applications (app) can contribute to patient empowerment. Rheumabuddy has been developed thanks to the collaboration of the Danish association of young patients with RMDs (FNUG) and a Danish agency specialised in digital healthcare (Daman). RheumaBuddy is designed for young patients (18–35 years old) with chronic arthritis and integrates the function of a diary to monitor the main features of the disease (e.g. pain, stiffness, fatigue) and a forum to interact with other users and provide mutual help.

**Objectives:** We aimed at developing the Italian version of RheumaBuddy to make it available to Italian patients with RMDs.

**Methods:** The Italian Society of Rheumatology Committee for young rheumatologists (SIRyoung) translated the content of the app from English to Italian adapting when needed because of language incompatibility.

**Results:** The Italian version of RheumaBuddy was launched on the 12th October 2017 (World Arthritis Day) in partnership with national patient associations (ANMAR and APMAR). The app was also presented via a press release from the Italian Society of Rheumatology. To date, RheumaBuddy was downloaded by 1182 users with 822 of them currently using the app on a regular basis. The feedback collected so far highlighted the usefulness of the app and pointed out potential weaknesses and issues to be tailored to the Italian population. The gathering of feedback from users is still ongoing.

**Conclusions:** We developed the Italian version of RheumaBuddy, which is currently used by a consistent number of young patients with chronic arthritis. A board including patient representatives, rheumatologists and the app developers will be established to specifically tailor the app according to the needs and priority of Italian users and based on the feedback collected.

### EFFICACY AND COST ANALYSIS OF A SYSTEMATIC SWITCH FROM ORIGINATOR INFILIXIMAB TO BIOSIMILAR CT-P13 OF ALL PATIENTS WITH INFLAMMATORY ARTHRITIS FROM A SINGLE CENTRE

A. Valido<sup>1</sup>, J. Silva-Dinis<sup>1,2</sup>, M.J. Saavedra<sup>1,2</sup>, N. Bernardo<sup>3</sup>, J.E. Fonseca<sup>1,2</sup>.  
<sup>1</sup>Rheumatology, Hospital Santa Maria – CHLN; <sup>2</sup>Rheumatology Research Unit, Instituto de Medicina Molecular, Faculty of Medicine, University of Lisbon; <sup>3</sup>Trading unit – Purchasing management service, Hospital Santa Maria – CHLN, Lisbon, Portugal

**Objectives:** The aim of this study was to analyse efficacy, safety and cost savings of switching from infliximab originator (IFXor) to the biosimilar (BS) CT-P13 in single centre.

**Methods:** Eligible patients were those older than 18 years old with the diagnosis of rheumatoid arthritis (RA), spondylarthritis (SpA) and psoriatic arthritis (PsA) on treatment (Tx) with IFXor for at least 6 months and with stable disease activity. In December 2016 all eligible patients were proposed to switch to CT-P13. At the day of the last Tx with IFXor, informed consent, data and blood samples were collected. On the next Tx day, CT-P13 was administered after standard evaluation of efficacy and safety. Efficacy was measured considering change from baseline in Disease Activity Score in 28 joints (DAS28) for RA and PsA and in Ankylosing Spondylitis Disease Activity Score (ASDAS) for SpA. Disease worsening was

considered when an increase of 1.2 from baseline in DAS28 or an increase of 1.1 in ASDAS occurred. A cost analysis was done based on the purchasing prices of the 2 drugs at our centre.

**Results:** In a 12 months period switch to CT-P13 was performed in 60 patients for non-medical reasons. Disease activity (DA) was stable over the observation period and similar to the values observed with IFXor. Median follow-up time was 261 days during which disease worsening occurred in 3 (5%) patients. 1 patient had a minor adverse event (oedema of the lip). These 4 (6.7%) patients stopped the BS. One returned to IFXor and the other 3 switched to another drug. The switch to CT-P13 represented a 26.4% reduction of costs in the use of IFX Tx in these patients.

**Abstract AB1231 – Table 1.** Numbers are medians unless otherwise stated.

	Total (n=60)	SpA (n=36; 60%)	RA (n=16; 27%)	PA (n=8; 13%)
Age (years)	53 (48–64)	50 (41–59)	59 (52–70)	56 (48–64)
Gender (n,% male)	39 (65%)	30 (83%)	2 (13%)	7 (88%)
Disease duration (years)	17 (10–23)	16 (10–22)	18 (13–24)	16 (10–22)
Patients on methotrexate	41 (68%)	20 (33%)	15 (25%)	6 (10%)
Patients with previous biologic therapy	4 (6.7%)	1 (2.8%)	3 (18.8%)	0 (0%)
Time on IFX originator before switch (years)	7.9 (6.5–11.9)	7.7 (6.4–12.3)	8.4 (6.7–12.4)	7.6 (6.7–9.6)
Time on CT-P13 since switch (months)	9 (7–11)	9 (7–11)	10 (9–10)	9 (4–10)

**Abstract AB1231 – Table 2.** Variables median from baseline to 9 months after switch to CT-P13. ESR – Erythrocyte Sedimentation Rate; CRP – C-Reactive Protein; PtGA – Patient global assessment of DA; PhGA – Physician global assessment of DA.

	Baseline	3 Months after switch	6 Months after switch	9 Months after switch	Variation from baseline to 9 Months after switch
ESR (mm/h)	15 (10–21)	17 (9–29)	15 (9–24)	15 (9–24)	0
CRP (mg/dL)	0.18 (0.80–0.57)	0.17 (0.06–0.50)	0.19 (0.10–0.46)	0.25 (0.10–0.72)	0.07
PtGA (0–100)	30 (20–50)	20 (30–50)	30 (3–50)	30 (15–50)	0
PhGA (0–100)	20 (10–30)	20 (10–30)	20 (0–30)	20 (10–30)	0

**Abstract AB1231 – Figure 1**

**Conclusions:** The switch in routine care of a group of RA, SpA and PsA patients from IFXor to CT-P13 did not affect efficacy and safety and reduced costs in 26.4%.

#### ESTIMATING THE ECONOMIC VALUE OF A PATIENT SUPPORT PROGRAM IN RHEUMATOID ARTHRITIS IN THE UNITED KINGDOM

A. Ostor<sup>1</sup>, V. Garg<sup>2</sup>, M. Yang<sup>3</sup>, C. Chamberlain<sup>4</sup>, M. Skup<sup>2</sup>. <sup>1</sup>Cabrini Medical Centre, Melbourne, Australia; <sup>2</sup>AbbVie, Chicago; <sup>3</sup>Analysis Group, Inc.; <sup>4</sup>Analysis group, Inc., Boston, USA

**Background:** A Patient Support Program (PSP) offered by AbbVie to adalimumab-treated patients assists them with issues pertaining to medication costs, nurse support, injection training, pen disposal, and medication reminders. A number of studies have reported the benefit of enrollment in this PSP from different perspectives, including clinical, patient-reported, and adherence outcomes.<sup>1–2</sup> There is limited information available on the economic value of the PSP.

**Objectives:** To estimate the incremental economic value associated with enrollment in the PSP for adalimumab-treated patients with rheumatoid arthritis (RA) from a UK societal perspective.

**Methods:** An Excel-based economic model was developed to describe adalimumab-treated PSP enrollees over non-enrollees in terms of a) improvement in clinical status as measured by the Health Assessment Questionnaire Disability Index (HAQ-DI), which resulted in reduced healthcare resource utilisation (HRU), and b) improvement in work productivity as measured by the Work Productivity and Activity Impairment Questionnaire (WPAI). The associated incremental direct and indirect cost savings were estimated over a 12 month period. Scores on HAQ-DI, work productivity impairment, and employment rate were obtained from a prospective, observational Phase IV study assessing patient satisfaction and outcomes in the context of the PSP (AbbVie Care) among RA patients (NCT01383421, PASSION)<sup>1</sup>. Inputs from literature and UK-specific publically available sources were used to model the association between HAQ-DI score categories (0 –<0.6, 0.6 –<1.1, 1.1 –<1.6, 1.6 –<2.1, 2.1–3) and HRU among RA patients, and to obtain unit costs of HRU (i.e., hospitalizations, specialist visits, imaging assessments) and weekly work compensation.

**Results:** In PASSION, a greater proportion of PSP enrollees were in the lower HAQ-DI categories (i.e., better outcomes) and enrollees had greater reduction in total work impairment than non-enrollees after treatment with adalimumab. Assuming a population of 10 000 adalimumab-treated RA patients in the UK, this was associated with an incremental annual cost saving of £2,320,809 should all these patients enrol in the PSP. The largest proportion of incremental cost saving resulted from the reduction in RA-related hospitalizations (£1,550,637; 66.8%). Cost saving due to improved work productivity accounted for the second largest proportion (£686,963, 29.6%). Specialist visits and imaging assessments accounted for 1.9% (£44,564) and 1.7% (£38,645) of the total incremental cost saving, respectively.

**Conclusions:** Enrollment in AbbVie's PSP was shown to be associated with incremental cost saving among adalimumab-treated RA patients due to reduced resource utilisation and improved work productivity.

#### DOES TIME MATTER? A SYSTEMATIC REVIEW TO ASSESS THE RELATIONSHIP BETWEEN DELAY IN DIAGNOSIS AND COSTS IN DMARD-NAÏVE RA PATIENTS

I. Sahbudin<sup>1,2</sup>, R. Singh<sup>1,2</sup>, J. Trickey<sup>2</sup>, A. Tracy<sup>3</sup>, K. Raza<sup>2,3</sup>, A. Filer<sup>1,2</sup>, A. Boonen<sup>4</sup>. <sup>1</sup>Department of Rheumatology, University Hospitals Birmingham NHS Foundation Trust, Queen Elizabeth Hospital Birmingham; <sup>2</sup>Rheumatology Research Group, Institute of Inflammation and Ageing, University Hospitals of Birmingham; <sup>3</sup>Department of Rheumatology, Sandwell and West Birmingham Hospitals NHS Trust, Birmingham, UK; <sup>4</sup>Maastricht University Medical Center and Caphri Research Institute, Maastricht University, Maastricht, Netherlands

**Background:** Early diagnosis is crucial to enable timely DMARDs initiation in RA patients. Although, early treatment improves clinical outcomes, it is unclear whether this has a similar impact on health economic outcomes. Early DMARDs

intervention may avert the requirement of expensive biological therapy as second-line treatment, which leads to improved overall cost-effectiveness. As a first step to address this issue, we performed a systematic literature review to appraise existing evidence relating to delay in diagnosis and cost-of-illness in DMARD-naïve newly-diagnosed RA patients.

**Objectives:** To identify whether disease duration before initiation of first DMARD therapy is a determinant of subsequent direct and indirect costs in DMARD-naïve RA patients.

**Methods:** We systematically searched Pubmed, EMBASE, CINAHL and Medline databases for published literature relating to rheumatoid arthritis, and direct and/or indirect costs. We included studies with DMARD-naïve patients who fulfilled the 1987 ACR or 2010 ACR/EULAR classification criteria for RA. We excluded: <sup>1</sup> studies on non-rheumatoid arthritis patients; <sup>2</sup> conference abstracts, systematic reviews or review articles; <sup>3</sup> studies with no documented symptom duration prior to diagnosis; <sup>4</sup> studies which did not report direct and/or direct costs and/or health utilisation. All studies were required to report their methods and sources of respective cost measurements. We extracted the following data from each study; <sup>1</sup> study design; <sup>2</sup> potential determinants of RA cost; <sup>3</sup> health economic outcomes and <sup>4</sup> source of unit cost for the health-resources.

**Results:** A total of 173 records were identified in the systematic search, five of which included in the analysis. Two were cost-of-illness studies within the context of observational studies and the remaining were cost-of-illness studies alongside clinical trials. The health outcomes reported were heterogeneous: 1) Direct medical costs were reported in three studies; 2) Indirect non-medical costs were reported in one study and 3) Health-care utilisation was reported in one study. Only one study reported indirect costs from the societal perspective e.g. work disability. The definition of symptom duration was not specified in any studies. Three studies reported disease duration of one year or less and two studies reported symptom duration of six months and <two years. The timing and duration of the reported health economic outcomes varied widely (figure 1). The direct medical costs for three papers were adjusted for purchasing power parities and consumer price index for 2017 US Dollars.

Abstract AB1233 – Figure 1

**Conclusions:** Data on the relationship between symptom duration and costs in DMARD-naïve RA patients is limited. Comparability between studies is hampered due to heterogeneity of the definition for symptom/disease duration and the health economic outcomes reported. An inception cohort of suspected/early RA should include data in resource utilisation and costs studies to identify the relationship between symptom duration and health economic outcomes.

**AB1234** **WHAT HAPPENS IF IT ISN'T EARLY INFLAMMATORY ARTHRITIS? A RETROSPECTIVE CASE NOTE REVIEW OF PATIENTS REFERRED TO OUR EIA SERVICE WHO DID NOT HAVE EIA**

A.G. Pulikal<sup>1</sup>, T. Ahmed<sup>2</sup>, S. Levy<sup>2</sup>. <sup>1</sup>Medical Student, St George's University of London; <sup>2</sup>Rheumatology, Croydon University Hospital, London, UK

**Background:** Early inflammatory arthritis (EIA) has been a flagship subject for Rheumatology in the last few years. There has been a lot of interest in the patients diagnosed with EIA but less is known about those who enter the EIA pathway and are subsequently found not to have EIA.

**Objectives:** This study looks at the diagnoses and management of those discharged from the EIA pathway and what impact this has on resources, management and time. Croydon University Hospital Rheumatology Department has been running an Early Inflammatory Arthritis service incorporating ultrasound since 2014. In this study we are looking at patients that were referred to the EIA Pathway from August 2014 to August 2015.

**Methods:** To collect the data we looked at the patient records from our clinical system, Cerner Millennium. We recorded the clinical impression on first appointment, final diagnosis, additional investigations, referrals to therapies and other specialists and those that were discharged within the 6 weeks of referral. The data was analysed using <sup>Microsoft Excel 2010</sup>

**Results:** Of the 368 patients who were referred to the EIA pathway 140 (38%) were not diagnosed with EIA. The final diagnosis of these patients was osteoarthritis 29 (26%), no rheumatological diagnosis 16 (14%), soft tissue abnormality 11 (9.8%), gout 7 (6.3%), fibromyalgia/hypermobility 7 (6.3%), SLE 5 (4.5%) and polymyalgia rheumatica 4 (3.6%). The remainder, 29 (26%), had miscellaneous rheumatological diagnoses. Of the 140 patients, 28 were thought to have possible EIA on the first consultation. The final diagnosis in this group was osteoarthritis 7 (25%), no rheumatological diagnosis 7 (25%), soft tissue/musculoskeletal injury 3 (11%) and fibromyalgia 2 (7%). The remainder had miscellaneous diagnosis 9 (32%). All patients had routine bloods and x-rays. In addition, musculoskeletal ultrasound was carried out in 22, MRI in 12, CT in 3, EMG in 4 and 3 patients underwent bone density scanning. 13 were referred on to physiotherapy (8 were to hand therapy). 5 were referred to other medical specialities. 30 patients were discharged within 6 weeks.

**Conclusions:** This is the first study looking at those who did not have EIA. The Best Practice Tariff for EIA states that those without EIA should be discharged back to the GP within 6 weeks. We have shown that these patients have a variety of rheumatological diagnoses that require investigation, referral and treatment with the majority (79%) remaining under our care at 6 weeks. This study highlights the resources needed to manage the patients attending rheumatology via the EIA pathway who do not have EIA and this should be taken into account when such a service is developed.

**AB1235** **WORK PRODUCTIVITY AMONG WORKERS WITH AXIAL SPONDYLOARTHRITIS**

C.A. Lopes<sup>1,2</sup>, F.M. Pimentel-Santos<sup>1,2</sup>, M. Mateus<sup>1</sup>, J.C. Branco<sup>1,2</sup>.

<sup>1</sup>Rheumatology, HOSPITAL EGAS MONIZ – CHLO; <sup>2</sup>CEDOC, NOVA Medical School, NOVA University of Lisbon, Lisbon, Portugal

**Background:** Axial Spondyloarthritis (axSpA) usually starts in early adulthood and the lifetime impact of the disease can be considerable. Pain, stiffness, sleep disturbances contribute to health-related quality of life reduction with significant impact in work productivity. Absenteeism and presenteeism are still responsible for high costs associated with the disease.

**Objectives:** Assess absenteeism, presenteeism, work and daily-activities impairment and their related associated factors in patients with axSpA.

**Methods:** Cross-sectional postal, unicenter, non-interventional study. Patients fulfilling the Assessment of Spa International Society Classification criteria for axSpA under working age were included. Two groups were defined: A) patients under current anti-TNF; B) patients under conventional therapy. Quantitative and qualitative surveys were performed: Work Productivity and Activity Impairment Questionnaire in SpA (WPAI); participants' experiences of working and their perceptions of how their condition had affected their work capacity and workplace relationships were recorded. The questionnaires were applied through a telephone call, after consent of the participant and respecting anonymity.

**Results:** 60 patients were included (table 1). No significant differences were found between the two groups. They worked on average 42±14.7 hours per week (h/w) and missed 2.3±4.1 h/w due to axSpA. Mean absenteeism, presenteeism, work and activities impairment due to axSpA were 6.8%, 32%, 35% and 41%, respectively. The univariable analysis showed correlations between absenteeism and Visual Analogue Scale physician (pVAS) (p=0.027); presenteeism and Anquilosing Spondylitis disease activity score – C reactive protein (ASDAS-CRP) (p=0.002), Bath AS Disease Activity Index (BASDAI) (p=0.03), Bath AS Functional Index (BASFI) (p=0.02), VAS patient (pVAS) and phVAS (p=0.01, p=0.006), erythrocyte sedimentation rate (ESR) (p=0.03), CRP (p=0.024); percent overall work impairment and ASDAS-CRP (p=0.002), BASDAI (p=0.019), BASFI (p=0.026), pVAS and phVAS (p=0.016, p=0.01), ESR (p=0.03) and CRP (p=0.03); percent activity impairment and BASDAI (p=0.006), BASFI (p=0.004), pVAS (p=0.0004) and phVAS (p=0.007). No correlation was found between work productivity and anti-TNF medication, education or marital status. Regression analysis revealed that BASDAI, BASFI, pVAS, phVAS and CRP accounted for 63% of the variance of presenteeism, with 10 points increase in pVAS resulted in an increase of 17% in presenteeism (p=0.046). Over time, 95% had already gone to work sick: economic reasons (60%), not liking staying at home even sick (43%) and importance of work (35%) were the major reasons to presenteeism. Overall, 63% considered that the disease can limit their projects or career progression; 56% had already cancelled or postponed work; 20% had already changed jobs and 15% stated that had already felt discriminated.

**Abstract AB1235 – Table 1.** Patient demographics and clinical variables.

		Group A under current biological therapy (for at least 6 months n=31)	Group B conventional therapy n=29	p- valu e
Patients	Male, female: n (%)	16 (52%); 15 (48%)	21 (72%); 8 (28%)	0.1
	Age: median (min-max)	40 (29-66)	43 (22-66)	0.6
Education	Primary education (5-11 ages)	8	4	0.5
	Secondary education (11-18 ages)	13	15	
	Tertiary education (> 18 ages)	10	10	
Clinical characteristics	Number of anti-TNF: median (min-max)	1 (1-4)	NA	
	Anti-TNF duration (months): mean (min-max)	30 (6-63)	NA	
	ASDAS CPR (mean, SD)	1.59 ± 0.97	1.95 ± 1.04	0.1
	BASDAI (mean, SD)	2.95 ± 2.13	2.41 ± 2.11	0.3
	BASFI (mean, SD)	3.04 ± 2.92	1.82 ± 2.43	0.3
	VAS patient (0-100) (mean, SD)	31.04 ± 24.53	27.13 ± 28.88	0.4
	VAS physician (0-100) (mean, SD)	13.35 ± 15.99	15.96 ± 16.81	0.5
	ESR (mm/h) (mean, SD)	13.35 ± 9.05	14.21 ± 11.11	0.9
	CRP (mg/d) (mean, SD)	0.56 ± 0.56	0.74 ± 0.82	0.4
	CRP (mg/d) (mean, SD)	0.56 ± 0.56	0.74 ± 0.82	0.4
Work Productivity and Activity Impairment Questionnaire in Spa (WPAI)	Absenteeism (Percent work time missed due to problem) (%)	7.6%	5.8%	0.6
	Presenteeism (Percent impairment while working due to problem) (%)	30.9%	34%	0.7
	Percent overall work impairment due to problem (%)	34.2%	35.9%	0.9
	Percent activity impairment due to problem (%)	43.5%	37.9%	0.4

**Conclusions:** Presenteeism, impairment of work productivity and activity were correlated with disease activity and physical functioning, with the increase of VAS physician resulting in increase in presenteeism. Economic reasons were the major factors to presenteeism and the majority of patients considered that the disease can limit their projects or career progression.

#### AB1236 THERAPEUTIC ADHERENCE AND SATISFACTION IN A RHEUMATOLOGY CONSULTATION

C. Iñiguez Ubiaga, C. Moriano, M. Garijo Bufort, A. Crespo Golmar, I. Gonzalez Fernandez, C. Alvarez Castro, A. Lopez Robles, M. Martin Martinez, E. Diez Alvarez, T. Perez Sandoval. *Unidad de Reumatología, Complejo Hospitalario de León, León, Spain*

**Background:** The lack of treatment adherence to is considered the main reason for therapeutic failure. It entails a high health care cost, both direct and indirect, affecting the patient's morbidity and mortality. In order to measure this adherence, there are different methods, which can be both objective and subjective. The ideal is the combination of both types in order to ensure that the data are as close as possible to reality.

**Methods:** We carried out an anonymous voluntary survey in October 2017 concerning the degree of satisfaction and therapeutic adherence of patients under follow-up in outpatient Rheumatology Consultations, selecting demographic data from them and using a MARS questionnaire for chronic diseases, which is validated in Spanish. This questionnaire consists of 30 questions that include items about beliefs, experiences and behaviour in terms of health. A score higher than 25 indicates good compliance, while a score lower means a suboptimal compliance.

**Results:** 201 surveys were collected, excluding those patients whose consultation was the first one and those who rejected their participation. The data analysis was performed descriptively with Microsoft Excel. 61% of the surveys collected were carried out by women, with an age range between 55 and 70 years (35%). 45% of the patients surveyed had a basic level of education and 28% had an average level of education, representing both of them three quarters of our sample. When we analyse the treatments that our patients receive, the most prevalent are the DMARDs, which represent 35% of the treatments, followed by the corticotherapy and biological drugs (25% and 16% respectively). Approximately 50% of the survey respondents stated that they had no problems with their medication, and in a small percentage (14%), they claimed they had problems, mostly digestive in relation to the administration of subcutaneous Methotrexate. A 14.92% of questionnaires that were not correctly completed were discarded. Out of the 171 surveys, only one respondent was considered to have a good compliance, being the compliance of the remaining respondents suboptimal. This can be influenced by the limitations of understanding due to the language used, taking into account the characteristics of our population, mainly aged and with a primary level of education, as well as the place where the survey was completed. We obtained 74% of satisfaction with the information shared in the consultation, 73% considered that enough time was devoted to said consultation and 98% said they followed the treatment regimens. However, 11% and 21% said they changed the regimen according to their lifestyle and according to how the treatment made them feel and only 55% had clear treatment options available.

**Conclusions:** The lack of therapeutic adherence is one of the fundamental factors of therapeutic failure. There is no a single method for its assessment. Our patients show a suboptimal therapeutic compliance, although we have to take into

account the limitations of the survey carried out. We must bear in mind the sociological aspects that can hinder adherence and re-assess it periodically for possible changes, as well as individualise each patient.

#### AB1237 PATIENTS' PERSPECTIVES AND EXPERIENCE OF PSORIASIS AND PSORIATIC ARTHRITIS: A SYSTEMATIC REVIEW AND THEMATIC SYNTHESIS OF QUALITATIVE STUDIES

D.J. Sumpton<sup>1,2,3</sup>, A. Kelly<sup>3,4,5</sup>, D.J. Tunnicliffe<sup>2,3</sup>, J.C. Craig<sup>2,3</sup>, G. Hassett<sup>6</sup>, D. Chessman<sup>6</sup>, A. Tong<sup>2,3</sup>. <sup>1</sup>Department of Rheumatology, Concord Repatriation General Hospital, Sydney; <sup>2</sup>Sydney School of Public Health, The University of Sydney; <sup>3</sup>Centre for Kidney Research, The Children's Hospital Westmead, Sydney; <sup>4</sup>Department of Rheumatology, Canberra Hospital, Canberra; <sup>5</sup>Department of Rheumatology, Liverpool Hospital, Sydney; <sup>6</sup>Department of Rheumatology, Liverpool Hospital, Sydney, Australia

**Background:** Patients with psoriasis and psoriatic arthritis have a lower health related quality of life than the normal population and experience high rates of treatment dissatisfaction<sup>1</sup>. The complexity of unmet needs in diagnosis and treatment<sup>2</sup> necessitate a deep understanding of the experience of people with both conditions to guide development of outcomes important to patients and improve patient centred care.

**Objectives:** To describe the perspectives and experiences of patients with psoriasis and psoriatic arthritis.

**Methods:** Databases (MEDLINE, Embase, PsycINFO, CINAHL) were searched to October 2016. Thematic synthesis was used to analyse the findings.

**Results:** From 46 studies (n=37 psoriasis and n=9 psoriatic arthritis) involving 1290 adult patients with psoriasis (n=1105) and psoriatic arthritis (n=185) we identified six themes (with subthemes): suffering uncontrollable and ongoing upheaval (dictating life choices and course, disrupting role functioning, limited by debilitating symptoms, unstoppable and far reaching fatigue); weighed down by mental load (struggling with unrecognised distress, anxiety provoked by the volatility and constancy of symptoms, depleting motivation and pleasure); harbouring shame and judgement (marked as unhygienic and contagious, rejected and isolated, resenting own appearance, pain and embarrassment in intimacy); demoralised by inadequacies and burden of therapy (disappointed by unmet expectations of treatment benefit, daily drudgery, deterred by unpalatable or inconvenient treatments, disempowered by lack of personalised care, fearing long term side effects); gaining control (making sense of the condition, shutting the disease out, accepting a new health status, attuning to the body); and making confident treatment decisions (trading off perceptible benefits against safety and convenience, relying on family input, reassured by clinician acknowledgement of fears, seeking empowering relationships with clinicians).

**Conclusions:** Patients with psoriasis and psoriatic arthritis contend with profound disruption in their functioning, roles and life course; fear deterioration of their health; and have unmet expectations about their treatment and care. Patients with psoriasis feel marked by their disease, stigmatised and rejected by others while patients with psoriatic arthritis experience social withdrawal and depleted motivation due to fatigue, joint impairment and pain. Establishing therapeutic relationships, addressing treatment expectations, and supporting psychosocial needs may help to improve satisfaction and outcomes in patients with psoriasis and psoriatic arthritis.

#### AB1238 THE SELF-MANAGEMENT MODEL IN THE AGENDA OF SUCCESSIVE CONSULTATIONS IN RHEUMATOLOGY

D. Castro Corredor. *Rheumatology service, Hospital General Universitario De Ciudad Real, Ciudad Real, Spain*

**Background:** The rheumatology service of Ciudad Real Hospital, located in an autonomous community of that same name that is nearly in the centre of Spain, implemented a self-management model of successive appointments more than

10 years ago. Since then, the physicians of the department schedule follow-up visits for their patients depending on the disease, its course and ancillary tests.

**Objectives:** The purpose of this study is to evaluate and compare the self-management model for successive appointments in the rheumatology service of Ciudad Real Hospital versus the model of external appointment management implemented in 8 of the hospital's 15 medical services.

**Methods:** A comparative and multivariate analysis was performed to identify variables with statistically significant differences, in terms of activity and/or performance indicators and quality perceived by users. The comparison involved the self-management model for successive appointments employed in the rheumatology service of Ciudad Real Hospital and the model for external appointment management used in 8 hospital medical services between January 1 and May 31, 2016.

**Results:** In a database with more than 1 00 000 records of appointments involving the set of services included in the study, the mean waiting time and the numbers of non-appearances and rescheduling of follow-up visits in the rheumatology department were significantly lower than in the other services. The number of individuals treated in outpatient rheumatology services was 7,768, and a total of 280 patients were surveyed (response rate 63.21%). They showed great overall satisfaction, and the incidence rate of claims was low.

**Conclusions:** Our results show that the self-management model of scheduling appointments has better results in terms of activity indicators and in quality perceived by users, despite the intense activity. Thus, this study could be fundamental for decision making in the management of health care organisations.

#### AB1239 THE BRAZILIAN RHEUMATOLOGY TRIAGE: AN ASSESSMENT OF THE PRIMARY HEALTHCARE SYSTEM

F.M. Borghi<sup>1,2</sup>, B.B.R. Chu<sup>2</sup>, D.N. Dias<sup>2</sup>, S.C. Kowalski<sup>2</sup>, P.R. Donadio<sup>3</sup>.  
<sup>1</sup>Universidade Federal do Parana, Maringá; <sup>2</sup>Universidade Federal do Parana, Curitiba; <sup>3</sup>Universidade Estadual de Maringá, Maringá, Brazil

**Background:** There are more than 100 rheumatic diseases involving 10% of the population. Their clinical manifestations and treatment vary but generally progress to disability. Recently, new technologies in rheumatology are available for diagnosis and treatment. However, the timely diagnosis and access to treatment are essential to prevent disability. Many barriers for the access to the rheumatologist have been identified, namely: population lack of knowledge regarding rheumatic diseases, lack of prioritisation in the reference process from primary care to rheumatologists, and scarcity of rheumatologists. Therefore, it is fundamental to address all the barriers and present facilitators in the healthcare system to ensure that rheumatic patients have timely access to rheumatologists.

**Objectives:** To assess the primary healthcare triage system in Maringá, a countryside city in the state of Parana-Brazil. Mainly, identifying barriers (waiting time from symptoms to primary care visit, to timely access to rheumatologists and beginning the treatment).

**Methods:** This is a cross-sectional study. The population of Maringá in 2016 was 399.605 people. There were 1200 patients in the waiting list for rheumatologists (2016). Medical records were analysed to describe the format and content of referrals, the duration of symptoms, exams ordered, and diagnosis agreement with rheumatologists.

**Results:** Medical records of 774 women and 147 men were analysed. The mean (SD) age was 55,1 (16)yrs. old. The median (IQR) time from symptoms to the rheumatologic visit was 16 mo. (9 to 28). About 10% of the referrals did not mention any detail about physical examination or diagnosis. 207 (22%) had diagnosis of gout, osteoporosis, rheumatoid arthritis, spondyloarthritis, and systemic lupus erythematosus. 111 patients (10%) cancelled their visits.

**Conclusions:** The period from the symptoms to the visit with rheumatologists was large. The format and content of the referrals were incomplete. There were many patients that cancelled the visits with unknown prognosis. Educational

initiatives should be implemented in Maringá-Brazil to enhance the skills of the primary care physicians to establish referral priorities and to start timely treatment.

#### AB1240 EFFECT OF A MULTIDISCIPLINARY APPROACH IN THE PHARMACOLOGICAL THERAPY PROCESS FOR PATIENTS WITH RHEUMATOID ARTHRITIS IN A SPECIALISED RHEUMATOLOGY CENTRE

D. Buitrago-García<sup>1</sup>, L. Villarreal-Peralta<sup>2</sup>, P. Santos-Moreno<sup>3</sup>. <sup>1</sup>Epidemiology, SIIES; <sup>2</sup>Healthcare Management; <sup>3</sup>Rheumatology, Biomab, Center For Rheumatoid Arthritis, Bogota, Bogota, Colombia

**Background:** Rheumatoid arthritis (RA-9 is an inflammatory autoimmune disease with a prevalence of 0.2% to 1%.<sup>1</sup> Although the advances in pharmacological treatments offered to manage the disease have achieved many goals, the disappearance of symptoms and disabilities are accomplished by a small proportion of patients with RA.<sup>2</sup> However, patients need a follow up where a multidisciplinary team care programs for patients with RA take into consideration not only the disease activity but psychosocial, adherence and other aspects that conventional care does not take into account, showing a positive effect in all life aspects of a patient with RA.<sup>2,3</sup>

**Objectives:** To evaluate the effectiveness regarding, treatment, safety and rehabilitation in patients with a complex disease activity through a multidisciplinary care management.

**Methods:** Once a rheumatologist identified a patient with RA with indication to begin biological therapy or switching from one biological to another, a checklist and an evaluation was performed, then the patient was presented in a multidisciplinary team meeting where a rheumatologist, pharmaceutical chemist, psychologist, physiatrist and a nurse assessed the particular case of the patient. Additionally, an ultrasound was performed in every patient in order to evaluate disease activity. Based on the patient's disease activity, adherence to treatment, psychosocial and economic factors the pharmacological therapy and management of the patient was prescribed.

**Results:** During 18 months 551 patients were evaluated by a multidisciplinary team, 90% to define the pharmacological therapy, and 10% for biologic switching. Mean DAS28 of patients was 3.79±1.37, once the patients were evaluated the choices made by the team were: 60% continued in follow-up receiving conventional DMARDs therapy because ultrasound didn't show any disease activity; finally biological therapy was initiated in 21% and switching among biologicals was made in 11%. conventional therapy was adjusted in 5% of patients, and discontinuation of therapy due to non-adherence of patients or other reasons was ordered in 3%.

**Conclusions:** As other studies have shown, a multidisciplinary assessment of the patient with RA from different viewpoints allows taking into consideration aspects that are not linked only to the pharmacological therapy but to other aspects in a patient's life. Also we avoided high costs therapies for the management of rheumatoid arthritis, therefore we contribute not only to the health outcomes of patients but the health economic aspects in the management of RA.

### AB1241 HIGH LEVELS OF PATIENT SATISFACTION IN A PUBLIC HOSPITAL STREAMED RHEUMATOID ARTHRITIS CLINIC COHORT

D. Wang<sup>1</sup>, T. Kovitwanichkanont<sup>2,3</sup>, N. Walpolo<sup>1</sup>, S. Raghunath<sup>1,2</sup>, L. Kyi<sup>2</sup>, S. Pignataro<sup>2</sup>, S. Morton<sup>2</sup>, M. Leech<sup>1,2</sup>. <sup>1</sup>Department of Medicine, Monash University, <sup>2</sup>Rheumatology, Monash Health, Melbourne, <sup>3</sup>Sydney School of Public Health, University of Sydney, Sydney, Australia

**Background:** Many Australian public rheumatology services have now adopted streamed clinics for RA and specific rheumatic diseases to promote best practice care. Our RA clinic has been operating for a decade and serves a large population in Southeast Victoria. Patient attitudes to such streamed clinics have not been extensively examined, despite the integral role patient satisfaction plays in decisions about how health care is delivered<sup>[1,2]</sup>.

**Objectives:** To evaluate the level of patient satisfaction in an established tertiary hospital streamed RA clinic.

**Methods:** A cross-sectional study of 106 patients was undertaken at a public RA outpatient's clinic. Eight domains included questions which evaluated clinic administration, the consultation itself, and overall experience using a Likert scale ranging from 1–5 (1=very poor, 5=very good). Qualitative comments were also recorded.

**Results:** Patient attitudes toward the clinic were predominately positive. 90.5% of patients scored their overall experience as good<sup>4</sup> or very good<sup>5</sup> (mean=4.46), with 69.8% of these patients scoring 5. Questions regarding the consultation itself received the highest satisfaction scores. Patients were highly satisfied with the explanations given about their condition or treatment (mean=4.59), addressing of patient concerns (mean=4.56) and length of consultation (mean=4.52). Waiting time received the lowest satisfaction score (mean=3.25), and a further 36.4% of qualitative comments expressed dissatisfaction with the long wait times. 15.2% of qualitative comments regarded limited parking at the hospital, and 9.1% to difficulty locating the clinic within the hospital. 6.1% of patients wanted more information regarding complementary medications or lifestyle modifications. Despite this, 94.7% of all patients surveyed would recommend the clinic to friends or family.

**Abstract AB1241 – Table 1**

Category	Question	Mean
Clinic administration	Ease of booking appointments	4.36
	Waiting time	3.25
Consultation	Explanations given by doctor/nurses	4.59
	Questions and concerns answered to your satisfaction	4.56
	Amount of time	4.52
Overall Experience	Rating of overall experience	4.46
	Would you recommend clinic to friends/family	Yes=94.74% No=5.26%

**Conclusions:** High levels of patient satisfaction with the streamed RA clinic consultation outweighed frustrations with wait times and parking. This is demonstrated by the high overall rating and most patients being likely to recommend the clinic, and highlights the priority and importance of good communication for patient satisfaction. These findings can guide areas of future improvement to the quality of patient experience. From the perspective of patients, streamed disease clinics like this RA clinic appear to be highly acceptable in the provision of specialised care, and have garnered extremely positive patient satisfaction and feedback.

### AB1242 COMPARING ADHERENCE TO TREATMENT IN LUPUS AND VASCULITIS PATIENTS

E. Ntatsaki<sup>1,2</sup>, B. Ali<sup>3</sup>, S. Hamour<sup>4</sup>, D. Isenberg<sup>1</sup>, A.D. Salama<sup>4</sup>. <sup>1</sup>Rheumatology, University College London, London; <sup>2</sup>Rheumatology, Ipswich Hospital NHS Trust, Ipswich; <sup>3</sup>Medicine, Mid Essex Hospital Services Trust, Chelmsford; <sup>4</sup>Nephrology, Royal Free Hospital, London, UK

**Background:** Good adherence to prescribed pharmacotherapy is often over-estimated by physicians. Although in Systemic Lupus Erythematosus (SLE) non-adherence is well-researched,<sup>1</sup> less research exists for vasculitis.

**Objectives:** We compared cohorts of patients with SLE and vasculitis to identify emerging patterns, behaviours and differences that could introduce barriers to adherence.

**Methods:** With patient input, we designed and undertook an anonymised questionnaire-based survey on the assessment of self-reported adherence and influencing factors in lupus and vasculitis clinics at University College Hospital (UCLH) and Royal Free Hospital (RFH). Both serve a largely urban and ethnically diverse population.

**Results:**

**Abstract AB1242 – Table 1**

	Lupus (n=110)	Vasculitis (n=75)	P value
Female	99/109 (91%)	43/73 (59%)	<0.001
Age>60 years	14/104 (14%)	34/68 (50%)	<0.001
Disease duration>10 years	61/106 (58%)	18/74 (24%)	<0.001
Self-rate Disease activity≥7/10	17/106 (16%)	16/70 (23%)	0.324
Kidney function Moderate or severe	32/96 (33%)	22/73 (30%)	0.659
Self-medicating	103/108 (95%)	69/72 (96%)	1.00
"Always taking tablets as prescribed"	70/102 (67%)	50/62 (81%)	0.104
"Managing well with medication"	52/103 (51%)	63/66 (96%)	0.0001
≥7/10 on Self rate Likert scale			
Attending>75% of clinic appointments	99/107 (93%)	72/72 (100%)	0.022

A total of 199 patients completed the questionnaire. 110 (55%) had lupus and 75 (38%) vasculitis. 14 (7%) patients reported having other conditions and thus excluded. 52% were Caucasian and 37% were born outside the UK. The majority (78%) were female and 28% were aged >60 years. Half were university graduates. Both centres had similar number of responses reducing bias. As shown in table 1, lupus patients were more females (p<0.001), younger (p<0.001), with longer disease duration (p<0.001) and commented that adherence decreased with time (p=0.011) compared to vasculitis patients. Conversely, the vasculitis patients had higher attendance at clinic appointments (p=0.022) and were more confident they could manage taking tablets correctly. 67% of lupus patients and 81% of vasculitis patients reported that they always took tablets as prescribed (p=0.104). Concerns of weight gain and osteoporosis worried patients on steroids. Changes in weight, appearance, nausea and fatigue were common side-effects for missed medications. A small number of patients cited religion or alternative therapies as a reason (<5%). Furthermore, as shown in fig 1, non-deliberate forgetfulness was the most common reason for non-adherence, in both groups. Overall, the majority of patients (96%) were self-medicating and reported taking an average of 5 different types of tablets, half of this for their Lupus/Vasculitis. Patients were well-informed about their condition and medications.

**Reasons relating to the Tablets/Medication**

**Abstract AB1242 – Figure 1**

**Conclusions:** Self-reported adherence was high in our cohort with differences between the two groups. "Forgetfulness" regarding medication and keeping track of hospital appointments were the commonest reasons for non-adherence rather than deliberate non-adherence. Therefore novel behavioural or electronic cues for medication, including mobile app use, and appointment alerts could lead to improvement. Further work is required to identify whether a different personalised approach in the lupus and vasculitis patients can improve adherence.

#### GETTING A HEEADSSS IN PSYCHOSOCIAL SCREENING: USE OF STANDARDISED CLINIC NOTE TEMPLATES FOR PSYCHOSOCIAL SCREENING IN A PAEDIATRIC RHEUMATOLOGY CLINIC

E. Brennan Treemarcki, J. Szymonifka, A. Adams, N. Pan, S. Taber, K. Onel.  
*Hospital for Special Surgery, New York, USA*

**Background:** Children and adolescents with rheumatic diseases are at risk for psychosocial challenges related to illness, treatment, and normal development and should receive psychosocial screening. Psychosocial assessments have been successfully utilised in other paediatric specialties, including oncology and gastroenterology. A common psychosocial screening tool is the HEEADSSS (home environment, education/employment, eating, activities, drugs, sexuality, suicide/depression, and safety). This tool is easy to remember, quickly administered, and modifiable for younger children.

**Objectives:** We conducted a quality improvement project aimed to increase psychosocial screening by providers in a single paediatric rheumatology clinic by instituting standardised follow up templates for juvenile idiopathic arthritis (JIA) and systemic lupus erythematosus (SLE) including the HEEADSSS assessment.

**Methods:** The quality improvement intervention evaluated in this study involved the creation of disease specific follow up note templates inclusive of the HEEADSSS assessment and introduction of the templates to the paediatric rheumatology fellows clinic. Charts of patients with an ICD-10 diagnosis of JIA or SLE were reviewed during a 3 month window prior to (February-April 2017) and after (October-December 2017) the intervention. Charts were reviewed for presence of 2 elements of the HEEADSSS assessment documented within the previous 12 months: smoking exposure (all patients) and sexual activity (ages 11 years and up). The proportion of patients with completed HEEADSSS assessment components pre- and post-intervention were compared using Fisher's exact test.

**Results:** Chart review included 36 patients pre- and 42 post-intervention (table 1). There was an increase in assessment of both measures in the period immediately following the intervention. Assessment of smoking exposure increased from 0.0% to 21.4% ( $p=0.003$ ) with greater but not significant improvement in SLE versus JIA patients (29.4% versus 16.4%,  $p=0.45$ ). Assessment of sexual activity in

patients 11 years and older increased from 13.0% to 37.5% ( $p=0.09$ ), although this comparison may be underpowered due to decreased sample sizes.

**Abstract AB1243 – Table 1.** Documentation status pre- and post- implementation of standardised follow up templates for providers.

	Pre-Intervention	Post-Intervention	p-value
Smoking assessed			
Overall	0/36 (0.0%)	9/42 (21.4%)	0.003
JIA	0/20 (0.0%)	4/25 (16.0%)	0.12
SLE	0/16 (0.0%)	5/17 (29.4%)	0.04
Sexual Activity (11+) assessed			
Overall	3/23 (13.0%)	9/24 (37.5%)	0.09
JIA	1/9 (11.1%)	2/8 (25.0%)	1.00
SLE	2/14 (14.3%)	7/16 (43.8%)	0.14

**Conclusions:** Introduction of standardised note templates with the HEEADSSS assessment has resulted in preliminary improvement in psychosocial screening by providers in a single paediatric rheumatology clinic as demonstrated by improved rates of screening for smoking exposure and a trend towards improved screening rates for sexual activity. Additional studies are needed to confirm these findings, and future studies will assess whether the improvement seen is sustained and whether usage of this template can be expanded to other paediatric patient populations.

**Acknowledgements:** We thank the EMR team for helping develop the note templates and the fellows for adopting these templates.

**Disclosure of Interest:** None declared

#### QUALITY LIFE IN PATIENTS WITH RHEUMATIC DISEASE, NON-RHEUMATIC DISEASES AND HEALTHY POPULATION

E.M. Cuervo<sup>1</sup>, on behalf of Grupo de investigación Espondiloartropatías, Universidad de La Sabana-Hospital Militar Central, A.M. Santos<sup>1</sup>, J.C. Rueda<sup>1</sup>, I. Angarita<sup>1</sup>, E.L. Saldarriaga, R. Giraldo<sup>1</sup>, J. Ballesteros<sup>1</sup>, I. Pelaez<sup>2</sup>, E. Forero<sup>3</sup>, J. Ramirez<sup>4</sup>, C. Toro<sup>4</sup>, J. Londono<sup>1</sup>. <sup>1</sup>Grupo de investigación Espondiloartropatías, Universidad de La Sabana-Hospital Militar Central, Chía, Colombia; <sup>2</sup>Hospital General de México, Ciudad de México, Mexico; <sup>3</sup>Universidad del Norte, Barranquilla; <sup>4</sup>Asociación Colombiana de Reumatología, Bogotá, Colombia

**Background:** Within public health strategies, the quality of life is a fundamental factor of intervention. The EQ-5D-3L is one of the most used instruments worldwide.

**Objectives:** To describe the change in quality of life and functional limitation of patients with rheumatic diseases compared to a healthy population and patients with other systemic diseases.

**Methods:** The EQ-5D-3L survey was used in 6693 people from 6 cities in Colombia. An analytical study was developed.

**Results:** In general, the healthy population ( $n=1104$ ) reported not to have problems according to the EQ-5D-3L (median: 98,34). Of the non-rheumatic patients ( $n=642$ ), 20% showed a moderate compromise because of pain and discomfort, as well as anxiety and depression. Twenty percent of patients with cardiovascular

disease (n=53) reported moderate limitation for mobility. Patients with cardiovascular diseases reported moderate difficulties in carrying out daily activities.

\* The values of each of the dimensions of the instrument are expressed in%

\*\* HBP: high blood pressure, CVD: cardiovascular disease, TB: tuberculosis

\*\*\* Mental disorders: anxiety, nervousness or depression.

Patients with rheumatic diseases (n=2274) manifested different degrees of limitation in mobility and daily activities. Patients with rheumatic diseases and comorbidities had greater compromise in quality of life predominately by pain and physical discomfort (more than 50% of the patients) figure 1.

**Abstract AB1244 – Figure 1.** EQ5D-3L in patients with comorbidities, rheumatic diseases and healthy patients

**Conclusions:** In comparison with general population, rheumatic patients had a lower quality of life, and it is even worse in patients with rheumatic diseases and comorbidities. Comprehensive care of rheumatic patients should include strategies to improve standards of quality of life such as mobility, to perform daily activities and management of problems such as pain and discomfort. There are specific factors of intervention to reduce long-term disability of patients with rheumatic diseases.

#### AB1245 EFFECTS OF A WORKPLACE-CENTRED COUNSELLING OF INDIVIDUALS WITH MUSCULOSKELETAL COMPLAINTS: A PROSPECTIVE COHORT STUDY

H. Leiss, M. Hücke, M. Bécède, J. Smolen, K. Machold. *Department of Rheumatology, Medical University of Vienna, Vienna, Austria*

**Background:** Actively employed people with musculoskeletal complaints frequently seek medical advice only when symptoms have become chronic and have led to loss of workability.

**Objectives:** In this study, a brief examination was offered in the workplace setting in order to detect and to counsel individuals with symptoms of Rheumatic and musculoskeletal diseases (RMDs).

**Methods:** Employees of four companies were sent a screening questionnaire regarding musculoskeletal problems. In case of a positive screening, consultation by RMD specialists was offered which took place close to the workplace. If necessary, participants were referred to a practice/clinic specialised in RMDs (Orthopaedics, Rheumatology, Physical Medicine). Employees' work was categorised into physically highly demanding (HD) and less demanding (LD).

From participants consenting to follow-up, additional data were acquired: demographics, known pre-existing RMD, pain intensity, affected region(s), current treatment, number of sick leave-days due to musculoskeletal complaints, and out of pocket costs for treatments during the preceding year. General wellbeing and depression were measured by Euroqol-5d (EQ-5d) and Hospital Anxiety and Depression Scale (HADS). After one year, information about general wellbeing, pain intensity, treatment, individual costs, and days of sick leave during the intervening year was collected by telephone-interview.

**Results:** 6170 employees were invited. 413 participated in the counselling program, 344 were enrolled in the study. 56.6% of the participants had no previously diagnosed RMD, after the specialists' assessment, this percentage decreased to 35.7%. Men with LD workload had significantly higher wellbeing (EQ-5d scale):  $77.3 \pm 15.1$  compared to women with both LD ( $71.0 \pm 20.1$ ,  $p=0.034$ ) and HD ( $64.6 \pm 21.3$ ,  $p=0.001$ ). LD and HD differed significantly regarding percentage with painful upper ( $28.6$  vs.  $45.3$ ,  $p=0.006$ ) and lower ( $49.6$  vs.  $65.3$ ,  $p=0.016$ ) limbs.

Back pain was distributed equally among all groups. HD women reported significantly higher use of NSAIDs (55.1% vs. 27.7% in female LD, 21.7% in male HD, 23.5% in male LD,  $p=0.001$ ). HD men showed the lowest ( $4.1 \pm 2.9$ ), HD women showed the highest HADS anxiety-score ( $6.3 \pm 3.8$ ,  $p=0.042$ ).

235 individuals participated in telephone follow-up. There was significant improvement in wellbeing (mean  $77.2 \pm 17.4$  vs.  $73.6 \pm 18.2$  at baseline,  $p=0.006$ ) and in rating of RMD pain (mean  $27.8 \pm 24.9$  vs.  $40.8 \pm 24.6$  at baseline,  $p=0.001$ ). Participants who were suspected by the specialist to suffer from RMDs had significantly increased out of pocket costs after one year (mean in €  $441.8 \pm 861.6$  vs.  $254.1 \pm 407.0$ ,  $p=0.026$ ). Use of NSAIDs decreased significantly from 29.1% to 17.4%,  $p=0.02$ . Conversely, rates of use of physiotherapy (7.6 vs. 24.7,  $p=0.001$ ), gymnastics (2.7 vs. 23.4,  $p=0.001$ ), physical therapy (12.8 vs. 43.3,  $p=0.027$ ) and complementary/alternative methods (7.4 vs. 13.2,  $p=0.003$ ) were significantly increased.

**Conclusions:** In our study we found most physical and psychological problems related to RMDs in HD working women. After one year, participants reported improved quality of life, reduction of RMD pain, higher utilisation of medical services and of gymnastics, less use of NSAIDs, and, if suspected to suffer from RMDs, higher out of pocket costs. Thus, this brief workplace-centred intervention appears to have had beneficial effects on both subjective well-being and on objective parameters suggesting improvements in physical/physiological health.

#### AB1246 PROVISION OF RHEUMATOLOGY SERVICES TO 30 MILLION PEOPLE IN NORTH-WESTERN PAKISTAN (A NAÏVE DEPARTMENT WITH HUGE CHALLENGES)

S. Khan<sup>1</sup>, I. Malik<sup>1</sup>, Z. Afridi<sup>2</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Pediatrics, Lady Reading Hospital, Medical Teaching Institution, Peshawar, Pakistan

**Background:** Practicing rheumatology needs multidisciplinary team work and also good funding. This becomes difficult in places where proper structure of healthcare is lacking.

**Objectives:** To share experience of establishing a Rheumatology unit in Khyber Pukhtunkhwa (KP) Pakistan.

**Methods:** KP is the Northwestern province of Pakistan. The population of KP is 30 million. The per capita income of Pakistan was 1180 US \$ in 2016.

Modern day treatments are expensive in rheumatology. Difficulties are in areas of expertise and biologics.

The first ever Rheumatology unit was established in Lady Reading Hospital (LRH) Peshawar in July 2017 which started its regular outpatient services. Problems at the start were absence of specialist nurses, junior doctors, special immunology and MSK Radiologists. Regular MSK ultrasound was started along with routine procedures. This had an enormous impact on the quality of care. Lack of awareness about rheumatic diseases in general population has been an issue which was addressed through newspapers, television and social media. The response was excellent. The outpatient numbers have raised, referral pathway was established and more patients are now seen in outpatients. Team was further built up by acquiring a trainee registrars and a consultant rheumatologist. Another problem was lack of proper patients education system due to lack of specialist nurses and non-availability of literature in local languages. Biologics are costly and very few people can afford these. Pakistan Baitul Maal, a charitable organisation is the only way to provide biologics to patients on need basis. Currently only few biologics are available in the market i.e Etanercept, Rituximab and Tocilizumab. Adalimumab will come to market sometime in 2018.

Kids with Juvenile Idiopathic arthritis, Systemic Lupus Erythematosus and other rheumatic problems are difficult to manage as there is no Paediatric Rheumatologist available in the entire province. We now have established a rapport with our paediatric colleagues which is working well.

Pakistan has only seven hospitals where training is offered in rheumatology but all are based in other provinces and none in KP. For this purpose we are in the process of establishing a dedicated rheumatology department where full training will be given to trainees according to international standards.

The data on rheumatic diseases is non-existing so we are now working on data collection on our local population.

**Results:** Working as a rheumatologist is a big challenge in under resourced areas. We have been having worst case scenario in almost all aspects. However someone has to be at the forefront as millions of people have rheumatic diseases and they cannot be left alone with these conditions untreated.

Abstract AB1246 – Figure 1

**Conclusions:** The idea is to persevere and continue efforts for the betterment of our patients. More specialists are needed to fill in the gaps along with appropriate funding to develop rheumatology services in our part of the country. We feel that situation in other countries with low socio-economics will be more or less the same or even worst for patients with rheumatic diseases. International communities and leagues such EULAR, BSR, ACR and APLAR etc should discuss this on their forums to see if in anyway they can improve lives of millions of people with rheumatic disorders in under-resourced countries.

#### IMPACT OF A SELF-CARE EDUCATION PROGRAM FOR PATIENTS WITH OSTEOARTHRITIS

A. Gurt<sup>1</sup>, J. Llorente<sup>2</sup>, M. López<sup>2</sup>, L. Tio<sup>2</sup>, B. Sena<sup>1</sup>, F. Montañes<sup>1</sup>, E. Marco<sup>3</sup>, J. Verges<sup>4</sup>, M. Herrero<sup>5</sup>, J. Monfort<sup>2</sup>. <sup>1</sup>CAP Vila Olímpica; <sup>2</sup>Rheumatology; <sup>3</sup>Rehabilitation, Hospital del Mar; <sup>4</sup>OAFI foundation; <sup>5</sup>Bioiberica S.A, Barcelona, Spain

**Background:** Osteoarthritis (OA) has a prevalence rate that reaches 29% in people older than 60 years<sup>1</sup>. Treatments available are limited. The costs of OA in Spain are about 4.800 million euros/year<sup>2</sup>.

**Objectives:** To create a self-care program for OA patients in order to improve their quality of life (QoL) and therefore to reduce the socioeconomic cost.

**Methods:** The design of the program was carried out by 2 PC physicians, 1 rheumatologist, 1 rehabilitator, 1 nurse and 2 psychologists. The program included a total of 9 sessions of 1.5 hours once a week. There were 2 sessions for each of the following topics: general information, physical activity, nutrition, coping with the disease, and 1 summary session. Three OA patients were trained and afterwards they were in charge of imparting the program to other patients with the assistance of a nurse. Before and after the program some data was collected relating the patients' knowledge, food and physical activity habits, social networks and hours of rest. They were asked to complete WOMAC, EuroQoL-5D, and HAD Scale questionnaires. The statistical analysis was performed using package SPSS v16.

**Results:** 60 Knee OA patients were recruited from Hospital del Mar and Vila Olímpica PC centre, and divided into 6 different groups. Only the results of the first two groups are shown. Group1 (11 patients) and 2 (10 patients). First we analysed differences between the basal data and the ones collected after the last session. The analysis of the data from all the patients (groups 1 and 2) showed that in knowledge about OA management the average value obtained in the basal visit was  $6.31 \pm 2.798$ , and  $7.81 \pm 1.94$  after the last session ( $p=0.024$ ). Analysis of pain by VAS showed that the average value in the basal visit was  $3.91 \pm 1.82$ , and  $2.44 \pm 2.03$  after the last session ( $p=0.014$ ). We observe a tendency, although it doesn't reach significant differences in QoL, where the average value in the basal visit was  $2.31 \pm 1.81$ , and  $1.63 \pm 1.54$  after the last session ( $p=0.052$ ). In the HADS scale the average value in the basal visit was  $9.86 \pm 6.02$ , and  $8.36 \pm 5.40$  after the last session ( $p=0.052$ ). Regarding the analysis of differences between two groups, categorical items were analysed. In the total questionnaire at the end of the sessions the average for group 1 was 6.89 and for group 2 was 8.75 ( $p=0.038$ ). Meeting with friends frequency at the beginning and at the end of the study was also different among groups ( $p=0.014/p=0.019$ ).

**Conclusions:** This self-care education program had a positive effect on the OA patients pain perception, and it could also be observed an improvement in QoL and the anxiety and depression. As differences among groups were also observed, socioeconomic and education aspects must be considered in the future.

#### VACCINATION RATE IN PATIENTS WITH RHEUMATIC DISEASES: A CROSS-SECTIONAL STUDY IN MEXICAN PATIENTS

J.P. Carrizales-Luna, D. Galarza-Delgado, J. Esquivel-Valerio, G. Serna-Peña, L. Ramírez-Monterrubio, L. Lozano-Plata, I. Hernández-Galarza, T. Gracia-Arechiga. *Rheumatology, Universidad Autónoma de Nuevo León, Monterrey, Mexico*

**Background:** Patients with rheumatic diseases have an increased risk of infections, which can be prevented with vaccination schemes. The vaccination rate in rheumatic patients is low in Mexico (17%–25%), mainly because of the lack of physician recommendation. Vaccination strategies have been shown to improve adherence to the application.

**Objectives:** The objectives of the study was to determine the vaccination rate in patients with rheumatic diseases and the main reasons of failed vaccination.

**Methods:** We questioned 84 patients from the rheumatology clinic of the Univesitary Hospital "José E. González", Mexico, from June to July 2017. The vaccination status and the reasons for failed vaccination were recorded.

**Results:** The majority of patients were women (89.3%), average age 50 years (17–81 years). Most of the patients had rheumatoid arthritis (45.3%), followed by other autoimmune diseases (27.4%) and non-autoimmune diseases (27.4%). The highest rates of vaccination were for tetanus-diphtheria (44%), influenza (39.3%) and pneumococcus (31%). They were lower for hepatitis B virus (9.8%), human papilloma virus (4.8%), hepatitis A virus (2.4%) and herpes zoster virus (0%). The main reason for failed vaccination was the lack of indication from the physician (34.5%). If indicated, 89.3% of the patients would accept to be vaccinated.

Abstract AB1248 – Table 1

Vaccination rate	Influenza	Pneumococcus	Hepatitis B	Human Papillomavirus	Herpes Zoster
Rheumatoid Arthritis	15 (39%)	16 (42%)	3 (7.9%)	1 (2.6%)	0 (0%)
Systemic Lupus Erythematosus	2 (25%)	1 (12.5%)	1 (12.5%)	1 (12.5%)	0 (0%)
Spondyloarthritis	1 (33%)	1 (33.3%)	0 (0%)	0 (0%)	0 (0%)
Systemic sclerosis	2 (25%)	2 (25%)	0 (0%)	0 (0%)	0 (0%)
Other autoimmune diseases	0 (0%)	0 (0%)	0 (0%)	0 (0%)	0 (0%)
<b>Reason of failed vaccination</b>					<b>N%</b>
Lack of medical recommendation					29 (34%)
Fear of vaccine side effects					8 (9.5%)
Previous vaccine side effects					2 (2.4%)
Disbelief in vaccination					7 (8.3%)
Other reasons					35 (41%)

**Conclusions:** We found a low vaccination rate in the rheumatology clinic. We found an insufficient promotion and indication of vaccination by the rheumatology staff. Constant fomentation and updated knowledge about vaccination recommendations in autoimmune diseases is necessary for the prevention of infections and to improve the comprehensive care of patients with rheumatic diseases.

**AN ANALYSIS OF INPATIENT REFERRALS TO RHEUMATOLOGY IN AN IRISH TERTIARY REFERRAL HOSPITAL**

K. Murray, N. Rutledge, Q. Shah, D.J. Veale. *Saint Vincent's University Hospital, Dublin 4, Ireland*

**Background:** Reviewing patients under other services is an important part of the service we deliver in our hospital's rheumatology department.

**Objectives:** In order to improve quality of the inpatient consult service and relevance of teaching delivered to rheumatology trainees, we wanted to examine the nature of referrals to our service.

**Methods:** All available consults (n=81) were reviewed. The age, gender, urgency and referral source were recorded. The most likely reason for referral as decided by our specialist registrar (research fellow) were determined.

**Results:** 49% of patients were 70 years of age or older. 30% of patients were 70–79 years old. 68% were female. There was a wide range of referrals, 21% were vasculitides (including polymyalgia and giant cell arteritis), 20% inflammatory arthritides, 19% crystal arthropathies, 16% connective tissue disease, 14% osteoarthritis, 3% septic arthritis, 3% fibromyalgia, 3% pyrexia of unknown origin, 1% sarcoid, 1% antiphospholipid syndrome and 1% osteoporosis. 59% of consults came from general medical teams, 14% from acute medicine, 14% from surgery, 3% from psychiatry and 11% from other inpatient services (including haematology, oncology etc).

36% of consults were considered urgent (to be seen within 24 hours) by the referring team, 64% were routine (to be seen within 48 hours).

**Conclusions:** Almost half of referrals were over 70 years of age. Most referrals came from medical teams. The majority of consults were women and referred due to a vasculitis, inflammatory arthritis or connective tissue disease. 3% were septic arthritis. Our trainee teaching will now focus primarily on these topics.

3% of referrals were for fibromyalgia, which could perhaps be managed on an outpatient basis. This may improve utilisation of limited inpatient hospital resources.

AB1250

**VACCINATION AWARENESS AND UPTAKE IN INFLAMMATORY ARTHRITIS PATIENTS**

K. Murray, A. O'Rourke, C. Low, F. Young, E. Feeney, D.J. Veale. *Saint Vincent's University Hospital, Dublin 4, Ireland*

**Background:** Inflammatory arthritides (IA) increase infection risk. The Centre for Disease Control and Prevention recommends influenza vaccination for all adults and pneumococcal vaccine for >65 years old and under 64 years receiving certain immunosuppressive therapies, including TNF inhibitors.

**Objectives:** We examined patients' knowledge, uptake and attitudes to influenza and pneumococcal vaccination and opportunities to increase vaccination rates in our IA clinic.

**Methods:** Patients attending the IA Clinic completed an anonymous 23 question worksheet recording demographic details, medical history, medications, knowledge about vaccinations, vaccination status, reasons for non-vaccination and availability and willingness to use smartphone for healthcare records.

**Results:** 329 patients completed the survey. Respondents were predominantly female (78%). 69% were >50 years old. 82% had completed secondary education. 59% of patients had rheumatoid arthritis, 11% had psoriatic arthritis and 30% other conditions. 29% of patients were taking a biological DMARD, 27% using methotrexate and 19% oral steroids.

52% knew some rheumatological conditions increase infection risk. 54% knew some rheumatological medications can increase infection risk.

66% knew influenza vaccination was recommended, most commonly via their general physician (GP) (70%). 50% of patients were up to date with their 'flu' vaccination, mainly (75%) via their GP. Reasons for non-vaccination included lack of awareness (45%) and fear of side effects (25%).

29% knew pneumococcal vaccination may be indicated, 78% of whom were informed by their GP. 33% of patients were up to date with their pneumococcal vaccine. 80% cited lack of awareness for non-vaccination.

70% of patients had smart phone access. 74% of these were willing to use this for their healthcare record and reminders re vaccination.

**Conclusions:** These data show low awareness amongst IA patients of the risk of immunosuppression associated with their disease and treatments and the need for regular vaccinations. Mobile technology may help increase vaccination rates.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.2231

AB1251

**QUALITY OF INPATIENT REFERRALS TO RHEUMATOLOGY IN AN IRISH TERTIARY REFERRAL HOSPITAL**

K. Murray, N. Rutledge, Q. Shah, D.J. Veale. *Saint Vincent's University Hospital, Dublin 4, Ireland*

**Background:** A previous audit of inpatient referrals to our service found 21% were vasculitides, 20% inflammatory arthritides, 19% crystal arthropathies, and 16% connective tissue disease. It was felt that many of these referrals lacked appropriate investigations (such as inflammatory markers) prior to rheumatology review.

**Objectives:** Prior to transitioning from handwritten to electronic consults, we wanted to examine the data given in inpatient referrals to our service.

**Methods:** All available consults (n=81) were reviewed. We assessed whether the age/date of birth, gender, location, duration of symptoms, medications, clinical examination findings, reason for consult, urgency and suspected diagnosis had been written on the consult request form. We examined what investigations were detailed (any blood result, C Reactive Protein (CRP) value and any imaging result) and what referrer details were given (name, contact details, consultant responsible).

**Results:** In 99% of cases, patients age or date of birth was given by the referring team. 84% detailed gender. 78% contained ward. 68% contained bed number. 56% listed urgency.

96% indicated reason for consult. 30% listed duration of symptoms. 21% detailed whether patient known to rheumatology service. 57% gave suspected diagnosis. 33% gave medications. 42% detailed clinical examination findings. 41% reported any blood test. 27% gave a CRP. 44% detailed imaging findings.

49% contained referrer name. 80% had referrer contact details. 70% gave referring consultant.

**Conclusions:** Overall, it was felt many of the inpatient referrals to our service lacked potentially important details. Less than half of consult requests included duration of symptoms, medications, examination findings, blood test results or referrer name.

We will soon be transitioning to an electronic referral system and all of these data points must be entered prior to submission of the consult. Hopefully, this will improve the quality of care we deliver to our patients.

AB1252

**PREVALENCE OF ANALGESIC USAGE IN PATIENTS WITH RHEUMATOID ARTHRITIS AND RELATIONSHIP WITH DISEASE ACTIVITY**

L. Villarreal<sup>1</sup>, D. Buitrago-Garcia<sup>2</sup>, M. Cabrera<sup>1</sup>, P. Santos-Moreno<sup>3</sup>. <sup>1</sup>*Health Services*; <sup>2</sup>*Epidemiology*; <sup>3</sup>*Rheumatology, Biomab, Center For Rheumatoid Arthritis, Bogota, Bogota, Colombia*

**Background:** Rheumatoid arthritis (RA) is a systemic, autoimmune disease in which chronic pain is a persistent symptom,<sup>1</sup> additionally pain management remains as a serious public health issue. Pain is often disabling and can reduce the quality of life of a patient.<sup>2</sup>

**Objectives:** To describe prevalence of analgesic usage in patients with rheumatoid arthritis and relationship with disease activity.

**Methods:** We collected data from the medical charts in a specialised RA centre conducted during 2017, we performed a descriptive analysis, we collected socio-demographic information, DAS28, and the prevalence of prescription of analgesic medications divided in three groups non opioid analgesics, opioid analgesics and NSAIDs. We calculated means, and standard deviations for continuous variables and categorical variables were presented as rates. We estimated the prevalence of comorbidities and evaluate independent associations calculating prevalence ratios.

**Results:** We included data from 6700 patients, 80% were women and 20% were men. Mean age was 59 years±13, 47% of all patients were between 60 and 80 years; The prevalence of use pain medications was 63.41%. Most of patients received non opioid analgesics 52% (paracetamol or dipyron) followed by opioids 23% (codein or tramadol), 10% of patients had pain medication combination of non opioids plus opioids. See table 1. The prevalence of pain medications usage was associated with sex but not with disease activity see table 2.

**Abstract AB1252 – Table 1.** Characteristics of patients with RA and comorbidities

Pain medication	n	%
Non-opioids	2234	52
Opioids	990	23
NSAID	67	2
<b>COMBINATIONS</b>		
Non opioids +Opioids	430	10
Non opioids +NSAID	309	7
Opioids+NSAID	209	5
All	70	2

**Conclusions:** Rheumatoid arthritis is a pain associated condition; two thirds of patients are using of pain medications mainly women; the most prescribed medication was paracetamol or opioids, coinciding with other studies.<sup>2</sup> This descriptive study is useful for further studies to develop in Latin America.

### AB1253 ANALGESIC DRUGS AND RISK OF ISCHAEMIC STROKE IN PATIENTS WITH OSTHEOARTRITIS: A REAL WORLD DATA CASE-CONTROL STUDY

A. Gomez-Lumbreras<sup>1</sup>, R. Vives<sup>2,3</sup>, M. Giner-Soriano<sup>1,3,4</sup>, H. Pera<sup>1</sup>, M. Fradera<sup>2</sup>, J. R. Marsal<sup>5</sup>, R. Morros<sup>1,3,4</sup>. <sup>1</sup>Medicines Research Unit, Institut Universitari d'Investigació en Atenció Primària (IDIAPJGol), Barcelona; <sup>2</sup>Institut d'Investigació i Innovació Parc Taulí, Corporació Sanitària Parc Taulí, Sabadell; <sup>3</sup>Universitat Autònoma de Barcelona; <sup>4</sup>Institut Català de la Salut, Barcelona; <sup>5</sup>Unitat de Suport a la Recerca, Institut Universitari d'Investigació en Atenció Primària (IDIAPJGol), Lleida, Spain

**Background:** Pharmacological treatment of osteoarthritis (OA) usually include analgesics, non-steroidal anti-inflammatory drugs (NSAID) and symptomatic slow-acting drugs in OA (SYSADOA). The association between these groups of drugs and the risk of ischaemic stroke has not been properly addressed.

**Objectives:** To analyse the risk of stroke in patients using analgesics, NSAID and SYSADOA drugs.

**Methods:** We used a population-based patient hospital registry to identify all patients with a first-ever stroke discharge diagnosis between 2009–2015. Cases were matched to controls obtained from the Information System for Research in Primary Care (SIDIAP) database. Information on drug exposure was obtained from invoice data from pharmacies. Crude and adjusted odds ratios (OR, OR<sub>adj</sub>) and their 95% confidence interval (95% CI) were calculated using multivariate models of conditional logistic regression for the next pharmacological groups and individual agents of each group: acetic acid derivatives, oxicams, propionic acid and derivatives, coxibs, SYSADOA and analgesics (opioids, metamizole and paracetamol). A cardiovascular risk score was calculated for each subject based on comorbidities.

**Results:** 12 616 cases were matched to 1 25 264 controls by gender, age and geographic area. Among cases, 43% were women. The mean age was 72.6 (IQR 65–82) years and more cases were classified as high cardiovascular risk patients (n=2,511, 19.9%) than controls (n=12,467, 10.0%). Mortality in the following year after the index date was higher for cases (n=2,633, 20.9%) than for controls (n=8,168, 6.5%). A higher percentage of cases had a previous diagnostic of ischaemic heart disease, 13.8% (n=1,745) vs 7.7% (n=9,656) of the controls. OA diagnosis was present in 2823 (22.4%) cases and in 29 098 (23.2%) controls. Paracetamol was the most used drug (n=106,515, 77.3%) followed by ibuprofen (n=84,790, 61.5%).

Current users of acetic acid derivatives showed an increased risk of stroke [OR<sub>adj</sub>, (95% CI) 1.10 (1.01–1.19)], so did diclofenac [OR<sub>adj</sub>1.14 (1.04–1.25)]. Among the propionic acid derivatives, current users showed an increased risk [OR<sub>adj</sub>1.24 (1.27–1.32)], dexametopfen showed the highest risk [OR<sub>adj</sub>1.42 (1.25–1.60)] and naproxen the lowest [OR<sub>adj</sub>1.18 (1.02–1.37)]. The SYSADOA group did not show any increased risk for any type of exposure, with a decreased risk of 17% [OR<sub>adj</sub>0.83 (0.77–0.91)] for lifetime glucosamine exposure and a 22% [OR<sub>adj</sub>0.84 (0.78–0.90)] for chondroitin sulfate. Analgesics were the most consumed drugs,

and cases were more exposed to all subgroups of analgesics than controls. While the non-adjusted OR showed an increased risk of stroke for lifetime exposure for all agents in this group, this association was not observed with the adjusted OR<sub>adj</sub> for fentanyl, neither buprenorphine, but it showed a risk for current users of metamizole [OR<sub>adj</sub> of 1.67 (1.56–1.80)], tramadol [OR<sub>adj</sub>1.15 (1.06–1.24)] and paracetamol [OR<sub>adj</sub>1.43 (1.37–1.51)].

**Conclusions:** Current exposure to NSAIDs, tramadol, metamizole and paracetamol is a risk factor for ischaemic stroke. Exposure to chondroitin sulphate and glucosamine are associated with a lower risk of ischaemic stroke.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.1428

### AB1254 IMPROVING RHEUMATOLOGIC CARE AND EDUCATION IN THE REPUBLIC OF MACEDONIA: A MODEL FOR PROMOTING RHEUMATOLOGIC EDUCATION IN A DEVELOPING COUNTRY

V. Ognenovski<sup>1</sup>, M. Arsovska-Nalbanti<sup>2</sup>. <sup>1</sup>Division Rheumatology, University of Michigan, Ann Arbor, USA; <sup>2</sup>Division Rheumatology, Clinical Center Dr. Trifun Panovski, Bitola, Macedonia, The Former Yugoslav Republic of Ireland

**Background:** In 2011 ILAR supported a pilot project in training a rheumatologist in an underserved area in Macedonia. The pilot took place in the clinical centre of Bitola. Previously, rheumatologic care was provided by visiting rheumatologists from the rheumatology clinic in the capital city.<sup>1</sup>

**Objectives:** The primary goal of this project was to pilot a model in rheumatologic training and improve rheumatologic care in an underserved area in Macedonia.

**Methods:** An internist from the clinical centre in Bitola was enrolled in a two-year training by the Rheumatology clinic at Ss Cyril and Methodius University in Macedonia, and the rheumatology division at the University of Michigan. Pre intervention metrics of quality of care as measured by access, standard therapy, and DAS 28 scores were compared with post intervention metrics.

**Results:** The primary goal of the project enabled training of a rheumatologist. A local internist completed her training in rheumatology (2014), and established a rheumatology clinic within the clinical centre in the city of Bitola in 2014, providing daily access to patients with rheumatic conditions in a region with a population of 3 000 000. Patient access changed from 120 visits/month to 800 visits/month. The service provided consultations to hospitalised patients.

The secondary endpoints: quality of care as measured by standard therapy for rheumatoid arthritis and DAS-28 scores are as shown on table 1.

**Abstract AB1254 – Table 1**

Rheumatoid Arthritis patients	Pre-intervention 2011 (n=115)	Post-intervention 2017 (n=86)	Statistical Significance
Patients taking methotrexate	44%	53%	
Methotrexate dose	11.5 mg (10–15 mg)	13.9 mg (10–25 mg)	p<0.00001
Combination therapy*	39%	38.5%	NS
Dual therapy*	31%	35%	NS
Triple therapy*	3.5%	5%	NS
DAS-28 average	4.8	4.41	NS

MTX=methotrexate; \*methotrexate, sulfasalazine, leflunomide, antimalarial (chloroquine, hydroxychloroquine)

Post intervention, more patients were taking methotrexate and at higher doses. Despite this trend, its average dose was less than 50% of its maximal dose (25 mg/week) commonly used in standard practice. The frequency of combination therapy remained unchanged. Likewise, no significant change in the DAS-28 scored was observed.

**Conclusions:** Prior to launching the pilot, the rheumatologic care in this region was provided by visiting rheumatologists from the university clinic in the capital city. Initial assessment pointed to several obstacles: poor access and substandard therapy that likely contributed to the prevalence of high disease activities. Our pilot succeeded in training a rheumatologist, thus reaching our primary goal of improving local access to rheumatic care. The secondary goals of improving the quality of care as measured by the DAS-28, standard of therapy for rheumatoid arthritis- reflected by appropriate use of DMARDs (use of methotrexate, combination therapy) showed a modest improvement While higher doses of methotrexate were used, combination therapy and better control of rheumatoid arthritis (DAS-28) remained unchanged, thus posing a challenge for ongoing need and future intervention goals.

AB1255

### A REVIEW OF CASE-MIX AND CENTRE EFFECT ADJUSTMENT IN EARLY RHEUMATOID ARTHRITIS COHORTS

M. Yates, K. Bechman, S. Norton, J. Galloway. *Academic Rheumatology, King's College London, London, UK*

**Background:** Observational cohort studies have been utilised extensively in early Rheumatoid Arthritis (RA), regularly conducted across multiple centres spanning regional and national boundaries. Case-mix and centre effect are considerations essential for determining comparability of results, and likely prevalence of bias. There is currently no standardised approach for case-mix and centre effect adjustment in early RA observational cohorts.

**Objectives:** Describe the spectrum of methodologies used to address case-mix and centre level effects on outcomes in multi-centre early RA observational cohort studies.

**Methods:** Inclusion criteria were cohorts recruiting from 2 or more centres with 100 or more subjects, with a Rheumatologist diagnosis of RA or EIA within the last 24 months. A systematic electronic search of publications was undertaken. Papers were reviewed by two researchers independently. Reference lists of included papers were reviewed for further relevant publications. A search of all included papers' authors was also conducted. Detail on cohort characteristics, case-mix data collection and adjustment, and consideration of centre-level effect in analyses were collected.

**Results:** 1047 papers were identified from the initial search. A total of 20 unique cohorts were identified. Reference review and author search produced 14 more, to make a total of 34 unique observational cohorts drawn from 205 papers. The cohorts were mainly conducted in Europe (24/34, 71%), With 2 (6%) from less economically developed regions. The period of data collection was between 1955 and 2017.

**Case-mix:** All cohorts considered case-mix in some form (e.g. age and gender), but with heterogenous approaches. The figure displays the relative frequencies of sociodemographic variable consideration across all included papers.

**Centre effect:** 18/205 (9%) of the included papers accounted for centre in their results, utilising a range methodologies. Where reported, centre had a significant impact.

Abstract AB1255 – Figure 1

**Conclusions:** The degree of case-mix reporting varied widely, and few studies addressed centre effect. Where analysed, a centre level impact was clearly apparent. A failure to incorporate centre into analyses can lead to unrecognised bias as a result of confounding by centre. It must be acknowledged that including case-mix variables and adjusting for centre substantially reduces power, and it is likely that many of the reported observations may have lost statistical significance had case-mix and centre effect been addressed more completely. This is the first

systematic review of centre effect and case-mix in early RA, and highlights a challenging field deserving further research.

AB1256

### DEVELOPMENT OF A NATIONAL SERVICE FOR BIOLOGIC DRUG MONITORING

M.E. Perry, on behalf of Effective Prescribing Programme Biologics Working Group, National Services Scotland. *Rheumatology, ROYAL ALEXANDRA HOSPITAL, Paisley, UK*

**Background:** Monitoring serum levels of biological drugs has well recognised benefits for patients and health services. These include appropriate dosing, avoidance of overtreatment, identification of drug failure due to immunogenicity, cost and facilitation of switching therapy.<sup>1</sup>

**Objectives:** To establish a national service for monitoring serum levels of biological drugs.

**Methods:** National Services Scotland established a working group comprised of clinicians, lead pharmacist and Director of Public Health to help optimise biological drug prescribing. (Effective Prescribing Programme Biologics -EPPB). It was recognised that ad-hoc biologic drug monitoring (BM) posed a risk of variation in standards and inequity of access. Existing test volume and cost was established and a business case submitted to the CEO's of each Health Board in Scotland for a national service, testing adalimumab and infliximab twice yearly in 2265 patients. Potential cost savings based on drug withdrawal of 2.5%, 5%, 10%, and 15% in gastroenterology patients ranged from 400,000Euro to 3.5 million Euro. Additional savings for dose reduction in rheumatology patients were not costed but likely to incur further financial advantage.

**Results:** The case was accepted and service tendered. A single site in Glasgow will run the assays (purchased from Grifols) commencing December 2017. The cost modelling predicts a 50% reduction in cost per test compared to existing arrangements. Cost for the whole service will be divided between the commissioning Health Boards with outlay proportional to patient population. The EPPB developed specialty specific advice and an ordercomm with minimum dataset accessible from all Health Boards with the option of retrospective interrogation. A national educational event is scheduled to improve clinician confidence and awareness.

**Conclusions:** To our knowledge this is the first national fully funded biologic drug monitoring service with access to all users of biological drugs. Its introduction will:

1. Support the implementation of national standards of care to ensure the effective and cost effective use of biologic medicines
2. Ensure equity of access to BM across Health Boards.
3. Provide a stronger position for procurement of biologic drugs (uncomplicated by additional service offerings)
4. Provide a sustainable service for Scotland, independent of the drug manufacturer.

### IMPACT OF A SYSTEMATIC SCREENING OF MULTIMORBIDITIES IN PATIENTS WITH CHRONIC INFLAMMATORY RHEUMATIC DISEASES

M. BEURAI-WEBER<sup>1</sup>, A. JAUSSENTA. JAUSSENT<sup>2</sup>, G.DU. CAILAR<sup>3</sup>, M.-C. PICOT<sup>2</sup>, F. ROUBILLE<sup>4</sup>, J.-D. COHEN<sup>1</sup>, J. MOREL<sup>1</sup>, J. BOUSQUET<sup>5</sup>, P. FESLER<sup>3</sup>, B. COMBE<sup>1</sup>, C. DAIEN<sup>1</sup>. <sup>1</sup>Rheumatology Department; <sup>2</sup>Department of medical information; <sup>3</sup>Internal medicine and hypertension, Lapeyronie Hospital and Montpellier University; <sup>4</sup>Department of cardiology, Arnaud de Villeneuve Hospital and Montpellier University; <sup>5</sup>MACVIA-France, Lapeyronie Hospital and Montpellier University, MONTPELLIER, France

**Objectives:** EULAR proposes to screen multimorbidities in chronic inflammatory rheumatic diseases. The aim of the study was to assess i) multimorbidities in patients with chronic inflammatory diseases, ii) how patients follow recommendations given after a systematic standardised multimorbidity screening.

**Methods:** Exams were performed during a 1 day multimorbidity clinic. Diabetes, hypertension, CVD damage, chronic respiratory diseases, osteoporosis and preventive measures were assessed. Advice, complementary exams and prescriptions were provided to patient and general practitioner after this check-up if needed. Patients were called 3 months later to assess the applications of the given recommendations.

**Results:** Among the 541 patients screened, hypertension was present in 28.1% patients, dyslipidemia in 19.2%, chronic respiratory tract diseases in 12.8% and diabetes in 9.6%. Screening led to the following recommendations: blood pressure monitoring (22.6% patients), dietary advice (56.8%), cardiologist referral (35.5%), intensification of physical activity (27.0%), cancer screening (50.5%), vaccinations (60.6%) and vitamino-calcium supplementation (30.3%). On the 237 patients called back, 72.3% underwent blood pressure monitoring, 58.6% followed dietary advice, 64.4% took vitamino-calcium supplementation, 55.2% had vaccinations done, 52.1% saw a cardiologist, 42.7% increased physical activity and 31.4% performed cancer screening. No specific gender, age, pathology, or psychological factors were associated with adherence to recommendations.

**Conclusions:** This study underlines the relevance of a systematic screening of multimorbidities in chronic inflammatory rheumatic diseases, and the good patient's adherence rate to the recommendations.

**AB1258 EARLY ARTHRITIS SERVICE IS COST EFFECTIVE, IMPROVES OUTCOMES AND REDUCES BIOLOGIC USE**

G.A. Niazi, M.K. Nisar. *Rheumatology, Luton and Dunstable University Hospital, Luton, UK*

**Background:** There is good evidence that dedicated early arthritis clinics (EACs) improve referral lag time and reduce delay in establishing disease-modifying therapy. However it remains arguable whether such clinics improve relevant disease outcomes. Nationally, only 57% of units have dedicated EACs.

**Objectives:** We established Early Arthritis Service (EAS), centred on NICE RA quality standards, to reduce the time to diagnosis and the start of definitive therapy with an aim to accomplish good outcomes by the introduction of dedicated Early Arthritis Clinics (EACs).

**Methods:** The department set up an early arthritis service with introduction of six clinics (EACs) every week. An agreed treatment protocol incorporating ultrasound was developed to ensure standardised approach to early initiation of treatment, drug education and timely review. This is a retrospective study of all patients presenting to the service in the first year.

**Results:** Our catchment area covers a population of 3 50 000 with 40% ethnic minorities. Of 1884 patients referred, 482 (25.5%) were triaged into EACs based on set criteria. All were reviewed within 3 weeks. 247 (51%) were confirmed to have early arthritis. Mean age was 52.4 years (17–86y). 157 (63.5%) were women. 177 (71.6%) were White, 58 (23.5%) of Asian and twelve of other background. 159 (64.3%) had RA, 57 (23%) with PsA and 31 had other inflammatory arthritides. 25 (10%) had erosions at presentation. There was median 26 weeks delay (0.4–1043 weeks) from symptom onset to GP presentation. Median time for GP referral to the department was 4.0 days (0–84 days). Mean DAS28 at first visit was 4.65 (0.6–8.0, n=166).

95% commenced their DMARDs within 3 week of initial review. Other 5% who missed the target was owing to patient factors. Treating to target achieved DAS28 remission for 84 (53.5%) and low disease activity for a further 44 (34%). Median time to achieve remission or LDA was 20 weeks (0–52 weeks, n=128). Similarly, 40/57 (70%) of PsA patients achieved good PsARC response in median 24 weeks. Of 247, only 21 (8.5%) patients required escalation to biologic therapy.

**Conclusions:** Dedicated EACs help achieve good clinical outcomes in majority of patients. Nearly 87% of our cohort attained remission or low disease activity in

less than six months. This was despite a significant delay in patients presenting to their GPs and moderately-high disease activity. 100% of our patients were treated to target facilitated by protocol driven escalation of therapy in these clinics. This is in contrast to the national audit findings whereby only 68% of patients were treated with disease modifying drugs within 6 weeks of referral and 89% had treatment to target. Patient experience also improved (94% would now recommend the service compared to 76% prior to the initiative).

The project was a financial success with total savings for the year, accounting for most generous cost estimates, were £1 36 973. In addition, there was a 42% reduction in biologic use in this group compared to 2015. These savings are on top of wider economic and societal benefits achieved by inducing low disease activity or remission.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.1329

**AB1259 IS DOSE BANDING OF INFlixIMAB COST EFFECTIVE – RESULTS FROM REAL WORLD IMPLEMENTATION**

M.K. Nisar. *Rheumatology, Luton and Dunstable University Hospital, Luton, UK*

**Background:** Infliximab dose is based on the patient's body weight (3–5 mg/kg) and requires the use of multiple 100 mg vials to reconstitute the individualised dose. As the product is expensive, there is a significant cost associated with unused and wasted infliximab in any part-used vials. "Dose banding" is one solution so that patients receive a pre-prepared dose produced in advance in batches where wastage from part vials is minimised. There is some encouraging data that reconstituted infliximab is stable for long enough to allow batch production of pre-prepared doses. The theoretical risk of course is over or under treatment while respectively rounding up or down the administered dose.

**Objectives:** We undertook a retrospective analysis of our experience of dose banding in rheumatology unit.

**Methods:** All patients prescribed infliximab for rheumatic indication at our centre were included in the analysis. Case notes were retrospectively reviewed to look at dose variance following implementation of this initiative, resultant disease control and the consequent cost savings.

**Results:** 10 patients prescribed infliximab biosimilar and two bio-originator were identified for the analysis. Median age was 55.5 years (range 25–80 years). Nine had the drug for RA, two for AS and one for myositis.

Three had no change in dose as a result of implementing dose banding program. Three had dose increased by 3%–5%. Remaining six had dose reduced by range of 4%–6%. Their disease scores before and after dose banding remained largely unchanged (table 1). This equated to £1,184.58 annual savings in addition to the economic benefit of successfully switching the ten patients to biosimilar. No patient suffered loss of efficacy or adverse events in any of the three groups.

**Conclusions:** Our data confirms the utility of dose banding program for infliximab in rheumatology practice with no concerns about efficacy or safety of the initiative. There are potential opportunities to achieve considerable reductions in medicines discarded and improving finances by adopting dose banding for infliximab. It also helped curb over £10 000 expense to our Trust in infliximab waste cost alone. There are some important caveats to consider as well. True savings will depend on list price of each product and varies with originator versus biosimilar. The variance increases as the width of the dose bands increases i.e. the variance is greater at lower body weights. Consequently, depending on patient population both clinical and cost considerations could alter. Finally, assurance of the product

**Abstract AB1259 – Table 1**

Age	Sex	Ethnicity	Indication	Prior dose (mg)	Pre banding Disease score	New dose (mg)	Post banding Disease score	Variance	Dose vials	Saving (12 month)

#### BASELINE CHARACTERISTICS AND PATIENT SATISFACTION DATA FROM COACH@HOME: THE GERMAN SUPPORT PROGRAM FOR PATIENTS WITH RHEUMATIC DISEASES TREATED WITH CERTOLIZUMAB PEGOL

N. Böhme<sup>1</sup>, A.-D. Holst<sup>2</sup>, F. Dybowski<sup>3</sup>, C. Volberg<sup>4</sup>, H.-G. Pott<sup>5</sup>, U. Lendl<sup>6</sup>.

<sup>1</sup>Healthcare at Home Deutschland GmbH, Weinheim; <sup>2</sup>Rheumapraxis, Ludwigslust; <sup>3</sup>Rheumapraxis Ruhr, Herne; <sup>4</sup>Rheumatologie in Neuss, Neuss; <sup>5</sup>Rheumatologikum Hannover, Hannover; <sup>6</sup>UCB Pharma, Monheim, Germany

**Background:** Certolizumab pegol (CZP)-treated patients (pts) with rheumatoid arthritis (RA), axial spondyloarthritis (axSpA, including ankylosing spondylitis [AS] and non-radiographic [nr-]axSpA), and psoriatic arthritis (PsA) may be recommended the patient-coaching program, coach@home (c@h) in Germany to manage their disease. Eight coaching calls are offered over one year, scheduled around 'critical' milestones along the therapeutic journey. These calls are made by professionally-trained nurses, who offer support and information about both the disease and its treatment with CZP.

**Objectives:** The purpose of this observational analysis was to assess the baseline characteristics of pts subscribed to c@h, and the level of pt satisfaction with the program.

**Methods:** c@h was launched in June 2014 and is available to pts who are prescribed CZP according to the local product label. Pts must be CZP-naïve when subscribed to the program, and pt consent is required prior to subscription by the treating physician. There are no additional criteria for enrolment, although the program must be recommended to the pt by the treating physician.

Pt satisfaction was measured either at the end of the program or at discontinuation using the net promoter score (NPS), which has previously been used for this purpose.<sup>1</sup> The NPS is derived by asking pts to state how likely it is that they would recommend c@h to others (on a 0–10 scale). Rankings of 9–10 are considered 'promoters', 7–8 'passives', and 0–6 'detractors'. Subtracting the percentage of detractors from that of promoters yields the NPS (figure 1).

**Results:** A cumulative total of 655 pts had been registered to the program as of 5 Oct 2017. Of the total number of reported indications (n=683; multiple indications per pt possible), 55.9% were RA, 16.5% AS, 7.6% nr-axSpA, and 19.9% PsA. The mean age at baseline was 55 (RA), 54 (AS), 53 (nr-axSpA), and 52 (PsA), and the proportion of female pts was 80%, 58%, 65%, and 69%, respectively. Prior biologic DMARD exposure was 32.8%.

The most common topics discussed on phone calls were therapy compliance (in 1339 calls), CZP maintenance dose (in 1333 calls) and syringe disposal (in 870 calls). The average length per call was 15.9 min at the end of Week 0 (total: 28 calls), and 14.0 min at the end of Week 52 (total: 1796 calls). A cumulative total of 272 pts had either completed the 1 year coaching period (n=70) or discontinued (n=202) by 28 Sep 2017 of whom 106 rated the program. Of these, 87.5% gave promoter scores, 10.4% passive, and 3.8% detractor, yielding an NPS of 83.7 (figure 1). The program was still ongoing at the time of this data cut.

**Abstract AB1260 – Figure 1.** Patient ratings and Net Promoter Score for the coach@home program (as of September 2017)

Patients were asked to rate the coach@home program on a scale of 0–10, where 0="I would certainly not recommend this program" and 10="I would most probably recommend this program". Scores of 9–10 were considered 'promoters', 7–8 'passives' and 0–6 'detractors'. Percentages shown are out of the total number of responders by the end of September 2017 (n=106). NPS: Net Promoter Score.

**Conclusions:** The c@h program offers guidance and support to pts treated with CZP in Germany. Feedback from pts who were willing to provide a rating indicates a high level of satisfaction with the program.

AB1261

#### DEVELOPMENT OF A LOCAL NEEDS-BASED GP CURRICULUM FOR SHARED CARE IN RHEUMATOLOGY

O. Hussein, T. Duffy. *Rheumatology, Connolly Hospital Blanchardstown, Dublin 15, Ireland*

**Background:** There is a role for shared care between rheumatologist and primary care for Musculoskeletal (MSK) disorders. General practitioners (GPs) are involved in monitoring of clinical status of patients and their management, in addition to psychosocial aspects of chronic pain and disability. We are going to look at the rheumatology knowledge and skills needed by local GPs and based on their needs we plan to develop an initiative to improve the service provided to our patients. Here are the results of the initial survey of local GPs.

**Objectives:** We aim to identify knowledge and skill gaps in primary care related to MSK disorders and to develop a need-based curriculum to address these gaps. Develop an implementation plan to deliver the curriculum components.

**Methods:** Initially we identify the needs and gaps in the current practice using survey in a small group of local GPs. There are two rounds of questionnaires to reach a list of important areas to develop the curriculum. The second round will include large number of GPs. Also, there will be meetings with GPs to reach agreement and to adopt method of delivering these training and skills.

**Results:** In the first survey, 31 out of 36 GPs (86%) returned questionnaires. One GP (3.2%) refer to rheumatology department twice a week, 4 GPs (13%) refer weekly, 23 GPs (74%) refer every month and three GPs (9.7%) rarely refer to rheumatologist. Reasons for referral were diagnosis and long-term management,<sup>21</sup> diagnosis and discharge back to GP<sup>15</sup> and patient's request.<sup>4</sup> Thirteen GPs (42%) have interest in rheumatology conditions management. Regarding GPs' concerns with rheumatology service, 22 of them (71%) mentioned the long wait time for rheumatology appointment. Other issues were delayed clinic letter, need for clear instruction, patients not aware of appointment time, whether there is an urgent clinic and which clinic patient should be referred to (outpatient versus procedure clinics). Nineteen GPs (61%) received undergraduate rheumatology training, 16 (52%) during GP training programme and 4 (13%) attended postgraduate courses. Topics of interest by GPs were variable rheumatology conditions in addition to joint injections,<sup>3</sup> referral guidance<sup>2</sup> and update on DMARD. Preferred teaching methods to deliver the syllabus were small group tutorials,<sup>12</sup> face-to-face lectures<sup>5</sup> and protocols and guidelines.<sup>5</sup>

**Conclusions:** From this initial survey, we could identify that the major concern of local GPs is the long waiting time for rheumatology clinic. Some of GPs (42%) expressed their interest to have further training in rheumatology. When we reach an agreed curriculum with GPs, we aim to deliver the syllabus through preferred methods by GPs. Shared care between rheumatologists and GPs would improve quality standard of care in community, provide patient care close to home and reduce referral rates.

### TAPERING OF BIOLOGICAL ANTIRHEUMATIC DRUGS IN RHEUMATOID ARTHRITIS PATIENTS IS ACHIEVABLE AND COST EFFECTIVE IN DAILY CLINICAL PRACTICE: DATA FROM THE BRUSSELS UCL RA COHORT

S. Dierckx, B. Lauwerys, T. Sokolova, L. Meric De Bellefon, M. Stoenoiu, A. Nzeusseu, F. Houssiau, A. Avramoska, P. Durez. *Rheumatology, Cliniques universitaires Saint-Luc – Université Catholique de Louvain – Institut de Recherche Expérimentale et Clinique (IREC), Brussels, Belgium*

**Background:** Several studies demonstrate that Rheumatoid Arthritis (RA) patients achieving low disease activity or remission are able to taper biological (b) DMARDs.

**Objectives:** The aim of this study is to determine the number of patients suffering from RA in whom tapering of bDMARDs is achievable in daily practice and to evaluate the patient characteristics. Another objective is to analyse the budget impact and determine which bDMARDs are more adapted to dose reduction.

**Methods:** Inclusion criteria were RA patients from our Brussels UCL cohort treated with a bDMARD for at least one year. A dose reduction was proposed by the senior physician when sustained low disease activity or remission was observed. Data from 357 eligible RA patients (247 women and 110 men) were collected. Patient characteristics and baseline features before the current bDMARDs and flares if happened were collected. Annual drug dosage and cost were calculated.

**Results:** In 131 patients (35.7%), the dose of the bDMARD could be tapered. Patients in the decreased dose group were older (60.6 vs 55.9 years,  $p=0.005$ ) and started bDMARDs earlier in their disease course (6.8 vs 8.4 years,  $p=0.025$ ). As expected, the current DAS28-CRP was lower (2.26 vs 2.55,  $p=0.018$ ) and interestingly, more patients were treated with a combination of Methotrexate (84% vs 73%,  $p=0.019$ ). No differences between groups was observed for gender, disease duration, baseline HAQ, DAS28-CRP, erosion, ACPA, number of previous bDMARDs and use of Glucocorticoids. In our cohort, Anti-TNF agents were the most commonly prescribed medications (see Table). Annual drug cost was largely decreased for Rituximab and anti-TNF agents. Only 11 patients experienced a flare during the follow-up.

Abstract AB1262 – Table 1

bDMARD	Number of Pts	Stable dose (%)	Annual cost/ Pts (€)	Dose decreased (%)	Annual cost/ Pts (€)
ABA	23	12 (52)	12 979	11 (48)	8643,5
ADA	46	21 (46)	12 525	25 (54)	6908,8
CERTO	7	7 (100)	11740,2	0 (0)	Not available
ETN	69	41 (59)	9328,6	27 (39)	6101,6
GOL	24	22 (92)	12703,08	2 (8)	Not available
IFX	99	74 (75)	7290	25 (25)	6067
RTX	37	22 (59)	8784	17 (46)	4691,6
TOC	52	35 (67)	12773,7	17 (33)	9371,9
	357	234		124	

**Conclusions:** In daily practice, tapering of bDMARDs in RA patients with low disease activity or remission is an achievable goal, thereby reducing annual drug cost, especially for Rituximab, Infliximab, Etanercept and Adalimumab.

**Disclosure of Interest:** None declared

### FINNISH HEALTHVILLAGE.FI-RHEUMATICDISEASES.FI: A SPECIALISED CARE SERVICE UNIT DEVELOPED TOGETHER WITH PATIENTS TO OFFER ON-LINE INFORMATION AND TREATMENT FOR PATIENTS IN A MODERN WAY

R.A. Luosujärvi<sup>1</sup>, K. Taimen<sup>2</sup>, S. Lindqvist<sup>1</sup>, R. Roiha<sup>1</sup>, O. Kaipainen-Seppänen<sup>3</sup>, H. Mäkinen<sup>4</sup>, P. Isomäki<sup>4</sup>, L. Pirilä<sup>5</sup>, A. Karjalainen<sup>6</sup>, T. Valviita<sup>7</sup>, S. Viinikainen<sup>8</sup>, K. Eklund<sup>8</sup>, S. Arvonen<sup>1</sup>, on behalf of Finnish Helathvillage.fi-rheumaticdiseases.fi working team. <sup>1</sup>Rheumatology virtual hospital, Helsinki university hospital, HUS, Helsinki; <sup>2</sup>Turku University Hospital, Turku; <sup>3</sup>Department of Rheumatology, Kuopio University Hospital, Kuopio; <sup>4</sup>Department of Rheumatology, Tampere University hospital, Tampere; <sup>5</sup>Department of Rheumatology, Turku University Hospital, Turku; <sup>6</sup>Department of Rheumatology, Oulu University Hospital, Oulu; <sup>7</sup>Helsinki university hospital, Hyvinkää; <sup>8</sup>Department of Rheumatology, Helsinki university hospital, HUS, Helsinki, Finland

**Background:** Finnish on-line Health village environment, so-called HUS-MAP®, was used to develop on-line information for rheumatic patients.

**Objectives:** To face the challenge of increasing demand for rheumatological care without additional resources a new virtual client-orientated service was developed.

**Methods:** In Finland, an on-line Health village environment, so-called HUS-MAP®, has been developed to offer virtual digital information to citizens, patients, and healthcare professionals. By using this HUS-MAP® environment, we provide information and support to citizens and patients who need information on different rheumatic diseases and various unspecified aches and musculoskeletal pains. The study group consisted of participants from every university hospital in Finland, from local authorities; rheumatologists, other specialists, general practitioners, nurses, special professionals such as physical therapists, and patients. Information provided was based on updated international and Finnish guidelines on rheumatic diseases. After the information was reviewed and accepted by our study group, it was fed into a special program and published on-line in the Health village environment.

**Results:** E-service for citizens and patients was opened in March 2017. Detailed description of symptoms, diagnosis and therapy of various rheumatic diseases, such as rheumatoid arthritis, spondyloarthritis, connective tissue diseases and vasculitis are available. Early diagnosis and treatment to remission when possible is emphasised. The service aids to identify, by using symptom navigator and questionnaires for back pain, as well as swollen and painful joints those who may have a rheumatic disease and guide patients to find medical services without delay. Already 60 500 persons have visited our website.

**Conclusions:** Finnish e-service, rheumaticdiseases.fi, offers an easy way to reach people and increase citizen's awareness on their own health. By guiding people to search for care the service may reduce delays in diagnosis of rheumatic diseases and the onset of therapy

**Acknowledgements:** To patients and healthcare professionals working in Finnish Helathvillage.fi-rheumaticdisease.fi

AB1264

### BARRIERS AGAINST TESTING ANTI-TNF DRUG LEVELS AND ANTI-DRUG ANTIBODIES IN ROUTINE CLINICAL PRACTICE

S.P. Gavan<sup>1,2</sup>, G. Daker-White<sup>3</sup>, K. Payne<sup>2</sup>, A. Barton<sup>1,4</sup>. <sup>1</sup>NIHR Manchester Biomedical Research Centre, Manchester University NHS Foundation Trust, Manchester Academic Health Science Centre; <sup>2</sup>Manchester Centre for Health Economics; <sup>3</sup>NIHR Greater Manchester Primary Care Patient Safety Translational Research Centre; <sup>4</sup>Centre for Musculoskeletal Research, The University of Manchester, Manchester, UK

**Background:** There is growing interest in using tests to measure anti-TNF drug levels and anti-drug antibodies (ADAb) in routine clinical practice for patients with rheumatic diseases. Testing may provide rheumatologists with additional information when considering a decision to adjust biologic treatment; for example, a decision to increase the interval between injections of an anti-TNF or to change treatment to a biologic that has a different target. However, it is not clear whether rheumatologists consider drug level and ADAb testing to be a useful technology within their routine clinical decision-making. Testing may be implemented imperfectly if rheumatologists perceive barriers against measuring drug levels and ADAb which, in turn, can affect the effectiveness and cost-effectiveness of care.

**Objectives:** To explore the potential barriers against testing anti-TNF drug levels and ADAb in routine clinical practice.

**Methods:** Semi-structured telephone interviews were conducted individually with a purposive sample of consultant rheumatologists from different hospitals across England. The telephone interviews were recorded and transcribed verbatim. Pilot interviews were undertaken to develop the interview schedule. The rheumatologists were invited to discuss their perceptions and experiences of anti-TNF drug

level and ADAb testing within their own clinical practice. The transcripts were analysed by thematic framework analysis where themes comprised perceived barriers to testing. Ethical approval was obtained from The University of Manchester's Research Ethics Committee.

**Results:** Eleven rheumatologists provided informed consent to participate in the study. All rheumatologists demonstrated an awareness of tests that were available to measure anti-TNF drug levels and ADAb. However, the majority (n=10) did not use these tests in their routine clinical decision-making. Five potential barriers against testing were identified as themes: <sup>1</sup> recognising the clinical problem within their own patients; <sup>2</sup> understanding the purpose of testing drug levels and ADAb; <sup>3</sup> a lack of robust evidence to support testing; <sup>4</sup> insufficient capacity to implement testing locally, and <sup>5</sup> the additional cost associated with testing.

**Conclusions:** The potential barriers against measuring anti-TNF drug levels and ADAb suggest that introducing these tests into practice for rheumatology may be challenging. Authoritative guidance for measuring anti-TNF drug levels and ADAb in specific rheumatic diseases may reduce the uncertainty over the purpose of testing in routine clinical settings. The generation and dissemination of robust evidence for the accuracy, effectiveness, and cost-effectiveness of testing is likely to be informative to rheumatologists and decision-makers that allocate resources for health care. Decisions to introduce testing in clinical practice may benefit from considering the implications of capacity constraints when analysing samples and the mechanisms to pay for the additional cost of testing. These barriers against testing are not unique to the health care system in England and may generalise to the delivery of care for rheumatic diseases within health care systems internationally.

**Disclosure of Interest:** None declared

#### AB1265 LOSS OF SPECIALTY MEDICAL CARE FOR ELDERLY RHEUMATOID ARTHRITIS PATIENTS WHO DISCHARGED FROM HOSPITAL

S. Mizuki, F. Sagawa, D. Hiraoka, K. Yoshida, H. Ikeuchi, K. Oryoji. *The Center For Rheumatology, Matsuyama Red Cross Hospital, Matsuyama, Ehime, Japan*

**Background:** As the ageing of the population progresses, the proportion of the population over the age of 65 reaches 27.3% in 2016, in Japan. Even elderly rheumatoid arthritis (RA) patients often require immunosuppressive agents or biological disease modifying antirheumatic drugs (DMARDs) due to their high disease activity. Therefore, they need to continuously receive treatment by specialty rheumatologists. Due to the deterioration of the ability of daily living activities, some patients may drop out of specialty medical care.

In recent years, the age of RA patients who need to be hospitalised has also increased. However, it is unclear whether elderly patients discharged from the hospital are able to continue receiving specialty medical care.

**Objectives:** To clarify whether a patient who has been discharged from a rheumatology specialty hospital can continue receiving rheumatology specialty medical care.

**Methods:** RA patients who discharged from our rheumatology unit from January 1, 2016 to December 31, 2016, were included. We investigated the backgrounds and outcomes of those patients retrospectively. We compared the background characteristics of patients who are receiving treatment by specialty rheumatologists at the final follow-up (specialty group) and those who are not (non-specialty group). For the statistical analysis, a chi-squared test and Student's t-test were used.

**Results:** We identified 147 patients. The mean  $\pm$ SD age of patients at discharge was 72.2 $\pm$ 9.1 years and 74.8% was female. The reasons for hospitalisation were 87 patients (59.2%) for treatment of RA and 60 (40.8%) for treatment of complications (sepsis, fracture and so on).

After discharge, 134 patients (91.1%) had returned to follow up in our department for RA treatment. The remaining 13 patients were treated at other hospitals, five of whom were treated by a primary care physician who was not specialised for rheumatology. Overall, we compared 142 patients in the specialty group and 5 in the non-specialty group.

The age, the use ratio of immunosuppressive agents/biological DMARDs/prednisolone and the dose of prednisolone in the specialty group and the non-specialty group were 71.9 and 79.0 years old (p=0.09), 50.0% and 20.0% (p=0.37), 29.6% and 20.0% (p=1.00), 78.7% and 80.0% (p=1.00), 6.5 and 5.6 mg/day (p=0.83), respectively.

**Conclusions:** In elderly RA patients, some patients drop out of RA specialty medical care. The background of such patients is not different from those of patients who are receiving treatment by specialty rheumatologists. In order to provide specialty medical care for RA patients throughout the community, a co-management medical collaboration system between specialty rheumatologists and primary care doctors should be established.

Brito-Zerón<sup>1,8</sup>, E.M. Aguilar Romo<sup>9</sup>, C. Yllera Gutiérrez<sup>10</sup>, A.C. Antolí-Royo<sup>5</sup>, A. Flores-Chavez<sup>1,11,12</sup>, C. Morcillo<sup>8</sup>, L. Caminal<sup>10</sup>, M. Pérez-de-Lis<sup>13</sup>, M. Ramos-Casals<sup>1</sup>, on behalf of the cBIOGEAS-SEMI Study Group. <sup>1</sup>Hospital Clinic, IDIBAPS, Barcelona, Spain; <sup>2</sup>Hospital Universitario de Córdoba, IUCBC; <sup>3</sup>INICSA, UNC-CONICET, Córdoba, Argentina; <sup>4</sup>Hospital Alvaro Cunqueiro, Vigo; <sup>5</sup>Hospital de Ávila, Avila; <sup>6</sup>Hospital Morales Messeguer, Murcia; <sup>7</sup>Hospital La Paz, Madrid; <sup>8</sup>Hospital CIMA-Sanitas, Barcelona; <sup>9</sup>Hospital Quironsalud, Madrid; <sup>10</sup>Hospital Universitario Central de Asturias, Oviedo, Spain; <sup>11</sup>CMNO, IMSS, Hospital de Especialidades, Guadalajara; <sup>12</sup>CUIB, Universidad de Colima, Colima, Mexico; <sup>13</sup>Complejo Hospitalario Universitario A Coruña (CHUAC), A Coruña, Spain

**Objectives:** To characterise the development of autoimmune diseases triggered by the new biological therapies used as immunotherapy in patients with advanced cancer in a real-life clinical setting.

**Methods:** In 2006, the Study Group on Autoimmune Diseases (GEAS) of the Spanish Society of Internal Medicine created the BIOGEAS project, a multicenter study devoted to collecting data on the use and safety of biological agents in adult patients. In December 2016, the cBIOGEAS-SEMI multicenter registry was formed with the aim of collecting patients with cancer treated with biological immunotherapies who developed autoimmune diseases.

**Results:** By January 2018, the cBIOGEAS-SEMI Registry includes 40 patients (26 men and 14 women, mean age of 59.7 years) who developed 54 triggered autoimmune diseases, including interstitial lung disease (n=11), enterocolitis (n=8), hypophysitis (n=6), polyarthritis (n=4), thyroiditis (n=3), vasculitis (n=3), severe cutaneous involvement (n=3), adrenalitis (n=2), Sjögren syndrome (n=2), cardiomyopathy (n=2), pancreatitis (n=2), Guillain-Barre syndrome (n=2), hepatitis (n=2) and CNS involvement, sclerosing cholangitis, glomerulonephritis and sarcoidosis (one case each). Underlying neoplasia consisted mainly in pulmonary neoplasia (n=16), melanoma (n=11) and breast cancer (n=3). The main pharmacological groups of cancer immunotherapies included PD1 inhibitors (n=26), CTL4 inhibitors (n=7), growth factor/adhesion molecules inhibitors (n=4), combined PD1/CTLA4 blockade (n=2) and TK inhibitors (n=1); biologics included nivolumab (n=20), ipilimumab (n=9), pembrolizumab (n=8), trastuzumab (n=3), catumaxomab (n=1) and vemurafenib/combinetinin (n=1). Glucocorticoids were used in all cases but 4, and 9 patients required intravenous methylprednisolone pulses; 5 patients required additional immunosuppressive therapies (intravenous immunoglobulins in 4, methotrexate in one). All cases responded to treatment with glucocorticoids except 4 patients who died (3 due to ILD and one due to neurological disease).

**Conclusions:** A wide variety of systemic and organ-specific autoimmune diseases triggered by the new cancer immunotherapies is emerging. In this nationwide real-life Registry, immune checkpoint inhibitors are the biologics involved in nearly 90% of cases. We found an excellent response to glucocorticoids, with a poor prognosis in those patients who developed pulmonary and neurological autoimmune diseases.

#### AB1267 BIO-SIMILAR TO BIO-ORIGINATOR SWITCHBACK: NOT A RELIABLE QUALITY INDICATOR

S.Y. Lee, M.C.H. Szeto, J.B. Galloway. *Kings College Hospital NHS Foundation Trust, London, UK*

**Background:** SB4 in an etanercept biosimilar which was licensed by the EMA in January 2016 for clinical use. Switching etanercept treated patients from reference etanercept (ETN) to SB4 can deliver substantial saving in drug costs. The SB4 to ETN switchback rate is often scrutinised by commissioners and clinicians, as it may be a quality indicator for the switch process.

**Objectives:** To evaluate SB4 drug survival and the SB4 to ETN switchback rate in our cohort of patients with Rheumatoid Arthritis, Axial Spondyloarthritis and Psoriatic Arthritis.

**Methods:** This was a retrospective observational study of 56 patients who were switched from ETN to SB4 in December 2016 at Kings College Hospital. Clinical data was collected 8 months post-switch to establish the number of patients in whom SB4 had been discontinued, the reasons for discontinuation, and the switchback rate.

**Results:** 84% (n= 47) of patients remained on SB4 at 8 months following the switch. Of the 9 patients who discontinued SB4, 89% (n=8) was due to loss of efficacy, whilst 11% (n=1) reported side effects. Of these, 78% (n=7) were switched over to a 3rd biologic agent, whilst 22% (n=2) were switched back to ETN. The

median pre-SB4 switch DAS score for patients with RA who were switched to a 3rd biologic agent was 4.23 (Range: 2.59–7.65), whilst that of those switched back to ETN was 4.08 (Range: 3.35–4.81).

Abstract AB1267 – Table 1

Demographics (n=56)	No. of patients remaining on SB4 at 8 months (n=47)	No. of patients switched to a 3rd biologic agent at 8 months (n=7)	No. of patients switched back to ETN at 8 months (n=2)
Mean Age	57.2	55.4	39.5
% Female	64%	71%	100%
% Disease RA	70%	71%	100%
AS	15%	14%	0
PsA	15%	14%	0
% Etanercept Monotherapy	43%	71%	100%
Median Time on SB4 prior to switch (days)	N/A	251 (Range: 79–357)	122.5 (Range: 114–131)

**Conclusions:** This switch back rate to ETN is considerably lower than what has been reported in the literature.<sup>1–3</sup> There appears to be a preference for switching patients to an alternative biologic agent, rather than switching patients back to the bio-originator. This could be explained by inadequate disease control on etanercept, which has been unmasked under the scrutiny of the biosimilar switch process. An alternative explanation could be that our local clinical commissioning group offers financial incentives if the department maintains a high percentage of etanercept treated patients on SB4. Hence, as prescribing practice can be influenced by both clinical factors and external targets, utilizing the switchback rate from biosimilar drugs to bio-originators is not a reliable indicator of the quality of biosimilar switch process.

#### AB1268 NO DIFFERENCES BETWEEN HOSPITAL AND CLINIC IN PATIENTS WITH RHEUMATOID ARTHRITIS BASED ON REAL-WORLD DATA FROM THE AORA OBSERVATIONAL COHORT STUDY IN JAPAN

T. Kashiwagura<sup>1</sup>, M. Kobayashi<sup>2</sup>, M. Urayama<sup>3</sup>, N. Konishi<sup>4</sup>, T. Aizawa<sup>5</sup>, H. Itoh<sup>6</sup>, Y. Sugimura<sup>7</sup>, H. Aonuma<sup>8</sup>, T. Kawano<sup>5</sup>, T. Sakuraba<sup>2</sup>, N. Miyakoshi<sup>8</sup>, Y. Shimada<sup>8</sup>. <sup>1</sup>Department of Orthopedic Surgery, AKITA CITY HOSPITAL, Akita; <sup>2</sup>Department of Orthopedic Surgery, Hiraka General Hospital, Yokote; <sup>3</sup>Department of Orthopedic Surgery, Ogachi Central Hospital, Yuzawa; <sup>4</sup>Department of Orthopedic Surgery, Akita Kousei Medical Center, Akita; <sup>5</sup>Department of Orthopedic Surgery, Kita Akita Municipal Hospital, Kita Akita; <sup>6</sup>Department of Orthopedic Surgery, Noshiro Kousei Medical Center, Noshiro; <sup>7</sup>Department of Orthopedic Surgery, Nakadori General Hospital; <sup>8</sup>Department of Orthopedic Surgery, Akita University Graduate School of Medicine, Akita, Japan

**Background:** In Japan, orthopaedic surgeons, rather than internists, are often involved in the management of rheumatoid arthritis (RA), including drug treatment. However, the paradigm shift in the RA management has changed, and orthopaedic surgeons have often faced challenges in treating RA. The proportion of RA patients treated by orthopaedic surgeons is high in Akita Prefecture, located in Tohoku region in Japan. Akita Prefecture has the 6th largest area in Japan and the highest ageing rate. As many elderly patients have difficulty commuting to distant clinics or hospitals, specialised centres are desirable for advanced treatment of RA. However, in Akita Prefecture, the focus has been on improving treatment of RA by orthopaedic surgeons in the community. In 2010, the Akita Orthopaedic Group on RA (AORA) was established. Currently, 18 hospitals and 10 clinics are participating in the group, and cover all medical districts throughout the prefecture. In addition to a regular study meeting, a workshop on joint ultrasonography and a

case conference with internists have been held. We established a case registration system (AORA registry) 8 years ago. This system has enabled us to share treatment experiences.

**Objectives:** This study examined whether the AORA clinics have provided consistent community-based care comparable to that provided by hospitals.

**Methods:** Data from the 2017 AORA registry (including 2238 registrations [1300 in hospitals and 938 in clinics]) were used.

**Results:** Patients treated in clinics were younger (68.1 years in hospitals vs. 64.4.1 years in clinics), and had shorter duration of disease (157.4.0±4.0 months in hospitals vs. 143.5±4.5 months in clinics). The frequency and amount of methotrexate use were not significantly different between the two groups, while those of prednisolone use were greater in patients treated in hospitals than in those treated in clinics. There were no significant differences in the frequency or amount of biological disease-modifying antirheumatic drug use (19.9% in hospitals vs. 18.9% in clinics). There were also no significant differences in disease activity (Disease Activity Score-28-erythrocyte sedimentation rate) in the total cohort (2.91±0.04 in hospitals vs. 2.90±0.04 in clinics) or in patients aged 80 years or older (n=341) (3.35±0.08 in hospitals vs. 3.37±0.11 in clinics). The frequency and amount of drug use for treatment of osteoporosis were significantly higher in patients treated in hospitals than in those treated in clinics.

**Conclusions:** The results of this study showed that RA treatment outcomes were not significantly different between hospitals and clinics, indicating that the treatment level provided at orthopaedic clinics in the community was high and in accordance with the treat-to-target strategy. Given that orthopaedic surgeons are better able to examine joints and are able to treat osteoporosis, they are expected to treat more RA patients. We believe that the AORA plays an important role in maintaining the quality of clinical services for RA patients in Akita Prefecture.

Sanz Sanz<sup>17</sup>. <sup>1</sup>Instituto de Salud Musculoesquelética; <sup>2</sup>Instituto de Salud Musculoesquelética, Madrid; <sup>3</sup>Hospital del Mar, Barcelona; <sup>4</sup>Hospital Universitario Ramón y Cajal, Madrid; <sup>5</sup>Hospital General Universitario de Elda, Alicante; <sup>6</sup>Hospital de Basurto, Bilbao; <sup>7</sup>Hospital Universitario Lucus Augusti, Lugo; <sup>8</sup>Hospital Universitario Parc Tauli de Sabadell, Barcelona; <sup>9</sup>Hospital Clínico Universitario de Valladolid, Valladolid; <sup>10</sup>Hospital Universitario Central de Asturias, Oviedo; <sup>11</sup>Hospital Clínic de Barcelona; <sup>12</sup>Hospital de Sant Joan Despí Moisés Broggi, Barcelona; <sup>13</sup>Hospital Universitario de Gran Canaria Dr. Negrín, Las Palmas de Gran Canaria; <sup>14</sup>Hospital General Universitario Santa Lucía, Cartagena; <sup>15</sup>Hospital Universitario Virgen del Rocío, Sevilla; <sup>16</sup>Hospital de Mérida, Badajoz; <sup>17</sup>Hospital Universitario Puerta de Hierro, Majadahonda, Spain

**Background:** In the context of complex diseases like psoriatic arthritis (PsA), in which patients are often followed by different professionals, it is important for health professionals, providers and patients to have tools for delivering and demanding optimal care. One way to organise and evaluate health care quality is by the use of validated standards of care and quality indicators.

**Objectives:** To develop nationally accepted standards of care and quality indicators for care in PsA.

**Methods:** Qualitative methodology was followed that included: 1) Two focus groups (one with patients with PsA and another with non-rheumatologists specialists involved in the care of patients with PsA); 2) A narrative literature review of published documents related to the quality of care in PsA (including the QUANTUM Report<sup>1</sup>); 3) A nominal group meeting in which 15 expert rheumatologists generated and consensuated, a series of quality criteria as well as formulas or quantifiable objective measures to evaluate them; 4) A Delphi to establish the feasibility, priority and agreement with the quality criteria; 5) A final generation of standards of care and their attributes (including quality indicators). A descriptive analysis of the results was carried out.

**Results:** A total of 59 standards of care were generated, 19 of mandatory compliance, grouped into 4 blocks according to specific objectives: 1) Early diagnosis (n=6); 2) optimising the management of the disease (n=26), 3) multidisciplinary collaboration (n=9); 4) monitoring improvement (n=18). To assess the compliance of these standards of care, in many cases the medical records will be reviewed. Other sources will be the memory of the service and hospital and bibliographic databases. Regarding to the level compliance, for some of the standards of care this is yes/no, for others the compliance will range are from 50% to 100%, and in this range for many this will be by 80%.

**Conclusions:** This set of standards of care should help improve quality of care in APs patients.

**AB1270** **ACHIEVING EARLY DISEASE CONTROL AND REDUCING INDIRECT COST – THE CRYSTAL REGISTRY IN HONG KONG RHEUMATOID ARTHRITIS PATIENTS**

T.H. Cheng<sup>1</sup>, M.C. Wan<sup>2</sup>, L.S. Tam<sup>1</sup>, on behalf of CRYSTAL Study Team.  
<sup>1</sup>Department of Medicine and Therapeutics, THE CHINESE UNIVERSITY OF HONG KONG; <sup>2</sup>Department of Medicine, Ruttonjee Hospital, Hong Kong, Hong Kong

**Background:** Rheumatoid arthritis is associated with irreversible joint erosion, jeopardising patients' work ability and incurs substantial indirect cost to the society. While early treatment yield clinical efficacy, its economic outcome remains uncertain in Hong Kong.

**Objectives:** To ascertain the effect of early disease control in early RA subjects on indirect cost.

**Methods:** This was a multi-centre, prospective cohort study involved 13 hospitals in Hong Kong. Subjects underwent intensive treatment scheme aiming at remission. Early disease control was defined as achieving remission or low disease activity (LDA) at month 6 indicated by DAS-28 score.

**Results:** Seventy early RA patients [53 (75.7%)Female, mean age: 53±11 years, mean disease duration 30±11 months] were included in this analysis. Forty-two (60%) subjects achieved early disease control. Subjects with or without early disease control were comparable at baseline. Twenty-two(31.4%) subjects had non-zero indirect cost[median(IQR) indirect cost: USD162(76–317)]. Among them, early disease control non-achievers(n=11) had significantly higher indirect cost than achievers[median(IQR) indirect cost: USD317(133–934) vs USD95,<sup>48–163</sup> p=0.008](figure 1). Using multivariate linear regression, after adjusting for age, gender, baseline pain score, fatigue level, physical and mental condition, every 1-unit increase in DAS score at month 6 was associated with USD82 increase in indirect cost [95% CI: 12–151, p=0.022]. When disease activity was categorised, not achieving remission/LDA was associated with USD165 increase in indirect cost [95% CI: 21–310, p=0.025] (table 1).

Model 1 – DAS score as continuous variable

Model 2 – DAS score categorised as early disease control or not

**AB1271** **SEVERE OUTCOMES OF AFRICAN PATIENTS FROM PALOP EVACUATED FOR MEDICAL ASSESSMENT IN PORTUGAL – RHEUMATOLOGY AS A CASE STUDY**

V.A. Teixeira, A. Valido, S. Barreira, J.E. Fonseca, C. Macieira. *Rheumatology and Metabolic Bone Diseases, Hospital de Santa Maria, CHLN, Lisbon, Portugal*

**Background:** Portugal has made an official commitment for improving health in Portuguese speaking African countries (PALOP) by allowing an annual quota of patients evacuated from these countries for medical reasons. The agreements pretend to compensate difficulties in health care access and medical resources of these populations. However, the bureaucratic process that mediates the displacement of patients to Portugal is invariably complex and delayed, so these aims are commonly not achieved.

**Objectives:** to report our experience dealing with PALOP rheumatic patients and evaluate their outcomes.

**Methods:** a retrospective analysis of patients evacuated from PALOP and referred due to rheumatic diseases or potentially related conditions, followed-up in our Department for the last 7 years. Clinical data was collected until September 2017.

**Results:** a total of 58 patients (77.6% female), with an average age of 33.5 years (±SD 15.2; range 2–78 years) were included, representing Guinea-Bissau 44.8%, Cape Verde 27.6%, São Tomé and Príncipe 17.2% and Angola 10.3%. Of all these patients, only 44.8% were primarily referred to our Department. The majority (55.2%) had no previous diagnosis, 19% were considered to have a wrong diagnosis and 25.9% were well diagnosed. After assessment in our Department, we ended up with the diagnoses listed, mainly SLE (17.2%) and Rheumatoid Arthritis (17.2%).

**Abstract AB1271 – Table 1**

Disease	N
SLE	10
Rheumatoid Arthritis	10
Vasculitis	6
Dermatomyositis	3
Other CTD	4
Osteoarticular infections	3
Psoriatic Arthritis	2
Ankylosing Spondylitis	2
Reactive Arthritis	2
JIA	1
SAPHO Syndrome	1
Non-inflammatory rheumatic diseases	6
Non-confirmed rheumatic diseases	8

The mean duration of symptoms was 62.4 months (minimum 1 month; maximum 40 years). From the evacuation request until effective journey patients waited a mean of 13.9 months (missing data in 37 patients). At arrival, only 25.9% of patients were or had been on corticosteroids and only 15.5% on conventional disease modifying antirheumatic drug (DMARD) treatment, versus 62% and 67.2%, respectively, after assessment in Portugal (graphic). Even common and cheap drugs, like prednisolone and hydroxychloroquine were underprescribed before our assessment. Twelve percent of patients required biologics. Hospitalizations related to disease activity or complications were required in 43.1%. Severe damage, measured by indication for orthopaedic, cardiothoracic or vascular surgery, need of chronic dialysis or long-term oxygen therapy and permanent neurologic deficits was present in 34.5% of the patients. Three patients died. Regarding infectious comorbidities, 12.1% of patients were diagnosed with tuberculosis, 8.6% had chronic hepatitis B infection and 12.1% had evidence of previous contact with hepatitis B virus.

Abstract AB1271 – Figure 1

**Conclusions:** PALOP patients present with long-lasting and severe rheumatic diseases with chronic damage, due to lack of precise diagnosis, ineffective referrals and lack of appropriate treatment. They also frequently present with important infectious comorbidities and social needs that may delay treatment. Despite the obvious advantages of the evacuation of patients to a more resourceful country, we believe there is a need for identification of onsite barriers and improvement of local awareness on Rheumatic diseases and Rheumatology speciality.

#### INCREASING STRENGTHS OF EVIDENCE FOR ROLE OF NURSES IN THE MANAGEMENT OF CHRONIC INFLAMMATORY ARTHRITIS: RESULTS OF A SYSTEMATIC LITERATURE REVIEW

V. Lion, M. Schirmer. *Internal Medicine, Clinic II, MEDICAL UNIVERSITY OF INNSBRUCK, AUSTRIA, Innsbruck, Austria*

**Background:** In 2011 EULAR first published European recommendations for the potential role of nurses in the management of patients with rheumatic diseases.<sup>1</sup> Since then, the EULAR recommendations were well disseminated and positively evaluated both across Europe and the United States (US).<sup>2</sup>

**Objectives:** To assess new evidence for the role of nurses in the management of chronic inflammatory arthritis (CIA) obtained since the 2011 EULAR recommendations.

**Methods:** A systematic literature search was performed for the time between 1/2010 and 9/2016 based on the PRISMA guidelines, using the search strategies and eligibility criteria and categorising evidence as did the EULAR taskforce.

**Results:** A total of 44 articles and 10 abstracts were identified fulfilling the eligibility and exclusion criteria. Strong new evidence exists for recommendation 3 with nurse-led telephone services to enhance continuity of care and to provide ongoing support (evidence level 3), and – at least in part – for recommendation 6, that nurses should promote self-efficacy (evidence level 1B) and empowerment (evidence level 2B), but sense of control was not studied. Some new evidence also exists for recommendations 7 and 8 (level 2B).

**Conclusions:** This literature review reveals new evidence for a role of nurses in managing CIA-patients especially with RA and in stable and low disease activity, and thus further supports the existing 2011 EULAR-recommendations.

#### UPTAKE OF PNEUMOCOCCAL AND INFLUENZA VACCINATION IN PATIENTS RECEIVING BIOLOGICAL DMARDS (bDMARDs) IN IRELAND

W.L. Ng<sup>1,2</sup>, A. Anjum<sup>1,2</sup>, A. Sebastian<sup>1,2</sup>, M. Brady<sup>1,2</sup>, E. Fitzgerald<sup>2</sup>, B. McCarthy<sup>2</sup>, M. Gillespie<sup>1</sup>, J.P. Doran<sup>1</sup>, J. Devlin<sup>1,2</sup>, A. Fraser<sup>1,2</sup>. <sup>1</sup>Rheumatology, University Hospital Limerick; <sup>2</sup>Rheumatology, Croom Orthopaedic Hospital, Limerick, Ireland

**Background:** Biological disease-modifying antirheumatic drugs (bDMARDs) have made significant positive outcomes in the lives of patients with rheumatic disease. This treatment has proven efficacy in delaying joint destruction and inducing disease remission.<sup>1</sup> Studies have shown that pneumococcal vaccination is cost effective while the influenza vaccination significantly prevents morbidity and mortality in the elderly and in patients with chronic disease.<sup>1</sup>

**Objectives:** To evaluate the pneumococcal and influenza vaccination status in patients receiving biological disease-modifying antirheumatic drugs (bDMARDs). **Methods:** Patients on bDMARDs attending the rheumatology infusion unit were asked about their vaccination status on pneumococcal and influenza using a questionnaire. The patients' diagnosis, current bDMARD and reasons for not having had vaccination were recorded.

**Results:** 92 patients were recruited. Mean age of 53.2 years with 63 (68.5%) female and 29 (31.5%) male. A total of 30 (32.6%) patients received both pneumococcal and influenza vaccination, 1 (1.1%) received pneumococcal vaccination alone, 22 (23.9%) received influenza vaccination alone and 39 (42.4%) had neither. Of the 18 (19.6%) patients age >65 years, 5 (27.8%) received influenza vaccination alone and 8 (44.4%) received both. Patients who did not receive vaccinations were given an educational booklet.

The most common diagnosis from our cohort was rheumatoid arthritis(37%), followed by spondyloarthritis(13%), Behçet's disease(9.8%), myositis(7.6%), vasculitis(5.4%), systemic lupus erythematosus(5.4%), psoriatic arthritis(4.4%) and others(17.4%). 48 (52.2%) were on rituximab, 37 (40.2%) on infliximab, 6 (6.5%) were on tocilizumab and 1 (1.1%) was on abatacept.

Of the 61 (66.3%) patients who did not receive the pneumococcal vaccine, 44 (72.1%) were unaware of its availability, 6 (9.8%) were not interested in receiving it, 4 (6.6%) were afraid of the side effects, 4 (6.6%) declined vaccination and 3 (4.9%) were unaware it was recommended. 40 (43.5%) who did not receive the influenza vaccine stated that they were either unaware(45%), not interested (25%), declined vaccination(10%), forgotten(5%), unaware it was recommended (5%) and afraid of the side effects(2.5%). 3 (7.5%) had previous bad experiences from influenza vaccination.

**Conclusions:** This is the first study in Ireland looking at vaccination uptake in patients on bDMARDs. The vaccination rate in our cohort was less than satisfactory. Patients on immunosuppressants are recommended to have these vaccinations and preferably to receive them before commencing on the immunosuppressants.<sup>2</sup> The lack of awareness is the main reason for failure to be vaccinated. Hence, primary care physicians and the rheumatology team should take active roles in increasing awareness amongst patients about the recommendation for pneumococcal and influenza vaccination.

### THE EFFECT OF IMPLEMENTING AN ONLINE PATIENT HEALTH RECORD AIMING TO PROMOTE PATIENT PARTICIPATION IN RHEUMATOID ARTHRITIS PATIENTS ON THE USE OF DISEASE-MODIFYING ANTIRHEUMATIC DRUGS AND OUTCOME IN DAILY CLINICAL PRACTICE

W.D. Müskens<sup>1</sup>, S.A.A. Rongen-van Dartel<sup>1,2</sup>, E. Adang<sup>3</sup>, P.L. van Riel<sup>1,2</sup>. <sup>1</sup>IQ Healthcare, Radboud UMC, Nijmegen; <sup>2</sup>Rheumatology, Bernhoven, Uden; <sup>3</sup>Health Evidence, Radboud UMC, Nijmegen, Netherlands

**Background:** Current guidelines say that there should be a prominent place for patient participation and shared decision making in rheumatic care.

To achieve this Bernhoven introduced an online patient health record (OPHR) for patients with rheumatoid arthritis (RA) aiming to facilitate self management and giving insight in the individual disease course in April 2014. This platform enables patients to monitor their disease by completing questionnaires about for instance pain, fatigue and quality of life. It also gives access to their medication history and offers patients information in the form of an online library.

**Objectives:** This study analyses how the introduction of an OPHR, aiming to promote patient participation, influences the prescription of DMARD's and the disease activity (DAS28) in daily clinical practice. A distinction was made between the effects of the PHR on patients recently diagnosed with RA (study A) and the RA population as a whole (study B).

**Methods:** In April 2014 anan OPHR for patients with RA was introduced at the rheumatology department of Bernhoven.

Using data from the rheumatology department registry, two analyses were performed to evaluate this implementation.

Study A compared the treatment and course of DAS28 of patients diagnosed in the period three years prior to the implementation ("prior group") with those diagnosed in the period three years after the implementation ("after group").

Study B was an observational study that examined yearly trends for DMARD use and DAS28 for the whole RA population between April 2011 and April 2017

**Results:** Study A

A total of 287 patients were diagnosed with RA of which 127 were in the prior group and 171 in the after group. CsDMARD's were given 160 days [95%>CI 123–198] after diagnosis in the "prior group" versus (vs.) 32 days [95%>CI 22–43] in the after group. Next to that there was an increase in cumulative time csDMARD's were used during follow-up, 54% vs. 74% (p-value<0.001). Also, more patients received csDMARD combination therapy, 49% vs. 64% (p-value=0.001). There was no difference in number of patients that started a bDMARD, 7% vs. 14% (p-value=0.059). However, a significant larger group started with a bDMARD in the first year after start of csDMARD therapy in the after group, 3.1% vs. 9.9% (p-value 0.024). 39% of the prior group vs. 69% in the after group achieved either remission or LDA within the first year of DMARD therapy (p-value<0.001).

Study B

The trend analysis of DMARD use in the RA population is plotted in figure 1. Between 2011 and 2017 a change in trend can be observed for the use of csDMARD's, the use of csDMARD combination and the use of bDMARD csDMARD combination therapy. The usage of bDMARD therapy did not change.

**Abstract AB1274 – Figure 1.** Trends in DMARD prescription, per yearly period

**Conclusions:** After the introduction of the OPHR patients recently diagnosed with RA got earlier and more intense treatment, with a more prominent role for biologicals. Next to that a bigger proportion of patients recently diagnosed with RA achieved remission and LDA within the first year of DMARD therapy. When looking for trends in the total RA population, an increase of the use of csDMARD's, the use of csDMARD combination and the use of bDMARD csDMARD combination therapy was observed after April 2014.

### RESEARCH CONTRIBUTION TO THE JOURNAL OF ANNALS OF THE RHEUMATIC DISEASES FROM 2012 TO 2016: A BIBLIOMETRIC ANALYSIS

Y. Yetik-Aydogdu<sup>1</sup>, O. Aydogdu<sup>2</sup>, Z. Sari<sup>2</sup>. <sup>1</sup>Physiotherapy and Rehabilitation, Haydarpaşa Numune Education and Research Hospital, Department of Physiotherapy and Rehabilitation; <sup>2</sup>Physiotherapy and Rehabilitation, Marmara University, Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation, Istanbul, Turkey

**Background:** Rheumatology, a subspecialty of medicine, is devoted to diagnosis and therapy of rheumatic diseases, including clinical problems in joints, soft tissues, and autoimmune diseases. "Annals of the Rheumatic Diseases" is one of the most read and prestigious journals in the field of rheumatology. Bibliometric studies concerning the quantity and quality of articles published in rheumatology journals are scarce. The scientific production in the field of rheumatology from 1996 to 2010 was compared by Cheng.<sup>1</sup> On the other hand, as to our knowledge, there is no study investigating research contribution to Annals of the Rheumatic Diseases since 2012.

**Objectives:** This study aims to investigate countries' research contribution in the field of rheumatology by classifying scientific papers according to their countries between 2012 and 2016 in Annals of the Rheumatic Diseases, official journal of EULAR.

**Methods:** All scientific papers which were published from 2012 to 2016 in Annals of the Rheumatic Diseases were screened. Some scientific papers such as editorial, viewpoint notes, or letters were excluded. In addition, supplementary issues were excluded as well. Rest of the papers were separated in two different part: "clinical and epidemiological research" and "basic and translational research". The papers were investigated one-by-one to determine their countries. All papers were classified according to their corresponding author.

**Results:** A total of 1616 scientific papers were investigated. Totally 1092 papers were included. While *clinical and epidemiological research* included 753 articles, *basic and translational research* contained 339 articles. There are 211, 188, 260, 235, 198 published articles in 2012, 2013, 2014, 2015, 2016, respectively. In 2012, 2014 and 2015 the top countries to publish articles in Annals of the Rheumatic Diseases are England, Netherlands and USA. In 2013 and 2016, France is in the list of top countries instead of Netherlands. While, 46, 37 and 37 articles were published from England, Netherlands and USA, respectively in 2012, 53, 35 and 18 articles were published from England, USA and France, respectively in 2016.

**Conclusions:** According to our results, Western Europe and USA clearly dominate the production of scientific papers in Annals of the Rheumatic Diseases, official journal of EULAR. Our results are in accordance with the literature. We conclude that research resources, financial and other some issues may contribute the publishing process.

### ECONOMIC IMPACT OF NON-MEDICAL SWITCHING FROM ORIGINATOR BIOLOGICS TO BIOSIMILARS – A SYSTEMATIC LITERATURE REVIEW

Y. Liu<sup>1</sup>, V. Garg<sup>2</sup>, M. Yang<sup>3</sup>, E.Q. Wu<sup>3</sup>, M. Skup<sup>2</sup>. <sup>1</sup>Division of Pharmacy Practice and Administration, The University of Missouri, Kansas City; <sup>2</sup>AbbVie, Chicago; <sup>3</sup>Analysis Group, Inc., Boston, USA

**Background:** Biosimilars, often priced at a discounted rate of originator biologics, may prompt switching patients from originator biologics to biosimilars for non-medical reasons. However, other relevant costs (e.g., non-medical switching (NMS) program setup, costs of concomitant therapies, additional healthcare resource utilisation [HRU]) associated with NMS are not well understood.

**Objectives:** A systematic literature review (SLR) was conducted to review and summarise economic consequences of NMS from a biologic originator to its biosimilar.

**Methods:** English publications reporting HRU or costs associated with biosimilar NMS were searched in PubMed and Embase over the past 10 years, and from selected scientific conferences over the past 3 years, along with grey literature (e.g., organisational reports). Search strings for keywords (e.g. biosimilar, HRU, cost, switch etc.) were combined using Boolean operators for all relevant agents with an approved biosimilar (e.g., tumor-necrosis factor inhibitors, erythropoiesis-stimulating agents, insulin, hormone therapies).

**Results:** A total of 244 publications were retrieved for review, where 122 were identified from the database search, 117 from conference abstracts and 5 from grey literature. Of these publications, 23 reported costs or HRU associated with biosimilar NMS, including 10 center-based cohort studies (all except one were single arm), 10 budget impact models/simulation studies, 2 national registry studies, and 1 policy review. Only three studies reported real-world HRU: a single-centre, two-cohort study found that switching to biosimilars was associated with higher inpatient readmission rate (80% vs 5%,  $p<0.001$ ), surgery rate (29% vs. 0%,  $p=0.02$ ), and steroid use (60% vs. 8%,  $p<0.001$ ); a single-centre, single-arm study reported extra visit/phone consultation with a provider among patients experiencing injection-site pain; a national registry-based study found that comparing 6 months before vs. after NMS, post-NMS had increased outpatient visit days (5.7 vs 5.4,  $p<0.001$ ) and increased rates in 6/16 service categories. Among the other 20 studies, most of them focused on potential cost savings with approximately half considering drug cost only. Estimation/simulation in cost savings varied substantially due to heterogeneity in study design and assumptions (e.g. disease areas, drug price discount rates, cost components, population size, study period etc.). Among these, discontinuing/switching or switching back to the originator was reported in four studies (rate range: 6%–29%) and biosimilar dosing increase (35%) was reported in one study. A policy review study pointed out that biologic rebates (commonly at 50%) should be taken into account in the context of NMS.

**Conclusions:** Few real-world studies reported economic consequences of biosimilar NMS and found increased HRU in patients with biosimilar NMS. Studies of cost estimation have been largely limited to drug prices. Comprehensive evaluation on the economic impact of NMS should incorporate all important elements of economic outcomes such as drug price, biologic rebates, HRU, NMS program setup, administration, and monitoring costs.

#### VACCINATION STATUS AND KNOWLEDGE AND ATTITUDE ON VACCINE AMONG PATIENTS WITH RHEUMATIC DISEASE IN CHINA

Y. Jiang<sup>1</sup>, X. Li<sup>2</sup>, X. Zhang<sup>1</sup>, Q. Lv<sup>1</sup>, Y. Zhang<sup>1</sup>, J. Qi<sup>1</sup>, Z. Liao<sup>1</sup>, J. Gu<sup>1</sup>.

<sup>1</sup>Rheumatology, The Third Affiliated Hospital of Sun Yat-Sen University, Guangzhou; <sup>2</sup>Rheumatology, The People's Hospital of Liuzhou City, Liuzhou, China

**Background:** Rheumatic diseases are associated with an increased susceptibility to infections.<sup>1</sup> Specific inactivated vaccinations are recommended for patients with autoimmune diseases.<sup>2–4</sup> However, vaccination coverage among patients with rheumatic disease is extremely low in China.

**Objectives:** Our study was to discover infection and vaccination status in patients with rheumatic diseases in recent five years. and then to determine knowledge and attitude on vaccine among patients with rheumatic diseases.

**Methods:** A questionnaire-based survey was conducted in a total of 242 patients. The Statistical Package for Social Sciences (SPSS) software version 21 was used for all data management and analysis.

**Results:** Of 242 patients, mean age was 39.84±4.42. Mean disease duration was 30.00±4.42. 55% had connective tissue disease. 7 patients had herpes zoster infection. 4 had influenza. 5 had pneumonia, 1 had dengue fever. And 1 had herpes genitalis infection in recent 5 years.

Only 15 patients (6.2%) had vaccination in recent 5 years. 2 female patients had inoculation of human papillomavirus (HPV) vaccine. 3 patients took shots of hepatitis B virus (HBV). 2 were vaccinated for tetanus, 4 for rabies vaccine and 1 for influenza.

159 (65.7%) of the patients had heard of influenza vaccine. Only 62 (25.6%) had heard of pneumococcal vaccine. 103 (43.6%) of the participants knew where to take vaccine. Only 9 patients had reported of former doctors' advice to taking vaccine (influenza, 2). 144 (59.5%) believed influenza could turn to serious infection.

47.5% had correct knowledge of vaccination function. Only 42.1% believed vaccine was safe and valid. 8.3% of the patients thought vaccination was useless. 57.4% of the patients would like to take vaccine if medical insurance could cover vaccination. Only 37.6% of the patients preferred to take vaccine with doctors' recommendation.

**Conclusions:** There is a need for educational intervention and awareness campaigns over the importance of vaccination in patients with rheumatic diseases.

#### MOBILE DEVICE-AIDED HEALTH CARE: ADMINISTRATION OF NEW HEALTH CARE IN CHINA

Q. Lv, Y. Jiang, J. Qi, Y. Zhang, X. Zhang, Z. Liao, Z. Lin, J. Gu. *Rheumatology, The Third Affiliated Hospital of Sun Yat-Sen University, Guangzhou, China*

**Background:** ,<sup>1</sup> <sup>2016</sup> the total population of mainland China has reached 1.38 billion, while there are only 2.21 licensed/assistant physicians per thousand people.<sup>1</sup> Another serious problem is uneven geographical distribution of medical resources. Less than 3% of general hospitals are responsible for more than 40% of medical service. Limited medical resources and distribution imbalance lead to countless of trans-provincial medical behaviours, resulting in an increase of economic cost and time cost. Meanwhile, China's mobile Internet communication is booming. By the end of 2016, there were 1.32 billion mobile phone users nationwide.<sup>2</sup> Based on these advantages, a new type of digital medical care has been developed rapidly in China.

**Objectives:** Our aim was to describe current situation of medical care and mobile medical care in China, and then to analyse medical big data to help manage chronic diseases such as rheumatic diseases.

**Methods:** Distribution and number of medical resources were acquired by the website of National Bureau of Statistics of the People's Republic of China and National Health and Family Planning Commission of the People's Republic of China. 7 biggest digital medical services and other healthcare websites or applications were compared in the aspects of application function, numbers and distribution of registered doctors and patients, and chronic disease management.

**Results:** According to different stages of medical interventions, operation modes of digital medical services can be divided into different types. Major functions encompass reservation, payment and medical consultancy. 3% of applications involve the management of chronic diseases. Many mobile medical platforms rely on doctors from comprehensive hospitals. Patients with definitive diagnosis and initial treatment could be managed and followed-up via the platform. This Internet management mode of chronic diseases currently attracts 3 89 407 specialists from comprehensive hospitals and 8 95 921 patients with chronic diseases. Although the number of registered doctors in the southeastern areas is absolutely higher, many doctors are more accepting Internet-based medical practice in relatively poor western regions. The proportion of physicians and patient with chronic diseases is very large. The top 5 departments of registered users are related to chronic diseases.

**Conclusions:** Limited medical and health resources and distribution imbalance is a serious problem in China. A new mode of digital medical service may help manage chronic diseases.

#### EFFICACIOUS TRANSITION FROM REFERENCE PRODUCT INFLIXIMAB TO THE BIOSIMILAR IN DAILY PRACTICE

Z. Layegh<sup>1</sup>, J. Ruwaard<sup>1</sup>, R.C. Hebing<sup>1</sup>, M.J. L'Ami<sup>1</sup>, W. van der Weele<sup>1</sup>, M. T. Nurmohamed<sup>1,2</sup>, G. Wolbink<sup>1</sup>, C. Krieckaert<sup>2</sup>, <sup>1</sup>Amsterdam Rheumatology and Immunology Center Reade; <sup>2</sup>Amsterdam Rheumatology and Immunology Center Vumc, University Medical Center, Amsterdam, Netherlands

**Background:** The biosimilar of infliximab, approved in September 2013 for the treatment of rheumatic diseases. The biosimilar is non-inferior to the reference product of infliximab based on safety, quality and efficacy.<sup>1</sup> In order to enable health care cost saving and efficient treatment, a transition to the biosimilar was deemed necessary.

**Objectives:** To evaluate the transition from the reference product to the biosimilar in patients with rheumatoid arthritis (RA), psoriatic arthritis (PsA).

**Methods:** Consecutive patients treated with reference product were switched to the biosimilar in the period July 2015 to June 2016 at the Amsterdam Rheumatology and immunology Center, Reade. Patients were informed by a letter about the transition to the biosimilar and were subsequently contacted by a nurse or the pharmacist for additional questions and whether they agreed upon the switch. Patients were advised to contact their treating rheumatologist when in doubt. Once agreed, the biosimilar was administered at the same dosage and interval as previous treatment with the reference product. Patients were followed until January 2018. The primary outcome was to evaluate the transition from the reference product to the biosimilar, secondary outcome was the change in disease activity measured with the Disease Activity Score in 28 joints using erythrocyte sedimentation rate (DAS28-ESR). Last available DAS28-ESR before switching and first available DAS28-ESR approximately 12 months after switching was used. In addition, the reason for discontinuation with infliximab or the restart with the reference product was recorded.

**Results:** In total 45 patients switched from the reference product to the biosimilar, 2 patients disagreed upon the switch and continued the reference product. The median treatment duration within fliximab in patients with RA and PsA was 17 (SD=11) years (table 1). During the follow-up period, 3 patients (7%) restarted the reference product due to subjective reasons, increase in disease activity was not objectified by the rheumatologist. The biosimilar was continued by 42 patients (93%). Furthermore, 1 patient switched to another biological due to lack of effect and in 2 biological therapy was stopped because of malignancy. The DAS28-ESR remained comparable before and after the switch, with a mean (SD) of respectively 2.34(±1.02) and 2.31 (±1.11).

**Abstract AB1279 – Table 1.** Baseline characteristics of the 45 patients who switched from the reference product to the biosimilar

RA/PsA no.	41/4
Age, mean (SD) years	65 (14)
Female no. (%)	32 (71)
Disease duration, median (SD) years	17 (11)
DAS28-ESR, mean (SD)	2.34 (1.02)
Duration infliximab use, median (SD) years	19 (11)
Methotrexate use; no.(%)	31 (69)

**Conclusions:** In our population, a high amount of patients (n= 42, 93 %) continued the biosimilar during the follow up period of two years. A very low number of the patients (n=3) restarted the reference product, due to subjective reasons, whilst retaining stable DAS28-ESR.

#### Epidemiology, risk factors for disease or disease progression

AB1280

#### PREDICTING WORK DISABILITY, PENSION CLAIM, ABSENTEEISM AND PRESENTEEISM IN RA PATIENTS

A.D. Houssien, M. Yates, S. Norton, J. Galloway. *Academic Rheumatology department, King's College London, London, UK*

**Background:** Despite advances in treatments for Rheumatoid Arthritis (RA) a high prevalence of unemployment and work disability (WD) is reported; almost one third of affected patients leave the work force within two years of diagnosis. However, historic studies focused upon work disability as a dichotomous outcome, whereas more recent research has shifted the focus to work productivity, absenteeism and presenteeism.

**Objectives:** We undertook a systematic review of observational studies to identify the known predictors of work productivity from work disability and identify the gap in between.

**Methods:** A systematic search of Medline and Embase and PsychINFO since 2000 was undertaken using search terms: "Rheumatoid arthritis", "Disability", "Employment", "Work", "Occupation", "presenteeism", "absenteeism", "productivity" and "indirect cost". Original publications, all observational studies, reporting on predictors of work outcomes in RA were eligible. Clinical trials of drug therapies were excluded. All article titles were manually reviewed by 2 reviewers (AH and MY) and relevant abstracts was discussed and agreed, for which full text articles were sourced. Selected articles were assessed for quality using: QUality In Prognosis Studies (QUIPS) for observational studies. The heterogeneity in study designs meant meta-analysis was not appropriate. Therefore, To account for variation across studies in outcome measures used, an albatross plot was used to confirm predictors that were significantly associated with adverse work outcome.

**Results:** In total 57 observational studies were included in the review, with data collectively on 83 686 patients. The studies were from 19 different countries, predominantly including developed countries. There was substantial heterogeneity across studies in terms of predictors evaluated as well as how work productivity was estimated. More contemporary studies were more likely to capture information on mental health as a predictor. Consistent significant predictors of work outcome could be divided into<sup>1</sup> demographic factors: older age, obesity, lower educational level, job type, commuting difficulty;<sup>2</sup> disease factors: higher disease activity, longer disease duration, joint erosions, longer morning stiffness, higher disability;<sup>3</sup> comorbidity: concomitant mental health disorder, fibromyalgia or cardiovascular disease.

**Conclusions:** The review highlights the lack of consistency in the use of validated work outcome measures in research. The key determinant of work disability extends beyond disease severity measures, and in particular mental health is emerging as a pivotal component of health that predicts ability to remain within the work force.

**Disclosure of Interest:** None declared

### INCIDENCE AND CHARACTERISTICS OF HEALTHCARE-ASSOCIATED INFECTION (HCAI) IN HOSPITALISED PATIENTS WITH RHEUMATOLOGIC DISORDERS AT ALEXANDRIA MAIN UNIVERSITY HOSPITAL

A.A. Abdelati<sup>1</sup>, E.A. Sultan<sup>2</sup>. <sup>1</sup>Internal Medicine; <sup>2</sup>Community Medicine, Faculty of Medicine – Alexandria University, Alexandria, Egypt

**Background:** Healthcare-associated Infection (HCAI) is an important cause of morbidity and mortality in autoimmune diseases<sup>(1)</sup>. The increased susceptibility to infections in such patients is explained by abnormalities of the cellular and humoral immune responses, as well as the use of immunosuppressive drugs. Infection in these patients can present with minimal signs and symptoms or with atypical features in unusual locations that considerably can delay the diagnosis and worsen the outcome. There are few detailed systematic reports on HCAI in rheumatology; most previous reports investigated HCAI in the setting of systemic lupus erythematosus (SLE) but lack other connective tissue diseases<sup>(2)</sup>.

**Objectives:** To determine the incidence and characteristics of HCAI in patients with rheumatologic diseases admitted to the Rheumatology Unit at the Alexandria Main University Hospital (AMUH) on 2017.

**Methods:** A One-year duration prospective observational study to elucidate the incidence and characteristics of HCAI in patients with underlying rheumatologic diseases who were admitted to the Rheumatology Unit of the Internal Medicine Department at AMUH between January 1st and December 31st 2017.

**Results:** A total of 516 patients (423 female (82%) and 93 male (18%)) with underlying rheumatologic diseases and disease duration of 6.03±4.18 years were admitted between January 1st and December 31st 2017. The mean age was 32.18±9.54 years, and the mean length of hospitalisation was 10.04±5.76 days. HCAI occurred in 14.9% (n=77) of patients with a total number of infections of 81 (15.69%) (four cases had more than one episode of infection in more than one site with a different organism during the same admission). Gram -ve bacilli were the most commonly isolated organisms (46.3%; n=38) followed by Gram +ve cocci (25.6%; n=21). The urinary tract was the most commonly documented site of infection (39.5%; n=32) followed by blood stream (18.5%; n=15), and *Klebsiella spp* (17.9%; n=15) was the most frequently identified infectious agent, followed by *Methicillin-resistant Staphylococcus Aureus* (MRSA) (14.3%; n=12). Of the total cases with HCAI (n=77), 85.7% (n=66) treated, 7.8% (n=6) deteriorated and shifted to the ICU with multiorgan failure, 5.2% (n=4) died, and 1.3% (n=1) (a case with meningitis) were referred to another specialised hospital.

**Conclusions:** Despite the improvement in healthcare services, the incidence of HCAI infection in our inpatient population is still high and represents a burden on our resources. Although most cases were treated with appropriate antimicrobials, HCAI is still the cause of deterioration and death in a considerable percentage of patients with rheumatologic diseases.

### TYPE OF PATIENT REFERRAL TO EARLY ARTHRITIS CLINIC (FLOW AND FATE)

A.A. Negm<sup>1,2</sup>, A.M. Marzooqi<sup>2</sup>, J. Al Saleh<sup>2</sup>. <sup>1</sup>Rheumatology, Faculty of Medicine, Al Azhar University, Cairo, Egypt; <sup>2</sup>Rheumatology Unit, Dubai Hospital, Dubai Health Authority, Dubai, United Arab Emirates

**Background:** Early Arthritis clinic (EAC) has a major contribution in Rheumatology outpatient services. Clinically, it gives a unique opportunity to assess, diagnose and classify various Rheumatic and Musculoskeletal diseases (RMD) during the initial phase of the disease process. Studying the patient's profile of EAC population aids in better management from the epidemiologic point of view. The average referral to EAC in Dubai hospital is 2 weeks over the last 5 years.

**Objectives:** The current study was conducted to explore the characteristics and common diagnoses of patients referred to EAC Rheumatology clinic in Dubai Hospital.

**Methods:** A review of the Electronic Medical Record of 117 patient presented to EAC between August 22nd 2017 and December 31st 2017. The following data were extracted from EMR and patient's files: Type of patient referral to EAC, initial visit diagnosis as well as concordance between initial diagnosis and established diagnosis.

**Results:** Autoimmune Rheumatic Diseases (ARDs) represents 41.1% of new cases diagnosed in the EAC. The number and percentage of the whole new cases

diagnosis is as shown in the following table while the type/percentage of patient presentation to EAC is shown in the graph.

Abstract AB1282 – Table 1

Disease category	Number	Percent (%)
Mechanical and soft tissue rheumatism	31	26.5
Fibromyalgia	10	8.6
Rheumatoid arthritis	19	16.2
Systemic lupus erythematosus	7	6
Spondyloarthritis	9	7.7
Vasculitis	3	2.6
Other	19	16.2
Osteoporosis	19	16.2

Occasionally, patients' clinical features were inconclusive at the initial presentation. Knowing that most patients presented within two weeks of symptoms onset to EAC, hence classification at initial visit was difficult in 16.2% (others or undifferentiated inflammatory arthritis).

on review of the initial visit diagnoses and the final established diagnoses after 3 months, we have found 97 of 117 has the same diagnosis, i.e. 82.9% concordance.

Abstract AB1282 – Figure 1. Type of patient presentations to EA in %

**Conclusions:** Early Arthritis Clinic grants an efficient access to patients with inflammatory and inflammatory back pain. However, a need of a standardised tool to triage patients with different musculoskeletal diseases to prevent delayed appointments to EAC.

We suggest adding Osteoporosis (Bone metabolic disorders), Undifferentiated (arthritis, CTD, SPA) and non-Rheumatic diseases to initial diagnosis to increase the current concordance.

### THE PREVALENCE AND COMORBIDITIES ASSOCIATED WITH PSORIATIC ARTHRITIS IN PATIENTS WITH PSORIASIS: AN OBSERVATIONAL COHORT STUDY

A.M. Abdalla<sup>1</sup>, M.H. Abd El-Halim<sup>2</sup>. <sup>1</sup>Rheumatology and Rehabilitation, Aswan University, Aswan; <sup>2</sup>Dermatology and Andrology, Benha University, Benha, Egypt

**Background:** The prevalence and comorbidities of psoriatic arthritis (PsA) varies in different parts of the world and there is little clinical and epidemiological data from the Egyptian

**Objectives:** : To investigate the prevalence of psoriatic arthritis (PsA) in patients with psoriasis (PsO), and to identify comorbidities associated with it.

**Methods:** : The study was designed as an observational cohort study involving patients with psoriasis. Information was collected about lifestyle, habits, comorbidities, and psoriasis activity. Patients were classified as having PsA if they fulfilled the criteria of the Classification of Psoriatic Arthritis Study group (CASPAR).

**Results:** : The data was obtained from the 371 psoriasis patients. The mean age was 40.0±16.6 years, 42% were women, and 58% were men. A diagnosis of PsA was found in 104 patients (28%), of whom 34.6% had peripheral involvement, 15.4% had isolated axial involvement, and 50% had both peripheral and axial involvement. The PsA onset was preceding psoriasis in 48%, together with psoriasis in 40% and following psoriasis in 12%. Family history of PsO and PsA was positive in 21.6% and 8.4% respectively. PASI score of our patients ranged from 1–30 with a mean of 8.77±6.33, which were relatively higher in PsA patients. Comorbidities in form of diabetes mellitus, hypertension, liver disease, HIV and dyslipidemia

were found in 14.6%, 10.5%, 10.2%, 0.3% and 0.5% respectively. Smoking was found in only 10 patients (2.7%).

**Conclusions:** The prevalence of PsA in Egyptian patients with psoriasis appears to be within the range reported in other studies. Whereas, most of PsA onset was found to precede the psoriasis.

**PRELIMINARY DATA OF VACCINATION STATUS, POST VACCINATION IMMUNITY AND LATENT TUBERCULOSIS IN PATIENTS WITH CHRONIC INFLAMMATORY DISEASE IN A RHEUMATOLOGY CONSULTATION IN ST RAFAEL'S HOSPITAL IN BARCELONA**

A. Erra<sup>1</sup>, H. Borrell<sup>1</sup>, L. López<sup>1</sup>, X. Martínez<sup>2</sup>. <sup>1</sup>Rheumatology, Hospital San Rafael; <sup>2</sup>Preventive medicine, Hospital Vall Hebron, Barcelona, Spain

**Background:** Chronic inflammatory diseases (CID)(Rheumatoid arthritis(RA), Psoriatic arthritis(PsA) and ankylosing spondylitis(AS) are treated with disease modifying antirheumatic drugs(DMARDs). The most common adverse events are infections so an adequate vaccination is necessary before starting these treatments

**Objectives:** Determine the vaccination status, post-vaccination response and presence of latent tuberculosis(TB) in patients(pts)with CID

**Methods:** Before treatment with DMARDs, hepatitis C virus(HCV) antibodies, hepatitis B(HBV)surface antigen are determined. Following the guideline of Spanish Society of Rheumatology, before start a biological treatment(BT), latent tuberculosis(TB)screening is done by PPD and booster test. We and Preventive Medicine Department(PMD) of Vall Hebron Hospital(VHH) established vaccination protocol for pts with CID treated with DMARDs or/and BT:anti pneumococcal vaccination, virus serological status(varicella zoster IgG, measles IgG, anti-hepatitis A IgG, HBV surface antigen, HBV anti-surface antigen, HBV anti-core antigen and anti-HCV) and quantiferon(QT) test by assessment latent TB. Vaccines were administered depending on the above tests such as the determination of the post-vaccination HBV serology. Positive QT pts were referred to Infectious Diseases Department of VHH and received Isoniazid for 6 months

**Results:** From October 2016 to November 2017,123 pts with CID(including new onset and chronic disease) were referred to PMD. The pts were classified:81 RA (16 BT/65 DMARDs);25 PsA(9 BT/16 DMARDs),13 AS(10 BT/3 DMARDs),5 others(2 BT/3 DMARDs);2 juvenile idiopathic arthritis,1 reactive arthritis,1 monoarthritis and 1 polymyalgia rheumatica. Pts with BT were treated:14 RA with combined therapy(CT) and 2 with monotherapy;9 AS with monotherapy and 1 with CT,2 PsA with monotherapy and 7 with CT.19 pts had QT(+);2 had previously PPD(-);3 had previously PPD(+) and it was unknown in 14. Pts with PPD(+) and QT(+)(n=4), all of them who received BT(n=3) had been treated with isoniazid. The patient treated with DMARDs didn't received it. Pts QT(+) and previous PPD(-)(n=2):1 with BT for years and never before had been treated with isoniazid, so this treatment was started. The other with DMARDs started treatment with isoniazid as she was going to start BT in a short time. The rest of the pts QT(+)(n=14) didn't have a previous PPD(all DMARDs).11 received prophylaxis with isoniazid and 3 didn't, because they didn't require BT soon.19% of pts had positive HBV's serology, so they didn't receive HBV vaccination. 81%(n=100) had a negative anti-Ag surface HBV.92% of them received the vaccination, and from them, 9% didn't develop immunologic response so they needed revaccination(3 received TC BT-DMARDs and 5 DMARDs in monotherapy).42% developed immunologic response and in 49% we are waiting for the results.16% had a negative HAV's serology and all of them received the vaccination

**Conclusions:** The quantiferon can detect latent TB in patients with negative PPD and booster. Most patients need vaccination to HBV. Check the immunity from HBV is necessary after vaccination to know if they need revaccination. In our preliminary data we have observed absence of immunity to HBV in patients who are treated with BT (with CT) and also in patients who are treated with synthetic DMARDs.

**SERUM INTERLEUKIN 33, A POSSIBLE NEW MARKER PREDICTING THE DEVELOPMENT OF VASCULITIS IN PATIENTS WITH SYSTEMIC LUPUS ERYTHEMATOSUS**

A. A.-R. Youssef<sup>1\*</sup>, A.E.M. A. Afify<sup>1</sup>, T.O. El-Said<sup>1</sup>, S.S. Metwally<sup>2</sup>, D.M. Abd El Ghafar<sup>1</sup>. <sup>1</sup>Rheumatology and Rehabilitation; <sup>2</sup>Clinical Pathology, Mansoura University, Mansoura, Egypt

**Background:** Systemic lupus erythematosus (SLE) is an autoimmune disease characterised by abnormal production of autoantibodies and proinflammatory cytokines. Although interleukin-33 (IL-33), a novel member of the IL-1 family, has

been reported to have proinflammatory effects, the association of IL-33 with SLE has not been fully investigated<sup>1</sup>

**Objectives:** To estimate serum levels of IL- 33 in Egyptian patients with SLE and in controls, and to find out any relation between IL-33 serum levels in SLE patients and disease activity in addition to other clinical and laboratory criteria.

**Methods:** 60 SLE Egyptian patients (53 females and 7males) diagnosed according to systemic lupus international collaborating clinics (SLICC); new classification criteria 2012 and 20 healthy controls matched for age and sex were included. Patients with diseases suggesting the possibility of increased serum IL-33 were excluded<sup>2</sup> 27 SLE patients were diagnosed clinically as having vasculitis and this was confirmed by laboratory and imaging studies. Serum IL-33 was measured by sandwich ELISA Kit. Disease activity was assessed using SLE disease activity index (SLEDAI) score.<sup>3</sup>

**Results:** Using Mann-Whitney U test, median serum level of IL-33 (30.3 pg./ml) was significantly higher in patients with SLE than that of healthy controls (24.80, p=0.003). Using logistic regression analysis, SLE patients with high IL-33 serum levels have 3.8 times higher risk of developing vasculitis (OR 3.8 (1.1–13.6, 95% CI: p=0.01) and 3.2 times higher risk of developing oral ulcers (OR 0.3.2 (1.2–11.7, 95% CI: p=0.033.) than those with lower IL-33 serum Levels. No significant correlation was found between serum levels of IL-33 and total SLEDAI score or any of the other clinical or laboratory criteria.

**Conclusions:** Our findings suggest that IL-33 may be considered as a possible new inflammatory marker predicting the development of vasculitis and/or mucosal ulcers in SLE patients. Neutralisation of IL-33 may hopefully result in a new therapeutic option for these patients. Further studies are warranted to get more conclusive results.

**ANKYLOSING SPONDYLITIS (AS), PSORIATIC ARTHRITIS, UNDIFFERENTIATED (U) SPONDYLOARTHRITIS (SPA) IN INDIA: RESULTS FROM WHO ILAR COPCORD INDIA PROGRAM STAGE I SURVEY 2000–2010**

A. Chopra<sup>1</sup>, R. Ghorpade<sup>1</sup>, M. Saluja<sup>1</sup>, A. Venugopalan<sup>1</sup>, S. Sarmukaddam<sup>1</sup>, T. Kainifard<sup>2</sup>, K.M. Mahendranath<sup>3</sup>, on behalf of BJD- COPCORD Team India. <sup>1</sup>rheumatology, Center for Rheumatic Diseases, Pune, India; <sup>2</sup>rheumatology research, Tehran Univ of Medical Sciences, Teheran, Iran, Islamic Republic of Ireland; <sup>3</sup>rheumatology, Arthritis Center, Bangalore, India

**Background:** Using a low cost low infrastructure model, the WHO ILAR COPCORD (Community Oriented Program for Control of Rheumatic Diseases) surveys have covered several population in Asia and Latin America. The reported prevalence of AS based on large sample surveys was 0.2–0.3 in China and 0.12 in Iran. We used the Bhigwan COPCORD model to complete comprehensive surveys at several urban and rural site in India.

**Objectives:** To describe the prevalence of SpA in India with a focus on AS

**Results:** 51 741 population (66% rural) in 11 sites all over India was screened using a suitable COPCORD core questionnaire and protocol. Stage I survey was carried out in 3 concurrent overlap phases. House to house visit identified respondents with current/past musculoskeletal pain (last 7 days). Paramedics interviewed respondents to map MSK pain and record patient centric outcome including an Indian version HAQ (Phase 2). Clinical evaluation was carried out by rheumatologists with minimal investigations (Phase 3). The diagnosis was clinical. Survey sites and samples were chosen by convenience. Data was centrally processed and analysed using standard software; significant p<0.05. Data standardised (age-gender) as per; India census 2002 adjusted prevalence reported.

Abstract AB1286 – Table 1

Disorder	Male (%)	Mean age (Range) years	Prevalence (95% confidence interval)
Spondyloarthritis	44.8	43 (19–80)	0.24 (0.20–0.29)
Ankylosing Spondylitis	72.2	39 (19–65)	0.03 (0.02–0.06)
Psoriatic Arthritis	64	54 (40–80)	0.02 (0.00–0.03)
Undifferentiated SpA	38.4	42 (21–80)	0.19 (0.16–0.23)

Abstract AB1286 – Figure 1

**Conclusions:** The burden of SpA in India (1.2 billion population) is enormous. Compared to global statistics, the prevalence of clinical AS and psoriatic arthritis in the Indian population appears low.

#### A POPULATION-BASED STUDY ON THE PREVALENCE AND INCIDENCE OF VASCULAR PRIMARY ANTIPHOSPHOLIPID SYNDROME: A NEW RARE DISEASE

C. Nalli<sup>1</sup>, L. Andreoli<sup>2</sup>, G. Pascariello<sup>1</sup>, A. Zentilin<sup>1</sup>, E. Raffetti<sup>3</sup>, G. Martini<sup>4</sup>, R. Kumar<sup>2</sup>, C. Gasparotti<sup>5</sup>, M. Magoni<sup>5</sup>, C. Scarcella<sup>5</sup>, F. Donato<sup>3</sup>, A. Tincani<sup>2</sup>.

<sup>1</sup>Rheumatology and Immunology Unit, Department of clinical and experimental sciences, ASST Spedali Civili of Brescia; <sup>2</sup>Rheumatology and Immunology Unit, Department of clinical and experimental sciences, Spedali Civili and University of Brescia; <sup>3</sup>Unit of Hygiene, University of Brescia; <sup>4</sup>Department of Diagnostics, Spedali Civili; <sup>5</sup>Brescia Health Protection Agency, Brescia, Italy

**Background:** Antiphospholipid Syndrome (APS) is a systemic autoimmune disease characterised by the presence of thrombotic and/or obstetrical manifestations and antiphospholipid antibodies (aPL). In 2006 the updated Sapporo criteria for APS were published but by now no epidemiological study on this disease were performed. Incidence and prevalence of primary APS (PAPS) in the general population are still unknown.

**Objectives:** The aim of this study was to evaluate the prevalence during the year 2013 and incidence for the period 2011–2015 of vascular PAPS in the adult population of a defined area, Valtrompia valley, using multiple sources. Valtrompia is a 40 kilometers-long prealpine valley in northern Italy. The population in 2013 was 101.477 inhabitants. The only easy access to the valley is from Brescia, the main city of the province. This valley is a cul-de-sac area without any other comfortable and practicable access. Therefore, this valley is ideal for epidemiological studies. In addition, the only Rheumatology referral tertiary Centre of the province is located in Brescia. This project was approved by the local Ethical Committee.

**Methods:** We identified adult subjects of 18–50 years old living in Valtrompia. Patients with thrombotic events were identified by two sources: 1) hospital

discharge code using keywords (deep vein thrombosis, pulmonary embolism, myocardial infarction, ischaemic stroke); 2) patients with defined diagnosis of vascular PAPS already followed by the Rheumatology tertiary Centre in Brescia.

**Results:** The prevalence of PAPS in 2013 was calculated to be 35.4 (CI 95% 20.6–59.6) per 100.000 inhabitants. Table 1 shows the incidence rates of vascular PAPS. We identified 47 patients with venous events during 2011–2015. 27/47 (57%) were tested for aPL, 4/27 (15%) positive. Regarding arterial events, 36 patients had stroke and 33/36 (92%) were tested for aPL, 4/33 (12%) positive. Finally, 64 patients with myocardial infarction (IMA): only 14/64 (22%) were tested for aPL, 2/14 (14%) positive.

**Table 1** Incidence rates of antiphospholipid antibody syndrome per 100.000 inhabitants in Valtrompia in adult population (18–49 years) between 2011 and 2015. The 95% confidence intervals (CIs) are reported in parenthesis.

	INCIDENCE	
	Number of cases	Incidence (95% CI) per 100,000
<b>OVERALL</b>		
Males + Females	9	3.7 (1.7-7.1)
Males	5	4.0 (1.3-9.4)
Females	4	3.4 (0.9-8.8)
<b>VENOUS THROMBOSIS</b>		
Males + Females	4	1.7 (0.5-4.3)
Males	1	0.8 (0.0-4.5)
Females	3	2.6 (0.5-7.5)
<b>STROKE/ICTUS</b>		
Males + Females	4	1.7 (0.5-4.3)
Males	3	2.4 (0.5-7.1)
Females	1	0.9 (0.0-4.8)
<b>IMA</b>		
Males + Females	1	0.4 (0.0-2.3)
Males	1	0.8 (0.0-4.5)
Females	0	-

Abstract AB1287 – Figure 1

**Conclusions:** Preliminary results of this population-based study showed that PAPS is a rare disease. A critical point emerged from this study is that aPL were not routinely tested in young subjects with vascular events, especially in patients with myocardial infarction. The study will be implemented by contacting patients who never tested for aPL during the hospital admission.

**Disclosure of Interest:** None declared

AB1288

#### PREDICTION OF AMENORRHEA IN FEMALE RHEUMATOID ARTHRITIS PATIENTS WITH TRIPTERYGIUM WILFORDII HOOK F

C. Zhang<sup>1</sup>, Y. Xu<sup>2</sup>, M. Liu<sup>3</sup>, X. He<sup>1</sup>, C. Lu<sup>1</sup>, A. Lu<sup>4</sup>. <sup>1</sup>Institute of Basic Research in Clinical Medicine, China Academy of Chinese Medical Sciences, Beijing; <sup>2</sup>Department of Traditional Chinese Medicine; <sup>3</sup>Department of Gynecology, The Third Affiliated Hospital of Guangzhou Medical University, Guangzhou; <sup>4</sup>School of Chinese Medicine, Hong Kong Baptist University, Hongkong, China

**Background:** The Chinese anti-inflammatory and immunosuppressive herbal remedy *Tripterygium wilfordii* Hook F (TwHF) is a widely used and effective treatment for rheumatoid arthritis (RA). Ovarian failure is one of the most important adverse effects among pre-menopausal women with TwHF therapy.

**Objectives:** To construct a statistical model for pre-treatment prediction of amenorrhea after TwHF therapy.

**Methods:** In this retrospective study, potential predictors of amenorrhea including demographic and clinical data were retrieved. Multivariate logistic regression models were used to evaluate the association between pre-treatment variables and amenorrhea. The probability of amenorrhea was calculated for combinations of pre-treatment variables.

**Results:** Post-TwHF therapy amenorrhea rate was 10.9% (70 of 641). The mean age was 36.2±5.5 years, mean body mass index 22.5±7.5 kg/m<sup>2</sup>. Age was the

strongest determinant of this adverse effect. In the final model, age >36 years, cumulative dose >4000 mg, and WBC<4.1 × 10<sup>9</sup>/L, were predictive of amenorrhea with adjusted odds ratios of 1.7 for TwHF therapy vs disease modifying anti-rheumatic drug (95% CI,1.2–3.2, p=0.017), 3.1 age >40 years (95% CI,1.8–4.7, p<0.001), 2.8 cumulative dose >6000 mg (95% CI,1.6–4.3, p<0.001), and 2.7 for WBC<3.5 × 10<sup>9</sup>/L (95% CI,1.4–6.3, p=0.012). The probability of amenorrhea can be as high as 76% or as low as 9% depending on the age, cumulative dose, WBC and the type of combination treatments employed.

**Conclusions:** This is first study to identify pre-treatment factors predictive of amenorrhea following TwHF therapy. Our model allows for optimum patient counselling and will help clarify expectations for the probability of amenorrhea following TwHF therapy.

#### SYSTEMIC FACTORS THAT AFFECT THE PROGRESSION OF PERIODONTAL DISEASE IN PATIENTS WITH EARLY RHEUMATOID ARTHRITIS

A.M. Heredia<sup>1</sup>, G.I. Lafaurie<sup>1</sup>, W. Bautista-Molano<sup>1</sup>, T.G. Trujillo<sup>1</sup>, P. Chalem Ch<sup>2</sup>, J.M. Bello-Gualtero<sup>3</sup>, C. Pacheco-Tena<sup>4</sup>, C. Romero-Sanchez<sup>1,3</sup>. <sup>1</sup>Unit of Oral Basic Investigation – UIBO, School of Dentistry, Universidad El Bosque; <sup>2</sup>Fundación Instituto de Reumatología Fernando Chalem; <sup>3</sup>Rheumatology and Immunology Department, Hospital Militar Central, Bogotá D.C., Colombia; <sup>4</sup>Investigación y Biomedicina de Chihuahua SC, Chihuahua, Mexico

**Background:** An association between Rheumatoid arthritis(RA) and Periodontal Disease(PD) has been reported. However, predicting factors of PD progression in patients with eRA are lacking

**Objectives:** To establish the predictive factors for progression of PD in patients with eRA including clinical and serological active scores of RA and status of PD

**Methods:** This cohort study evaluated the progression of PD at 280 inter-proximal dental sites in 28 patients within 2 years of diagnosis with eRA and they were evaluated to establish their progression through one year of follow-up. Adult patients were classified according to the 2010 ACR and the EULAR criteria. Periodontal diagnosis was established based on the AAP and the CDC and Prevention criteria. Serum markers of RA (rheumatoid factor, erythrocyte sedimentation rate (ESR), C reactive protein (CRP), and anticitrullinated protein antibodies (ACPAs) were evaluated, disease activity was assessed by disease activity score (DAS28-ESR) AND the simplified disease activity index (SDAI). Plaque index, gingival index, pocket depth, and clinical attachment loss (CAL) were evaluated at baseline and at one year follow-up. Data were analysed to establish predictive generalised linear mixed models (GLMM) for clinical attachment loss progression at each site with  $\geq 2$  or  $\geq 3$  mm CAL

**Results:** The patients included had an average age of 47.5±12.69 and 75% were women. The comorbidity given by the habit of smoking actively occurred only in 1% of patients. The 35.71% had levels of ESR >20 mm3/h and 39% APCA positive while in 60.71% had CRP  $\geq 3$  mg/L and 67.86% of patients had a positive FR. Regarding the indices of activity of the disease, DAS28-PCR>2.6 was found in 67.86% of the patients and SDAI scale >3.3 in 75%. 71.43% of the patients were being treated with DMARD and corticoid therapy. 71.43% of patients had a diagnosis of periodontitis. CAL $\geq 2$  mm and  $\geq 3$  mm was observed at 15% and 7.5% of dental sites, respectively. Factors associated with CAL in dental sites were: age, ESR, RF, DAS28, treatment with DMARD-Corticoids, periodontal pocket, CAL and percentage of CAL>5 mm, plaque index, gingival index and haemorrhage. Variables RA associated with activity such as CRP, DAS28, and SDAI showed a similar behaviour and they were more frequently associated in periodontal progressive sites. The principal predictive periodontal factors were the percentage of sites with CAL>5 mm and high gingival inflammation at baseline. Patients receiving combined treatment with disease-modifying antirheumatic drugs (DMARD) and corticosteroids exhibited less CAL. The predictive values of the GLMM for CAL of  $\geq 3$  and  $\geq 2$  mm were 98% and 82%, respectively

**Conclusions:** Systemic factors as disease activity score and serum biomarkers such as baseline periodontal status are associated with periodontal disease progression in early RA patients. It is known that the very low daily dose prednisolone in combination DMARD therapy substantially decreased radiographic progression and it could influence periodontal disease progression too in patients with RA in early stages of the disease

#### ANTI CARBAMYLATED PROTEIN IN HEALTHY SYSTEMIC FIRST-DEGREE RELATIVES OF RHEUMATOID ARTHRITIS INDIVIDUALS: RELATION WITH CLINICAL SIGNS OF ARTHRITIS

C. Romero-Sanchez<sup>1,2</sup>, J. De Avila<sup>2</sup>, L. Chila<sup>2</sup>, M. Mahler<sup>3</sup>, W. Bautista-Molano<sup>1,2</sup>, J.M. Bello-Gualtero<sup>1</sup>. <sup>1</sup>Department of Rheumatology and Immunology, Hospital Militar Central, Bogotá, Colombia; <sup>2</sup>Unit of Oral Basic Investigation, Universidad El Bosque, Bogotá D.C., Colombia; <sup>3</sup>INOVA Diagnostics, San Diego, USA

**Background:** Association studies in rheumatoid arthritis (RA) have been focused in the pre-clinical phases of the disease in asymptomatic individuals with higher risk to develop RA such as first-degree relatives (FDR). A new group of autoantibodies directed against carbamylated proteins (anti-Carp) have been discovered in RA.

**Objectives:** To investigate the levels of anti-Carp in FDR and establish their association with the state of rheumatic condition and compare these variables with a control group of healthy individuals from general population

**Methods:** In total, 118 FDR and 118 healthy controls matched by age and gender were included. Rheumatologic (clinical and markers) and periodontal assessment was performed. Individuals selected were over 18 and less than 65 years old were studied in Bogota-Colombia. A complete medical history related to RA was obtained by rheumatologist. They were assessed by two periodontists calibrated. Cancer, autoimmune disease, recent infection, lactation or pregnancy, use of antibiotics in the last three months, diabetes, edentulous, periodontal and orthodontic treatment in the last six months, were exclusion criteria. Anti-carbamylated-fetal calf serum protein by ELISA (RUO, Inova Diagnostics, San Diego), RF (Rheumatoid Factor, Spinreact), ACPAs IgG/IgA (Inova, Diagnosis), Enzyme-linked immunosorbent assay for leptin, Adiponectin based on Luminex xMAP technology, high-sensitivity CRP and IL-6 (Siemens) by chemiluminescence and ESR were evaluated. An association analysis was performed to evaluate the relationship between anti-Carp levels and rheumatologic conditions using Chi square and Fisher test. Logistic regression model was performed to confirm these associations. All the analyses were performed with a level of significance of 95%

**Results:** In the FDR-group, seventy three percent were female with a mean age of 40.19±12.47 years, 22.2% were current smoker, leptin high in 26.27% and 4.23% and 16.9%, had positive RF and ACPAs respectively. Anti-Carp in 26.3%; Among the controls, 70.97% were women, with an average age of 41.0±12.2 years, leptin high in 12.7% (p=0.004), positive RF in 2.5% (p=0.71), ACPA 6.8% (p=0.013) and anti-Carp 15.3(p=0.027); in the general group 20.8% were positive (49/236) for anti-Carp, of which 63.3% are FDR (OR=2.02 IC 95% 1.03–3.96, p=0.04). Likewise, a greater frequency of painful joint (62.2%) p=0.008 and swollen joint (79.2%) (OR=4.35 CI 95% 1.5–12.36,p=0.006) were observed. The model designed for FDR showed a significant association between anti-Carp positive with of at least 1 swollen joint adjusted to the presence of leptin levels above the moderate range (OR=2.84, CI 95% 1.20–6.71,p=0.017)

**Conclusions:** The Research effort aimed at the "risk" phases of RA has increased. That is, before the development of clinical signs of arthritis, to identify those individuals and modify environmental factors and pharmacological intervention. The findings show us a significantly higher frequency of anti-Carp in a cohort of FDR of RA patients compared to healthy controls no associations were found with other autoantibodies but a very interesting way with signs of early inflammation

### CAROTID INTIMA-MEDIA THICKNESS IS INCREASED IN MEXICAN-MESTIZO PATIENTS WITH RHEUMATOID ARTHRITIS: A CASE-CONTROL STUDY

D.A. Galarza-Delgado<sup>1</sup>, J.R. Azpiri-López<sup>2</sup>, I.J. Colunga-Pedraza<sup>1</sup>, A.H. Guillén-Lozoya<sup>1</sup>, J.A. Davila-Jimenez<sup>1</sup>, E.E. Abundis-Márquez<sup>1</sup>, J.A. Cárdenas-De la Garza<sup>1</sup>, R. Vera-Pineda<sup>1</sup>, A. Valdovinos-Bañuelos<sup>1</sup>, R.E. Ramos-Cázares<sup>1</sup>, F. J. Torres-Quintanilla<sup>1</sup>, R.I. Arvizu<sup>1</sup>, A. Martínez-Moreno<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Cardiology, Hospital Universitario "Dr José E. Gonzalez", UANL, Monterrey, Mexico

**Background:** Patients with rheumatoid arthritis (RA) have a significantly increased risk for cardiovascular (CV) morbidity and mortality when compared to general population. Traditional risk factors do not explain the increased CV risk, which appears to be linked to chronic inflammation.<sup>1</sup> The leading cause of death in RA-patients is atherosclerotic cardiovascular disease (ASCVD).<sup>2</sup> Carotid artery evaluation by ultrasound is a useful tool for the detection of subclinical atherosclerosis. The presence of increased carotid intima-media thickness (CIMT) significantly raises the risk of ASCVD, mainly stroke and myocardial infarction.<sup>3</sup>

**Objectives:** To compare CIMT between Mexican-mestizo RA-patients and matched controls.

**Methods:** Design: observational, cross-sectional, case-control study. Patients 40 to 75 years old who fulfilled the 2010 ACR/EULAR and/or the 1987 ACR classification criteria for RA were consecutively enrolled. Patients with previous ASCVD or any other rheumatic disease were excluded. Carotid artery wall hypertrophy (CAWH) was defined as a CIMT $\geq$ 0.9 and <1.2 mm whereas carotid plaque (CP) was defined as a CIMT $\geq$ 1.2 mm or a $\geq$ 50% focal increase of CIMT compared to the surrounding wall.

**Results:** A total of 100 RA-patients and 49 matched control subjects were included in the final analysis. Their characteristics are shown in Figure 1. RA-patients had a median disease duration of 10.3 years and a median DAS-28-CRP of 3.2. Regarding carotid ultrasound findings, there was a significant difference in CAWH and average CIMT between groups (p<0.001).

	RA-Patient Group (n = 100)	Control Group (n = 49)	P
Female gender, n (%)	96 (96)	42 (85.7)	0.04
Age, mean $\pm$ SD	56.6 $\pm$ 9.1	53.6 $\pm$ 6.4	0.6
DM2, n (%)	14 (14)	4 (8.1)	0.42
Current Smoking	9 (9)	12 (24.4)	0.03
Lipid-lowering drug use	16 (16)	7 (14.2)	0.78
CAWH, n (%)	27 (27)	1 (2)	<0.001
Carotid Plaque, n (%)	27 (27)	16 (32.7)	0.564
Average CIMT (mm), median (p25 – p75)	0.82 (0.71 – 1)	0.62 (0.52 – 0.85)	<0.001
Disease duration (years), median (p25 – p75)	10.3 (4.2 – 17.9)	–	–
DAS-28-CRP, median (p25 – p75)	3.2 (1.9 – 4.1)	–	–

Abstract AB1291 – Figure 1. Demographic Characteristics

SD: Standard deviation, DM2: Type 2 diabetes mellitus, CAWH: Carotid artery wall hypertrophy, CIMT: Carotid intima-media thickness.

**Conclusions:** There was significantly increased CIMT and presence of CAWH in RA-patients compared to matched controls. These findings might be major contributors to the increased CV morbidity and mortality of RA-patients. Further research is needed to determine the relationship between RA-specific factors such as disease duration and activity and the presence and magnitude of carotid ultrasound abnormalities.

### METABOLIC SYNDROME AND ITS COMPONENTS AMONG HISPANIC RA PATIENTS: A CASE CONTROL STUDY

D.A. Galarza-Delgado<sup>1</sup>, J.R. Azpiri-López<sup>2</sup>, I.J. Colunga-Pedraza<sup>1</sup>, A.H. Guillén-Lozoya<sup>1</sup>, E.E. Abundis-Márquez<sup>1</sup>, J.A. Davila-Jimenez<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Cardiology, Hospital Universitario "Dr José E. Gonzalez", UANL, Monterrey, Mexico

**Background:** Metabolic syndrome (MetS) comprises a group of risk factors for type 2 diabetes and cardiovascular diseases. MetS is responsible for a three-fold increase in the risk of atherosclerotic cardiovascular diseases (ASCVD) and increased mortality compared to general population.<sup>1</sup> The frequency of MetS in RA patients is 14% to 56%. However, although many studies have reported a higher prevalence of MetS among RA patients, a number of studies have reported a higher prevalence of MetS in healthy controls.<sup>2</sup> Despite the importance of detection of MetS and its role in RA patients, information is scarce.

**Objectives:** To compare the prevalence of MetS among Mexican-mestizo RA-patients and matched controls.

**Methods:** Design: observational, cross-sectional, case-control study. Patients of 40 to 75 years old who fulfilled the 2010 ACR/EULAR and/or the 1987 ACR classification criteria for RA were consecutively enrolled. Patients with any other rheumatic disease were excluded. Our study used ATP III Criteria (Abdominal obesity: Men<102 cm Women<88 cm; Triglyceride level  $\geq$ 150 mg/dL; HDL:<40 mg/dL for men<50 mg/dL for women; Blood pressure  $\geq$ 130/ $\geq$ 85 mmHg; Fasting glucose  $\geq$ 100 mg/dL) to classify patients with MetS.

**Results:** There were no differences in any independent variable of these patients. However there was a higher prevalence of high blood pressure in controls than RA patients (See Table 1).

A. Demographic Characteristics			
Variable	RA n=299	Control n=125	P
Age (years), mean $\pm$ SD	55.3 $\pm$ 13.2	53.5 $\pm$ 7	0.282
Women, n (%)	287 (96)	112 (90)	0.340
Weight, mean $\pm$ SD	68.2 $\pm$ 13.5	73.1 $\pm$ 15.0	0.055
Height (meters), mean $\pm$ SD	1.5 $\pm$ 0	1.3 $\pm$ 0.07	0.001
BMI, mean $\pm$ SD	25.5 $\pm$ 4.9	28.6 $\pm$ 6	0.859
Waist circumference (cm), mean $\pm$ SD	95.8 $\pm$ 8.8	96.2 $\pm$ 4.4	0.432
Type 2 diabetes mellitus, n (%)	47 (16)	20 (16)	0.369
Hypertension, n (%)	114 (38)	35 (28)	0.288
Dyslipidemia, n (%)	108 (36)	20 (16)	0.023
Active smokers, n (%)	18 (6)	15 (12)	0.482

B. Metabolic Syndrome, ATP III Criteria				
Variable	RA n=299	Control n=125	P	OR (I.C. 95%)
Metabolic syndrome, n (%)	100 (33)	46 (37)	0.570	0.85 (0.55-1.33)
Large waist circumference, n (%)	250 (77)	95 (74)	0.695	1.04 (0.66-1.65)
High triglyceride level, n (%)	198 (66)	40 (32)	0.417	1.29 (0.77-1.87)
Reduced high-density lipoprotein, n (%)	141 (47)	66 (53)	0.289	0.79 (0.52-1.21)
Increased blood pressure, n (%)	52 (17)	59 (48)	0.00001	6.31 (6.13-6.50)
Elevated fasting blood glucose, n (%)	85 (28)	30 (24)	0.425	1.20 (0.75-1.87)

Abstract AB1292 – Figure 1. Metabolic Syndrome among RA patients. A. Demographic Characteristics. B. Metabolic Syndrome by ATP III Criteria

**Conclusions:** There is no difference in the diagnosis of MetS in RA patients than control population. However, the role of the diagnosis of MetS in patients with RA represents an important task in the management of the disease in order to reduce its high cardiovascular risk.

### INCIDENCE OF SACROILIITIS IN INFLAMMATORY BOWEL DISEASE: A SINGLE-CENTRE STUDY FROM TIANJIN, CHINA

D. Xiaoyan<sup>1</sup>, L. Ling<sup>2</sup>. <sup>1</sup>Master of Traditional Chinese Medicine, Tianjin University of Traditional Chinese Medicine; <sup>2</sup>Department of rheumatology, Tianjin Union Medical Center, Tianjin, China

**Background:** Time trend studies have shown a rising incidence and prevalence of inflammatory bowel diseases (IBD) in China. IBD is a complex disease, which can present with a large number of extraintestinal manifestations (EIMs), such as skin, eye and joint lesions. Among these EIMs, spinal involvement is often silent and do not correlate with IBD activity. So the prevalence of spinal involvement in IBD is poorly understood.

**Objectives:** To estimate the incidence of sacroiliitis and other extraintestinal complaints among patients with IBD in Tianjin Union Medical Centre.

**Methods:** From September 2017 to January 2018, for all patients who came to our hospital do endoscopic examination, we picked out patients who had a diagnosis of IBD (include ulcerative colitis, crohn's disease and colitis). All IBD patients who agreed to participate in the study completed a questionnaire. To investigate the incidence of spondyloarthritis, part of patients took screening test. Radiologic examination of pelvic to screen sacroiliitis, blood sample to test erythrocyte sedimentation(ESR), C-reactive protein(CRP) and human leukocyte antigen B27 (HLA-B<sub>27</sub>).

**Results:** 87 patients were enrolled; 93.1% had ulcerative colitis (UC), 1.1% had Crohn's disease (CD), and 5.7% had colitis. Among them, 54% were female. The mean age of onset in female and male was 47.6 years (range from 28 to 81) and 41.3 years (range from 18 to 72) respectively. Of the 87 patients, 56 patients (64.4%) had a history of articular pain, some of which were involved in axial articular (45/56), peripheral articular (2/56), and both axial and peripheral articular (9/56). 20 patients (22.98%) had history of enthesitis (e.g. plantar fasciitis, tendinitis achillea, anterior chest wall pain). 4 patients (4.6%) had history of skin impairment (e.g. nodule erythema, psoriasis, urticaria). 6 patients (6.9%) had history of ocular lesions (e.g. red eye, sore eye, epiphephsitis, cataract, vitreous opacity). 5 patients (5.7%) had oral ulcer. 3 patients had family history of gastrointestinal disease (2 bowel cancer, 1 UC). 25 patients conducted radiologic examination of pelvic (14 X-ray, 10 CTs and 1 MR). 8 patients (32%) revealed sacroiliitis. Among these 8 patients, 2 of them showed asymptomatic radiological involvement of sacroiliac joint. The texts of HLA-B<sub>27</sub> were performed in 29 patients (include patients who conducted radiologic examination of peivic), and all revealed negative results. 52 patients tested ESR and CRP, 30 patients showed higher results than normal bias.

**Conclusions:** This study displayed the incidence of sacroiliitis, among patients with IBD in our centre, it showed that patients with IBD have a higher incidence of sacroiliitis. In order to evaluate the patients comprehensively, IBD patients with articular pain should be evaluated by rheumatologist. Besides, among our patients with IBD, the occurrence of HLA-B<sub>27</sub> is low, and there were no correlation between IBD activity and articular symptoms or inflammatory indicators.

### IMPACT OF WORK STATUS ON HEALTH-RELATED QUALITY OF LIFE (HRQOL) IN RA

E. Alemao<sup>1</sup>, A. Boonen<sup>2</sup>, Z. Guo<sup>1</sup>, C. Iannaccone<sup>3</sup>, M. Frits<sup>3</sup>, M.E. Weinblatt<sup>3</sup>, N. A. Shadick<sup>3</sup>. <sup>1</sup>Bristol-Myers Squibb, Princeton, USA; <sup>2</sup>Maastricht University Medical Centre, Maastricht, Netherlands; <sup>3</sup>Brigham and Women's Hospital, Boston, USA

**Background:** Compared to the general population, RA patients (pts) are less likely to be employed and have lower HRQoL.<sup>1,2</sup> However, data on impact of work status on HRQoL in RA pts are limited.

**Objectives:** Evaluate association between work status and HRQoL in RA pts.

**Methods:** We analysed data from adult pts enrolled in a large sequential RA registry. Physicians assessed pt demographics, clinical characteristics, disease activity and laboratory parameters at baseline (BL) and then annually. Follow-up questionnaires to assess pt-reported outcomes were administered every 6 months and included HRQoL measures (12-Item Short-Form Health Survey physical and mental component summary [SF-12 PCS, MCS], EuroQoL-5 Dimension [EQ-5D]) and work status; higher score indicates better health for all 3 HRQoL measures. General linear mixed models with repeated measures were used for SF-12 analysis and finite mixture models for the EQ-5D analysis, controlling for BL covariates.

**Results:** A total of 974 RA pts with HRQoL information were included: 49.3% (n=480) 'employed for pay', 38.9% (n=379) 'employed not for pay' (retired,

homemaker or student), 11.8% (n=115) 'not employed or on disability'. Pts employed for pay were younger and had lower disease activity compared with other groups (table 1). Compared with pts 'not employed or on disability', pts employed had significantly higher PCS (mean [SE] 7.17 [0.82]; p<0.001), MCS (5.39 [0.80]; p<0.001) and EQ-5D (0.48 [0.16]; p=0.0031) scores. Similar results were observed comparing pts 'employed not for pay' to pts 'not employed or on disability' (Table 2).

**Abstract AB1294 – Table 1.** BL Characteristics by Work Status

Variable	Employed (n=480)	Employed not for pay* (n=379)	Not employed or disabled (n=115)
Age, years	52.66 (0.53)	66.21 (0.60)	56.69 (0.90)
RA disease duration, years	12.78 (0.46)	18.40 (0.67)	17.09 (1.05)
DAS28 (CRP)	2.94 (0.07)	3.51 (0.08)	4.03 (0.16)
Multidimensional HAQ	0.36 (0.02)	0.60 (0.03)	0.99 (0.05)
SDAI	13.34 (0.65)	18.83 (0.89)	24.75 (1.84)
TJC (28 joints)	7.47 (0.47)	11.67 (0.66)	14.64 (1.41)
Female, n (%)	395 (82.29)	310 (81.79)	106 (92.17)
Biologic DMARDs, n (%)	239 (49.79)	174 (45.91)	64 (55.65)
Seropositive, n (%)	230 (60.53)	211 (67.2)	59 (64.13)
Household income <\$50,000, n (%)	86 (18.90)	146 (45.63)	65 (60.74)
Household income ≥\$50,000, n (%)	369 (81.10)	174 (54.38)	42 (39.25)
Stopped work due to RA, n (%)	9 (1.88)	101 (27.15)	80 (70.18)

Data are mean (SE) unless otherwise indicated; \*Retired, homemaker or student

**Abstract AB1294 – Table 2.** Multivariate Analysis of Impact of Work Status on HRQoL

Effect	SF-12 PCS general linear model		SF-12 MCS general linear model		EQ-5D mixture model	
	Estimate (SE)	Pr > t	Estimate (SE)	Pr > t	Estimate (SE)	Pr > t
Employed for pay (vs not employed or disabled)	7.17 (0.82)	<0.0001	5.39 (0.80)	<0.0001	0.48 (0.16)	0.0031
Employed not for pay (vs not employed or disabled)	3.75 (0.82)	<0.0001	6.78 (0.81)	<0.0001	0.42 (0.16)	0.0104
Income <\$50,000/year (vs ≥\$50,000/year)	-1.04 (0.56)	0.0655	-2.56 (0.55)	<0.0001	-0.19 (0.12)	0.1084

Other covariates included in the model were age, sex, disease duration, disease activity, acute-phase reactant (CRP), BMI, serostatus and time points

**Conclusions:** Work status and household income in RA are independently associated with HRQoL. More studies are needed to evaluate impact of work on changes in HRQoL in RA pts.

### AB1295 ASSOCIATION OF SHARED EPITOPE AND POOR PROGNOSTIC FACTORS IN RA

E. Alemao<sup>1</sup>, Z. Guo<sup>1</sup>, J. Bryson<sup>1</sup>, C. Iannaccone<sup>2</sup>, M. Frits<sup>2</sup>, N.A. Shadick<sup>2</sup>, M. E. Weinblatt<sup>2</sup>. <sup>1</sup>Bristol-Myers Squibb, Princeton; <sup>2</sup>Brigham and Women's Hospital, Boston, USA

**Background:** Strong genetic association has been reported between RA and human leukocyte antigen (HLA) regions, particularly HLA-DRB1 alleles with the shared epitope (SE). SE alleles are associated with seropositivity, erosions and higher disease activity (DA) in RA.

**Objectives:** To evaluate the association between SE alleles and the presence of multiple poor prognostic factors (PPFs) of seropositive (anti-citrullinated protein antibody [ACPA] and/or RF) and erosive RA; as well as changes in DA.

**Methods:** We analysed patients (pts) enrolled in a large sequential RA registry established in 2003; most had established RA and annual clinical evaluations. Pts with baseline (BL) data on SE status were included. A commercially available kit (Qiagen, USA) was used for HLA genotyping. HLA-DRB1 serotypes were assessed from DNA sequences using allele-specific polymerase chain reaction methods and categorised as pts with no, 1 or 2 SE alleles. Changes from BL were compared in pts with vs without SE alleles. The association of multiple PPFs and SE status was evaluated using multinomial logistic models. The association between change in DA and SE status was analysed using linear regression models with age, sex, disease duration (DD), co-morbidities and biologic DMARDs as covariates.

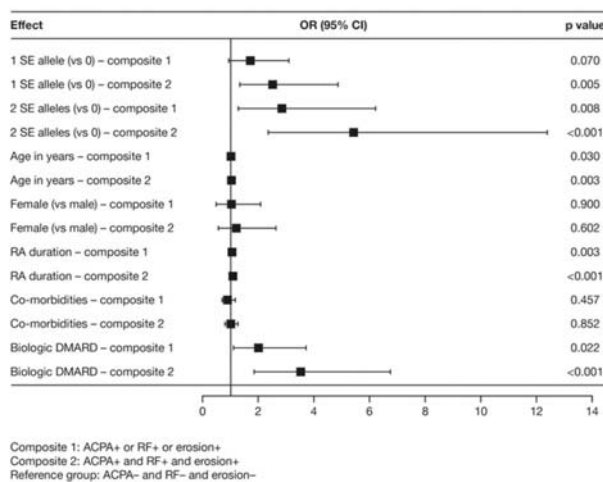

**Abstract AB1295 – Table 1.** Baseline Characteristics by SE status

	No SE alleles (n=241)	1 SE allele (n=275)	2 SE alleles (n=173)
Mean (SD) age, years	57.7 (13.6)	58 (13.9)	57.8 (13.6)
Female, n (%)	202 (83.8)	219 (79.6)	141 (81.5)
Mean (SD) RA duration, years	12.9 (12.1)	17 (13.3)	16.1 (12.2)
Biologic DMARDs, n (%)	83 (34.4)	145 (52.7)	83 (48.0)
ACPA+, n (%)	118 (49.0)	196 (71.3)	137 (79.2)
Erosions, n (%)	116 (48.1)	168 (61.1)	114 (65.9)
RF+, n (%)	120 (49.8)	195 (70.9)	128 (74.0)
Double positive, n (%)	100 (41.5)	174 (63.3)	121 (69.9)
DAS28 (CRP), mean (SD)	3.8 (1.5)	4.2 (1.6)	4.3 (1.6)

**Abstract AB1295 – Table 2.** Multivariate Analysis of Impact of SE Status on Change in DA

	DAS28 (CRP) model		CDAI model		SDAI model	
	Coefficient	p value	Coefficient	p value	Coefficient	p value
1 or 2 SE alleles (vs no SE)	0.24	0.031	2.71	0.027	3.25	0.013
Baseline DA	-0.41	<0.001	-0.46	<0.001	-0.48	<0.001
Age, years	0.01	0.271	0.04	0.367	0.04	0.406
Female (vs male)	0.11	0.435	2.52	0.099	2.12	0.198
No. of co-morbidities	0.11	0.003	1.25	0.003	1.42	0.002
Biologic DMARD (yes vs no)	0.41	<0.001	3.79	0.002	4.09	0.001
Adjusted R-square	0.23		0.27		0.29	

**Results:** Of 689 RA pts included, no, 1 and 2 SE alleles were reported in 241 (35.0%), 275 (40.0%) and 173 (25.1%) pts, respectively. At BL, pts with SE alleles (vs no SE) were more likely to have PPFs, and had longer DD and higher DA (table 1). The odds ratio (OR) for seropositive erosive RA in pts with 2 and 1 SE alleles (vs no SE) was 5.44 (95% CI 2.39, 12.39) and 2.87 (1.32, 6.23; Fig), respectively. The OR for double seropositivity in pts with 2 and 1 SE alleles (vs no SE) was 4.27 (95% CI 2.51, 7.28) and 2.56 (1.66, 3.94), respectively. A total of 551 pts had DA measures at BL and 1 year follow-up. After controlling for BL covariates, pts with SE (vs no SE) had an average increase in DAS28 (CRP) of 0.24 (p=0.031), CDAI of 2.71 (p=0.027) and SDAI of 3.25 (p=0.013; Table 2).

**Abstract AB1295 – Figure 1.** Multinomial Model for Multiple PPFs (Seropositive and Erosions)

**Conclusions:** Pts with (vs without) SE alleles are more likely to have multiple PPFs; pts with 2 SE alleles are 5 times more likely to be seropositive with erosive RA and 4 times more likely to be double positive. Pts with (vs without) SE alleles also experienced an increase in DA over time with standard-of-care treatment.

**AB1296 GENETIC POLIMORPHISMS AND METHOTREXATE SAFETY IN RHEUMATOID ARTHRITIS**

E. Chamizo<sup>1</sup>, E. González<sup>2</sup>, C. Carrasco<sup>1</sup>, S. Rojas<sup>1</sup>, J.J. Aznar<sup>1</sup>, P. Dorado<sup>2</sup>, A. Llerena<sup>2</sup>. <sup>1</sup>Rheumatology, Hospital Mérida and CHU Badajoz, Mérida; <sup>2</sup>CICAB, CHU de Badajoz, Badajoz, Spain

**Background:** Methotrexate (MTX) is the DMARD of choice in the treatment of rheumatoid arthritis (RA). Despite an acceptable efficacy, its use is limited by side effects. The most known adverse events (AE) are gastrointestinal, hepatic, and haematological.

**Objectives:** To study the effect of clinical characteristics and of different genetic single nucleotide polymorphisms (SNPs) related to the transport and metabolic pathways of MTX, on the toxicity of this compound, in a cohort of RA patients treated with MTX in monotherapy.

**Methods:** Observational study. Toxicity was defined as the occurrence of AE, global and of haematological, hepatic, and gastrointestinal nature. Factors under study: SNPs of transport (ABCB1 C3435T), glutamation (GGH T16C and FPGS G2782A), transmethylation (MTHFR C677T and MTHFR A1298C) and adenosine (AMPD1 C34T, ADA A534G, ITPA C94A). The association between SNPs and MTX toxicity was analysed using logistic regression models, assessing allele independence (Hardy-Weinberg equilibrium) and interaction with sex. Different models of inheritance of SNPs were analysed. The models were adjusted by the characteristics of the patient, of disease and of treatment. The haplotypes of the MTHFR SNPs (C677T and A1298C) were also analysed.

**Results:** Bivariate analysis showed that AE, globally considered, are related to lower age at diagnosis (OR=0.98), female sex (OR=1.95), disease activity (OR=1.38), extra-articular manifestations (OR=1.84) and comorbidity (OR=1.14). For the SNPs, the A/G genotype of the ADA A534G decreases the probability of AE (OR=0.55); the G/G of the ADA A534G increases the hepatic AE (OR=10.1) and the genotypes C/T and T/T of the ABCB1 C3435T decrease the risk of haematological AE.

According to the adjusted analysis, the probability of global AE increased with the C/T genotypes of MTHFR C677T (OR=1.85) and C/C of GGH T16C (OR=2.53) and decreased with the A/G of ADA A534G (OR=0.49). Gastrointestinal AEs were less frequent in patients with A/G genotype of ADA A534G (OR=0.49) and in men with G/A of FPGS\_2782GAc (OR=0.29). The G/G genotype of the SNP ADA\_534AG was associated with a significant increase in hepatic AE (OR=12.7), which was also observed in men with the MTHFR A1298C (OR=8.34). The T allele of the ABCB1 C3435T decreases the probability of haematological AE, especially in women (OR=0.06). All the effects were independent of the characteristics of patient, disease and treatment. The C/C haplotype of the combination MTHFR C677T and MTHFR A1298C increases the probability of global (OR=4.35) and hepatic AE (OR=11.9) in men, but not in women.

**Conclusions:** SNPs related to the transport and metabolism of MTX are associated with liver toxicity of MTX.

Zarate-Dominguez<sup>9</sup>, M. Mendoza<sup>3</sup>, I. Pelaez-Ballestas<sup>2</sup>, on behalf of GLADERPO.

<sup>1</sup>Faculty of Medicine, Universidad Autonoma del Estado de Puebla, Puebla; <sup>2</sup>Rheumatology Unit, Hospital General de Mexico, Mexico, Mexico; <sup>3</sup>University of Calgary, Calgary, Canada; <sup>4</sup>Private Practice, Cancún; <sup>5</sup>Hospital Star Medica; <sup>6</sup>Universidad Autonoma de Yucatan, Merida; <sup>7</sup>Faculty of Medicine, Universidad Nacional Autonoma de Mexico, Mexico; <sup>8</sup>Hospital General de Valladolid, Valladolid, Mexico

**Background:** Eighty percent of people living with rheumatoid arthritis (RA) are seropositive. Recent studies show that seronegative RA is associated with a more aggressive clinical presentation; however, this association has not been studied in indigenous populations.

**Objectives:** To compare the clinical and radiographic characteristics, functioning and quality of life in a group of Maya-Yucateco indigenous patients with RA, based on their seropositivity Rheumatoid Factor (RF- IgM).

**Methods:** A community-based cohort was formed in 2014 with the aim of detecting and performing a community intervention in a Mayan Municipality in Mexico. Patients who fulfilled ACR/EULAR criteria 1987/2010 for RA were included and rheumatologists evaluated them every 3 months. All evaluations were conducted in the community with the support of trained translators and included: 1. Clinical examinations. 2. Laboratories (i.e. RF, ESR, CRP). 3. Radiographic evaluations. 4. Functioning (HAQ-DI) and quality of life (EQ5D-3L) assessments. 5.

Pharmacological treatment. 6. Non-pharmacological treatment: individual and group exercises.

A quantitative comparative analysis was conducted by dividing the cohort in seropositive and seronegative and comparing all variables measured using a  $\chi^2$  test, Student's *t*-test or Mann-Whitney *U* test, as well as Kruskal-Wallis test for the non-parametric variables.

**Results:** Twenty eight of 430 participants were diagnosed with RA (1.8%, CI95%: 1.2 to 2.6), for an incidence 0.72% (CI95% 0.3 to 1.2) in 4 years. Seventy-eight% were women, the mean age was 53.9 years (standard deviation (SD)=13.2) and the level of education was on average 2 years (0–5.5).

We observed high prevalence of family history of rheumatic disease (75%), exposure to woodstove (96.1%), and a Chikungunya virus infection (10.7%) and RF- (65.3%).

The treatment given was methotrexate in 64.2% as monotherapy, and 21.4% in combination therapy. NSAIDs were prescribed in 98.2%. Prednisone was prescribed at low doses (<7.5 mg/day) in 14.2%.

The level of pain/discomfort assessed through EQ-5D3L dimension was significantly higher in the seropositive group in comparison with the seronegative group. No other differences were detected between these groups (see Table).

**Abstract AB1297 – Table 1**

**AB1298 PREVALENCE OF RHEUMATIC DISEASES IN COLOMBIA BY CITY**

J. Londono<sup>1</sup>, E.M. Cuervo<sup>1</sup>, J.C. Rueda<sup>1</sup>, E.L. Saldarriaga<sup>1</sup>, I. Angarita<sup>1</sup>, I. Peláez<sup>2</sup>, E. Forero<sup>3</sup>, J. Ramirez<sup>2</sup>, C. Toro<sup>4</sup>, A. Santos<sup>1</sup>. <sup>1</sup>Grupo de investigación Espondiloartropatías, Universidad de La Sabana-Hospital Militar Central, Chía, Colombia; <sup>2</sup>Hospital General de México, Ciudad de México, Mexico; <sup>3</sup>Universidad del Norte, Barranquilla; <sup>4</sup>Asociación Colombiana de Reumatología, Bogotá, Colombia

**Background:** Knowledge of the prevalence of rheumatic diseases allows us to design public health strategies for their comprehensive care and reduction of the costs derived from the potential complications of these diseases.

**Objectives:** To describe and compare the prevalence of rheumatic disease between six cities from Colombia.

**Methods:** The study was developed according the COPCORD epidemiological strategy designed for the identification, prevention and control of rheumatic diseases in developing countries.

A cross-sectional analytical study including individuals older than 18 years was designed with a calculated sample size of 6528 people (2336 from Bogotá, 1220 from Medellín and Cali each, 746 from Barranquilla, from Bucaramanga and Cúcuta each one). Prevalence of each rheumatic disease was compared between the evaluated cities from Colombia.

**Results:** A total of 6693 individuals from six cities of Colombia were evaluated. The average age was 46,40±18,35 and 4283 (64%) individuals were women. The cities with the highest frequency of positive COPCORD population were Bogotá 36,6% (n=1813), Cali 19,1% (n=945) and Medellín 15,9% (n=789). **Abstract AB1298 – Figure 1**

The majority of musculoskeletal pain manifested by the population correspond to non-specific muscular discomfort (MMNE). Osteoarthritis (OA) is the most prevalent rheumatic disease (10,81%, 95% CI, 9,68–12,06%). Mechanical low back pain was the most frequent disease in Barranquilla, with a prevalence of 11,91%, mainly in men 15,9% (95% CI, 11,24–21,92%). Regarding to rheumatoid arthritis (RA) it was more prevalent in women, between 40 and 59 years. It was found to

be more prevalent in Bogotá (2,8%, 95% CI, 1,8%–4,1%), Cali (4,2%, 95% CI, 2,4–7,3%) and Barranquilla (1,5%, 95% CI, 0,65–3,23%). **Table 1.**

**Abstract AB1298 – Figure 1.** Diagram of cities surveyed as COPCORD\* positive

**COPCORD\*:** Community Oriented Program for Control of Rheumatic Diseases  
**Conclusions:** Prevalence of rheumatic diseases is higher in the cities of Bogotá, Cali and Medellín. In Bogotá, Cali and Barranquilla, RA was more prevalent. Low back pain was found to be more prevalent in Barranquilla. The hypothesis is that ethnic diversity of Colombia could explain the difference in prevalence of the rheumatic disease among separate regions.

**AB1299 FUNCTIONAL CAPACITY MEASURED BY HAQ IN PATIENTS WITH RHEUMATIC DISEASES IN COLOMBIA**

F.M. Cuervo<sup>1</sup>, A. Santos<sup>1</sup>, E.L. Saldarriaga<sup>1</sup>, J.C. Rueda<sup>1</sup>, I. Angarita<sup>1</sup>, J. Ballesteros<sup>1</sup>, I. Peláez<sup>2</sup>, E. Forero<sup>3</sup>, J. Ramirez<sup>4</sup>, J. Londono<sup>1</sup>. <sup>1</sup>Grupo de investigación Espondiloartropatías, Universidad de La Sabana-Hospital Militar Central, Chía, Colombia; <sup>2</sup>Hospital General de México, Ciudad de México, Mexico; <sup>3</sup>Universidad del Norte, Barranquilla; <sup>4</sup>Asociación Colombiana de Reumatología, Bogotá, Colombia

**Background:** Functional capacity is an important indicator of quality of life that is affected in different pathologies and is susceptible to intervention in early stages once it is recognised. In rheumatic diseases, functional limitation has a great impact that is evidenced by multiple degrees of long-term disability.  
**Objectives:** To evaluate the functional capacity in different rheumatic diseases by HAQ (Health Assessment Questionnaire) instrument.  
**Methods:** In the context of the prevalence study of rheumatic disease in Colombia, the assessment of functional capacity was measured by using the HAQ score, where functional limitation is scored in a range from 0 to 3 points according to the severity of limitation. The major functional limitation is scored 3 and not limitation 0.  
 A total of 4020 individuals answered the questionnaire.  
**Results:** Patients with rheumatic diseases (n=2274) reported a greater degree of limitation compared with disease-free people (n=1104) or non-rheumatic patients (n=642) (p<0.001). Especially patients with rheumatoid arthritis (RA) had the worst score (0.88±0,72) compared to 0.06±0,22 and 0.01±0,14 of the population with non-rheumatic and healthy population, respectively (p<0.001). The HAQ score in the remaining diseases was 0,67 (SD ±0,62) for systemic lupus erythematosus (SLE), followed by patients with osteoarthritis (OA) 0,59 (SD ±0,58), fibromyalgia (FM) 0,56 (SD ±0,57) and spondylarthritis (SpA) 0,52 (SD ±0,43).  
**Abstract AB1299 – Figure 1**

**Abstract AB1299 – Figure 1.** Functional capacity of patients with rheumatic diseases

Functional capacity evaluated by HAQ, the points represent the mean of the instrument. \* RA: Rheumatoid Arthritis; SLE: Systemic Lupus Erythematosus; OA: Osteoarthritis; FM: Fibromyalgia; SpA: Spondylarthritis; CHIKV: Chikungunya fever; RRPS: Rheumatic Regional Pain Syndromes (Rotator cuff tendinopathy, shoulder bicipital tendinopathy, lateral and medial epicondylalgia, Quervain's tendinopathy, carpal tunnel syndrome, Dupuytren's contracture, trochanteric syndrome, anserine bursitis, achilles tendonopathy, plantar talgalgia); NEMD: non-specific musculoskeletal disease.  
**Conclusions:** In comparison with disease-free population and non-rheumatic patients, the rheumatic patients had a lower functional capacity measured by HAQ. Patients with RA had more disability followed by patients with SLE and OA.  
**Disclosure of Interest:** None declared  
**DOI:** 10.1136/annrheumdis-2018-eular.4336

**AB1300 COMORBIDITIES IN PATIENTS WITH RHEUMATIC DISEASES IN COLOMBIA**

F.M. Cuervo<sup>1</sup>, A. Santos<sup>1</sup>, E.L. Saldarriaga<sup>1</sup>, J.C. Rueda<sup>1</sup>, I. Angarita<sup>1</sup>, I. Peláez<sup>2</sup>, E. Forero<sup>3</sup>, J. Ramirez<sup>4</sup>, C. Toro<sup>4</sup>, J. Londono<sup>1</sup>. <sup>1</sup>Grupo de investigación Espondiloartropatías, Universidad de La Sabana-Hospital Militar Central, Chía, Colombia; <sup>2</sup>Hospital General de México, Ciudad de México, Mexico; <sup>3</sup>Universidad del Norte, Barranquilla; <sup>4</sup>Asociación Colombiana de Reumatología, Bogotá, Colombia

**Background:** Patients with systemic autoimmune conditions often develop concomitant disease contributing to a higher mortality than in the general population. An early diagnosis and treatment is fundamental to improve the life expectancy of this population.  
**Objectives:** The objective of this study was to describe the frequency of comorbidities in patients with rheumatic diseases.  
**Methods:** Based on data from the population studied under the COPCORD strategy, in the prevalence of rheumatic disease in Colombia, the frequency of non-rheumatic diseases in patients with rheumatic diseases was described in 6 cities of Colombia (Bogotá, Medellín, Cali, Barranquilla, Bucaramanga and Cúcuta).  
**Results:** From a total of 4020 individuals, 2274 rheumatic patients were identified. Sixty nine percent of the Colombian patients with rheumatic disease (n=1571) had some comorbidity. The most frequent was hypertension (HBP) in 20,95% (n=330), followed by migraine 19,11% (n=300) and venous insufficiency 17,69% (n=278). Seventeen percent had any mental disorders, of which anxiety and depression were the most common (n=273). Other comorbidities like obesity (8,1%), diabetes (5,85%), heart disease (5,79%) and cerebrovascular disease (1,99%) were less common among rheumatic patients. The frequency of cancer was low 1.48% (n=23).  
**Abstract AB1300 – Figure 1**

**Abstract AB1300 – Figure 1.** Most frequent comorbidities in rheumatic patients

**Conclusions:** Hypertension is the most common comorbidity in patients with rheumatic diseases in Colombia. Screening and diagnosis in early stages of HBP is important, since it is the main modifiable cardiovascular risk factor. The goals of pharmacological and non-pharmacological treatment are essential to reduce the risk of coronary heart disease, stroke and end-stage renal disease. Additionally, migraine is the second most frequent disease that affects the patient's quality of life. And venous insufficiency should be taken into account by primary care physicians in order to assure a complete health care assessment.

**Background:** Rheumatoid arthritis (RA) patients are at high risk of cardiovascular disease (CVD). Risk age estimations are recommended as adjuncts to assessment of absolute 10 year risk of fatal CVD events. Two risk age models based on the Systematic Coronary Risk Evaluation (SCORE) algorithm have been developed; the cardiovascular risk age and the vascular age.

**Objectives:** We aimed to compare the discriminative ability of cardiovascular risk age and vascular age among RA patients and in subgroups of RA patients.

**Methods:** Patients with RA were included from an international consortium, aged 30–70 years at baseline. Those with prior CVD, diabetes and/or users of lipid-lowering and/or antihypertensive therapy at baseline were excluded. Cardiovascular risk age was estimated based on chronologic age, smoking status, total cholesterol and systolic blood pressure at baseline. Vascular age was derived from the 10 year risk of CVD according to the SCORE algorithm, with or without high density lipoprotein cholesterol, using the equations for low and high risk countries. Performance of each risk age model in predicting CVD events was assessed by c-statistics.

**Results:** Among 1867 patients included, 74% were female, median (inter-quartile range) age and disease duration were 52.0 (44.0, 59.9) and 0.6 (0.1, 6.4) years, 72.5% were rheumatoid factor positive, 24.7% were using glucocorticoids and 10.3% were using biologics at baseline. Overall, 144 CVD events occurred. Median follow-up time was 5.0 (2.6, 9.3) years. C-indices across risk models ranged from 0.71 to 0.73 with standard errors of 0.03. Across prediction models, the lowest observed concordance was found among women and in glucocorticoid users and in those with new-onset disease ( $\leq 1$  year). Additional analyses including RA patients on cardio preventive therapy yielded slightly lower c-indices. Since SCORE was developed for use in Europe, we performed analyses on European RA patients, which yielded similar results. Certain characteristics were associated with low concordance, but standard errors were high (data not shown).

**Conclusions:** The cardiovascular risk age and vascular age models have comparable performance in predicting CVD in RA patients. The influence of RA disease characteristics on the predictive ability of these prediction models remains inconclusive.

### RESULTS FROM THE PROSPECTIVE NATIONWIDE NORWEGIAN PREGNANCY QUALITYREGISTER REVNATUS

H. Bjørngaard<sup>1</sup>, B. Jakobsen<sup>1</sup>, H.S.S. Koksvik<sup>1</sup>, M. Wallenius<sup>1,2</sup>. <sup>1</sup>Norwegian National Advisory Unit on Pregnancy and Rheumatic Diseases, RHEUMATOLOGY UNIT, ST OLAVS HOSPITAL; <sup>2</sup>INB (Institute of neuro medicine and movement science), NTNU Norwegian university of science and technology, Trondheim, Norway

**Background:** To establish a register to determine disease activity, pregnancy surveillance and safety of medication during pregnancy and lactation, and monitoring this group as a quality register.

**Methods:** The Norwegian pregnancy register RevNatus is designed as a nationwide, web-based longitudinal observational cohort study with 17 participating centres. Pregnant patients or patients planning a pregnancy with confirmed diagnosis of inflammatory rheumatic disease are eligible to be enrolled. The women are preferred enrolled before conception and with registrations each trimester, 6 weeks, 6 and 12 months postpartum. At baseline diagnosis, sociodemographic parameters, disease activity, anti-rheumatic medication, obstetric history, comorbidities and antibody status are reported. The register has been approved by the Norwegian Data Inspectorate and is run by The Norwegian National Advisory Unit on Pregnancy and Rheumatic Diseases.

**Results:** From February 2016 – January 2018 597 women were included in RevNatus, mean age at inclusion was 30.8 (17–44). Among these patients 4% had only completed primary school, 24% secondary education and 72% had completed a university education. At inclusion 4% were smoking (general population 11%) and 6% used snuff (general population 12%). At registration 6 weeks after delivery 3% were smoking and 2% used snuff. Altogether 346 women were registered with a control 6 weeks after delivery. Of these, 31 women experienced spontaneous abortion and one therapeutic abortion. Among the remaining, 314 had live born infants including 7 twin births and one triplet birth. Among the women with registration 6 week postpartum, 260 (75%) women were diagnosed with chronic inflammatory arthritis including rheumatoid arthritis, spondylarthritis, juvenile idiopathic arthritis and unspecified arthritis. Correspondingly, 79 (23%) women were registered with inflammatory connective tissue disease (SLE, MCTD, poly-dermato myositis, systemic sclerosis), 3 with vasculitic disease (Takayasu's arteritis, Mb Behcet), and 5 with primary anti-phospholipid antibody (APS) syndrome. Mean disease duration (SD) for all diagnoses was 6.5 years.<sup>6,8</sup> Corresponding, mean disease duration in women with RA was 6.7 (4.1) years, in women with SLE 9.4 (6.1) years and in women with JIA 20.7 (7.3) years. Mean gestational age at birth for all diagnoses was 38.7 (2.5) weeks. The gestational age was lowest in SLE women 37.9 (2.59) weeks. Mean gestational week for spontaneous abortion was at 11 weeks. Mean birthweight (SD) was 3268<sup>758,7</sup> gram in offspring of women with RA and 3133 gram in women with SLE. Overall 71 (22%) women had caesarean deliveries, 14% were acute and 9% planned caesarean deliveries. Six weeks postpartum 258 women (82,7%) were breastfeeding their babies.

**Conclusions:** The Norwegian pregnancy register RevNatus was established to study the course and outcomes of pregnancies in women with inflammatory rheumatic diseases as well as increased knowledge on the use and safety of treatments during pregnancy and lactation. The results of the register gives data to monitor the quality of the treatment for this group of patients.

### ANALYSIS OF SYMPTOMS IN VERY EARLY PHASE IN PATIENTS WITH ADULT-ONSET STILL'S DISEASE

H. Tamai, Y. Kaneko, T. Takeuchi. Division of Rheumatology, Department of Internal Medicine, Keio University School of Medicine, Tokyo, Japan

**Background:** The initial symptoms of Adult-onset Still Disease (AOSD) are non-specific and confusing with those of common cold, which can lead to the delay of diagnosis and treatment.

**Objectives:** To clarify characteristic features in AOSD in very early phase and to find the key symptoms and markers to an earlier diagnosis and treatment.

**Methods:** We retrospectively reviewed consecutive AOSD patients in our hospital from April 2012 to July 2017. Symptoms and laboratory data before treatment were collected from their charts and analysed.

**Results:** A total of 62 patients were enrolled. The mean age at diagnosis was 45.9 and female was 81%. The duration from the first symptoms to the first visit to a medical facility was 18.7 days, from the first visit to the first blood test was 5.8 days, from the first blood test to the fulfilment of Yamaguchi's Criteria was 11.0 days, and from the fulfilment of Yamaguchi's Criteria to the treatment was 22.2 days. During the course of developing the disease, fever was found in all patients, skin lesion in 91.9%, arthralgia in 87.1%, sore throat in 66.1%. Laboratory and imaging tests demonstrated liver enzyme elevation in 82.2%, white blood cell count (WBC) increase in 80.6%, lymphadenopathy/splenomegaly in 72.6%, negative RF and ANA in 56.5%, ferritin elevation in 82.3%. Laboratory tests before treatment demonstrated that the mean WBC count 15272.3/ $\mu$ L, AST 101.8 U/L, CRP 15.1 mg/dl, and ferritin 10103.1 ng/ml. Patients who presented with sore throat as the first symptom fulfilled Yamaguchi's Criteria in 13.6 days after the onset, which was shorter than patients with any other symptoms (fever, 24.0 days; arthralgia, 45.7 days; skin lesion, 31.5 days). Before treatment, patients with sore throat as the first symptom showed highest AST of 139.6 U/L (fever, 95.3 U/L; arthralgia, 100.7 U/L; skin lesion, 71.6 U/L) and highest ferritin of 19791.8 ng/ml (fever, 9508.2 ng/ml; arthralgia, 13071.5 ng/ml; skin lesion, 8438.1 ng/ml). However, the duration from the Yamaguchi's Criteria fulfilment to treatment initiation in patients with sore throat as the first symptom was 38.5 days, which was no less

**Abstract AB1307 – Table 1.** Prevalence and direct medical costs of AIRDs in South Korea

Category of diseases	Number of patients (N/100,000)					Change of prevalence between 2012 and 2016 (%)	Total direct medical cost (USD) in 2016	Direct medical cost per person (USD) in 2016
	2012	2013	2014	2015	2016

Wegener granulomatosis	260 (0.5)	305 (0.6)	338 (0.7)	364 (0.7)	376 (0.7)	42.4	1,061,500	2,823.1
Microscopic polyangiitis	114 (0.2)	147 (0.3)	204 (0.4)	259 (0.5)	323 (0.6)	179.1	2,010,130	6,223.3

than that in patients with the other symptoms (fever, 15.4 days; arthralgia, 31.0 days; skin lesion, 27.0 days).

**Conclusions:** Although symptoms of AOSD developed rapidly with symptoms of sore throat, fever, liver enzyme elevation and ferritin elevation, the diagnosis was frequently delayed. Our study suggests that the delayed diagnosis can be attributed in part to non-assessment of the disease. Paying attention to the combination of these symptoms can lead to an earlier diagnosis.

### ASSOCIATION BETWEEN CONCOMITANT USE OF SULFASALAZINE AND DECREASE OF ANTI-CCP ANTIBODY LEVELS IN RHEUMATOID ARTHRITIS PATIENTS TREATED WITH TUMOUR NECROSIS FACTOR INHIBITOR OR ABATACEPT

H.-H. Chen<sup>1,1</sup>, D.-Y. Chen<sup>2</sup>. <sup>1</sup>Department of Medical Research; <sup>2</sup>Department of Internal Medicine, Taichung Veterans General Hospital, Taichung, Taiwan, Province of China

**Background:** Anti-citrullinated protein antibodies (anti-CCP) has been found to be associated with not only the development of rheumatoid arthritis (RA), but also treatment response of RA. A recent study revealed that biologics targeting adaptive immunity, such as abatacept and rituximab, significantly decreased anti-CCP levels.<sup>[1]</sup> However, anti-cytokine therapy, such as tumour necrosis factor inhibitor (TNFi), and methotrexate (MTX) did not significantly lower anti-CCP levels. However, whether concomitant use of sulfasalazine (SSZ) is associated with a decrease of anti-CCP levels in RA patients treated with TNFi or abatacept is unknown.

**Objectives:** To investigate the influence of sulfasalazine on the decrease of anti-CCP IgG levels among RA patients treated with TNFi or abatacept.

**Methods:** After exclusion of those whose baseline anti-CCP levels (CCP0) were above the level that could be accurately measured, we enrolled biologic-naïve, anti-CCP-positive RA patients who initiated treatment with TNFi (n=76), including etanercept (n=20), adalimumab (n=40), and golimumab (n=16), or abatacept (n=23). We followed anti-CCP levels (CCP1) 12 months after the initiation of biologics. A decrease of anti-CCP levels after therapy was identified if CCP1 minus CCP0 was less than 0. A multivariable logistic regression analysis was used to examine the influence of age, sex, biologic agents, disease duration, MTX, SSZ, hydroxychloroquine (HCQ), and leflunomide (LEF) on the risk of anti-CCP decrease, as shown by odds ratios (ORs) with 95% confidence intervals (CIs).

**Results:** Sixty-one (80.3%) of the 76 TNFi users and 18 of the 23 abatacept users were female (p=0.834). The mean ±SD age was 49.8±15.2 years and 56.0±12.4 years for TNFi users and abatacept users respectively (p=0.079). The mean ±SD disease duration was not different between TNFi users and abatacept users (4.7 ±5.1 vs. 6.7±4.9, p=0.098). Thirty-eight (50.0%) of 76 TNFi users and 7 (30.4%) of 23 abatacept users concomitantly used SSZ (p=0.099). Of the 74 TNFi users and 23 abatacept users, 59 (77.6%) and 14 (60.9%) had a decrease of anti-CCP levels (p=0.110). Using multivariable logistic regression analysis to examine factors associated with a decrease of the anti-CCP level after 12 months, we found that only concomitant use of SSZ had a significant correlation (OR, 3.54; 95% CI, 1.06–11.89; p=0.041). In subgroup analysis, this positive correlation remained consistently significant in the TNFi group (OR, 5.19; 95% CI, 1.16–23.29; p=0.031), but not in the abatacept group.

**Abstract AB1304 – Table 1**

	Univariate		Multivariable	
	OR(95% CI)	P value	OR(95% CI)	P value
Concomitant DMARDs				
SSZ	2.95 (1.11–7.86)	0.031	3.54 (1.06–11.89)	0.041
MTX	2.23 (0.85–5.85)	0.104	2.13 (0.58–7.77)	0.254
LEF	0.86 (0.29–2.53)	0.787	0.79 (0.22–2.93)	0.728
HCQ	1.55 (0.55–4.41)	0.409	0.64 (0.15–2.76)	0.546

**Conclusions:** In RA patients who initiated treatment with TNFi or abatacept, concomitant use of SSZ was associated with a decrease of anti-CCP levels, especially among TNFi users.

### RISK OF AUTOIMMUNE RHEUMATIC DISEASES IN PATIENTS WITH PALINDROMIC RHEUMATISM: A NATIONWIDE, POPULATION-BASED, COHORT STUDY

H.-H. Chen<sup>1,1,1</sup>, W.-C. Chao<sup>1</sup>, T.-L. Liao<sup>1</sup>, C.-H. Lin<sup>1</sup>, D.-Y. Chen<sup>2</sup>. <sup>1</sup>Department of Medical Research; <sup>2</sup>Department of Internal Medicine, Taichung Veterans General Hospital, Taichung, Taiwan, Province of China

**Background:** Although the association between palindromic rheumatism (PR) and rheumatoid arthritis (RA) development has been widely reported, no research has estimated the magnitude of the risk of progression of PR to RA or to other autoimmune rheumatic diseases, such as systemic lupus erythematosus (SLE), systemic sclerosis (SSc), Sjögren's syndrome (SS), dermatomyositis (DM) and polymyositis (PM).

**Objectives:** This study aimed to examine the relative risk of development of RA, SLE, SSc, SS, DM, or PM among patients with PR compared with that in non-PR individuals using a nationwide, population-based, administrative dataset.

**Methods:** The study utilised 2003–2013 claims data from the Taiwanese National Health Insurance Research Database. We identified 4421 cases of PR from 2007 to 2012 and randomly chose 44 210 non-PR individuals who matched (1:10) for age, sex and the year of index date without prior history of RA, SLE, SSc, SS, DM, or PM. After adjusting for age, sex, and the Charlson comorbidity index, we calculated the hazard ratios (HRs) with 95% confidence intervals (CIs) using the Cox proportional hazard model to quantify the risk of RA, SLE, SS, DM and PM in PR patients compared with that in matched non-PR individuals.

**Results:** The mean age ±SD was 46±15 years, and 70.4% of the study subjects were female. The proportion of patients with one or more CCI was higher in the PR group than in the non-PR group (33.0% vs. 14.8%, p<0.001). Among the 4421 patients with PR, 569 (12.87%) developed RA, 269 (6.08%) developed SS, 113 (2.56%) developed SLE, 5 (0.11%) developed SSc, 8 (0.18%) developed PM, and 1 (0.02%) developed DM. After adjusting for potential confounders, the patients

with PR had an increased risk of RA (HR, 118.76; 95% CI, 89.81–157.04), SS (HR, 59.57; 95% CI, 43.87–80.88), SLE (HR, 51.56; 95% CI, 32.96–80.66) PM (HR, 57.38; 95% CI, 6.90–476.83), and SSc (HR, 13.42; 95% CI, 3.79–47.55) but not of DM (HR, 3.44; 95% CI, 0.34–34.59).

**Conclusions:** Patients with PR had an increased risk of developing RA, SS, SLE, PM, and SSc.

#### EPIDEMIOLOGY OF ACUTE ANTERIOR UVEITIS, PSORIASIS, INFLAMMATORY BOWEL DISEASE, PALINDROMIC RHEUMATISM AND SJOGREN'S SYNDROME IN TREATED ANKYLOSING SPONDYLITIS PATIENTS IN TAIWAN

H.-H. Chen<sup>1</sup>, D.-Y. Chen<sup>2</sup>, T.-Y. Hsieh<sup>3</sup>, K.-L. Lai<sup>3</sup>, Y.-M. Chen<sup>1</sup>, C.-W. Tseng<sup>3</sup>, C.-T. Lin<sup>3</sup>. <sup>1</sup>Department of Medical Research; <sup>2</sup>Department of Internal Medicine; <sup>3</sup>Division of Allergy, Immunology and Rheumatology, Taichung Veterans General Hospital, Taichung, Taiwan, Province of China

**Background:** The population-based epidemiology of extra-articular manifestations of ankylosing spondylitis (AS), including acute anterior uveitis (AAU), psoriasis (PsO), inflammatory bowel disease (IBD) in Taiwan had not been investigated. Whether or not the incidences of palindromic rheumatism (PR) and Sjogren's syndrome (SS) are higher than non-AS individuals is also unknown.

**Objectives:** This study aimed to investigate the incidences of AAU, PsO, IBD, PR, and SS in a population-based AS cohort compared with a matched non-AS cohort in Taiwan.

**Methods:** Using 2003–2012 claims data from the Taiwanese National Health Insurance Research Database, we firstly identified 30,900 AS patients newly diagnosed from 2006 to 2012 who received at least 3 courses of AS-related therapy (i.e., non-steroidal anti-inflammatory drugs, methotrexate, salazopyrine or corticosteroid) and defined the first date of AS diagnosis as the index date of the AS cohort. Then we randomly selected 3 09 000 non-AS individuals matching (1:10) AS cases for age, sex and the year of the index date as the comparison cohort and defined the first ambulatory visit date of the index year as the index date of the non-AS cohort. We calculated the proportions of having AAU, PsO, IBD, PR, and SS before the index date in both cohorts. After excluding subjects with the corresponding prior diseases, we calculated the incidence rates (IRs) of AAU, PsO, IBD, PR and SS for the AS and non-AS cohorts, and estimated the incidence rate ratios (IRRs) with 95% confidence intervals (CIs) of AAU, PsO, IBD, PR, and SS for AS patients as compared to non-AS individuals.

**Results:** The proportion of men was 62.9%, and the mean  $\pm$ SD age was 42 $\pm$ 17 years. Before the index date, AS patients had higher proportions of having AAU (8.6% vs. 0.7%), PsO (1.8% vs. 0.5%), IBD (0.061% vs. 0.007%), PR (1.7% vs. 0.1%) and SS (0.33% vs. 0.042%) compared with non-AS individuals. AS patients also had higher incidence rates of AAU (IR, 992 per 10<sup>5</sup> years vs. 128 per 10<sup>5</sup> years; IRR, 7.74, 95% CI, 7.16–8.38), PsO (IR, 167 per 10<sup>5</sup> years vs. 73 per 10<sup>5</sup> years; IRR, 2.30; 95% CI, 1.97–2.70), Crohn's disease (IR, 2.7 per 10<sup>5</sup> years vs. 0.2 per 10<sup>5</sup> years; IRR, 16.44; 95% CI, 2.75–98.4), ulcerative colitis (IR, 6.1 per 10<sup>5</sup> years vs. 0.1 per 10<sup>5</sup> years; IRR, 76.03; 95% CI, 9.35–617.98), PR (IR, 591 per 10<sup>5</sup> years vs. 29 per 10<sup>5</sup> years; IRR, 20.33 95%; CI, 17.87–23.12), and SS (IR, 84 per 10<sup>5</sup> years vs. 6 per 10<sup>5</sup> years; IRR, 13.61; 95% CI, 10.05–18.43).

**Conclusions:** Consistent with prior studies, our data showed that the incidence of AAU, PsO, and IBD were higher in AS patients than non-AS individuals. We also found that AS patients had a higher incidence of PR and SS compared with non-AS individuals.

#### DISEASE BURDEN OF AUTOIMMUNE INFLAMMATORY RHEUMATIC DISEASES IN SOUTH KOREA

H. Kim<sup>1</sup>, S.-M. Choi<sup>2</sup>, S.-K. Cho<sup>1</sup>, S.-Y. Jung<sup>3</sup>, D. Kim<sup>2</sup>, E.J. Jang<sup>4</sup>, Y.-K. Sung<sup>1</sup>.

<sup>1</sup>Division of Rheumatology, Hanyang National University Medical Center, Seoul;

<sup>2</sup>Department of Statistics, Kyungpook National University, Daegu; <sup>3</sup>College of Pharmacy, Chung-Ang University, Seoul; <sup>4</sup>Department of Information Statistics,

Andong National University, Andong, Korea, Republic of Ireland

**Background:** Little is known about the epidemiology and disease burden of autoimmune inflammatory rheumatic diseases (AIRDs) in South Korea.

**Objectives:** To investigate the prevalence and direct medical cost of AIRDs in South Korea.

**Methods:** The prevalence of AIRDs including seropositive rheumatoid arthritis (RA), ankylosing spondylitis (AS), systemic lupus erythematosus (SLE), vasculitides, and other connective tissue diseases was calculated, and their trends between 2012 and 2016 were observed using nationwide claims database and the Rare Intractable Disease registration program. Direct medical costs of each AIRD in 2016 were estimated on the basis of claims charged for specific ICD-10 diagnostic codes.

**Results:** Among the all AIRDs, seropositive RA was most prevalent in Korea with prevalence of 188.5/100,000 persons in 2016, followed by AS (58.7/100,000), SLE (38.0/100,000), Behçet disease (29.2/100,000), Sjögren syndrome (23.5/100,000), and systemic sclerosis (7.1/100,000). Relatively low prevalence was observed in inflammatory myositis (4.5/100,000), polymyalgia rheumatica (4.1/100,000), psoriatic arthritis (PsA, 2.5/100,000), and each vasculitis (0.6–3.1/100,000). Prevalence of most AIRDs had been increased from 2012 to 2016, while their sex and age distribution were not changed significantly. Total direct medical costs in 2016 of overall AIRDs were \$263,136,087, which were mostly composed of direct medical expenditures for seropositive RA, AS, and SLE. For the direct medical cost per person, microscopic polyangiitis (\$6,223.3) was the highest, followed by PsA (\$3,603.7), Wegener granulomatosis (\$3,002.6), dermatomyositis (\$2,643.1), and AS (\$2,603.9).

**Conclusions:** Most prevalent AIRD in Korea was seropositive RA, followed by AS, Sjogren's syndrome, SLE, Behçet's disease, and systemic sclerosis. Direct medical cost per person was high in microscopic polyangiitis, PsA, Wegener granulomatosis, dermatomyositis, and AS.

#### FACTORS ASSOCIATED WITH THE DEVELOPMENT OF ESRD IN A RECENT LARGE SINGLE CENTRE COHORT OF PATIENTS WITH LUPUS NEPHRITIS

I. Dasilva Santos<sup>1</sup>, H. Wilson<sup>1</sup>, T. Turner-Stokes<sup>1</sup>, T. Cairns<sup>1</sup>, L. Lightstone<sup>2</sup>.

<sup>1</sup>Department of Medicine; <sup>2</sup>Imperial College Lupus Centre, Hammersmith Hospital, London, UK

**Background:** Lupus nephritis (LN) remains a major cause of morbidity in systemic lupus erythematosus. Worldwide, at 5 years about 19% (Class IV) and 4% (class V) of patients with LN develop end-stage renal disease (ESRD), depending upon the disease severity, ancestral and socio-economic factors as well as response to initial treatment. ESRD is an unusual direct cause of death in this disease but is associated with premature mortality.

**Objectives:** The aim of this study was to retrospectively review our large cohort of LN patients, predominantly treated with MMF and rituximab based steroid sparing regimens, who required renal biopsy for new presentation between 2010 and 2017 to analyse the factors associated with the development of ESRD.

**Methods:** We identified 176 patients with LN from a renal biopsy database, at our tertiary Lupus Centre presenting between 01/2010 and 09/2017. The 21 patients (11%) who progressed to ESRD were included, and using propensity score matching, were matched for age, gender and ethnicity with 63 patients who did not develop ESRD. Patients who required dialysis at presentation were excluded.

**Results:** Baseline characteristics were similar with regard to gender, age and ethnicity between both groups. Mean follow-up was 4 $\pm$ 17 years overall (2.1 $\pm$ 1.4 years in the ESRD group and 3.8 $\pm$ 1.5 years in the non-ESRD group, p=0.0002). The ESRD group had significantly higher serum creatinine at baseline (184.2  $\pm$  143.6 vs 89.0 $\pm$ 48.0, p=0.031) and at 12 m (256.2 vs 79.5, p=0.001) and significantly lower baseline eGFR (44.6 vs 68.1, p=0.003) and eGFR at 12 m (27 vs 73.1, p=0.001). The absence of remission at 1 year was also associated with a higher risk of ESRD (71.7% vs 9.5%, p=0.001), as well as the presence of positive

MPO-ANCA ( $p=0.040$ ), the ANCA titre ( $p=0.031$ ) and persistent low levels of complement (50% vs 21.5%,  $p=0.035$ ). Using multivariable regression analysis, independent factors predictive of ESRD were baseline serum creatinine and no response to treatment at 12 months. There was no significant difference in outcome between groups regarding the type of induction treatment.

**Conclusions:** The rates of ESRD in our LN cohort are comparable with the published literature despite. In our patient population with high use of rituximab and low steroids, the features that predict poor long term outcome are baseline serum creatinine and the failure to attain a remission at 1 year. These data highlight the importance of a) early diagnosis of lupus nephritis and b) defining the features which determine non response at 1 year and being able to identify earlier what would be the right treatment regimen for each individual patient.

#### RADIOGRAPHIC PROGRESSION OF WEIGHT-BEARING LARGE JOINT DAMAGE IN PATIENTS WITH RHEUMATOID ARTHRITIS DURING TNF-BLOCKING THERAPIES – MAXIMUM 12-YEAR FOLLOW UP –

I. Matsushita, H. Motomura, T. Hiraiwa, T. Kimura. *Orthopaedic Surgery, University of Toyama, Toyama, Japan*

**Background:** We have demonstrated that TNF-blocking therapies are effective in inhibiting the radiographic progression in weight-bearing large joints with pre-existing Larsen grade 0-II during short term follow-up<sup>1,2</sup>. However, it is not clarified that the observed effect is persistent during long-term TNF-blocking therapies.

**Objectives:** The purpose of this study is to assess radiographic progression of weight-bearing large joint damage in patients with rheumatoid arthritis during long-term TNF-blocking therapies.

**Methods:** Sixty two consecutive patients (7 male, 55 women, mean age of 59.5 years old) were evaluated at baseline and after TNF-blocking therapy (infliximab, etanercept, adalimumab and golimumab). Joints that had undergone surgical intervention or ankylosis before the initiation of TNF-blocking therapy were excluded from the radiographic analysis. We assessed the radiographic progression of 327 weight-bearing large joints (109 hip joints, 99 knee joints, 119 ankle joints) at baseline and every year after TNF-blocking therapy. The structural damage in the weight-bearing large joints was evaluated using the Larsen grade (LG) at baseline. Radiographic progression of joint damage was defined as ARASHI change score<sup>3</sup> except bone quality score  $\geq 1$ . Survival rate was analysed using Kaplan-Meier method and the end point was defined as progression of joint damage.

**Results:** Average follow-up period was 7.0 years (rang, 1–12 years). Analysis of hip and knee joints with baseline LG 0/I indicated that 12 year survival rates were 93.4% and 84.1%, respectively. Radiographic progression was limited to cases with poor clinical response. All of the hip and knee joints with pre-existing damage of LG III/IV showed rapid progression at 1 year. Hip joint with baseline LG II showed gradual progression of damage. Two and 5 year survival rates of hip joint with LG II were 60.0% and 0%, respectively. Knee joint with baseline LG II also showed slow progression. Two, 5- and 9 year survival rates of knee joint with LG II were 81.3%, 48.2% and 0%, respectively. On the other hand, the radiographic progression of ankle joint damage was not significantly related to pre-existing damage. Twelve-year survival rates of ankle joint with baseline LG 0/I, II and III/IV were 81.6%, 75.0% and 82.4%, respectively.

**Conclusions:** In hip and knee joint, it was sometimes difficult to inhibit the progression when the baseline Larsen grade had been at II-IV. Therefore, it is essential to pay attention to the occurrence of early radiographic damage to avoid progression of hip and knee joint destruction.

#### ANTI-MÜLLERIAN HORMONE AND VITAMIN D SERUM LEVELS IN WOMEN WITH RHEUMATOID ARTHRITIS

I. Perez Onofre, C.M. Skinner Taylor, L. Perez Barboza, M. Erguia Bernal, D. A. Galarza Delgado, J.L. Riega Torres. *Rheumatology Service, Universidad Autónoma de Nuevo León, Monterrey, Mexico*

**Background:** Anti-Müllerian hormone (AMH) is a marker for ovarian reserve, whose levels when found decreased suggest compromise of the fertility. The AMH gene promoter contains a vitamin D response element that may cause vitamin D status to influence serum AMH levels, vitamin D has an influence in the activity of Rheumatoid Arthritis (AR) since it has been found that patients with autoimmune diseases show lower serum levels of this vitamin in comparison of normal controls. The current study examined the vitamin D status and AMH levels in women with RA.

**Objectives:** Evaluate serum levels of vitamin D and AMH in women with RA and in control group.

**Methods:** Observational, cross-sectional, study conducted between May and July 2017 at the University Hospital "Dr. José E. González " in Mexico. We included 38 women between 18 and 39 years of age, they met diagnostic criteria for RA established by the ACR in 2010, excluding pregnant patients, with primary amenorrhea or known risk factors for diminished ovarian reserve. A control group of 38 healthy age-matched women was integrated. Serum AMH level was measured using ELISA method in commercial kit (AMH Gen II, Beckman Coulter, Brea, CA, EU) as well the 25-hydroxyvitamin D [25(OH)D] status using chemiluminescence immunoassay. To analyse differences between the groups, we used Mann-Whitney U test; Spearman correlation coefficients were calculated between AMH level and Vitamin D level. Values are shown as the mean  $\pm$ SD. Two-sided *P* values less than 0.05 were considered significant. The statistical package used was SPSS Statistics, V17(Chicago: SPSS Inc.)

**Results:** It was found a mean age of 34.42 ( $SD=5.43$ ) and 31.47 years ( $SD=5.72$ ) in the control group and in women with RA, respectively. Regarding the mean serum levels of Vitamin D it was reported 20.04( $SD=7.81$ ) in control group and 23.55 ( $SD=8.2$ ) in women with RA. In control group, it was reported a mean of AMH of 2.83( $SD=0.47$ ) and in women with RA a mean of 2.63( $SD=0.50$ ). Serum levels of Vitamin D of patients with RA were statistically significant compared with the control group ( $p=0.015$ ) and AMH were statistically significant in women with RA compared with the control group ( $p=0.052$ )(Table1). There was no significant correlation between serum levels of vitamin D and AMH ( $p=0.795$ ).

Abstract AB1310 – TABLE 1

	Control	RA	<i>P</i>
Age (years)	34.42 $\pm 5.43$	31.47 $\pm 5.72$	
Serum 25 (OH) D (ng/ml)	20.04 $\pm 7.81$	23.55 $\pm 8.2$	0.015a
Serum AMH (ng/ml)	2.83 $\pm 0.47$	2.63 $\pm 0.50$	0.052a

Control: healthy patient; RA: rheumatoid arthritis; AMH: anti-Müllerian hormone. The values are expressed in mean  $\pm$ SD. A Differences between the 2 groups as calculated by the Mann-Whitney U test. Values of 25 (OH) D <10 deficient, 10–30 insufficient, 30–100 normal.

**Conclusions:** The current study shows that AMH and Vitamin D levels are lower in RA patients compared with controls. However, results do not indicate significant correlation between serum levels of vitamin D and AMH. So, it is suggested more studies.

#### ULTRASOUND EVALUATION OF ENTHESIS IN PSORIATIC ARTHRITIS: A SYSTEMATIC LITERATURE REVIEW

I. Janta<sup>1</sup>, T. Gudu<sup>2</sup>, R. Ionescu<sup>2</sup>. <sup>1</sup>Rheumatology, Gregorio Marañon Hospital, Madrid, Spain; <sup>2</sup>Rheumatology, Sf Maria Hospital, UMF Carol Davila, Bucharest, Romania

**Background:** Enthesis involvement is considered as a key pathological lesion in psoriatic arthritis (PsA) patients. Recently, ultrasound (US) became an important

tool to evaluate the enthesis involvement in PsA. Power Doppler (PD) is able to identify vascular abnormalities which are known to be associated with inflammation.

**Objectives:** To perform a systematic literature review on how entheses are evaluated by US in PsA.

**Methods:** The objective was reformulated according to the PICO approach. Several synonyms for the main components (i.e. ultrasound and entheses) were used. No search limits were applied. The literature search was performed in Medline and Embase from databases inception to 1st October 2017. References identified were imported into a bibliographic manager. Firstly, duplicates were removed. Then, to identify eligible studies the remaining articles were assessed by title and abstract. Only articles in English and Latin languages were retained.

From the selected studies, data about the examined structures, pathological findings and definition used to identify pathology were retired using a predefined data collection form.

**Results:** The literature search resulted in 411 articles, of which 101 were captured in Medline and 310 in Embase. Figure 1 shows the study flow-chart for article selection. After removing duplicates and scanning titles and abstracts, 41 articles remained for the detailed review. After full-text review, 12 articles were excluded. The main reason for article exclusion after full-text review was the lack of explanation of US evaluation.

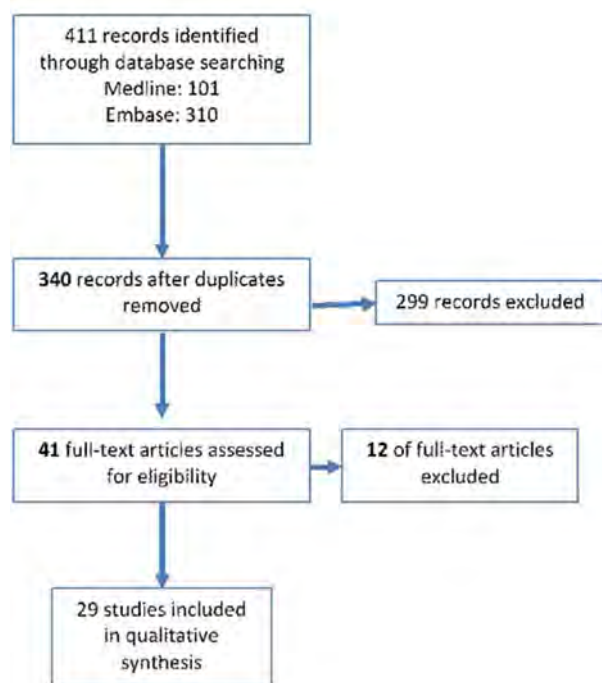

29 articles were included in qualitative analysis. The mean (range; SD) number of patients evaluated was 66.3 (7–141; 41.9).

The US was used for diagnostic in 26 (89.7%) articles and for monitoring in 7 (24.1%) articles. 4 (13.8%) evaluated also the US nail involvement. All articles used B mode evaluation and 26 (89.7%) used also Doppler mode, all of them using PD.

Thickening was evaluated in 27 (93.1%) articles, hypoechogenicity in 21 (72.4%), the presence of enthesophytes in 21 (72.4%) articles, the presence of calcifications in 11 (37.9%) articles, the presence of erosions in 21 (72.4%) articles, irregularities in 8 (27.6%) articles and bursitis in 15 (51.7%) articles, peri-enthesal soft-tissue oedema in 2 articles.

Triceps was evaluated in 8 (29.6%) articles, elbow extensors in 8 (29.6%) articles, quadriceps in 14 (51.9%) articles, proximal patellar in 12 (51.9%), distal patellar in 15 (55.6%), Achilles in 22 (81.5%), plantar fascia in 18 (66.7%) and finger extensor in 2 (7.4%), elbow flexors 3, medial collateral ligament in femur condyle 3, supraspinatus tendon in 1 articles, gluteus tendons in 1 article, first and seventh costo-sternal joints, anterior superior iliac spine, and iliac crest, the posterior superior iliac spine, and the fifth lumbar spinous process, rotator cuff in one article.

OMERACT definitions were used in 6 (20.6%) articles. Qualitative evaluation was used in 12 (41.3%) articles, semi-quantitative evaluation in 4 (13.7%) articles. As global score, GUESS score was used in 5 (17.2%) articles and MASEI score was used in 4 (13.7%) articles.

Abstract AB1311 – Figure 1

**Conclusions:** Although the majority of the articles evaluated the same enthesis and the same US findings, we found a lack of consensus regarding the global score.

**AB1312 EFFECTS OF VITAMIN D ON DISEASE ACTIVITY, FUNCTIONAL DISABILITY AND SERUM INTERLEUKIN-6 IN RHEUMATOID ARTHRITIS**

K. Gopal<sup>1</sup>, M. Thevarajah<sup>2</sup>, C.M. Ng<sup>3</sup>, J. Raja<sup>1</sup>. <sup>1</sup>Division of Rheumatology, Department and Faculty of Medicine; <sup>2</sup>Department of Pathology; <sup>3</sup>Institute of Mathematical Sciences, Faculty of Science, University of Malaya, Kuala Lumpur, Malaysia

**Background:** Vitamin D may have a potential role in rheumatoid arthritis (RA) pathogenesis by inhibiting the expression of pro-inflammatory cytokines including interleukin-6 (IL-6)<sup>1-2</sup>.

**Objectives:** The aim of this study is to determine the clinical factors of vitamin D deficiency in a multi-ethnic Malaysian RA patients and its association with disease activity, functional disability and serum IL-6 level.

**Methods:** One-hundred RA patients and 50 healthy controls, age- and sex-matched were recruited. DAS28 and HAQ score were assessed. Baseline serum vitamin D and IL-6 were measured in all subjects. RA patients who were vitamin D deficient were given loading dose of vitamin D3 and repeated assessments were done.

**Results:** Vitamin D deficiency (<50 nmol/L) was found in 63% of RA patients and 76% of healthy controls. Chinese RA patients and healthy controls had significantly more sufficient vitamin D levels compared to Malays and Indians (p=0.002) and (p=0.006), respectively. Only BMI was significantly associated with vitamin D deficiency in RA patients (p=0.012) after adjustment for potential confounding variables. 21 patients received and were compliant to 8 weeks of loading dose 50,000 IU/week vitamin D. Serum vitamin D levels improved from 24.10±7.78 to 91.57±23.70 nmol/L (p<0.001) during this period, whereas no improvement was seen in serum IL-6 levels (16.33±24.58 to 16.38±22.56 pg/ml). No significant association was seen between vitamin D level and disease activity or serum IL-6 level in both pre- and post-treatment groups. A negative association was observed between vitamin D levels and functional disability, including a 33% improvement post-treatment (mean ±SD 0.30±0.46 to 0.20±0.18). The table below shows the independent factors association with serum vitamin D level in RA patients (n=100).

		Mean ± SD	P value	
Vitamin D	Age (years)	45.9 ±3.48	0.202	
	Race	Malay (35%)	30.73 ± 18.19	0.002
		Chinese (34%)	68.64 ± 23.76	
		Indian (31%)	38.11 ± 22.40	
	BMI (kg/m <sup>2</sup> )	26 ± 5	0.002	
	Post-menopausal (%)	yes	45 %	0.784
		no	55 %	
	ESR (mm/hr)	37.4 ±19.6	0.206	
	CRP (mg/L)	1.37 ±1.53	0.779	
	Prednisolone (%)	yes	51.5%	0.083
		no	47.5%	
	Low dose vit D (%)	yes	61.4%	0.791
		no	37.6%	
Serum IL-6 (pg/ml)	14.1 ±18.56	0.330		
DAS28 (n)	Inactive (remission/low)	31	0.802	
	Active (mod/high)	69		
HAQ (n)	Mild to mod disability	94	0.033	
	Mod to severe disability	6		

Abstract AB1312 – Figure 1

**Conclusions:** Vitamin D deficiency is prevalent in Malaysian RA patients. This study suggests that vitamin D does not have a role in disease activity or serum IL-6 but it may have a role in functional disability in RA patients.

**SYSTEMATIC SCREENING OF COMORBIDITIES IN CHRONIC INFLAMMATORY RHEUMATIC DISEASES IN DAILY PRACTICE: A RETROSPECTIVE MONOCENTRIC FRENCH STUDY ACCORDING TO RECENT EULAR GUIDELINES**

J. Hubac<sup>1</sup>, R. Gastaldi<sup>1</sup>, B. Allenet<sup>2</sup>, P. Gaudin<sup>1</sup>, A. Baillet<sup>1</sup>. <sup>1</sup>*Rheumatology*, <sup>2</sup>*Pharmacy, CHU Grenoble Alpes, grenoble, France*

**Background:** In chronic inflammatory rheumatic diseases, comorbidities such as cardiovascular diseases and infections are more frequently observed than in general population and are suboptimally prevented, screened and managed.<sup>1-4</sup> A nurse-led programme demonstrated the short-term benefit on management of comorbidities in rheumatoid arthritis patients.<sup>5</sup> EULAR recently published points to consider for reporting, screening, and preventing specific comorbidities in chronic inflammatory rheumatic diseases in daily practice.

**Objectives:** Our objective was to screen and report comorbidities in chronic inflammatory rheumatic diseases patients in daily practice according to recent EULAR guidelines.

**Methods:** We included patients with rheumatoid arthritis, spondyloarthritis, and psoriatic arthritis from November 2016 to November 2017 in a retrospective monocentric study in the rheumatology department of the Grenoble Alpes Teaching Hospital. Data regarding comorbidities were collected in a standardised multidisciplinary consultation with a rheumatologist, a specialised nurse and a hospital pharmacist, according to EULAR and French Society of Rheumatology guidelines. Data concerning cardiovascular diseases, infectious comorbidities, cancer screening, and osteoporosis were collected. Data about the rheumatic disease including treatment and disease activity were recorded. Adherence was analysed in consultation by the pharmacist. Recommendations were notified to the patients, his general practitioner, and rheumatologist on a standardised letter. Data were analysed as mean/SD if appropriate and percentage.

**Results:** We included 101 patients, 43 patients had rheumatoid arthritis, 45 had spondyloarthritis, and 13 were diagnosed with psoriatic arthritis. The mean age was 49,6 years old.<sup>14,9</sup> 50 patients were followed in the hospital, 39 were followed by private practitioners and 12 were followed by both. All patients were treated with bDMARDs. In average, patients received 2,3 (SD 1,6) different biologic treatments. In our total population, 55,5% had influenza vaccination >1 year ago, 42,6% had an appointment to the dermatologist >1 year ago, 25% of the women between 50 and 75 years old had a mammography >2 years ago and 27,3% of women >50 years old with FRAX above threshold were not treated for osteoporosis. Moreover, 60,5% of patients with rheumatoid arthritis had a Heart Score >1% and 45,6% in the total population.

**Conclusions:** Our monocentric study confirmed that comorbidities are frequent and suboptimally prevented and managed according to the EULAR point to consider. An evaluation of the efficiency of our standardised consultation and intervention is necessary.

**LACK OF ASSOCIATION BETWEEN ABO BLOOD GROUPS AND RHEUMATIC DISEASES IN CHINA: A SINGLE-CENTRE EXPERIENCE**

J. Qi, Q. Lv, Z. Chen, X. Zhang, M. Yang, Y. Zhang, J. Gu. *Department of Rheumatology, Third Affiliated Hospital of Sun Yat-sen University, Guangzhou, China*

**Background:** Various genetic and environmental risk factors have been shown to be associated with the incidence of rheumatic diseases. Several studies have shown associations of ABO blood groups with various diseases.

**Objectives:** Our study aimed to determine whether there is an association between the types of rheumatic diseases and ABO blood groups.

**Methods:** The study included the patients, followed up at the Immunology-Rheumatology clinic between January 2010 and December 2017 for diagnosis of rheumatic disease, who had an ABO Rh blood data. Age, gender, type of rheumatic disease, ABO Rh blood groups were recorded.

**Results:** A total of 1551 patients were included in the study, such as 392 AS patients, 297 RA patients, 752 SLE patients and 110 pSS. The patients were assessed for blood types, 40.2% had O type, 26% patients had A type, 26.8% had B type, and 7.0% had AB type. AS, RA, SLE and pSS were more common in the patients with O blood type. The blood type where all the diseases are observed the least commonly was AB. There was no significant difference in the distribution of blood types in rheumatic diseases.

**Conclusions:** In our study, we thought that there was lack association between types of different rheumatic diseases and ABO blood groups.

AB1315

**MEDICATION USE AMONG PREGNANT WOMEN WITH RHEUMATIC DISEASES IN KOREA BASED ON THE NATIONAL HEALTH INSURANCE SERVICE-NATIONAL SAMPLE COHORT**

M.K. Chung<sup>1</sup>, J. Lee<sup>1</sup>, E.-H. Ha<sup>2</sup>, J.-Y. Shin<sup>2</sup>. <sup>1</sup>*Division of Rheumatology, Department of Internal Medicine*; <sup>2</sup>*Department of Occupational and Environmental Medicine, Ewha Womans University School of Medicine, Seoul, Korea, Republic of Ireland*

**Background:** Many rheumatic diseases (RD) predominantly affect women in their reproductive ages. Medication use during pregnancy is an important issue in women with RD since it may affect the health of both fetus and the mother.

**Objectives:** This study aimed to characterise the status of medication dispensed for Korean women with RD in pre-gestational period and during pregnancy.

**Methods:** Women aged between 20–44 years and diagnosed as RD and had delivery after the diagnosis of RD were identified from National Health Insurance Service-National Sample Cohort (NHIC-NSC) (2009–2013). Rheumatoid arthritis (RA), systemic lupus erythematosus (SLE), and ankylosing spondylitis (AS) were included as RD. We analysed prevalence of RD related medication including disease-modifying antirheumatic drugs (DMARDs), NSAIDs, and corticosteroids (CSs) dispensed between the pre-gestational periods of 3 months before pregnancy until delivery. We also analysed prevalence of other medications and supplements which are commonly dispensed during pregnancy in women with RD and the age and sex matched controls.

**Results:** There were 71 deliveries among 1059 women with RD. In RD pregnancies, 54.9% had taken at least 1 RD related medications. The prevalence of DMARDs dispensing during pregnancy was 23.9%, CSs 43.7%, and NSAIDs 38.0% in RD population. Although usage of antibiotics and medication for thyroid diseases during pregnancies were not different between the women with RD and the control, use of vitamin and iron supplements were significantly higher in the women with RD (38.0% vs 13.4%,  $p < 0.0001$ ).

**Abstract AB1315** – Table 1RD-related. medication dispensing prevalence by pregnancy period (N=71)

	Pre-pregnancy	1st Trimester	2nd Trimester	3rd Trimester
<b>cdMARDs</b>	17 (23.9)	15 (21.1)	14 (19.7)	12 (16.9)
Azathioprine	1 (1.4)	1 (1.4)	1 (1.4)	1 (1.4)
Cyclosporin	0 (0.0)	0 (0.0)	0 (0.0)	0 (0.0)
Hydroxychloroquine	17 (23.9)	14 (19.7)	13 (18.3)	10 (14.1)
Sulfasalazine	0 (0.0)	0 (0.0)	1 (1.4)	2 (2.8)
Tacrolimus	1 (1.4)	1 (1.4)	0 (0.0)	0 (0.0)
Others	0 (0.0)	0 (0.0)	0 (0.0)	0 (0.0)
<b>bdMARDs</b>	0 (0.0)	0 (0.0)	0 (0.0)	0 (0.0)
<b>Corticosteroids</b>	31 (43.7)	24 (33.8)	24 (33.8)	22 (31.0)
<b>NSAIDs</b>	27 (38.0)	13 (18.3)	3 (4.2)	1 (1.4)

**Conclusions:** Medications are frequently required during pregnancies of women with RD. RD are a significant burden for pregnant women requiring increased number of medication use.

#### AB1316 HOSPITAL ADMISSION TRENDS AND SHORT-TERM OUTCOME FOR IGA VASCULITIS IN CHILDREN AND ADULTS IN WESTERN AUSTRALIA

J. Nossent<sup>1,2</sup>, W. Raymond<sup>2</sup>, H. Keen<sup>2,3</sup>, C. Inderjeeth<sup>1,2</sup>, D. Preen<sup>4</sup>.  
<sup>1</sup>Rheumatology, Sir Charles Gairdner Hospital, Nedlands; <sup>2</sup>Rheumatology, School of Medicine, UNIVERSITY OF WESTERN AUSTRALIA, Crawley; <sup>3</sup>Rheumatology, Fiona Stanley Hospital, Murdoch; <sup>4</sup>School of Population Health, University of Western Australia, Crawley, Australia

**Background:** Immunoglobulin A vasculitis (IgAV), formerly called Henoch-Schönlein purpura, is an immune complex mediated small-vessel vasculitis that preferentially affects the skin, intestines and kidneys. While more common in children, IgAV is not unusual in adults, where it has been associated with worse outcomes.

**Objectives:** To compare hospital admission rates and outcomes over time between adult and paediatric inpatients with IgA vasculitis

**Methods:** Data were extracted from a state-wide registry for all hospital admissions in Western Australia (WA) between 1980 to 2015 for patients with a primary or secondary diagnosis of IgAV (ICD-9-CM code 287.0/ICD-10-AM code D69.0). Paediatric cases were defined as those ≤19 years at first diagnosis.

**Results:** From a total 764 patients admitted to hospital with an IgAV diagnosis 508 (66%) were paediatric and 256 (34%) adult cases. IgAV was the primary diagnosis in 463 (91.1%) paediatric and in 123 (48%) adult patients (p<0.01). In children, mean age at primary diagnosis was 5.6 years of (range 0–19) versus 50.2 years (range 20–91) in adults. Both groups had similar proportions of Indigenous (3.5 vs 1.6%, p=0.4) and male patients (59 vs 51.2%, p=0.3). Over the observation period, the annual rates per 100,000 for a first admission for IgAV declined from 4.2 to 0.4 for children and from 0.42 to 0.2 for adults, while length of stay in days decreased from 5.8 to 1.8 for children and increased from 10.5 to 21.1 for adults. Three adults (2.4%) but no child required ICU admission, while one adult (0.7%) and no child died in hospital. Readmission rates for IgAV were considerable and higher in children than adults (25.6% vs 18.7%, p=0.1).

**Conclusions:** Admission rates for IgAV in children in WA have declined steeply over the last decades and now almost equate admission rates for adults. The reduction in length of stay and absence of in-hospital mortality support an increased willingness or necessity to manage children with IgAV outside the hospital setting despite a significant readmission rate. In contrast, hospital admission for IgAV in adults associates with prolonged length of stay and a slight risk for ICU admission and in-hospital mortality.

**Acknowledgements:** Supported by an unrestricted grant from the Arthritis Foundation of Western Australia. We acknowledge the contribution by Data Linkage WA staff and custodians.

#### AB1317 IDENTIFICATION OF CARDIOMETABOLIC ABNORMALITIES IN THE FIRST VISIT TO A PREVENTIVE CARDIO-RHEUMA CLINIC

D.A. Galarza-Delgado<sup>1</sup>, J.R. Azpiri-López<sup>2</sup>, I.J. Colunga-Pedraza<sup>1</sup>, E.E. Abundis-Márquez<sup>1</sup>, J.A. Dávila-Jiménez<sup>1</sup>, A.H. Guillén-Lozoya<sup>1</sup>, R. Vera-Pineda<sup>2</sup>, J. A. Cárdenas-de la Garza<sup>1</sup>, A. Martínez-Moreno<sup>2</sup>, R.I. Arvizu-Rivera<sup>1</sup>, R.E. Ramos-Cázares<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Cardiology, Hospital Universitario "Dr José E. Gonzalez", UANL, Monterrey, Mexico

**Background:** Rheumatoid arthritis (RA) is a chronic, systemic and autoimmune disease with articular and extra-articular manifestations. RA is associated with increased prevalence of comorbidities and higher cardiovascular risk when compared to general population. Atherosclerotic cardiovascular (CV) events are the leading cause of death in RA. In a recent meta-analysis, hypertension, type 2 diabetes mellitus (T2DM) and hypercholesterolemia were shown to increase the risk of CV disease in this population.<sup>1</sup> A study reported a prevalence of hypertension 29.8%; dyslipidemia 27.1% and T2DM 12.4% in Mexican-mestizo RA patients.<sup>2</sup> The cardio-rheuma clinics were designed to provide healthcare for CV diseases in patients with rheumatic conditions. Specific guidelines recommendations have been published to enhance detection and management of specific comorbidities associated to RA.<sup>3</sup>

**Objectives:** To identify the prevalence of unknown cardiometabolic risk factors in a Mexican-mestizo cohort with RA.

**Methods:** Cross-sectional, observational study. Patients who fulfilled the 1987 ACR and/or the 2010 ACR/EULAR classification criteria were consecutively recruited. Patients were divided in two groups, with and without history of cardiovascular comorbidities. Clinical history and physical exam were performed by a general physician in a cardio-rheuma clinic. Fasting blood glucose and lipid profile were performed on all subjects. Categorical variables are expressed as percentages and numerical variables as means±standard deviations.

**Results:** A total of 296 patients were included. Demographical characteristics are shown in Figure 1. Hypertension was the most frequent comorbidity (27.7%), followed by dyslipidemia (26.7%) and T2DM (13.5%). Many of the patients without history of cardiometabolic risk factor had important findings on baseline visit: 18.7% had altered blood pressure without history of hypertension, 76.5% had an abnormal lipid profile without history of dyslipidemia, and 21.5% had an altered fasting glucose without history of T2DM.

A. Demographic data		
Characteristic	N= 296	
Age (years), mean ± SD	55.8 ± 8.5	
Female, n (%)	275 (92.9%)	
Active or former smoker, n (%)	27 (9.1%)	
T2DM history, n (%)	40 (13.5%)	
Hypertension history, n (%)	82 (27.7%)	
Dyslipidemia history, n (%)	79 (26.7%)	
Steroids use	174 (58.8%)	
bdMARDs, n (%)	20 (6.8%)	
Methotrexate, n (%)	249 (84.1%)	
Leflunomide, n (%)	61 (20.6%)	
DAS 28-CRP, mean ± SD	3.36 ± 1.4	
Disease duration (years), mean ± SD	10.91 ± 13.3	
B. Cardiometabolic abnormalities		
	Previous history	No previous history
<b>Hyperglycemia (n)</b>	<b>40</b>	<b>256</b>
<b>Fasting plasma glucose levels (mg/dL)</b>		
≤99 mg/dL, n (%)	13 (32.5 %)	201(78.5%)
100-125 mg/dL, n (%)	13 (32.5 %)	43 (16.8 %)
126-199 mg/dL, n (%)	6 (15 %)	12 (4.7 %)
≥ 200 mg/dL, n (%)	8 ( 20 %)	0
<b>Hypertension (n)</b>	<b>82</b>	<b>214</b>
<b>Blood pressure (mmHg)</b>		
Blood pressure ≤ 140/90 mmHg, n (%)	52 (63.4 %)	174 (81.3 %)
Systolic blood pressure ≥ 140 mmHg, n (%)	15 (18.3 %)	26 (12.2 %)
Diastolic blood pressure ≥ 90 mmHg, n (%)	5 (6 %)	13 (6.1 %)
Blood pressure ≥ 140/90 mmHg, n (%)	10 (12 %)	1 (0.5 %)
<b>Dyslipidemia (n)</b>	<b>79</b>	<b>217</b>
Normal lipid profile, n (%)	14 (17.7 %)	51 (23.5 %)
Altered lipid profile*, n (%)	65 (82.3 %)	166 (76.5 %)

Abstract AB1317 – Figure 1

\*Altered lipid profile was defined as TC  $\geq$ 200 mg/dL, HDL-C  $<$ 50 mg/dL, TG  $\geq$ 150 mg/dL, LDL-C  $\geq$ 100 mg/dL. SD=Standard deviation; T2DM=Type 2 diabetes mellitus; bDMARDs=biological agents; DAS 28-CRP=Disease Activity Score 28 joints C-reactive protein.

**Conclusions:** In our cohort of Mexican-mestizo RA patients there is a high prevalence of cardiometabolic risk factors. An important amount of these were discovered in patients without previous diagnosis at their first visit to a cardio-rheuma clinic.

#### AB1318 PRACTICAL ASPECTS OF BIOLOGICAL-DRUG MONITORING IN RHEUMATOID ARTHRITIS AND SPONDYLOARTHRITIS

J. Rosas-Gómez de Salazar<sup>1</sup>, M. Martín-López<sup>2</sup>, T. Oton<sup>3</sup>, L. Carmona<sup>3</sup>, A. Balsa<sup>4</sup>, J. Calvo-Alén<sup>5</sup>, R. Sanmarti<sup>6</sup>, J. Tornero<sup>7</sup>. <sup>1</sup>Hospital Marina Baixa, Villajoyosa-Alicante; <sup>2</sup>Hospital 12 de Octubre; <sup>3</sup>Instituto de Salud Musculosquelética- InMusc; <sup>4</sup>Hospital Universitario La Paz, Madrid; <sup>5</sup>Hospital Universitario Araba, Vitoria; <sup>6</sup>Hospital Clinic, Barcelona; <sup>7</sup>Hospital General Universitario de Guadalajara, Guadalajara, Spain

**Objectives:** To prepare recommendations on practical aspects of biological-drug monitoring that may be useful for rheumatologist

**Methods:** A systematic review of the literature was carried out to determine in which patients and in what clinical circumstances may be most beneficial to monitor the levels of biological drugs and their antibodies in patients suffering Rheumatoid Arthritis (RA) and/or Spondyloarthritis (SpA). With the results of the review, a group of experts produced a series of clinical questions, to be answered through the available scientific evidence, and then, subsequently, to make the recommendations and clinical algorithms for instructing the decision-making process.

**Results:** Results from the systematic review showed that the biological-drug monitoring might be especially useful in two clinical situations; in case of a treatment failure (primary or secondary) and in sustained remission (see figure 1). It was also reviewed which laboratory technique might be better and the optimal time for blood withdrawal. Specific recommendations are given on the interpretation of drug levels and on factors that should be taken into account are given (i.e. body mass index and concomitant medication).

Abstract AB1318 – Figure 1

**Conclusions:** Informed algorithms have been developed regarding the optimal time for requesting drug levels and anti-drug antibodies in patients with RA and

SpA. This recommendations may help in the decision-making process and could be useful as part of future guidelines in the field.

#### AB1319 DRUG RESISTANCE IN BACTERIA ISOLATED FROM URINE OF RHEUMATOID ARTHRITIS PATIENTS AND INDUCTION OF RESISTANCE BY CHLOROQUINE

I. Konieczna<sup>1</sup>, L. Lechowicz<sup>1</sup>, M. Chrzanowska<sup>1</sup>, M. Chyb<sup>1</sup>, S. Cholewa<sup>1</sup>, D. Grzegorzczak<sup>1</sup>, J. Ciura<sup>2</sup>, J. Gaweda<sup>3</sup>. <sup>1</sup>Department of Microbiology, Jan Kochanowski University; <sup>2</sup>Regional Sanitary-Epidemiologic Station in Kielce, Kielce; <sup>3</sup>Swietokrzyskie Rheumatology Center, St. Luke Specialized Hospital, Koneskie, Poland

**Background:** Rheumatoid arthritis (RA) was connected with bacterial infections.<sup>1</sup> Usage of antibiotics generate resistance in pathogens as well as natural microflora.<sup>2</sup> Some anti-rheumatic drug (chloroquine) probably is associated with selection of quinolone resistant bacteria.<sup>3</sup>

**Objectives:** To isolate bacteria from urine of rheumatoid arthritis patients, determine antibiotic resistance profiles for isolated bacteria and induce ciprofloxacin resistance by exposition to chloroquine.

**Methods:** Two consecutive samples of morning urine was obtained from 26 RA patients without urinary infection tract symptoms. Patients were treatment-naive or treated with different anti-rheumatic drugs. Bacteriuria was determinate on UTI chromogenic medium (HIMEDIA). Resistance against 38 commonly used drugs (MAST) was determined according EUCAST standards. For OXA-48 carbapenemase detection, a temocillin disc was used. Isolated bacterial strains were cultivated on LB broth supplemented with chloroquine (625 and 1875 µg/ml) for 2 weeks, than incubated on medium with ciprofloxacin (32, 15, 8, 4, 2, 1, 0.5 µg/ml). Growth was measured with spectrophotometer ( $\lambda=600$  nm) against non-inoculated medium.

**Results:** Bacteria were cultivated from almost 88% of patients, but only in 26% of them in titer higher than  $10^5$  cfu/ml of urine. Bacteriuria were more often in treated individuals. Isolated bacteria belonged to *Escherichia coli*, *Klebsiella pneumoniae*, *Enterobacter cloacae*, *Proteus mirabilis*, *Morganella morganii*, *Staphylococcus* sp. Among tested bacteria 23% were determined as MDRs and one strain were XDR. Screening test detecting OXA-48 revealed that 35% of strains probably possess this resistance mechanism.

Selected 10 ciprofloxacin sensitive strains (*E. coli*, *P. mirabilis*, *E. cloacae*, *M. morganii*) were exposed to increasing concentration of chloroquine. After 2 weeks of passing, 80% of bacteria become resistant to antibiotic (with ciprofloxacin MIC up to 8 µg/ml).

**Conclusions:** Asymptomatic bacteriuria is general phenomenon in RA patients. This research showed that many of Polish RA patients may be carriers of drug resistant bacteria, including MDR. This phenomenon may be connected with poor comply of antibiotic policy by patients as well as health service in Poland. Exposition on chloroquine induce bacterial resistance against ciprofloxacin. In RA treatment procedure, a risk of induction of quinolone resistance in bacterial flora should be considered.

### CLINICAL, IMMUNOLOGICAL AND EXPOSITIONAL FACTORS IN A COLOMBIAN POPULATION WITH SYSTEMIC LUPUS ERYTHEMATOSUS ASSOCIATED WITH LUPUS NEPHRITIS

J.C. Diaz-Coronado<sup>1</sup>, A. Rojas-Villarraga<sup>1</sup>, D. Hernandez Parra<sup>1</sup>, L. Betancur-Vasquez<sup>2</sup>, J. Lacouture-Fierro<sup>2</sup>, D. Gonzalez-Hurtado<sup>2</sup>, J. Gonzalez-Arango<sup>2</sup>, L. Uribe-Arango<sup>2</sup>, M.C. Gaviria-Aguilar<sup>2</sup>, P. Perez-Estrada<sup>1</sup>, M.C. Soto-Osorio<sup>3</sup>, R. Pineda-Tamayo<sup>1</sup>, on behalf of grupo de información clínica. <sup>1</sup>Medical research, artmedica; <sup>2</sup>Internal medicine; <sup>3</sup>Medical research, ces university, medellin, Colombia

**Background:** Systemic lupus erythematosus (SLE) is an autoimmune disease characterised by multiple organ involvement, lupus nephritis (LN)<sup>1</sup> being one of the most serious manifestations

**Objectives:** To establish associated factors with lupus nephritis development in patients with SLE

**Methods:** Cross-sectional study taken from a cohort of 1175 patient with SLE who met criteria for classification for ACR<sup>1997</sup> or SLICC<sup>2012</sup> between 2007 and 2015. Bivariate analysis of multiple characteristics was performed between patients with presence and absence of LN at through chi squared and U Mann Whitney. Multivariate analysis was performed by logistic regression to adjust for significant associations

**Results:** The cohort of patients with SLE 90% was female gender, had an average of 44 years with a duration of the disease of 10.6 years. Joint and haematological involvement was present in more than 80% of patients. The presence of antibodies against DNA and low complement was found in 53% and 60% respectively. The exposure to dyes was 44% and tobacco 21%.

It was found 455 patients with SLE and LN with an average age of 41 years and a time of evolution of SLE of 11 years. The male gender proportion was higher in those who presented LN with 11.6% compared to 7.1% who did not have LN. The immunological profile of patients with NL was characterised by a higher proportion of positivity for Anti-DNA, anti-SM and low complement. Male gender has a greater association with LN (OR 1.98 CI 95% 1.20–3.27). Having a disease duration greater than 10 years increases the association with LN (OR 1.48 95% CI 1–2.16) as well as the presence of anti-DNA (OR 1.34 CI95% 1.03–1.75) and antiSM (OR 1.45 95% CI 1.04–2.02). Never smoker was a protective factor for LN (OR 0.52 CI95% 0.34–0.81).

**Abstract AB1320 – Table 1.** Factors associated with Lupus nephritis in a cohort of patients with systemic lupus erythematosus, in Colombia from 2007 to 2015

Lupus nephritis	OR	CI (95%)	OR adjust*	CI (95%)
<b>Gender</b>				
Male	1,27	1,04–1,55	1,98	1,20–3,27
<b>Time progress SLE<sup>a</sup></b>				
≥10 years	1,37	1,08–1,74	1,48	1,01–2,16
<b>Anti SM</b>				
Positive	1,46	1,10–1,95	1,45	1,04–2,02
<b>Anti DNA +</b>				
Positive	1,34	1,05–1,72	1,34	1,03–1,75
<b>Past or current cigarette consumption</b>				
Yes	1,66	1,22–2,25	1,75	1,14–2,69
<b>No previous or current cigarette consumption</b>				
Yes	0,56	0,41–0,77	0,52	0,34–0,81

**Conclusions:** This study shows a greater association of LN in men. Although there are disparities in the findings worldwide, we believe that other factors typical of this current population such as ancestry and racial mixing may be influencing this finding. No smoking seems to be a protective factor. Awareness of the disclosed risk factor should encourage preventive strategies for LN in SLE patients such as suppression of cigarette smoking.

AB1321

### THE EXPANSION OF MYELOID-DERIVED SUPPRESSOR CELLS IN PATIENTS WITH RHEUMATIC DISEASES

J. Zhu<sup>1</sup>, S. Chen<sup>2</sup>, L. Wu<sup>2</sup>, R. Wang<sup>2</sup>, D. Zhao<sup>2</sup>, J. Li<sup>2</sup>. <sup>1</sup>Department of Rheumatology, Nanfang Hospital Southern Medical University; <sup>2</sup>Department of Internal Medicine of Traditional Chinese Medicine, College of Traditional Chinese Medicine, Southern Medical University, Guangzhou, China

**Background:** Myeloid-derived suppressor cells (MDSCs) are a heterogeneous population of immature myeloid cells with a remarkable ability to suppress the immune system. Although MDSCs were found to suppress the T cell response of some cancer patients and tumour bearing mice, the role of those cells have been revealed in patients with RA, SLE, and IBD. Nevertheless, most rheumatic diseases have a common pathological process, such as inflammatory arthritis and systemic tissue damage. Whether or not MDSCs and their subsets are abnormally expressed in patients with inflammatory-associated rheumatic diseases is still unclear.

**Objectives:** To investigate the proportion of MDSCs and their subsets in patients with different rheumatic diseases and clarify the association between those cells and patients clinical data including the disease activity index and the inflammation of joints.

**Methods:** One hundred and nine patients with various rheumatic diseases and twenty-five healthy controls were recruited. The common clinical characteristics and the special clinical indexes for each rheumatic disease were obtained from patients. The MDSCs and their subsets were marked with fluorescently labelled antibodies and were then analysed with flow cytometry. All statistics were calculated with SPSS 20.0. A p<0.05 was considered to be statistically significant.

**Results:** The patients included 31 with RA, 21 with AS, 14 with OA, 11 with SLE with arthritis, 13 with SLE without arthritis, 9 with Gout, 10 with HUA, and 25 healthy controls. The proportions of MDSCs, M-MDSCs, and G-MDSCs were higher in patients with RA than in healthy controls (6.56%±6.77% vs. 1.46±0.96%, 2.52±3.81% vs. 0.35±0.35%, 1.13±1.64% vs. 0.18±0.14%; p<0.001). The same increase in the number of MDSCs and their subsets was also found in patients with AS, OA, SLE with arthritis, and Gout. The proportions of MDSCs and M-MDSCs were mostly correlated with the patient's joint inflammation indexes (such as CRP and total joint pain) and the disease activity. Additionally, an increased risk of arthritis was found from MDSCs, M-MDSCs, and G-MDSCs (OR=2.417, 13.257, 6.204; 95% CI=1.625–3.597, 3.974–44.223, 1.798–21.406; p<0.01). When other cell subsets were adjusted, the same risk was also obtained for the expansion of M-MDSCs (adjusted OR=5.772; 95% CI 1.174–28.369; p=0.031).

**Conclusions:** The expansion of MDSCs and their subsets were found to be correlated with the disease activity and joint inflammation in patients with different rheumatic diseases. Further analysis revealed that the proportion of M-MDSCs was associated with the risk of arthritis in those populations.

### TREATMENT RESPONSE AS A PREDICTOR FOR REFRACTORY DISEASE AND/OR TRANSITION TO RHEUMATOID ARTHRITIS IN PATIENTS WITH POLYMYALGIA RHEUMATICA

K. Hayashi, K. Ohashi, H. Watanabe, K.-E. Sada, Y. Asano, S. Hiramatsu, Y. Yamamura, Y. Miyawaki, M. Morishita, Y. Matsumoto, T. Kawabata, J. Wada. Department of Nephrology, Rheumatology, Endocrinology and Metabolism, Okayama University Graduate School of Medicine Dentistry and Pharmaceutical Sciences, Okayama, Japan

**Background:** Polymyalgia rheumatica (PMR) is a common inflammatory rheumatic disease that affects elderly people and predominantly causes shoulder and pelvic girdle pain. PMR is sometimes refractory (1), and some cases are finally diagnosed with rheumatoid arthritis (RA) (2). Predictive factors for clinical course of PMR are not fully elucidated.

**Objectives:** The purpose of this study is to elucidate predictive factors for clinical course of PMR.

**Methods:** Newly diagnosed PMR patients at our hospital from July 2006 to June 2017 were enrolled. All patients fulfilled the EULAR/ACR<sup>2012</sup> Provisional Classification Criteria for PMR but not the EULAR/ACR<sup>2010</sup> Classification Criteria for RA.

Patients who had GCA, other rheumatic disorders like SLE or were newly diagnosed with cancer within 2 years of diagnosis were also excluded. The primary endpoint was the remission by one month after commencement of treatment. Remission was defined as the absence of PMR symptoms and the elevation of erythrocyte sedimentation rate (ESR) or C-reactive protein (CRP). For evaluation of the composite outcome of refractory PMR and final diagnosis of RA, the secondary outcome was defined as requirement of additional treatment and/or relapse during the observation period. Relapse was defined as a flare of PMR symptoms and the elevation of ESR or CRP. Categorical variables with a possible relation to the outcomes such as clinical characteristics, criteria items, articular symptoms and laboratory data were compared by using the nonparametric chi-square test.

**Results:** The mean age of enrolled 61 patients was 70.6 years and 67% were female. 38 (62%) patients failed to achieve remission by one month. The proportion of patients showing elevated ESR (>100 mm/h) at baseline was higher in patients without remission than those with remission (62% vs. 30%,  $p=0.017$ ) though there were no differences in sex, articular symptoms. Patients without remission also showed a lower reduction rate of CRP after a week (76% vs. 89%,  $p=0.026$ ) compared to those with remission. Furthermore, 30 (49%) patients required additional treatments and/or had relapses during the observation period. These patients showed higher platelet counts at baseline ( $42.9 \pm 1.9$  vs.  $36.3 \pm 2.0 \times 10^4/\text{mm}^3$ ,  $p=0.023$ ) and lower proportion of achievement of CRP levels less than 1.0 mg/dl after a week (44% vs. 80%,  $p=0.009$ ).

**Conclusions:** ESR and platelet counts at baseline and early treatment response might be useful for prediction of refractory PMR and/or transition to RA.

#### AB1323 DOES OBESITY REPRESENT A RISK FACTOR FOR A POOR REMISSION RATE IN JAPANESE PATIENTS WITH RHEUMATOID ARTHRITIS TREATED WITH ANTI-TUMOUR NECROSIS FACTOR-ALPHA THERAPY?

K. Yamazaki, T. Inoue, T. Miyamoto. *Department of rheumatology, Seirei Hamamatsu General Hospital, Shizuoka, Japan*

**Background:** Despite increased interest in the association between obesity and rheumatoid arthritis,<sup>1</sup> evidence remains sparse in the Japanese population due to the fact that Asians have different associations between the body mass index (BMI), percentage of body fat, and health risks compared with the Western population. To address this problem, a World Health Organisation (WHO) consultation report proposed appropriate BMI cut-off points for the Asian population and redefined obesity as BMI of  $\geq 27.5 \text{ kg/m}^2$ .<sup>2</sup>

**Objectives:** From the perspective of exploring the association of obesity and rheumatoid arthritis, it is necessary to precisely define obesity for appropriate ethnic groups. Hence, this study aimed to assess whether obesity represents a risk factor for a poor remission rate in Japanese patients with rheumatoid arthritis requiring anti-tumour necrosis factor-alpha (TNF- $\alpha$ ) therapy using appropriate BMI cut-off points for the Asian population.

**Methods:** Participants were identified from our hospital in Shizuoka, Japan, and followed up from 2009 to 2017. Based on WHO guidelines, we classified participants using an appropriate BMI for the Asian population as follows: underweight,  $< 18.5 \text{ kg/m}^2$ ; normal weight,  $18.5\text{--}23.0 \text{ kg/m}^2$ ; overweight,  $23.0\text{--}27.5 \text{ kg/m}^2$ ; and obese,  $\geq 27.5 \text{ kg/m}^2$ . The primary outcome was to define whether obesity affects the clinical response to anti-TNF- $\alpha$  therapy. The response variable was defined as the simplified disease activity index (SDAI) remission after 12 months. In addition, we estimated multivariate odds ratios and their 95% confidence intervals (CIs) for nonremission after 12 months of initiating anti-TNF- $\alpha$  therapy or censored as nonresponders to the therapy after adjusting for sex, age, smoking status, anticyclic citrullinated peptide antibody status, rheumatoid factor status, and disease duration.

**Results:** We monitored 295 outpatients with rheumatoid arthritis who received anti-TNF- $\alpha$  therapy for at least 12 months or censored as nonresponders to the therapy. The mean  $\pm$ SD for SDAI at the baseline was  $24.20 \pm 14.47$ . The BMI was  $\geq 27.5 \text{ kg/m}^2$  (obese) in 16 (4.2%) of 295 patients. At the 12 month follow-up, 62.0% of patients with rheumatoid arthritis had reached SDAI remission. The multivariate odds ratio for nonremission at 12 months or nonresponsiveness of obese patients referred to normal weight was 2.24 (0.53–9.43), which tended to be higher for poor response, albeit not significantly.

**Conclusions:** Obesity may represent a risk factor for a poor remission rate in Japanese patients with rheumatoid arthritis treated with anti-TNF- $\alpha$  therapy. Thus, weight-loss programs might be a feasible solution for improving the condition of obese Japanese patients with rheumatoid arthritis.

#### AB1324 STUDYING THE RELATIONSHIP BETWEEN BODY MASS INDEX, BMI, AND BONE MINERAL DENSITY, BMD, OF LUMBAR VERTEBRAE AND FEMORAL NECK

K. Talash<sup>1</sup>, M. Bukhari<sup>2</sup>. <sup>1</sup>Royal Lancaster Infirmary, Lancaster, UK; <sup>2</sup>Rheumatology, Royal Lancaster Infirmary, Lancaster, UK

**Background:** There is a well known association between BMI and BMD in as much that patients with higher BMI have higher BMD, secondary to factors including muscle mass and fat mass<sup>1</sup>. However it is not clear whether this relationship is equal in all areas of the body assessed for bone mineral density (BMD) estimation, which traditionally are the lumbar vertebrae, and different areas of the femur. Our study sets out to establish if this association exists in the lumbar vertebrae and femoral neck, since Dual Energy X-ray Absorptiometry (DEXA) scans measure BMD of both.

**Objectives:** To explore the relationship between BMI and BMD in a cohort of patients referred for DEXA scan.

**Methods:** Data was used from patients referred for DEXA scan to Royal Lancaster Infirmary between (2006 and 2010). The following were recorded: age, sex, height, weight, BMI, BMD at L1-L4, BMD at femoral neck (left and right) and BMD at hip (left and right).

Male and female patients were analysed separately. A Linear regression model was fitted using BMI with BMD at L1, L2, L3, L4, total right hip, total left hip, right neck of femur and left neck of femur as explanatory variables. Adjusted r-squared ( $r^2$ ) values were used to compare the fit of the models, both with and without age-adjustment.

**Results:** 35759 patients were used in the study, of which 84% were female. Mean age was 62.2 years (SD 12.8), mean height was 161.9 cm (SD 8.3), mean weight was 70.4 kg (SD 15.3), mean BMI was 26.8 kg/cm<sup>2</sup> (SD 5.2).

**Abstract AB1324 – Table 1** Adjusted.  $r^2$  values for each group were as follows:

Site	Adjusted $r^2$ Male	Adjusted $r^2$ Female	Adjusted $r^2$ Male (age-adjusted)	Adjusted $r^2$ Female (age-adjusted)
L1	0.0986	0.0909	0.1002	0.1747
L2	0.0708	0.0678	0.0718	0.1488
L3	0.0581	0.0603	0.0695	0.1127
L4	0.0611	0.0548	0.0921	0.0740
Total Right Hip	0.1480	0.1345	0.1806	0.2983
Total Left Hip	0.1532	0.1518	0.1767	0.3180

Neck of Femur, Left	0.0898	0.0715	0.1603	0.2695

**Conclusions:** Our study identifies that there is a positive correlation between increasing BMI and BMD at lumbar vertebrae and at the hips, in both male and female patients. We also identified age as a contributing factor. The relationship between BMI and BMD appears to be more significant in the hip and neck of femur than the lumbar spine. When studying the lumbar spine we found that the association is greater the higher up the lumbar spine, with most positive correlation being in L1 of female patients. This would indicate that using the lower lumbar spine might not be appropriate to assess bone health.

**THE FREQUENCY OF ANTI-DFS70 AUTOANTIBODIES IN JAPANESE WOMEN WITH PERI- AND POST-MENOPAUSAL ARTHRALGIA**

K. Miyachi<sup>1,2</sup>, A. Ihar<sup>3</sup>, B. Sasse<sup>4</sup>, M.Y. Choi<sup>5</sup>, M.J. Fritzler<sup>5</sup>. <sup>1</sup>Rheumatology and Women's Health, Keigu Clinic; <sup>2</sup>The Technological Development, Health Sciences Research Institute; <sup>3</sup>Rheumatology, Keigu Clinic, Yokohama, Japan; <sup>4</sup>Rheumatology, Monash Health, Victoria, Australia; <sup>5</sup>Cumming School of Medicine, University of Calgary, Calgary, Canada

**Background:** The antinuclear antibody (ANA) test is often used as a screening test to aid in the diagnosis of systemic lupus erythematosus (SLE) and other systemic autoimmune rheumatic diseases (SARD). However, recently it was reported that a certain autoantibody referred to as anti-dense fine speckled 70 (DFS70) are much more common (up to 25%) of non-SARD and healthy individuals but rare (<5%) in SLE and certain SARD. The frequency of anti-DFS70 is even lower (i.e. <1%) if monospecific anti-DFS70 antibodies are found. Some reports suggested that anti-DFS70 are more common in younger females, suggesting that hormonal factors may be responsible for the cognate B cell response.

**Objectives:** The primary objective of our study was to determine the frequency of anti-DFS70 in menopausal women who were referred for evaluation of undifferentiated arthritis (UA).

**Methods:** 282 women including 105 with UA and an age range of 27~91 years (mean=60.3) were enrolled. Menopausal women were divided into pre-, peri-, and post-menopausal stages according to menstrual regularity. (E2), Follicle stimulating hormone (FSH), rheumatoid factor (RF), ANA (by indirect immunofluorescence (IIF) (MBL) anti-cyclic citrullinated peptide antibody (ACPA: MBL ELISA) and C-reactive protein (CRP) were included in the serology workup. Postmenopausal arthralgia was designated PoMA and perimenopausal arthralgia PeMA.

**Results:** In PoMA women who received HRT for two months estradiol levels increased, FSH levels decreased and the joint pain visual analogue scale was reduced by 70%, as compared to baseline. Similarly in PeMA women, administration of 600 mg tocopherol N daily had the same efficacy as that observed in PoMA. The overall frequency of anti-DFS70 of 26.7% (28/105) in PoMA and PeMA women was significantly higher than that in UA females who were diagnosed with rheumatoid arthritis (RA) (7/65:10.8%) or primary Sjogren's syndrome (SjS) (3/31: 9.7%) (p<0.05). In addition, anti-DFS70 Ab was observed primarily in low titer (1:40 – 1:160) ANA positive sera. On the other hand, higher titer ANAs (titer >1/320) were observed in the females that were diagnosed as systemic lupus erythematosus (SLE) (30%) or primary SjS (48.4%), the majority of whom had lower titers of anti-DFS70, although several sera contained both high titer ANA and anti-DFS70 (see figure).

**Abstract AB1325 – Figure 1.** Relationship of ANA titers and anti-DFS70 levels in peri- and post-menopausal women. The majority of anti-DFS70 positive sera had only low to modest ANA titers. ANA titer in vertical axis and anti-DFS70 titers by ELISA on the horizontal axis

**Conclusions:** Anti-DFS70 was found in higher frequency in PeMA and PoMA women than in women who developed a defined systemic autoimmune rheumatic disease such as SLE, SjS or RA. This is the first study to suggest that the presence of this autoantibody may reflect oestrogen fluctuations or deficiency. A negative association between ANA titer and anti-DFS70 levels by ELISA remains to be confirmed in larger studies.

**NICOTINAMIDE PHOSPHORIBOSYLTRANSFERASE MAY BE NEW FACTORS CONTRIBUTING TO OSTEOARTHRITIS**

L. Sivordova<sup>1</sup>, J. Polyakova<sup>1</sup>, Y. Akhverdyan<sup>1</sup>, V. Kravtsov<sup>1</sup>, N. Fofanova<sup>2</sup>, B. Zavodovsky<sup>1</sup>. <sup>1</sup>Federal State Budgetary Institution "Research Institute of Clinical and Experimental Rheumatology named after A.B. Zborovskiy"; <sup>2</sup>Federal State Budgetary Volgograd Medical University, Volgograd, Russian Federation

**Background:** Obesity is a condition that prolongs chronic inflammation and promotes synthesis and secretion of pro-inflammatory factors by adipose tissue including adipokines<sup>1</sup> and can be one of the significant factors in the progression of osteoarthritis (OA).<sup>2</sup> Nowadays many studies have shown that level nicotinamide phosphoribosyltransferase (Nampt) increases in obesity and can also affect the inflammation in local tissues and together with other adipokines influences the development of OA.<sup>3</sup>

**Objectives:** To study the effect of weight loss over 5 kg on the clinical manifestations of OA, indicators of water, lipid metabolism and Nampt serum levels in patients with OA.

**Methods:** We observed 110 people: 80 patients with OA and 30 healthy individuals in the control group with body mass index (BMI) of 25 to 35 kg/m<sup>2</sup>, aged 18 to 79 years participated in the study.

Nampt level in serum was determined by indirect solid phase ELISA using a commercial test systems (RaiBiotech, cat № EIA – VIS – 1).

**Results:** As overweight patients were recruited in the study, hypocaloric diet low in animal fats and physiotherapy has been recommended to all participants. The first group consisted of patients who were able to reduce body weight by 5 kg and more (18 pers.), the second group – patients with weight reduction of less than 5 kg and patients without any weight loss (62 pers.). Nampt concentration were evaluated in these patients I groups 4,33±0,39 before treatment to 2,40±0,23 ng/ml (t=5,85, p<0,001). In analysing the parameters before and after treatment, it should be noted that we observed significant decrease in the severity of the clinical manifestations of OA, visfatin level, CRP, and glucose levels and lipid profile in the 1st group of patients. These data proves that obesity may be an important risk factor for OA progression. As a result, weight loss results in decreasing metabolic disorder severity. In the second group of patients we have seen a decrease in all the parameters, but a significant difference has been observed only in the level of CRP, level of pain at rest and during walking according to VAS scale and total index on the WOMAC.

**Conclusions:** As a result of our study patients with OA with weight loss of more than 5 kg had more obvious pain relief than patients with the original weight. At the same time a significant improvement has been seen in carbohydrate and lipid metabolism. These findings suggest that there is a possible role of Nampt in the pathogenesis of OA.

**CARDIAC MANIFESTATIONS IN SPONDYLOARTHRITIS: PREVALENCE AND PREDICTIVE FACTORS**

J. Eddarami, L. Ichchou. Department of Rheumatology, Mohamed VI University Hospital, Mohammed I University, Oujda, Morocco

**Background:** Cardiac involvement is a well-recognised complication of spondyloarthritis (SpA). The spectrum of this condition is large and includes mitral valve disease, conduction disorders and pericarditis, but the aortic disease remains the most characteristic lesion.

**Objectives:** The aim of this study is to determine the prevalence of cardiac manifestations and to assess their predictive factors in a population of Moroccan patients suffering from SpA.

**Methods:** We have conducted a cross-sectional study over two months in our department of rheumatology. All SpA patients fulfilled <sup>ASAS 2009</sup> criteria. They all have had a cardiac check up with research of clinical cardiac manifestation, 12-lead electrocardiogram and trans-thoracic echocardiography.

Data analysis was carried out using the SPSS Statistics 20 software. A univariate analysis as well as multivariate regressions were carried out to identify the factors associated with cardiac manifestations.

**Results:** We have included 61 men and 31 women with a mean age of 37.34 ±12.77 years old. The mean disease duration was 10.59±7.63. The median CRP was 9.60 mg/L (IQR 0–180), the mean ASDAS CRP 2.24±1.30 and the mean BASDAI 2.7±1.99.

Traditional cardiovascular risk factors in our series included dyslipidemia in 15 patients (18.3%), hypertension in 10 patients (10.9%) and type 2 diabetes in 7 patients (7.6%). Mean BMI was 23.88±5.83 Kg·m<sup>-2</sup>. Twenty nine patients (31.9%) were overweight and 10 patients (11%) were obese. Eight patients (8.7%) smoked and 3 patients (3.3%) used alcohol whereas 19 patients (20.7%) had a history of smoking and 6 patients (6.5%) had a history of alcohol use.

Cardiac manifestations were found in 12 patients (13.6%): 3 (3.3%) had aortic regurgitation (AR), 1 (1.1%) had aortic dilatation, 1 (1.1%) had aortic thickening, 2 (2.2%) had mitral thickening, 1 (1.1%) had mitral regurgitation (MR), 1 (1.1%) had mitral stenosis (MS), 3 (3.4%) had pericarditis and 2 (2.2%) had bundle branch block.

In comparison with the group without cardiac manifestations, axial involvement, current enthesitis and extra-articular manifestations were common in patients with cardiac involvement. Furthermore, uveitis was frequent in patients with aortic dilatation and MR. Patients with AR and MS had higher ESR and disease activity compared to the group without heart disease. Patients with pericarditis had an accelerated ESR unlike the group without cardiac involvement.

In univariate analysis, AR was significantly associated with ESR and ASDAS VS (OR=1.03 [1.003–1.063], p=0.028; 2.75 [1.062–7.123], p=0.037, respectively). Pericarditis was significantly associated with ESR (OR=1.03 [1.003–1.062], p=0.029).

In multivariate analysis, cardiac manifestations were significantly associated with current enthesitis and extra-articular manifestations (OR=4.48 [1.078–18.683], p=0.039 and 6.35 [1.156–34.893], p=0.033, respectively).

**Conclusions:** Heart disease was common in our study and was associated with the enthesitis involvement and the severity of SpA.

#### AB1328 FLARES IN SPONDYLOARTHRITIS: PREVALENCE AND RELATED FACTORS

J. Eddarami, L. Ichchou. *Department of Rheumatology, Mohamed VI University Hospital, Mohammed I University, Oujda, Morocco*

**Background:** Spondyloarthritis is a chronic condition characterised by alternated periods of flares and stable disease.

**Objectives:** The aim of this study is to assess the prevalence of patient-reported flares and the validity of this concept through its related factors.

**Methods:** We have conducted a cross-sectional study over two months in our department of rheumatology. All SpA patients fulfilled <sup>ASAS 2009</sup> criteria.

Current and past flares over the last 3 months were recorded. Disease activity and functional status were assessed by the BASDAI score (0–10) and the Bath Ankylosing Spondylitis Functional Index (BASFI; 0–100), respectively. Data analysis was carried out using the SPSS Statistics 20 software. Univariate and multivariate regressions were performed to identify the factors associated with current flare.

**Results:** We included ninety tow patients with SpA, 61 (66.3%) were men. The mean age was 37.34±12.77 years old. The mean disease duration was 10.59 ±7.63 year. The mean BASDAI was 2.7±1.99 and the median BASFI was 14 (IQR 0–100). Thirty-five patients (38%) received antitumor necrosis factor alpha (anti-TNF-α). Twenty-nine patients (31.5%) were currently in flare, and 6 patients (6.5%) reported only past flares.

In univariate analysis, patients reporting current flares had a current enthesitis (OR=3.14 [1.250–7.923], p=0.015) and higher values of BASDAI, ASDAS VS and

ASDAS CRP (OR=2.17 [1.085–4.362], p=0.029; 2.20 [1.448–3.359], p=0.0001; 2.23 [1.495–3.340], p=2.235, respectively). These patients had also more extra-articular manifestations (OR=3.37 [1.326–8.601], p=0.011).

In multivariate analysis, the following factors were associated with current flare: higher BASFI (OR=1.05 [1.013–1.098], p=0.010), protein c-reactive (OR=1.087 [1.016–1.163], p=0.016), ASDAS VS (OR=10.99 [1.921–62.873], p=0.007), current enthesitis (OR=25.00 [2.185–286.146], p=0.01), the presence of extra-articular manifestations (OR=30.66 [1.709–550.049], p=0.02) and the use of non steroidal anti-inflammatory drugs during the last 3 months (OR=125.064 [3.33–4491.0], p=0.009).

**Conclusions:** Our study shows that assessment of flares may provide a good estimation of disease activity.

#### AB1329 BIOLOGIC AGENTS AND RISK OF SERIOUS INFECTIONS IN RHEUMATOID ARTHRITIS, PSORIATIC ARTHRITIS AND ANKYLOSING SPONDYLITIS: RESULTS BY INTEGRATING TEN-YEAR (2006–2015) ADMINISTRATIVE DATABASES IN THE ITALIAN REGION OF FRIULI VENEZIA GIULIA

L. Quartuccio<sup>1</sup>, A. Zabotti<sup>1</sup>, S. Del Zotto<sup>2</sup>, L. Zanier<sup>2</sup>, S. De Vita<sup>1</sup>, F. Valent<sup>3</sup>.

<sup>1</sup>Department of Medical Area, Rheumatology Clinic, Udine Academic Hospital "Santa Maria della Misericordia"; <sup>2</sup>Central Direction of Health of Friuli Venezia Giulia, Epidemiology Service; <sup>3</sup>Institute of Epidemiology, Academic Hospital "Santa Maria della Misericordia", Udine, Italy

**Background:** Serious infections are a major concern for patients considering biologic agents for rheumatoid arthritis (RA) or psoriatic arthritis (PsA) or ankylosing spondylitis (AS). Evidence from meta-analyses is consistent with an increased risk of serious infections with biologic disease-modifying antirheumatic drugs (bDMARDs);<sup>1</sup> however, long-term real-life studies are scarce and controversial.

**Objectives:** To determine the risk of serious infections (i.e., need of hospitalisation) in patients affected by RA, psoriatic arthritis (PsA) or ankylosing spondylitis (AS), treated by bDMARDs in the Italian region of Friuli Venezia Giulia, approximately 1,200,000 inhabitants.

**Methods:** The regional health information system was used as the source of data. Administrative data from the hospital discharge records database, the medical prescription database, and the database of exemptions from medical charges were linked at the individual patient level through an anonymous univocal stochastic key. A cohort of patients diagnosed for RA, PsA or AS from 2006 to 2015 was identified from specific national exemption codes (006, 045, 054) and followed up to either the end of 2015, or hospitalisation with the main discharge diagnosis of infection, as ICD-9-CM codes, or death, or change of residency out of the Region. Multivariate Cox regression was used to estimate the hazard ratio (HR) of hospitalisation associated with bDMARDs and adjusting for age, sex, Charlson's comorbidity index, calendar year, prescription of steroids and of csDMARDs. Use of bDMARDs was treated as a time-dependent variable.

**Results:** Overall, the cohort consisted of 5596 subjects: 3216 (57.5%) with RA,<sup>1702</sup> (30.4%) with PsA, and 678 (12.1%) with AS. Of them, 940 patients (16.8%) had received at least one prescription of a bDMARDs during the study period. During follow-up, 193 (3.4%) subjects were admitted to the hospital with a primary diagnosis of infection. The most frequent infections were upper and lower respiratory tract infections (86/193, 44.5%), followed by sepsis (19/193, 9.8%), and soft tissue and skin infections (16/193, 8.3%). After adjusting for the abovementioned variables, when starting a bDMARD, the risk of infections was significantly increased, with an observed increased risk of almost 2-fold by the time of the bDMARD prescription (HR 1.694, 95% CI 1.158–2.478, p=0.0066). Compared with patients <40 years if age, the elderly (>=65 years) showed a much higher risk of infections (HR 3.919, 95% CI 2.286–6.716, p<0.0001). Analyses stratified by disease indicated that RA, PsA, and AS patients starting biologic medications have increased risk of infection.

**Conclusions:** By integrating the information coming from ten-year administrative databases, RA, PsA and AS patients starting bDMARDs are at high risk of serious infections. This risk is much higher in the elderly. Upper and lower respiratory tract

infections are the most common infections, supporting the prevention policies by vaccination for influenza viruses and *Str. pneumoniae*, in particular in the elderly population.

#### AB1330 A PRELIMINARY STUDY ON THE BASELINE HRCT SCORING CRITERIA FOR PREDICTING THE FIBROSIS PROGRESSION OF RA-ILD

*L. Li*. Department of Rheumatology and Immunology, Beijing Chaoyang Hospital West Hospital Affiliated to Capital Medical University, Beijing, China

**Background:** Interstitial lung disease (ILD) is the most common pulmonary manifestation of RA. The progression of fibrosis in RA-ILD varied differently, and effective predictors of progression were absent.

**Objectives:** To explore the baseline HRCT scoring criteria that can predict progressive fibrosis and provide reference for clinical diagnosis and treatment.

**Methods:** The chest HRCT of RA-ILD patients from 2009 to 2017 were retrospectively analysed, including 102 patients with progressive fibrosis and 50 patients without progressive fibrosis. Progressive fibrosis was defined as honeycombing development or an increase in extent of reticulation on follow-up HRCT. The baseline HRCT evaluation was performed by two thoracic radiologists blinded to all patient data, which including routine interstitial lesion evaluation and fibrosis predictive score. We proposed the baseline HRCT fibrosis predictive score to differentiate progressive fibrosis from the stable patients. The score included two parts, subpleural lesion score and bronchovascular bundle thickening score, with a total score of 0–9 points.

**Results:** In the routine evaluation, peripheral distribution was more common in the progressive fibrosis group (78.43% VS 52%,  $p < 0.05$ ), traction bronchiectasis and traction bronchiolectasis both were more common in the progressive group (41.18% VS 8%,  $p < 0.01$ ; 93.14% VS 46%,  $p < 0.01$ ; respectively). Compared with non-progressive fibrosis group, subpleural reticulation and subpleural linear opacities were more common in the progressive fibrosis group (79.21% VS 28%,  $p < 0.0$ ; 41.80% VS 14%,  $p < 0.01$ ; respectively), subpleural honeycombing was more common in the progressive fibrosis group (41.17% VS 20%,  $p < 0.05$ ), subpleural ground-glass opacity showed no difference between the two groups (52.94% VS 66%,  $p > 0.05$ ). Notably, subpleural honeycombing in the progressive group were all accompanied by the presence of subpleural reticulation and subpleural linear opacities on baseline HRCT. The AUC curve of fibrosis predictive score was 0.87 (95% confidence interval, 0.81, 0.93), indicating that baseline HRCT score had a better judgement value for progressive fibrosis. The cut-off value was 5.5 points (sensitivity was 64%, specificity 94%), that is, baseline HRCT score  $\geq 6$  points was more likely to develop progressive fibrosis. Drug interventions (glucocorticoids, cyclophosphamide) were relatively deficient in the progressive fibrosis group, (26.47% VS 44%,  $p < 0.05$ ; 9.80% VS 22%,  $p < 0.05$ ; respectively). Further analysis showed that treatment situations (glucocorticoids, cyclophosphamide) were similar between the baseline HRCT score  $\geq 6$  points group and the baseline HRCT score  $< 6$  points group (34.78% VS 30.12%,  $p > 0.05$ ; 10.14% VS 16.87%,  $p > 0.05$ ; respectively), suggesting that patients with potential fibrotic tendencies had not been treated actively in the early stage.

**Conclusions:** The baseline HRCT score has a better predictive value for the progressive fibrosis of RA-ILD, traction bronchiectasis and traction bronchiolectasis are helpful to identify progression. The baseline HRCT evaluation may provide a reference for the choice of time for treatment.

#### AB1331 SERUM DRUG LEVELS IN THE MANAGEMENT OF RHEUMATOID ARTHRITIS AND SPONDYLOARTHRITIS: A SYSTEMATIC REVIEW

*M. Martín López*<sup>1</sup>, *L. Carmona*<sup>2</sup>, *A. Balsa*<sup>3</sup>, *J. Calvo-Alén*<sup>4</sup>, *R. Sanmartí*<sup>5</sup>, *J. Tornero*<sup>6</sup>, *T. Otón*<sup>2</sup>, *J. Rosas-Gómez de Salazar*<sup>7</sup>. <sup>1</sup>Hospital Universitario 12 de Octubre; <sup>2</sup>Instituto de Salud Musculoesquelética (InMusc); <sup>3</sup>Hospital Universitario La Paz, Madrid; <sup>4</sup>Hospital Universitario Araba, Vitoria; <sup>5</sup>Hospital Clinic de Barcelona, Barcelona; <sup>6</sup>Hospital General Universitario de Guadalajara, Guadalajara; <sup>7</sup>Hospital Marina Baixa, Villajoyosa-Alicante, Spain

**Background:** Several studies in rheumatic and other inflammatory diseases treated with tumour necrosis factor-alpha inhibitors (TNFi) support the association between clinical response and trough drug levels (DL). The utility of monitoring DL in rheumatoid arthritis (RA) and spondyloarthritis (SpA) patients on biological

therapy is not clear, so it is important to identify clinical situations in which, the knowledge of DL, would allow an individualised therapeutic decision in the patient, more cost-effective.

**Objectives:** To answer the most relevant clinical questions related to the usefulness of DL measurement in clinical practice: 1) whether, in patients in remission who are candidates for optimisation, DL predict relapse or survival to dose-titration; 2) whether, in patients with primary or secondary failure to biological agents, DL influence prognosis; and 3) whether concomitant use of methotrexate (MTX) influences the association between DL and response.

**Methods:** An electronic search of the major databases was performed, Medline, Embase and Cochrane Library, from inception to December 2016. We included articles published in English or Spanish on patients with RA, SpA or both, treated with TNFi, tocilizumab or abatacept, and related to answer any of the three questions of the target research. Overall characteristics and outcomes of the studies were collected in a table of evidence and the quality of the studies was assessed with a scale based on the Oxford levels of Evidence.

**Results:** The electronic search strategy yielded 1749 articles, twelve of which were included in this systematic review. 2 studies responded the first question, 5 the second, and 7 the third. These studies were mainly observational studies, 6 retrospective and 4 prospective cohort studies, and 2 randomised clinical trials. Sample sized varied from 24 to 395 patients, for a total of 1482 patients analysed. A total of 1281 RA patients were included (64 in the first question, 243 in the second and 1038 in the third) and 201 SpA patients (32 in the first and second questions, 169 in the third). Studies were small and with limitations, but suggest that measurement of DL may be useful in patients in remission, that higher DL predict a longer relapse-free optimisation, and in patients with failure to a biological agent, treatment may need individual adjustment according to the presence of DL or anti-drug-antibodies. In addition, MTX influences the association between response and DL in most studies, with greater controversy in tocilizumab and SpA patients.

**Conclusions:** Monitoring DL would allow optimal use of current biological therapies, but more studies and of better quality are needed to draw definitive conclusions. In addition, future research should be performed to determine therapeutic ranges of DL, so that the proposed algorithms can be used in a standardised and reliable manner.

Miguel Servet, Zaragoza; <sup>4</sup>Rheumatology, H San Jorge, Huesca; <sup>5</sup>Rheumatology, H Univ. Santiago, Santiago de Compostela; <sup>6</sup>Rheumatology, H Gran Canaria, Las Palmas; <sup>7</sup>Rheumatology, H Virgen Macarena, Sevilla; <sup>8</sup>Rheumatology, H La Princesa, Madrid; <sup>9</sup>Rheumatology, H Sant Pau, Barcelona; <sup>10</sup>Rheumatology, H Germans Trias i Pujol, Badalona; <sup>11</sup>Medical Affairs, Merck Sharp Dohme Spain, Madrid, Spain

**Background:** Persistence to treatment may be used as a surrogate marker for long-term treatment success

**Objectives:** To assess the probability of persistence on golimumab (GOL) up to 5 years after treatment initiation and the factors associated to longer persistence

**Methods:** BIOBADASER is the Spanish registry of biological drugs of the Spanish Society of Rheumatology and the Spanish Medicines Agency. A data-base analysis was done in October 2017 on all the patients who had initiated GOL for one of the approved indications (rheumatoid arthritis [RA], axial spondyloarthritis [SpA] or psoriatic arthritis [PsA]). The probability of persistence was calculated with a Kaplan-Meier test. Factors related to persistence were analysed with a Cox-regression model.

**Results:** 353 patients were included (105 [29.8%] RA, 147 [30.6%] axial SpA and 101 [28.6%] with PsA), mean age 52<sup>11</sup> years, 55% women). Median duration of disease at the onset of GOL was 8.0 [2.8–15.0] years. GOL was the first biological drug in 40.1% of the patients, second in 30.1% and third or further biological in 29.8%. Concomitant medication at GOL initiation was methotrexate (MTX) (33.7%), sulphasalazine (SSZ) (6.1%), leflunomide (LEF) (12.7%), steroids (CS) (26.0%). At the last observation on GOL, 32.0% were on MTX, 5.8% on SSZ, 12.8% on LEF, 16.3% on CS. The probability of persistence on GOL since treatment initiation was 85.9% at year 1 (95% CI 81.4–89.5), 73.7% at year 2 (67.1–79.1), 68.5% at year 3 (60.5–75.1), 60.6% (50.2–69.5) at year 4 and 57.1% (44.9–67.5) at year 5. Persistence was similar for RA, axial SpA or PsA patients (p log-rank 0.070), and higher when GOL was used as first biological agent (p log-rank  $< 0.001$ ). As first biological drug the probability of persistence was 94.5%

(year 1) and 85.4% (year 2), (insufficient number of cases to assess persistence at year 3 or further). As second biological drug, it was 89.8% (year 1), 75.2% (year 2), 67.4% (year 3) and 59.2% (year 4) and as third biological drug the figures were, respectively, 69.6%, 58.4%, 54.5% and 46.1%. Cox-regression analysis (table 1) showed that the probability of persistence on GOL therapy was higher in first vs second or third biological line patients (Hazard Ratio for discontinuation [HR]: 2.30 [95% CI: 1.16–4.55] for second and 3.92 [2.07–7.39] for third line), and in patients with concomitant MTX (HR discontinuation=0.55 [0.33–0.91]), and lower in those needing CS (HR discontinuation=2.83 [1.72–4.66]).

**Abstract AB1332 – Table 1.** Factors related to persistence of golimumab treatment

	Hazard Ratio of Discontinuation	95% Confidence Interval	p
<b>Initial Model</b>			
Gender (women vs men)	1.23	(0.62-2.44)	0.56
Age at golimumab initiation	1.01	(0.99-1.04)	0.25
Disease duration	0.99	(0.95-1.02)	0.38
Smoking habit	1.67	(0.85-3.26)	0.13
Overweight (vs normal)	1.61	(0.74-3.52)	0.23
Obesity (vs normal)	1.53	(0.64-3.66)	0.33
Second vs first biological drug	3.06	(1.28-7.32)	0.01
Third vs first biological drug	5.22	(2.18-12.49)	<0.01
Axial SpA vs RA	0.79	(0.36-1.73)	0.55
PsA vs RA	0.59	(0.27-1.29)	0.19
Methotrexate	0.41	(0.21-0.80)	0.01
Steroids	4.26	(2.26-8.04)	<0.01
<b>Final Model</b>			
Gender (women vs men)	1.38	(0.84-2.27)	0.21
Age at golimumab initiation	1.01	(1.00-1.03)	0.14
Second vs first biological drug	2.30	(1.16-4.55)	0.02
Third vs first biological drug	3.92	(2.07-7.39)	<0.01
Methotrexate	0.55	(0.33-0.91)	0.02
Steroids	2.83	(1.72-4.66)	<0.01

**Conclusions:** In patients with RA, axial SpA or PsA, the probability of persistence on GOL after initiation was high. The retention rate was higher both in patients with GOL as first biological drug and in those with concomitant therapy with MTX, and lower in those needing CS.

**AB1333 RETENTION RATES OF ADALIMUMAB, ETANERCEPT, AND INFLIXIMAB AS BIOTHERAPIES FOR RHEUMATOID ARTHRITIS, SPONDYLOARTHRITIS, OR PSORIATIC ARTHRITIS PATIENTS IN DAILY PRACTICE IN AUVERGNE (FRANCE)**

M. Soubrier<sup>1</sup>, A. Fan<sup>1</sup>, M. Couderc<sup>1</sup>, S. Malochet-Guinamand<sup>1</sup>, S. Mathieu<sup>1</sup>, C. Giraud<sup>1</sup>, A. Tournadre<sup>1</sup>, J.-J. Dubost<sup>1</sup>, B. Pereira<sup>2</sup>. <sup>1</sup>Rheumatology department; <sup>2</sup>BioStatistics Unit, CHU Clermont-Ferrand, Clermont-Ferrand, France

**Background:** The use of TNF- $\alpha$  inhibitors, has considerably improved the treatment of rheumatoid arthritis (RA), spondyloarthritis (SpA), and psoriatic arthritis (PsA). The most widely used anti-TNFs are infliximab (IFX), adalimumab (ADA), and etanercept (ETN). Their efficacy and safety have been demonstrated in randomised controlled trials, though of short duration and involving a selected patient population differing from those seen in daily practice.

**Objectives:** To compare, in real-life settings, the retention rates of anti-TNF treatments (ETN, ADA, or IFX) initiated as first-line biotherapy following their approval in the three clinical indications.

**Methods:** Monocentre retrospective cohort involving patients on initial anti-TNF therapy for RA, SpA, or PsA since 2006.

**Results:** Anti-TNF treatment was initiated on 228 RA (ETN 160, ADA 45, or IFX 23), 208 SpA (ETN 91, ADA 62, or IFX 55), and 81 PsA (ETN 40, ADA 26, or IFX 15) patients. Treatment retention rates at 1, 3, and 5 years were 82%, 53%, and 44% in RA; 75%, 57%, and 49% in SpA; 75%, 64%, and 51% in PsA, with no differences detected among the pathologies ( $p=0.96$ ). Retention rates at 1, 3, and 5 years did not differ among the 3 anti-TNFs either for all pathologies included (ETN: 80%, 57%, and 43%; ADA: 80%, 58%, and 51%; IFX 72%, 56%, and 52%;  $p=0.75$ ) or each pathology alone (RA: ETN: 83%, 55%, and 41%; ADA: 83%, 51%, and 51%; IFX: 76%, 44%, and 44%,  $p=0.84$ ; SpA: ETN: 78%, 57%, and 48%; ADA: 78%, 59%, and 46%; IFX: 68%, 55%, and 52%,  $p=0.81$ ; PsA: ETN: 70%, 60%, and 36%; ADA: 79%, 69%, and 69%; IFX: 80%, 66%, and 53%,  $p=0.65$ ). Overall, 89 RA, 85 SpA, and 28 PsA patients discontinued treatment for inefficacy (32%) or side effects (SE, 9%). In RA, predictors for treatment discontinuation were: Disease activity (DAS 28 ESR HR: 1.27 [1.05–1.55]); DAS28-CRP HR: 1.27 [1.03–1.60]), (CRP HR: 1.01 [1.01–1.02]), and corticosteroid intake (HR: 2.05 [1.027–3.32]). Concomitant methotrexate intake tended to decrease the

treatment discontinuation risk (HR: 0.64 [0.41–1.01]). Predictors for treatment discontinuation due to inefficacy were similar (DAS28 ESR, HR: 1.31 [1.05–1.63]; DAS28 CRP, HR: 1.33 [1.04–1.72], CRP HR: 1.02 [1.01–1.03]), corticosteroid intake HR: 3.79 [2.02–7.11]). We were unable to identify any predictors for treatment discontinuation due to SE, though corticosteroid intake was found to be protective (HR: 0.23 [0.07–0.71]). In SpA, the sole predictor for treatment discontinuation identified was increased BASDAI score (HR: 1.02 [1.01–1.04]), while the sole predictor for treatment maintenance was inflammatory syndrome (CRP HR: 0.97 [0.95–0.99]). Similar findings were seen for treatment discontinuation due to inefficacy (BASDAI HR: 1.03 [1.01–1.05]); CRP HR: 0.98 [0.96–0.99]). We were unable to identify any predictors for treatment discontinuation due to SE. In PsA, active smoking was revealed to be a predictor for treatment discontinuation due to inefficacy (HR: 2.234 [1.02–4.91]).

**Conclusions:** ETN, ADA, and IFX display similar treatment retention rates in RA, SpA, or PsA without between-agent differences.

**AB1334 EVALUATION OF DYNAMICS OF MORTALITY FROM DISEASES OF THE BONE-MUSCULAR SYSTEM IN KARAKALPAKSTAN**

M. Salokhiddinov, U. Anarmetova, G. Haydarova. TASHKENT MEDICAL ACADEMY, Tashkent, Uzbekistan

**Background:** Karakalpakstan is now mostly desert and is located in western Uzbekistan near the Aral Sea, in the lowest part of the Amu Darya basin. The desertification of the Aral Sea has brought a lot of dust in the air, and respiratory diseases – bone-muscular diseases – have become the largest local health problem among the population of Karakalpakstan, a region in the North Western part of Uzbekistan.

**Objectives:** To assess the dynamics of mortality trends from diseases of bone-muscular system (BMS) in the Karakalpakstan region in 2010–2015

**Methods:** To study mortality from BMS, databases on mortality of residents in Karakalpakstan for 2010–2015, obtained with the help of an automated mortality registration system, were used to automatically code and select the original cause of death in accordance with the rules of ICD-10.

**Results:** In the Karakalpakstan region, there has been a trend of a significant increase in mortality from BMS from 3.0 in 2010 to 5.6 per 1 000 in 2015 (1.9 times), with a slight decrease in the death rate from the BMS in Uzbekistan from 1.7 in 2010 to 1.6 in 2015 per 100 thousand people (the rate of decline is 5.9%). So that Decrease in the mortality rate from diseases of the musculoskeletal system in Uzbekistan from 1.7 to 1.6 per 100 thousand of population (the rate of decrease is 5.9%) and the growth of mortality rates from diseases of the musculoskeletal system was 1.9 times from 2001 to 2015

**Conclusions:** The growth of mortality rates from musculoskeletal system diseases in the Karakalpakstan region is not related to the rates of overall mortality of the population, but is more reliable due to the use of the automated system for recording mortality, as well as training physicians to codify medical and statistical diagnoses.

**AB1335 SERUM MMP-3 IS CLOSELY RELATED TO KNEE JOINT SYMPTOMS IN RHEUMATOID ARTHRITIS PATIENTS: A CROSS-SECTIONAL STUDY FROM KURAMA COHORT**

M. Azukizawa<sup>1</sup>, H. Ito<sup>1</sup>, K. Nishitani<sup>1,2</sup>, K. Murata<sup>1,2</sup>, A. Okahata<sup>1</sup>, T. Tomizawa<sup>1</sup>, M. Hashimoto<sup>2</sup>, M. Tanaka<sup>2</sup>, T. Mimori<sup>3</sup>, S. Matsuda<sup>1</sup>. <sup>1</sup>Department of Orthopaedic Surgery; <sup>2</sup>Department of Advanced Medicine for Rheumatic Diseases; <sup>3</sup>Department of Rheumatology and Clinical Immunology, Kyoto University Graduate School of Medicine, Kyoto, Japan

**Background:** Joint damage progression occurs within the first 2 years of rheumatoid arthritis (RA).<sup>1</sup> Large joints are often involved in RA patients. The knee joint, in particular, is affected in about 30% of RA patients.<sup>2</sup> Knee joint disability in RA is thought to be one of the most important prognostic factors decreasing quality of life. However, few studies have focused on what would influence knee joint function in RA patients. Therefore, a cross-sectional study on this subject was

conducted using a RA patient cohort: the Kyoto University Rheumatoid Arthritis Management Alliance (KURAMA) cohort.

**Objectives:** The purpose of this study is to clarify risk factors related to functional disability in knee joint from a RA cohort.

**Methods:** A total of 447 female RA patients (mean age; 63.7 years) were recruited in KURAMA cohort. Clinical data included age, disease duration (DD), Steinbrocker stage and class, anti-cyclic citrullinated peptide antibody (anti-CCP), rheumatoid factor (RF), C-reactive protein (CRP), matrix metalloproteinase-3 (MMP-3), Disease Activity Score 28 using CRP (DAS28-CRP), and visual analogue scale for pain (Pain-VAS). Knee function was assessed by the scores of the Japanese Knee Osteoarthritis Measure (JKOM) questionnaire.<sup>3</sup> The correlations between the total JKOM score and each factor were evaluated by univariate and multivariate regression analyses.

**Results:** A total score of JKOM had a median value of 17 points, an interquartile range of 5.5 to 43.5 points. Univariate analyses showed that age, DD, stage, class, anti-CCP titer, CRP, MMP-3, DAS28-CRP, and Pain-VAS were significantly correlated with total JKOM score (table 1). Multivariate regression analysis with JKOM as the objective variable revealed that Pain-VAS ( $\beta=0.63$ ,  $p<0.01$ ), age ( $\beta=0.23$ ,  $p<0.01$ ), and MMP-3 ( $\beta=0.16$ ,  $p<0.01$ ) were extracted as significant factors (table 2).

**Abstract AB1335 – Table 1.** Pearson's correlation coefficients (r) between each risk factor for knee disability and total JKOM score.

Parameter	r	p
Age	0.32	< 0.01
Disease duration	0.22	< 0.01
Steinbrocker stage	0.24	< 0.01
Steinbrocker class	0.29	< 0.01
Anti-CCP	0.13	0.01
CRP	0.20	< 0.01
MMP-3	0.33	< 0.01
DAS28-CRP	0.54	< 0.01
Pain-VAS	0.66	< 0.01

Parameter	$\beta$	p
Age	0.23	< 0.01
MMP-3	0.16	< 0.01
Pain-VAS	0.63	< 0.01

**Abstract AB1335 – Table 2.** Multivariate regression analyses of risk factors for knee disability and total JKOM scores.

**Conclusions:** Pain has the most significant influence on knee joint symptoms in RA patients. Serum MMP-3 is closely related to knee joint disability, and attention should be paid to knee joint dysfunction in RA patients with high serum MMP-3.

#### MUSCULOSKELETAL DISORDERS IN HEMODIALYSIS PATIENTS: DIFFERENT DISEASE CLUSTERING ACCORDING TO AGE AND DIALYSIS VINTAGE

N. Ziade<sup>1,2</sup>, S. Hage<sup>3</sup>, V. Hage<sup>4</sup>, N. Khoury<sup>5</sup>, H. Azar<sup>6</sup>, D. Chelala<sup>6</sup>.

<sup>1</sup>Rheumatology, Saint-Joseph University; <sup>2</sup>Rheumatology, Hotel Dieu de France; <sup>3</sup>Radiology, Hotel-Dieu de France Hospital, Beirut; <sup>4</sup>Nephrology, Bhannes Hospital, Bhannes; <sup>5</sup>Rheumatology, Hotel-Dieu de France; <sup>6</sup>Nephrology, Hotel Dieu de France, Beirut, Lebanon

**Background:** The number of patients suffering from stage 5 Chronic Kidney Disease is constantly increasing and their life expectancy has improved due to the hemodialysis technique. Musculoskeletal disorders remain a major problem in long term hemodialysis patients. Frequency and severity of these manifestations increase with the length of the dialysis.

**Objectives:** To identify diseases clustering profiles of musculoskeletal disorders in hemodialysis patients.

**Methods:** All adult patients in the hemodialysis centre were included in this cross-sectional study. For each patient, we filled a data collection sheet including basic demographic characteristics, musculoskeletal symptoms, biologic parameters and treatments. Musculoskeletal disorders were classified by a rheumatologist into pre-defined diagnostic categories: Osteoarthritis, Fractures, Tendinopathies, Carpal Tunnel Syndrome, Crystal deposition disease and Others. Prevalences were presented and a cluster analysis was performed.

**Results:** Eighty-nine patients were included (table 1). Mean age was 67.5±12 years. 43.8% were female. Dialysis vintage was 5.7±5.37 years. Musculoskeletal symptoms were reported by 76.4% of the patients. Pain was the most frequent symptom (44.9%). The main disorders were osteoarthritis (53.9%), fracture (27%), tendinopathy (22.5%), carpal tunnel syndrome (18%), and chondrocalcinosis (9%). Musculoskeletal symptoms were significantly related to the dialysis vintage and age ( $p=0.044$ ,  $p=0.035$  respectively). All disorders categories were significantly associated with dialysis vintage, particularly increasing after the seventh year of dialysis. Cluster analysis identified three patient profiles: younger with low calcium levels, younger but long dialysis vintage with osteoarthritis and carpal tunnel syndrome, older and long dialysis vintage with fractures (figure 1).

**Abstract AB1336 – Table 1**

#### Population characteristics

N	89
Age (years±SD)	67.5±12.6
Sex ratio (M/F)	49/39
Age at the start of hemodialysis year(±SD)	61.5±14.6
Dialysis vintage (years±SD)	5.7±5.37
Diagnostic nephropathy	
Diabetes	27 (30.3%)
Hypertension	26 (29.2%)
Chronic glomerulonephritis	13 (14.6%)
Polycystic kidney disease	10 (11.2%)
Chronic interstitial nephropathy	7 (7.9%)
Others	6 (6.7%)

**Abstract AB1336 – Figure 1**

**Conclusions:** The prevalence of the musculoskeletal manifestations is high (76.4%) in the hemodialysis population. Musculoskeletal disorders seem to cluster differently according to age and dialysis vintage.

### AB1337 CELIAC DISEASE AND RISK OF SARCOIDOSIS: A SYSTEMATIC REVIEW AND META-ANALYSIS

K. Wijampreecha<sup>1</sup>, P. Panjawanatnan<sup>2</sup>, P. Lertjitbanjong<sup>1</sup>, J.E. Corral<sup>3</sup>, P. Ungprasert<sup>4</sup>. <sup>1</sup>Medicine, Bassett medical center, cooperstown, USA; <sup>2</sup>Biochemistry, Faculty of Medicine, Chiang Mai University, Chiang Mai, Thailand; <sup>3</sup>Gastroenterology and Hepatology, Mayo Clinic, Jacksonville, USA; <sup>4</sup>Research and development, Faculty of Medicine Siriraj Hospital, Mahidol University, Bangkok, Thailand

**Background:** Several epidemiologic studies have demonstrated that patients with celiac disease may be at an increased risk of developing sarcoidosis. However, the data on this risk remain inconsistent.

**Objectives:** To compare the risk of developing sarcoidosis between patients with celiac disease and individuals without celiac disease.

**Methods:** A literature review was performed using MEDLINE and EMBASE database from inception to December 2017. Studies that compared the risk of sarcoidosis among patients with celiac disease versus those without celiac disease were included. The inclusion criteria were as follows: <sup>1</sup> case-control, cross-sectional or cohort studies that investigated the risk of sarcoidosis among patients with celiac disease compared with individuals without celiac disease and <sup>2</sup> odds ratios (OR), relative risks (RR), hazard ratios (HR) or standardised incidence ratios (SIR) with 95% confidence intervals (CI) or sufficient raw data to calculate these ratios were provided. Study eligibility was independently determined by 3 investigators. Differences in the determination of study eligibility were resolved by mutual consensus. Pooled odds ratio (OR) and 95% confidence interval (CI) were calculated using a random-effect, generic inverse variance method of DerSimonian and Laird.

**Results:** Of 375 retrieved studies, 4 studies (2 case-control studies and 2 cohort studies) with 6 93 639 participants met our eligibility criteria and were included in analysis. We found a higher risk of sarcoidosis among patients with celiac disease compared with individuals without celiac disease with the pooled OR of 7.16 (95% CI, 1.48–34.56). The statistical heterogeneity of this study was high ( $I^2=95\%$ ). Funnel plot was relatively symmetric and did not suggest the presence of publication bias in favour of positive studies.

Abstract AB1337 – Figure 1. Forest plot of this meta-analysis

**Conclusions:** This systematic review and meta-analysis found a significantly higher risk of sarcoidosis among patients with celiac disease.

### AB1338 COHORT OF PARAGUAYAN PATIENTS WITH EARLY ONSET ARTHRITIS

P.D. Delgadillo Benitez<sup>1</sup>, S. Cabrera Villalba<sup>1</sup>, G. Ávila Pedretti<sup>1</sup>, I. Acosta Colmán<sup>2</sup>, P. Melgarejo<sup>1</sup>, M. Franco<sup>1</sup>, G. Elizaur<sup>1</sup>, J. Mazzoleni<sup>1</sup>, A. Ramagli<sup>3</sup>, P. de Abreu<sup>4</sup>. <sup>1</sup>Servicio de Reumatología, Instituto de Previsión Social; <sup>2</sup>Reumatología, Hospital de Clínicas, Asunción, Paraguay; <sup>3</sup>Reumatología, Instituto Nacional de Reumatología, Montevideo, Uruguay; <sup>4</sup>Reumatología, Sociedad Paraguaya de Reumatología, Asunción, Paraguay

**Background:** The PANLAR-EOA (early-onset-arthritis) project includes panamericanrheumatologists to determine regional characteristics of patients with early onset arthritis.

**Objectives:** To describe the cohort of Paraguayan patients included in PANLAR-EOA project.

**Methods:** Longitudinal, prospective, multicentric study. Patients were included according to the PANLAR-EOA project and registered in REPANARC (www.panlareoa.org) database. At baseline and annual visits, a large number of demographic, clinical and analytical variables were recorded. Quantitative variables were characterised by their means and standard deviations, while the qualitative

variables were characterised according to the percentage of patients. The comparison of epidemiological and clinical variables was performed using the chi-squared test and the Wilcoxon test respectively for qualitative and quantitative variables, respectively.

**Results:** 136 patients with early onset arthritis were included, out of which 88 completed the 12 months follow up and 58 the 24 months one. In these, 86% were female with a median age of 43.9±13.2 years. The most frequent race was mestiza in 80.1%. According to GRAFFAR index, middle class was the predominant social stratum (9.8±3.1). The average number of years of schooling was 12.8±3.8. Polyarticular onset was registered in 61% patients. During follow-up, 43.1% had positive rheumatoid factor and 56.5% positive anti-CCP. The diagnostic delay was 3.9±3.0 months. Initially, 63.2% (86/136) were diagnosed with rheumatoid arthritis (RA) and 36.8% (50/136) with undifferentiated arthritis (UA). The most frequent treatment was methotrexate (85.3%, 90.9%, and 89.3% at baseline, 1 and 2 years of follow-up respectively). During follow-up, a significant diagnostic change was observed in patients with UA (p=0.004, OR=2.9 [95%CI, 1.4–6.5]). The variables associated with RA diagnosis were presence of anti-CCP (p=0.000, OR=15.8 [95%CI, 5.4–51.1]), rheumatoid factor (p=0.000, OR=9.2 [95%CI, 3.4–27.0]), smoking (p=0.032, OR=8.8 [95%CI, 1.1–404.7]), high body mass index (p=0.041, OR=1.94 [95%CI, 0.2–4.1]) and high activity measured by the DAS28 index (p=0.01). After one year of follow-up there was a significant decrease in disease activity according to DAS 28 (p=2.2e-09 [95% CI, -1.5, -0.9]), SDAI (p=1.2e-11 [95% CI, 18.2, -11.2]) and HAQ (p=7.2e-08 [95% CI, -0.7, -0.4]). Similar results were found at the 2nd year of follow-up, DAS28 (p=8.8e-06 [95% CI, -1.6, -0.7]), SDAI (p=2.1e-07 [95% CI, -20.0, -10.3]) and HAQ (p=3.4e-08 [95% CI, -0.9, -0.5]).

**Conclusions:** In this cohort of early onset arthritis, diagnostic delay was lower than that observed in other series and the rate of change from diagnosis of UA to RA was statistically significant during the first year of follow-up. A good control of the inflammatory activity of the disease was observed, with a significant improvement of all the variables analysed during its evolution.

### AB1339 ASSOCIATION OF ANTI-THYROID ANTIBODIES AND MUSCULOSKELETAL PAIN IN PATIENTS WITH AUTOIMMUNE THYROIDITIS

P. Rodríguez Henríquez<sup>1</sup>, R. López-Vargas<sup>2</sup>, N. Mateos-Santacruz<sup>3</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Internal Medicine; <sup>3</sup>Endocrinology, Hospital General Dr. Manuel Gea González, Mexico, Mexico

**Background:** Autoimmune thyroiditis is closely associated with autoimmune diseases and can exhibit musculoskeletal pain as a clinical manifestation; the exact pathogenic mechanism of coexistence with other autoimmune disorders has not been clearly defined. There are very few studies that describe the association of anti-thyroid antibodies and musculoskeletal pain in patients with controlled autoimmune thyroiditis without rheumatologic disease

**Objectives:** To Determine the association of anti-thyroid antibodies and musculoskeletal pain in euthyroid patients with autoimmune thyroiditis who doesn't meet any criteria of a rheumatic disease

**Methods:** Fifty consecutive euthyroid (TSH test in a range of 0.34–5.6 μU/mL and Ft4 0.54–1.64 ng/dL) patients with a diagnosis of autoimmune thyroiditis (positive anti peroxidase antibodies [TPOAb] ≥10 IU/mL and/or anti thyroglobulin antibodies [TGAb] ≥5 IU/mL), who attended the endocrinology clinic in an one-year period were included. At the moment of enrollment the patients didn't meet any classification criteria of a rheumatic disease. The presence of musculoskeletal pain was assessed using the survey "Program of modified community orientation for rheumatic diseases" (COPCORD) phase II, validated for the Mexican population, and used as a tool to determine the prevalence of rheumatic and musculoskeletal diseases [6]. COPCORD questionnaire consists of several sections such as number of affected joints, anatomic sites and pain severity measured by Visual Analogue Scale (VAS) with values ranged from 0 to 10. Descriptive statistical analyses were performed using the mean, range and standard deviation of variables. Correlations of statistical significance between groups were carried out using Spearman's rank correlation. P values <0.05 were considered to be significant.

**Results:** 26 patients were TPOAb positive (830.76 IU/mL ± 1169.33 IU/mL); 41 patients were TGAb positive (257.126 IU/mL ± 629.344 IU/mL). There was a positive correlation between the presence of TPOAb with the number of affected joints (Spearman  $r=0.9618$ ,  $p=0.00001$ ) and with pain intensity (Spearman  $r=0.9552$ ,  $p=0.00001$ ). Similarly, there was a positive relationship between TgAb with the number of joints affected ( $r=0.07800$ ,  $p=0.00001$ ) and with pain intensity ( $r=0.7268$ ,  $p=0.00001$ ).

Correlation, (n)	Spearman <i>r</i>	<i>p</i> value
TPOAb versus intensity of pain, 26	0.9552	0.00001
TPOAb versus number of joints affected, 26	0.9618	0.00001
TPOAb versus age, 26	-0.3007	0.1328
TPOAb versus body mass index (BMI), 26	0.0024	0.9904
TgAb versus intensity of pain, 41	0.7268	0.00001
TgAb versus number of joints affected, 41	0.7800	0.00001
TgAb versus age, 41	-0.1615	0.6959
TgAb versus body mass index (BMI), 41	0.2172	0.1694

Abstract AB1339 – Figure 1

**Conclusions:** Our results suggests that in patients with controlled autoimmune thyroiditis, anti-thyroid antibody titers have a positive correlation with the presence of musculoskeletal pain and its severity; these findings deserve further study and research to establish the relationship of different autoantibodies present in autoimmune thyroid disease and musculoskeletal pain, as well as their role in rheumatic diseases, with a clinical importance not yet well established in this latter group.

#### DIFFERENTIAL CHARACTERISTICS IN A COHORT OF COLOMBIAN PATIENTS WITH THREE AUTOIMMUNE/AUTOINFLAMMATORY DISEASES: A NATIONAL REGISTRY UNDER A RISK MANAGEMENT MODEL

R. Pineda-Tamayo<sup>1</sup>, J.C. Diaz-Coronado<sup>1</sup>, D. Hernandez Parra<sup>1</sup>, P. Perez-Estrada<sup>1</sup>, J.C. Salazar-Urbe<sup>2</sup>, M.-A. Alzate<sup>1</sup>, A. Rojas-Villarraga<sup>1</sup>. <sup>1</sup>Clinical information group, *Artmedica IPS, Medellín*; <sup>2</sup>Statistics Department, *National University of Colombia, Medellín, Colombia*

**Background:** Latin American (LA) population with autoimmune/autoinflammatory (AID/AI) diseases is considered as a minority, with special characteristics of ancestry, socioeconomic status (SES) and cultural among others, with particular manifestations and prognosis outcomes

**Objectives:** To describe the largest cohort of patients with rheumatoid arthritis (RA), spondyloarthropathies (SpA) and systemic lupus erythematosus (SLE), in Colombia, evaluated through the social health care security system (SHCSS) and under a risk management model highlighting shared characteristics, as well as differences

**Methods:** A national register-based retrospective cohort study of the SHCSS since 2015 assessing three AID/AI diseases (RA, SLE, SpA) treated in a centre of excellence in rheumatology, under a risk management program in six cities of Colombia. Data about covered population was obtained from the integral information system of SHCSS (SISPRO). Clinical records of patients with AID/AI ICD-10 codes were selected. Adult patients fulfilling international validated diagnoses criteria for the three AID/AI were included. A survey data collection instrument was implemented. Analyses (SAS software V9.4) with standard statistical methods (Polytomous logistic regression, Chi-squared test Fisher's exact test, and Kruskal-Wallis test) were done. Odds ratio (OR) and 95% percent CIs were computed ( $p < 0.05$ )

**Results:** Of 1 62 487 population covered from national security system (SISPRO data) having AID/AI diseases, 71 515 were evaluated in the 6 cities and 12 323 records were selected of patients by population census attended in the institution. A total of 5372 records meet international validated criteria and were included (RA=3576, SLE=1175, SpA=621). RA patients were older, had lower educational level and SES, longer duration of the disease and late age at onset. Cardiovascular compromise was high in RA and SLE. Polyautoimmunity was predominant in SLE. A total of 89% of patients were under steroids treatment (SLE and RA) and 35% in SpA. Biologics were indicated in 59% (SpA), 23% (RA) and 7,1% (SLE). EuroQoL five dimensions scores were significantly better in the SLE group (time of admission). Additional clinical characteristics are described in Table 1

Abstract AB1340 – Table 1. Main Clinical characteristics in the three groups

Clinical compromise	RA n=3576		SLE n=1175		SpA n=621	
	N	%	N	%	N	%
Cardiovascular*	1397	39,1	371	31,6	13	2,1
Pulmonary *	112	3,1	65	5,5	6	0,96
Central and peripheral nervous system*	67	1,8	63	5,4	5	0,8
Cutaneous*	170	4,7	881	75	298	47,9
Ocular*	415	11,6	130	11,1	112	18
Haematological*	90	2,5	970	82,5	10	1,6
Hepatic*	141	3,9	54	4,6	51	8,2
Renal*	11	0,3	473	40,2	4	0,64
Polyautoimmunity**	137	3,8	248	21,1	15	2,4

\*p-value<0.0001 \*\* p-value<0,0001

**Conclusions:** This is the largest cohort evaluated through the SHCSS and under a risk management model in Colombia (LA). This population share special characteristics, highlighting differences between these three AID/AI diseases that are frequently evaluated in the same scenario in real life conditions by the rheumatologist. It is worth noting the specific poor prognosis factors of RA and the high percentage of patients under biological treatment in SpA group, which implies a high cost for the health system

#### PROFILE AND IMPORTANT CHARACTERISTICS OF RHEUMATOLOGICAL DISEASES MANAGED OVER ONE YEAR IN A URBAN UNIVERSITY BASED RHEUMATOLOGY CLINIC IN KUALA LUMPUR, MALAYSIA

S. Sockalingam, J.M. Em, S.R. Lee, S. Tan, A.Y.S. Lee, J. Raja, F. Yahya, L.S. L. Pok. *Medicine, UNIVERSITY MALAYA MEDICAL CENTRE, Kuala Lumpur, Malaysia*

**Background:** The Rheumatology Unit of University Malaya in Kuala Lumpur is cases that are managed as outpatient over a period of 1 year. The data is analysed to provide the required information Details regarding therapy with biologics and small molecules are collected and analysed.

**Objectives:** The main objective is to create a database and registry of all the cases that are managed as outpatient over a period of 1 year. The data is analysed to provide the required information Details regarding therapy with biologics and small molecules are collected and analysed.

**Methods:** A case report form was designed for each patient, which include fields capturing first time visit and subsequent visits. Information captured were demographic data, disease diagnosis and duration, clinical features, laboratory values, co-morbidity and current medications. Longitudinal data was captured. All information were entered into RedCap software with an institutional license. SPSS statistical analysis software was used.

**Results:** Total number of patients in 2017 was 2329. The total number of patient visits was 8255. There was preponderance of females (1,856, 79.7%) compared to males (473, 20.3%). For ethnicity, Chinese patients constitute the most (1,041, 44.5%), followed by Malay (697, 29.8%), Indian (565, 24.2%) and others ethnicities (34, 1.5%). In this population, 3 most common rheumatological diseases seen are Rheumatoid arthritis (760, 32.6%), osteoarthritis (610, 26.2%) and Systemic Lupus Erythematosus (514, 22.1%). Following in descending order are gout (158, 6.8%), soft tissue rheumatism (153, 6.6%), psoriatic arthritis (118, 5.1%), Sjogren syndrome (102, 4.4%), scleroderma (58, 2.5%), mixed connective tissue diseases (49, 2.1%), vasculitis (44, 1.9%), ankylosing spondylitis (36, 1.5%), overlap syndrome (29, 1.2%), Adult onset Still's disease (26, 1.1%), dermatomyositis/polymyositis (25, 1.1%), and fibromyalgia (20, 0.9%). Most recent management activity after clinical assessment, majority of patients (1391, 60.8%) were noted to have no change in management (same therapy continued, but not in remission), followed by those in remission (544, 23.6%). 215 (9.3%) patients require escalation therapy. 13 patients (0.6%) required hospitalisation. 112 (4.9%) had de-escalation therapy. There were 13 deaths (0.6%). Most patients on biologics or small molecules are diagnosed with either Rheumatoid arthritis, SLE, Ankylosing Spondylitis and Psoriatic Arthritis. 44.7% of the patients on biologics have moderate disease activity while 33% of them have mild disease activity. 13.8% of them had achieved remission and 8.5% of them continued to have severe disease activity. The overall assessment of disease activity noted that 57 (2.5%) had severe

disease activity, 550 (23.9%) had moderate disease activity, 1139 (49.5%) considered as mild disease activity and 557 (24.2%) were considered to be in remission.

**Conclusions:** This study has created a database and registry from which important data has been derived. Majority of the patients are being managed sub-optimally, most likely due to limited access to advanced therapies in prominent rheumatological diseases that are intrinsically active and respond modestly to conventional DMARDs and therapy. Further analysis is ongoing

**AB1342 RHEUMATIC DISEASES PREVALENCE AND QUALITY OF LIFE IN SARAGURO INDIGENOUS POPULATIONS OF ECUADOR: A CROSS-SECTIONAL COMMUNITY-BASED STUDY**

S. Guevara-Pacheco<sup>1,2</sup>, A. Feican-Alvarado<sup>3</sup>, W. Valdiviezo-Vicuña<sup>4</sup>, G. Molina-Alvarado<sup>5</sup>, N. Ortega-Mendoza<sup>5</sup>, J. Delgado-Pauta<sup>3</sup>, M. Montaleza-Neira<sup>3</sup>, L. Chimbo-Pullaguani<sup>6</sup>, M. Hernandez<sup>7</sup>, R. Cervera-Segura<sup>7</sup>, L.H. Sanin<sup>8</sup>, I. Pelaez-Ballestas<sup>9</sup>, on behalf of GLADERPO. <sup>1</sup>Medicine Faculty, Universidad de Cuenca, Cuenca, Ecuador; <sup>2</sup>Medicine Postgraduate, Universitat de Barcelona, Barcelona, Spain; <sup>3</sup>Universidad de Cuenca, Cuenca; <sup>4</sup>Hospital Homero Castanier, Azogues; <sup>5</sup>Hospital Jose Carrasco Arteaga, Cuenca; <sup>6</sup>Distrito de Salud, Saraguro, Ecuador; <sup>7</sup>Hospital Clinic, Barcelona, Spain; <sup>8</sup>Universidad Autonoma de Chihuahua, Chihuahua; <sup>9</sup>Hospital General de Mexico, Mexico City, Mexico

**Background:** Rheumatic diseases are more prevalent and aggressive in indigenous population groups, in which providing medical attention poses a challenge for the rheumatologist.

**Objectives:** To estimate the prevalence of musculoskeletal (MSK) disorders and rheumatic diseases in the Saraguro indigenous people and their impact on the quality of life.

**Methods:** Cross-sectional analytical study carried out in the community of Saraguro using the COPCORD methodology. Mixed and randomised sampling techniques were employed. The following validated questionnaires were administered: 1. Screening for musculoskeletal (MSK) disorders and rheumatic diseases. 2. A sociodemographic questionnaire. 3. A functional capacity questionnaire (HAQ-DI) and an instrument to measure workload and repetitive movements. 4. Quality of life (EQ-5D3L). Cases with MSK disorders were reviewed by rheumatologists within the community.

**Results:** A total of 2687 individuals over 18 years of age participated, with an average age of 44 (SD 19.9) years; 1690 (62.9%) were women, 872 (32.4%) were Kwichua speakers; 2108 (78.4%) were employed, of these 32.5% were farm workers. MSK pain was reported in 1244 (46.3%); pain was severe in 448 (36%); 868 (69.7%) used some medical treatment and 1013 (81.4%) used traditional medicine. The most prevalent self-reported comorbidities were anxiety (55.5%) and depression (46.8%). Rheumatic diseases were diagnosed in 861/1244 (69.2%), with the following most prevalent conditions: Low back pain 9.3%, hand osteoarthritis 7.2%, knee osteoarthritis 6.5%, RRPS (rheumatic regional pain syndrome) 5.8%, fibromyalgia 1.8%, rheumatoid arthritis (RA) 1.3%. Disability (HAQ >0.8) was observed in 356 (28.6%), whereas loading and pushing objects heavier than 20 kg and shaking hands was significantly associated with MSK pain. The regression models showed a significant association with a lower quality of life in those with lower education levels (OR=0.89; 95% CI 0.88 to 0.91, p<0.001), physically demanding jobs (OR=0.54; 95% CI 0.42 to 0.69, p<0.001), cooking with firewood (OR=1.55; 95% CI 1.05 to 2.30, p=0.02), high blood pressure (OR=2.31; 95% CI 1.73 to 3.10, p<0.001), and rheumatic diseases, especially RA (OR=5.52; 95% CI 2.48 to 12.27, p<0.001) and hands OA (OR=2.05; 95% CI 1.44 to 2.91, p<0.001). One finding is that having RA was associated with cooking with firewood, and that smoking was almost nonexistent in this population. This suggests that wood smoke pollutants play a similar role to that described with tobacco smoke.

**Conclusions:** A high prevalence of MSK disorders, rheumatic diseases and RA was found. The prevalence of rheumatic diseases was associated with a lower education level, cooking with firewood, and physically demanding jobs. The greatest impact on the quality of life in all dimensions was on the individuals with RA and hand OA.

**Objectives:** To analyse the prevalence of autoimmune diseases (ADs) in Catalonia by using a public big data program (Public Data Analysis for Health Research and Innovation Program, PADRIS)

**Methods:** We used the health insurance database of the Catalan National Health Insurance (CNHI) which includes all catalan population registered as insured population in 2016. The sample included 7,483,761 inhabitants. ADs were identified according to the corresponding International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) codes. A total of 33 autoimmune diseases were analysed classified in 4 main categories: rheumatic, systemic, organ-specific and immunodeficiency/autoinflammatory. The prevalence of ADs was calculated as the number of ADs patients divided by the total CNHI beneficiaries in the same year (rate per 1 00 000 persons, 95% confidence intervals -CI-)

**Results:** The overall prevalence of ADs was 1202 per 1 00 000 persons (95% CI 1,194–1,209); the prevalence was 1455 (95%CI 1,443–1,467) in women and 939 (95%CI 929–949) in men. ADs were classified as organ-specific (43%), systemic (33%), rheumatic (23%) and immunodeficiency/autoinflammatory (1%) autoimmune diseases. The ADs with the highest prevalence rates included psoriasis (282 cases per 100,000, 95% CI 278–286), rheumatoid arthritis (RA) (178 cases per 100,000, 95% CI 175–181), polymyalgia rheumatic (98 cases per 100,000, 95% CI 96–101), spondyloarthropathies (92 cases per 100,000, 95% CI 90–94), systemic lupus erythematosus (SLE) (68 cases per 100,000, 95% CI 66–70) and Sjögren's syndrome (59 cases per 100,000, 95% CI 57–61). In 26 (79%) of the 33 ADs, the female:male ratio was higher than 1; the highest ratios were reported for Sjögren's syndrome (10.5:1), primary biliary cholangitis (5.8:1), SLE (5.4:1), systemic sclerosis (3.4:1) and rheumatoid arthritis (2.6:1). An enhanced prevalence of ADs was reported in Southern regions (1225 cases per 1 00 000 persons in Barcelona/Tarragona regions -CI95% 1,216–1,233- vs 1075 cases per 1 00 000 persons in Girona/Lleida regions -CI95% 1,056–1,093-, p<0.001).

**Conclusions:** Nearly 90 000 catalans are classified as having an autoimmune disease, representing a prevalence of 1.2% of the total catalan population, a rate which reaches 1.5% in women. The highest frequencies are reported for psoriasis (0.28%), rheumatoid arthritis (0.18%), polymyalgia rheumatica (0.10%), spondyloarthropathies (0.09%), lupus (0.07%) and Sjögren syndrome (0.06%).

**AB1344 PRESENCE OF ECHOCARDIOGRAPHIC CRITERIA FOR HFPEF MULTIPLIES THE RISK FOR DEATH AND CARDIOVASCULAR EVENTS IN PATIENTS WITH RHEUMATIC DISEASES**

S. Kleinert<sup>1,2</sup>, C. Morbach<sup>3</sup>, H.-P. Tony<sup>2</sup>, C.E. Angermann<sup>4</sup>, S. Stoerk<sup>3</sup>, M. Breunig<sup>3</sup>. <sup>1</sup>Praxisgemeinschaft Rheumatologie – Nephrologie, Erlangen; <sup>2</sup>Dept. of Medicine II, Rheumatology/Clinical Immunology; <sup>3</sup>Comprehensive Heart Failure Center and Dept. of Medicine I, Würzburg; <sup>4</sup>Comprehensive Heart Failure Center, University Hospital of Würzburg, Würzburg, Germany

**Background:** Patients with rheumatic diseases (RD) have an increased risk for cardiovascular (CV) disease and heart failure (HF). Clinical assessment of HF signs and symptoms in RD is often limited by functional impairment.

**Objectives:** We investigated the prognostic value of echocardiographic and neurohormonal criteria for HF with preserved ejection fraction (HFpEF) in patients with RD.

**Methods:** This prospective, single-centre study included consecutive RD outpatients considered at increased risk for CV events according to ESC score ( $\geq 3\%$ ), pathological ECG, or elevated NTproBNP ( $>200$  pg/mL) as published by this group\*. Clinical assessment and transthoracic echocardiography according to

ESC criteria was performed. Presence of HFpEF was assumed if patients had NTproBNP >125 pg/mL, and either left ventricular hypertrophy (LVH; averaged septal-posterior wall thickness >11 mm) or left atrial dilation (LAD; LA Diameter >43 mm), regardless of presence of dyspnea. Kaplan-Meier plots were generated, and hazard ratios (HR) with 95% confidence intervals were computed using Cox regression with adjustment for age.

**Results:** Out of 764 patients (mean age 51 years, 70% female) 46% had rheumatoid arthritis (RA), 34% systemic autoimmune diseases (SAI; connective tissue disease or vasculitis), and 20% spondylo-arthritis (SpA); 248 of these patients (mean age 61±13 years, 62% female, RA 46%; SAI 32%; SpA 22%) had valid echocardiographic data (4 patients with LV ejection fraction <50% were excluded; follow-up data was missing in 3 cases). After a median follow-up time of 5.4 years, 20.6% of patients (group 1–4: n=19/5/8/1 respectively) had died or suffered a CV event (myocardial infarction 4.1%; stroke 1.8%; decompensated HF 1.8%; resuscitation 0.9%).

In univariable analysis NTproBNP >125 pg/ml (HR 3.6; 1.9–6.8, p=0.0001), LAD or LVH (HR 2.3; 1.1–4.5, p=0.02), and age per 5 years (HR 1.4, 1.2–1.6, p<0.0001) were significant predictors for an increased risk for death or CV event. Compared to the referent group consisting of patients with no signs of LVH or LAD in the presence of normal NTproBNP (group 4; n=59, 23.8%), patients with echocardiographic criteria for HFpEF (group 1; n=84, 33.9%) had a 7-fold increased risk for death or CV event: HR 7.2 (1.6–31.9; figure). The event risk for both patients with elevated NTproBNP but absent LVH or LAD (group 2; n=49, 19.8%) as patients with normal NTproBNP but presence of LVH or LAD (group 3; n=56, 22.6%) was also 5- to 6-fold increased: HR 5.5 (1.2–25.8) and 5.5 (0.9–18.2), respectively.

**Conclusions:** In patients with RD with an increased baseline CV risk, echocardiographic criteria suggestive of HFpEF are highly relevant indicators of worse outcome (7-fold increased risk for death or CVE), in particular in conjunction with an elevated NTproBNP value, irrespective of clinical presentation.

#### AB1345 EVALUATION OF MACROPHAGE ACTIVATION SYNDROME IN HOSPITALISED FEBRILE PATIENTS WITH KIKUCHI-FUJIMOTO DISEASE BASED ON THE 2016 EULAR/ACR/PRINTO CLASSIFICATION CRITERIA

S.S. Ahn, H.J. Kim, H.W. Kim, S.M. Jung, S.-W. Lee, M.-C. Park, Y.-B. Park, J. J. Song. *Division of Rheumatology, Department of Internal Medicine, Yonsei University College of Medicine, Seoul, Korea, Republic of Ireland*

**Background:** The incidence and the risk of MAS in Kikuchi-Fujimoto disease (KFD) have been poorly understood, probably because of the rarity of the disease.

**Objectives:** To evaluate the 2016 classification criteria for MAS in hospitalised febrile patients with KFD and compare the clinical features of MAS in KFD with those of systemic lupus erythematosus (SLE) and adult-onset Still's disease (AOSD).

**Methods:** The records of febrile patients with KFD, hospitalised between November 2005 and April 2017, were reviewed. Patients were evaluated for MAS using the 2016 classification criteria. Clinical and laboratory features between patients with KFD with and without MAS, as well as those of patients with MAS in KFD, AOSD, and SLE were compared.

**Results:** Among 78 patients hospitalised with KFD, 24 had MAS during admission. Patients with MAS had longer hospital stays than patients without MAS and only patients with MAS required intensive unit care and experienced in-hospital mortality. Patients with MAS had higher C-reactive protein, aspartate aminotransferase, alanine aminotransferase, lactate dehydrogenase, and ferritin levels and lower lymphocyte count, platelet count, and total protein and albumin levels. MAS patients with KFD, AOSD, and SLE exhibited different clinical characteristics

according to the underlying disease; however, MAS patients with KFD required less intensive immunosuppressive treatment than those with AOSD and SLE.

**Abstract AB1345 – Table 2.** Comparison of baseline laboratory findings of patients with MAS and without MAS

Variable	Without MAS (n=54)	With MAS (n=24)	p-value
<b>General laboratory variables</b>			
WBC count (/ $\mu$ L)	3475.0 (2350.0–5000.0)	3285.0 (2335.0–5905.0)	0.996
Haemoglobin (g/dL)	12.5 (11.7–13.4)	11.7 (10.3–13.2)	0.102
Neutrophil count (/ $\mu$ L)	1925.0 (1310.0–3050.0)	2206.5 (1375.0–4833.5)	0.378
Lymphocyte count (/ $\mu$ L)	1045.0 (860.0–1370.0)	600.0 (490.0–940.0)	<0.001
ESR (mm/h)	48.5 (27.0–64.0)	52.5 (39.5–72.5)	0.242
CRP (mg/L)	15.0 (7.5–37.1)	52.6 (27.7–97.1)	<0.001
Creatinine (mg/dL)	0.7 (0.6–0.8)	0.7 (0.5–1.1)	0.349
ALT (IU/L)	21.5 (14.0–38.0)	44.5 (23.0–153.0)	0.003

<b>Laboratory variables selected for MAS classification</b>			
Platelet count ( $\times$ 1000/ $\mu$ L)	195.5 (155.0–260.0)	139.0 (94.5–184.0)	<0.001
AST (IU/L)	29.0 (22.0–39.0)	93.5 (62.5–191.0)	<0.001
Ferritin (ng/mL)	242.8 (112.0–405.2)	1449.7 (812.9–4463.1)	<0.001
Triglyceride (mg/dL) <sup>†</sup>	89.0 (60.0–106.5)	133.0 (90.3–161.3)	0.076
Fibrinogen (mg/dL) <sup>§</sup>	342.0 (338.0–346.0)	317.5 (227.5–401.0)	0.695
<b>Bone marrow biopsy findings*</b>			
Presence of hemophagocytosis	0/7 (0.0)	2/12 (16.7)	0.509

Data are expressed as median (interquartile range) or n (%).

ALT, alanine aminotransferase; AST, aspartate aminotransferase; CRP, C-reactive protein; ESR, erythrocyte sedimentation rate; LDH, lactate dehydrogenase; MAS, macrophage activation syndrome; WBC, white blood cell

**Abstract AB1345 – Figure 1.** Comparison of HScore and the probability of having hemophagocytic syndrome in patients with KFD with and without MAS

Comparison of HScore (A) and the probability of having hemophagocytic syndrome (B) in KFD patients with MAS and without MAS

HScore, hemophagocytic syndrome score; KFD, Kikuchi-Fujimoto disease; MAS, macrophage activation syndrome.

**Conclusions:** The 2016 classification criteria were useful in identifying KFD patients with poor clinical outcome. Although treatment for patients with MAS in KFD, AOSD, and SLE differed according to the underlying disease, the 2016 classification criteria for MAS might aid in stratifying high-risk patients and provide guidance for treatment.

### THE CLINICAL COURSE OF PATIENTS WITH BIOLOGICS-TREATED RHEUMATOID ARTHRITIS COMPLICATED WITH NONTUBERCULOUS MYCOBACTERIAL LUNG INFECTION

T. Kise, K. Shimada, Y. Miyoshi, N. Yokogawa, S. Sugii. *Department of Rheumatic Diseases, Tokyo Metropolitan Tama Medical Center, Fuchushi, Tokyo, Japan*

**Background:** For now, it has been difficult for rheumatoid arthritis (RA) patients with lung nontuberculous mycobacterial infection (LNTMI) to achieve therapeutic goal of RA because of insufficient treatment considering the risk of NTM deterioration by immunosuppressive therapy. Although use of biologics in RA with LNTMI is not recommended based on results of an epidemiological study from USA,<sup>1,2</sup> prognosis analysis considering confounding factors, including the species of NTM, remains to be studied. On the other hand, some Japanese case series of RA with LNTMI after biological treatment had shown the acceptable outcomes.<sup>3</sup>

**Objectives:** This study was performed in order to investigate clinical course of patients with biologics-treated RA complicated with LNTMI.

**Methods:** This study is descriptive study. All the patients diagnosed with RA and proved the positivity of acid fasting culture were extracted. We retrospectively collected the clinical data between 1<sup>Jan 2011</sup> and 31<sup>Mar 2017</sup> including age, sex, date of RA onset, onset of NTM infection, species of NTM organisms, biologic drugs used, the clinical course, the findings of high resolution computed tomography (HRCT) and the outcome after commencement of biologics, at Tokyo Metropolitan Tama Medical Centre. The diagnosis of LNTMI was made by satisfying both of the two following conditions;<sup>1</sup> either positivity of bronchoalveolar lavage fluid culture at least once or sputum culture twice or more and<sup>2</sup> the compatible findings with LNTMI on HRCT.

**Results:** During investigation period, 13 LNTMI-RA patients were administered biologics, of which 76.9% were female. Their mean age at NTM diagnosis was 71 years old. The duration between the RA diagnosis and the occurrence of LNTMI ranged widely from 1 to 40 years. The species of NTM were *Mycobacterium avium* (12 cases) and *M. intracellulare* (1 case), which did not include rapid growing species. Twelve cases had treated with glucocorticoid. Of 10 cases who underwent biologics therapy after NTM diagnosis, 6 had continued biologics after diagnosis of LNTMI. All the 4 of the 13 cases who first received biologics after diagnosis of LNTMI were treated with abatacept, which improved their RA activity and did not exacerbate LNTMI. Of the 13, there were no patients requiring home oxygen therapy. During the average observational period after LNTMI of 3.6 years (0.8–10.3 years), 10 of the 13 were alive and 3 died, whose causes of death were not directly associated with LNTMI. When each period upon every biologics was independently calculated, the Kaplan-Meier survival curve illustrated the tendency of survival difference of between LNTMI-RA cases treated with non-TNF inhibitors and those with TNF inhibitors (figure 1).

Abstract AB1346 – Figure 1

**Conclusions:** Even when patients with RA have LNTMI of not rapid growing species, RA may be safely and sufficiently treated by abatacept with careful monitoring of the respiratory condition, which may improve their joint prognosis.

### ELEVATED NESFATIN-1 LEVELS IN PATIENTS WITH RHEUMATOID ARTHRITIS

T.Z. Kvlividze<sup>1</sup>, B.V. Zavodovsky<sup>2</sup>, Y.R. Akhverdyan<sup>2</sup>, L.E. Sivordova<sup>2</sup>, Y. V. Polyakova<sup>2</sup>, D.P. Lavrova<sup>1</sup>, A.T. Yakovlev<sup>1</sup>. <sup>1</sup>*Volgograd State Medical University, Volgograd, Russian Federation;* <sup>2</sup>*Federal State Budgetary Institution "Research Institute of Clinical and Experimental Rheumatology named after A.B. Zborovskiy", Volgograd, Russian Federation*

**Background:** Recent studies indicate that adipokines affect tissues and cells involved in rheumatoid arthritis (RA), including synovium, cartilage, bone, and immune cells.<sup>1,2,3</sup> Nesfatin-1, a member of the adipokine family, was identified in 2006 as a potent anorexigenic peptide involved in the regulation of homeostatic feeding. Nesfatin-1 concentrations in serum and synovial fluid were closely correlated with disease occurrence and severity of knee osteoarthritis.<sup>4</sup> We did not find any data about Nesfatin-1 levels in sera of rheumatoid arthritis (RA) patients.

**Objectives:** To investigate the serum nesfatin-1 level in RA patients.

**Methods:** At baseline we measured Nesfatin-1 level in sera of 110 RA patients (mean age 54,07±11,32; hereinafter M±Std.dev.) and 60 healthy controls (52,09±14,12). The diagnosis of RA was set according to the ACR/<sup>EULAR Classification Criteria for RA (2010)</sup>. Serum C-reactive protein (CRP) and erythrocyte sedimentation rate (ESR) were measured to assess inflammation severity. Nesfatin-1 in serum was determined by enzyme-linked immunosorbent assay (RaiBiotech, cat№ EIA-NESF).

**Results:** We revealed that nesfatin-1 levels in RA patients were equal 50,49±34,05 ng/ml and was higher than of healthy controls – 31,61±3,17 ng/ml. We divided 120 RA patients into 2 subgroups – 1st (n=44) with normal nesfatin-1 concentration in sera, and 2nd (n=66) – with increased nesfatin-1 level. We noted that 2nd group's patients had higher DAS28 activity index, functional joints disability, higher levels CRP and ESR.

**Conclusions:** The present study shows that RA patients have increased serum Nesfatin-1 levels which strongly correlated with systemic inflammation and functional impairment in RA. These data sustained the pathogenic role of Nesfatin-1 in RA progression.

of Medicine, Beni-Suef University, Beni-Suef, <sup>7</sup>Internal Medicine, Rheumatology Unit, Egyptian Atomic Energy Authority (EAEA), Cairo, <sup>8</sup>Rheumatology, Faculty of Medicine, Fayoum University, Fayoum, <sup>9</sup>Rheumatology, Faculty of Medicine, Minia University, Minia, <sup>10</sup>Rheumatology, Faculty of Medicine, Beni-Suef University, Beni-Suef, <sup>11</sup>Internal Medicine, Rheumatology Unit, Faculty of Medicine, Cairo University, Cairo, <sup>12</sup>Rheumatology, Faculty of Medicine, Suez-Canal University, Ismailia, <sup>13</sup>Rheumatology, Faculty of Medicine, Ain-Shams University, Cairo, <sup>14</sup>Ophthalmology, Faculty of Medicine, Beni-Suef University, Beni-Suef, Egypt

**Background:** Behçet's disease is a chronic, relapsing multisystemic vasculitis that is common in the Mediterranean basin region with a diverse spectrum of clinical manifestations. A previous single-centre study from Alexandria conducted 20 years ago reported a prevalence of 7.6/100.000 population and a M:F ratio of 5.4:1.

**Objectives:** The aim of this multicenter study was to present the prevalence and pattern of Behçet's disease (BD) in adult Egyptian patients.

**Methods:** This study included 1098 BD patients from 14 highly specialised centres over <sup>Egypt during 2017</sup>. The demographic, clinical characteristics, laboratory findings, BD current activity form (BDCAF) and medications received were reported.

**Results:** The mean age of the patients was 36.3±10.2 years (16–73 years), disease duration was 6.7±5.2 years and they were 776 males and 322 females (2.4:1) and was 1.9:1 from Alexandria. Their mean age at disease onset was 29.8±8.7 years. 24.9% were diabetic and 30.7% hypertensive. The frequency of presenting cases was highest from Alexandria (41.3%) followed by Cairo (35.3%), Beni-Suef (6.4%), Assuit (6.1%), Sharkia (3.9%), Fayoum (3.2%), Minia (2.7%) and 1.1% from Ismailia. The total prevalence from those 8 major cities after adjusting for adults according to the 2017 population consensus was 4.35/100.000 inhabitants; 13.76 for Alexandria, 6.3 for Cairo and the highest prevalence in upper Egypt from Beni-Suef was 3.48 and the least from Minia (0.85). The prevalence from Sharkia was 0.93, Fayoum 1.51 and was 1.41 from Ismailia. All patients had oral ulcers while genital ulcers were present in 80%. The eyes were involved in 78.9%, cutaneous manifestations were present in 59.8%, arthritis in 34.7%, neuropsychiatric manifestations in 13.9%, gastrointestinal tract involvement in 11.5% and deep venous thrombosis in 23.1%. Their mean BDCAF was 4.6±4.6. The mean erythrocyte sedimentation rate was 29.1±19.9 mm/1sthr, C-reactive protein 11.3±15.2 mg/dl, haemoglobin content 13.3±6 g/dl, total leucocytic count 8.6±14.5 × 10<sup>3</sup>/mm<sup>3</sup>, platelets 262.6±76.9 × 10<sup>3</sup>/mm<sup>3</sup> and serum uric acid 4.8±1.6 mg/dl. 90.7% were receiving steroids, 81.1% were receiving colchicine, while only 8.1% were receiving biologic therapy.

**Conclusions:** The prevalence of BD in Egypt is high and higher in Alexandria than previously reported. The male-to-female ratio is lower than previously found being more in harmony with the globally reported ratios. The pattern of clinical presentation is unique for this country yet comparable to the universally stated frequencies.

#### SAFETY AND EFFECTIVENESS OF COSMETIC MINIMALLY INVASIVE PROCEDURES AMONG PATIENTS WITH SYSTEMIC AUTOIMMUNE DISEASE

O. Reitblat, T.T. Lerman, T. Reitblat. *Rheumatology, Barzilai MC, Ashkelon, Israel*

**Background:** Noninvasive or minimally invasive cosmetic dermatologic procedures are considered safe with low percentage of reported adverse events. However, reliable prevalence data regarding adverse event of such cosmetic procedures among patients with systemic autoimmune diseases are insufficient.

**Objectives:** To assess the occurrence of adverse events and disease exacerbation associated with noninvasive or minimally invasive cosmetic dermatologic procedures, including those involving hyaluronic acid fillers, botulinum toxins and laser application among patients with systemic autoimmune diseases.

**Methods:** Consecutive cases of patients suffering from autoimmune diseases and attending the rheumatology clinic for regular follow-ups, were asked about receiving cosmetic procedures during the last two years. Medical history, including clinical and laboratory signs of disease exacerbation after the date of the procedure, was retrospectively obtained from medical files of the patients included in the study. Patients were also asked about subjective disease exacerbation and local adverse events after the procedure.

**Results:** During the three months of study period, 148 patients were inquired. Nineteen patients (89% females) underwent 23 cosmetic procedures in total. Thirty-nine percent had Rheumatoid arthritis (RA), 39% had Ankylosing spondylitis (AS) and 22% had other systemic connective tissue disease. Sixty seven percent were treated by Disease-modifying antirheumatic drugs (DMARDs), 28% by Biologic treatment and 5% did not receive any specific treatment. All patients were in remission during the cosmetic procedures. Forty three and a half percent of patients underwent hyaluronic acid injection, 21.7% botulinum toxin injection, 21.7% laser application, 8.7% mesotherapy and 4.3% silicon injection. None of

the patients suffered from subjective disease exacerbation after the procedure. No changes in antibody titer and level of acute phase reactants (C-reactive protein and erythrocyte sedimentation rate) were noticed. Two patients (10.5%) experienced local oedema after filler injections. Both patients received Hydroxychloroquine treatment (one patient with RA and one with AS).

**Conclusions:** Our results suggest that noninvasive or minimally invasive cosmetic dermatologic procedures, including energy, neurotoxin, and filler procedures, may be safe among rheumatological patients, and do not cause autoimmune systemic disease exacerbation when performed in periods of remission. Hydroxychloroquine may predispose to a higher occurrence rate of local site injection adverse events. Further studies are desired to investigate this phenomena.

#### IS THE RADIOGRAPHIC DAMAGE A RISK FACTOR FOR NEUROPATHIC PAIN IN RHEUMATOID ARTHRITIS?

T.M. Rocha<sup>1</sup>, S. Pimenta<sup>1</sup>, M. Bernardes<sup>1</sup>, A. Bernardo<sup>1</sup>, M. Barbosa<sup>2</sup>, R. Lucas<sup>3</sup>, L. Costa<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Pain Unit, Centro Hospitalar de São João; <sup>3</sup>Clinical Epidemiology, Faculty of Medicine University of Porto (FMUP), Porto, Portugal

**Background:** Features suggestive of neuropathic pain (NP) have been described in Rheumatoid Arthritis (RA) patients. The structural damage assessed on radiographs is a direct consequence and reflection of cumulative of disease activity and its association with NP has not been studied in RA.

**Objectives:** To determine whether existence and intensity of NP is associated with radiographic damage in RA patients.

**Methods:** Cross-sectional study was performed with RA patients followed at our Rheumatology department. Patients with diagnosed neuropathy or non-RA risk factors for NP were excluded. Selected patients were evaluated in a medical visit. Two questionnaires were applied to assess NP: the Leeds Assessment of Neuropathic Symptoms (LANSS) and the painDETECT (PDQ). Wrist, hands and feet radiographic studies from the previous 12 months before were classified according to the modified van der Heijde Sharp's method by one trained reader, blinded for patient clinical variables and treatment allocation. Correlation studies (spearman coefficient analysis) and univariate and multivariate logistic regression were performed. Significance level was set as <0.05.

**Results:** Ninety one RA patients were included. Seventy (77%) were women, with a mean age of 55.6±10.8 years and median disease duration of 12 years;<sup>2-41</sup> 84% patients were seropositive for Rheumatoid Factor and/or ACPA; 85 (93%) were treated with conventional synthetic Disease-Modifying Antirheumatic Drugs (DMARDs) and 41% with a biological DMARD (bDMARDs). The mean DAS28 4V CRP was 3.15±0.77 and the mean HAQ score was 1.04±0.6. The median joint erosion score (JE) was 28<sup>3-143</sup> and the median joint space narrowing (JN) was 46.<sup>10-133</sup> Forty-two (46%) patients had LANSS NP (≥12), 29% had a possible/likely NP in the PDQ (>12), and 13% had likely NP in the PDQ (>18). JN and global score (GS) had a negative weak correlation with LANSS (r=-0.21 and r=-0.25, respectively, p<0.05) and JN correlated with PDQ (r=-0.23, p=0.03). No significant correlations were observed with JE. Disease duration significantly correlated with all the radiographic scores (r=0.48 for GS, r=0.43 for JN, r=0.44 for JE, p<0.05) and negatively correlated with LANSS (r=-0.28, p=0.01). Lower median GS values were observed in LANSS positive group (62 vs 79, p=0.01). Patients under bDMARDs had significant higher median GS (80 vs 61, p=0.03) but also higher disease duration (14 vs 10, p=0.01). No statistically significant differences were observed for other variables. Disease duration was a negative predictor of LANSS NP (OR: 0.98, p=0.03). JN was inversely associated with LANSS NP (OR: 0.978, p=0.02) and remained significant after adjustments for bDMARDs treatment, but not for disease duration. JN was also a negative predictor of PDQ likely NP and remained significant after adjustment for bDMARDs (OR: 0.979, p=0.03), but not for disease duration.

**Conclusions:** In this cohort, JN score had a weak negative association with NP. Higher structural damage and disease duration do not seem to increase the risk of non-nociceptive RA pain. Further studies are needed to confirm these results.

**AB1351 SYSTEMIC RHEUMATIC DISEASES AND CUMULATIVE CHILDHOOD STRESS**

A.P.L. Luiz, H. Antico, T.A.F.G. Santos, R. Nishihara, T.L. Skare. *Departamento de Reumatologia, Hospital Universitário Evangélico de Curitiba, Curitiba, Brazil*

**Background:** It has been suggested that the adaptative stress response may be disrupted by life adverse events. Childhood maltreatment has been linked to increased inflammatory markers such as C reactive protein levels and increased prevalence of autoimmune disorders in adulthood. The mechanisms that underlie such association are not clear but it has been postulated that a dysregulated hypothalamic adrenal axis, accelerated immune cell ageing and altered immune cell gene expression pattern may play a role.

**Objectives:** To study the prevalence of adverse childhood experiences (ACEs) in a sample of patients with systemic lupus erythematosus (SLE), spondyloarthritis (SpA), scleroderma (SSc) and rheumatoid arthritis (RA) comparing them with controls.

**Methods:** After approval from the local Committee of Ethics in Research, we interview 315 patients with rheumatic disease (100 SLE; 40 SSc; 60 SpA; 115 RA) and 272 controls applying the ACEs Study questionnaire with questions on childhood abuse, negligence, domestic violence and household dysfunctions. This questionnaire score ranges from zero (best result) to 8 (worst scenario). Controls were paired for age ( $p=0.39$ ), gender ( $p=0.64$ ), monetary income ( $p=0.20$ ), religiosity ( $p=0.19$ ) and years of formal education ( $p=0.62$ ).

**Results:** In the whole group of rheumatic patients the median number of ACEs was 3 (IQR 2.5–5); in the controls was 3 (IQR=2–5) with  $p=0.45$ . About 201/315 (63.8%) of patients had ACEs score  $\geq 3$ ; the controls had 163/272 (59.9%) with  $p=0.31$ . In the SLE group 64/100 (64%) of the patients have had at least 3 ACEs; in SSc group 24/40 (60%); in SpA 36/60 (60%); in RA 77/115 (66.9%) and in controls 163/272 (59.9%). Studying the prevalence of ACEs according to the rheumatic disease it was found that patients did not differ from controls in SLE ( $p=0.47$  for ACEs scale and 0.87 in the number of ACEs $\geq 3$ ); in SSc ( $p=0.67$  for ACEs scale and 0.72 in the number of ACEs $\geq 3$ ); in SpA ( $p=0.92$  for ACEs scale and 0.21 in the number of ACEs $\geq 3$ ); neither in RA ( $p=0.06$  for ACEs scale and 0.14 in the number of ACEs $\geq 3$ ).

**Conclusions:** In this sample, it was not possible to associate the occurrence of ACEs with the appearance of rheumatic diseases in adulthood.

**AB1352 EVALUATION OF MRI RAMRIS SCORE AND CLINICAL RESPONSE IN PATIENTS WITH ACPA POSITIVE UNDIFFERENTIATED ARTHRITIS TREATED WITH INFILIXIMAB VERSUS PLACEBO**

T. Kirchgessner<sup>1</sup>, B. Vande Berg<sup>1</sup>, T. Sokolova<sup>2</sup>, L. Meric de Bellefon<sup>2</sup>, A. Nzeusseu<sup>2</sup>, M. Stoenoiu<sup>2</sup>, P. Durez<sup>2</sup>. <sup>1</sup>Musculoskeletal Imaging Unit, <sup>2</sup>Rheumatology, Cliniques universitaires Saint-Luc – Université Catholique de Louvain – Institut de Recherche Expérimentale et Clinique (IREC), Brussels, Belgium

**Background:** Patients (Pts) with Undifferentiated Arthritis (UA), positive for ACPA antibodies are at high risk of progressing to Rheumatoid Arthritis (RA). TNF play a key role in the pathogenesis of RA. Very early treatment with the combination of Methotrexate and Infliximab (IFX) in a small cohort of UA showed a benefit in clinical symptoms and reduction of MRI evidence of synovitis and erosions.

**Objectives:** To assess whether IFX as a monotherapy is more effective than placebo (Pbo) in UA pts positive for ACPA. Here we evaluate the clinical response, the MRI RAMRIS score MRI and the risk to develop RA.

**Methods:** This was a randomised, double-blind, Pbo-controlled, two-arm parallel design study of 12 months to the primary endpoint (proportion of pts who developed RA by ARA 2007 criteria). Pts with UA and symptomatic clinical synovitis of  $\geq 1$  joints and ACPA positivity were randomised 1:1 to IFX (3 mg/kg) or Pbo at week

0, 2, 6, 14 and 22, after which treatment was terminated. NSAIDs/stable low-dose oral corticosteroid ( $\leq 5$  mg/day prednisone or equivalent) were permitted but no DMARDs.

Disease activity measures (DAS28-CRP) were evaluated at BL, Wks 2 and 4, and every 4 wks until Wk 52. OMERACT RAMRIS scores (components: erosion, osteitis, synovitis, tenosynovitis) and peritendinitis scores were evaluated at BL and Mth 4. Pts who developed RA at any time were discontinued and could receive standard of care.

**Results:** 28 pts were randomised (mean age:  $48 \pm 12$  years; mean duration of arthritis:  $0.34 \pm 0.53$  year; mean CRP level:  $1.67 \pm 2.23$  mg/dL). By 1 year, 11/15 (73%) pts treated with IFX developed RA vs 10/15 (67%) Pbo-treated pts (Kaplan Meier, log rank  $p=0.868$ ). At wk 14, ACR 20, 50, 70 responses were observed respectively in 71.4%, 42.9%, 28.6% pts treated with IFX vs 21.4%, 0%, 0% treated with Pbo. Remission DAS28CRP rate was observed in 50% in the IFX group vs 21.4% in the Pbo group. Pts in the IFX arm experienced significantly greater improvements in RAMRIS score versus pbo at wk 16 (see graph). No severe safety issues was observed except one case of severe hepatotoxicity induced by Isoniazid.

Abstract AB1352 – Figure 1

**Conclusions:** In this small randomised cohort of UA ACPA positive pts, we noted a significant difference in the RAMRIS scoring after 4 months in the IFX group vs PBo. This is the first study to report a worsening of disease activity based on the RAMRIS scores in the PBo group but changes were minimal and not observed in all pts. IFX has higher efficacy but did not prevent the progression to definite RA. Further analyses are ongoing to determine MRI predictors for severity.

Ingegnoli<sup>1,2</sup>. <sup>1</sup>Division of Rheumatology, ASST Pini-CTO; <sup>2</sup>Dept of Clinical Sciences and Community Health, Università degli Studi di Milano; <sup>3</sup>Lab of Medical Statistics, Epidemiology and Biometry GA Maccacaro, Milan, Italy

**Background:** Raynaud's phenomenon (RP) is considered a prominent feature of systemic sclerosis (SSc).<sup>1</sup> SSc-RP is related to considerable disease-related morbidity including pain, impaired hand function, reduced social participation, body image dissatisfaction, increased reliance on others and reduced quality of life.<sup>2</sup> In most cases RP is triggered by low environmental temperature or sudden variation of it. According to EULAR recommendations, intravenous (IV) iloprost (ILO) should be used to control severe RP, after oral therapy failure.<sup>3</sup> Unfortunately no validated IV ILO regimens have been so far published.

**Objectives:** Aim of our study was to estimate the impact of environmental temperature on RP in patients with SSc treated with two different IV ILO regimens and in patients not treated with IV ILO.

**Methods:** We conducted a monocentric, prospective, pragmatic and non-randomised study, after the local ethical committee approval, between September 2016 and February 2017. In the present study, we enrolled all consecutive SSc patients not requiring therapy with IV ILO (group A), or requiring therapy with IV ILO once monthly (group B) or therapy with IV ILO for 5 consecutive days every 3 months

(group C). RP severity was evaluated through a visual analogue scale (VAS) from 0 to 10. Group A and C patients were evaluated at baseline and after 3 months. Group B were evaluated at every infusion for 3 months. Environmental temperature for each patient was calculated as the mean temperature during the week before the evaluation in the place of residence (data supplied by Meteo Operations Italia (MOPI) Srl – Centro Epson Meteo). Moreover for each participations demographic and disease characteristics were collected at baseline.

**Results:** 96 patients were enrolled in the study: 52 in group A, 24 in group B, and 20 in group C. Of these 35, 21 and 16 respectively completed the study.

RP VAS was related to the average temperature observed the week before the evaluation at place of residence. In group A, VAS RP decreases of  $-0.072$  for a growth of one grade of the temperature (IC 95%:  $-0.206-0.061$ ,  $p$ -value=0.297). In group B, VAS RP decreases of  $-0.278$  for a growth of one grade of the temperature (IC 95%:  $-0.397 - -0.160$ ,  $p$ -value<0.001). In group C, VAS RP decreases of  $-0.053$  for a growth of one grade of temperature (IC 95%:  $-0.201-0.095$ ,  $p$ -value=0.483).

**Conclusions:** RP severity, as assessed by VAS, showed a correlation with the environmental temperature. This information could support the seasonal administration of IV ILO only during the coolest periods of the year.

#### AB1354 RHEUMATOID ARTHRITIS IN ADULTS IN AN URBAN AREA: TRENDS FOR INCIDENCE, PREVALENCE AND HOSPITALISATION RATES FOR A 10-YEAR PERIOD

V. Dostanko<sup>1</sup>, V. Yagur<sup>1</sup>, A. Rekun<sup>2</sup>, A. Tushina<sup>1</sup>, N. Dostanko<sup>1</sup>. <sup>1</sup>2-d Department of Internal Medicine, BSMU; <sup>2</sup>Rheumatology Department, 9-th Minsk City Clinical Hospital, Minsk, Belarus

**Background:** Rheumatoid arthritis (RA) is the most common inflammatory polyarthropathy. According to the previously published data its prevalence was 0.3%–1.5% and incidence – about 0.01%–0.02%<sup>1,2</sup> with some variations due to genetic and ethnical factors.<sup>3</sup> During last decades significant progress has been achieved in early diagnostic and treatment of RA. Nevertheless a tendency for the increase of both incidence and prevalence of RA was reported lately by some national registers.<sup>4</sup>

**Objectives:** We estimated incidence, prevalence and hospitalisation rates for RA in Minsk (the Republic of Belarus) for a 10 year period.

**Methods:** Minsk is a typical urban area which is considered to be representative for the urban population of the whole country. The data on the new onset RA and the first visit for RA in a corresponding year were collected from all rheumatologic services of Minsk for the period 2005–2015. Only patients older than 18 years old with the diagnosis of RA according to the ICD-10 (M05-M06) were included. Demographic data on the population of the Republic of Belarus were obtained from the annual Statistical bulletins of the National Statistical Committee. Hospitalisation rates were calculated on the base of statistical reports on discharges for the corresponding years.

**Results:** Population size for adults in Minsk in 2005 was 1467390 with 135 new onset RA cases revealed and corresponding RA incidence was 9.2 (CI<sub>95%</sub>8.6–9.8) per 100 000 adults. Population size in 2010 increased to 1529470, 131 new onset RA cases were revealed and RA incidence was 8.6 (CI<sub>95%</sub>8.4–8.7) per 100 000 adults. Population size in 2015 also increased at the same rate and amounted to 1598120, 206 new onset RA cases were revealed and corresponding RA incidence increased to 12.9 (CI<sub>95%</sub>12.7–13.1) per 100 000 adults ( $p$ <0.001).

There were registered 2745 first visits for RA in 2005 with corresponding RA prevalence 187.1 (CI<sub>95%</sub>186.4–187.7) per 100 000 adults. There were registered 3373 first visits for RA in 2010 and 4315 visits in 2015. RA prevalence rates were 220.5 (CI<sub>95%</sub>219.9–221.2) and 270.0 (CI<sub>95%</sub>269.3–270.7) per 100 000 adults, correspondingly. These data suggest a steady increase of RA prevalence for the last 10 years ( $p$ <0.001).

There were 7147 hospitalizations in Minsk for RA for the period 2010–2015. Hospitalisation rates for RA increased from 75.4 (CI<sub>95%</sub>73.8–77.1) to 79.2 4 (CI<sub>95%</sub>77.5–80.9) per 100 000 adults ( $p$ <0.001) with the same provision of the population with the specialised rheumatologic beds – 15.7 (CI<sub>95%</sub>14.9–16.5) and 15.0 (CI<sub>95%</sub>14.3–15.8) per 100 000 adults (NS) in 2010 and 2015,

correspondingly, while hospitalisation rates among RA patients decreased from 34.2% to 29.3% ( $p$ <0.001).

**Conclusions:** We revealed the significant increase (1.4 times) in incidence and prevalence of RA in adults in Minsk (Belarus) for the period 2005–2015. Hospitalisation rates for RA in the population had the same trend for the study period.

#### AB1355 BONE MINERAL DENSITY, T-SCORE AND Z-SCORE IN YOUNG MEN WITH JUVENILE IDIOPATHIC ARTHRITIS

V. Povoroznyuk<sup>1</sup>, M. Dzhus<sup>2</sup>. <sup>1</sup>D.F. CHEBOTAREV INSTITUTE OF GERONTOLOGY NAMS UKRAINE; <sup>2</sup>O. Bohomolets National Medical University, Kyiv, Ukraine

**Background:** Juvenile Idiopathic Arthritis (JIA) is term used to classify a group of heterogeneous paediatric rheumatic diseases. Many of these conditions remain active until adulthood. Presences of chronic inflammatory disease together with glucocorticoid treatment are the risk factors of development of osteoporosis in young adult males.

**Objectives:** Aim: to study the bone mineral density (BMD), T-score, Z-score in young adult males with JIA.

**Methods:** The study included 50 adult men aged 19 to 25 years, divided into two groups: I – 25 practically healthy young males; II – 25 young men from different regions of Ukraine with a history of JIA in childhood regardless of the presence or absence of active inflammation at the time of the observation. Two-energy X-ray densitometry (Prodigy, GE Lunar, Madison, USA) was performed on the basis of the Institute of Gerontology, Ukrainian Research Centre of Osteoporosis Problems with analysis of BMD, T- and Z-scores in different skeletal areas.

**Results:** Young men with JIA and healthy individuals did not differ in age, height, weight and BMI. In assessing the number of fractures in patients with JIA were identified 4 patients (16%), while in the control group were no fractures. Negative impact of the JIA on the BMD was found in the I group compared with II group. Lumbar spine BMD in I group was lower ( $p$ <0.01) than in healthy subjects, as well as the Z-score ( $p$ <0.001) in the L1-L4 lumbar spine region. BMD, T-score and Z-score in femoral neck region were lower in I group than in II ( $p$ <0.001,  $p$ <0.001,  $p$ <0.01 correspondingly). Reliable differences between the two groups were found in total body BMD ( $p$ <0.001), T-score ( $p$ <0.01), Z-score ( $p$ <0.05). Patients with JIA had lower ( $p$ <0.01) BMD and T-score ( $p$ <0.05) in ultradistal area of forearm. Reduction of BMD up to the level of osteopenia (Z-score <2 SD) was found in 5 out of 25 (20%) patients at the level of L1-L4 lumbar spine, in 2 (8%) patients at the level of femoral neck, in 3 (12%) patients at total body and in 2 (8%) patients at the level of ultradistal area of forearm.

**Conclusions:** Young men with JIA aged 19–25 years had reduced total body BMD, T-score, Z-score, which indicates the negative impact of the disease on the bone tissue compared with healthy men of the corresponding age.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.6288

#### AB1356 AGE PECULIARITIES OF BONE MINERAL DENSITY IN YOUNG FEMALE WITH JUVENILE IDIOPATHIC ARTHRITIS

V. Povoroznyuk<sup>1</sup>, M. Dzhus<sup>2</sup>. <sup>1</sup>D.F. CHEBOTAREV INSTITUTE OF GERONTOLOGY NAMS UKRAINE; <sup>2</sup>O. Bohomolets National Medical University, Kyiv, Ukraine

**Objectives:** Aim: to study the bone mineral density (BMD) in young adult females with juvenile idiopathic arthritis (JIA) depending on the age.

**Methods:** 99 females aged 19–39 (40 patients with JIA and 59 practically healthy persons) were examined. All surveyed were divided into 2 groups by age: I group–20–29 years old and II group–30–39 years old. The age of disease onset, delay in diagnosis, disease duration, ILAR-variant of JIA, BMD, T-score and Z-score were estimated.

**Results:** The onset of JIA was at the age of 11.16±4.34 years, delayed diagnosis–23.52±21.37 months, the disease duration–11.9±9.4 years, persistent

oligoarthritis was detected in 25% of patients, RF-negative polyarthritis—in 22.5%, extended oligoarthritis—in 10%, RF-positive polyarthritis—in 10%, systemic-onset JIA—in 12.5%, enthesitis-related JIA—in 15%, undifferentiated arthritis—in 2.5%, psoriatic arthritis—in 2.5% of patients. BMD ( $p < 0.000001$ ) in the lumbar spine (LS) were lower in female with JIA than in healthy people. Femoral neck (FN) BMD ( $p < 0.000001$ ), total body (TB) BMD ( $p < 0.000001$ ) were lower in patients with JIA than in healthy people. The BMD was significantly lower at the LS ( $p < 0.001$ ) and at the TB ( $p < 0.01$ ) in both groups, and at the FN ( $p < 0.001$ ) in patients aged 20–29 years in comparison with healthy group. Z-score  $< -2$  SD in young females was detected in 40% of patients in the LS, in 25% of patients in the FN, in 35% of patients in the TB and 52.5% of patients in ultradistal forearm, and T-score  $< -2.5$ —in 2.5% in LS, 2.5%—FN, 37.5%—TB, 22.5%—ultradistal forearm. Osteopenia by T-score at the LS was found in 42.5%, of the FN—42.5%, TB—37.6%, ultradistal forearm—22.5% of patients.

**Conclusions:** The presence of JIA in childhood had negative effects on the formation of peak bone mass and BMD at young female.

### AB1357 RISK FACTORS FOR CYTOMEGALOVIRUS REACTIVATION IN PATIENTS WITH CONNECTIVE-TISSUE DISEASE; SINGLE-CENTRE PROSPECTIVE COHORT STUDY

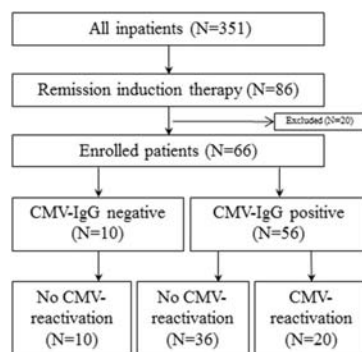

Y. Ota, Y. Kaneko, T. Takeuchi. *Division of Rheumatology, Department of Internal Medicine, KEIO UNIVERSITY SCHOOL OF MEDICINE, Tokyo, Japan*

**Background:** Cytomegalovirus (CMV) reactivation is one of serious opportunistic infections for immunosuppressed patients, therefore, identifying patients at risk for CMV reactivation is of importance. However, no prospective study about CMV reactivation in connective tissue disease (CTD) has been reported.

**Objectives:** To identify risk factors relevant with CMV reactivation in patients with CTD during remission-induction therapy.

**Methods:** Consecutive CTD cases who started immunosuppressive therapy from February until December 2017 were enrolled. Serum CMV-IgG was measured before the induction therapy, and subsequently, CMV pp65 antigen was monitored weekly. Patients were divided into 2 groups according to the presence or absence of CMV reactivation, and risk factors for CMV reactivation were analysed.

**Results:** Sixty six cases were enrolled. Mean age was 59.9±17.9 y/o, and female was 68.2%. The underlying diseases were following; anti-neutrophil cytoplasmic antibody-associated vasculitis 18, systemic erythematosus 11, polymyositis/dermatomyositis 9, IgG4-related disease 7, giant cell arteritis 6, and others 15. The initial dose of glucocorticoid (GC) was 50.8±11.5 mg/day (0.92±0.15 mg/kg/day) as prednisolone (PSL) with additional methylprednisolone (mPSL) pulse therapy being conducted in 17 (25.8%). Concomitant immunosuppressive therapies were intravenous cyclophosphamide (IVCY) in 25, mycophenolate mofetil 9, and calcineurin inhibitor 7, tocilizumab 2, infliximab 1, abatacept 1, and rituximab 1. None of 10 CMV-IgG negative patients developed CMV reactivation. Among 56 CMV-IgG positive patients, CMV reactivated in 20 patients (35.7%). Among those, CMV infection occurred in 2 patients (hematopoietic injury and hepatitis). Previous history of GC administration ( $p = 0.032$ ), initial GC dose ( $p = 0.033$ ), mPSL pulse therapy ( $p = 0.018$ ), IVCY ( $p = 0.003$ ), and low lymphocyte count 1 week after treatment initiation ( $p = 0.023$ ) were significantly related with CMV reactivation.

**Abstract AB1357 – Figure 1.** Patient flow of this study.

**Conclusions:** While no CMV reactivation occurred in CMV-IgG negative cases, treatment regimen and low lymphocyte count were associated with CMV reactivation in CMV-IgG positive CTD cases.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.4391

### Validation of outcome measures and biomarkers

#### AB1358 INFECTIOUS ANTIBODIES REPERTOIRE IN RHEUMATOID ARTHRITIS

A. Schmiedl<sup>1</sup>, S. Reuter<sup>1</sup>, A. Lerner<sup>1</sup>, S. Brunner<sup>1</sup>, A. Schwarting<sup>2</sup>, T. Matthias<sup>3</sup>.  
<sup>1</sup>RandD, Aesku.KIPP Institute, Wendelsheim; <sup>2</sup>Department of Internal Medicine, Johannes Gutenberg-University, Mainz; <sup>3</sup>CEO, Aesku.KIPP Institute, Wendelsheim, Germany

**Background:** The incidence of infectious diseases in the RA ADAPThera study by ELISA antibody screening and the differences in infectious distribution in active or low active disease patients was explored.

**Methods:** Sera from 88 naive RA patients out of the ADAPThera study cohort, disease duration  $< 6$  months, were tested for antibody titers against: Herpes simplex virus 1 and 2 (HSV1 +2, IgG and IgM) Helicobacter pylori (HP, IgA and IgG), Cytomegalovirus (CMV, IgG and IgM), Toxoplasma gondii (Toxo, IgG), Adenovirus (IgG and IgM), Epstein Barr virus (EBV, IgG and IgM), and Parvovirus B19 (P-B19, IgG) were determined by using NovaLisa from NovaTec Immunodiagnostica GmbH, GERMANY. Borrelia (IgG and IgM) titers were determined by AESKULISA and confirmed by Western blot (AESKUBLOTS) by AESKU.DIAGNOSTICS GmbH and Co. KG, GERMANY.

**Results:** 82% RA patients were found to be positive for HSV1 +2 IgG (2% IgM positive), 8% for Adenovirus (IgA), 77% (IgG), and 1% (IgM). 99% for EBV-IgG (no IgM positive). 53% (IgG), and 26% (IgM) for CMV. 38% for HP-IgG and 15% for IgA and 79% for P-B19-IgG (3% IgM). 6% for Borrelia-IgM and 14% for IgG. A slightly increase was found for EBV sera positivity (99% IgG), compared to the normal population.

**Conclusions:** Limited evidence exists regarding the impact of the disease activity on the susceptibility for infections, possibly due to the close association of RA disease activity and therapy dependent dosage of immunosuppressive treatment. Still, some infections may present memory contact, presenting an epiphenomenon. On the contrary, they might play an active role in RA pathophysiology.

**Disclosure of Interest:** None declared

#### AB1359 TRANSLATION, CULTURAL ADAPTATION AND VALIDATION OF THE ITALIAN VERSION OF THE BILD: THE BILDIT

A. Santoni<sup>1</sup>, C. Tani<sup>1</sup>, V. Lorenzoni<sup>2</sup>, C. Stagnaro<sup>1</sup>, E. Elefante<sup>1</sup>, R. Vagelli<sup>1</sup>, L. Carli<sup>1</sup>, G. Turchetti<sup>2</sup>, M. Mosca<sup>1</sup>. <sup>1</sup>University of Pisa; <sup>2</sup>Institute of Management, Scuola Superiore Sant'Anna, Pisa, Italy

**Background:** Evaluation of organ damage is one of the most important assessments in SLE patients; the SLICC/DI is a physician-driven instrument widely used to assess organ damage in SLE. Patient-reported outcomes (PROs), self-assessments that are not being interpreted by a clinician, are gaining a central role as outcome measures. Among these, the Brief Index of Lupus Damage (BILD) is a patient-reported instrument for the assessment of organ damage in SLE.<sup>1</sup>

**Objectives:** The aims of the present study are translation, cultural adaptation and validation of an Italian version of the BILD.

**Methods:** The process of translation and cultural adaptation followed published guidelines.<sup>2</sup> The final version of the questionnaire (BILDit) was pretested in a group of 30 SLE patients to evaluate acceptability, comprehension and feasibility. The validity of the BILDit was evaluated by its administering to consecutive patients attending the outpatients clinic or the inpatients wards. The external validity was tested toward the SLICC/DI scored by a physician blinded to the BILDit results. Correlation with other PROMs (FACIT, SF-36) was also tested. In a subgroup of 30 patients the questionnaire was administered twice at 2 weeks interval to assess their reliability.

**Results:** A total of 166 SLE patients participated to the study (93.4% female, 97% Caucasian); mean age ( $\pm$ standard deviation) at enrollment was 45.4 years $\pm$ 13, mean disease duration resulted 14.3 $\pm$ 10 years. Overall, disease activity at enrollment as expressed by the SLEDAI score resulted quite low (median SLEDAI 2, IQR 0–4) and 27.3% of patients presented an active disease (SLEDAI >4). At least one organ damage according with the SLICC/DI was present in 111 patients (56.35%) with a median score of 2 (IQR1–4). In the pilot test, 80% of patients answered to all the questions; 93% of the patient declared no difficulty in completing the questionnaire and the median time required resulted 5 min.<sup>3–5</sup> BILDit showed very high reliability (test-retest  $\alpha$  >0.8). The BILDit scores in our sample showed a strong positive correlation with SLICC/DI ( $\rho$ =0.69;  $p$ <0.001); by comparing the single BILDit and SLICC/DI items, we found a significant concordance for all but retinopathy and cerebrovascular disease that resulted underestimate by patients. BILDit scores showed a positive linear relation with age ( $p$ <0.01) and disease duration ( $p$ <0.01); in a multivariate analysis, a significant inverse correlation was found between BILDit scores and FACIT scores ( $p$ <0.01) and with both physical and mental components of the SF-36 ( $p$ <0.01).

**Conclusions:** BILDit demonstrated to be acceptable, comprehensible, feasible and reliable in our routine clinical setting; it also showed good correlation with physician's driven instruments and quality of life measures. The BILDit can be considered a useful screening tool for the assessment of organ damage as perceived from the patient's point of view before the standard visit.

#### AB1360 RANGE AND CONSISTENCY OF OUTCOME MEASURES REPORTED IN RANDOMISED TRIALS IN DERMATOMYOSITIS: A SYSTEMATIC REVIEW

A.H. Kelly<sup>1,2,3</sup>, G. Hassett<sup>3</sup>, D. Singh-Grewal<sup>2</sup>, A. Tong<sup>1</sup>. <sup>1</sup>Sydney School of Public Health, University of Sydney; <sup>2</sup>Paediatric Rheumatology, Sydney Children's Hospital Network; <sup>3</sup>Rheumatology, Liverpool Hospital, Sydney, Australia

**Background:** Dermatomyositis – an idiopathic inflammatory myopathy- can be resistant and unresponsive to initial treatments and require chronic therapy. Symptoms including muscle weakness and skin rash can lead to severe complications and impair quality of life. There are a paucity of randomised trials in dermatomyositis, which may not consistently report outcomes that are important to patients and their clinicians.

**Objectives:** To assess the scope and consistency of outcomes reported in randomised trials in dermatomyositis.

**Methods:** MEDLINE, Embase, CINAHL, PsycINFO were searched to February 2017 for randomised trials in children and adults with dermatomyositis. The frequency and characteristics of the outcome domains and measures reported were then analysed. Similar outcomes were grouped into outcome domains and classified as surrogate, clinical or patient-reported outcomes. The frequency and characteristics of the outcome domains and measures reported were then analysed.

**Results:** We included 18 trials ( $n$ =844 participants), reporting 680 outcome measures. These were grouped into 27 different outcome domains; including 12 (44%) clinical outcomes, 9 (33%) surrogate/biochemical outcomes, and 6 (22%) patient-reported outcomes. The 5 most frequently reported outcome domains were: physical function (13 trials, 72%), muscle strength (12, 67%), muscle inflammation (12, 67%), biomarkers (11, 61%), and composite i.e. myositis disease activity (10, 56%).

**Conclusions:** The majority of outcomes reported in trials in dermatomyositis are clinical outcomes and few are patient-reported. Establishing a core set of patient-important outcomes may improve the consistency and relevance of outcomes reported in trials in dermatomyositis to inform decision-making.

**Disclosure of Interest:** None declared

#### AB1361 SEASONAL SENSITIVITIES OF DISEASE ACTIVITY INDICES IN RHEUMATOID ARTHRITIS

A. Şahin Eşkara<sup>1</sup>, N. Taştekin<sup>1</sup>, M. Birtane<sup>1</sup>, N. Süt<sup>2</sup>. <sup>1</sup>Trakya University Faculty of Medicine, Department of Physical Therapy and Rehabilitation, Edirne; <sup>2</sup>Trakya University Faculty of Medicine, Department of Biostatistics and Medical Informatics, Edirne, Edirne, Turkey

**Background:** Rheumatoid arthritis (RA) is a chronic and progressive autoimmune disease which is primarily characterised by the inflammation of synovial joints. In rheumatoid arthritis, evaluation of the disease activity is very important in monitoring the disease progression and effectiveness of the treatment

**Objectives:** The aim of this study was to evaluate the seasonal sensitivity of disease activity indices (DAS28-ESR, DAS28-CRP, SDAI and CDAI) in rheumatoid arthritis. In addition, we investigated the presence of seasonal variation in disease activity in rheumatoid arthritis and its relation to vitamin D levels.

**Methods:** This is a prospective study. This study included female RA patients, who were diagnosed/verified according to 2010 ACR/EULAR criteria, with a diagnostic history of 5 years or older. The seasons were identified as spring (March, April, May), summer (June, July, August), autumn (September, October, November) and winter (December, January, February), and the study was completed with 85 patients. We assessed the disease activation with DAS28-ESR, DAS28-CRP, SDAI and CDAI scales, functional status with HAQ questionnaire, quality of life with the 36-Item Short Form Health Survey (SF-36), and presence of depression with beck depression inventory (BDI). Blood samples from patients were kept at appropriate storage conditions at  $-80^{\circ}\text{C}$ , and serum levels of 25-OH vitamin D were analysed by the chemoluminescence assay method at the end of each season.

**Results:** The assessment of mean of DAS28-ESR and DAS28-CRP scores found that the disease activity showed statistically significant seasonal differences ( $p$ <0.05). Although the assessment of mean of SDAI and CDAI scores showed that the disease activity was higher in the autumn season, this difference was not statistically significant ( $p$ >0.05). There was no statistically significant correlation between the mean vitamin D levels and mean of DAS28-ESR, DAS28-CRP, SDAI, CDAI scores in any season ( $p$ >0.05).

**Conclusions:** These results suggest that there may be seasonal variation in disease activity in RA and that DAS28-ESR and DAS28-CRP may be more sensitive than CDAI and SDAI in establishing this variation. There was no correlation between seasonal changes in disease activity and changes in serum 25-OH Vitamin D levels

#### AB1362 SPECIFIC FEATURES OF THE CLINICAL COURSE AND OUTCOMES OF ERYTHEMA NODOSUM, ASSOCIATED WITH INFECTION

B. Belov, N. Savushkina, O. Egorova. V. A. Nasonova Research Institute of Rheumatology, Moscow, Russian Federation

**Background:** Erythema nodosum (EN) is the most common type of septal panniculitis (Pn) without vasculitis. The prevailing identifiable cause of EN in paediatric population is bacterial infection (*Streptococcus*), while in adults sarcoidosis and streptococcal infection are considered to be the most common etiological factors.

**Objectives:** The aim of the current study is to evaluate specific features of the clinical course and outcomes of EN, associated with infection, in rheumatology practice.

**Methods:** The study included 121pts (112 females—92,6%, 9 males—7,4%, mean age 38,9 $\pm$ 12,6 y) who were on the record at VA Nasonova Research Institute of Rheumatology during 7 years with referral diagnosis «erythema nodosum». The disease duration varied from 1 week to 20 years. Patient's assessment included general clinical examination, immunological and serological tests for *Chlamidia* (*Chl. Pneumoniae*, *Chl. trachomatis*), *Mycoplasma* (*M. pneumoniae*, *M. hominis*), *Ureaplasma*, Herpes viruses type I and II, Cytomegalovirus, Epstein-Barr virus, *Yersinia*, HBV and HCV, HIV, anti-streptolysin O (ASO) using ELISA and immunoturbidimetry. The outcomes were assessed in 1–6 years.

**Results:** EN association with infection was identified in 32 pts (30 females, 2 males, mean age 39,6 $\pm$ 13 y). Chronic conditions prior to EN onset were found in 12 pts (37%): tonsillitis—in 8 pts (25%), endometriosis—in 1 (3%), bronchitis—in 1 (3%), colpitis—in 1 (3%), toxoplasmosis—in 1 (3%). Elevated ASO titers were documented in more than half cases (18 (56,25%) pts). "Blooming bruise" symptom was characteristic for this population ( $p$ <0,0001). Clear clinical and laboratory

signs of active inflammation were not found. Based on etiological agent all pts were divided into 3 groups: Group I—with bacterial infection (5 pts (15%)), Group II—with viral infection (11 pts (35%)), Group III—with mixed bacterial and viral infection (16 pts (50%)). Rapid nodule regression was strongly associated with elevated ASO titers at baseline ( $p=0,02$ ) and presence of bacterial agents ( $p=0,0007$ ). Recurrences were documented in 13 pts (40,6%), among them 7 (54,1%) cases were triggered by ARVI/common frigorigism, 2 (15,3%) cases—by stress, 2 (15,3%) cases – by non-compliance or treatment failure, 2 (15,3%) – by exacerbation of chronic tonsillitis. There was no statistically significant association between intake of individual medications and full reversal of the disease. There was 1 (8% from total number) recurrence episode in Group I, 7 (54%) episodes—in Group II, and 5 (38%)—in Group III. Recurrent disease inversely correlated with affected surface area (affected leg surfaces) ( $p=0,03$ ). Pts who achieved nodular regression had elevated ASO at EN onset ( $p=0,00008$ ), in contrast to pts with recurrent disease.

**Conclusions:** Streptococcus spp (56,3%) seem to be the leading cause of EN associated with infection. Lab verification of streptococcal infection with subsequent adequate antibacterial therapy facilitates the favourable clinical course of EN.

#### ARE YOU ABLE TO CUT YOUR MEAT? – EXPLORING THE CHALLENGES DURING THE CULTURAL ADAPTATION OF THE HEALTH ASSESSMENT QUESTIONNAIRE DISABILITY INDEX (HAQ-DI) INTO 130 LANGUAGES

C. Acquadro<sup>1</sup>, C. Anfray<sup>2</sup>, P. Bindi<sup>2</sup>, V. Uzun<sup>3</sup>. <sup>1</sup>Thought Leadership, Mapi, an ICON plc Company; <sup>2</sup>Author Collaboration Unit, Mapi Research Trust; <sup>3</sup>Language Services, Mapi, an ICON plc Company, Lyon, France

**Background:** The disability assessment component of the Health Assessment Questionnaire, the HAQ-DI,<sup>1</sup> developed in US English, assesses a patient's level of functional ability and includes questions of fine movements of the upper extremity, locomotor activities of the lower extremity, and activities that involve both upper and lower extremities. There are 20 questions in eight categories of functioning which represent a comprehensive set of functional activities – dressing, rising, eating, walking, hygiene, reach, grip, and usual activities. The stem of each item asks over the past week "Are you able to ..." perform a particular task. The patient's responses are made on a scale from zero (no disability) to three (completely disabled).

**Objectives:** To explore the challenges faced during the cultural adaptation of the HAQ-DI, focusing on one simple task, i.e., "Are you able to cut your meat?" in the eating category.

**Methods:** The archives of Mapi Language Services were searched and 130 translations were retrieved, representing 13 language families. The translation methods followed either the standard linguistic validation process [i.e., conceptual analysis, dual translation process (forward, backward translation into English), test with patients and clinician review] or the adjusted process in case of countries using national variants of the same language (i.e., Australian English or English used in India).<sup>2</sup>

**Results:** In most of the target languages, cutting a whole piece of meat presented in one plate was not a cultural issue. However, in vegetarian-driven cultures or countries where cutting meat was performed while cooking, the item had to be adapted and changed to comply both with the local culture and the concept explored by the item (i.e., fine movement of the upper extremity). For instance, an equivalent of "to cut meat while cooking" was chosen in Korean; "to cut meat (when eating or preparing food)," in Bahasa (Indonesia); "to cut raw vegetables," in Gujarati (India); or "make bite size pieces of your food (e.g., chapatis)" in English for India.

**Conclusions:** The close collaboration between the developer and the translation teams was essential in finding appropriate conceptual equivalents of the simple task of cutting meat in 13 different language families.

#### ADAPTATION AND VALIDATION OF THE RHEUMATOID ARTHRITIS QUALITY OF LIFE (RAQOL) SCALE FOR PORTUGAL

F. Fernandes<sup>1</sup>, C. Duarte<sup>1,2</sup>, N. Madeira<sup>3</sup>, P. Pinto<sup>4</sup>, C. Furtado<sup>5</sup>, C. Ribeiro<sup>6</sup>, M. Couto<sup>7</sup>, D. Santos Faria<sup>8</sup>, T. Rocha<sup>9</sup>, R. Freitas<sup>10</sup>, A.R. Cunha<sup>11</sup>, A. Heaney<sup>12</sup>, S. McKenna<sup>12</sup>, J.A. Pereira da Silva<sup>1,2</sup>. <sup>1</sup>Faculdade de Medicina da Universidade de Coimbra; <sup>2</sup>Centro Hospitalar Universitário de Coimbra, Coimbra; <sup>3</sup>Instituto Português de Reumatologia, Lisboa; <sup>4</sup>Centro Hospitalar Vila Nova de Gaia, Vila Nova de Gaia; <sup>5</sup>Hospital do Divino Espírito Santo, S. Miguel; <sup>6</sup>Centro Hospitalar Universitário do Algarve, Faro; <sup>7</sup>Centro Hospitalar Tondela-Viseu, Viseu; <sup>8</sup>Unidade Local de Saúde Alto Minho, Ponte de Lima; <sup>9</sup>Centro Hospitalar São João, Porto; <sup>10</sup>Hospital Garcia de Orta, Almada; <sup>11</sup>Centro Hospitalar Baixo Vouga, Aveiro, Portugal; <sup>12</sup>Galen Research, London, UK

**Background:** Rheumatoid Arthritis (RA) is a chronic inflammatory disease that has a major impact on patients' quality of life. The Rheumatoid Arthritis Quality of Life Questionnaire (RAQoL) is a patient-centric outcome measure, specific to RA. The measure has not previously been available for use with Portuguese RA patients.

**Objectives:** To produce a Portuguese version of the RAQoL that is acceptable to Portuguese patients and demonstrates sound psychometric properties.

**Methods:** The dual panel methodology was used to translate the UK RAQoL into Portuguese. This involved conducting a bilingual panel (providing the initial translation into Portuguese) followed by a lay panel (where items are assessed for comprehension and acceptability). Cognitive debriefing interviews were conducted with Portuguese RA patients to determine the face and content validity of the translated scale. A large-scale postal validation survey was carried out to establish the psychometric properties of the Portuguese RAQoL. The measure was administered on two occasions to RA patients, alongside a comparator instrument – the Nottingham Health Profile (NHP).

Internal consistency was assessed using Cronbach's alpha coefficient. Spearman's Rank correlation coefficient was employed to assess test-retest reliability. Convergent validity was tested by correlating RAQoL scores with those on the NHP sections. Known group validity was assessed using non-parametric tests for independent samples. This involved determining the ability of the RAQoL to distinguish between patients that differed according to their self-perceived severity of RA and general health.

**Results:** The translation panels produced a Portuguese version of the RAQoL that was easily understood and considered natural by native speakers. Interviewees considered the new language version to be relevant and appropriate. One hundred and seventy-eight RA patients (82% female) took part in the postal validation survey with a mean age of 56.6 (range 25 to 79) years. The Portuguese RAQoL demonstrated excellent internal consistency (Cronbach's  $\alpha=0.95$ ) and test-retest reliability ( $r=0.92$ ), indicating that the measure produces low levels of random measurement error.

RAQoL scores correlated most strongly with scores on the NHP Physical mobility scale ( $r=0.77$ ) and showed moderately strong correlations with the Emotional reactions, Pain and Energy level section scores.

Non-parametric tests for independent samples demonstrated significant differences in RAQoL scores between patients who differed according to their self-perceived RA severity ( $p<0.001$ ) and general health ( $p<0.001$ ).

**Conclusions:** The Portuguese version of the RAQoL was found to be a comprehensive, reliable and valid questionnaire. The new language version is recommended for use in routine clinical practice and for research purposes, to assess quality of life in Portuguese RA patients.

#### PROTEIN CONVERTASE SUBTILISIN/KEXIN TYPE 9 (PCSK9) IN PATIENTS WITH SYSTEMIC LUPUS ERYTHEMATOSUS/LUPUS NEPHRITIS

C. Fang, T. Luo, L. Lin. *Second Affiliated Hospital of Fujian Medical University, Quanzhou, China*

**Background:** SLE patients have a tendency of accelerated atherosclerosis (AS) which can only partly be explained by traditional risk factors for cardiovascular disease. Proprotein convertase subtilisin/kexin type 9 (PCSK9), which is a protease associated with cardiovascular risk that regulates both cholesterol metabolism and inflammatory reaction, had been regarded as a highly promising therapeutic target for cardiovascular disease.<sup>1</sup> Recent study had demonstrated that SLE patients with lupus nephritis (LN) had much higher risk of atherosclerosis.<sup>2</sup>

**Objectives:** To assess serum PCSK9 concentrations and the possible factors linked with PCSK9 variation in SLE/LN patients.

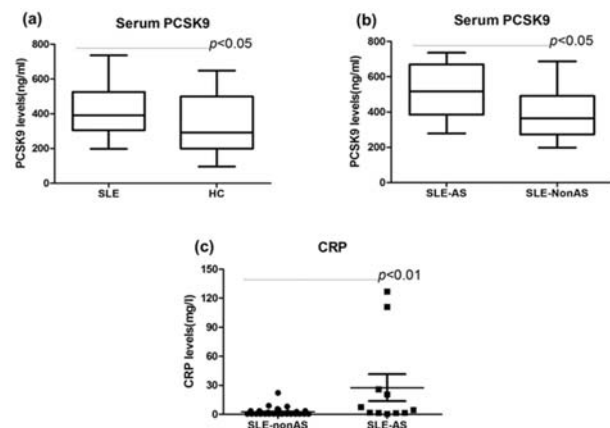

**Methods:** 47 SLE patients and 30 healthy controls were included. Traditional cardiovascular risk factors were compared. According to cIMT, SLE patients were divided into two subgroups (SLE-AS subgroup and SLE-NonAS subgroup, cut-off point is 1.0 mm). PCSK9 concentrations were compared between:<sup>1</sup>SLE patients

and controls;<sup>2</sup>SLE-AS subgroup and SLE-NonAS subgroup;<sup>3</sup>SLE patients with and without lupus nephritis(LN). The correlational analyses between PCSK9 levels and disease parameters were undergone.

**Results:** The differences of lipids parameters, body mass index (BMI), uric acid (UA) between SLE group and controls had no statistical significance. Even so, the ratio of cIMT thickening were higher in SLE patients, when compared with healthy controls (23.40% versus 6.67%,  $p=0.05$ ). Serum PCSK9 levels were also significantly elevated in SLE patients than controls (median of PCSK9 level: 390.53 ng/ml versus 292.44 ng/ml,  $p<0.05$ ). Patients in SLE-AS subgroup had even higher PCSK9 and C-reactive protein(CRP) levels than those in SLE-NonAS subgroup (median of PCSK9 level: 516.41 ng/ml versus 364.47 ng/ml,  $p<0.05$ ; median of CRP level: 4.56 mg/L versus 1.05 mg/L,  $p<0.01$ ) (figure 1). PCSK9 levels correlated with CRP levels, but not with age, disease activity, lipids characteristics, BMI or UA levels, particularly in female patients (table 1). Despite of no statistical significance, the ratio of lupus nephritis were higher in SLE-AS subgroup than those in SLE-NonAS subgroup (63.64% versus 44.44%,  $p>0.05$ ). SLE patients with LN had higher PCSK9 concentrations than those without LN evidence(509.53  $\pm$ 131.69 ng/ml versus 332.02 $\pm$ 92.72 ng/ml,  $p<0.001$ ).

**Abstract AB1365 – Table 1.** Correlational analysis of PCSK9 levels and disease parameters in SLE patients.

Variables	$r_s$	$p$ -value
Age(years)	-0.014	0.927
SLEDAI	0.092	0.539
BMI(kg/m <sup>2</sup> )	-0.120	0.420
Cholesterol(mmol/l)	-0.012	0.935
LDL cholesterol(mmol/l)	0.002	0.989
ApoA1(g/l)	0.011	0.943
ApoB(g/l)	0.181	0.223
Triglycerides(mmol/l)	-0.020	0.896
HDL cholesterol(mmol/l)	-0.112	0.453
Fasting blood glucose(mmol/l)	-0.193	0.193
Uric acid( $\mu$ mol/l)	-0.079	0.599
CRP(mg/l)	<b>0.351</b>	<b>0.016</b>
CRP(mg/l) in female patients	<b>0.487</b>	<b>0.001</b>

**Abstract AB1365 – Figure 1**

**Conclusions:** Elevation of PCSK9 concentrations can be observed in SLE patients, especially in those with LN or atherosclerosis. PCSK9. PCSK9 is probably linked with low-grade inflammation participating in the pathogenesis of atherosclerosis in SLE/LN patients.

#### AB1366 RADIOISOTOPIC SYNOVIORTHESIS IN THE CONTROL OF REFRACTORY SYNOVITIS IN CASTILLA-LA MANCHA (A REGION OF SPAIN). AN EXPERIENCE OF 10 YEARS

D. Castro Corredor. RHEUMATOLOGY SERVICE, HOSPITAL GENERAL UNIVERSITARIO DE CIUDAD REAL, CIUDAD REAL, Spain

**Background:** Our hospital is the reference hospital in Nuclear Medicine for the realisation of radioisotopic synoviorthesis for all of Castilla-La Mancha (a region of Spain).

**Objectives:** To describe the experience in the performance of radioisotopic synoviorthesis in arthritis refractory to other treatments in our hospital.

**Methods:** Observational, descriptive and cross-sectional study protocolised through the review of the database of radioisotopic synoviorthesis performed between 2007 and 2017. Previous clinical data were collected (age, sex, pathology, previous treatments, previous infiltration and affected joint) and evolutive at 6 months after administering the isotope. An Excel database was created for a frequency analysis with SPSS 21.

**Results:** 30 radiosynovitis were performed with the most frequent pathologies, in this order: pigmented villonodular synovitis (40%), rheumatoid arthritis (23.3%), spondyloarthritis (13.3%), osteoarthritis (10%) and nonspecific arthritis (6.7%), followed by systemic lupus erythematosus and gout. After 6 months, 56.7% of patients improved compared to 36.7% who remained the same. Likewise, none of them presented complications related to the procedure. A 6.6% of patients were lost to follow-up.

**Conclusions:** In patients with episodes of recurrent arthritis with associated joint effusion in one or two joints, refractory to systemic treatments, to local infiltrations with corticosteroids and in those patients in whom other treatments may be contraindicated, we must consider the possibility of performing an isotope radiosynoviorthesis, as it is a simple, safe technique with a success rate of more than 50%.

### DIAGNOSTIC ASSOCIATION BETWEEN ELASTIN AND ELASTASE ANTIBODIES WITH CARDIOVASCULAR SYSTEM INVOLVEMENT IN SYSTEMIC SCLERODERMA PATIENTS

I.P. Gontar<sup>1</sup>, O.A. Rusanova<sup>2</sup>, O.I. Emelyanova<sup>1</sup>, L.A. Maslakova<sup>1</sup>, I. A. Zborovskaya<sup>1</sup>. <sup>1</sup>Research Institute of Clinical and Experimental Rheumatology named after A.B. Zborovskiy; <sup>2</sup>Research Institute of Clinical and Experimental Rheumatology named after A.B. Zborovskiy, Volgograd, Russian Federation

**Background:** Large amounts of elastin are contained in vascular walls and in the cardiac valves. Elastin and elastase antibodies are predictors, *sui generis*, of vascular disease development in systemic scleroderma. The mechanism of direct proatherogenic effect of antibodies consists in stimulation of adhesion molecules and cytokine synthesis, oxLDL capture, induction of serine proteinase cascade by the coagulation system. In systemic rheumatoid disease, autoimmune inflammation is nowadays regarded as one of risk factors for the development of early atherosclerosis, disturbance of the structure and elasticity of vascular wall and of related cardiovascular conditions.

**Objectives:** Studying the effect of elastin and elastase autoantibody production on the cardiovascular system in systemic scleroderma (SSD) patients.

**Methods:** 42 patients hospitalised at municipal hospital 25 with diagnosis of SSD verified by <sup>ARA</sup> diagnostic criteria (1980) the diagnosis was considered firm if the patient showed one major and two minor criteria in any combination, simultaneously or consecutively, regardless of the time of their onset. The systemic scleroderma patients included 11 men and 31 women aged 22–72. The mean age of patients was 44.1±15.4 years. 30 healthy donors from the Volgograd hemotransfusion centre served as controls. Antibodies to elastin and elastase were determined in the blood serum using indirect enzyme immunoassay with magnetocontrolable adsorbents based on polyacrylamide granules according to the original technique by Gontar et al (1990)

**Results:** SSD patients showed considerable increase in the rate of elastase (52%) and elastin (38%) antibodies formation, in comparison with the controls. The upper normal limit of elastin antibody was within the range of 0.131 optical density units, elastase antibodies – 0.131 optical density units. In SSD patients elastin antibodies amounted to 0.125±0.068 optical density units. The titer of elastase antibodies was 0.143±0.071 optical density units. Healthy individuals did not show any elastin or elastase antibodies. An elevated antibody titer was associated with heart and vessels lesion in 47% of patients with SSD. In 20 patients of the studied group we revealed cardiovascular disease (IHD, macrofocal cardiovascular sclerosis with false infarction changes, chronic cardiac failure, and aorta atherosclerosis).

**Conclusions:** Among the patients we examined, 47% showed cardiovascular lesion associated with elevated elastin and elastase antibodies. This fact indicates that in systemic rheumatic disease, autoimmune inflammation is a risk factor for the development of early atherosclerosis, and of related cardiovascular conditions. Elastin and elastase antibodies are predictors, *sui generis*, of the development of vascular disease in patients with SSD.

AB1368

### THE COMPARATIVE RESPONSIVENESS OF HOSPITAL UNIVERSITARIO PRINCESA INDEX AND OTHER COMPOSITE INDICES FOR ASSESSING RHEUMATOID ARTHRITIS ACTIVITY

I. Gonzalez-Alvaro<sup>1</sup>, I. Castrejon<sup>2</sup>, L. Carmona<sup>3</sup>. <sup>1</sup>Rheumatology, Hospital Universitario La Princesa. IIS-IP, Madrid, Spain; <sup>2</sup>Rheumatology, Rush University, Chicago, USA; <sup>3</sup>Rheumatology, InMusc, Madrid, Spain

**Background:** HUPI was developed with data from the PEARL study (Princess Early Arthritis Register Longitudinal study) as an easy to calculate index, which avoided the gender bias affecting DAS28 and SDAI. In addition, it can be calculated either with erythrocyte sedimentation rate (ESR), C reactive protein (CRP) or both. Response criteria based on HUPI have also been developed<sup>1</sup>.

**Objectives:** To evaluate the responsiveness of the Hospital Universitario La Princesa Index (HUPI) comparatively to the traditional composite indices to assess disease activity in rheumatoid arthritis (RA), and to compare the performance of HUPI-based response criteria with that of the EULAR response criteria.

**Methods:** Post-hoc analyses were performed using data from the following studies: ACT-RAY (clinical trial), PROAR (early RA cohort) and EMECAR (pre-biologic era long term RA cohort). Responsiveness was evaluated by: 1) comparing change from baseline ( $\Delta$ ) of HUPI with  $\Delta$  in other scores by calculating correlation coefficients; 2) calculating standardised effect sizes. The accuracy of response by HUPI and by EULAR criteria was analysed using linear regressions in which the dependent variable was change in global assessment by physician ( $\Delta$ GDA-Phy).

**Results:**  $\Delta$ HUPI correlation with change in all other indices ranged from 0.387 to 0.791; HUPI's standardised effect size was larger than those from the other indices in each database used. In ACT-RAY, depending on visit between 65% and

80% of patients were equally classified by HUPI and EULAR response criteria. However, HUPI criteria were slightly more stringent, with higher percentage of patients classified as non-responder, especially at early visits. HUPI response criteria showed a slightly higher accuracy than EULAR response criteria when using  $\Delta$ GDA-Phy as gold standard.

Table 1

Comparison of sensitivity to change HUPI with other composite indices.

	Standardised size effect					Response (% EULAR vs HUPI)		
	HUPI	DAS28-VSG	DAS28-PCR	SDAI	CDAI	None	Moderate	Good
3 months	2'3	2'18	2'2	1'99*	1'67*	9 vs 22	53 vs 42	38 vs 36
6 months	3'13	2'93	2'85	2'56*	2'27*	3 vs 9'5	34 vs 29	63 vs 60'5
12 months	3'69	3'45	3'28*	2'87*	2'65*	2 vs 6'5	23 vs 20	75 vs 73'5

\*p<0.05 respect HUPI

**Conclusions:** HUPI shows good responsiveness in each studied scenario (clinical trial, early RA cohort, and established RA cohort). Response criteria by HUPI seem more stringent than EULAR's.

### ELEVATED CA-125 IN IGG4-RELATED MESENTERIC DISEASE: A RED HERRING? A SYSTEMATIC LITERATURE REVIEW

I. Panayotidis<sup>1</sup>, M. Michaud Maturana<sup>1</sup>, S. Psarelis<sup>2</sup>, E. Nikiphorou<sup>3</sup>. <sup>1</sup>Medical School, University College London (UCL), London, UK; <sup>2</sup>Rheumatology Department, Nicosia General Hospital, Nicosia, Cyprus; <sup>3</sup>Department of Academic Rheumatology, King's College London, London, UK

**Background:** Mesenteric panniculitis (MP), a rare fibrotic inflammatory disease of the bowel mesentery, can be a rare manifestation of IgG4-related disease (IgG4-RD). IgG4-RD is a chronic inflammatory disease most commonly affecting the pancreas, characterised by infiltration of IgG4-positive plasma cells and lymphocytes into various organs.<sup>1</sup>

We recently encountered a male patient with IgG4-related MP who was incidentally found to have a very high level of CA-125, which correlated with CRP levels and normalised after steroid treatment. This prompted a systematic literature review (SLR) to better understand this unexpected phenomenon.

**Objectives:** To investigate for associations between CA-125, MP and/or IGG4-RD, understand possible common pathophysiological mechanisms and explore potential clinical implications.

**Methods:** The SLR was performed using MEDLINE, EMBASE, Web of Science, and Scopus, looking for literature on either MP and CA-125 or IgG4-RD and CA-125 up to January 8 2018, using a comprehensive search strategy with relevant mesh terms and keywords linked to the above broad categories. Literature screening was performed by two independent reviewers.

**Results:** 24 unique citations were found, of which 13 were unanimously identified as relevant by the two reviewers. The final selected articles included: 8 case reports, 3 conference abstracts of case reports, 1 cohort study of 22 patients, and a retrospective study of 7 patients (table 1). CA-125 was raised in 22/40 patients in the identified reports (shown in red), including males, and was often the only elevated tumour marker (yellow). We also report on the presence of effusions (blue), as this may be linked to the causal mechanism.

Table 1 The clinical and laboratory characteristics of cases of IgG4-RD and MP

Article	Patient demographics	Main diagnosis	Serum CA-125 (U/mL)	Other tumour markers	Presence of effusions

Current report	56 M	IgG4-related MP	↑ (1/1)	CA 19-9 ↔, AFP ↔, CEA ↔	Pleural effusion in 1/4 M

## Abstract AB1369 – Figure 1

**AI:** Autoimmune, **AIH:** Autoimmune Hepatitis, **AIP:** Autoimmune Pancreatitis, **SM:** Sclerosing Mesenteritis, **↑:** Raised, **↔:** Normal

**Conclusions:** To our knowledge, this is the first SLR exploring the association between CA-125 and IgG4-RD and MP. Despite the small sample, our results do indicate that CA-125 was raised in more than 50% of reported cases, the majority of which also had some kind of effusion. Although traditionally a marker of ovarian cancer, this report highlights that a raised CA-125 can be found in other, non-malignant, inflammatory conditions, and potentially correlates with inflammatory burden. CA-125 in this setting may thus represent a useful biomarker and have a role in monitoring treatment response.

### AB1370 PATIENT REPORTED OUTCOMES MEASURES FOR FIBROMYALGIA: A REVIEW

J.B. Negrón, L. Carmona. *Instituto de Salud Musculoesquelética, Madrid, Spain*

**Background:** Persons with fibromyalgia (FM) suffer from numerous symptoms with various levels of intensity, such as widespread pain, fatigue, cognitive dysfunction, non-restorative sleep, depression, and anxiety among others. The patient's perspective has been recognised by Outcome Measure in Rheumatology (OMERACT) as a key assessment in FM. For that reason, some patient reported outcomes measures (PROMs) have been developed. PROMs allow the comparison of a specific component of the disease in a patient through time, and also provide the opportunity to health professionals to compare patients between them in clinical trials. However, some PROMs are used over others despite a limited validation process. In addition, different versions of the same PROMs can co-exist, what can lead to uncertainty when selecting the adequate instrument.

**Objectives:** To identify the existing PROMs for FM and analyse their psychometric properties.

**Methods:** The authors performed a comprehensive search in electronic databases (Medline, Embase, and Cochrane) in order to identify validation studies of PROMs for FM. Studies published between January 1990 and November 2017 were included. Generic PROMs and validation of diagnostic criteria and related screening tools were not considered as PROMs and were excluded. Information was gathered based on the Consensus-based Standards for the selection of health Measurement Instruments (COSMIN) checklist manual.

**Results:** The electronic search produced 1832 records. After screening, a total of 48 studies containing 16 PROMs for FM were included. The PROMs included address different constructs of the disease, Fibromyalgia Impact Questionnaire (FIQ), Revised Fibromyalgia Impact Questionnaire (FIQR), Combined Index of Symptom Severity, Combined Index of Severity of Fibromyalgia, Comprehensive Rating Scale for Fibromyalgia Symptomatology, Fibromyalgia Assessment Status, Fibromyalgia Bladder Index, Fibromyalgia Burden Assessment, Fibromyalgia Health Assessment Questionnaire, Fibromyalgia Impact Questionnaire+Visual Analogue Scales, Fibromyalgia Participation Questionnaire, Fibromyalgia Sleep Diary, Multidimensional Inventory of Subjective Cognitive Impairment, Multidimensional Patient Reported Outcome Measures Questionnaire, PROMIS Fatigue FM Profile, and Multidimensional daily diary of fatigue-fibromyalgia-17 items.

Almost all PROMs have adequate content validity. Three PROMs do not report construct validity; seven do not report reliability, and six do not report internal consistency. Only three PROMs evaluate criterion validity and three responsiveness. The FIQ and the FIQR are the PROMs more widely cross-cultural validated with 18 and 13 adaptations respectively.

**Conclusions:** PROMs for FM have, in general, only partial validation of their psychometric properties. Validation of an instrument is a continuous process in which quality is more important than quantity. Instead of creating new PROMs for FM, future works should focus on completing missing parts of the validation process of existing ones. In addition, cultural adaptations and translations of the available PROMs should be prioritised in order to offer researchers across the globe a toolbox of options in where they can choose the best PROMs to address their objectives in a highly subjective syndrome as FM.

**Disclosure of Interest:** None declared

### AB1371 CLINICAL SIGNIFICANCE OF KL-6 AND SP-D AS SERUM MARKERS FOR INTERSTITIAL LUNG DISEASE IN PATIENTS WITH CONNECTIVE TISSUE DISEASE

K.-E. Lee, J.-H. Kang, D.-J. Park, S.-S. Lee. *CHONNAM NATIONAL UNIVERSITY MEDICAL SCHOOL AND HOSPITAL, Gwangju, Korea, Republic of Ireland*

**Objectives:** To evaluate the association between serum levels of Krebs von den Lungen-6 (KL-6) and surfactant protein-D (SP-D) and the clinical manifestations and severity of interstitial lung disease (ILD) in patients with connective tissue disease (CTD).

**Methods:** Eighty patients with various CTDs were included, as follows: 33 with rheumatoid arthritis (RA), 19 with systemic lupus erythematosus (SLE), 10 with systemic sclerosis (SSc), 9 with Sjogren's syndrome (SS), and 9 with inflammatory myositis. KL-6 and SP-D levels were measured using an enzyme-linked immunosorbent assay and defined as abnormal if KL-6  $\geq 500$  U/mL and SP-D  $\geq 110$  mg/mL. All patients were simultaneously evaluated for parameters related to disease activity using laboratory tests and a pulmonary function test, and interstitial lung abnormalities (ILA) using chest computed tomography (CT). Patients were subclassified according to ILA score: 0 for no ILD, 1 for indeterminate ILD, 2 for mild ILD, and 3 for advanced ILD based on chest CT scans.

**Results:** In all, 29 patients had radiologically advanced ILD, 18 had mild ILD, 18 had indeterminate ILD, and 15 had no ILD. A higher ILA score was associated with more severe dyspnea, and decreased volume and percent of functional vital capacity, forced expiratory volume in 1 s, and diffusion capacity of carbon monoxide. As clinical manifestations, a higher ILA score was associated with a higher GAP index but not with the parameters of disease activity. A higher ILA score was associated with higher levels of KL-6 and SP-D and a higher percentage of subjects with abnormal levels, and this was more pronounced in SLE, SSc, and SS than in RA.

**Conclusions:** Serum levels of KL-6 and SP-D are associated with the radiological severity of ILD. Hence, these can serve as markers for ILD severity, especially in SLE, SSc, and SS.

### AB1372 TOWARDS REFORMING THE TAXONOMY OF HUMAN DISEASE: THE PRECISESADS CROSS SECTIONAL STUDY

L. LAIGLE<sup>1</sup>, L. BERETTA<sup>2</sup>, J. WOJICK<sup>3</sup>, J. MAROVAC<sup>4</sup>, J.-O. PERS<sup>5</sup>, B. LAUWERYS<sup>6</sup>, J. FROSTEGARD<sup>7</sup>, F. MAC DONALD<sup>8</sup>, M. JUAREZ<sup>4</sup>, R. BENSCHOP<sup>9</sup>, E. DOW<sup>9</sup>, S. RAO<sup>10</sup>, C. CHAMBERLAIN<sup>4</sup>, J. MARTIN<sup>11</sup>, M. E. ALARCON-RIQUELME<sup>12</sup>, on behalf of the Clinical Consortium. <sup>1</sup>Center for Therapeutic Innovation – Immuno-Inflammatory Disease, I.R.I.S., SURESNES CEDEX, France; <sup>2</sup>Scleroderma Unit, Fondazione IRCCS Policlinico, Milan, Italy; <sup>3</sup>QuartzBio SA, Geneva, Switzerland; <sup>4</sup>UCB Biopharma, Slough, UK; <sup>5</sup>UMR1227, INSERM, Brest, France; <sup>6</sup>Cliniques Universitaires Saint-Luc and Université Catholique de Louvain, Brussels, Belgium; <sup>7</sup>Institute of Environmental Medicine, Karolinska Institutet, Stockholm, Sweden; <sup>8</sup>Bayer AG, Berlin, Germany; <sup>9</sup>Eli Lilly and Company, Indianapolis; <sup>10</sup>Sanofi-Aventis Research and Development, Bridgewater, USA; <sup>11</sup>Instituto de Parasitología y Biomedicina López-Neyra; <sup>12</sup>GENYO, Pfizer-University, Granada, Spain

**Objectives:** The PRECISESADS project aims at using OMICs, and bioinformatics to identify new classifications for systemic autoimmune diseases (SADs) known to share common pathophysiological mechanisms in view of personalised treatments. Multi OMICs parameters collected in addition to routine clinical data in a cross-sectional study involving patients suffering from systemic lupus erythematosus (SLE), systemic sclerosis (SSc), Sjogren's syndrome (SjS), rheumatoid arthritis (RA), primary antiphospholipid syndrome (PAPs), mixed connective

tissue disease (MCTD), undifferentiated connective tissue disease (UCTD) and healthy controls (HC) will be analysed to identify clinically relevant clusters.

**Methods:** A European multi centre, non-randomised, cross-sectional clinical study was conducted in 18 sites and 9 countries. Collection of OMIC data including genetic, epigenomic, transcriptomic (from peripheral blood and from isolated cells), flow cytometry, metabolomics and proteomic in plasma and urine, exosome analysis and classical serology (antibodies and autoantibodies) was organised. Novel and innovative methodologies including fine flow cytometry were conducted. Quality procedures were established to ensure standardisation of samples collection, processing, transportation and storage. Techniques were validated to ensure reproducibility of analyses. Unsupervised bioinformatics and biostatistics approaches will be applied.

**Results:** Recruitment started in <sup>December 2014</sup> and ended in October 2017. A total of 2656 participants were recruited: 377 RA, 470 SLE, 402 SSs, 385 Sjs, 99 MTCD, 106 PAPs, 166 UCTD patients and 651 HCs. Median age was between 46 and 59 years and was consistent with each disease onset peak. 97% of the population was Caucasian. Most of the patients were treated with standard of care therapies and less than 10% were on biologics. OMICs and bioinformatics analyses are on-going.

**Conclusions:** We have established one of the largest collaborative multi-OMICs studies from patients with SADS. The most important challenge is now the integration of all these novel data to support hypothesis-free, machine learning-led analytical protocols. It is expected that the integration of data from affected patients, in comparison with well-matched controls, will provide new biomarker-led descriptions of clusters of potentially etiologically distinct disease entities.

#### AB1373 URINARY PROTEIN PROFILE COMPARISON BETWEEN SLE PATIENTS WITH AND WITHOUT RENAL INVOLVEMENT

N. Rivera<sup>1</sup>, E. Ruiz<sup>1</sup>, E. Úcar<sup>1</sup>, M.L. García Vivar<sup>1</sup>, F. Elortza<sup>2</sup>, M. Azkargorta<sup>2</sup>, O. F. Berrizbeitia<sup>1</sup>, E. Galindez<sup>1</sup>, I. Torre<sup>1</sup>, A. Intxaurre<sup>1</sup>, J. Blanco<sup>1</sup>, C. Pérez<sup>1</sup>, M. J. Allande<sup>1</sup>, O. Ibarquengoitia<sup>1</sup>, I. Calvo<sup>1</sup>, E. Guerrero<sup>1</sup>. <sup>1</sup>Rheumatology, Basurto University Hospital; <sup>2</sup>Proteomic, CIC bioGUNE, Bilbao, Spain

**Background:** Lupus nephropathy (NL) is an important cause of morbidity and mortality in patients with Systemic Lupus Erythematosus (SLE). The objective of the renal biopsy is to determine the type of glomerulonephritis that the patient presents to direct treatment. Considering that it is a specialised technique and not risk free, a proteomics study is proposed to determine biomarkers that help us to differentiate patients diagnosed with SLE with and without renal involvement.

**Objectives:** To determine if there is a different pattern of proteins between patients diagnosed with SLE with and without renal involvement.

**Methods:** We selected 12 patients diagnosed with SLE with renal involvement and 14 patients diagnosed with SLE without renal involvement. There were no differences between groups according to race, gender and age. The patients were classified as high, low or negative level of proteinuria in the urine. A 24 hour urine sample was obtained for analysis.

**Results:** We have done a Principal Component Analysis (PCA) where we can see differences between samples from patients who have high level of proteinuria in 24 hours and patients who have not renal involvement. Patients with positive proteinuria but not high level are a little confuse figure 1.

A total of 292 proteins (identified with at least two peptides with a FDR<1%) were quantified and further considered in the analysis. The Student's T-test analysis reflected the differential presence of 147 proteins ( $p<0.01$ ). Of these, 130 were less abundant in the urine of the patients with renal damage, whereas 17 showed the opposite pattern, being more abundant in the patients with affected renal function.

Consistent with the nature of the sample, the Gene Ontology (GO analysis) of the whole list of identified proteins revealed the presence of extracellular (277 proteins,  $p=2.25E-171$ ) and secretion-related proteins (49 proteins,  $p=1.1E-09$ ), among others. Proteins related to defensive processes were prominent among them. Interestingly, the subset of proteins whose abundance increases upon renal damage is comprised of typical highly-abundant serum proteins. These proteins render a large number of peptides, suggesting they are very abundant. This protein pattern may reflect the higher albuminuria characteristic of patients with affected renal function. On the other hand, a number of proteins became significantly less abundant upon renal damage. The presence of highly abundant serum proteins in the urine of patients with compromised renal function may explain this phenomenon, since this will provoke a dramatic reduction in the relative abundance of the proteins already present in their urine.

Abstract AB1373 – Figure 1

**Conclusions:** A different protein pattern is observed between the two groups of patients, so in a more detailed study we can indicate if some of these can serve as prognostic markers for this type of patients.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.3720

#### AB1374 PERFORMANCE OF EQ-5D, RAPID-3 AND HADS SCALES IN THE ASSESSMENT OF QUALITY OF LIFE AND FUNCTIONAL STATUS IN PATIENTS WITH ERYTHEMA NODOSUM

N. Savushkina, V. Amirdjanova, O. Egorova, B. Belov, V. A. Nasonova Research Institute of Rheumatology, Moscow, Russian Federation

**Background:** Erythema nodosum (EN) is the typical example of a mostly *septal panniculitis* with no vasculitis. Sarcoidosis and streptococcal infection are considered to be the most common etiological factors. There are no special scales available for practitioners to assess the efficacy of EN treatment in spite of high disease prevalence in general population. Sensitivity, specificity and validity of EQ-5D, RAPID-3 and HADS questionnaires have been demonstrated in other rheumatic diseases.

**Objectives:** The aim of this study is to evaluate the psychometric properties of EQ-5D, RAPID-3 and HADS scales in EN patients.

**Methods:** The study included 47 patients (45 females, 2 males) aged 37,6 ± 11,2 y with mean EN duration 2,5<sup>1</sup>; 6 months who were on the record at V. A. Nasonova Research Institute of Rheumatology during 2013–2017 yy. All patients filled in EQ-5D, RAPID-3 and HADS questionnaires at baseline (first visit) and 12 months later. The sensitivity of the questionnaires was assessed by comparing obtained scores with patient's response to therapy until achievement of nodular regression at the time of dynamic examination. The construct validity was determined using a correlation analysis with "external criteria", such as presence of artralgia/arthritis, palpatory tenderness of nodules assessed with VAS scale, ESR and CRP levels.

**Results:** Complete nodular regression was achieved in 39 patients. Positive post-treatment changes (nodular regression) correlated with improved EQ-5D (EQ-5D-index –  $p=0,005$ , EQ-5D-VAS –  $p=0,009$ ) and HADS-anxiety subscale –  $p=0,02$ . No significant association was found for other questionnaires with  $p$  value=0,11 for RAPID-3 and  $p=0,69$  for HADS-depression scale. Moderate correlation was established at control visit after 12 months (Mo12) between EQ-5D-index and nodular tenderness to palpation ( $r=-0,49$ ,  $p=0,0001$ ), between EQ-5D-index and ESR value ( $r=-0,55$ ,  $p=0,0016$ ), as well as between general health status assessed by VAS and nodular tenderness to palpation at baseline visit ( $r=-0,56$ ,  $p=0,0001$ ), indicating close association of data obtained by these assessment tools with objective physical and laboratory findings. There was also moderate correlation between functional RAPID-3 scores and nodular tenderness to palpation at Mo12 ( $r=0,37$ ,  $p=0,0172$ ) and ESR level ( $r=0,52$ ,  $p=0,0002$ ). These data demonstrate close association of assessment scales performance with objective health status. Moderate correlation was established for HADS-depression subscale scores with nodular tenderness to palpation in 12 month after initiation of treatment ( $r=0,41$ ,  $p=0,0077$ ) and CRP value ( $r=0,34$ ,  $p=0,025$ ). There were no additional statistically significant correlations for RAPID-3 and HADS subscales with clinical and laboratory findings.

**Conclusions:** EQ-5D questionnaire is a valid and sensitive tool for assessment of quality of life in EN patients.

**Acknowledgements:** The study had no sponsorship.

AB1375

### RELIABILITY AND VALIDITY OF TURKISH VERSION OF SHORT FORM OF THE SOCIAL ROLE PARTICIPATION QUESTIONNAIRE (S-SRPQ) IN PATIENTS WITH ANKYLOSING SPONDYLITIS

Y. Akyol<sup>1</sup>, Y. Ulus<sup>1</sup>, Y. Terzi<sup>2</sup>, A. Bilgici<sup>1</sup>, O. Kuru<sup>1</sup>. <sup>1</sup>Physical Therapy and Rehabilitation; <sup>2</sup>Statistics, Ondokuzmayis university, Samsun, Turkey

**Background:** Ankylosing spondylitis (AS) is a chronic inflammatory rheumatic disease with a usual onset in the third decade of life, when persons are committed to various social roles that adults fulfil.<sup>1</sup> When evaluating the outcomes of clinical care, social role participation is an increasingly important outcome, especially when considering diseases with substantial limitations in physical functioning such as inflammatory rheumatic diseases.<sup>2</sup> The Short Form of the Social Role Participation Questionnaire (s-SRPQ) is a questionnaire which was developed to assess effect of ankylosing spondylitis (AS) on participation.<sup>2</sup>

**Objectives:** This study aims to evaluate the reliability and validity of the Turkish version of the s-SRPQ in Turkish patients with AS.

**Methods:** The Turkish version of s-SRPQ questionnaire was obtained after a translation and back translation process. The study sample included 100 AS patients (59 males, 41 females; mean age 42.00±11.00 years; range 19 to 69 years). To assess the test-retest reliability of the Turkish s-SRPQ, the questionnaire was reapplied 15 days after the first interview (interclass correlation coefficient, ICC). Cronbach's alpha (α) was used to evaluate the internal consistency. The s-SRPQ was compared with Short Form-36 survey (SF-36), Ankylosing Spondylitis Quality of Life questionnaire (ASQoL), Bath Ankylosing Spondylitis Disease Activity Index (BASDAI), Bath Ankylosing Spondylitis Functional Index (BASFI), and Satisfaction With Life Scale (SWLS) for convergent validity. The internal structure of s-SRPQ was examined by factor analysis.

**Results:** For s-SRPQ/experienced physical difficulties; the individual item ICC ranged from 0.78 to 1.00 and Cronbach's alpha value ranged from 0.88 to 1.00. For s-SRPQ/satisfaction with role performance; the individual item ICC ranged from 0.93 to 0.98 and Cronbach's alpha value ranged from 0.96 to 0.99. KMO values was determined as 0.90 and 0.89 in the s-SRPQ/experienced physical difficulties and s-SRPQ/satisfaction with role performance, respectively. Bartlett's test of sphericity had a p<0.001. The Turkish version of s-SRPQ/experienced physical difficulties scores negatively correlated with the SWLS and SF-36 sub-parameters scores (p<0.01). There were also strong positive correlations between s-SRPQ/experienced physical difficulties scores and BASDAI, BASFI, and ASQoL scores (p<0.01). The SRPQ/satisfaction with role performance scores positively correlated with the SWLS and SF-36 sub-parameters scores (p<0.01). There were also strong negative correlations between s-SRPQ/experienced physical difficulties scores and BASDAI, BASFI, and ASQoL scores (p<0.01).

**Conclusions:** Turkish version of s-SRPQ has good comprehensibility, internal consistency, and validity and is an adequate and useful instrument for the assessment of participation in Turkish patients with AS.

### URINARY MONOCYTE CHEMOATTRACTANT PROTEIN 1 CANNOT DIFFERENTIATE BETWEEN HISTOLOGICAL CLASSES OF LUPUS NEPHRITIS

R.K. Gane<sup>1</sup>, V. Dhir<sup>2</sup>, A. Sandhu<sup>2</sup>, A. Sharma<sup>2</sup>, M. Rathi<sup>3</sup>, R. Nada<sup>4</sup>, S. Sharma<sup>5</sup>, S.K. Sharma<sup>6</sup>. <sup>1</sup>Internal medicine, Post graduate institute of medical education and research, Chandigarh; <sup>2</sup>Internal medicine; <sup>3</sup>Department of Nephrology; <sup>4</sup>Department of Histopathology; <sup>5</sup>Department of Biochemistry, Post Graduate Institute of Medical Education and Research; <sup>6</sup>Internal medicine, Post Graduate Medical Education and Research, Chandigarh, India

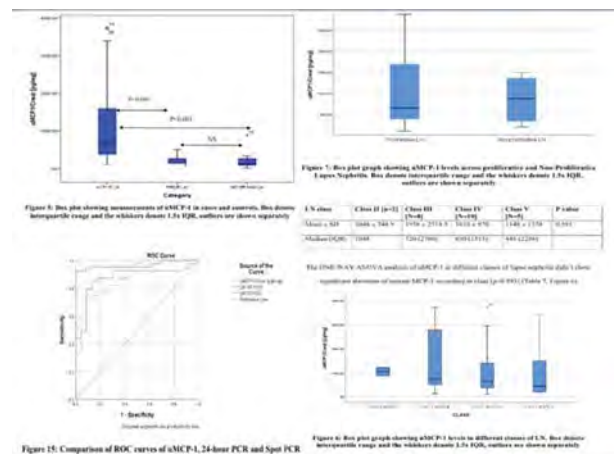

**Background:** Lupus Nephritis, one of the commonest manifestation of SLE, seen in 60% of adult SLE patients at some point of time, carries poor prognosis when compared to those with no renal involvement. The natural course of the LN has recurrent flares, necessitating the need for early detection and treatment. Despite being the gold standard in diagnosing Lupus nephritis and its severity, renal biopsy is an invasive procedure with potential complications, and difficult to repeat. Hence, a novel biomarker, reflecting the disease activity and severity is needed to predict flare. Monocyte chemoattractant Protein 1, a chemokine

produced locally during Lupus Nephritis flare, was shown in many previous studies as a promising biomarker

**Objectives:** We studied the role of Urinary MCP-1 as a biomarker of disease activity in LN and compare its value among different histological classes of Lupus nephritis

**Methods:** This is a case-control study conducted at a tertiary care centre in North India from July 2016 to December 2017. Cases were those patients undergoing renal biopsy satisfying the inclusion criteria set for SLE with LN (n=36). Controls were patients of SLE without active LN [Control I-prior LN (n=11) and Control II-never had LN (n=15)]. Urinary MCP-1 measurement was done using Sandwich ELISA kit

**Results:** The mean age in cases was 31.1±10.2 years and mean age in control-I was 34.6±8.0 and in control II was 36.3±10.4. Urinary MCP-1 values in cases (1214±1467.1 pg/mg) was significantly higher compared to Controls (184.5±186.8). However, no significant difference was observed between Control I (170.5±150.8) and Control II (194±214). Urinary MCP-1 levels show significant correlation when compared with classical disease markers like 24 hour proteinuria, 24 hour PCR, Spot PCR and SLEDAI. Cut off value (339 pg/mg, p<0.001) obtained from ROC curve has sensitivity and specificity of 80% and 92% respectively. However, there was no significant difference of Urinary MCP-1 levels was observed among different classes of LN (p=0.593). ROC curve comparison of urinary MCP-1 (AUC=0.879) with 24 hour urine protein to creatinine ratio (AUC=0.964) and spot urine protein to creatinine ratio (AUC=0.872) showed that it is not a better marker of disease activity than both of them. Urinary MCP-1 levels didn't show significant correlation with Renal activity index calculated on renal biopsy.

**Conclusions:** In this study we found higher Urinary MCP-1 levels in active LN compared to Inactive LN and its level was correlated well with the presently used disease markers. However there was no significant difference among different histological classes of LN.

**Disclosure of Interest:** None declared

### IS THE PATIENT GLOBAL HEALTH ASSESSMENT RELIABLE IN JUVENILE IDIOPATHIC ARTHRITIS (JIA)?

R. Trachtman, C.M. Wang, J. Szymonifka, K.B. Onel. Hospital for Special Surgery/Weill Cornell Medicine, New York, USA

**Background:** JIA is a chronic autoimmune disease that poses many challenges. There is increasing recognition of the importance of patient-reported outcomes (PROs) and newer PROs are being developed and more widely utilised both in clinical care and in research. However, their performance and reliability remain unclear.

**Objectives:** This study seeks to evaluate:<sup>1</sup> performance of the patient global health assessment (PGA) compared to standard disease activity measures in children with JIA,<sup>2</sup> correlations of the PGA with socioeconomic status (SES) in JIA, and<sup>3</sup> relationship between PGA and physician global health assessment in JIA.

**Methods:** A convenience sample of patients with JIA (n=47) aged 2–18 were recruited from a single centre. Patients aged ≥10 years completed the questionnaire, and parents of patients aged 2–9 completed a proxy questionnaire for their child. Correlations between<sup>1</sup> the PGA and disease activity, as measured by the Juvenile Disease Activity Score-71 (JADAS-71),<sup>2</sup> the PGA and physician global health assessment, and<sup>3</sup> the physician global health assessment and the JADAS-71 were evaluated using Spearman correlation coefficients. PGAs were compared by age, sex, insurance status, race, and ethnicity; and differences between

PGA and physician global health assessments were compared using Wilcoxon rank-sum tests.

**Results:** 16 parents and 31 patients completed the assessments (table 1). There was a moderate correlation between PGA and JADAS-71 ( $r=0.503$ ,  $p<0.001$ ), and PGA and physician global health assessments ( $r=0.503$ ,  $p=0.002$ ). There was a stronger correlation between physician global health assessments and JADAS-71. PGA median scores and IQRs appeared to be higher among patients with Medicaid insurance, non-white race, and Hispanic ethnicity, with the greatest difference seen in the category of race (Table 2). There were no differences between patient and physician assessments across all groups except among patients with Medicaid (difference median=-1.25) and Hispanic patients (difference median=2).

**Abstract AB1377 – Table 1.** Patient Characteristics

	Patients and Parents (n=47)	Patients (n=31)	Parents (n=16)
<b>Age, years</b>	12.4	14.2	4.3
<b>(median, IQ range)</b>	[8.6–15.0]	[12.4–15.8]	[3.3–9.0]
<b>Male Gender</b>	17 (36.2%)	14 (45.2%)	3 (18.8%)
<b>Race</b>			
<b>Caucasian/White</b>	38 (80.9%)	24 (77.4%)	14 (87.5%)
<b>Asian</b>	3 (6.4%)	3 (9.7%)	0 (0.0%)
<b>Other</b>	6 (12.7%)	4 (12.9%)	2 (12.5%)
<b>Hispanic Ethnicity</b>	8 (17.0%)	5 (16.1%)	3 (18.8%)
<b>Insurance</b>			
<b>Medicaid</b>	8 (17.0%)	4 (12.9%)	4 (25.0%)
<b>Private</b>	39 (83.0%)	27 (87.1%)	12 (75.0%)

**Abstract AB1377 – Table 2.** Comparison of Patient Global Assessments by age, sex, insurance status, race and ethnicity

	Patient global median [IQR]	P-value
<b>Age</b>	2 [0–5]	0.892
<b>Patient completed</b>	2 [0.05–4.5]	
<b>Parent completed</b>		
<b>Sex</b>	2 [0–5]	0.679
<b>Male</b>	2 [0–4]	
<b>Female</b>		
<b>Insurance</b>	2.5 [1, 5]	0.313
<b>Medicaid</b>	2 [0–4]	
<b>Private</b>		
<b>Race</b>	1.5 [0–4]	0.266
<b>White</b>	4 [2–5]	
<b>Non-white</b>		
<b>Ethnicity</b>	2.5 [2.5–5]	0.134
<b>Hispanic</b>	1 [0–4]	
<b>Non-Hispanic</b>		

**Conclusions:** Our results demonstrate that physician global health assessment had a stronger correlation with standard disease activity measures than the PGA. These scores were higher in patients who were non-White race, Hispanic, and had Medicaid insurance; however, these were not statistically significant. These data indicate that the PGA is fairly stable across groups, and can be used reliably for disease monitoring.

**AB1378** **CLINICAL COMPARISON OF NEW CRITERIA FOR INFLAMMATORY MYOPATHY IN A COLOMBIAN COHORT**

R. Fuentes<sup>1</sup>, D. Gil-Calderon<sup>1</sup>, M. Cañola<sup>1</sup>, J.C. Diaz-Coronado<sup>2</sup>, A. Rojas-Villarraga<sup>2</sup>, D. Hernandez-Parra<sup>2</sup>, P. Perez-Estrada<sup>2</sup>, J.C. Salazar-Urbe<sup>3</sup>, R. Pineda-Tamayo<sup>2</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Clinical Research, Artmedica; <sup>3</sup>National University of Colombia, Medellin, Colombia

**Background:** Idiopathic inflammatory Myopathies are a group of diseases characterised by weakness due to muscle inflammation, with or without dermatological involvement, that classically includes pathognomonic findings like Gottron sign. There have been different criteria used to classify these diseases, being Peter and Bohan the most used in time, but recently the ARC/EULAR group proposed a new way to approach the classification.

**Objectives:** To compare ACR/EULAR 2017 versus Peter and Bohan criteria for Idiopathic Inflammatory Myopathy in a Colombian cohort

**Methods:** A cross-section retrospective research was done with data collected between 2014 and 2017 from a population diagnosed with Idiopathic Myopathy according to Peter and Bohan criteria and followed up for at least six months. The new ACR/EULAR criteria were applied to each individual using the online tool

(<http://www.imm.ki.se/biosstatistics/calculators/iim>). Both sets of criteria were compared using Cohen's kappa coefficient and concordance was evaluated.

**Results:** Data of 149 patients were obtained. Anti-Jo1 results were not available for 75% of the patients. Biopsy was available in 44,3% of patients. Biopsy results were compatible with inflammatory myopathy in 66,7% and non-compatible in 33,3%. According to Peter and Bohan criteria the diagnosis of idiopathic inflammatory myopathy was definite in 63,1% of the patients, and probable in 27,5%. Using ACR/EULAR 2017 criteria instead the diagnosis was definite in 63,1%, probable 10,1% and non-possible in 20,8%. According to the new criteria, 31 patients had polymyositis, 47 dermatomyositis, 4 amyopathic dermatomyositis, 35 juvenile myositis and 1 inclusion body myositis. The concordance analysis between the two sets of criteria showed agreement of 54% (kappa 0,22  $p<0,001$ ) in the whole group, 59% (kappa 0,21  $p<0,001$ ) in adults, 32% (kappa 0,18  $p=0,05$ ) in children, 44% (kappa 0,05  $p=0,3$ ) in polymyositis and 42% (kappa 0,16  $p=0,1$ ) in dermatomyositis.

**Conclusions:** Data of 149 patients were obtained. Anti-Jo1 results were not available for 75% of the patients. Biopsy was available in 44,3% of patients. Biopsy results were compatible with inflammatory myopathy in 66,7% and non-compatible in 33,3%. According to Peter and Bohan criteria the diagnosis of idiopathic inflammatory myopathy was definite in 63,1% of the patients, and probable in 27,5%. Using ACR/EULAR 2017 criteria instead the diagnosis was definite in 63,1%, probable 10,1% and non-possible in 20,8%. According to the new criteria, 31 patients had polymyositis, 47 dermatomyositis, 4 amyopathic dermatomyositis, 35 juvenile myositis and 1 inclusion body myositis. The concordance analysis between the two sets of criteria showed agreement of 54% (kappa 0,22  $p<0,001$ ) in the whole group, 59% (kappa 0,21  $p<0,001$ ) in adults, 32% (kappa 0,18  $p=0,05$ ) in children, 44% (kappa 0,05  $p=0,3$ ) in polymyositis and 42% (kappa 0,16  $p=0,1$ ) in dermatomyositis.

**AB1379** **POTENTIAL DIAGNOSTIC SERUM IMMUNOLOGICAL MARKER PANEL IN PRIMARY AND SECONDARY OSTEOARTHRITIS IN SRI LANKAN PATIENTS**

S. Rankotgedera<sup>1</sup>, I. Atukorala<sup>2</sup>, D. Muidasa<sup>3</sup>, L. Wijayarathne<sup>4</sup>, P. Udagama<sup>1</sup>.

<sup>1</sup>Department of Zoology and Environment Sciences, University of Colombo, Sri Lanka, Colombo 3; <sup>2</sup>Department of Clinical Medicine, University of Colombo, Sri Lanka, Colombo 8; <sup>3</sup>Rheumatology and Rehabilitation Hospital, Ragama; <sup>4</sup>Department of Zoology and Environment Sciences, Nawaloka Hospital PLC, Colombo 2, Sri Lanka

**Background:** Osteoarthritis (OA) is commonly perceived as a degenerative joint disease but it is now established that inflammation contributes to OA. Though OA is categorised into primary and secondary osteoarthritis, most clinicians manage patients of both categories in a similar manner.

**Objectives:** The current study aimed to identify potential diagnostic markers of primary and secondary OA. Two cohorts of Sri Lankan patients, one with primary OA and another with secondary OA were assessed for a selected panel of immunologic mediators i.e. cytokines (TNF- $\alpha$ , IL-1 $\beta$ , IL-6, IL-10) and nitric oxide derivatives (NOx).

**Methods:** A case control study was conducted with 40 OA patients (Primary, n=30; Secondary, n=10), and 60 age and gender matched controls (normal healthy, n=30; Systemic Lupus Erythematosus (SLE) disease control, n=30). The socioeconomic and demographic data were accrued via an interviewer administered questionnaire. Sandwich ELISAs assayed serum cytokine levels, while the 'Griess assay' measured serum NOx levels.

**Results:** In comparison to healthy controls, OA patients showed significantly higher serum concentrations of all five analytes tested ( $p<0.05$ ). Patients with primary OA had significantly higher levels of TNF- $\alpha$  and IL-1 $\beta$  and lower level of IL-6 in serum compared to disease controls (SLE) ( $p<0.05$ ). Secondary OA patients exhibited a significant increase in serum TNF- $\alpha$  and IL-1 $\beta$  and lower serum IL-10 levels compared to disease controls ( $p<0.05$ ). In the two test groups, the serum levels of TNF- $\alpha$  and IL-6 were significantly elevated in secondary OA patients ( $p<0.05$ ). The NOx concentrations between the two test groups was not significantly different. The Th1:Th2 cytokine ratio (TNF- $\alpha$ :IL-10) was significantly higher in secondary OA compared with primary OA ( $p<0.05$ ).

The Receiver operating characteristic (ROC) curves identified TNF- $\alpha$  and IL-10 as potential diagnostic biomarkers of both primary OA and secondary OA compared with healthy controls. IL-1 $\beta$  and IL-6 may be used specifically as diagnostic

biomarkers for primary and secondary OA, respectively, when compared with healthy individuals. TNF- $\alpha$  is a suitable biomarker for the diagnosis of both primary and secondary OA when compared to SLE patients, whereas IL-6 and IL-1 $\beta$  were apparent explicit markers of primary OA, while IL-10 was exclusive for secondary OA.

**Abstract AB1379 – Table 1.** lists the values obtained from the ROC curves for the cytokine panel and NOx for patients clinically diagnosed with primary and secondary osteoarthritis against normal healthy controls.

	Primary OA				Secondary OA			
	AUC (%)	Cut-off value*	Sensitivity	Specificity	AUC (%)	Cut-off value*	Sensitivity	Specificity
TNF- $\alpha$	88.3	>10.8	93.33	80.00	97.0	>28.2	100.00	96.67
IL-10	88.6	>32.67	85.71	92.59	93.1	>32.67	90.00	92.59
IL-6	59.3	>3.98	89.66	40.74	81.2	>12.02	66.67	96.15
IL-1 $\beta$	85.2	>1.18	96.43	68.42	61.4	>0.88	77.78	57.89
NOx	72.0	>18.89	93.33	60.71	73.0	>18.89	100.00	60.71

\*For the cytokines, in pg/ml and for NOx in  $\mu$ mol/l

**Conclusions:** This preliminary study suggests that higher levels of inflammatory cytokines are present in secondary OA compared to primary OA. Furthermore, distinct markers for primary and secondary OA were identified, indicative of the potential for developing different therapeutic agents for the different types of OA.

## AB1380 PERIPHERAL NEUROPATHY IN INFLAMMATORY JOINT DISEASES

Y. Yehudina<sup>1</sup>, O. Syniachenko<sup>2</sup>, T. Bevzenko<sup>3</sup>. <sup>1</sup>Internal Medicine, Dnepropetrovsk Medical Academy, Dnipro; <sup>2</sup>Donetsk Medical University, Lyman; <sup>3</sup>Shupyk National Medical Academy, Kyiv, Ukraine

**Background:** For frequent extra-articular (systemic) manifestations of joints inflammatory diseases are various damage of the nervous system,<sup>2</sup> and the presence and severity of peripheral neuropathy (PNP) have significance in the clinical course, which incidence among these patients is 5%–10%.<sup>1</sup> Nevertheless, many clinical and pathogenic aspects of this peripheral neuropathy (PNP) remain obscure.

**Objectives:** to evaluate the rate and clinical features of PNP in rheumatoid arthritis (RA), chlamydia urogenital reactive arthritis (ReA), psoriatic arthritis (PA) and ankylosing spondylitis (AS), to examine the issues of pathogenetic constructions such changes of the nervous system, define risk factors.

**Methods:** The study included 416 patients with inflammatory joint diseases, among them 131 RA patients, 101 ReA, 76 PA and 108 AS. The average age of the examined was respectively 45, 32, 42 and 38 years, disease duration – 10, 4, 12 and 11 years, male to female ratio – 1.5, 1.1, 1.2 and 10.1.

**Results:** The frequency of the PNP in RA, ReA, PA and AS was 13%, 19%, 24% and 34%, while its severity in patients with PA <ReA < RA < AS, and the same type ratio of motor, sensory and mixed disorders of inflammatory joints diseases, trophic, visceral and vascular vegetative changes, the connexion with the male sex, the activity of arthritis and the presence of tendovaginitis, participation of immune disorders, endothelial dysfunction of blood vessels and changes in physical and chemical rheological viscoelastic properties of blood in the pathogenesis constructions of the nervous system lesions are united around. ReA and PA are different by frequency of hands and feet distal pathology, the AS – by the beginnings of tunnel syndrome. RA tends to impact on the PNP digital arteritis, myositis, eye disease, and Sjogren's syndrome, ReA – on sacroiliitis, PA – on exudative form of cutaneous psoriasis, AS – on eye disease, at that, the risk factors for severe course of neuropathy in RA is considered to involve in the process of elbows, ReA – intervertebral and facet joints, PA – wrist, AS – sacroiliac. Guillain-Barré syndrome develops respectively in 3%, 4%, 5% and 9% of patients with RA, PA, ReA and AS, or in 24%, 17%, 26% and 27% cases of PNP, which is closely linked to the presence of tendovaginitis in all inflammatory diseases and severity of articular syndrome, in RA it depends on the presence of hypothyroidism, in ReA – on nephropathy and violations of the heart's electrical conduction, in AS – on osteoporosis, and seropositive for anti-cyclic citrullinated peptide antibody is a risk factor for such peripheral nervous system disorders.

**Conclusions:** PNP is a relatively common manifestation of inflammatory diseases of the joints, which correlate with clinical and laboratory signs of the disease, and in the future such active detection of the nervous system pathology will be useful for timely follow-up rehabilitation.

## Education

### AB1381 FOUR ANNUAL INTERNATIONAL DIFFERENT MEETINGS OF RHEUMATOLOGY: COMPARISON OF THE CONTENTS, ANALYSIS, CHALLENGE AND OPPORTUNITIES

A.J. Pedro<sup>1</sup>, E. Cuevas<sup>1</sup>, C. Abud<sup>1</sup>, R. Moreno<sup>1</sup>, M. Martinez<sup>1</sup>, D. Herrera<sup>1</sup>, E. Acevedo<sup>2</sup>, H. Lopez<sup>2</sup>, D. Ramos<sup>2</sup>, G. Aguilera Barragan<sup>2</sup>, G. Martinez<sup>2</sup>, T. Luna<sup>2</sup>, E. Santillan<sup>2</sup>. <sup>1</sup>Rheumatology, <sup>2</sup>Hospital Central Ignacio Morones Prieto, San Luis Potosí, Mexico

**Background:** The medical meetings are a tool to help us be able to escalate and actualize the medical knowledge and their quality is a responsibility of Colleges and Institutions.

**Objectives:** To assess the academic level of four types of different annual Meeting of Rheumatology

**Methods:** We used as support information the summaries published in the supplements of the journal *Reumatologia Clinica*, SE1 Vol. 12 of February 2016, the supplement SE 1 Vol. 13 of February 2017, the application for electronic media of the ACR/ARHP 2016 of the American Congress of Rheumatology 2016 and the website for abstracts of EULAR 2017 dedicated to the surveys presented in the XLIV Mexican Congress of Rheumatology, XLV Mexican Congress of Rheumatology and the 2016 ACR/ARHP Annual Meeting, and EULAR 2017 respectively, of each survey we was obtained information about of the diverse pathologies, the type of trial, content and population referred (adults versus children).

**Results:** 275, 340, 3275 and 4129 were presented in the XLIV Mexican Congress of Rheumatology, XLV Mexican Congress of Rheumatology, the 2016 ACR/ARHP Annual Meeting and EULAR 2017 respectively. Rheumatoid arthritis (RA) was the most common pathology with 23%, 26%, 21% and 27% in CMR 44, CMR 45, ACR 2016 and EULAR 2017 respectively, followed by systemic lupus erythematosus, third place was vasculitis, beside in international congress was the spondyloarthritis. Highlighted, RA the items about of clinic manifestations were accounted for almost 30% in the Mexican congress and almost 20% in ACR and EULAR. Observational studies accounted for almost 40% in Mexican congresses vs. 33% in ACR 2016 and 55% in EULAR 2017 beside surveys about of basic research were minimal in Mexican congress, but in ACR 2016 accounted for 21% and 12% in EULAR 2016

The trials about of Paediatric Rheumatology were 12.3%, 5.5% and 4.9% in CMR 44, CMR 45 and ACR 2016 respectively.

**Abstract AB1381 – Figure 1.** percentage of rheumatic disease

**Conclusions:** Rheumatology Meeting constitutes a support to obtain the adequate medical knowledge based in evidence, in this important branch of

Medicine. We require of the collaborative efforts to achieve best goals with controlled studies, clinical and basic assays, increasing the Meeting's quality.

AB1382

#### HOW EFFECTIVE IS POSTGRADUATE TRAINING IN THE RHEUMATOLOGY DEPARTMENT OF A TEACHING HOSPITAL?

A. Paul<sup>1</sup>, C. Bennett<sup>2</sup>. <sup>1</sup>Rheumatology, South Tees Hospitals NHS Foundation Trust, Middlesbrough; <sup>2</sup>Division of Health Sciences, The University of Warwick, Coventry, UK

**Background:** Rheumatological disorders are very common in primary<sup>1</sup> and secondary care.<sup>2</sup> Each year, 20% of the general population consult their General Practitioner (GP) due to a musculoskeletal problem.<sup>3</sup> With demands on musculoskeletal service likely to rise further, there is a growing concern that new doctors of tomorrow may not be equipped with necessary competencies to deal with this burden.<sup>4, 5</sup>

**Objectives:** To explore the effectiveness of rheumatology departmental induction training. To explore the confidence of post-graduate trainees in assessing and managing patients with rheumatological conditions. To evaluate the confidence of post-graduate trainees to do knee aspiration and injection. To explore the satisfaction of post-graduate trainees and trainers with various teaching activities in the department. To make recommendation for further improvement of the quality of on-the-job teaching of junior doctors posted in the department of rheumatology.

**Methods:** An online questionnaire survey was administered to all current and previous four years' rheumatology trainees. Subsequently trainees were interviewed divided in to two focus groups for Specialty Trainees and non-specialist (General Practice and Foundation Year 2) trainees. Consultants, Allied Health Professionals and nurses were also interviewed divided in to two focus groups. The data from questionnaire survey and qualitative data from focus group interviews was then analysed and collated.

**Results:** Induction was suboptimal with only two-thirds of trainees rating its quality as excellent or good. Most trainees were confident in the assessment and management of rheumatological conditions but felt less confident in prescribing rheumatological drugs. Most trainees were confident in performing knee injection and aspiration. The trainees were satisfied with educational and clinical supervision, learning environment and availability of training opportunities. However both trainees and trainers were dissatisfied with inadequate formal teaching and under-utilisation of specialty and multidisciplinary clinics. Rota gaps and excessive workload were thought to be the main barriers.

**Conclusions:** In a climate of increasing service demands, limited time and manpower shortage, training junior doctors effectively has become more challenging. An effective induction, supportive learning environment, structured training with incorporated formal teaching would help optimise the learning opportunities.

#### RHEUMATOLOGY NURSES KNOWLEDGE AND CONFIDENCE IN THE EVER-CHANGING RHEUMATOLOGY -A REGIONAL SURVEY AMONG EAST MIDLANDS RHEUMATOLOGY SPECIALIST NURSES

T. Dorman, M. Attwal, J. Sabu, A. Moorthy. *University Hospitals of Leicester NHS trust, Leicester, UK*

**Background:** Rheumatology as a specialty moving rapidly due to the advent of novel therapeutic agents. Rheumatic Disease management concepts are also changing with a treat to target approach and early escalation of therapies. Role of Rheumatology specialist nurses should not be underestimated in the tight control and achieve treat to target goals. The expectation of Specialist Nurse role has been changed over the years. NHS pressure in service delivery compromised teaching and training opportunities for Specialists Nurses which may result in the knowledge gap. Education and training for Rheumatology nurses are key in delivering high-quality service to rheumatology patients. We attempted to explore the current knowledge and skills among Rheumatology specialist nurses regionally.

**Objectives:** 1To explore the knowledge perception of different disease management

2. To identify the difference in two disease management RA and Spondyloarthritis (SpA).

3. To evaluate the confidence level in assessing different Rheumatic diseases

**Methods:** This is a Questionnaire based prospective study among east midlands Rheumatology Specialist Nurses. The initial questionnaire was piloted and improved 17 questionnaires were distributed among the specialist nurses working in our region via email and in person. The questions were designed to gauge the nurses level of confidence in assessing different rheumatology conditions and also their confidence in making treatment decisions for different conditions.

**Results:** 26 out of 40 nurses in East Midlands responded with response rate of 65%. 77% Responses are from nurses working in University hospitals and 23% working from DGH. The level of experience in current role is variable from 2 to 20 Year and clinical session performed by nurses varies from 2–8 per week. The nurses are mostly supervised by consultant and some do independent clinic. The awareness of delay in diagnosis of SpA is about 80% with average reported delay as 6 years. Confidence in assessing RA is very good however not confident in assessing SLE. Confidence level in counselling biologic therapy varies with different diseases with SLE been very low. SpA assessment with extra articular management is low and less confidence in advising therapy in Pregnancy. Interesting note the awareness concept of Non-Radiographic SpA and MRI protocols in SpA Confidence is exists. Variable level of confidence in the in assessment of various diseases. Confidence in assessing Fibromyalgia in a patient with Rheumatic disease is at a low level.

**Conclusions:** we noted the very good level of confidence in RA and PSA assessment and management however low levels of confidence in the assessment of SLE and SpA. More education and training is needed particularly focused on assessment. This is the first study among Rheumatology Specialist Nurses with limitations. Education and training through continuous Medical education for Rheumatology nurses are key to achieve tight control of Rheumatic diseases, reduce the morbidity and Mortality.

AB1384

### ARE THE SPANISH HOSPITALARIAN EMERGENCY UNITS PREPARED FOR THE DIAGNOSTIC AND THERAPEUTIC CARE OF URGENT RHEUMATOLOGICAL PATHOLOGY?

C.A. Guillen-Astete<sup>1</sup>, I. Miguens-Blanco<sup>2</sup>, G. Rodríguez De Lema Tapetado<sup>3</sup>, J. Short-Apellaniz<sup>3</sup>. <sup>1</sup>Rheumatology Department, Ramon y Cajal University Hospital; <sup>2</sup>Gregorio Marañón University Hospital; <sup>3</sup>Jimenez Díaz Foundation, Madrid, Spain

**Background:** The rheumatological emergencies are considered a pathology of low complexity by the classification and triage systems of the Emergency Departments (ED). However, their frequency ranks first in reasons for consultation. Although the majority of these reasons for consultation do not imply immediate urgency, some autoimmune diseases and their manifestations in the locomotor system are underdiagnosed, causing a delay in the referral to the specialist and the initiation of appropriate treatment.

**Objectives:** To determine the baseline knowledge level of the medical staff of the EDs in the diagnosis and treatment of rheumatological emergencies.

**Methods:** A survey was designed and distributed in 18 Spanish EDs. The choice of centres was made exclusively by availability and logistical access. In all cases, only medical personnel were surveyed. The survey was distributed through an electronic link to an online form created on the Google Forms platform. The first section of the questionnaire collected demographic data from the surveyed and the SU in which he performs his clinical activity. The second part compiled several aspects of general knowledge, training in diagnostic techniques and therapeutic behaviours.

**Results:** Of a potential 290 recipients, the survey was answered by 267 physicians. 68% of the surveyed were specialists in Family and Community Medicine, 25% in Internal Medicine and 7% were from other specialities. 25% declared having more than ten years of experience, 61% between 5 and ten years, and 14% less than five years. 91.7% of the people polled stated that the management of the non-traumatic pathology of the locomotor system was part of their usual work, while 8.3% indicated that this activity was within the responsibility of the Emergency Traumatologist. The proportion of surveyed who declared themselves capable of performing the following procedures were: knee arthrocentesis, 91.7%; Shoulder infiltration, 75%; Shoulder bursae puncture and fluid aspiration, 16.7%; Joint ankle infiltration, 2.3%; Infiltration in the carpal tunnel, 3.5%; drainage of a patellar bursa, 14.3%; drainage of an olecranon bursa, 12.1%; Infiltrate the elbow, 21.2%; Drain a popliteal cyst, 2.3%. In the last three months, 38.5% of the polled said they had never obtained a joint or bursal fluid for diagnostic purposes, while 30.8% said they had done so only once. In the last three months, 61.5% of the assessed suspected once, giant cell arteritis. More than 60% of the surveyed felt confident of suspecting an outbreak of gout, rheumatoid arthritis, spondyloarthritis, rheumatic polymyalgia, giant cell arteritis, vertebral crushing and chondrocalcinosis based on the clinical signs. Less than 20% of the surveyed reported being able to suspect a connective tissue disorder or a vasculitis.

**Conclusions:** It is our understanding that the teaching priorities are in the field of training in diagnostic techniques, infiltrations other than those of large joints, clinical suspicion of autoimmune systemic diseases and diagnostic management of soft tissue pathology. Those topics must be included in further teaching initiatives to improve the quality of emergency units healthcare in the field of rheumatological urgencies.

### #RHEUMJC: 3 YEAR ANALYSIS OF A TWITTER BASED RHEUMATOLOGY JOURNAL CLUB

C. Collins<sup>1</sup>, J. Campos<sup>2</sup>, A. Isabelle<sup>3</sup>, S. Bhana<sup>4</sup>, A. Jayatilleke<sup>5</sup>, P. Sufka<sup>6</sup>. <sup>1</sup>Rheumatology, MedStar Washington Hospital Center, Washington, USA; <sup>2</sup>Rheumatology, Puerta de Hierro Majadahonda University Hospital, Madrid, Spain; <sup>3</sup>Rheumatology, National Jewish Health, Denver; <sup>4</sup>Crystal Run Healthcare, Middletown; <sup>5</sup>Rheumatology, Drexel University College of Medicine, Philadelphia; <sup>6</sup>Rheumatology, HealthPartners, Saint Paul, USA

**Background:** Twitter is an increasingly popular platform for discussion and engagement amongst healthcare professionals. #RheumJC is a Twitter-based international rheumatology journal club which has occurred approximately once a month for the past 3 years. Here we describe participant analysis and survey results from the past 36 months of this initiative.

**Methods:** A #RheumJC development team, consisting of academic and private practice rheumatologists as well as rheumatology Fellows in Training (FIT), was created to help define the structure and moderate the online discussions. Based

on results from an initial needs assessment survey, a structured journal club format was developed. A total of 23 different online journal clubs were conducted between January 2015 and December 2017, each consisting of both "live" one hour chats, as well as a full 24 hours to allow for asynchronous participation for each session. An analysis of the different sessions was performed to assess participant demographics and participation rates. Additionally, follow up surveys were conducted after the 4th, 10th and 23rd journal club sessions to assess metrics of satisfaction and identify additional strengths or barriers to participation.

**Results:** Over the 36 month observation period, a total of 646 individuals from 36 different countries tweeted with the hashtag #RheumJC. Over 90% of these tweets occurred during the live chat sessions. While the majority of participants were rheumatologists, over 10 different medical fields were represented. The Twitter account @RheumJC currently has almost 2700 followers from 36 different countries, with the USA and UK representing the largest numbers of followers (36.4% and 15.7% respectively), and 31.9% of all accounts originating from the European continent. The affiliated mailing list for #RheumJC has over 235 subscribers. The most recent survey (done after the 23rd journal club session) recorded responses from 37 individuals from 13 different countries who indicated they had participated or followed along in at least one of the journal clubs. 74% of the respondents indicated they had participated in at least 2 or more different sessions. The majority (86%) indicated they were either satisfied or very satisfied with the #RheumJC initiative. 31% of respondents admitted that they had only observed some of the sessions and not joined in the actual discussion suggesting that the total number of #RheumJC participants could be greater than the participation data presented here. Of interest, 9% of respondents indicated they had joined Twitter solely because of #RheumJC, and another 29% stated that #RheumJC had increased their use of Twitter as a tool for medical education. The results from this survey closely mimic the responses from prior surveys suggesting an enduring satisfaction with the initiative.

**Conclusions:** #RheumJC is a novel and popular approach to the traditional medical journal club, bringing together people from around the globe and across specialities to discuss current rheumatology literature utilising Twitter as a medium for medical education. Given its continued success for over 3 years now, the #RheumJC initiative has proven itself a valuable addition to the rheumatology medical education community.

### PHYSICIAN AWARENESS OF RHEUMATIC IMMUNE-RELATED ADVERSE EVENTS IN CANCER PATIENTS TREATED WITH IMMUNE CHECKPOINT INHIBITORS

F. Araújo<sup>1,2</sup>, J.E. Fonseca<sup>3,4</sup>. <sup>1</sup>Rheumatology and Osteoporosis Unit, Hospital de Sant'Ana, SCML, Cascais; <sup>2</sup>Institute of Microbiology, Faculdade de Medicina da Universidade de Lisboa; <sup>3</sup>Rheumatology Research Unit, Instituto de Medicina Molecular, Faculdade de Medicina, Universidade de Lisboa, Portugal; <sup>4</sup>Rheumatology Department, Hospital de Santa Maria, Lisbon Academic Medical Centre, Portugal., Lisbon, Portugal

**Background:** Immune checkpoint inhibitors (ICI) are novel and promising therapies for the treatment of a range of cancer types, acting through stimulation of the patient's immune system to engage on tumour cells. This enhanced immune system may potentially cross-react against any organ system, and reporting of rheumatic immune-related adverse events (irAE) has been growing.

**Objectives:** To evaluate awareness of treatment with ICI and rheumatic irAE among Portuguese rheumatologists and oncologists.

**Methods:** A web-based questionnaire was sent in November 2017 to members of the Portuguese Society of Rheumatology and Portuguese Society of Oncology. Aside from demographic variables, assessed domains included awareness and clinical experience with ICI and irAE, as well as educational needs on the topic and interest in participating in multidisciplinary approaches.

**Results:** Response rates were 61/221 (27.6%) for rheumatologists and 13/653 (2.0%) for oncologists. Demographics were similar in both groups, including mean age (39.9 and 41.1 years) and female gender (59% and 53.8%), respectively; the majority were consultant physicians (67.2% and 69.2%) working at public hospitals (86.9% and 92.3%), respectively. Regarding ICI, most rheumatologists had heard of but were unfamiliar (63.9%) while most oncologists were at least moderately familiar (92.3%) with such therapies. Almost all physicians were aware but more oncologists reported having patients with rheumatic irAE (46.2 vs 4.9%); the most frequent were arthralgia and arthritis. These physicians were all moderately or very confident in managing these irAE. Most physicians considered that Rheumatology-Oncology multidisciplinary approaches would be of benefit and were interested in participating. Education on pathophysiology, epidemiology, clinical assessment and treatment was deemed necessary. Table 1 summarises the main results.

	Rheumatology n=61	Oncology n=13	Total n=74
<b>How familiar are you with ICI used for the treatment of cancer (for instance, anti-CTLA-4, ipilimumab, and anti-PD-1, nivolumab)?</b>			
Totally unfamiliar, n(%)	7 (11.5)	0 (0.0)	7 (9.5)
I have heard of them, but am not familiar, n(%)	39 (63.9)	0 (0.0)	39 (52.7)
Somewhat familiar, n(%)	11 (18.0)	1 (7.7)	12 (16.2)
Moderately familiar, n(%)	4 (6.6)	7 (53.8)	11 (14.9)
Totally familiar, n(%)	0 (0.0)	5 (38.5)	5 (6.7)
<b>Are you aware that ICI can cause rheumatic irAE?</b>			
Yes, n(%)	52 (85.2)	13 (100)	65 (87.8)
No, n(%)	6 (9.8)	0 (0.0)	6 (8.1)
No answer, n(%)	3 (4.9)	0 (0.0)	3 (4.1)
<b>Do you have any patient treated with ICI (namely, anti-CTLA-4, ipilimumab, or anti-PD-1, nivolumab) who developed a rheumatic irAE?</b>			
Yes, n(%)	3 (4.9)	6 (46.2)	9 (12.2)
No, n(%)	36 (59)	6 (46.2)	42 (56.7)
I have no patient treated with such drugs, n(%)	19 (31.1)	1 (7.7)	20 (27)
No answer/do not know, n(%)	3 (4.9)	0 (0.0)	3 (4.1)
<b>If you answered "yes" to the previous question, what type of rheumatic irAE was it?</b>			
Arthralgia, n(%)	2 (66.7)	3 (50.0)*	5 (50.0)
Arthritis, n(%)	1 (33.3)	1 (16.7)	2 (20.0)
Myositis, n(%)	0 (0.0)	1 (16.7)	1 (10.0)
Sicca syndrome, n(%)	0 (0.0)	1 (16.7)*	1 (10.0)
Vasculitis, n(%)	0 (0.0)	0 (0.0)	0 (0.0)
Other, n(%)	0 (0.0)	1 (16.7)	1 (10.0)
<b>Do you believe there is benefit in a multidisciplinary Rheumatology-Oncology approach allowing timely assessment and referral of patients who develop rheumatic irAE?</b>			
Yes, n(%)	56 (91.8)	11 (84.6)	67 (90.5)
No, n(%)	1 (1.6)	1 (7.7)	2 (2.7)
No answer/do not know, n(%)	4 (6.6)	1 (7.7)	5 (6.8)
<b>What are your educational needs on rheumatic irAE?</b>			
Pathophysiologic and immunologic principles, n(%)	7 (11.5)	0 (0.0)	7 (7.9)
Epidemiology and clinical features, n(%)	8 (13.1)	0 (0.0)	8 (9.1)
Assessment and treatment, n(%)	19 (31.1)	5 (38.5)	24 (27.3)
All of the above, n(%)	41 (67.2)	8 (61.5)	49 (55.7)

ICI: Immune checkpoint inhibitors; irAE: Immune-related adverse events  
 \* Postgraduate clinical experience, including residency.  
 † Predominant workplace (> 50% of weekly schedule).  
 \* One patient developed concurrent arthralgia and sicca syndrome.  
 \* More than one answer was allowed.

Abstract AB1386 – Figure 1

**Conclusions:** Most rheumatologists had limited knowledge of ICI and limited experience with rheumatic irAE, compared to oncologists. Both groups considered that the development of multidisciplinary teams would be beneficial to allow timely assessment and referral of these patients. Despite limited by the response rate (particularly low for oncologists) and response bias, this study emphasises the need for specific education on ICI and irAE, especially for Portuguese rheumatologists.

#### ACKNOWLEDGED BIostatistical HELP AND THE QUALITY OF STATISTICAL ANALYSES IN RANDOMISED CONTROLLED TRIALS IN RHEUMATOLOGY

G. Guzelant, E. Dincses, G. Hatemi, H. Yazici. *Rheumatology, Istanbul University, Cerrahpasa, Istanbul, Turkey*

**Background:** The quality of statistical analysis and reporting are wanting even in our most prestigious journals.<sup>1</sup> It stands to reason that active participation of biostatisticians in data analysis and reporting would improve the situation.

**Objectives:** We aimed to test the hypothesis that more close cooperation with biostatisticians would improve the quality of reporting randomised clinical trials in rheumatology. We defined a *close cooperation* as the inclusion of a formal biostatistician among the co-authors and/or a declaration of formal statistical help in the study reports.

**Methods:** Two independent observers screened both by reading and, when applicable, electronic scanning the texts of all randomised controlled trials (RCT) in *Annals of the Rheumatic Diseases*, *Arthritis Care and Research*, *Arthritis and Rheumatology*, *Rheumatology Oxford* published in 2015 and 2016. Using a prepared worksheet, the observers specifically tabulated, the presence of a biostatistician among the co-authors and/or formal acknowledgement of statistical help in the methods, the inclusion of effect sizes (whether they were specifically indicated as such, could be calculated or not given at all) and the corresponding confidence intervals. The instances in which an effect size was given as a number needed to treat (NNT) and number needed to harm (NNH) were separately sought. In addition at the number of times separate p values were reported for interdependent comparisons (like DAS28-CRP and DAS28-ESR), and the presence of a Bayesian analysis in the methods.

**Results:** The total RCT number in these four journals was 134. In 26 trials, there was a biostatistician or an epidemiologist as a co-author and in 3, statistical help

was acknowledged in the text. In the remaining 105 papers (78%) no statistical help was declared. The tabulation of effect sizes, confidence intervals and giving separate p values for interdependent variables are given in the table 1. In giving the effect sizes it is to be noted that the presence of a statistician made did not improve the explicit announcement of an effect size but made it more calculable. None of the trials used Bayesian methods for analysis. Only in one trial NNT and in another NNH (both with no acknowledged biostatistical help) were given.

Abstract AB1387 – Table 1. The differences of the parameters between two groups

	Group 1 (n=29) (with statistician)	Group 2 (n=105) (without statistician)	Calculated effect size between the Groups 1 and 2
Effect size reporting, n (%)	26 (90)	61 (58)	32% (95% CI 13.1–43.3) p=0.001
Given directly, n (%)	2 (7)	5 (5)	
Can be calculated (given HR, OR, RR, B coefficient), n (%)	24 (83)	46 (44)	
Confidence intervals reporting, n (%)	16 (55)	43 (41)	14% (95% CI –6–32.7) p=0.18
Calculating p values for interdependent variables, n (%)	14 (48)	46 (44)	4% (95% CI –14.9– 23.9) p=0.67

**Conclusions:** The inclusion of a biostatistician improved the reporting of effect sizes, at least rendering them calculable. The same cannot be said for reporting confidence intervals and separate p values for interdependent variables. It was interesting that Bayesian analyses and giving NNT and NNH, rather intuitive ways of expressing effect sizes, were not popular. There were 2 main limitations. The sample size was relatively small and many authors could have obtained statistical help without acknowledging it.

<sup>3</sup> ARTHIL Institute

<sup>4</sup> Universidad de las Américas Puebla, Puebla, Mexico.

<sup>5</sup> Department of Psychology, Medicine School Benemérita Universidad Autónoma de Puebla, Puebla, México.

**Summary:** Systemic lupus erythematosus (SLE) has been associated with cardiovascular disease and metabolic syndrome (MS). A supportive educational intervention to modify lifestyle could improve morbidity and mortality in SLE patients with MS.

**Objectives:** To measure the impact of an educational intervention that improves the knowledge about disease and lifestyle in SLE patients with MS.

**Methods:** A quasi-experimental study was conducted among SLE patients with SM according to the ATP III criteria at Systemic Autoimmune Diseases Research Unit of the Regional General Hospital No. 36 of the Mexican Institute of Social Security, Puebla. Clinical educational intervention in emotional and cognitive domains in the experimental group included classroom activities and outpatient consultation, evaluating healthy lifestyle knowledge that included physical activity, feeding habits and stress management with FANTASTIC instrument. Basal and final measurements were analysed with the Wilcoxon test with SPSS v21.

**Results:** Eighty nine patients were included. Age  $46.1 \pm 12.6$  years,<sup>17-70</sup> weight  $64.2 \pm 14.5$  kg,<sup>42-137</sup> 20.2% overweight and 38% obesity, 50% education over 12 years, 49.4% housewife, 39% employed, 67% lived with a partner, SLE disease evolution  $12.1 \pm 6.9$  years and prednisone dose  $10.2 \pm 10.8$  mg/day (0–50).

In the retest, disease and comorbidities knowledge was modified. The domains of lifestyle such as physical activity, family-friends and nutrition showed statistical significant changes after the intervention  $p < 0.05$ .

**Conclusions:** The educational intervention modified the conceptual perception of SLE and MS as well as some domains of lifestyle.

### HOW DO WE LEARN TO COMMUNICATE TO OUR PATIENTS? AN INVENTORY STUDY AMONGST RHEUMATOLOGISTS IN TRAINING IN THE NETHERLANDS HOW THEY TRAIN COMMUNICATION SKILLS

L. Kraneburg – Van Koppen<sup>1</sup>, M. Hazes<sup>1</sup>, W.V.D. Broek<sup>2</sup>, M. Dankbaar<sup>2</sup>.  
<sup>1</sup>Rheumatology, <sup>2</sup>Erasmus MC, Rotterdam, Netherlands

**Background:** Effective doctor-patient communication, more specific 'Shared Decision Making (SDM)', is essential in high-quality health care. Physicians value the principles of SDM, but the practice is disappointing. Difficult subjects are avoided, options are not equally explained or patients' values remain unclear. As a rheumatologist, communication is an essential and powerful competency. Guidelines endorse SDM for the management of various rheumatic diseases. What we do not know is how we acquire the right communication skills for the task. As rheumatologists we learn a lot about pathophysiology, diagnostic approach and treatment options, but not how to explain these aspects in comprehensible language to our patients.

**Objectives:** Objective of this study is to investigate how rheumatologists in training acquire communication skills, more specific skills in SDM. How do they rate their communication competency and what can be done to improve.

**Methods:** An online survey was developed with questions dedicated to evaluate the posed questions. The survey was distributed amongst aspirant members of the Dutch Society for Rheumatology by email with a link to the survey. The survey consists of questions asking for self-reflection and rating on various communication skills regarding different aspects of communication.

**Results:** These are preliminary results based at the first 23 responses, which is 33% of the total number of rheumatologists in training. From the received responses eleven fellows were in their fourth year, four in their fifth year and seven were in their final year of education. Fellows believe communication is the most important CanMEDS competency after 'Medical Expert'. Self-assessment of communication competency shows an average score of 3.7 on a five-point scale (5=most experienced). When a new diagnosis is explained, fellows rate their skills at levels to be expected for their years of education, except for the diagnose SLE, Systemic Sclerosis and M. Sjögren. Items that are always discussed are the diagnosis and the treatment, but other aspects such as implications for pregnancy, work, social life and sexual intercourse are only discussed on request. Regarding the explanation of treatment options the right words to explain different biological DMARDs seem to run short. When presenting details about treatment fellows always communicate possible treatment effect and side effects, but do not always mention frequency of side-effects. Furthermore, alternatives and preferences of the patient are not always discussed but only on request by 68% of the respondents. Fellows indicate that they think communication and SDM are very important and are interested to acquire further skills. They prefer videos with examples of how to explain certain diagnoses, treatment options and how to deal with various patient types. A specific request was made for a training in Somatic Unexplained Complaints.

### HOW DO WE LEARN TO COMMUNICATE TO OUR PATIENTS?

AN INVENTORY STUDY AMONGST RHEUMATOLOGISTS IN TRAINING IN THE NETHERLANDS HOW THEY TRAIN COMMUNICATION SKILLS

Abstract AB1389 – Figure 1

**Conclusions:** Rheumatologists in training highly value good doctor-patient communication. In daily practice the explanation of certain diseases and treatment options seems difficult. Diagnoses and drugs with possible (side) effects are always explained, but social implications and patients' preferences are only discussed on request. Therefore, additional training of SDM seems important.

### OSTEOPOROSIS ASSOCIATED MORBIDITY ANALYSIS CAN REVEAL TARGETS FOR BETTER DISEASE DIAGNOSIS AND MANAGEMENT

L. Chicea. Rheumatology, County Hospital, University Lucian Blaga of Sibiu, Romania SIBIU, Sibiu, Romania

**Background:** Osteoporosis accounts for more disability and life years lost than rheumatoid arthritis. It brings an elevated risk of mortality, morbidity and re-hospitalisation due to fractures and a significant financial and social burden.

A rationale use of diagnostic and therapeutic resources is useful and should be encouraged at all intervention levels. For admitted patients, clinical risk factors for fractures and conditions that are causes for secondary osteoporosis should trigger either the diagnosis approach or the referral to a (Rheumatology/Endocrinology) specialist and treatment should be started during hospitalisation.

**Objectives:** We aimed to identify targets for educational or protocol interventions in order to improve inpatient osteoporosis diagnosis and subsequent management.

**Methods:** A retrospective three years (2014–2016) cross-sectional prevalence analysis of comorbidities in all hospitalised patients with osteoporosis in our general hospital was conducted. We used the medical records database of our hospital.

**Results:** Osteoporosis as a principal diagnosis was found in 46 cases, mostly from the Endocrinology Department (65%). Osteoporosis as a secondary diagnosis was found in 2464 cases, and only 11% were diagnose-associated with fractures. 23% of all comorbidities are of endocrine or diabetic etiology. A small percent of osteoporosis cases have simultaneous skeletal disease, mostly vertebral fractures, osteomalacia or degenerative disease. Only 8,77% of secondary osteoporosis was diagnosed in the Orthopaedic Department. No osteoporosis was mentioned in association with COPD or oncologic disease. Only 65% of patients leaving the hospital had specific recommendation for anti-osteoporotic medication.

**Conclusions:** Osteoporosis should be mentioned in all cases in the patients medical records that are further sent to the general practitioner. Osteoporosis may be better diagnosed in diabetic, oncologic, COPD, Parkinson disease patients and in a large percent of fracture patients if internal referral protocols will be implemented. Appropriate therapy should be recommended from the hospital specialists.

### OBSTACLES FACING EVIDENCE BASED MEDICINE IN PHYSICAL MEDICINE AND REHABILITATION: FROM OPINION AND KNOWLEDGE TO PRACTICE

M. Babaei, S.A. Raeissadat, S.M. Rayegani, M.H. Bahrami. *Physical medicine and rehabilitation research center, Shahid Beheshti university of medical sciences, Tehran, Iran, Islamic Republic of Iran*

**Background:** Evidence-based medicine (EBM) is a new approach to medicine. Up to now, there have been few available articles about specialists' EBM status, specifically the status of physiatrists in the area of EBM.

**Objectives:** To determine the present status of physiatrists' attitudes, knowledge and skill in the area of EBM and the existing obstacles

**Methods:** The cross-sectional study was performed among physiatrists in Iran. The valid and reliable questionnaire contained 25 questions in 8 fields including demographic and professional information, point of view regarding EBM, familiarity with databases, educational history and information about EBM, use of scientific resources, scientific evidence usage, and the amount of access to resources.

**Results:** One hundred twenty-eight questionnaires were completed (response percentage 52.2%). In total, 48.4% specialists had attended EBM workshops and 89.6% of people were familiar with medical search engines. The amount of familiarity with databases was mostly with MEDLINE/PubMed (52.3%). Respondents mainly had a positive point of view towards EBM. Those who had access to databases at work or somewhere out of home had a more positive attitude ( $p=0.002$ ). Those who had attended EBM workshops and members of faculty also had more positive attitudes ( $p=0.003$  and  $p=0.01$ , respectively). Around 70% of responders had adequate knowledge regarding EBM. Physicians, members of faculty and participants who had spent more time on research, reviewed articles and attended workshops had more knowledge ( $p=0.001$ ).

**Conclusions:** Results from our study revealed that although there is a significant number of physiatrists who are familiar with the practicality of EBM, they are still not familiar enough with its concepts and applications.

### EFFECT OF UNIVERSITY STRUCTURE ON MEDICAL STUDENTS' KNOWLEDGE DURING EXAM PREPARATION

R. Sengewein, R. Brinks, G. Pongratz. *POLIKLINIK FÜR RHEUMATOLOGIE, UNIKLINIK DÜSSELDORF, Düsseldorf, Germany*

**Background:** In 2016 the German Society of Rheumatology found out that only seven faculties out of 37 could be classified as an independent rheumatological teaching unit. Amount of lecture hours and type varied largely between

universities and was usually the most in universities with academic freedom. Besides the lack of lectures in rheumatology, all students have to pass a medical state examination ("Staatsexamen"), which is carried out by the IMPP ("Institut für Medizinische und Pharmazeutische Prüfungsfragen"). The written exam consists of 320 Multiple-Choice IMPP-Questions with only one correct answer out of five possible choices. Approximately five to ten questions, varying from exam to exam, also contain rheumatological content. After each exam questions are published and used by younger students for exam preparation. The e-Learning platform "Amboss" is frequently used by medical students for this reason in Germany.

**Objectives:** To investigate the effect of university structure on correct answering former IMPP-Questions during exam preparation.

**Methods:** We analysed former IMPP-Questions answered by students over a four-year period recorded on "Amboss" (Oct. 2012 – Oct. 2016). First time answered questions with rheumatological content from students during exam preparation were identified and extracted from the total record. Students with only a single or very few questions answered were not considered as being in exam preparation and excluded. A sensitivity analysis was done after exclusion. Students from independent (Group A) and non-independent (Group B) medical faculties were divided into two groups and investigated for the rate of correct answering IMPP-Questions. Statistical Analysis was done with the Statistical Software R (The R-Foundation for Statistical Computing; Version 3.4.1).

**Results:** A total of 176 questions with rheumatological content were identified. 32.166 students answered those questions or a subset of these (in total 2.610.217 questions). After excluding students not being in exam preparation 14.739 students were left, answering those questions 2.148.801 times. On an average 68,3% of the questions were answered correctly. The sensitivity analysis did not show a significant difference. 3330 students from Group A answered 495.614 questions, on an average 69,4% correct. 11.409 students from Group B answered 1.963.066 questions, on an average 68% correct. The difference between both groups was significant ( $p<0.01$ ).

**Conclusions:** Students from independent faculties answered more questions correct than from non-independent faculties. The difference was significant, but taking into account the few questions asked in the real exam the difference would have no relevance.

AB1393

### EFFECT OF AN EDUCATIONAL INTERVENTION BASED ON CLINICAL SIMULATION IN THE DIAGNOSIS OF RHEUMATOID ARTHRITIS IN LATIN AMERICAN NON-RHEUMATOLOGISTS PHYSICIANS

S.A. Mora Alfonso<sup>1,2</sup>, D.G. Fernández Ávila<sup>2,3</sup>. <sup>1</sup>Rheumatology, Universidad de la Sabana; <sup>2</sup>Rheumatology, Sociedad para la Investigación, atención y educación en enfermedades reumáticas INVEDER SAS; <sup>3</sup>Pontificia Universidad Javeriana – Hospital Universitario San Ignacio. Bogotá, Colombia, Bogotá, Colombia

**Background:** Previously our group demonstrated the effectiveness of an educational intervention based on clinical simulation to improve the diagnostic approach to RA (Rheumatoid Arthritis) <sup>(1)</sup> so we wanted to apply this same principle in the learning of RA among a group of Latin American non-Rheumatologists

**Objectives:** This paper wants to quantify the rate of improvement in the diagnosis of Rheumatoid Arthritis (RA) among a group of Latin American non-Rheumatologists (general practitioners, internists, physiatrists, orthopedists, neurosurgeons, dermatologists) who received an educational intervention based on clinical simulation.

**Methods:** Observational study before and after

**Results:** 286 Latin American non-rheumatologists physicians received an educational intervention based on clinical simulation. The topic of this educational intervention was based on Rheumatoid Arthritis. They reviewed a workshop that includes clinical simulation models of 5 hands and each hand, had various semiological findings of RA (synovitis, pannus, joint deformities). The workshop lasted 5 hours and it was divided into two parts: the first was about the clinical approach of joint pain and relevant aspects of RA. The second part focused on clinical cases applied to clinical simulation models, applying the knowledge acquired during the theoretical phase. Participants made a several stations where they could appreciate for periods of 20 min each simulator and improve their visual and tactile sensitivity in each semiological findings for the diagnosis of RA. The participants filled out a pre and post test, which included 6 (six) clinical cases with simulators and photographs of hands of patients with suspected RA. 286 non-rheumatologists (general practitioners, internists, physiatrists, orthopedists, neurosurgeons, dermatologists) from 3 Latin American countries (Colombia, Costa Rica and Dominican Republic) participated in the study, 71% women, average age 40,3 years (SD 7,5 years). Non-rheumatologists physicians obtained an improvement in the correct diagnosis of RA of 45,6% (the correct diagnosis increased from 44,5% to 90,1%). The total number of exams requested in the cases presented decreased significantly, from an average of 7 to 3 exams requested by each clinical case presented. 95% of participants would recommend to other colleagues to make this

workshop. 97% believe that this educational intervention will improve the diagnostic approach to patients with suspected RA.

Abstract AB1393 – Figure 1

**Conclusions:** The present research is a pioneer and innovator in the field of rheumatology education. We have shown the usefulness of clinical simulation by an improvement in the diagnostic sensitivity towards the diagnosis of RA, highlighting the semiology as a key element at the time of making the diagnosis. A significant decrease in the total number of exams requested for each of the clinical cases analysed was documented, which can have a positive effect on costs for the national health systems.

#### AB1394 DEVELOPMENT OF A SERIES OF SIMULATORS AND DESIGN OF A COURSE BASED ON CLINICAL SIMULATION, FOR TEACHING DIAGNOSTIC APPROACH TO PATIENTS WITH JOINT PAIN AND SUSPECTED RHEUMATIC DISEASES

S.A. Mora Alfonso<sup>1,2</sup>, D.G. Fernández Ávila<sup>2,3</sup>, on behalf of Sociedad para la Investigación, atención y educación en enfermedades reumáticas INVEDER SAS. <sup>1</sup>Rheumatology, Universidad de la Sabana; <sup>2</sup>Rheumatology, Sociedad para la Investigación, atención y educación en enfermedades reumáticas INVEDER SAS; <sup>3</sup>Pontificia Universidad Javeriana – Hospital Universitario San Ignacio. Bogotá, Colombia, Bogotá, Colombia

**Background:** The teaching of clinical approaches to patients with RA (Rheumatoid Arthritis) and SpA (Spondyloarthritis) requires both a practical and a theoretical component, and there are difficulties in having real patients for teaching. Previously our group has shown the use of clinical simulation in rheumatology, an area in which it had not been used. We demonstrated the effectiveness of an educational intervention based on clinical simulation to improve the diagnostic approach to RA1. Thus, the idea emerged to apply clinical simulation in the field of RA and SpA teaching. An exhaustive search of the scientific literature through May 2017 revealed no works on clinical simulation for rheumatic diseases. The simulation models received a patent for intellectual property and utility for education, with a 10-year protection.

**Methods:** Design and installation a life-sized mannequin and separate anatomical parts (five hands, six fingers, three feet) with a set of semiological findings for SpA and RA

**Results:** We have designed unique simulation models –a life-sized mannequin and separate anatomical parts (five hands, six fingers, three feet) with a set of semiological findings for SpA and RA. Each simulator (artificial hands, finger or feet) has natural size and was made of epoxy resin. The simulators ligaments, muscles and support tissues were made of silicone rubber, and the simulator was covered by polyurethane skin on an acrylic support. Each hand, feet or finger has various semiological findings of SpA and RA (synovitis, pannus, enthesitis,

dactylitis, joint deformities, classical findings of psoriatic nails and psoriatic plaques) made from materials that generated textures very similar to those found in real patients. Learning is transferred from interacting with the models by using the sense of touch to feel and perceive how the clinical manifestations of the diseases are. The workshops comprise a six-stage rotation where the anatomical models are accompanied by a brief video describing a clinical case. After viewing the video participants interact with the models to understand and recognise each of the clinical features of SpA and RA, as if in a real patient. Whereas in regular workshops where knowledge is transfer through a keynote speaker and visual images, this one is a total learning by the experience of touching and feeling.

Abstract AB1394 – Figure 1

**Conclusions:** The present research is a pioneer and innovator in the rheumatology education. In this vein, we hope that this research is the first in the context of a new way of teaching rheumatology, educational process and eventually will have a global projection that allows the creation of a course for early diagnosis and initial treatment of rheumatic diseases, similar to what is currently done in cardiology with ACLS and in trauma with ATLS

#### AB1395 EFFECT OF AN EDUCATIONAL INTERVENTION BASED ON CLINICAL SIMULATION IN THE DIAGNOSIS OF SPONDYLOARTHRITIS (SPA) FROM GENERAL PRACTITIONERS, A STUDY BEFORE AND AFTER

S.A. Mora Alfonso<sup>1,2</sup>, D.G. Fernández Ávila<sup>2,3</sup>, on behalf of Sociedad para la Investigación, atención y educación en enfermedades reumáticas INVEDER SAS. <sup>1</sup>Rheumatology, Universidad de la Sabana; <sup>2</sup>Rheumatology, Sociedad para la Investigación, atención y educación en enfermedades reumáticas INVEDER SAS; <sup>3</sup>Pontificia Universidad Javeriana – Hospital Universitario San Ignacio. Bogotá, Colombia, Bogotá, Colombia

**Background:** Previously our group has shown the use of clinical simulation in rheumatology. We demonstrated the effectiveness of an educational intervention based on clinical simulation to improve the diagnostic approach to RA1, so we wanted to apply this same principle in the learning of SpA (Spondyloarthritis).

**Objectives:** This paper wants to quantify the rate of improvement in the diagnosis of Spondyloarthritis (SpA) among a group of general practitioners who receive an educational intervention based on clinical simulation.

**Methods:** Intervention study before and after

**Results:** 102 general practitioners received an educational intervention based on clinical simulation. The topic of this educational intervention was Spondyloarthritis (SpA). A workshop that includes clinical simulation models of feet, fingers and a mannequin created for this purpose was created, based on the strategy of problem-based learning. The workshop lasted 5 hours, it was divided into two parts: the first was about the of the clinical approach of joint pain and lumbar pain diagnosis and relevant aspects of SpA. In this first part, besides the theoretical support

for the diagnosis of SpA, participants viewed pictures of patients with spondylitis and peripheral involvement (enthesitis, dactylitis, arthritis) seeking to achieve awareness of their sense of sight with respect to the diagnostic approach to patients with suspected SpA and sought to strengthen the logical approach to be implemented when approaching this type of patients. The second part focused on clinical cases applied to clinical simulation models, applying the knowledge acquired during the theoretical phase. Participants made a several stations where they where they could appreciate for periods of 15 min each simulators of 3 feet, 6 simulators simulated fingers and a mannequin where they can identify entheses and psoriasis lesions, improving visual and tactile sensitivity in each semiologic findings for the diagnosis of SpA. The participants filled out an pre and post test, which included clinical cases with simulators and photographs of hands and feet of patients with suspected SpA. 102 participants (59% women), average age 32.3 years (SD 7.1). Improvement in the correct diagnosis of SpA of 47% (the correct diagnosis increased from 39% to 86%). laboratories application in the cases presented decreased significantly, from an average of 8–4 exams requested by each clinical case presented. 98.5% of participants would recommend to other colleagues to make this workshop. 97.7% believe that this educational intervention will improve the diagnostic approach to patients with suspected SpA

Abstract AB1395 – Figure 1

**Conclusions:** We have shown the usefulness of clinical simulation given by an improvement in the diagnostic sensitivity towards the diagnosis of SpA. A significant decrease in the total number of exams requested for each of the clinical cases analysed was documented, which can have a positive effect on costs for the national health systems.

#### TEACHING THE MILLENNIALS: USING YOUTUBE FOR TEACHING RHEUMATOLOGY IN THE STANDARD EDUCATIONAL SETTINGS

Y. El Miedany<sup>1,2</sup>, N. El Arousy<sup>2</sup>, S. Youssef<sup>2</sup>, S. Almedany<sup>3</sup>, D. Palmer<sup>4</sup>.  
<sup>1</sup>Rheumatology, Darent Valley Hospital, Dartford, UK; <sup>2</sup>Rheumatology and Rehabilitation, School of Medicine Ain Shams University, Cairo; <sup>3</sup>Rheumatology and Rehabilitation, School of Medicine Tanta University, Tanta, Egypt; <sup>4</sup>Rheumatology, North Middlesex University Hospital, London, UK

**Objectives:** To assess learning potential and educational value of online videos made freely available via a dedicated YouTube channel for undergraduate and post-graduate students studying musculoskeletal medicine.

**Methods:** The YouTube video database was systematically searched using 5 search terms related to "Joint": examination, anatomy, regional anatomy, OSCE and Ultrasonography. Two independent clinical reviewers assessed videos for procedural technique and educational value using a 5-point global score, ranging from 1=poor quality to 5=excellent educational quality. To be included in the teaching process the clip must score  $\geq 4$ . Permission for sharing the video was sought from the publisher. 59 undergraduate 55 postgraduate trainees were included in this educational activity. The students were sent the YouTube channel link to the students for viewing prior to the class-time active learning session. The teaching session adopted an interactive learning environment and the course instructor served as a facilitator rather than a dominator and offered timely feedback/guidance to students. Evaluation of the teaching session was assessed using a scenario based learning and an evaluation check list. The students were asked to complete a survey based on a 5-point Likert scale: to assess for their perceived effectiveness and satisfaction. The outcomes of the evaluation sheet and students' survey, were compared to 55 undergraduate and 52 postgraduate trainees, a control group, who were taught in former years on the same topics in a lecture-based model using the standard teaching protocols.

**Results:** 25 videos met the inclusion criteria and were considered useful for teaching purposes. The average length was  $5.31 \pm 2.28$  min. The mean global score for educational value was  $4.3 \pm 0.3$ . There was no significant difference regarding socio-demographics between the 2 students' groups included in this work. In the study group 93% of the students viewed the videos prior to the class session, and 95% attended the education sessions in comparison to 86% attendance in the traditional teaching group. Students reported an increase in knowledge, a positive learning experiences and perceptions of the online teaching model. Student perceived effectiveness and satisfaction was significantly high among the online flipped learning in contrast to the traditional teaching comparative group (4.88 Vs 4.31,  $p < 0.05$ ). Similarly, analysis of the students' assessment scores after the scenario based learning sessions was higher in the online learning group compared to the students taught by traditional methods ( $p < 0.01$ ).

**Conclusions:** Making videos on Joint anatomy and OSCE joint examination freely available on a dedicated channel on the YouTube appeared to be suitable and valuable for medical students, fellows, and residents learning. YouTube is a great example for web-based modern musculoskeletal teaching tailored to the students' needs/time, and this educational approach seems to be very well received by the students. However, though the learning potential of the internet is incredible, finding the best content can be a challenge.

**HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative)****THU0710-HPR QUALITIES OF PARTICIPATION AS DESCRIBED BY PEOPLE WITH EARLY RA IN WORKING AGE**

A. Sverker<sup>1,2,3</sup>, I. Thyberg<sup>4</sup>, E. Valtersson<sup>1</sup>, M. Björk<sup>5,6</sup>, G. Östlund<sup>7</sup>, S. Hjalmarsson<sup>8</sup>. <sup>1</sup>Department of Activity and Health, Department of Medical and Health Sciences, Linköping University; <sup>2</sup>Department of Rehabilitation Medicine, Linköping University, Linköping; <sup>3</sup>Department of Social and Welfare Studies, Linköping University, Norrköping; <sup>4</sup>Department of Rheumatology, Linköping University; <sup>5</sup>Department of Rheumatology, Linköping University, Linköping; <sup>6</sup>Department of Social and Welfare Studies, Linköping University, Norrköping; <sup>7</sup>Division of Social Work, School of Health Care and Social Welfare, Mälardalen University, Eskilstuna; <sup>8</sup>Patient Research Partner, Swedish Rheumatism Association, Norrköping, Sweden

**Background:** Early diagnosis and medication has been effective but impairments, activity limitations, and participation restrictions are still evident in RA. To be able to participate despite RA is a recurrent goal for persons with early RA as well as in standards of care. Nevertheless, patients' perceptions of what kind of situations constitute an experience of participation are seldom explored in research. Though, participation ladders illustrating people's influence on matters that concern them have earlier been described in social sciences in relation to citizens' rights, and children's rights.

**Objectives:** To describe when and how people with early RA describe a positive sense of participation in everyday life, including to categorise the qualities of these experiences.

**Methods:** This study is part of the Swedish early RA project "TIRA". Critical incidents technique was used in the design of the semi structured interviews. In all, 59 patients (age 18–63 years) were interviewed; 25 men and 34 women. The study has been approved by the local ethics committee and has followed the ethical standards of the Helsinki Declaration. Content analysis was used to identify meaning units with descriptions related to the aim, which were sorted based on type of situations described, and later on categories based of quality aspects of participation were developed.

**Results:** The qualities of participation as described by people with RA were arranged as a ladder with the following steps; 1. Being part of a group, 2. Carry out activities in company, 3. Share everyday chores and responsibilities, 4. Have influence on actions, 5. Give direction of goals, 6. Share decision making. Participation was experienced with others at specific moments when the positive feeling described was *being part of a group* in relations with family, friends, in working life and in recreation and social life. For instance, both women and men described the experience of participation in the work group, especially when given the possibility to *have influence on actions*, or the possibility to *give direction of goals* in the management of work or in organised activities. They described a positive feeling of participation if *sharing everyday chores and responsibilities* with someone and when just *carrying out activities* in company with others at work, in domestic life, and in sports and leisure activities. The interviewees also described how the sense of participation was particular intensive when *sharing decision making*.

**Conclusions:** Participation from an individual's perspective is about belonging and having influence that mediates a positive feeling of being included and that you matter as a person. The results are important when using participation as a goal in the clinical care.

**HPR Measuring health (development and measurement properties of PROs, tests, devices)****THU0711-HPR WIDESPREAD PAIN IN AXIAL SPONDYLOARTHRITIS: CLINICAL IMPORTANCE AND GENDER DIFFERENCES**

T.W. Swinnen<sup>1,2,3</sup>, W. Dankaerts<sup>3</sup>, R. Westhovens<sup>1,2</sup>, K. de Vlam<sup>1,2</sup>. <sup>1</sup>Division of Rheumatology, University Hospitals Leuven; <sup>2</sup>Skeletal Biology and Engineering Research Center, Department of Development and Regeneration, KU Leuven; <sup>3</sup>Musculoskeletal Rehabilitation Research Unit, Department of Rehabilitation Sciences, KU Leuven, Leuven, Belgium

**Background:** Cardinal clinical signs and symptoms of axSpA include inflammatory pain, stiffness and impaired mobility in the axial region and to a lesser extent the peripheral joints. Although these features are thought to reflect local disease processes, bottom-up or top-down amplification of nervous system signalling may

alter this relationship and may induce widespread pain.<sup>1</sup> There is a remarkable lack of detailed knowledge on pain areas in axSpA and its clinical relevance is unknown. Also, gender differences in pain area may exist in axSpA and may confound disease activity outcomes.

**Objectives:** Firstly, pain locations in axial axSpA were detailed and gender differences were assessed. Secondly, the relationship of regional pain definitions as well as widespread pain with clinical outcomes was evaluated. Finally, the role of pain area in the assessment of disease activity was explored, taking gender into account.

**Methods:** Body charts informed on axial, peripheral articular and non-articular pain in 170 (108 men, 62 women) patients with axSpA. Multivariate odds ratios compared genders. General linear models explored clinical differences in disease activity (BASDAI, Bath Ankylosing Spondylitis Disease Activity Index), activity limitations (BASFI, Bath Ankylosing Spondylitis Functional Index), fear of movement (TSK-11, Tampa Scale for Kinesiophobia 11-item version), anxiety (HADS-A, Hospital Anxiety and Depression Scale subscale anxiety) and depression (HADS-D, HADS subscale depression) between four subgroups classified by widespread non-articular pain (WNAP±) and physician-reported global disease activity (PGDA±). Principal component analysis explored gender differences in the structure of disease activity outcomes.

**Results:** Axial thoracic pain was least prevalent (lumbar: 74.4%, cervical: 47.6%, cervicothoracic: 47.6%, thoracic: 32.4%), but about three times more likely in women (OR: 2.92, p=0.009). Axial cervicothoracic junction pain spread more diffusely in women (OR: 2.48, p=0.018). Women exhibited a two to three-fold increased likelihood of widespread axial (OR: 3.33, p=0.007) and peripheral articular (OR: 2.34, p=0.023) pain. A subgroup of WNAP+/PGDA- combined with low PGDA (27% of all patients) was associated with worse BASFI, BASDAI, HADS-A and HADS-D in men and worse TSK-11 and HADS-A in women (p<0.05). Disease activity outcomes showed a two-factor structure in women, but not in men.

**Conclusions:** In patients with axSpA, the location and spread of pain was different between genders and is related to worse clinical status. Based on pain area and physician-reported global disease activity, meaningful clinical subgroups were identified with a remarkably distinct health status. Outcome instruments such as BASDAI should acknowledge gender differences to ensure structural validity.

THURSDAY, 14 JUNE 2018

**HPR Epidemiology and public health (including prevention)****THU0712-HPR TRAJECTORIES OF PAIN AND PHYSICAL FUNCTION IN PATIENTS WITH SYMPTOMATIC KNEE AND HIP OSTEOARTHRITIS: RESULTS FROM THE FRENCH POPULATION-BASED KHOALA COHORT**

M. Wiecek<sup>1</sup>, C. Rotonda<sup>1</sup>, F. Guillemin<sup>1,2</sup>, A.-C. Raï<sup>1,3</sup>. <sup>1</sup>EA 4360 APEMAC, University of Lorraine; <sup>2</sup>CIC-1433 Epidémiologie Clinique, Inserm; <sup>3</sup>Department of rheumatology, CHRU Nancy, Vandoeuvre-lès-Nancy, France

**Objectives:** The aims of this study were to identify homogeneous subgroups with distinct trajectories of pain and physical function in patients with symptomatic knee and/or hip OA and to identify the baseline predictive factors associated with these trajectories.

**Methods:** The KHOALA cohort is a French population-based multi-center cohort of 878 patients with symptomatic knee and/or hip OA, aged between 40 and 75 years old. Pain and function were measured annually with the WOMAC questionnaire. Baseline comorbidities were assessed by the Functional Comorbidity Index (FCI), perceived vitality was measured with SF-36 and psychosocial distress with the General Health Questionnaire (GHQ). Using the follow-up data over 5 years, latent class growth analyses (LCGA) were used to identify homogeneous subgroups with distinct trajectories of pain and function. The selection of the optimal models was based on maximisation of the Bayesian information criterion, the proportion of patients in each trajectory group (>5%) and the statistical significance of the equation modelled (intercept only, linear, quadratic or cubic). Multinomial logistic regressions were performed to identify the predictive baseline characteristics associated with each trajectory and were adjusted for socio demographic and clinical factors.

**Results:** Among the 878 patients, 609 (69.4%) were women, 222 (25.3%) had hip OA, 607 (69.1%) knee OA and 49 (5.6%) both hip and knee OA.

LCGA revealed 4 distinct linear and stable trajectories of pain: "no pain" (n=131, 16.2%), "mild pain" (n=269, 33.3%), "moderate pain" (n=247, 30.5%), and "severe pain" (n=162, 20.0%). Compared with the "no pain" group, subjects belonging to the subgroup "severe pain" were more likely to be female (Odds ratio [OR]=5.13, 95% confidence interval [CI]=2.46–10.70), with a high body mass index (BMI) (OR=1.13, 95%CI=1.07–1.20), a high number of comorbidities (OR=1.42, 95% CI=1.13–1.78), a low vitality score (thus a high level of fatigue; OR=0.94, 95% CI=0.91–0.96), a high disease duration (OR=1.06, 95%CI=1.02–1.10), and a low GHQ score (thus a high psychosocial distress; OR=0.94, 95%CI=0.91–0.98). For physical function, 4 distinct stable trajectories were identified: "no functional limitations" (n=239, 29.6%), "low functional limitations" (n=266, 32.9%), "moderate functional limitations" (n=208, 25.7%), "severe functional limitations" (n=95, 11.8%). In multivariate analyses, female sex (OR=5.11, 95%CI=2.04–12.81), increasing age (OR=1.13, 95% CI: 1.08–1.18), a high BMI (OR=1.15, 95% CI=1.08–1.21), a high number of comorbidities (OR=1.28, 95%CI=1.12–1.61), a low vitality score (thus a high level of fatigue; OR=0.91, 95%CI=0.88–0.93), and a low GHQ score (thus a high psychological distress; OR=0.96, 95%CI=0.93–0.99) were associated with the trajectory of "severe functional limitations".

**Conclusions:** Based on the 5 year follow-up data, we identified 4 distinct trajectories of pain and 4 trajectories of physical function. None of the trajectories demonstrated worsening or improvement over time, confirming that OA is a chronic persistent disease that does not inevitably worsen.

**Disclosure of Interest:** None declared

## HPR Interventions (educational, physical, social and psychological)

### THU0713-HPR BEHAVIOUR CHANGE INTERVENTIONS TARGETING PHYSICAL ACTIVITY IN ADULTS WITH FIBROMYALGIA SYNDROME: A SYSTEMATIC REVIEW

T. O'Dwyer<sup>1</sup>, L. Durcan<sup>2</sup>, S. Maguire<sup>2</sup>, D. Mockler<sup>3</sup>, F. Wilson<sup>1</sup>. <sup>1</sup>Physiotherapy, Trinity College Dublin; <sup>2</sup>Rheumatology, Beaumont Hospital; <sup>3</sup>Trinity College Dublin, Dublin, Ireland

**Background:** Recent EULAR guidelines for the management of fibromyalgia syndrome (FMS) strongly recommend aerobic and strengthening exercise programmes, which demonstrate positive effects on symptoms and physical function.<sup>1</sup> Despite these benefits, physical activity (PA) and exercise promotion remains a significant clinical challenge. Behaviour change theories and techniques are recommended as part of complex health interventions to change health behaviours<sup>2</sup>; their integration into interventions aimed at PA behaviour in people with FMS is not known.

**Objectives:** To review behaviour change interventions targeting PA and exercise behaviour of adults with FMS.

**Methods:** A systematic review of quasi-randomised and randomised controlled trials targeting PA behaviour in people with FMS was conducted. Studies were retrieved by searching MEDLINE (OVID), EMBASE, PEDro, PsychINFO, CINAHL, Scopus, Web of Science, and The Cochrane Central Register of Controlled Trials for keywords and medical subject headings relating to FMS, PA and exercise, and behaviour change. Two reviewers independently determined study eligibility. The Cochrane Risk of Bias tool was used to assess risk of bias and data extraction was completed using a standardised template. Due to heterogeneity of interventions and outcome measures, a planned meta-analysis was deemed inappropriate.

**Results:** The search strategy produced 2117 records, after removal of duplicates. Of these, 6 studies were ultimately deemed eligible for inclusion. Overall, the risk of bias of included studies varied from unclear to high. Median (IQR) study size was 114.5 (91.5) participants, with mean (SD) participant age ranging from 42.5 (7.6) to 53.1 (9.9) years. PA and exercise behaviours were the primary focus of three interventions and were components of broader interventions in three studies. Specific behaviour change theories informed two interventions. The number of behaviour change techniques (BCTs) included in studies ranged from 9 to 21; all interventions included elements of goal setting, problem solving, instruction, demonstration and practice of PA or exercise, and use of credible sources. Two studies reported objective measures of PA (pedometry and accelerometry); no significant improvements were sustained at 6 month follow-ups, although a significant post-intervention increase in steps-per-day favouring a behaviour change intervention compared to an education intervention was reported. Outcomes of self-reported measures of PA were conflicting.

**Conclusions:** To date, the small number of behaviour change interventions targeting PA in people with FMS have had limited success. This may be partly due to the varying application of behaviour change theories and techniques in interventions. If the potential benefits demonstrated in exercise trials are to be realised,

future studies should incorporate behaviour change theories at the core of PA interventions and describe BCTs comprehensively so that the most effective techniques may be identified.

## HPR Professional education, training and competencies

### THU0714-HPR INTERPROFESSIONAL COLLABORATION IN RHEUMATOLOGY REHABILITATION – THE CLASH BETWEEN IDEOLOGY AND PRACTICE

T.M. Kristiansen<sup>1</sup>, M.H. Persson<sup>2,3</sup>, M. Stauner<sup>4</sup>, J. Primdahl<sup>1,3,4</sup>. <sup>1</sup>Research Unit for Rheumatic Diseases, King Christian Xth Hospital for Rheumatic Diseases, Graasten, Graasten; <sup>2</sup>Research Unit for Health Promotion, Department of Public Health, University of Southern Denmark, Odense; <sup>3</sup>Hospital of Southern Jutland, Aabenraa; <sup>4</sup>University of Southern Denmark, Odense, Denmark

**Background:** Interdisciplinary collaboration in rheumatology rehabilitation is pivotal in order to meet the complex and multifaceted needs of the patients.<sup>1</sup> However, in practice, an interprofessional approach is hard to achieve.<sup>2</sup>

**Objectives:** To explore how health professionals working with inpatient rehabilitation at a Danish hospital for rheumatic diseases, experience the interdisciplinary collaboration in practice compared to their ideals. Further, to explore what fosters or prevents interprofessional collaboration.

**Methods:** In total six focus groups and two individual interviews were conducted with 32 health professionals (HPs) working with rehabilitation. The HPs included occupational therapists, physiotherapists, rheumatologists, nursing staff, a social worker and a dietician. The composition of the focus groups were monodisciplinary, except from one group where nurses and doctors from the outpatient unit were interviewed together. The individual interviews were conducted with a social worker and a dietician, as they were sole employers within these disciplines.

The interviews were transcribed ad verbatim and a thematic condensation and indexing was used in the analysis of the data.<sup>3</sup>

**Results:** The analysis revealed a clash between ideals about interdisciplinary teamwork and the dominant monodisciplinary work practice. Physical, organisational and cultural factors were perceived as important barriers. Lack of common physical facilities hindered both informal and formal interdisciplinary cooperation. The organisational set up with only one interdisciplinary team meeting before the patients were admitted to hospital and with a lack of rheumatologists' involvement during admission did not support interdisciplinary teamwork. The existing monodisciplinary work culture acted as a barrier towards both formal and informal collaboration. All these factors led to a lack of knowledge about the contributions from other HPs.

Common physical work and meeting facilities and informal networking fostered interprofessional collaboration.

**Conclusions:** To support the development of interprofessional teamwork in rehabilitation practice, it is important to consider both common physical work facilities and to change the organisational and cultural factors acting as barriers towards collaboration. Further knowledge about the contributions from other HPs is a prerequisite to interprofessional collaboration.

**HPR Interventions (educational, physical, social and psychological)****THU0715-HPR STRATIFIED EXERCISE THERAPY BY PHYSICAL THERAPISTS IN PRIMARY CARE IS FEASIBLE IN PATIENTS WITH KNEE OSTEOARTHRITIS**

J. Knoop<sup>1</sup>, M. van der Leeden<sup>1,2</sup>, M. van der Esch<sup>1</sup>, M. de Rooij<sup>1</sup>, W.F. Peter<sup>1</sup>, K. L. Bennell<sup>3</sup>, M.P. Steultjens<sup>4</sup>, A. Hakkinen<sup>5</sup>, L.D. Roorda<sup>1</sup>, W.F. Lems<sup>6,7</sup>, J. Dekker<sup>2</sup>. <sup>1</sup>Amsterdam Rehabilitation Research Institute, Reade; <sup>2</sup>Department of Rehabilitation Medicine, VU University Medical Center, Amsterdam, Netherlands; <sup>3</sup>School of Health Sciences, University of Melbourne, Melbourne, Australia; <sup>4</sup>School of Health and Life Sciences, Glasgow Caledonian University, Glasgow, UK; <sup>5</sup>Faculty of Sports and Health Sciences, University of Jyväskylä, Jyväskylä, Finland; <sup>6</sup>Jan van Breemen Research Institute, Reade; <sup>7</sup>Department of Rheumatology, VU University Medical Center, Amsterdam, Netherlands

**Background:** There is strong evidence that exercise therapy is effective in reducing pain and activity limitations in knee osteoarthritis (OA), but effect sizes are low to moderate. Stratified exercise therapy tailored to clinically relevant subgroups of patients is expected to optimise treatment effects in a cost-effective manner.

**Objectives:** This study aimed to explore the feasibility of a newly developed model of stratified exercise therapy in primary care.

**Methods:** A mixed method design was used, consisting of an uncontrolled pre-test-posttest design and a process evaluation. Eligible patients visiting a participating primary care physical therapist (PT) were included. Based on our model, participants were allocated to the 'high muscle strength subgroup', 'low muscle strength subgroup', 'obesity subgroup' or 'depression subgroup', and received subgroup-specific, protocolised, 4 month exercise therapy. Feasibility of stratified exercise therapy according to this model was evaluated by a process evaluation (process documentation, semi-structured interviews and focus group meeting) and outcome (physical functioning (KOOS-ADL) and knee pain (NRS), assessed at baseline and 4 months follow-up).

**Results:** We included 50 patients, of which 3 patients dropped out. The process evaluation suggests that our model is feasible for patients and PTs, with some adaptations for further optimisation. We found clinically relevant improvements on physical functioning ( $p < 0.001$ ; 20%) and knee pain ( $p < 0.001$ ; 37%) for the total group. PTs provided on average 10 sessions, ranging from 2 to 24. The average number of sessions was 6 for the 'high muscle strength subgroup', 12 for the 'low muscle strength subgroup', 13 for the 'obesity subgroup' and 16 for the 'depression subgroup'.

**Conclusions:** Our model of stratified exercise therapy is feasible in primary care. Minor adaptations could further optimise the feasibility. Future research should determine the (cost-)effectiveness of this model, compared to usual, non-stratified exercise therapy.

**Disclosure of Interest:** None declared

**THU0716-HPR THE IMPACT OF EXERCISE ON SLEEP IN PEOPLE WITH RHEUMATOID ARTHRITIS: A PILOT RANDOMISED CONTROLLED TRIAL**

S.G. McKenna<sup>1</sup>, A. Donnelly<sup>2</sup>, B. Appel Esbensen<sup>3</sup>, L. Comber<sup>1</sup>, W.L. Ng<sup>4</sup>, A. Maqsood<sup>4</sup>, A. Fraser<sup>4</sup>, N. Kennedy<sup>1</sup>. <sup>1</sup>Discipline of Physiotherapy, School of Allied Health; <sup>2</sup>Department of Physical Education and Sport Sciences, University of Limerick, Limerick, Ireland; <sup>3</sup>Department of Clinical Medicine, Faculty of Health and Medical Sciences, University of Copenhagen, Copenhagen, Denmark; <sup>4</sup>Department of Rheumatology, University Hospitals Group Limerick, Limerick, Ireland

**Background:** Reduced sleep duration and poor sleep quality are prevalent complaints in rheumatoid arthritis (RA). These in turn may further deteriorate functional ability and reduce the person's exercise levels. Current rheumatology guidelines recommend exercise as a key component in the management of RA however, what is lacking is its impact on sleep.

**Objectives:** To obtain reliable estimates regarding recruitment rates; retention; protocol adherence; adverse events, in addition to producing estimates of the potential effect sizes of the intervention on changes in outcomes of sleep duration; sleep quality and disturbances; RA related pain; depression; anxiety; functional limitation; disease activity and fatigue.

**Methods:** Participants were recruited in person at weekly rheumatology clinics at a University Hospital and through self-selected social networking. They were randomised to either a walking based exercise intervention consisting of 28 walking sessions, with 1 per week being supervised by a trained physiotherapist, spread over 8 weeks (2–5 times/week), or a control group who received advice on

the benefits of exercise for people with RA. Ethical approval was received. Descriptive statistics and t-tests were used to analyse the data with SPSS v22.

**Results:** One hundred and one (101) people were identified through the rheumatology clinics, with 36 contacting the primary investigator through social networking. Of these, 24 met the eligibility criteria, with 20 being randomised (18% recruitment; 100% female; mean age 57 (SD 7.3 years). Ten exercise participants (100%) and 8 controls (80%) completed final assessments, with both groups being equivalent for all variables at baseline. Exercise participants completed 87.5% of supervised sessions and 93% of unsupervised sessions. No serious adverse events were recorded and through semi-structured interviews the intervention was highly acceptable to exercise participants. Pittsburgh Sleep Quality Index (PSQI) global score showed a significant mean improvement between the exercise group  $-6.6$  (SD 3.3) compared to control  $-0.25$  (SD 1.1) ( $p = 0.012$ ); PSQI subcomponent sleep duration showed a significant improvement in mean hours between the exercise group 1.65 (SD 0.39) and control 0.56 (SD 0.46) ( $p = 0.021$ ); PSQI subcomponent sleep quality indicated those in the exercise group improved their sleep quality from fairly bad/poor to fairly good/very good, while those in control reported no change at fairly bad/poor. Global rating of change indicated exercise participants reporting their sleep was minimally/much improved, while control participants reported no change/minimally worse, post intervention.

**Conclusions:** The walking based exercise intervention designed to improve sleep was feasible, safe and highly acceptable to study participants, with those participants in the exercise group reporting improvements in sleep duration and sleep quality compared to the control group. Adverse events were predominantly mild. This pilot provides a framework for larger intervention studies and based on these findings a fully powered trial of walking as an exercise based intervention is recommended, preceded by focus groups to investigate methods to improve recruitment of males.

**HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative)****THU0717-HPR IMPAIRED MUSCLE FUNCTION AND SHOULDER-ARM MOVEMENT IN PATIENTS WITH SYSTEMIC SCLEROSIS**

H. Pettersson<sup>1</sup>, C. Boström<sup>1</sup>, F. Bringby<sup>1</sup>, R. Walle-Hansen<sup>2</sup>, L. Jacobsson<sup>3</sup>, E. Svenungsson<sup>4</sup>, A. Nordin<sup>4</sup>, H. Alexanderson<sup>1</sup>. <sup>1</sup>Department of Neurobiology, Care Sciences and Society, Karolinska Institutet, Huddinge, Sweden; <sup>2</sup>Oslo University Hospital, Oslo, Norway; <sup>3</sup>Internal Medicine, Lund University Hospital, Lund; <sup>4</sup>Department of Medicine, Karolinska Institutet, Stockholm, Sweden

**Background:** A few studies report limitations in upper and lower extremity mobility and muscle function in patients with systemic sclerosis (SSc). Little is known about to what extent skin involvement (lcSSc/dcSSc) and lung function (no-mild vs moderate-endstage lung disease) influence active range of motion (AROM) in the shoulder-arms and muscle function in patients with SSc.

**Objectives:** We aim to examine shoulder-arm AROM, shoulder and hip muscle endurance as well as lower extremity muscle function in patients with SSc in comparison with reference values and also to explore possible differences in function depending on lung function and skin involvement.

**Methods:** 205 patients, fulfilling the EUSTAR/ACR criteria for SSc, were recruited from the Karolinska University Hospital. AROM in shoulder-arms (Functional Shoulder Assessment, FSA), muscle endurance in shoulder and hip flexion (Functional Index 2, FI-2), and muscle function in the lower extremities (Timed-Stands Test, TST) were assessed and compared with reference values. Patients were classified as to lung disease severity using sub-items from the SSc disease severity score for lung involvement. Patients with a score of 0–1 were classified as no-mild lung disease and a score of 2–4 as having moderate-endstage lung disease.

**Results:** SSc-patients had overall more reduced muscle endurance (FI-2, % of predicted) in shoulders 53(27–100) and hips 40(23–90) when compared with reference values, 100(100–100) and 100(72–100) ( $p < 0.001$ ) and patients with moderate-endstage lung disease were more impaired, 39(21–71) and 35(20–70) than no-mild, 57(33–99) and 48(28–100) ( $p < 0.05$ ). No differences were found between dcSSc/lcSSc. All patients, regardless of subgrouping, had lower muscle strength when measured with TST, 21(17–29) seconds, when compared to reference values, 17(15–18) ( $p < 0.001$ ). The FSA-scores were overall lower on both right, 22(20–24) and left, 23(20–24) compared with reference values 23(22–24) and 23(22–24) ( $p < 0.05$ ), especially in patients aged 60 years or more. DcSSc-patients had lower FSA-score than lcSSc-patients ( $p < 0.05$ ). No differences were found between patients with no-mild and moderate-endstage lung disease.

**Conclusions:** SSc-patients have markedly reduced muscle endurance and muscle function compared with reference values and patients with moderate-end-stage lung disease have reduced lower extremity muscle function compared to patients with no-mild lung disease. SSc-patients have slightly less AROM than controls and dcSSc-patients are more restricted than lcSSc. This study highlights the importance of identifying patients with an enhanced risk of developing severe muscle impairments. We suggest that physiotherapists regularly assess muscle function using standardised tests and when needed initiate exercise to improve function

### THU0718-HPR THE PSYCHOSOCIAL IMPACT OF JOINT HYPERMOBILITY SYNDROME AND EHLERS-DANLOS SYNDROME (HYPERMOBILITY TYPE): A QUALITATIVE INTERVIEW STUDY

S.E. Bennett, S. Palmer, N. Walsh, T. Moss. *Faculty of Health and Applied Sciences, The University of the West of England, Bristol, UK*

**Background:** Existing research examining those with Joint Hypermobility Syndrome (JHS) and Ehlers-Danlos Syndrome (Hypermobility Type) (EDS-HT) has predominately focused on factors such as pain, range of movement and physical function. However psychosocial factors have received much less attention.

**Objectives:** This study sought to 1. Identify the psychosocial impact of JHS/EDS-HT by examining participants' lived experiences, and; 2. Identify characteristics of effective coping with JHS/EDS-HT, using qualitative methods.

**Methods:** Adults with JHS/EDS-HT took part in semi-structured telephone interviews to discuss their own lived experiences and the impact of the condition on their lives. All met the Hakim and Grahame (2003) five-item criteria for clinically significant joint hypermobility, and had a self-confirmed diagnosis of JHS/EDS-HT. The transcripts were coded using NVivo 10 and analysed using inductive thematic analysis.

**Results:** 17 participants (14 women, 3 men) took part (age range 22–70, mean 38 years). The sample was purposively selected from across the UK to broadly represent different genders, ages and ethnicities. Inductive thematic analysis indicated five main themes:

**Healthcare limitations:** All participants reported a lack of awareness of JHS/EDS-HT among healthcare professionals, and diagnosis typically took several years. Examples were given where local anaesthetics had either partly or completely failed, leaving patients aware of severe pain during surgical or dental procedures.

**A restricted life:** Participants experienced a range of symptoms including joint pain and instability, fatigue, gastrointestinal issues, frequent dislocations and subluxations. Due to difficulty completing daily activities, some relied on their partners or family for support, but this led to feelings of guilt and shame.

**Social stigma:** The invisible nature of their condition led to participants facing criticism and confrontations with others as they 'looked fine'. Fears of being judged led some to hide their symptoms. Many felt frustrated and angry that due to fatigue or injury they could not keep up with friends, family or colleagues.

**Fear of the unknown:** Not knowing when the next injury was going to occur, and how JHS/EDS-HT would affect them over time made participants especially fearful of declines in their physical ability. Many cited a lack of reliable information about their condition, other than in published books or research journals. Psychological support to better cope with the enduring impact of JHS/EDS-HT on their lives was lacking.

**Ways of coping:** Several coping approaches were identified by participants, including acceptance of their condition, building social networks, finding out more about JHS/EDS-HT and adapting their activities. Physiotherapists were instrumental in supporting participants to exercise regularly.

**Conclusions:** The results of this qualitative study highlight the significant psychosocial impact of JHS/EDS-HT on participants' lives. Further research should consider potential interventions to improve information provision, address psychological support and increase awareness of JHS/EDS-HT among healthcare professionals.

### THU0719-HPR NON-PHARMACOLOGICAL CARE IN SYSTEMIC SCLEROSIS: ROOM FOR IMPROVEMENT?

J.K. Stöcker<sup>1</sup>, J. Spierings<sup>2</sup>, C.H.M. van den Ende<sup>1</sup>, M.C. Vonk<sup>1</sup>, on behalf of ARCH Study Group. <sup>1</sup>Rheumatology, Radboudumc, Nijmegen; <sup>2</sup>Rheumatology, UMC Utrecht, Utrecht, Netherlands

**Background:** Although health professional (HP) treatment is considered to be a corner stone in the management of systemic sclerosis (SSc), little is known about the referral process to and the content of non-pharmacological care in SSc.

**Objectives:** To describe the contribution of HP to SSc care from the perspective of SSc patients, including the referral process, use of care provided by HP, treatment targets and outcome satisfaction.

**Methods:** Dutch SSc patients from different hospitals were invited through their rheumatologists (RT) to complete an still ongoing online survey provided by the ARCH (Arthritis Research and Collaboration Hub) working group, containing questions on a wide range of issues within SSc care. Items concerning access to care (referral versus direct access), use of HP services, and quality of care perceived by patients assessed by the CQ Index were extracted to answer the research question. Reasons for referral/direct access and treatment targets were examined by means of open questions.

**Results:** On January 10th, 2018, 433 SSc patients, 73% women (n=317), with a median age of 61 (SD=10,81) completed the survey. 38% of the patients had limited and 23% diffuse cutaneous SSc. The mean time since diagnosis was 4,1 years.

In total, 10 different HP disciplines were reported and 76% (n=331) of the patients ever had contact with one or more HP; 50% (n=215) had contact with a HP in the past year. Compared to the other 9 disciplines named, physiotherapists (PT) were the most often referred to; 57% (n=245) had PT treatment since SSc onset, 41% (n=177) in 2017, whereas only 35 were referred to occupational therapists and 9 to hand therapists (figure 1).

Rheumatologists (RT) were the main referrers to HP care with 49% (n=106); 27% (n=59) sought care by one or more HP through direct access in the past year. A total of 52% (n=111) of the 215 patients that received HP treatment in 2017 perceived the collaboration between their RT and the treating HP as insufficient and 68% (n=146) reported that RT and HP did not make good agreements with each other. Further, 45% (n=97) of the patients felt that there was no coordination between the referrers and the HP about advices issued.

76% (n=164) of respondents found their HP sufficiently competent for SSc treatment. 73% (n=156) could cope better with their complaints after the treatment and reported improvement in their daily activities. Qualitative analysis of the data on the PT as main HP treatment provider in 2017 yielded 36 different referral reasons and 42 treatment targets, of which the most frequently mentioned (>4) are shown below.

Most frequent reasons for referral and therapeutic objectives physiotherapy

**Referral reasons:** pain, joint problems, shoulder problems, decreased mobility, back problems, muscle weakness/stiffness/ pain and general stiffness.

**Treatment targets:** improvement of general mobility, joint mobility, condition, muscle function, skin flexibility and hand function, pain relief, stiffness avoidance and fatigue reduction.

D=dietist, OT=occupational therapist, PT=physio therapist, HT=hand therapist, LST=language and speech therapist, SW=social worker, OH=oral hygienist, ExT=exercise therapist, Po=podiatrist, Ps=psychologist

Abstract THU0719HPR – Figure 1. Frequency of referrals to health professionals

**Conclusions:** HP treatment is a meaningful part of SSc care, as reflected in the satisfaction of SSc patients. The results describe a suboptimal communication

between RT and HP. In view of other published studies on hand problems in SSc, a surprisingly small amount of referrals to occupational- and hand therapists. Further research should focus on the optimisation of professional communication.

## HPR Interventions (educational, physical, social and psychological)

### THU0720-HPR FACTORS ASSOCIATED WITH POOR SLEEP QUALITY IN PATIENTS WITH CHRONIC WIDESPREAD PAIN: RESULTS FROM THE AMSTERDAM PAIN COHORT

A. de Rooij<sup>1</sup>, M. van der Leeden<sup>2</sup>, L.D. Roorda<sup>1</sup>, M. Rinkema<sup>3</sup>, W. Beuving<sup>3</sup>, J. Dekker<sup>4</sup>. <sup>1</sup>Department of Rehabilitation Medicine, Amsterdam Rehabilitation Research Center | Reade, Amsterdam; <sup>2</sup>Department of Rehabilitation Medicine, VU University Medical Centre; <sup>3</sup>Department of Rehabilitation Medicine, Reade center for rehabilitation and rheumatology; <sup>4</sup>Department of Psychiatry, VU University Medical Centre, Amsterdam, Netherlands

**Background:** Reduced sleep quality is a major concern in patients with chronic widespread pain (CWP).<sup>1,2</sup> Poor sleep quality in CWP has received relatively little attention in both multidisciplinary treatment and clinical research in multidisciplinary treatment.<sup>3,4</sup>

**Objectives:** (i) To investigate the prevalence of poor sleep quality and (ii) to explore the associations between clinical, cognitive and emotional factors and quality of sleep in patients with CWP indicated for multidisciplinary treatment.

**Methods:** Baseline data were used from 163 CWP patients referred for multidisciplinary treatment. Linear regression models, adjusted for age and gender, were used to assess the relationship of clinical (pain, fatigue, pain interference and disability), emotional (anxiety, depression and psychological distress) and cognitive factors (catastrophizing, acceptance, self-efficacy, kinesiofobia and illness beliefs) with sleep quality, as measured with the Pittsburgh Sleep Quality Index (PSQI).

**Results:** Poor sleep quality was found in 92% of the patients. The multivariate model showed that a higher level of fatigue, psychological distress and more concerns about the illness were independently associated with poorer quality of sleep. The model explained 27.9% of the variance of sleep quality.

**Conclusions:** The high prevalence of poor sleep quality in patients with CWP referred for multidisciplinary treatment emphasises the need to target sleep during the treatment program. Poorer quality of sleep is related to a higher level of fatigue, psychological distress and more concerns about the illness. Attention to these factors during multidisciplinary treatment could contribute to improvement in quality of sleep.

### THU0721-HPR THE EFFECTS OF UPPER AND LOWER LIMB EXERCISE ON THE MICROVASCULAR REACTIVITY IN SYSTEMIC SCLEROSIS PATIENTS

A.M. Mitropoulos<sup>1</sup>, A. Gumber<sup>2</sup>, H. Crank<sup>1</sup>, M. Aki<sup>3</sup>, M. Klonizakis<sup>1</sup>. <sup>1</sup>Centre for Sports and Exercise Science; <sup>2</sup>Sheffield Hallam University; <sup>3</sup>Rheumatology, Royal Hallamshire Hospital, Sheffield, UK

**Background:** Vascular endothelial injury is one of the early hallmarks in systemic sclerosis (SSc). High intensity interval training (HIIT) is known to improve vascular function in a range of clinical conditions. Ramos et al., 2015 HIIT in particular has demonstrated improvements in clinical outcomes, in conditions that have a strong macroangiopathic component. Nevertheless, the effect of HIIT on microcirculation in SSc patients is yet to be investigated.

**Objectives:** Therefore, the purpose of the study was to compare the effects of two HIIT protocols (cycle and arm cranking) on the microcirculation of the digital area in SSc patients.

**Methods:** Thirty four SSc patients (65.3±11.6 years old) were randomly allocated in three groups (cycling n=11, arm cranking n=11 and control group n=12). The exercise groups underwent a twelve-week exercise program twice per week. All patients performed the baseline and post-exercise intervention measurements where the physical fitness, functional ability, transcutaneous oxygen tension ( $\Delta\text{tcpO}_2$ ), body composition and quality of life were assessed. Endothelial-dependent as well as -independent vasodilation were assessed in the middle and index fingers using LDF and incremental doses of acetylcholine (ACh) and sodium nitroprusside (SNP). Cutaneous flux data were expressed as cutaneous vascular conductance (CVC).

**Results:** Peak oxygen uptake increased in both exercise groups ( $p<0.01$ ,  $d=1.36$ ).  $\Delta\text{tcpO}_2$  demonstrated an increase in the arm cranking group only, with a large effect, but found not statistically significant ( $p=0.59$ ,  $d=0.93$ ). Endothelial-dependent vasodilation improvement was greater in the arm cranking ( $p<0.05$ ,  $d=1.07$ ) in comparison to other groups. Both exercise groups improved life satisfaction ( $p<0.001$ ) as well as reduced discomfort and pain due to Raynaud's phenomenon ( $p<0.05$ ). Digital ulcers and hospitalizations reported in four patients (36%) of the control group and one of them proceeded for amputation. Arm cranking seems to be the preferred mode of exercise for study participants as compared to cycling ( $p<0.05$ ). No changes were observed in the body composition or the functional ability in both exercise groups compared to the control group.

**Conclusions:** Our results suggest that the arm cranking has the potential to improve the microvascular endothelial function in SSc patients and to prevent digital ulcers and further related complications. Also notably, our recommended training dose (e.g., a 12 week HIIT program, twice per week), appeared to be sufficient and tolerable for this population. Future research should focus on exploring the feasibility of a combined exercise such as aerobic and resistance training by assessing individual's experience and the quality of life in SSc patients.

### THU0722-HPR PHYSICAL THERAPY IS EFFECTIVE IN PATIENTS WITH ANKYLOSING SPONDYLITIS: A RANDOMISED CONTROLLED TRIAL

A. Ünal Enginar<sup>1</sup>, H. Uğurlu<sup>2</sup>. <sup>1</sup>Physical Medicine and Rehabilitation, Akdeniz University, School of Medicine, Antalya; <sup>2</sup>Physical Medicine and Rehabilitation, Necmettin Erbakan University, School of Medicine, Konya, Turkey

**Background:** Ankylosing spondylitis (AS) is a chronic inflammatory disease that predominantly affects the spine and may cause serious functional impairment. The prevalence of AS is approximately 0.1% of the Caucasoid population. Treatment of AS includes use of anti-inflammatory drugs to reduce pain and stiffness. In addition, patients are advised to exercise daily and to engage in weekly group physical therapy to maintain mobility of the spine and peripheral joints.

**Objectives:** To evaluate the effects of physical therapy on pain, disease activity, functional and emotional status and quality of life in patients with AS.

**Methods:** Thirty one patients diagnosed with AS and followed up in outpatient clinic were conducted into the study. Routine physical examination of musculoskeletal and neurological system of all patients has been performed. Patients divided into two groups (physical therapy group and control group) as random. 15 seance physical therapy (hotpack, ultrasound, TENS and hydrotherapy) exercise and medical treatment performed for the physical therapy group and only home exercise programme and medical treatment for control group. All patients received medical therapy which was not changed during the study. We evaluated all patients with visual analogue scale (VAS) at night and rest for pain, Bath Ankylosing Spondylitis Functional Index (BASFI) for functional status, Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) for disease activity and modified Schober, finger floor distance (FFD), lateral flexion of the lumbar spine, cervical rotation, intermalleolar distance, tragus wall distance, chest expansion, cheek manubrium distance and Bath Ankylosing Spondylitis Metrology Index (BASMI) for spinal mobility measurements at the beginning, 2nd and 6th weeks. Also Beck Depression Inventory (BDI) and short form 36 (SF-36) were fulfilled by all patients at the beginning and 6th week.

**Results:** Between the groups there was no difference in demographic data. We showed significant improvement in all parameters except lateral flexion, tragus wall distance measurements for spinal mobility and beck depression index scores at second week ( $p<0.05$ ) in physical therapy group. This improvement in all parameters was discontinued for intermalleolar distance, cheek manubrium distance, cervical rotation, finger floor distance and BASFI at 6th week measurements. We also showed significant improvements mental capacity and social function subgroups of SF-36 at 6th week when compared with beginning ( $p<0.05$ ). We detected significant improvement in second week and sixth week for VAS rest and general health subgroup of SF-36 at physical therapy group when comparing two groups.

**Conclusions:** Physical therapy may have beneficial effects on pain, spinal mobility and quality of life in patients with AS.

#### THU0723-HPR NICE GUIDANCE ON SPONDYLOARTHRITIS: RECOMMENDATIONS SUPPORTING RECOGNITION AND REFERRAL BY PHYSIOTHERAPISTS & PODIATRISTS

C. McCrum<sup>1,2</sup>. <sup>1</sup>Centre for Health Research, University of Brighton; <sup>2</sup>Physiotherapy Dept, East Sussex Healthcare NHS Trust, Eastbourne, UK

**Background:** Physiotherapists and podiatrists are key to earlier diagnosis of spondyloarthritis (SpA) and have an essential role in assessing for signs, symptoms and risk factors in people with joint, tendon or back pain. Spondyloarthritis can be a challenge to recognise and often mistaken as chronic back pain or unrelated tendon and joint problems. Symptoms can move around, flare and settle, and links between back pain, peripheral problems and extra-articular conditions can be missed.

**Objectives:** This presentation raises awareness of recent NICE guidelines on Spondyloarthritis<sup>1</sup> and provides an overview of recommendations on recognition and referral relevant for physiotherapists and podiatrists.

**Methods:** The guideline was developed using standard NICE guideline methodology. Quality ratings of evidence applied GRADE methods based on quality of available evidence for assessed outcomes. When standard methodology could not be applied, customised quality assessments provided narrative summaries or customised GRADE tables. Recommendations were developed by a multispecialty development group which included people with SpA and review by stakeholder organisations informing the final version.

**Results:** NICE guidance offers recommendations for suspecting axial and peripheral presentations and when to refer to rheumatology for assessment. These are based on the evidence for signs, symptoms and risk factors that increase the likelihood that a person may have SpA. The guidance highlights that SpA can occur with negative HLA B27, normal inflammatory markers and not to exclude SpA based on any one sign, symptom or test result.

Referral is recommended for suspected axial spondyloarthritis with back pain lasting >3 mths with onset before 45 years of age plus four or more additional features: Onset before 35 years; Woken second half of night by symptoms; Buttock pain; Improves with movement; Improves within 48 hours of taking NSAIDs; First-degree relative with SpA or psoriasis; Current/past enthesitis; Current/past psoriasis; Current/past uveitis plus psoriasis or if HLAB27 positive).<sup>1,2</sup> Morning stiffness lacked specificity as a referral criterion for axial SpA however prolonged morning stiffness remains important in suspecting inflammatory disease.

Referral is recommended for suspected peripheral SpA if a person presents with dactylitis; or with persistent or multiple-site enthesitis (inflammation at tendon/ligament attachment to bone) without apparent mechanical cause plus if any of the following: back pain without apparent mechanical cause; current/past psoriasis, inflammatory bowel disease or uveitis; first degree relative with SpA or psoriasis; or symptom onset following gastrointestinal or genitourinary infection.

**Conclusions:** Recognising possible signs, symptoms and risk factors of spondyloarthritis is an essential aspect of clinical practice for clinicians assessing musculoskeletal problems. Recent NICE guidance offers advice on suspecting SpA and when to refer to rheumatology for assessment to support earlier diagnosis, treatment and reduce the significant impacts of these conditions.

#### THU0724-HPR INVESTIGATION OF IMMEDIATE EFFECT OF CERVICAL STABILISATION EXERCISES ON PROPRIOCEPTION IN PATIENTS WITH NECK PAIN

E. Tonga, T. Özen, E. Timurtaş, G.M. Polat. *Marmara University, Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation, Marmara University, Istanbul, Turkey*

**Background:** Reduced ability to maintain and upright posture, may reflect impaired muscle endurance and proprioceptive accuracy required to control the postural position in patients with neck pain. A recent study investigated the effect of cervical stabilisation exercises on proprioception of neck pain patients. But in mentioned study the joint position change was evaluated for only cervical flexion movement.

**Objectives:** The aim of our study is determine the acute effect of cervical stabilisation exercises on joint position sense in all ranges of neck movement in patients with idiopathic chronic neck pain.

**Methods:** 20 patients (27–45 ages, 80% female and 4 men 20% male) with neck pain for more than 3 months were participated in this study. Exercise training was performed only one session. Patients with any neurological deficits, any recent injuries to neck and were excluded from the study. Training included craniocervical flexion, deep cervical extensor muscle activation, isometric flexion-extension exercises in upright position and shoulder flexion with neutral cervical position in upright position. Each exercise were performed five times. The measured variables included joint repositioning errors in the sagittal and horizontal directions. Visual Analogue Scale (VAS), Neck Disability Index (NDI) were implemented for determining the personal characteristics of patients. Cervical joint repositioning error was evaluated by laser pointer in flexion, extension, rotation and lateral flexion of cervical movement directions at sitting position before and after exercise session. Wilcoxon test was used to compare to differences between repeated assessments

**Results:** VAS values for pain intensity were (mean  $\pm$ SD) 5.56 $\pm$ 3.17, NDI values were 14.06 $\pm$ 6.83 and HADS scores were 18.27 $\pm$ 2.23. In comparison to baseline values, joint position error was significantly lower in flexion, extension, rotation and lateral flexion directions at horizontal and sagittal planes ( $p<0.001$ ) except right lateral flexion at sagittal plane ( $p>0.05$ ) (table 1).

**Abstract THU0724HPR – Table 1.** Comparison of joint position errors

Variable (degree)	Before exercise Median $\pm$ SD	After exercise Median $\pm$ SD	p value
JPE in flexion horizontal	1.71 $\pm$ 0.66	0.57 $\pm$ 0.80	<0.001
JPE in flexion sagittal	1.14 $\pm$ 0.43	0.68 $\pm$ 0.40	<0.001
JPE in extension horizontal	0.85 $\pm$ 0.48	0.57 $\pm$ 0.42	<0.001
JPE in extension sagittal	0.85 $\pm$ 0.55	0.28 $\pm$ 0.22	<0.001
JPE in right rotation horizontal	1.05 $\pm$ 0.53	0.57 $\pm$ 0.31	<0.001
JPE in right rotation sagittal	0.76 $\pm$ 0.73	0.28 $\pm$ 0.30	<0.001
JPE in left rotation horizontal	1.14 $\pm$ 0.39	0.28 $\pm$ 0.42	<0.001
JPE in left rotation sagittal	0.95 $\pm$ 0.49	0.29 $\pm$ 0.28	<0.001
JPE in right side bend horizontal	1.05 $\pm$ 0.56	0.57 $\pm$ 0.28	<0.001
JPE in right side bend sagittal	0.19 $\pm$ 0.36	0.19 $\pm$ 0.22	0.209
JPE in left side bend horizontal	1.19 $\pm$ 0.54	0.47 $\pm$ 0.37	<0.001
JPE in left side bend sagittal	0.19 $\pm$ 0.39	0.38 $\pm$ 0.23	<0.001

JPE=Joint position error, p values are based on Wilcoxon Signed Ranks Test

**Conclusions:** The immediate effects of neck stabilisation exercises on proprioceptive function of neck may reflect that these exercises, may enhance postural awareness and control while in motion.

#### THU0725-HPR EULAR POINTS TO CONSIDER/RECOMMENDATIONS FOR THE HEALTH PROFESSIONALS' PREVENTION AND MANAGEMENT OF OSTEOPOROTIC FRACTURES

E. Hurkmans<sup>1</sup>, N. Wilson<sup>2</sup>, T. Stamm<sup>3</sup>, J. Adams<sup>2</sup>, on behalf of Task force group HP management osteoporotic fractures. <sup>1</sup>*Social Affairs and Health, Ecorys, Rotterdam, Netherlands*; <sup>2</sup>*Faculty of Health Sciences, University of Southampton, Southampton, UK*; <sup>3</sup>*Section for Outcomes Research, Center for Medical Statistics, Informatics, and Intelligent Systems, Medical University of Vienna, Vienna, Austria*

**Background:** Interventions delivered by non-physician health professionals, such as physiotherapists, occupational therapists and nurses play an important role in effective management of patients with osteopenia or osteoporosis.

**Objectives:** To establish EULAR Points to Consider/Recommendations for the prevention and management of osteoporotic fractures by non-physician health professionals.

**Methods:** Points to consider/recommendations were developed according to EULAR standard procedures<sup>1</sup> using six stages: i) establishment of an international expert panel/task force including patients, rheumatologists, orthopaedic surgeons and health professionals; ii) a first Delphi-round to set up clinical questions; iii) a literature review; iv) a task force meeting to review the results of the literature search and to formulate points to consider/recommendations; v) development of consensus and assessment of the level of agreement with the points to consider/recommendations using second Delphi round; vi) a field test.

**Results:** Eight clinical questions and two overarching principles were formulated, subject to the literature search (the clinical questions only) and discussed and refined during the task force meeting. The two overarching principles focused on the importance of shared decision making between patients and professionals and the involvement of different health professionals. Two clinical questions were merged and the task force finally agreed on seven recommendations/points to consider: 1) Health professionals should start with fall risk evaluation in patients at risk of primary or secondary fracture. Patients with high risk should be evaluated by a health professional using multi-component screening, or referred to another health professional competent in multi-component screening. 2) Health professionals should ensure that after osteoporotic fracture, patients are given

opportunities to participate in adequate exercise and are supported in adequate nutritional intake. Calcium and vitamin D intake should be discussed with the patients. 3) Smoking and overuse of alcohol should be discouraged. 4) Tailored multicomponent interventions including, for example: exercises, environmental adaptations, nutrition, life-style and education, should be offered to patients at high risk of primary osteoporotic fracture and/or high risk of falls. 5) Health professionals should be included in Fracture Liaison Services (FLS) and/or a coordinated, multidisciplinary post-fracture prevention program. Patients with fragility fractures should be referred to a FLS or an adequate, coordinated, multidisciplinary post-fracture prevention program. 6) Health professionals should address, monitor and support medication adherence in a structured follow up. 7) Health professionals should identify patients at risk of bone fragility, ensure they are offered opportunities for adequate treatment, and address bone fragility through patient education.

**Conclusions:** These points to consider/recommendations should be applied by health professionals in the prevention and management of osteoporotic fracture to ensure high quality care.

#### THU0726-HPR ADHERENCE TO BIOLOGICAL THERAPY IN CHRONIC INFLAMMATORY RHEUMATISM: RESULTS OF A RETROSPECTIVE STUDY IN AUVERGNE, FRANCE

E. Fayet, M.R. Rodere, C. Savel, B. Pereira, M. Soubrier, M. Couderc. *Hospital Gabriel Montpied, Clermont-ferand, France*

**Background:** The arsenal of treatment options for Chronic inflammatory rheumatism (CIR) has considerably grown over recent years with the biological therapies. Poor patient adherence to treatment is a major barrier to proper disease management. Patient education enhances drug adherence by improving the knowledge and skills needed to manage the disease and treatments.

**Objectives:** This study aimed to assess adherence to subcutaneous biological therapy using the Morisky Medication Adherence Scales (MMAS-4) in patients with CIR: rheumatoid arthritis (RA), ankylosing spondylitis (SA) and psoriatic arthritis (PsA), who received education in our department.

**Methods:** This was a retrospective single-centre observational study of routine care. All patients on subcutaneous biological therapy who received at least one education interview between 2009 and 2013 were included. Adherence was assessed using the Morisky questionnaire (MMAS-4). A comparison of adherence was made based on the BIOSECURE questionnaire (knowledge and skills relating to biological therapy) and type of educational model received by patient (model 1: providing information; model 2: performing one-on-one education; model 3: performing head to head and group-based education). Adherence was also compared based on population characteristics, type of care (mixed or solely hospital), type of CIR, number of education interviews, injection frequency and type of biological therapy.

**Results:** A total of 193 patients were included in the study, 124 of whom were women. The population's mean age was 53.3±14.8 years. Patients had had CIR for 10 years, 5-18 with 113 patients suffering from RA, 73 from SA, and 7 from PsA. Of the 193 patients, 192 (99.5%) were on TNF inhibitors (of whom 107 [55.4%] were on etanercept, 58 [30.1%] on adalimumab, 10 [5.2%] on certolizumab and 17 [8.8%] on golimumab) while 1 (0.5%) was on abatacept. About 75.7% (n=146) of the patients reported good adherence (Morisky=0), 17.6% (n=34) moderate adherence (Morisky=1 or 2), and 6.7% (n=13) poor adherence (Morisky=3 or 4). No significant association was observed between knowledge and skill levels as evaluated by the BIOSECURE questionnaire and adherence as evaluated by the Morisky questionnaire (respectively, 76±13, 77±11, 76±18, p=0.91). A total of 92 patients received model 1, 80 received model 2, and 21 received model 3. Adherence was poorer in the group that received model 3 compared with the other two models (79% Morisky score of 0 for model 1, 76% for model 2 versus 57% for model 3; p=0.04) and poorer in young patients (p=0.005). No difference existed based on gender, education level, marital status, type of care (mixed or solely hospital), type of CIR, number of education interviews, frequency (1, 2 or 4 weeks) of biological injections.

**Conclusions:** Adherence to biological therapy was quite good in this study. No link existed between adherence and knowledge levels. Combining head to head and group-based patient education did not improve adherence compared with simply providing information or performing head to head patient education alone.

**THU0727-HPR** **COMPARISON OF KINESIO TAPE APPLICATION AND MANUAL LYMPHATIC DRAINAGE ON LOWER EXTREMITY OEDEMA AND FUNCTIONS AFTER TOTAL KNEE ARTHROPLASTY**

H. Guney Deniz<sup>1</sup>, G.I. Kiriikli<sup>1</sup>, S. Onal<sup>1</sup>, C. Sevinc<sup>1</sup>, O. Caglar<sup>2</sup>, I. Yuksel<sup>1</sup>.  
<sup>1</sup>Physiotherapy and Rehabilitation Department, Hacettepe University Faculty of Health Sciences; <sup>2</sup>Orthopedics and Traumatology Department, Hacettepe University Faculty of Medicine, Ankara, Turkey

**Background:** Significant trauma and muscular tightness often result during Total Knee Arthroplasty (TKA) surgery and thus act to restrict tissue fluid movement resulting with lower extremity oedema. Kinesio Taping is applied directly on the skin for restoration of normal fluid perfusion, removing congestion of lymphatic fluid or haemorrhages. In addition manual lymphatic drainage (MLD) enhances blood circulation and stimulates the lymphatic movement and unblocks lymphatic territories.

**Objectives:** The aim of the study was to investigate the effectiveness of Kinesio Taping and MLD in reducing postoperative oedema, pain and lower extremity functions in the early stage after TKA.

**Methods:** Forty patients who underwent unilateral TKA were randomised as Kinesio Taping group (n=12), MLD group (n=13) and control group (n=15). For all patients, postoperative rehabilitation program included early mobilisation and physical therapy twice a day during the stay in orthopaedic traumatology department. On the second day after surgery, lymphatic correction method was used on the Kinesio Taping group patients and a standardised 30 min MLD treatment was applied to the MLD group patients. Control group received only physiotherapy treatment. Circumference measurements were applied on preoperatively and the second, third, fourth day and 6th weeks after surgery. Knee Injury and Osteoarthritis Outcome Score (KOOS) was used to determine the functional outcomes on the 6th weeks after surgery. Repeated measures analysis was used to determine the group by time differences between groups.

**Results:** A significant group effect was observed for oedema difference ( $F_{(4,42)}=2.44$ ,  $p=0.047$ ) and pain levels ( $F_{(3,54)}=4.56$ ,  $p=0.006$ ) and post hoc testing demonstrated a significantly lower oedema and pain levels in the both Kinesio Taping and MLD compared to control group. There was no difference found between Kinesio Taping and MLD groups ( $p=0.933$ ). KOOS results were better in Kinesio Taping and MLD groups when compared to control group ( $p=0.021$ ). There was no difference in KOOS results between Kinesio Taping and MLD groups ( $p=0.851$ ).

**Conclusions:** Applications of both Kinesio Taping and MLD to remove congestion of lymphatic fluid at the early stage after TKA surgery were found affective in enhancing blood circulation and stimulating the lymphatic movement. In addition, Kinesio Taping and MLD were both effective on relieving pain and improving functional outcomes after TKA surgery.

**THU0728-HPR** **A MIXED METHODS STUDY OF A GROUP PHYSIOTHERAPY PROGRAMME INCORPORATING EXERCISE AND EDUCATION IN FIBROMYALGIA PATIENTS**

J. Pereira, C. Caeiro, R. Fernandes, E. Cruz. *School of Health Care, Polytechnic Institute of Setúbal, Setúbal, Portugal*

**Background:** Research on non-pharmacological treatments for fibromyalgia patients has demonstrated that exercise and education have positive effects on pain and disability<sup>1</sup>. However, the traditional approach of studying treatment effectiveness based exclusively on quantitative measures has been questioned. There is growing recognition of the importance of integrating patients' perspectives into clinical research. Outcome measures focused on patients' perceptions of improvement have been increasingly used, however they do not offer expanded definitions of what constitutes a "successful" outcome<sup>2</sup>. The further exploration of patients' perspectives about treatment benefits may contribute to the development of treatments that better match patients' needs.

**Objectives:** The aim of this study was twofold: firstly, to examine the effectiveness of a group physiotherapy programme (incorporating exercise and education) on pain intensity, disability and global impression of change in fibromyalgia

patients; and, to explore how patients, who achieved success in pain and/or disability (according to the score from the Patient Global Impression of Change Scale - PGIC), understand and make sense of the results.

**Methods:** A sequential explanatory mixed methods approach, combining quantitative (1 st phase) and qualitative methods (2nd phase), was carried out. In the 1 st phase, the participants underwent an 8 week (3 times weekly) standardised group programme. Participants were assessed at baseline, 4 and 8 weeks later. Outcome measures included the Numeric Pain Rating Scale (NPRS), the Revised Fibromyalgia Impact Questionnaire (FIQR) and the PGIC. Participants who had scored  $\geq 5$  in the PGIC were invited to participate in a focus group. In the 2nd phase, 2 focus groups meetings were carried out to collect data. A semi-structured interview schedule was used and the sessions were audiotaped and transcribed verbatim.

**Results:** Thirty-seven participants (females; 49.3±10.2 years) completed the 1 st phase. Analysis using SPSS revealed statistically significant improvements on pain intensity (mean SD change:  $-1.38\pm 2.363$ ,  $p=0.001$ ) and disability ( $-21.577\pm 21.02$ ,  $p<0.001$ ). In what concerns to participants' impression of change, 26 participants (70.3%) perceived substantial improvements on pain and disability (PGIC  $\geq 5$ ). From these, 12 accepted to participate in the focus groups. The qualitative analysis indicated that "doing more daily-life activities" and "taking less medication" were identified as the main reasons for the participants' improvements. According to these participants, the knowledge about strategies for self-management played a key role in their success.

**Conclusions:** The combination of data from both phases provided detailed information about the participants' perceptions regarding the key elements for achieving success with a physiotherapy programme. Further research on patients' perspectives regarding treatment effectiveness is recommended since it may contribute to the design of more effective and patient-centred treatments.

**THU0729-HPR** **PATIENT WITH RHEUMATOID ARTHRITIS ARE STILL NOT SUFFICIENTLY PHYSICAL ACTIVE. TIME FOR A PERSONALISED PHYSICAL ACTIVITY PROGRAMME!**

J. Weijers<sup>1</sup>, S. Rongen-van Dartel<sup>1,2</sup>, P. van Riel<sup>1,2</sup>. <sup>1</sup>*IQ healthcare, Scientific Center for Quality of Healthcare, Radboud university medical center, Nijmegen;* <sup>2</sup>*Rheumatology, Bernhoven, Uden, Netherlands*

**Background:** For individuals with rheumatoid arthritis (RA), it is important to be sufficiently physically active. The international recommendation for physical activity states that each adult should perform moderate-intensity aerobic physical activity for at least 30 min, five days a week. In recent years, attention and awareness of the importance of being physically active has increased, including the development of exercise programmes for people with rheumatic diseases. However, it is unknown whether patients with RA actually became more physically active in daily practice in the past years.

**Objectives:** Primary, this study will estimate whether the percentage of RA patients that meet the recommended level of physical activity has changed in recent years. Secondary, this study aims to identify RA patients of the outpatient clinic who are physical inactive and motivated to improve their level of physical activity.

**Methods:** In 2014, 740 RA patients from seven outpatient clinics across the Netherlands filled out a questionnaire which contained items about self-reported physical activity and sport habits. In 2017, the same items were assessed again by sending a questionnaire to all 727 RA patients of the outpatient clinic in Bernhoven, a hospital in the south of the Netherlands. In addition, questions about motivation to increase the level of physical activity were added.

**Results:** In 2014, 52% of the RA patients met the recommendation for physical activity. In 2017, 33% of the 514 RA patients of the outpatient clinic in Bernhoven who filled out the questionnaire reported that they met the recommendation. Walking, cycling, aerobic and strength fitness training and swimming were mentioned as the most popular sports among RA patients in 2014 as well as in 2017. 133 of the 233 (57%) inactive RA patients of the outpatient clinic in Bernhoven reported that they were convinced to be able to improve their physical activity level and 51% reported that they were motivated to become more physically active in the upcoming months.

**Conclusions:** Despite the increased attention and awareness of the benefits of being physically active, the percentage of RA patients who meet the recommended level of physical activity did not increase between 2014 and 2017. This could be caused by the fact that the effect of the developed exercise programmes typically wear off after the exercise interventions have stopped. Another reason could be that patients with RA need to be more assisted to overcome barriers to implement physical activities in their daily life. A more personalised approach, based on coaching and shared-decision making to set personal physical activity goals, could increase compliance and reduce barriers to being physically active. Half of the inactive RA patients of the outpatient clinic are motivated to become more physically active. Therefore a new study will examine whether a personalised physical activity programme is effective to increase and sustain the level of physical activity in inactive RA patients.

#### THU0730-HPR A SYSTEMATIC REVIEW OF ONLINE INTERVENTIONS FOR ADDRESSING PSYCHOLOGICAL DISTRESS IN RHEUMATOID ARTHRITIS AND OTHER LONG-TERM CONDITIONS

K. Fishpool<sup>1,2</sup>, B. Jones<sup>1,3</sup>, S. Hewlett<sup>1,3</sup>, M. Ndosi<sup>1,3</sup>. <sup>1</sup>Department of Nursing and Midwifery, University of the West of UK; <sup>2</sup>Integrated Community Healthcare Team, Bristol Community Health; <sup>3</sup>Academic Rheumatology Unit, University Hospitals Bristol, Bristol, UK

**Background:** Psychological distress in rheumatoid arthritis (RA) is associated with severity of disease activity and poor treatment outcomes. Online interventions have the potential to reach large numbers of patients.

**Objectives:** The aims of this study were to identify online interventions for psychological distress and determine their effectiveness in RA and other long-term conditions.

**Methods:** The following databases were searched: MEDLINE, EMBASE, CINAHL and PsychINFO (Jan 2007-Jul 2017). Inclusion criteria were randomised controlled trials (RCTs) of effectiveness of interventions to address psychological distress in adults. Titles and abstracts were screened independently by 2 reviewers. Methodological quality was assessed by 3 reviewers using Cochrane's Risk of Bias tool. Data were extracted independently by 4 reviewers. Meta-analysis was not possible due to clinical heterogeneity of the included studies.

**Abstract THU0730HPR – Table 1.** Presents the studies and evidence of their effectiveness.

Study	Condition	Effectiveness
Boeschoten 2017	Multiple sclerosis	Not effective BDI: Effect size d=0.01; p=0.953
Bond 2010	Diabetes	Effective CESD: Effect size d=0.7; p<0.05 PAID: Effect size d=0.6; p<0.05
Cohn 2014	Type 2 diabetes	Mixed CESD: Effect size d=-0.44; p=0.05 Diabetes Distress Scale: Effect size not shown
Ferwerda 2017	Rheumatoid arthritis	Effective BDI: Effect size d=0.54; p=0.001 IRGL-Negative mood: Effect size d=0.38; p=0.01 IRGL-Anxiety: Effect size d=0.48; p=0.001
Fischer 2015	Multiple sclerosis	Effective BDI: Effect size d=0.53; p=0.01
Hunt 2009	Irritable bowel syndrome	Effective Anxiety Sensitivity Index -GI: Effect size d=0.63; p<0.01 Anxiety Sensitivity Index -non GI: Effect size d=0.70; p<0.01
Lorig 2008	Rheumatoid arthritis, osteoarthritis and fibromyalgia	Effective Health Distress Scale RA: d=0.5 Health Distress Scale OA: d=0.4 Health Distress Scale FM: d=0.03
Newby 2017	Type 1 and type 2 diabetes	Effective Patient Health Questionnaire: Effect size g=0.78; p<0.001 PAID: Effect size g=0.80; p=0.01
Nobis 2015	Type 1 and type 2 diabetes	Effective CESD: Effect size d=0.89; p<0.001
Rondags 2016	Type 1 and type 2 diabetes	Not effective Hypoglycaemia Fear Survey: RR=0.80; 95% CI 0.64 to 1.01; (p=0.059).
Van Bastelaer 2011	Type 1 and type 2 diabetes	Effective CESD: Effect size d=0.70; p<0.001.

Effectiveness of interventions is reported with effect sizes based on between-group differences in the primary outcomes at the end of each study.

**Results:** The review included 11 RCTs in the following conditions: arthritis,<sup>2</sup> multiple sclerosis,<sup>2</sup> diabetes<sup>6</sup> and irritable bowel syndrome.<sup>1</sup> The quality of most RCTs was poor due to attrition, selective reporting and limited follow-up. Eight disease-specific and 3 generic interventions were identified. Cognitive behavioural therapy was the most common intervention type. All interventions were online but support delivery and outcome measures varied significantly. Nine of the 11 interventions were shown to be effective, including 2 for RA. Most interventions were not available outside of the trial.

**Conclusions:** The findings are inconclusive due to the overall bias of the included studies and insufficient evidence in RA. More good quality RCTs are required to determine effectiveness of online interventions in RA.

**Acknowledgements:** This study was funded by Arthritis Research UK.

#### THU0731-HPR THE ABDOMINAL HYPOPRESSIVE TECHNIQUE CAN BE USED TO TREAT LOW BACK PAIN?

L. Soriano<sup>1</sup>, L. Carmona<sup>2</sup>, J.B. Negrón<sup>2</sup>. <sup>1</sup>Universidad Europea de Madrid, Villaviciosa de Odón; <sup>2</sup>Instituto de Salud Musculosquelética, Madrid, Spain

**Background:** In 1980, Dr. Marcel Cauriez created the abdominal hypopressive technique (AHT) with the goal of reprogramming the core muscles. The term hypopressive refers to the decrease of the pressure related to the thoracic, abdominal and pelvic cavities. However most traditional exercises are hyperpressive – they increase the internal pressure. In addition, conventional core exercises train conscious control, but the core is designed to cope at a subconscious level. Publications testing AHT are surprisingly low and are mostly published in not indexed journals. Despite the lack of scientific evidence to support its benefits, AHT is gaining popularity among European physiotherapists as a recommended treatment for a wide spectrum of disorders.

**Objectives:** To test the effect of a structured AHT program on low back pain intensity and disability in women and the retention of effect after two-month.

**Methods:** A cross-over intervention trial with random assignment and blind assessments was carried-out. The experimental sequence included a first period of intervention or control (rest), and a second period in which the initial groups were switched to the complementary. The exercises included in the AHT program were standardised by two Doctors in Physiotherapy trained in this technique. Measures were taken by a trained physiotherapist blinded to the group allocation at baseline, after finishing the first period, and after completing the entire sequence. Efficacy was defined as changes between groups in low back pain intensity and disability, measured with a visual analogue scale (VAS) and the Oswestry Disability Index (ODI) respectively.

**Results:** Overall, 42 participants were randomly assigned to a sequence (n=21 for each group). From the initial sample, 88% have been diagnosed by a physician with low back pain at least once in their lives and 100% of them self-reported low back pain at baseline. Baseline low back pain intensity measures did not differ between groups. The VAS for the group that started as control was 4.0 (2.5 to 5.4) vs 4.3 (2.8 to 5.7) for the group that started with the AHT program (p=0.774). However, the difference ( $\Delta$ ) after two months was statistically significant between groups (group that started as control, 0.3 (-0.1 to 0.6) vs the group that started with AHT, -2.7 (-3.9 to -1.6); p<0.001). Improvements decayed by 0.87 after a two-month follow up (p=0.094).

Regarding low back pain disability, similar results were found. ODI baseline measures between groups were not significantly different with 10.3 (5.7 to 14.9) for the group that started as control and 7.7 (4.1 to 11.3) for the group that started with the AHT program (p=0.368). The  $\Delta$  after two months showed that both groups improved (started as control, -0.2 (-2.7 to 2.4)) but the improvement in the AHT group was greater (-3.5 (-7.1 to 0.3)); p=0.120. Improvements were maintained after a two-month follow.

Is important to highlight that a sequence effect was noted, with residual effect of AHT; therefore, only results from the first sequence were analysed.

**Conclusions:** A structured AHT program produce benefits on low back pain intensity (short-term) and disability (long-term). However, further research is needed to test its effectiveness in comparison with conventional core exercises.

**THU0732-HPR** **INDIVIDUAL RESPONDER ANALYSIS OF THE EFFECTIVENESS OF MANUAL THERAPY AND EXERCISE VERSUS USUAL CARE IN PATIENTS WITH CHRONIC NONSPECIFIC NECK PAIN: PRELIMINARY RESULTS OF A RANDOMISED CONTROLLED TRIAL**

L.A. Domingues<sup>1,2</sup>, F.M. Pimentel-Santos<sup>1,3</sup>, E.B. Cruz<sup>4</sup>, J.C. Branco<sup>1,3</sup>.

<sup>1</sup>Rheumatological Disease, CEDOC – Chronic Diseases Research Center – Nova Medical School | Faculdade de Ciências Médicas – Universidade Nova de Lisboa;

<sup>2</sup>Unidade de Fisioterapia, Centro de Medicina e Reabilitação de Alcoitão;

<sup>3</sup>Rheumatology Department, CHLO | Hospital Egas Moniz, Lisboa; <sup>4</sup>Escola Superior de Saúde – Instituto Politécnico de Setúbal, Setúbal, Portugal

**Background:** Chronic nonspecific neck pain (CNP) is a common health problem worldwide. The physiotherapy approach is the second line of treatment and a large variety of modalities are frequently used. However, the mean effect of interventions is small and it is unknown if the patients achieving clinically important change. Individual responder analyses provide researchers with complementary information about the patterns of recovery and the proportion of patients achieving clinically important treatment responses.

**Objectives:** The aim of this study was to compare the effectiveness of a combined intervention of manual therapy and exercise (MET) versus usual care (UC), on pain intensity and global perceived recovery.

**Methods:** A randomised controlled trial was conducted on 62 participants with CNP lasting  $\geq 3$  months, assigned to MET and UC groups. Participants in the MET group (n=31) received 12 sessions of passive articular mobilisation and exercise (coordination, strength, endurance), whereas the UC group (n=31) received 15 sessions of usual physiotherapy care, combining electrotherapy, massage and stretching exercises. Patients were assessed at baseline, and then at 3 and 6 weeks (final of intervention). The Minimal Clinically Important Difference (MCID) in treatment response for pain intensity was defined as a decrease of  $>2$  point in the Numeric Rating Scale of Pain compared to the baseline score and for global perceived recovery a value of  $\geq 5$  in Patient's Global Impression of Change Scale.

**Results:** A significant difference between-groups was observed at 6 weeks on pain intensity ( $p \leq 0.001$ ), favouring the MET group. No significant differences were found between-groups in pain intensity at the baseline ( $p \geq 0.626$ ) and at 3 weeks ( $p \geq 0.777$ ). At patient-level response, in the MET group, 58% of the participants experienced an MCID in the first 3 weeks of treatment and this proportion was increased to 94% at 6 weeks on pain intensity, and rose from 68% to 81% on global perceived recovery. In the UC group the proportion of patients that experienced an MCID rose from 55% to 61% on pain intensity, at 3 and 6 weeks, respectively, and 68% in global perceived recovery in both moments. The patients in MET group were 10% (RR=1,1) and 50% (RR=1,5) more likely to achieve the MCID on pain intensity than the UC group, at 3 and 6 weeks, respectively. In global perceived recovery, the MET group were 20% (RR=1,2) more likely to achieve an MCID response at the 6 weeks. No differences were found in chances of recovery at 3 weeks.

**Conclusions:** These findings suggest that participants of MET group had a pattern of recovery over 6 weeks and achieved a higher response rate to treatment, on pain intensity and a better global perceived recovery, compared to those receiving UC.

**THU0733-HPR** **EFFECT OF CUSTOM-MADE FOOT ORTHOSES VERSUS PLACEBO IN PATIENTS WITH RHEUMATOID ARTHRITIS: RANDOMISED CLINICAL TRIAL**

M. Reina-Bueno<sup>1</sup>, P.V. Munuera-Martínez<sup>2</sup>, C. Vázquez-Bautista<sup>1</sup>, S. Pérez-García<sup>3</sup>, C. Rosende-Bautista<sup>3</sup>. <sup>1</sup>Podiatry, University of Seville, Seville; <sup>2</sup>Podiatry, University of Seville, Seville; <sup>3</sup>Ciencias de la Salud, University of a Coruña, Ferrol, Spain

**Background:** Rheumatoid Arthritis (RA) affects among 0.3% and 1.5% of people.<sup>1</sup> Foot involvement occurs in more than 85% of people with RA.<sup>2</sup> One of the most prevalent deformities is rearfoot valgus.<sup>3</sup>

**Objectives:** To study whether the use of custom made foot orthoses improves pain, foot function, and quality of life in RA patients.

**Methods:** This randomised clinical trial was carried out in the University of Seville and of A Coruña. Inclusion criteria: to be over 18 years and to have diagnosis of RA with involvement in the foot. Exclusion criteria: Acute phase, neurological problems or cognitive impairment. Participants were given an informational form. They had to use physiological footwear and assigned foot orthoses during at least 8 hours/day, for 3 months. Participants were randomly assigned to one of the two groups: Experimental Group (A) (foot orthosis with a Rovafoam upper sheet and polypropylene) and Control Group (B) (5mm-thick Rovafoam sheet, without adaptation). The SF-12, the Visual Analogue Pain Scale (EVA), the Manchester

Questionnaire and the Foot Function Index (FFI) are administered at the first visit and at the last review.

**Results:** The final sample consisted of 47 participants with RA, 53.2% were group A and 46.8% were group B. This

**Abstract THU0733HPR – Table 1.** shows the results of the different questionnaires for both groups.

		Group A		Group B	
		Baseline	End	Baseline	End
EVA		6.52±2.34	4.16±2.82	6.23±1.88	5.47±2.89
Manchester	Functional	12.32±5.77	10.72±7.17	12.19±4.53	10.71±5.58
	Personal Appearance	1.2±1.44	0.68±1.21	1.62±1.56	1.38±1.57
	Pain	7.00±2.61	5.52±3.28	6.52±3.06	5.47±2.63
	Work	2.56±1.78	2.12±1.83	2.33±1.46	2.19±1.75
	Total	22.60±9.58	19.04 ±11.93	21.86±8.54	19.76±9.79
FFI	Pain	69.26	45.97	61.85	53.36
		±18.67	±29.11	±19.59	±25.95
	Disability	58.97	45.55	57.71	46.67
		±28.95	±34.43	±24.09	±30.97
	Activity Limitation	24.75	13.24	14.14	10.54
	Limitation	±23.76	±14.67	±12.43	±10.55
	Total	54.70	39.08	51.12	42.69
	±20.55	±26.26	±15.98	±24.17	

At the initial moment between groups, there were no statistically significant differences.

Data obtained baseline and end of the follow-up period were compared within the control group, and showed significant differences in some FFI domains (days with pain, disability and total). In the experimental group there was a statistically significant decrease in EVA scale, some Manchester questionnaire domains (pain and total sections) and in some FFI domains (activity limitation and total; there was a very statistically significant in EVA scale and in some FFI domains (pain and total). There was no significant difference in the SF-12 scale between these two moments.

**Conclusions:** Custom made foot orthoses improved foot pain and function in people with RA who participate in this study. However, this treatment did not have a positive effect on their quality of life.

**THU0734-HPR** **NOVEL EXPERIENCE EQUIPMENT FOR RHEUMATOID HAND-FINGERS**

M. Kusumoto<sup>1</sup>, S. Tsujii<sup>2</sup>, M. Toshiharu<sup>3</sup>, Y. Kushimoto<sup>1</sup>, N. Ise<sup>1</sup>, N. Yoshida<sup>1</sup>, S. Kawai<sup>1</sup>, T. Kyrosawa<sup>3</sup>, E. Oguro<sup>2</sup>, Y. Okita<sup>2</sup>, K. Kuzuya<sup>2</sup>, H. Matsuoka<sup>2</sup>, S. Teshigawara<sup>2</sup>, M. Yoshimura<sup>2</sup>, Y. Harada<sup>2</sup>, T. Noguchi<sup>2</sup>, M. Matsushita<sup>2</sup>, K. Hagio<sup>1</sup>, S. Tsujii<sup>2</sup>, S. Akita<sup>2</sup>, S. Ohshima<sup>2</sup>, J. Hashimoto<sup>2</sup>, Y. Saeki<sup>2</sup>. <sup>1</sup>Department of Rehabilitation; <sup>2</sup>Department of Rheumatology, National Hospital Organization Osaka Minami Medical Center, Kawachinagano; <sup>3</sup>Kawamura Gishi Co., LTD., Daito, Japan

**Background:** RA patients are prone to ulnar deviation and swan-neck deformity even early after onset of the disease. Limitation of finger joint range of motion due to hand-finger deformation brings restriction to ADL in the workplace as well as in the home. Patients and caretakers of patients are often burdened by these limitations; however, RA hand-finger deformation experience equipment have not been developed to experience these limitations. We have developed a novel RA hand-finger deformation experience equipment with opened fingertips (RSE; RA hand/finger simulation equipment).

**Objectives:** To assess the utilisation of RSE in healthy volunteers (HV) to experience RA hand-finger dysfunction using DASH (Disabilities of the Arm, Shoulder

and Hand), STEF (Simple Test for Evaluating Hand Function), and Purdue Pegboard.

**Methods:** We developed the following equipment: Type U to imitate extension limitation of metacarpophalangeal (MCP) joints seen in ulnar deviation; Type B which imitates flexion deformity of the distal interphalangeal (DIP) joints by seen in boutonniere deformity; and Type S which imitates flexion limitation of proximal interphalangeal (PIP) and interphalangeal (IP) joints by reversing the upper and lower ends of the Oval-8 Finger Splint (Fukui Co. Ltd, Japan). Types U and S were fitted on HV (index to pinky). RSE was evaluated using DASH, STEF and Purdue Pegboard in hand-finger function evaluation. Twenty-four RA patients with hand-finger deformation and Forty-one HV were included in this study to evaluate the equipment.

**Results:** Mean  $\pm$ SD ages for RA patients was  $67.4 \pm 8.0$  years (95.8% female) and  $38.2 \pm 17.7$  for HV (63.4% female), respectively. Total hand-finger deformities for RA patients were 23 hands for ulnar deviation, 66 fingers for swan-neck deformity, and 33 fingers for boutonniere deformity. Randomization for RA patients was as follows: 13 DASH, 5 (10 hands) STEF, and 6 Purdue Pegboard. 10 HV were assigned to DASH, 10 to Purdue Pegboard, and 14 (28 hands) to STEF. HV were evaluated with RSE and without RSE. For DASH, STEF, and Purdue Pegboard, RA patients showed significant functional loss compared to HV. Significant function loss in RA patients was also observed with the RSE. However, no differences were seen between the RA group and the HV with RSE group (figure 1).

Abstract THU0734HPR – Figure 1 Purdue. pegboard scores of RA, RSE and HV groups

**Conclusions:** We developed the RSE, which allows for one to experience the decrease in function with RA hand-finger deformity. Our study showed that RSE use can indeed allow this experience. By using RSE, health care workers, patient caretakers and early RA patients can experience joint limitation of RA for educational purposes, personalised rehab programs, and development of self-help tools.

#### THU0735-HPR HOW RHEUMATOLOGY SPECIALIST NURSE DETECTS SMOKING HABIT IN RHEUMATOID CHRONIC INFLAMMATORY DISEASE PATIENTS

M. Serra Miralles<sup>1</sup>, F. Abella<sup>2</sup>, N. Montalà<sup>1</sup>, M. Mateu<sup>1</sup>, A. Palau<sup>1</sup>, M. Conde<sup>1</sup>, L. Roselló<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Psychology, Hospital Santa Maria, Lleida, Spain

**Background:** Inflammation plays a significant role in the development of atherosclerosis and cardiovascular disease (CVD). Patients with chronic inflammatory disease (CID) have an increased risk of CVD. Smoking is one of the main risk factors for CVD and a predictor of poor response to treatment and poor prognosis.

**Objectives:** We aimed to describe the role on a rheumatology specialist nurse in the detection of smoking habit and dependence to nicotine in CID patients before the start of an interventionism plan to avoid it in CID patients.

**Methods:** All CID patients attended in a nurse rheumatologist unit, during one month, were asked for smoking habit. We determined the characteristics, onset of smoking and number of cigarettes per day. The Fagerström test was used to establish the nicotine dependence (ND) (score >5) and the Richmond test for predicting abstinence following intervention to stop smoking (score >5). Exhaled CO level Coximetry was also recorded. We planned an interventionism consenting in health advice provided by a nurse and the derivation to a smoke unit.

**Results:** 22 patients were identified. 12 (50.0%) were female and mean age was 46.0 (SD 10.5). 14 (63.6%) suffered Rheumatoid Arthritis, 6 (27.3%) Ankylosing Spondylitis and 2 (9.1%) Psoriatic Arthritis. 5 (22.7%) subjects were under

biological treatment. Mean number of cigarettes smoked per day and smoking years were 16.0 (SD 8.9) cigarettes and 27.2 (SD 11.7) years respectively. Up to 5 out of 22 (22.7%) subjects had high ND. Patients with ND had higher exhaled CO levels than non ND subjects (24.6 [SD 6.0] vs. 17.9 [SD 12.2] p-value 0.160). We observed no differences in age, sex, rheumatoid diagnosis, years smoking or cigarettes per day between both groups. Active treatment with biological drugs was significantly associated with ND (60.0 vs. 14.3%, p-value 0.046). One out of five patients with ND had good abstinence prediction according to Richmond test

**Conclusions:** Nearly one out of five smoking CID subjects had severe ND. Treatment with biological drugs was related to ND. Interestingly, most of the ND subjects had good prediction for smoking cessation. Therefore, the development of a nurse program to detect smoking and our interventionism plan to avoid smoking habit are of enormous interest.

#### THU0736-HPR THE EFFECTIVENESS OF SHORT TRAINING IN PSYCHOLOGICAL SUPPORT FOR NURSES IN RHEUMATIC CARE

M. Fusama<sup>1</sup>, H. Nakahara<sup>2</sup>, K. Higashi<sup>1</sup>, M. Mori<sup>3</sup>, M. Mabuchi<sup>4</sup>, Y. Sakai<sup>5</sup>, T. Motonaga<sup>6</sup>, T. Takeuchi<sup>7</sup>. <sup>1</sup>Division of Nursing; <sup>2</sup>NTT West Osaka Hospital, Osaka; <sup>3</sup>Jikei University School of Medicine; <sup>4</sup>Tokyo University of Agriculture and Technology; <sup>5</sup>Atomi University; <sup>6</sup>Teikyo University; <sup>7</sup>Department of Internal Medicine, Keio University School of Medicine, Tokyo, Japan

**Background:** Patients with rheumatoid arthritis (RA) often suffer from psychological concerns.<sup>1</sup> There is a lack of psychology specialists in many hospitals and clinics. According to EULAR, nurses should undertake a significant portion of providing psychological support to patients.<sup>2</sup> However, in Japan nurses involved in clinical practice often do not have sufficient time and opportunity to receive adequate education on psychological support.

**Objectives:** The aim of this study is to evaluate nurses' understanding of basic psychological concepts and the efficacy of a short psychology workshop for nurses in RA clinical care.

**Methods:** A clinical psychotherapist provided a lecture on psychological support once for a period of 30 min, followed by 1 hour of role-play groupwork. The lecture focused on basic psychological support including concepts of "listening", "acceptance", "empathy", "open question", "closed question" and "patient-centred perspective". Group work focused on applying the aforementioned concepts. Nurses were asked before and after workshop regarding their understanding and opinions on the necessity and feasibility of psychological support, as well as their motivation for implementation. Nurses' opinions were evaluated on a 1-7 rating scale (1=not at all, 7=full). Client Satisfaction Questionnaire-8 (CSQ-8J) was utilised to assess satisfaction with the workshop. Data analyses were performed with Wilcoxon signed rank test.

**Results:** 53 nurses (M/F: 1/52) participated in this study. The average of ages, clinical experience and clinical experience in RA care were 45.5 years old, 21.0 and 7.9 years, respectively. Nurses' opinions regarding the necessity and feasibility of psychological support in general, as well as their motivation for providing psychological support statistically significantly increased post-workshop (necessity: p=0.0052, feasibility: p<0.0001, motivation: p=0.0033).

Nurses' answers regarding their current application of these concepts in clinical practice were as follows: mean  $\pm$ SD; listening: 5.15 $\pm$ 1.20, empathy: 5.06 $\pm$ 1.18, acceptance: 4.71 $\pm$ 1.18, open question: 4.80 $\pm$ 1.31, closed question: 4.49 $\pm$ 1.47. The understanding of these concepts was statistically significantly higher after the workshop (p<0.0001 for each concept). Moreover, the feasibility of all the above concepts was rated as statistically significantly higher post-workshop. (p<0.001 for each concept). The necessity of adopting a patient centred perspective was also judged as statistically significantly higher post-workshop (p<0.001). Based on CSQ-8J, satisfaction with the workshop was overall high.

**Conclusions:** This is the first report evaluating the effectiveness of brief psychological workshops for nurses in rheumatic care in Japan. This preliminary study

demonstrated that even a brief workshop appears effective for assisting and encouraging nurses in providing psychological support to patients. Further studies of training methods and of nurses' application of the skills acquired in such training are ongoing.

#### THU0737-HPR THE EFFECTIVENESS OF RELAXATION EXERCISES ON PAIN, FUNCTIONAL LEVEL AND MUSCLE STRENGTH IN PATIENTS WITH TOTAL KNEE ARTHROPLASTY: A PRELIMINARY RESULTS

M. Eymir<sup>1</sup>, B. Ünver<sup>1</sup>, V. Karatosun<sup>2</sup>. <sup>1</sup>*School of Physical Therapy and Rehabilitation;* <sup>2</sup>*Department of Orthopaedics and Traumatology, School of Medicine, Dokuz Eylul University, Izmir, Turkey*

**Background:** Total Knee Arthroplasty (TKA) is a common procedure performed mainly due to advanced osteoarthritis (OA), pain, physical disability and reduced quality of life. However, approximately 20% of the patients respond poorly to the surgery and chronic pain and disability following TKA remains a major health burden for many patients. Among the most well documented predictors of poor outcome following TKA is pain catastrophizing. Inadequate pain relief can cause impaired functional performance, increased skeletal muscles tension which are close to surgery related incision site, longer length of hospital stay, unnecessary psychological distress and decreased patient satisfaction. There is high need of developing treatments aimed at improving self-management for patient with TKA at early postoperative period.

**Objectives:** The aim of this study is to investigate the effectiveness of progressive muscle relaxations exercises (PMR) on pain coping, physical function and muscle strength among patients with TKA due to OA.

**Methods:** The study group consisted of 22 patients (33 knees), who underwent primary TKA because of OA were consecutively allocated to an intervention group (n=11, with mean age; 66.18±13.29 years), and were allocated to a control group (n=11, with mean age; 62.45±7.28 years). After surgery, all patients underwent the same rehabilitation program. The intervention group also was instructed pre-operative patient education about PMR exercises, and the intervention group received PMR exercises focusing on reducing overall body tension, anxiety and pain managed by a physiotherapist. Patients were evaluated regarding the pain (Numeric Pain Rating Scale (NPRS)), muscle strength, knee function score (Hospital for Special Surgery (HSS) score), pain-related fear (Tampa Scale for Kinesiophobia (TSK)), anxiety and depressive symptoms (Hospital Anxiety and Depression Scale (HADS)) and quality of life (Short-Form 12 Health Survey (SF-12)). Functional activities were evaluated using the Iowa Level of Assistance Scale and walking speed was evaluated using the Iowa Ambulation Velocity Scale. Also functional outcomes were evaluated with timed up and go (TUG) test and 10-metre walk test (10 MWT). Patients were evaluated preoperatively and at discharge.

**Results:** At baseline, demographic characteristics were similar in groups and there was no statistically difference between groups (p>0.05). It was determined at postoperatively that; the intervention group had better results in terms of reduction of pain severity (p=0.001), improvement of HADS anxiety level (p<0.030), pain-related TKS level (p<0.035) and SF-12 mental component score (p<0.011). When the HSS knee scores and quadriceps muscle strength were compared, there was statistically difference between groups and the two outcomes scores were lower in control group after surgery (p<0.040, p<0.012, respectively). There were no statistical differences between groups for other outcomes after TKA (p>0.05).

**Conclusions:** The current results suggest that the PMR exercises at early stage after TKA might be an effective method for patient rehabilitation outcomes. However, in this comparison to obtain more comprehensive results studies on larger series are needed. In this way, a more uniform and objective data can be achieved.

#### THU0738-HPR COMPARISON OF THE FUNCTIONAL PROFILE OF THE FOOT BETWEEN THE PATIENTS WITH PATELLOFEMORAL OSTEOARTHRITIS AND TIBIOFEMORAL OSTEOARTHRITIS

N.B. Sari<sup>1</sup>, H. Güney Deniz<sup>2</sup>, G. Baltacı<sup>1</sup>, on behalf of Hande Güney Deniz, Gul Baltacı. <sup>1</sup>*Physical Therapy and Rehabilitation Department, Guven Hospital;* <sup>2</sup>*Physical Therapy and Rehabilitation Department, Hacettepe University, Faculty of Health Science, Ankara, Turkey*

**Background:** The biomechanics of the patellofemoral (PF) joint are distinct from the tibiofemoral (TF) joint and hence, interventions that have been designed to reduce pain and improve function in those with tibiofemoral disease may be inappropriate for those with Patellofemoral OA (PFOA). Therefore, patients with PFOA have been recently considered a subgroup different from patients with Tibiofemoral OA (TFOA). Loading asymmetries of the foot, discrepancy in foot contact area, and excessive increase in plantar pressure are associated with knee OA patients but there is lack of information that how PFOA or TFOA affect the foot profile.

**Objectives:** The purpose of this study was to investigate the foot profile differences between PFOA and TFOA patients and also compare these foot profiles with healthy individuals.

**Methods:** Twenty-nine patients with unilateral knee OA and 14 age-matched controls (median age=42.5 years, median BMI=23.8 kg/m<sup>2</sup>) were included in the study. The patients were divided into two groups; PFOA group (n=16, median age=52.5 years, median BMI=26.7 kg/m<sup>2</sup>) if they had a radiographic Kallgren and Lawrence (KL) score grade 2 or 3 in the PF joint, which was greater than KL score for the TF compartments; TFOA group (n=13, median age=54 years, median BMI=26.6 kg/m<sup>2</sup>) if they had a radiographic KL score grade 2 or 3 in the TF joint, which was greater than KL score for the PF compartments. Plantar pressure distribution was recorded by Digital Biometry Scanning System and Millettix software (DIASU, Italy). The static test was used to determine the maximum foot pressure (N/cm<sup>2</sup>) of the foot, forefoot weight ratio, rarefoot weight ratio, total load and foot angle axis (FAA). Kruskal Wallis test was used to compare the affected side of TFOA and PFOA groups with the control group. After application of the Bonferroni correction, Mann Whitney-U was used to compare the two-group differences.

**Results:** The age (p=0.179) and BMI (p=0.150) were similar between the groups. There were no differences on the affected side maximum foot pressure (p=0.603), forefoot weight ratio (p=0.247), rarefoot weight ratio (p=0.240) and total load (p=0.599) between TFOA, PFOA and control groups. FAA was higher in TFOA group [median-IQR: 17.0°(13.3°–35.4°)] when compared to PFOA (p<0.001) and control group (p<0.001). In addition, foot angle axis was lower in PFOA groups [median-IQR: 9.4°(1.5°–19.5°)] than control group [median-IQR: 13.4°(10.0°–15.8°)] (p=0.005). A reference value is appreciable if found to be between 12°–16°.

**Conclusions:** The angle of the foot plays an important role on optimal weight distribution during walking. Changing the angle of the foot may affect all other joints and create a modifying effect on the moment around the lower extremity. PFOA patients presented lower foot angle axis than normal values while TFOA patients presented higher angles. This may indicate that the intervention should be design for the joint involvement in the knee OA patients.

#### THU0739-HPR EFFECTIVE PREVENTION AND MANAGEMENT OF OSTEOPOROTIC FRACTURES: A SYSTEMATIC LITERATURE REVIEW OF NON-PHYSICIAN HEALTH PROFESSIONALS' INTERVENTIONS FOR A EULAR POINTS-TO-CONSIDER PROJECT

N. Wilson<sup>1</sup>, E. Hurkmans<sup>2</sup>, J. Adams<sup>1</sup>, T. Stamm<sup>3</sup>. <sup>1</sup>*Faculty of Health Sciences, University of Southampton, Southampton, UK;* <sup>2</sup>*Social Affairs and Health, Ecorys, Rotterdam, Netherlands;* <sup>3</sup>*Center for Medical Statistics, Informatics and Intelligent Systems, Medical University of Vienna, Vienna, Austria*

**Background:** Osteoporotic fractures are a global concern due to associated patient mortality, morbidity and health service expenditure. Optimal care provided

by non-physician health professionals, such as dieticians, nurses, occupational therapists, pharmacists and physiotherapists, to adults at high risk of primary or secondary osteoporotic fracture, is integral in the prevention and management of minimal trauma fracture, but may not be sufficiently realised in all European countries. To address this, a commissioned task force has developed the first collaborative EULAR points to consider/recommendations for non-physician health professionals in the prevention and management of osteoporotic fractures, underpinned by a systematic literature review (SLR).

**Objectives:** To identify and review the scientific literature to inform the development of evidence-based EULAR points to consider/recommendations for non-physician health professionals in the prevention and management of osteoporotic fracture.

**Methods:** A SLR for each of eight clinical questions that were previously formulated and consensually agreed by the task force members was undertaken by a research fellow (NW), with guidance from the task force convenors and the methodologist. Four electronic databases (Medline, Embase, Cinahl and PubMed) were searched over the period 13th - 31 st October 2017. The search strategies combined MeSH terms and keywords to identify studies related to two key concepts: (i) adults  $\geq 50$  years of age at high risk of primary or secondary osteoporotic fracture and (ii) interventions delivered by non-physician health professionals to prevent, treat and manage osteoporotic fractures. Exclusion criteria included articles not in English and without online access. Evidence was categorised using the Oxford Centre for Evidence-based Medicine Levels of Evidence. For critical appraisal of systematic reviews, AMSTAR 2 was used. Risk of bias was assessed by the Cochrane Collaboration's tool.

**Results:** The eight primary searches returned a total of 15 917 citations; duplicates were removed and the remaining 11 195 citations screened for relevance by title, abstract, design and year of publication (recently published reviews and/or RCTs were prioritised). Thirty-two studies were finally selected. Overall confidence in the findings of included systematic reviews ( $n=13$ ) ranged from low to high. Risk of bias also varied across other included studies. Strongest evidence of benefit was found for exercise in the management of osteoporotic fracture [level 1a].

**Conclusions:** There is a lack of high quality evidence for the role of health professionals in the prevention and management of adults at high risk of primary or secondary osteoporotic fracture. We recommend the instigation of an education and research agenda for non-physician health professionals.

#### THU0740-HPR DETERMINATION OF EXERCISE BEHAVIOUR IN PATIENTS WITH JUVENILE IDIOPATHIC ARTHRITIS

N. Arman<sup>1</sup>, E. Tarakcı<sup>2</sup>, A. Adrovic<sup>3</sup>, S. Sahin<sup>3</sup>, K. Barut<sup>3</sup>, O. Kasapcopur<sup>3</sup>, on behalf of Cerrahpasa. <sup>1</sup>Faculty of Health Science, Division of Physiotherapy and Rehabilitation, Department of Physiotherapy and Rehabilitation; <sup>2</sup>Faculty of Health Science, Division of Physiotherapy and Rehabilitation, Department of Neurologic Physiotherapy and Rehabilitation; <sup>3</sup>Medical Faculty of Cerrahpasa, Department of Pediatric Rheumatology, Istanbul University, Istanbul, Turkey

**Background:** Juvenile idiopathic arthritis (JIA) is one of the most common rheumatic diseases in childhood, affecting at least 1 in 1000 children. Children with JIA experience joint inflammation and swelling, pain and tenderness, morning stiffness, limited mobility. Children with JIA complain pain and have lower functional ability and decreased quality of life compared with their peers. Many studies have reported that patients with JIA have low physical activity levels and also exercise therapy is considered an important component of the treatment of JIA. Nowadays, studies for evaluating exercise behaviours in order to cope with physical inactivity for many chronic diseases are becoming increasingly important.

**Objectives:** The objective of this study was to determine exercise behaviour in patients with JIA.

**Methods:** 34 patients with JIA (23 female and 11 male), age range 5–18 years, home exercise program being recommended, participated in this study. The survey that was created with Google Forms was sent via WhatsApp to patients after 1 week-10 days than setting home based exercise program for each patient. In the survey, disease duration, involvement joint(s), Childhood Health Assessment Questionnaire (CHAQ) for functional ability, 11-point Numeric Analogue Scale

(NRS) for satisfaction of exercising, Exercise Stages of Change Scale-Short Form (ESCS), Exercise Self-Efficacy Scale (ESES), and Decisional Balance Scale (DBS) for exercise behaviour were inquired for the patients with JIA.

**Results:** The mean age and disease duration were 11.38 $\pm$ 4.68 and 5.36 $\pm$ 4.16 years, respectively. The mean of the number of affected joints was 5 $\pm$ 4.41. According to the five behavioural processes by ESCS, the patients were enrolled 38.2% of them in the stage of maintenance, 26.5% of them in the stage of action, 14.7% of them in the stage of preparation, 14.7% of them in stage of contemplation, 5.9% of them in stage of pre-contemplation. 67.5% of them was satisfaction for exercising ( $\geq 5$  for NRS). When comparison of the patients' CHAQ scores due to satisfaction level with NRS, the mean of CHAQ scores was significantly lower in patients with high satisfaction than patients with low satisfaction ( $p=0.014$ ). The mean of scores ESES and DBS were 17.06 $\pm$ 6.13 and 12 $\pm$ 4.61, respectively. All of the patients represented "positive perception of exercise" due to DBS. Only a significant correlation with age of patient and DBS was found ( $r=0.375$ ,  $p=0.029$ ).

**Conclusions:** This study demonstrated that patients with JIA were in high stages participated in exercising and have high self-efficacy of exercise, decreasing of functional ability may affect the satisfaction level of exercising and as age increases, decisional balance for exercising also increases. Therefore, future researchers should investigate potential facilitators of and barriers to exercise for larger population in patients with JIA by following up long term.

#### THU0741-HPR MAPPING THE BEHAVIOUR CHANGE TECHNIQUES USED IN A PRACTICE-BASED FIBROMYALGIA SELF-MANAGEMENT PROGRAMME: A QUALITATIVE STUDY

J. Pearson<sup>1</sup>, K. Whale<sup>2</sup>, N. Walsh<sup>1</sup>, S. Derham<sup>3</sup>, J. Russell<sup>4</sup>, F. Cramp<sup>1</sup>. <sup>1</sup>Faculty of Health and Applied Science, University of the West of UK; <sup>2</sup>Musculoskeletal Research Unit, University of Bristol; <sup>3</sup>Rheumatology Therapy Department, Royal National Hospital for Rheumatic Diseases, Royal United Hospitals Bath NHS Foundation Trust, Bristol; <sup>4</sup>Rheumatology Therapy Department, Royal National Hospital for Rheumatic Diseases, Royal United Hospitals Bath NHS Foundation Trust, Bath, UK

**Background:** Fibromyalgia (FM) is a complex long-term condition affecting up to 5.4% of the UK population. It is associated with chronic widespread pain, fatigue, sleep and cognitive difficulties. FM can cause high levels of functional and work disability; with individuals making frequent use of healthcare resources. There is limited robust evidence for effective pharmacological treatments for FM, and current guidelines all recommend non-pharmacological interventions.

Allied health professionals at the Royal National Hospital for Rheumatic Diseases (RNHRD), Bath developed the Fibromyalgia Self-Management Programme (FSMP); a non-pharmacological, multidisciplinary exercise and education group.

**Objectives:** Main aims of the FSMP are to provide condition-specific, patient centred, education and exercise advice, to support development of core, self-management skills. The FSMP comprises of 16 hours of group treatment, spread over four or six weekly sessions. Core components include education about FM, sleep, diet and lifestyle advice, hydrotherapy and stretches.

The FSMP was developed clinically, with little opportunity for the clinical team to explore the mechanisms by which it is effective. To inform successful implementation beyond the RNHRD, this evaluation aimed to map the FSMP to the NICE recommended Michie Behaviour Change Taxonomy (BCT) to determine key behaviour change components.

**Methods:** Non-participatory observations were conducted of the four and six week FSMP. Detailed notes on course content, therapist delivery, and additional content not included in the manual were recorded. Semi-structured interviews were conducted with therapists ( $n=4$ ) and patients ( $n=9$ ). Observations and review of the therapist manual data were deductively coded in NVIVO to the Michie Behaviour Change Taxonomy using Framework Analysis. Interview data were analysed using Theoretical Thematic Analysis.

**Results:** Review of the course manual and course observations show the FSMP coded onto 12 of the 16 main areas of the Michie Behaviour Change Taxonomy, encompassing 22 behaviour change techniques. Patients' interviews indicated significant behaviour changes as a result of attending the course; including increased activity levels, pacing, better quality sleep, and improved communication with family members. Patients reported positive changes to symptoms as a result of attending the course.

Therapists highlighted four key challenges in delivering the course; fidelity between therapists, patient readiness and acceptance of FM, group management and patient fatigue while attending the programme.

**Conclusions:** The FSMP utilises a range of behaviour change techniques. Patients who attend the course make changes to their behaviour which enables them to manage their symptoms of FM more effectively.

**THU0742-HPR** HOW TO OPTIMISE EXERCISE BEHAVIOUR IN AXIAL SPONDYLOARTHRITIS: RESULTS OF AN INTERVENTION MAPPING STUDY

S. Hilberdink<sup>1,2</sup>, S. van Weely<sup>1</sup>, F. van der Giesen<sup>1</sup>, M. Nijkamp<sup>3</sup>, N. Lopuhaä<sup>4</sup>, T. Vliet Vlieland<sup>1</sup>. <sup>1</sup>Orthopaedics, Rehabilitation and Physical Therapy, Leiden University Medical Center, Leiden; <sup>2</sup>Allied Healthcare Center for Rheumatology and Rehabilitation (PCRR), Groningen; <sup>3</sup>Psychology and Educational Sciences, Open University of the Netherlands, Heerlen; <sup>4</sup>Dutch Arthritis Foundation, Amsterdam, Netherlands

**Background:** Regular exercise has many health benefits for people with axial spondyloarthritis (axSpA).<sup>1</sup> However, most patients do not engage in frequent exercise.<sup>2</sup> In order to improve exercise behaviour of axSpA patients, a well-founded intervention is needed.

**Objectives:** To identify effective intervention methods to optimise exercise behaviour in axSpA.

**Methods:** The first three steps of the Intervention Mapping (IM) protocol, which is a six-step framework for intervention development, were used to determine effective intervention components. This study comprised 1) a needs assessment, to examine the discrepancy between current and desired exercise behaviour of axSpA patients, 2) a determinant analysis, to identify barriers and facilitators (determinants) to overcome this discrepancy, and 3) an intervention method analysis, to select effective methods that target these determinants. All three steps included literature reviews: PubMed and Web of Science were systematically searched for articles up to August 2017 using a well-defined search strategy. Additionally, semi-structured interviews with axSpA patients (n=2) and physiotherapists specialised in axSpA (n=2) explored the literature search findings of IM steps 1 to 3 qualitatively and ranked the determinants and methods identified in steps 2 and 3 in order of relevance.

**Results:** The literature searches resulted in 28 (64), 23 (257) and 15 (209) included articles (hits) for IM steps 1, 2 and 3, respectively. IM step 1 revealed that only one third of axSpA patients engage in (frequent) mobility, strengthening and/or cardiorespiratory exercises, while especially these components appear beneficial in axSpA. IM step 2 showed that the determinants self-efficacy, attitude, skills, therapists' skills, knowledge, intentions, planning and exercise group support positively influence exercise behaviour in axSpA (ordered by relevance). IM step 3 identified effective methods to stimulate exercise behaviour in axSpA by targeting aforementioned determinants: guided practice, action planning, goal setting, education (on disease, coping, exercise and available resources), feedback, tailoring, motivational interviewing, monitoring, therapists' education and encouragement of exercising in a group (ordered by relevance).

**Conclusions:** This study showed that in order to optimise exercise behaviour in axSpA, patients should be offered an intervention including education, motivational interviewing, goal setting and action planning and they should be stimulated to exercise in a group. In addition, therapists should be educated how to tailor, practice and monitor exercise and how to base this on thorough assessment.

**THU0743-HPR** SUPPORTED SELF-MANAGEMENT INTERVENTIONS FOR FAMILIES AND CHILDREN AGED 4 TO 11 YEARS OLD LIVING WITH ARTHRITIS, ASTHMA AND TYPE ONE DIABETES: AN INTEGRATIVE REVIEW

S.R. Stones, on behalf of iSMART Research Group. *School of Healthcare, University of Leeds, Leeds, UK*

**Background:** The Shared Management Model implies that as children with chronic conditions like rheumatic and musculoskeletal diseases (RMDs) mature, they should increasingly take on responsibility for self-managing their health, in partnership with those involved in their care and education.<sup>1</sup> An initial search of the literature suggested that there was a reduced emphasis on the supported self-management of chronic conditions like RMDs in children aged 4 to 11 years, inspiring a more rigorous and systematic search of the empirical literature.

**Objectives:** The aim of this integrative review were to understand the evidence base regarding supported self-management of chronic conditions by children and their families, including interventions that promote supported self-management skills development.

**Methods:** Studies published since 2012 were identified through a search of eight bibliographic databases. Given the extensive nature of chronic conditions in children, the review focused on three groups of chronic conditions sharing similar self-management characteristics: asthma, RMDs, and type one diabetes mellitus (T1DM). The methodological quality of quantitative studies was assessed using the Cochrane Risk of Bias scale. Non-randomised studies were assessed using the Methodological Index for Non-randomised Studies (MINORS) instrument. Review articles and qualitative studies were assessed using Critical Appraisal Skills Programme (CASP) Systematic Review Checklist and CASP Qualitative Checklist, respectively.

**Results:** The review identified 29 relevant articles, reporting on 22 primary research studies and three review articles. Study participants were children with asthma (n=17) and T1DM (n=4). No studies were identified for children with RMDs. Seventeen studies reported an underlying theoretical basis, the most common of which was social cognitive theory. Interventions promoting supported self-management skills appeared to be effective in improving a range of self-reported and clinical outcomes, including health status, health knowledge, and self-efficacy. However, there was limited evidence of the effect of interventions on the psychosocial wellbeing of children. It also became clear that education-based interventions alone are insufficient in improving self- and shared-management skills. In addition, most studies failed to contextualise chronic conditions in children and their families, who shift between interacting with interventions and living their everyday lives over time.

**Conclusions:** Given the complexity of childhood chronic conditions and intervention components and contents, further investigation is required to specify the mechanisms by which supported self-management interventions operate. Most studies were also aimed at parents and carers, and appeared to neglect the importance of including and engaging children in decisions involving their health-care. Finally, the review clearly highlighted the need for research on the supported self-management of RMDs in children, since no evidence-based interventions were identified for these individuals.

**THU0744-HPR** EFFECTIVENESS OF PROFIBRO MOBILE APP ON QUALITY OF LIFE, SYMPTOMS AND SELF-CARE AGENCY IN PATIENTS WITH FIBROMYALGIA: A RANDOMISED, SINGLE-BLIND TRIAL

S.L.K. Yuan, A.P. Marques. *Physical Therapy, Speech Therapy and Occupational Therapy, School of Medicine at the University of Sao Paulo, Sao Paulo, Brazil*

**Background:** ProFibro is the first free mobile Android application in Brazilian Portuguese for fibromyalgia (FM). It was developed as a complementary Mobile Health resource in FM management for the promotion of self-care. Its main functions are educational animation, self-monitoring, sleep strategies, scheduling, exercise, hints through notifications, practice of gratitude with a diary and family adjustments.

**Objectives:** to assess the effectiveness of ProFibro in the improvement of health-related quality of life, symptoms and self-care agency of patients with FM.

**Methods:** Forty subjects with FM, aged 19–59 years, were randomised into ProFibro and a control group. ProFibro group received a smartphone with the mobile app and subjects were instructed to use it for 6 weeks, while control group

#### THU0745-HPR USE OF WEARABLE ACTIVITY TRACKERS TO IMPROVE PHYSICAL ACTIVITY BEHAVIOUR IN RHEUMATIC CONDITIONS – A SYSTEMATIC REVIEW

T. Davergne<sup>1</sup>, A. Pallot<sup>2</sup>, L. Gossec<sup>1</sup>, B. Fautrel<sup>1</sup>. <sup>1</sup>GRC 08 UMR S 1163, Paris; <sup>2</sup>IFMK Ceerrf, Saint-Denis, Paris, France

**Background:** Patients with rheumatic conditions, such as low back pain (LBP), lower limb osteoarthritis (OA) and chronic inflammatory rheumatic diseases (CIRDs) are vulnerable regarding physical inactivity, although they derive specific benefits from regular physical activity.<sup>1, 2</sup> Wearable activity trackers (WATs), including simple pedometers and more advanced WATs (e.g. Fitbit), could be a promising strategy to improve physical activity levels.

**Objectives:** To obtain an overview regarding the adherence and effectiveness of WATs to increase physical activity levels and to reduce sedentary behaviours in rheumatic patients.

**Methods:** This systematic review was conducted in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-analysis (PRISMA) statement (PROSPERO CRD42018083532).

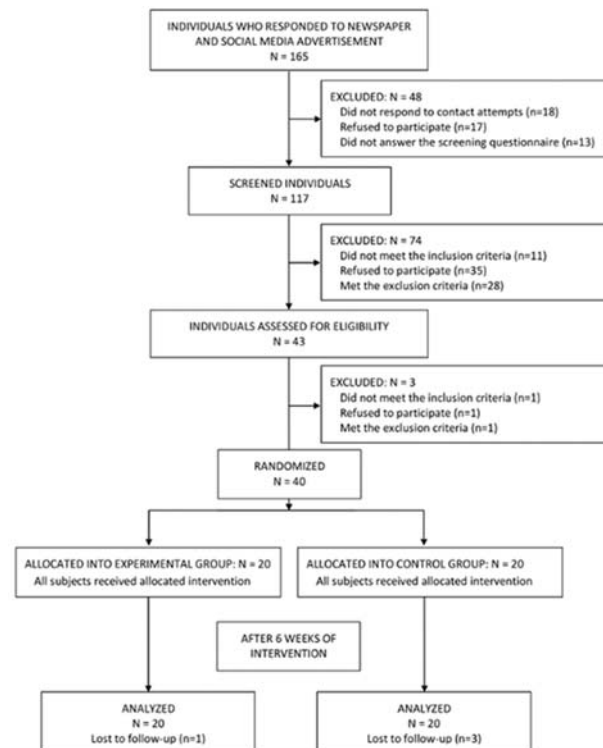

All articles available in English, published between 2000 and 2018 (January), in MEDLINE, EMBASE, PsycINFO and Central Register for Controlled Trials were screened as well as extensive hand search. Study selection and data collection were performed by two independent reviewers. Studies were included if they assessed WATs in patients with OA, LBP or CIRDs. Data collected pertained to (a) adherence (i.e.% days with the WAT worn), (b) efficacy on physical activity (i.e. increase in step counts or moderate to vigorous physical activity), (c) efficacy on symptoms (function, pain, quality of life). Standardised mean differences were calculated and reported as null (<0.2) small (0.2–0.5) moderate (0.5–0.8) or large (>0.8).

**Results:** Of 2378 abstracts, 15 studies were included in the review (of which, 7, 47%, published in 2017) with a total of 1344 patients: 42% men, range of mean age 16–64 years. Among the 15 studies, 7 (47%) were related to OA, 5 (33%) to LBP and only 3 (20%) to CIRDs. In all, 7 (47%) reported on advanced WATs and 8 (53%) on simple pedometers. (a) Adherence: 4/15 studies (27%) reported adherence, in a total of 416 patients. The weighted mean duration of the studies was 12.6 weeks and adherence was excellent (weighted mean time worn: 92.7% (SD 4.6)). (b) Efficacy on physical activity was reported in 11/15 (73%) studies (ie 876 patients). The mean increase in steps per day was 1579 (SD 770) in the intervention group over a weighted mean duration of 22.6 (SD 13.6) weeks. Effect sizes were null (2/10 studies), small (4/10 studies), moderate (3/10 studies) or large (1/10 studies) (figure 1). (c) For impact on symptoms, 14/15 (93%) studies reported on function, pain or quality of life (or several of these leading to 20 analyses). Overall, effect sizes were null (14/20, 70%) or small (6/20, 30%).

**Conclusions:** Findings suggest that both ProFibro app and the booklet are effective for reducing symptom severity. ProFibro may also reduce the overall impact of FM in the quality of life. More studies with larger sample sizes and longer periods of intervention are needed to confirm the findings of the present study.

**Conclusions:** Short term adherence to WATs was high in published studies of LPB, OA or CIRDS but the efficacy to increase physical activity levels was small to moderate. There were no modifications of symptoms. The incorporation of WAT in patient care remains challenging. Further studies are needed, especially for CIRDS.

#### THU0746-HPR EFFICACY OF SURGICAL TREATMENTS FOR PAIN ASSOCIATED WITH TRAPEZIOMETACARPAL (THUMB BASE) OSTEOARTHRITIS: A SYSTEMATIC REVIEW

T. Hamasaki<sup>1,2,3</sup>, S. Laprise<sup>4</sup>, P.G. Harris<sup>1,2,3</sup>, D. Ziegler<sup>2</sup>, H.T.V. Zomahoun<sup>5</sup>, N. J. Bureau<sup>1,2,3</sup>, N. Gaudreault<sup>6,7</sup>, M. Choinière<sup>1,3</sup>. <sup>1</sup>Université de Montréal, <sup>2</sup>Centre hospitalier de l'Université de Montréal (CHUM), <sup>3</sup>Research Center of the CHUM, Montréal, <sup>4</sup>Physiotherapie MyoSynergie, Amos; <sup>5</sup>Quebec Spor-support Unit, Quebec; <sup>6</sup>Université de Sherbrooke; <sup>7</sup>Centre hospitalier universitaire de Sherbrooke, Sherbrooke, Canada

**Background:** Trapeziometacarpal osteoarthritis (TMO) is a highly prevalent, painful, and debilitating disorder. Unfortunately, TMO management remains sub-optimal and this is in part due to the lack of knowledge on evidence-based care management. The aim of this systematic review (SR) is to document the efficacy of existing surgical interventions for reducing TMO pain.

**Methods:** We performed this SR according to the Cochrane intervention review methodology. Trials and SRs assessing surgical intervention efficacy on TMO were identified via 16 databases and hand search via the included references. Studies selection, data extraction and methodological quality assessment were conducted by two independent reviewers. Effect estimates of interventions were extracted from SRs when available, otherwise estimated from randomised controlled trials (RCTs). If RCTs were not available, non-RCTs (NRCTs) were referred to. Characteristics and efficacy of interventions were quantitatively analysed. In addition, we rated the level of evidence quality by using the GRADE tool.

**Results:** A total of 8 SRs, 16 RCTs and 41 NRCTs were identified. Most of these studies had unclear to high risk of biases which may have compromised their results. More than 40 comparisons of different surgical interventions were identified, including arthroscopic debridement (AD) (n=2 studies); 1 st metacarpal osteotomy (n=3); resection of 1 st metacarpal/trapezium (R) (n=3); arthrodesis (A) (n=14); trapeziectomy (T) (n=16); hematoma distraction arthroplasty (n=5); ligament reconstruction (LR) (n=5); tendon interposition (TI) (n=13); LRTI (n=17); and manufactured implants - Arex (n=1), Artelon (n=7), chondrocostal autograft (n=4), De la Caffinière (n=5), Elektra (n=5), Graftjacket (n=1), Gore-Tex (n=6), Guepar (n=3), Ledoux (n=2), Maia (n=1), Marlex (n=5), porcine dermal collagen xenograft (n=2), pyrocarbon Pi<sub>2</sub> (n=5), PyroDisk (n=1), Pyrocardan (n=1), and Swanson (n=11). The effect sizes of most of the interventions were small (standardised mean differences 0.04–4.81, risk ratios 1.05–11.1) and/or their 95% confidence intervals included null value. Nonetheless, the superiority of the following interventions was supported by the evidence of very low to moderate quality: AD

over conservative interventions; R+GraftJacket over R; A over R, T+TI and T+LRTI; partial T+chondrocostal autograft over T; T over T+porcine xenograft; T+TI over Artelon; T+LRTI+ bone tunnel over T+LRTI without tunnel for a short-term period; T+LRTI over T+LRTI+ Mitek anchor suture; T+Elektra over T+TI; PyroDisk over Pyrocardan.

**Conclusions:** This SR allowed collating comprehensive evidence on the efficacy of surgical interventions for TMO pain. Based on the available scientific evidence, arthrodesis appears superior to other interventions (R, T+TI and T+LRTI) to alleviate pain, however, adverse effects (e.g., nonunion) have been reported. Thus, it goes without saying that when choosing a proper surgical intervention for TMO, not only its analgesic effects but also the risk and gravity of adverse effects must be taken into consideration.

#### THU0747-HPR THE EFFECT OF CLINICAL PILATES EXERCISES ON DISEASE SPECIFIC INDICES, CORE STABILISATION AND BALANCE IN PATIENTS WITH ANKYLOSING SPONDYLITIS

Y. Acar<sup>1</sup>, B. Gürpınar<sup>1</sup>, G. Can<sup>2</sup>, F. Önen<sup>2</sup>, N. Özdemir<sup>1</sup>. <sup>1</sup>Physical Therapy and Rehabilitation; <sup>2</sup>Rheumatology, Dokuz Eylül University, izmir, Turkey

**Background:** The Pilates method has been widely used to improve physical fitness and rehabilitation in general. Although Pilates method gives precedence to the spine and focuses on controlled movement, posture, and breathing, which are obviously the basic goals of Ankylosing Spondylitis(AS) treatment there is limited literature on the effectiveness of the Pilates method as treatment for patients with AS.

**Objectives:** The aim of this study was to investigate the efficacy of clinical pilates exercises on on disease-specific indices, core stabilisation and balance in patients with AS.

**Methods:** The study included 21 AS patients(11 male, 10 female). Demographic and physical characteristics(age, height, weight, body mass index) were recorded. Evaluations were performed before clinical pilates treatment and after 8 weeks clinical pilates treatment. Bath Ankylosing Spondylitis Disease Activity Index(BASDAI) for disease activity, Bath Ankylosing Spondylitis Functional Index (BASFI) for functional capacity, Bath Ankylosing Spondylitis Mobility Index (BASMI) for spinal mobility were used. Balance was evaluated with Biodex Balance System SD. Overall postural stability indices obtained with bilateral stance (stable and unstable platform), single leg stance(stable platform) and overall limits of stability scores were recorded. Static and dynamic endurance tests were used to evaluate core stabilisation. Modified sit-ups test for dynamic core endurance and static core endurance tests recommended by McGill were used to evaluate core stabilisation. Patients attended group clinical pilates exercise sessions three times a week, during 8 weeks with physiotherapist.

**Results:** The mean age of patients was 43,9±8,93 years and the mean body mass index(BMI) was 27,37±3,68 kg/m<sup>2</sup>. Pre and post treatment measurements were shown in table 1. Statistically significant improvement was observed in all parameters except stable platform bilateral stance and single leg stance postural stability results(p<0,05).

**Abstract THU0747HPR – Table 1.** Comparison of pre and post treatment measurements

	Pre-Treatment Median(IQR)	Post Treatment Median(IQR)	p value

**THU0748-HPR** EVALUATION OF ADHERENCE TO BIOLOGIC DISEASE MODIFYING ANTI-RHEUMATIC DRUGS IN PATIENTS WITH INFLAMMATORY ARTHRITIS

Y.C. Lim<sup>1</sup>, W.G. Teo<sup>2</sup>, M.N. Eng<sup>1</sup>, H.M. Cheen<sup>1</sup>, X.Y. Tay<sup>1</sup>, S.I. Yeo<sup>3</sup>, T.G. Lim<sup>1</sup>.

<sup>1</sup>Pharmacy, Singapore General Hospital; <sup>2</sup>Pharmacy, National Heart Centre Singapore; <sup>3</sup>Rheumatology and Immunology, Singapore General Hospital, Singapore, Singapore

**Background:** In recent years, bDMARDs have revolutionised IA treatment in improving IA symptoms, as well as slowing down structural damage. However, efficacy observed in the controlled settings of clinical trials may not always translate to effectiveness in clinical practice.<sup>1,2</sup> Currently, there are no published studies assessing adherence to bDMARDs and its associated factors among IA patients in Singapore. Knowledge of the extent of poor adherence to bDMARDs and its risk factors can facilitate efficient implementation of interventions to improve adherence and IA outcomes.

**Objectives:** The primary objective of the study was to assess adherence to bDMARDs among patients with IA in Singapore. The secondary objective was to identify factors associated with poor adherence to bDMARDs.

**Methods:** A retrospective observational study was conducted at Singapore General Hospital, a 1600-bed academic medical centre. Electronic records of patients diagnosed with rheumatoid arthritis (RA), spondyloarthritis (SpA) or psoriatic arthritis (PsA) who had received at least six consecutive months of bDMARDs between 1 st January 2010 and 31 st December 2015 were reviewed. Adherence was calculated by proportion of days covered (PDC) using the following formula:  $PDC = \frac{\sum(\text{number of doses} \times \text{prescribed frequency})}{(\text{total duration}) \times 100\%}$ . Patients with  $PDC \geq 0.80$  were considered adherent.<sup>3</sup> Factors associated with adherence to bDMARDs were identified using multivariate logistic regression using the entire dataset and then by type of IA.

**Results:** Among 115 patients included in the analyses, majority of the patients were Chinese (n=77, 67%) and females (n=61, 53%). Other pertinent demographics and clinical characteristics are detailed in table 1. The mean PDC was 0.82 ( $\pm 0.18$ ) and 69 (60%) patients were adherent (i.e.  $PDC \geq 0.8$ ). Multivariate logistic regression did not identify any factors significantly associated with adherence. Patients with SpA who previously received a bDMARD (OR=5.12; 95% CI 1.02–25.8;  $p=0.048$ ) and who did not receive subsidy (OR=0.21; 95% CI 0.50–0.89;  $p=0.034$ ) were found to be significantly associated with adherence.

**Abstract THU0748HPR – Table 1.** Patient demographics and clinical characteristics

Characteristics (n=115)	n, (%) unless indicated
Mean age at bDMARD initiation, years ( $\pm$ SD)	45.5 ( $\pm 12.0$ )
Gender	
Male	54 (47.0)
Female	61 (53.0)
Race	
Chinese	77 (67.0)
Indian	17 (14.8)
Malay	9 (7.8)
Others	12 (10.4)
Diagnosis	
RA	45 (39.0)
SpA	44 (38.0)
PsA	26 (23.0)
Biologic Naïve	
Yes	79 (68.7)
No	36 (31.3)
Current Biologic	
TNFi	101 (87.8)
Non-TNFi	14 (12.2)

**Conclusions:** The findings of this study suggest that IA patients have suboptimal adherence to bDMARDs. Determinants of poor adherence remain elusive and further research into the social, psychological and environmental aspects is warranted. Measures to improve affordability of bDMARDs such as obtaining government subsidies and offering patient access schemes may improve adherence as seen in patients with SpA.

**FRIO702-HPR** TREATMENT SATISFACTION IN PATIENTS WITH JUVENILE IDIOPATHIC ARTHRITIS

A. Tollisen<sup>1</sup>, A.M. Selvaag<sup>1</sup>, T. Ingebrigtsen<sup>1</sup>, A. Aasland<sup>2</sup>, A. Lerdal<sup>3</sup>, B. Flato<sup>1</sup>.

<sup>1</sup>Department of Rheumatology; <sup>2</sup>Department of Clinical Neurosciences for Children, Rikshospitalet, Oslo University Hospital; <sup>3</sup>Department of Research, Lovisenberg Diaconal Hospital, Oslo, Norway

**Background:** Limited information exists regarding treatment satisfaction in patients with Juvenile Idiopathic Arthritis (JIA).

**Objectives:** The aim of this study was to investigate satisfaction with synthetic and biologic disease-modifying anti-rheumatic drugs (sDMARDs and bDMARDs) in adults with JIA.

**Methods:** Patients with JIA who attended Oslo University Hospital from 1995–2000 with <18 months disease duration were invited to participate. From a cohort of 96 patients, 52 (54%) used DMARDs. Patients treated with Methotrexate (MTX) or biologics were assessed with the 14-item Treatment Satisfaction Questionnaire for Medication (TSQM, one questionnaire for each medication). The TSQM covers 4 domains (effectiveness, side effects, convenience and global satisfaction) with a score range from 0 – 100 and with higher score representing higher satisfaction on the domain.

**Results:** The mean age of the 52 participants was 25.1 (4.6) years, 75% were female and 33 (63%) patients had polyarticular course JIA. The following DMARDs were used; MTX (n=29), biologics [n=37 (etanercept, n=13; adalimumab, n=8; tocilizumab, n=6; infliximab, n=3; certolizumab, n=3; golimumab, n=2; anakinra, n=1 and rituximab, n=1)] and sulfasalazine (n=5). 19 patients used a combination of sDMARDs and bDMARDs or 2 sDMARDs.

Clinical characteristics	All patients (N=96)	Patients on DMARDs (n=52)
Disease duration, years, mean (SD)	18.9 (1.5)	18.7 (1.6)
Age at disease onset, years, mean (SD)	6.1 (4.0)	6.3 (4.4)
ILAR classification, n (%)		
Systemic arthritis	7(7)	2 (4)
Polyarticular RF negative	24 (25)	16 (31)
Polyarticular RF positive	1 (1)	1 (2)
Oligoarticular persistent	36 (38)	13 (25)
Oligoarticular extended	10 (10)	7 (13)
Enthesitis-related arthritis	5 (5)	2(4)
Psoriatic arthritis	4 (4)	4 (8)
Undifferentiated arthritis	9 (9)	7 (13)

TSQM domains, mean (SD)	MTX (n=29)	Biologics (n=37)	P-value
Effectiveness	59.8 (19.6)	74.2 (15.5)	0.002
Side effects	62.(30.1)	90.1 (20.5)	<0.001
Convenience	64.3 (22.1)	69.1 (13.3)	0.282
Global satisfaction	48.5 (23.1)	70.4 (18.9)	<0.001

A correlation was found between the domain side effects and age in patients using MTX (rs 0.368,  $p=0.049$ ). No other associations were found between TSQM domains and age, gender, disease duration or polyarticular disease course.

**Conclusions:** Patients reported higher treatment satisfaction with biologics compared to MTX in the domains effectiveness, side effects and global satisfaction. An association was found between age and the TSQM domain side effects in patients using MTX. Other domains of TSQM were not related to patient or disease characteristics in JIA. In order to ensure good health care, information of patients' treatment satisfaction should be incorporated in the process of treatment decision-making.

**FRI0703-HPR** **EVALUATION OF AN INDIVIDUAL TARGETED INTERVENTION WITH THE PURPOSE OF REDUCING SEDENTARY TIME IN PEOPLE WITH RHEUMATOID ARTHRITIS – A MIXED METHODS STUDY BASED ON QUESTIONNAIRES AND FOCUS GROUP INTERVIEWS**

B.A. Esbensen<sup>1</sup>, T. Thomsen<sup>1</sup>, M.R. Petersen<sup>2</sup>, M. Aadahl<sup>3</sup>. <sup>1</sup>Centre for Head and Orthopaedics, Rigshospitalet, Glostrup, Copenhagen Center for Arthritis Research, Center for Rheumatology and Spine Diseases, Glostrup; <sup>2</sup>Department of Rehabilitation, Copenhagen University Hospital, Herlev Gentofte Hospital, Herlev; <sup>3</sup>Research Centre for Clinical Research and Prevention, Bispebjerg and Frederiksberg Hospitals, Frederiksberg, Denmark

**Background:** People with rheumatoid arthritis (RA) spend a high proportion of their waking time in sedentary behavior (SB). Reduction of SB and increase in light intensity physical activity has been suggested as a means to improve health in people with mobility problems. RCT study was conducted aiming to investigate the efficacy of an individually tailored, theory-based behavioral intervention for reducing daily sitting time, pain and fatigue, as well as improving health-related quality of life, general self-efficacy, physical function and cardio-metabolic biomarkers in people with RA[1]. The 16-week intervention included 1) three individual motivational counseling sessions and 2) Tailored Short Text Message Service (SMS) reminders. The intervention was effective for reducing daily sitting time, improving patient reported outcomes and reducing total cholesterol in the intervention group (n=75) compared to the usual lifestyle control group (n=75) [1]. It is relevant to know the participants' attitude towards the intervention prior to implementation.

**Objectives:** To evaluate participants' perspective on an individually tailored intervention in the RCT study "The efficacy of motivational counselling and SMS reminders on daily sitting time in people with rheumatoid arthritis".

**Methods:** A mixed methods study including both quantitative and qualitative data was applied. In a convergent parallel design, quantitative data (N=69) was collected by the end of the intervention using a questionnaire designed to evaluate experiences with participation and the intervention. 18 out of those 69 responding to the questionnaire were invited to take part in one of three focus group interviews, involving an evaluation of the intervention through discussion and dialogue. Criteria: maximum of variation in gender, age, duration of RA, employment and the time of conclusion in the RCT study. Data from quantitative and qualitative studies were analyzed and reported separately and then merged at the final stage of the mixed methods study.

**Results:** Participants were generally satisfied with the content and the course of the intervention. In particular, they were satisfied with the individual tailoring of the intervention and the ongoing feedback and follow-up throughout the intervention period. Participants indicated that they had changed their habits regarding sedentary behavior as a direct result of the intervention, and had managed to maintain these changes after their participation. Furthermore, participants reported that their participation in the RCT study indirectly affected their family, friends and colleges, who also gained knowledge about the risk and consequences of sedentary behavior and participation led to changed habits especially at work.

**Conclusions:** Participants in the intervention group in the RCT "The efficacy of motivational counselling and SMS reminders on daily sitting time in patients with rheumatoid arthritis" were satisfied with the content and delivery of the intervention and had managed to change behavior in relation to sedentary time.

**FRI0704-HPR** **SESAME QUIZ: A PLAYFUL ONLINE QUESTIONNAIRE TO ASSESS PATIENTS' KNOWLEDGE ABOUT SJOGREN'S SYNDROME**

C. Ménage-Anjuère<sup>1,2</sup>, R. Belkhir<sup>1</sup>, E. Bergé<sup>1</sup>, A. Decotignies<sup>2</sup>, A. Rieutord<sup>2</sup>, X. Mariette<sup>1</sup>, R. Seror<sup>1</sup>. <sup>1</sup>Rheumatology, Hôpital Bicêtre, Le Kremlin-Bicêtre; <sup>2</sup>Pharmacy, Hôpital Antoine Bécélère, Clamart, France

**Background:** We needed to assess the impact of our patient education program on Sjogren's syndrome (SESAME) in order to continuously improve it.

**Objectives:** A playful online questionnaire was designed and implemented to assess patients' knowledge about Sjogren's syndrome.

**Methods:** A interprofessional team (3 rheumatologists, 3 pharmacists) and a 4-patient group who participated in the education program together proceeded to the questionnaire design: 1) definition of a competency framework for patients with Sjogren's syndrome; 2) from literature review, identification of quality requirements for a questionnaire (scientific quality, opportunity to interact, means of expression, logical chaining of questions, simplicity, utility, shortness, bias prevention, playfulness, variety, online diffusion). To fulfill these criteria, we used a clear vocabulary and concise questions, included open-ended questions on patient experience, focused on the artwork, randomized the order of answer choices, and shared the questionnaire online. Once the SESAME quiz was established, a scoring system was defined by the expert group. Face validity, feasibility and reproducibility were assessed to validate the questionnaire. 25 patients were contacted to complete the questionnaire twice. Patients also evaluated the content, structure and feasibility using 12 items (understandable language, unambiguous sentences, length of the questionnaire, difficulty, web access). Reproducibility was calculated using intraclass correlation coefficient (ICC) on patient answers separated by 48 hours.

**Results:** The questionnaire includes 28 questions divided into 4 parts: Sjogren's signs, Sjogren's causes, treatment, daily life with the disease. The 25 patients filled in the questionnaire twice (96% women, 54 years min-max[23;74], 4 years since the diagnosis min-max[1;20]). The questionnaire was filled in from a computer (n=38), a tablet (n=3) or a smartphone (n=9). The average response time was 19 minutes. The median score was 34 points min-max[22;46] out of 50. 18 patients evaluated the questionnaire. 15 patients or more regarded its content, organization and feasibility as "very good". 5 patients found it difficult. The reproducibility was very high (total ICC=0.87 IC95% [0.74–0.94], ICC on each part between 0.61 et 0.87).

**Conclusions:** The SESAME quiz is now freely available (<https://etp-rhumato.typeform.com/to/qsVhr1>) and all the Hospital centers caring for Sjogren patients can use it for their follow up.

**FRI0705-HPR** **COMPARISON OF PAIN BEHAVIOR OF INDIVIDUALS WITH DIFFERENT RHEUMATIC DISEASE**

E. Ünal<sup>1</sup>, G. Arın<sup>1</sup>, N.B. Karaca<sup>1</sup>, S. Öksüz<sup>2</sup>, F.B. Oflaz<sup>1</sup>, A. Özçadırcı<sup>1</sup>, Y. Yakut<sup>3</sup>, S. Apraş Bilgen<sup>4</sup>. <sup>1</sup>Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences, Ankara, Turkey; <sup>2</sup>Department of Physiotherapy and Rehabilitation, Eastern Mediterranean University Faculty of Health Sciences, Famagusta, Cyprus; <sup>3</sup>Department of Physiotherapy and Rehabilitation, Hasan Kalyoncu University Faculty of Health Sciences, Gaziantep; <sup>4</sup>Department of Internal Medicine-Rheumatology, Hacettepe University Faculty of Medicine, Ankara, Turkey

**Background:** Pain is an important symptom in rheumatic diseases. Chronic pain is strongly associated with cognition, anxiety and depression levels in these patients.<sup>1,2</sup> Pain behavior can be related to the patient's response to the disease and the use of painkillers.

**Objectives:** The aim of this study is to compare the pain behavior of patients with different rheumatic diseases.

**Methods:** Patients with Ankylosing Spondylitis (AS), Fibromyalgia (FM), and Rheumatoid Arthritis (RA) were included in the study and their demographic data were recorded. The Hospital Anxiety and Depression Scale (HADS) was used to determine the anxiety and depression levels of patients. Health Assessment Questionnaire (HAQ) was used to determine functional status and Cognitive Exercise Therapy Approach Scale (the authors request that the abbreviation stays as "BETY" as the original in Turkish) was used to assess bio-psychosocial status of the patients.<sup>3</sup> The first and fourth questions of BETY were used to investigate pain behavior.

**Results:** The mean age of 329 patients were 45,5±11,5 years and the body mass index was 27,8±5,9. The patient's HAQ score was 12,5±10,5, the HADS anxiety score was 8,7±5,2 and the HADS depression score was 7,50±4,6. The BETY total score was 62.6±26.3. According to BETY scale's 1st question, although the patients felt pain, the rate of continuing activity was 42.6% and the non-continuity rate was 13.4%. According to BETY scale's 4th question, the painkiller using rate was 27.8% and the non-painkiller rate was 25.3% (table 1).

**Conclusions:** Although patients knew that their pain would increase, it was determined that the patients had continued their activities. It was also found that the use of painkillers was higher in AS patients compared to the others. It was concluded that these groups should be trained in regarding to restricting their activities when they felt pain.

Table 1 Findings related to questionnaires

	RA (n=126)	AS (n=100)	FMS (n=103)	ALL (n=329)
HAQ	13,3±11,9	12,6±9,9	11,7±9,5	12,6±10,6
HADS-A	7,1±5,4	9,9±4,8	9,7±4,8	8,8±5,2
HADS-D	5,7±4,5	8±4,2	9,2±4,4	7,5±4,6
BETY	60,6±29,7	59,9±24,3	67,1±22,7	62,7±26,3
<b>1st question</b>				
(I can't stop myself doing activities even though I know it will increase my pain.)				
Yes always (%)	46	50	33	43,2
Yes often (%)	8,7	21	21,4	16,4
Yes sometimes (%)	23	12	26,2	20,7
Yes rarely (%)	4	2	13,6	6,4
No never (%)	18,3	15	5,8	13,4
<b>4th question</b>				
(I don't feel comfortable unless I take painkillers.)				
Yes always (%)	21,4	38	29,1	28,9
Yes often (%)	9,5	11	9,7	10
Yes sometimes (%)	22,2	15	22,3	20,1
Yes rarely (%)	16,7	13	19,4	16,4
No never (%)	30,2	23	19,4	24,6

**FRI0706-HPR** **VALUES UNDERLYING DISEASE-MODIFYING ANTIRHEUMATIC DRUG PREFERENCES OF PATIENTS WITH RHEUMATOID ARTHRITIS**

E. Mathijssen, J. Vriezekolk, B. van den Bemt. *Rheumatology, Sint Maartenskliniek, Nijmegen, Netherlands*

**Background:** Disease-modifying antirheumatic drugs (DMARDs) are the cornerstone of treatment in rheumatoid arthritis (RA). Each DMARD has its own characteristics (e.g. onset of action, route of administration and dosing frequency). Treatment decisions should ideally be made through a shared decision making (SDM) process between clinicians and patients, taking account of patient preferences (1,2). This requires an understanding of patient preferences. A number of studies have explored DMARD preferences of patients with RA (3). However, insight into values underlying DMARD preferences that may drive patients' treatment decisions is still lacking. Such information is relevant for clinicians in order to better understand patient preferences. Ultimately, this will facilitate the SDM process.

**Objectives:** To provide insight into values underlying DMARD preferences of patients with RA.

**Methods:** A secondary analysis of transcripts from three focus groups in patients with RA. Two researchers independently analysed the transcripts, using thematic analysis with an inductive approach.

**Results:** Twenty-three patients participated in the focus groups. They had a median age of 62 years (range: 36–78 years), 87% were female and the median disease duration was 11 years (range: 2–42 years). Three values were identified: certainty, independency and safety. Certainty: patients wanted to be certain that the DMARD would work for them. DMARD characteristics that represented this value were onset of action and efficacy. Independency: a DMARD that could easily be fitted into patients' everyday lives was considered important. Route of administration, dosing frequency, location of administration and storage conditions were DMARD characteristics that represented this value. Safety: patients wanted to prevent health damage related to their DMARD use. DMARD characteristics that represented this value were chance of side effects, severity of side effects and consequence of long term use.

**Conclusions:** Certainty, independency and safety are important values to patients with RA. These values underlie DMARD preferences that may drive patients' treatment decisions. This deserves attention in the SDM process.

**FRI0707-HPR** **PATIENTS' EXPERIENCES OF HEALTH IN EARLY RHEUMATOID ARTHRITIS – A QUALITATIVE STUDY**

E. Landgren<sup>1</sup>, A. Bremander<sup>1,2,3</sup>, E. Lindqvist<sup>3,4</sup>, K. Van der Elst<sup>5,6</sup>, I. Larsson<sup>1,7</sup>. <sup>1</sup>Spenshult Research and Development Center, <sup>2</sup>School of Business, Engineering and Science, Halmstad University, Halmstad; <sup>3</sup>Department of Clinical Sciences, Section of Rheumatology, Lund University; <sup>4</sup>Skåne University Hospital, Lund, Sweden; <sup>5</sup>Department of Rheumatology, University Hospitals Leuven; <sup>6</sup>Skeletal Biology and Engineering Research Center, Department of Development and Regeneration, KU Leuven, University of Leuven, Leuven, Belgium; <sup>7</sup>School of Health and Welfare, Halmstad University, Halmstad, Sweden

**Background:** The World Health Organization defines health as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity". Health changes dramatically when a person becomes ill in a chronic disease as rheumatoid arthritis (RA). RA is a disease with great impact on all aspects of life. Living with RA affects patients' health including physical, emotional, psychological and social aspects. The purpose of a person-centered care is to see patients as experts; sharing decisions with them and helping them manage their health. Therefore it is important to understand how patients in early disease stage of RA experience the concept of health.

**Objectives:** The purpose of this study was to describe patients' experiences of health in early RA.

**Methods:** The study had a descriptive design with a qualitative content analysis approach. Individual interviews were conducted with 24 patients with early RA. In this study the patients had disease duration less than 12 months. A manifest qualitative content analysis was used to analyze the question: "What does health mean to you?"

**Results:** In the early stage of RA, patients experienced health as the most important goal in their life. They described health as well-being, independence, life satisfaction and vitality. Health as well-being meant to feel good, be painless and

have a good sleep to feel rested. Health as independence meant to have both physical and financial prerequisites to perform everyday activities, to exercise and being able to travel. Health as life satisfaction meant to feel joy in life, enjoy the family and to believe in the future. Health as vitality meant to have the energy, power and strength to cope with everyday life. The patients expressed that their health had been adversely affected by the RA disease and they had a strong desire for full health including well-being, independence, life satisfaction and vitality.

**Conclusions:** Patients in an early stage of RA describe a strong desire to regain health in terms of well-being, independence, life satisfaction and vitality. The concept of health at early RA is similar to health at established RA in terms of well-being, independence and life satisfaction. Unique findings for patients with early RA are the description of health as vitality, and the emphasis of having energy, power and strength to cope with everyday life. Health professionals should have these different ways of experiencing health in mind when providing person-centred care to patients with early RA. Depending on the patients' perception of health, different support strategies are needed.

#### FRI0708-HPR THE USE OF TECHNOLOGY FOR SYMPTOM MEASUREMENT IN RHEUMATOID ARTHRITIS: A QUALITATIVE INVESTIGATION

F. Matcham<sup>1</sup>, R. Williams<sup>2</sup>, E. Foncel<sup>3</sup>, H.-Y. Tung<sup>4</sup>, S. Norton<sup>5</sup>, J. Galloway<sup>3</sup>, M. Hotopf<sup>6</sup>. <sup>1</sup>Department of Psychological Medicine, IoPPN, King's College London; <sup>2</sup>Department of Rheumatology, Faculty of Life Sciences & Medicine, King's College London; <sup>3</sup>Department of Rheumatology, Faculty of Life Sciences & Medicine, King's College London; <sup>4</sup>Psychology Department, Institute of Psychiatry, Psychology & Neuroscience, King's College London; <sup>5</sup>Psychology Department; <sup>6</sup>Department of Psychological Medicine, Institute of Psychiatry, Psychology & Neuroscience, King's College London, London, United Kingdom

**Background:** Rheumatoid Arthritis (RA) outcome measurement is limited by infrequent appointments, triggered by symptom flares, linking blood test data with retrospective recall of symptoms. Remote measurement technologies (RMT), such as wearable sensors or smartphone apps, provide opportunity for ongoing measurement of symptoms such as pain, fatigue, and depression, which may vary throughout the day, offering new insight into the lived experience of chronic illness [1]. However, implementation of such data collection strategies requires careful development with the service-user an integral part of co-design to maximise real-world acceptability [2].

**Objectives:** This study aimed to gather qualitative information about service-user priorities for using RMT for symptom measurement.

**Methods:** Two focus groups were conducted in people with RA, using a semi-structured topic guide designed to elicit thoughts about RA symptoms considered important and acceptable for measurement via RMT. The focus groups were moderated by an expert service user (RW) and research lead (FM). A systematic thematic analysis was applied to the data, using a coding framework to extract themes and sub-themes by two researchers independently.

**Results:** A total of 9 participants attended the two focus groups. Participants were aged 23–77 (mean=55.8, SD=18.1), with a mean disease duration of 20.2 (SD=15.2). All 9 were female, with 44.4% identifying as White British. Symptoms prioritisations and the perceived benefits and risks of technology were categorised into several themes including: personal empowerment; communication with healthcare teams; routine/convenience; and under-prioritised symptom experiences.

**Conclusions:** The results of these focus groups highlight several areas to focus RMT development in this area, including identifying the symptoms patients feel are under-prioritised by healthcare providers, and establishing methods to ensure RMT can be embedded in daily activities despite fluctuating symptom severity. Future work testing specific app prototypes and wearable usability can ensure RMT projects are developed with optimised user experience.

Lobosco<sup>11</sup>. <sup>1</sup>Medical Affairs, JANSSEN; <sup>2</sup>Rheumatology Section, Hospital Italiano Buenos Aires, Buenos Aires, Argentina; <sup>3</sup>Rheumatology, Hospital Universitario Mayor MEDERI, Bogota, Colombia; <sup>4</sup>Rheumatology, Buenos Aires University School of Medicine, Buenos Aires, Argentina; <sup>5</sup>Rheumatology, Hospital Universitario "Dr. José Eleuterio González", Monterrey, Mexico; <sup>6</sup>Rheumatology, Universidade Federal de Santa Catarina, Hospital Universitário, Florianópolis, Brazil; <sup>7</sup>Rheumatology Section, Centro Médico Paitilla, Panama, Panama; <sup>8</sup>Rheumatology, Universidad Militar Nueva Granada and Rheumatology Department, Hospital Militar, Bogota, Colombia; <sup>9</sup>Rheumatology Section, Hospital General de México, Ciudad de México, Mexico, Mexico; <sup>10</sup>Rheumatology, University of Paraná, Brazil, Parana, Brazil; <sup>11</sup>Rheumatology, Adelphi Group, Manchester, UK

**Objectives:** To assess levels of rheumatologist and patient satisfaction with PsA treatment across Latin America and any disconnects that may exist between the two in real world clinical practice.

**Methods:** Data from the 2015 PsA Disease Specific Programme (DSP), a cross-sectional, multi-national survey of patients and rheumatologists conducted in Argentina, Mexico, Colombia and Venezuela were analyzed. Rheumatologists (n=141) completed forms containing patient demographics, patient disease severity and treatment satisfaction. Patients self-reported their level of treatment satisfaction and disease severity.

**Results:** A total of 293 PsA patients from across Latin America were included in this analysis. Current mean age was 49.9 years and 48.1% were female. Proportions of rheumatologists and patients reporting satisfaction with treatment were both similarly high (84% and 92% respectively), however current disease severity reporting differed more markedly between rheumatologists and patients (mild 78%/moderate-severe 22% rheumatologists vs. 63% mild/37% moderate-severe patients; p=0.002). When assessed for alignment, 19% of all rheumatologists and patients disagreed on the level of treatment satisfaction; 13% of this was due to rheumatologists stating greater dissatisfaction than their patients, with the remaining 6% due to patients stating greater dissatisfaction than their rheumatologists (p=0.0543). For current disease severity, 32% of all rheumatologists and patients disagreed; 25% due to patients stating greater severity than their rheumatologists, with 7% due to rheumatologists stating greater severity than their patients (p<0.001). Of those patients for whom their rheumatologist was satisfied with treatment, 14% were classified as having moderate to severe PsA by that same physician.

**Conclusions:** Despite many rheumatologists and their patients in Latin America reporting high levels of satisfaction with treatment, PsA patients can remain moderate to severe and disconnected from their physician. There is a need to improve physician/patient engagement as a means to improving clinical control.

#### FRI0710-HPR OBJECTIVE AND SUBJECTIVE MEASURES OF PHYSICAL FUNCTIONING IN WOMEN WITH FIBROMYALGIA: WHAT TYPE OF MEASURE IS ASSOCIATED MOST CLEARLY WITH SUBJECTIVE WELL-BEING? THE AL-ÁNDALUS PROJECT

F. Estevez-Lopez<sup>1,2</sup>, F.M. Acosta<sup>1</sup>, P. Acosta-Manzano<sup>1</sup>, M. Rodriguez-Ayllon<sup>1</sup>, B. Gavilán-Carrera<sup>1</sup>, M. Herrador-Colmenero<sup>1</sup>, A. Carbonell-Baeza<sup>3</sup>, R. Geenen<sup>2</sup>, B. Walitt<sup>4</sup>, D. Munguía-Izquierdo<sup>5</sup>, M. Pulido-Martos<sup>6</sup>. <sup>1</sup>University of Granada, Granada, Spain; <sup>2</sup>Utrecht University, Utrecht, Netherlands; <sup>3</sup>University of Cádiz, Cádiz, Spain; <sup>4</sup>National Institute of Nursing Research, National Institutes of Health, Bethesda, MD, United States; <sup>5</sup>Universidad Pablo de Olavide, Seville; <sup>6</sup>University of Jaén, Jaén, Spain

**Background:** In fibromyalgia there is a discordance between performance-based (i.e., objective) and patient-reported (i.e., subjective) physical functioning (1,2). However, it is unknown whether the association of physical functioning with health outcomes is different between objective and subjective measures.

**Objectives:** To analyse the associations of the objective and subjective dimensions of physical activity, sedentary behaviour, and physical fitness with subjective well-being in women with fibromyalgia.

**Methods:** This population-based cross-sectional study included 375 women with fibromyalgia from southern Spain. Physical activity, sedentary behaviour, and physical fitness were measured by questionnaires, accelerometers, and performance testing. Participants self-reported their levels of positive affect, negative affect, and satisfaction with life. Conservative multivariate analyses were used to

analyse the association between these physical functioning measures and the assessment of affect and life satisfaction.

**Results:** We found independent associations of the objective measures but not the subjective assessments of physical activity with positive affect and satisfaction with life (both,  $p < 0.01$  and adjusted  $R^2 > 0.06$ ) and of sedentary time with positive affect ( $p < 0.02$  and adjusted  $R^2 > 0.03$ ). Moreover, we observed consistent and independent associations of both the objective and subjective dimensions of physical fitness with all the components of subjective well-being (all,  $p < 0.01$  and adjusted  $R^2$  ranged from 0.02 to 0.05).

**Conclusions:** Both objective and subjective measures of physical activity and sedentary behaviour independently impact affect and subjective well-being. Strategies to enhance both dimensions of physical fitness may be a promising approach for improving the subjective well-being in fibromyalgia.

### FRI0711-HPR KINESIOPHOBIA IN ADULT PATIENTS WITH FAMILIAL MEDITERRANEAN FEVER: ASSOCIATION WITH PHYSICAL ACTIVITY, DEPRESSION AND ANXIETY

I. Karanki, E.I. Günaydin, A. Çetinkaya, S. Saka, M.G. Yavuzer. *Haliç University, Istanbul, Turkey*

**Background:** Familial Mediterranean fever (FMF) characterized by pain and inflammation with fever which requires a lifelong treatment<sup>1</sup>. All of this causes psychosocial influences and also causes kinesiophobia, which is defined as avoidance of physical activity and fear of repetition of the pain. As it may affect the levels of physical activity and functional capacity, it is important to identify factors related to kinesiophobia in patients with FMF.

**Objectives:** The aim of this study was to investigate the existence of kinesiophobia and related factors such as depression, anxiety and physical activity in adult patients with FMF.

**Methods:** 38 subjects with FMF (15 male) from Society of Behçet & FMF Diseases included in the study. The demographic characteristics of the participants were recorded. The 'Tampa Scale for Kinesiophobia (TSK)<sup>2</sup>', 'International Physical Activity Questionnaire (IPAQ)<sup>3</sup>', 'Hospital Anxiety and Depression Scale (HADS)<sup>4</sup>' and 'Fatigue Severity Scale (FSS)<sup>5</sup>' were used to assess associated factors.

**Results:** Demographic and disease characteristics of the participants were presented in the table 1. Only 9 subjects reported regular exercise. 86% of the subjects had a score over 37 in TSK representing high kinesiophobia<sup>6</sup>. TSK scores were positively correlated with HAD-D ( $r=0,530$ ;  $p=0,001$ ) and FSS ( $r=0,340$ ;  $p=0,035$ ). On the other hand, age, disease duration, body mass index, HAD-A and IPAQ scores were not correlated with TSK. Gender or exercise routine had no effect on TKS.

Table 1 Demographic and disease characteristics

	Mean±Std	Min.	Max.
Age (year)	37.05±8.71	19	57
Disease duration (years)	13.11±11.14	1	46
BMI (kg/cm <sup>2</sup> )	24.5±4.43	16.65	38.05
IPAQ	6942.5 ±2520.4	3018	14580
TSK	44.16±5.06	33	54
HAD-A	9.84±4.43	2	20
HAD-D	8.82±4.70	1	20
FSS	56.45±13.05	23	70

**Conclusions:** Kinesiophobia is very common and associated with depression and fatigue in patients with FMF. Limited number of participants reported regular exercise habit which should be added to treatment programs to increase physical activity and functional capacity in patients with FMF.

Marín-Jiménez<sup>8</sup>, M. Mosquera<sup>2</sup>, M.J. Arteaga<sup>2</sup>, D. Orozco-Beltrán<sup>9</sup>. <sup>1</sup>Rheumatology Department, H. U. A Coruña, Universidad A Coruña, INIBIC, A Coruña; <sup>2</sup>Merck Sharp & Dohme, Madrid; <sup>3</sup>Rheumatology Department, Basurto University Hospital, Bilbao; <sup>4</sup>Rheumatology Department, H. El Bierzo, Ponferrada; <sup>5</sup>Rheumatology Department, Manacor Hospital, Palma de Mallorca; <sup>6</sup>Rheumatology Department, Moisés Broggi Hospital, Barcelona; <sup>7</sup>Internal Medicine Department, H. Clínico de Valencia, Valencia; <sup>8</sup>Gastroenterology Department, H. U. Gregorio Marañón, Madrid; <sup>9</sup>Department of Medicine, Miguel Hernández University, Sant Joan, Alicante, Spain

**Background:** Insights from patients are important for health care planning

**Objectives:** In this study we describe the perception of patients with 4 different chronic conditions with health care in Spain through the IEXPAC scale ("Instrument to Evaluate the Experience of Patients with Chronic diseases"), a scale developed and validated in Spain.

**Methods:** The IEXPAC scale (<http://www.iemac.es/iexpac/>) was developed and validated in Spain by health care professional and social organizations, experts in quality of health care and chronic patients. The scale is structured in 12 items with Likert responses from "always" to "never", yields a score from 0 (worst experience) to 10 (best experience), and identifies aspects of health care needing improvement. A survey was handed to patients needing care in at least two different levels (i.e. primary care and hospital) and with one of the following chronic conditions A) Rheumatic diseases, B) Inflammatory bowel disease (IBD), C) Human immunodeficiency virus infection (HIV) and D) Diabetes mellitus (DM) plus cardiovascular or renal chronic disease. Patients completed the survey at home and responded by pre-paid mail.

**Results:** 2474 patients received the survey, 1618 (65.4%) returned it (359 with rheumatic disease, 341 with IBD, 467 with HIV infection, 451 with DM, mean age 56 years, 41% women). Only 6.1% were affiliated to a patients association. Patients declared a median of 8 visits (IQR 25–75: 4–15) to primary care or specialty clinics in the last year and 29% had visited an emergency room. In the last 3 years 48% had been hospitalized. Up to 61% reported to search for information on diseases, therapies, lifestyle or diet in webpages, general or social media. Responses to the IEXPAC items (percentages that responded "mostly" + "always" to each item) are displayed in the table. In general, these % were higher in HIV patients, which represents a better experience with health care. In some items, patients with rheumatic diseases scored lower (table 1). Mean IEXPAC score was 6.0 (SD1.8) and was higher in HIV patients (table 1). Worst scores were seen in items related to access or guidance for getting reliable information on health and on social resources, contact with other patients and follow-up after hospital discharge.

IEXPAC item	Percentage (%) who responded "mostly" + "always"					p
	All patients	Rheumatic Disease	IBD	HIV	DM	
They respect my lifestyle	81.5%	76.5%	75.1%	89.6%	81.9%	<0.001
They are coordinated to offer good health care to me	69.3%	60.6%	69.1%	76.8%	73.3%	<0.001
They help me to get information from the Internet	15.0%	12.8%	19.0%	19.8%	8.3%	<0.001
Now I can take care of me better	81.0%	74.5%	79.3%	89.7%	78.3%	<0.001
They ask me and help me to follow my treatment plan	79.8%	73.5%	77.8%	87.6%	78.2%	<0.001
We set goals for a healthy life and better control my	70.1%	63.4%	62.6%	74.7%	76.1%	<0.001
I can use Internet and my mobile phone to consult my medical records	7.2%	7.3%	5.5%	8.6%	7.1%	0.529
They make sure that I take medication correctly	76.0%	72.4%	73.7%	83.5%	72.9%	<0.001
They worry about my welfare	84.3%	79.1%	80.4%	91.5%	83.8%	<0.001
I have been informed on the health and social	41.3%	33.8%	32.3%	52.6%	42.3%	<0.001
They encourage me to talk to other patients	14.9%	10.3%	15.7%	30.4%	12.0%	<0.001
Respond to the following statement only if you have been admitted to the hospital in the last 3 years.						
They care about me when I come home after being in the hospital	30.6%	25.7%	28.9%	33.0%	32.8%	0.205
Global IEXPAC score, mean (SD)	6.0 (1.3)	5.3 (2.0)	5.9 (2.0)	6.6 (1.7)	5.9 (1.9)	<0.001

**Conclusions:** The IEXPAC questionnaire identified areas of improvement in chronic patients health care in Spain, especially those related with access to reliable information and services, interaction with other patients and continuity of health care after hospital discharge. Patients with HIV infection scored higher, maybe consequence of a more personalized care. In several items, patients with rheumatic diseases scored lower

**FRI0713-HPR THE PATIENTS' PERSPECTIVES TOWARDS THE PROVISION OF INFORMATION DURING TRANSITION TO A BIOSIMILAR**

J. Kreuk, A. Twisk, J. Meilink, R. Alblas, W. van der Weele, R.C. Hebing, J. Ruwaard, M. l'Ami, Z. Layegh, G. Wolbink. *Amsterdam Rheumatology and Immunology Center Reade, Amsterdam, The Netherlands*

**Background:** In July 2015, at the Amsterdam Rheumatology and Immunology Centre, location Reade, 93% of the patients with rheumatoid arthritis, treated with reference product infliximab switched to the biosimilar infliximab. This transition was needed to enable cost savings. Patients gained information via several ways, where the rheumatology nurses had a central role in informing the patients. Patients' perspectives are warranted to investigate the effect of the transition to the biosimilar.

**Objectives:** To investigate patients' perspectives towards the provided information regarding the switch to the biosimilar.

**Methods:** Consecutive patients treated with reference product infliximab were switched to the biosimilar in the period July 2015 to June 2016 at the Amsterdam Rheumatology and immunology Center, Reade. Patients were informed by a letter about the transition to the biosimilar and were subsequently contacted by a nurse or the pharmacist for additional questions and whether they agreed upon the switch. All patients who were switched from the reference product to the biosimilar were approached at the day care to fill in a questionnaire. In this qualitative questionnaire, patients were asked to evaluate the information provision process and how they gained information about the transition to the biosimilar initially. This was done by the nurses of the day care.

**Results:** All patients who switched to the biosimilar (n=46) filled in the questionnaire, of which 15 patients scored the information provision as excellent (33%), 25 patients as good (54%), 4 patients as reasonable (9%) and 2 patients found the information sufficient (4%). Furthermore, the majority of patients was initially informed by nurses and rheumatologist prior to the letter that was sent to all patients. In total, 12 patients were initially informed by rheumatology nurse (26%), 12 patients by the rheumatologist (26%). Four patients were informed via the letter that was sent at first (9%) and 3 patients gained the information about the transition otherwise (7%). Fifteen patients gave more than one answer to the question by whom they were informed initially.

**A. Patient's perspective**

**B. Initially informed by:**

**Conclusions:** Patients were satisfied about the information provision process, there were no patients who experienced the information provision insufficient. Next to the rheumatologist, rheumatology nurses played an important role in informing the patients about the transition.

**FRI0714-HPR THE PATIENT'S JOURNEY FROM ONSET OF BACK PAIN TO DIAGNOSIS OF AXIAL SPONDYLOARTHRITIS: RESULTS FROM A QUALITATIVE STUDY**

L. Passalent<sup>1,2,3</sup>, L. Soever<sup>1,2</sup>, K. Bednis<sup>1</sup>, C. Hawke<sup>1,2</sup>, A. Bidos<sup>4</sup>, J. Bloom<sup>1,2</sup>, Y. R. Rampersaud<sup>1,2,3</sup>, N. Haroon<sup>1,2,3</sup>, R. Inman<sup>1,2,3</sup>. <sup>1</sup>Toronto Western Hospital; <sup>2</sup>University of Toronto; <sup>3</sup>Krembil Research Institute; <sup>4</sup>University Health Network, Toronto, Canada

**Background:** People with axial spondyloarthritis (SpA) wait an average of 9 years between onset of back pain and time to diagnosis by a rheumatologist (Feldkeller 2000). During this time, patients often experience significant pain and dysfunction, while waiting for appropriate diagnosis and intervention. Understanding patients' perspectives of this diagnostic process is essential in order to optimize early detection and promote appropriate management for axial SpA.

**Objectives:** The purpose of this study was to understand patients' perspectives of referral and screening practices for axial SpA from onset of back pain to diagnosis by a rheumatologist.

**Methods:** Semi-structured key informant interviews were conducted with patients diagnosed with axial SpA, based on ASAS criteria, attending a tertiary academic spondylitis clinic. Interviews addressed patients' experiences with screening and referral practices for adults with chronic back pain and suspected axial SpA from symptom onset to diagnosis. All interviews were recorded, transcribed verbatim and evaluated using a compare and contrast analysis by coding groups of words that addressed the research objectives. Two members of the research team undertook this exercise independently and then met to reconcile emergent overarching categories and their respective themes. NVIVO V9 was used to assist with organization of codes.

**Results:** A total of 10 patient interviews were conducted. 90% of participants were male, mean age 42.8 years (± 12.6). The mean duration of back pain prior to diagnosis of axial SpA was 8.9 years (± 6.0). The majority of patients (90%) had post-secondary education. Three overarching categories were identified regarding patients' experiences with screening and referral practices for axial SpA from symptom onset to diagnosis and included: 1) "system factors"; 2) "healthcare provider factors" and 3) "patient factors". Themes related to "system factors" included timely and appropriate access to care. Perceived lack of clinical skills and healthcare provider interpersonal skills were allocated to the category of "healthcare provider factors". Themes identified under the category of "patient-related factors" included: coping with uncertainty; the role of health literacy; the notion of hope, and the belief of stoicism.

**Conclusions:** The results of this study indicate that care provided by knowledgeable, caring, empathetic and receptive healthcare providers is critical to patients with axial SpA as they navigate the healthcare system from symptom onset to

diagnosis. Furthermore, access to the right specialist, at the right time, in the right place may improve patients' experience of screening and referral practices for chronic back pain. Models of care and targeted patient and medical education strategies aimed at reducing the gap between onset of back pain and diagnosis of axial SpA may have the potential to improve existing screening and referral practices of axial SpA.

#### FRI0715-HPR PATIENTS', RELATIVES AND HEALTH PROFESSIONALS VIEWS ON GOALSETTING IN RHEUMATOLOGY REHABILITATION.

L.B. Jensen<sup>1</sup>, T. Mechlenborg Kristiansen<sup>2</sup>, L. Ovens<sup>2</sup>, J. Primdah<sup>2,3,4</sup>, <sup>1</sup>Haderslev municipality, Haderslev; <sup>2</sup>King Christian X's Hospital for Rheumatic Diseases, Graasten; <sup>3</sup>Hospital of Southern Jutland, Aabenraa; <sup>4</sup>Institute for Regional Health Research, University of Southern Denmark, Odense, Denmark

**Background:** Patient-centered goals are important for successful rehabilitation because they focus on the direction and process of rehabilitation. Scarce knowledge exists about goalsetting in rheumatology rehabilitation.

**Objectives:** To explore views on the goalsetting process in rehabilitation during admission among health professionals (HPs), patients with rheumatic diseases and their relatives.

**Methods:** Two focus group interviews, with 11 HPs (physiotherapists, occupational therapists and nursing staff) were conducted as well as eight individual interviews with patients. Relatives participated in two of the patient interviews. The analysis of the transcribed interviews focused on meaning condensation. (Kvale, Brinkmann, 2014)

**Results:** The analysis resulted in three overarching themes. The first theme focused on *the many aspects of communication before and during the goalsetting process*. The HPs expressed that the patients need to be well-informed. Several of the patients expressed the need for information about what the hospital can provide to ease the goalsetting process for them. The HPs pointed out the need for a uniform approach and to be able to communicate with the patients in a clear and understandable way. Some of the patients' experienced unclear communication, as some were not sure what the long-term goal was until halfway through the actual admission. The second theme was *considerations regarding goals*. The HPs considered patient-centered goals to be important, and patients also expressed that the goals should reflect what they prioritized to work with during admission. Both HPs and patients found that the goals needed to be realistic in order to be beneficial. The HPs considered that goals should be measurable. They saw it as a requirement that they should demonstrate that goals were reached, although this was sometimes difficult to demonstrate. Some of the patients expressed a need to be able to relate to and understand the goal in order to see themselves work towards it during admission. The HPs also pointed out that the patients had to take ownership of the goals. The last theme was *the roles in the goalsetting process*. Both the HPs and the patients expected the HPs to have a guiding role in the goalsetting process. The HPs found that patients needed to participate actively in the goalsetting process to reach a patient-centered goal. Both the HPs, patients and relatives believed that participation of a relative in the goalsetting process was positive since they could complement on what the patients said.

**Conclusions:** The goal-setting process is complex, and several aspects need to be taken into consideration to achieve successful patient-centered goals. Clear communication and an overall agreement on the content and importance of the goals are important. Each stakeholder has their role to play in the goalsetting process; the patients need to take an active role, relatives complement the patients views and the HPs guide the goalsetting process.

#### FRI0716-HPR ASSESSING THE BURDEN OF TREATED AND UNTREATED OSTEOARTHRITIS PAIN IN EUROPE

M.J. Doane<sup>1</sup>, D.H. Jaffe<sup>2</sup>, E. Dragon<sup>3</sup>, L. Abraham<sup>4</sup>, L. Viktrup<sup>5</sup>, A.G. Bushmakina<sup>6</sup>, J.C. Cappelleri<sup>6</sup>, <sup>1</sup>Kantar Health, Horsham, United States; <sup>2</sup>Kantar Health, Tel Aviv, Israel; <sup>3</sup>Pfizer Ltd., Budapest, Hungary; <sup>4</sup>Pfizer Ltd., Surrey, UK; <sup>5</sup>Eli Lilly & Company, Indianapolis; <sup>6</sup>Pfizer Ltd., Groton, United States

**Background:** Osteoarthritis (OA) is a chronic, progressive musculoskeletal condition, estimated to affect >40 million people across Europe. OA is a major challenge for health care systems worldwide and is a leading contributor to years lived with disability (YLD) globally.<sup>1</sup> Current pharmacological treatment options may provide limited pain relief or may not be appropriate for long-term use in all patients because of adverse events.<sup>2</sup> There are few studies on the burden of chronic pain due to OA in Europe and whether this burden varies for those being treated with prescription (Rx) treatments compared with those who are not Rx treated.

**Objectives:** To assess the burden of OA in Europe and to determine whether burden differs by pain severity and treatment status.

**Methods:** A retrospective, cross-sectional study was conducted using data from the 2016 and 2017 National Health and Wellness Survey (NHWS) from five European Union countries (5EU): France, Germany, Italy, Spain, and United Kingdom. NHWS respondents with a self-reported OA diagnosis who completed the pain module were identified. Neuropathic and phantom limb pains were excluded. OA respondents were categorized into 4 groups by severity of pain and treatment: moderate/severe Rx-treated [M/S-Treated]; moderate/severe Rx-untreated [M/S-Untreated]; Mild Rx-treated; and Mild Rx-untreated (reference group). Outcomes of interest included health-related quality of life (HRQoL) (SF-12v2: mental and physical component summary scores [MCS, PCS]), health status (EQ-5D), productivity loss (Work Productivity and Activity Impairment [WPAI] questionnaire), and healthcare utilization in past 6 months. Multivariable analyses adjusted for baseline differences between groups (e.g., demographic and health characteristics).

**Results:** 2,417 OA patients reported a mean age of 61.8 (SD=10.8) years and the majority was female (64.5%). Sixty-percent of OA patients had M/S pain (n=1,440). Stratification by pain and treatment groups resulted in the following: M/S-Treated=27.4%, M/S-Untreated=32.2%, Mild-Treated=22.3%, and Mild-Untreated=18.2%. Those with M/S pain severity, both Rx treated and untreated, showed significantly worse HRQoL, health status and work impairment compared with the reference group (table 1). Further, both Rx treated groups had significantly more health care provider visits compared with OA patients without a Rx.

Table 1 Adjusted mean levels per outcome according to disease severity and prescription treatment status<sup>a</sup>

Outcome	M/S-Treated (A) (n=663)	M/S-Untreated (B) (n=772)	Mild-Treated (C) (n=338)	Mild-Untreated (D) (n=439)	95% CI	p-value	95% CI
					Group A	Group B	Group C
Mental Component Score (MCS)	41.2	44.3	44.9	45.9	<0.001	<0.001	<0.001
Physical Component Score (PCS)	38.7	44.8	43.4	50.0	<0.001	<0.001	<0.001

<sup>a</sup>All models controlled for age, sex, marital status, education, income, employment status, smoking status, alcohol use, exercise, body mass index, Charlson Comorbidity Index, and country using generalized linear regression models.

<sup>b</sup>Among employed respondents only: M/S-Treated n=163; M/S-Untreated n=214; Mild-Treated n=155; Mild-Untreated n=143

<sup>c</sup>Among employed respondents only: M/S-Treated n=138; M/S-Untreated n=222; Mild-Treated n=146; Mild-Untreated n=141

**Conclusions:** The majority of European patients with OA in this study reported moderate-severe pain irrespective of prescription treatment. Whether treated or untreated, those with moderate to severe OA pain demonstrated a substantial burden on quality of life, health status, and productivity compared with those with mild pain.

### FRI0717-HPR | ASSESSING THE BURDEN OF TREATED AND UNTREATED CHRONIC LOW BACK PAIN IN EUROPE

M.J. Doane<sup>1</sup>, D.H. Jaffe<sup>2</sup>, E. Dragon<sup>3</sup>, L. Abraham<sup>4</sup>, L. Viktrup<sup>5</sup>, A.G. Bushmakina<sup>6</sup>, J.C. Cappelleri<sup>6</sup>. <sup>1</sup>Kantar Health, Horsham, United States; <sup>2</sup>Kantar Health, Tel Aviv, Israel; <sup>3</sup>Pfizer Ltd., Budapest, Hungary; <sup>4</sup>Pfizer Ltd., Surrey, United Kingdom; <sup>5</sup>Eli Lilly & Company, Indianapolis; <sup>6</sup>Pfizer Ltd., Groton, United States

**Background:** Chronic low back pain (CLBP) is estimated to affect about 20% of adults<sup>1</sup> and is the greatest contributor to disability globally.<sup>2</sup> Current pharmacological treatment options may provide limited pain relief or may not be appropriate for long-term use in all patients because of adverse events.<sup>3</sup> Despite the large burden of CLBP, few studies have evaluated the humanistic and economic impact of this condition in Europe, or whether this burden varies for those being treated with prescription (Rx) treatments compared with those who are not Rx treated.

**Objectives:** To assess the burden of CLBP in Europe and to determine whether burden differs by pain severity and treatment status.

**Methods:** A retrospective, cross-sectional study was conducted using data from the 2016 and 2017 National Health and Wellness Survey (NHWS) from five European Union countries (5EU): France, Germany, Italy, Spain, and United Kingdom. NHWS respondents with a self-reported CLBP diagnosis, current pain lasting  $\geq 3$  months, and who completed the pain module were identified. Neuropathic and phantom limb pains were excluded. CLBP respondents were categorized into 4 groups by severity of pain and treatment: moderate/severe Rx treated [M/S-Treated]; moderate/severe Rx untreated [M/S-Untreated]; mild Rx treated; and mild Rx untreated (reference). Outcomes of interest included health-related quality of life (HRQoL) (SF-12v2: mental and physical component summary [MCS, PCS]), health status (EQ-5D), productivity loss (Work Productivity and Activity Impairment [WPAI] questionnaire), and health care professional (HCP) visits in past 6 months. Multivariable analyses adjusted for baseline differences between groups (e.g., demographic and health characteristics).

**Results:** A total of 2,086 CLBP patients were identified from the NHWS. CLBP patients reported an average age of 56.4 (SD=13.2) years and most were female (61.2%). Two-thirds of CLBP patients had M/S pain (n=1,403). Stratification by pain and treatment groups resulted in the following groups: M/S-Treated=29.8%, M/S-Untreated=37.4%, Mild-Treated=19.5%, and Mild-Untreated=13.2%. Increased pain severity among both treated and untreated patients showed significantly worse HRQoL, health status, work and activity impairment, and greater HCP visits compared with the reference group (Mild-Untreated) (table 1).

Table 1 Adjusted mean levels per outcome according to disease severity and prescription treatment status<sup>a</sup>

Outcome	M/S-Treated (A) (n=422)	M/S-Untreated (B) (n=791)	Mild-Treated (C) (n=497)	Mild-Untreated (D) (n=276)	Mild-Untreated (Reference) n=276		
					% Group A	% Group B	% Group C

### FRI0718-HPR | ARE PAIN, ACTIVITY LIMITATIONS AND QUALITY OF LIFE ASSOCIATED WITH OBJECTIVELY MEASURED PHYSICAL ACTIVITY IN PATIENTS WITH END-STAGE OSTEOARTHRITIS OF THE HIP OR KNEE?

C. Leichtenberg<sup>1</sup>, F. van Tol<sup>1</sup>, T. Krom<sup>1</sup>, C. Tilbury<sup>1</sup>, H. Horemans<sup>2</sup>, H. Bussmann<sup>2</sup>, R. Nelissen<sup>1</sup>, M. Gademán<sup>1,3</sup>, T. Vliet Vlieland<sup>1</sup> on behalf of the LOAS Study group. <sup>1</sup>Department of Orthopaedics, LUMC, Leiden; <sup>2</sup>Department of Rehabilitation, ErasmusMC, Rotterdam; <sup>3</sup>Department of Epidemiology, LUMC, Leiden, Netherlands

**Background:** Hip and knee osteoarthritis (OA) are a major cause of disability, yet relatively little is known on the relationship between OA and the total amount of physical activity.

**Objectives:** We investigated if OA-associated pain, functional disability and quality of life (QoL) are associated with objectively measured physical activity in patients with end-stage hip/ knee

**Methods:** Preoperative data from the Longitudinal Leiden Orthopaedics Outcomes of Osteoarthritis Study (LOAS) were used. All patients were scheduled for primary total hip or knee arthroplasty. Patients wore an accelerometer (Activ8 Remedy Distribution Ltd) which assessed levels of physical activity (LPA) in activity counts and %time spent on physical activity (%PA, i.e. time spent on walking, cycling or running) and sedentary behaviour (%SB, i.e. time spent in lying/sitting). Pain, functional disability and health related QoL were assessed with the Hip Disability and Knee Injury Osteoarthritis Outcome Scores (HOOS/KOOS) and Short-Form 12 (SF12). Multivariate linear regressions models adjusted for confounding were conducted. The physical activity outcomes were transformed to Z-scores.

**Results:** 9 hip OA and 48 knee OA patients were included. When awake, mean LPA was 18.787 $\pm$  7.247 for hip OA patients and 21.193 $\pm$  6.164 for knee OA patients. In hip OA patients %PA was on average 14 $\pm$ 6.4, while %SB was 66 $\pm$ 10.5. In knee OA patients these percentages were 15 $\pm$ 5.0 and 68 $\pm$ 8.7, respectively. In hip OA, the HOOS-QoL and SF12-PCS were positively associated with more LPA, ( $\beta$ 0.028; 95%CI:0.007 – 0.048,  $\beta$ 0.041; 95%CI:0.010 – 0.071) and better SF12-PCS scores also with PA ( $\beta$  0.040, 95%CI:0.007 – 0.073). No other associations were found.

**Conclusions:** Whereas QoL was associated with physical activity in end-stage hip OA patients, no associations between pain or functional disability and physical activity were observed in either hip or knee OA.

**Acknowledgements:** This study was supported by the Dutch Arthritis Association [grant number LLP13].

### FRI0719-HPR | SELF-ASSESSMENT OF QUALITY OF LIFE OF PATIENTS WITH RHEUMATIC DISEASES AND OTHER CHRONIC DISEASES IN THE IEXPAC PROJECT

M.L. García-Vivar<sup>1</sup>, L. Cea-Calvo<sup>2</sup>, J. de Toro<sup>3</sup>, L. Pantoja<sup>4</sup>, C. Lerín<sup>5</sup>, S. García-Díaz<sup>6</sup>, M.J. Galindo<sup>7</sup>, I. Marín-Jiménez<sup>8</sup>, S. Fernández<sup>2</sup>, Y. Mestre<sup>2</sup>, D. Orozco-Beltrán<sup>9</sup>. <sup>1</sup>Rheumatology Department, Basurto University Hospital, Bilbao; <sup>2</sup>Medical Affairs Department, Merck Sharp & Dohme, Madrid; <sup>3</sup>Rheumatology Department, H. U. A Coruña, A Coruña; <sup>4</sup>Rheumatology Department, H. El Bierzo, Ponferrada; <sup>5</sup>Rheumatology Department, Manacor Hospital, Palma de Mallorca; <sup>6</sup>Rheumatology Department, H. de Sant Joan Despí Moisès Broggi, Barcelona; <sup>7</sup>Internal Medicine Department, H. Clínico de Valencia, Valencia; <sup>8</sup>Gastroenterology Department, H. U. Gregorio Marañón, Madrid; <sup>9</sup>Department of Medicine, Miguel Hernández University, Sant Joan, Alicante, Spain

**Background:** Improving quality of life is a goal in the treatment of patients with rheumatic diseases.

**Objectives:** In this work, we describe the self-assessment of quality of life made by patients with rheumatic diseases and with other chronic diseases through an anonymous survey in the context of a wider project on quality of care.

**Methods:** In the context of a quality of care project, focused in the perceptions of chronic patients with health care in Spain (assessed with the IEXPAC scale ("Instrument to Evaluate the EXperience of PATients with Chronic diseases", <http://www.iemac.es/iexpac/>), a survey was handed patients with 4 different profiles of chronic diseases needing care in at least two different levels (i.e. hospital clinic and primary care): A) Patients with rheumatic diseases (rheumatoid arthritis or spondyloarthritis) from hospital clinics, B) Inflammatory bowel disease (IBD) patients from hospital clinics, C) Patients with human immunodeficiency virus (HIV) infection from HIV units and D) Patients with diabetes mellitus (DM) plus

cardiovascular or renal chronic disease from primary care or endocrinology clinics. Patients were handed the survey and completed the survey at home, returning it by pre-paid mail. As part of the survey, they completed the quality of life questionnaire EQ-5D-5L.

**Results:** 2474 patients received the survey, 1618 (65.4%) returned it (359 with rheumatic disease [mean age 55 years, 63% women], 341 with IBD [mean age 47 years, 48% women], 467 with HIV infection [mean age 52 years, 27% women], 451 with DM [mean age 70 years, 32% women]). Patients with rheumatic diseases more frequently described moderate or severe problems with mobility, self-care and usual activities and reported more pain (table 1). Patients with rheumatic disease and IBD more frequently reported anxiety or depression (table 1). Scores in the Visual Analogic Scale "Your Health Today" (from 0 worst health to 100 best health) were lower in patients with rheumatic diseases (mean score 61.9 [SD 19.5]) than in patients with IBD (68.8 [17.8]), HIV infection (73.3 [19.1]) or DM (67.0 [17.1]), all multiple comparison tests rheumatic disease versus other,  $p < 0.001$ .

		Rheumatic Disease	IBD	HIV	DM	P
MOBILITY	I have no problems in walking about	48.4%	74.7%	73.3%	59.3%	<0.001
	I have slight problems in walking about	27.8%	17.3%	12.0%	21.3%	
	I have moderate problems in walking about	15.0%	6.3%	8.3%	13.0%	
	I have severe problems in walking about	8.3%	1.2%	3.1%	5.8%	
	I am unable to walk or use a cane	0.3%	0.0%	1.1%	0.4%	
SELF-CARE	I have no problems washing or dressing myself	70.1%	90.8%	92.4%	86.3%	<0.001
	I have slight problems washing or dressing myself	19.2%	7.4%	5.3%	7.0%	
	I have moderate problems washing or dressing myself	9.3%	1.8%	1.3%	3.4%	
	I have severe problems washing or dressing myself	0.8%	0.0%	0.0%	0.7%	
	I am unable to wash or dress myself	0.6%	0.0%	0.9%	0.4%	
USUAL ACTIVITIES	I have no problems doing my usual activities	44.6%	66.7%	77.3%	70.1%	<0.001
	I have slight problems doing my usual activities	24.9%	17.9%	13.8%	17.8%	
	I have moderate problems doing my usual activities	25.4%	12.5%	8.1%	8.3%	
	I have severe problems doing my usual activities	5.1%	1.3%	2.0%	2.7%	
	I am unable to do my usual activities	2.0%	1.5%	0.8%	1.1%	
PAIN / DISCOMFORT	I have no pain or discomfort	9.4%	28.6%	50.3%	31.9%	<0.001
	I have slight pain or discomfort	33.8%	42.3%	27.5%	31.9%	
	I have moderate pain or discomfort	40.3%	23.2%	16.5%	27.2%	
	I have severe pain or discomfort	14.3%	5.4%	4.3%	6.1%	
	I have extreme pain or discomfort	2.0%	0.6%	0.9%	0.9%	
ANXIETY / DEPRESSION	I am not anxious or depressed	43.8%	44.5%	51.2%	57.2%	0.042
	I am slightly anxious or depressed	32.9%	25.4%	27.6%	24.8%	
	I am moderately anxious or depressed	16.6%	15.4%	15.0%	13.2%	
	I am severely anxious or depressed	5.4%	3.4%	3.1%	3.6%	
	I am extremely anxious or depressed	1.2%	1.3%	1.2%	1.2%	

**Conclusions:** Self-evaluation by patients showed that quality of life of patients with rheumatic diseases (rheumatoid arthritis, spondyloarthritis) is worse than that of patients with IBD, HIV infection or DM. Improving quality of life is an essential goal to achieve in the care of patients with these rheumatic diseases.

**Acknowledgements:** Funded by Merck Sharp & Dohme of Spain and endorsed by 4 patients associations (CONARTRITIS: patients with arthritis; ACCU: patients with Crohn's disease and ulcerative colitis; SEISIDA: AIDS multidiscipline group, FEDE: patients with diabetes mellitus).

#### FRI0720-HPR THE EFFECT OF OVERWEIGHT ON KNEE PROPRIOCEPTION INPATIENTS WITH KNEE PROSTHESIS DUE TO KNEE OSTEOARTHRITIS

M. Eymir<sup>1</sup>, B. Ünver<sup>1</sup>, V. Karatosun<sup>2</sup>. <sup>1</sup>School of Physical Therapy and Rehabilitation; <sup>2</sup>Department of Orthopaedics and Traumatology, School of Medicine, Dokuz Eylul University, Izmir, Turkey

**Background:** Total knee arthroplasty (TKA) has been established as a valuable procedure for the management of patients with disabling knee osteoarthritis, and the rates of elective TKA are increasing steadily each year. Being overweight is a risk factor for osteoarthritis of weight-bearing joints, such as the knee joint. In literature some studies about obesity and lower limb biomechanics found that obesity will change a person's gait model to adapt weight loading. Also it is stated that obese people have to reorganize their neuromuscular function to reduce the total load on the knee joint. Therefore, the ability to reorganize neuromuscular function may be a more insightful risk factor for knee osteoarthritis. There is not any study research on the effect of overweight on knee proprioception in patients with TKA due to osteoarthritis.

**Objectives:** The aim of this study was to determine the effect of the overweight on knee joint proprioception in patients with TKA due to osteoarthritis.

**Methods:** The study group consisted of 61 patients, who underwent primary TKA because of arthrosis were stratified by obesity status using pre-operative

BMI. Non-obese (n=23, mean age; 67.60±8.48 years) subjects were those with BMI <30 kg/m<sup>2</sup> and obese (n=38, mean age; 63.81±9.21 years) subjects were those with BMI ≥30 kg/m<sup>2</sup>. Patients were evaluated regarding knee proprioception (in knee joint angle 15°, 30° and 60°), knee function score (Hospital for Special Surgery (HSS) score), pain (Numeric Pain Rating Scale (NPRS)), knee range of motion, length of hospital stay, the day of knee flexion angle achieved 70 degrees, quality of life (Short-Form 12 Health Survey (SF-12)). Functional activities were evaluated using the Iowa Level of Assistance Scale and walking speed was evaluated using the Iowa Ambulation Velocity Scale. Patients were evaluated preoperatively and at discharge. All patients underwent the same rehabilitation program.

**Results:** When the patients' proprioceptive acuity in knee joint angle 30° were compared between groups, while there were statistically differences preoperatively (p=0.007), there were not differences after surgery (p>0.05). When the proprioceptive acuity measured before and after surgery were compared in knee joint angle 15°, 60°, there were not differences (p>0.05) between groups. It was determined that; the non-obese group had better results in terms of length of hospital stay, the day of knee flexion angle achieved 70 degrees and both pre-/postoperative knee flexion degree (p<0.05, for all). There were no statistical differences in the pain degree, HSS score, Iowa help level and Iowa walking speed, SF-12 score between groups before and after TKA (p>0.05).

**Conclusions:** There were not differences in knee proprioception between groups after surgery (p>0.05). The deficits in joint position sense in patients with TKA may be due to factors other than the BMI level (being overweight). On the other hand, obesity had negative effects on inpatient rehabilitation outcomes following TKA due to osteoarthritis. These results suggest that the rehabilitation after TKA focused on reducing hospital stay, the day of knee flexion angle achieved 70 degrees and improving knee flexion degree could be important to enhance the potential benefits of the patients' outcomes, and could be important to reduce the payment in rehabilitation hospitals.

#### FRI0721-HPR WE ARE IN IT TOGETHER: EXPLORING RHEUMATOLOGY PRACTICE WITH PATIENTS AS RESEARCHER PARTNERS

O. Gjonnes Tvedten<sup>1</sup>, J. Croker<sup>1,2</sup>, A. Croker<sup>2</sup>, N. Pery<sup>1</sup>, K. Williams<sup>1</sup>, M. Lawrence<sup>1</sup>. <sup>1</sup>Dowe St Rheumatology; <sup>2</sup>University of Newcastle, Tamworth, Australia

**Background:** Rheumatological conditions are often complex requiring careful history-taking, discussion of options, and plans for treatment and ongoing monitoring. Accordingly, similar to many areas in health, the importance of good communication with patients and with colleagues is well recognised. Issues such as adherence, safety, patient satisfaction and workplace thriving are often cited as supporting evidence for good communication. However communication comes with different intentions (e.g. developed as a one-size-fits-all or personalised to individual situations), in different forms (e.g. verbal, non-verbal, written), occurs within and across different spaces (e.g. face-to-face and technologically enabled) and uses time in different ways (e.g. synchronous and asynchronous, structured or unstructured)<sup>1</sup>. While the literature relating to colleague communication is vast, covering different aspects of communication, literature relating to patient communication tends to focus on one-size-fits-all styles of written communication, such as web resources and printed patient handouts, and verbal and non-verbal communication styles during consultations. We identified scope to contribute to understandings about patient communication by focusing on personalised written communication for patients, as both a product of the consultation and a tool for ongoing dialogue. In taking a patient-centred approach we sought to involve patients as co-researchers and dialogue partners. Together we explored the value of patients' personalised written consultation summaries.

**Objectives:** The purpose was to (i) to enhance patient communication within a rheumatology practice, and (ii) to develop insights into collaborating with patients in research.

**Methods:** Collaborative dialogical inquiry provided an appropriate research method for exploring the complex practice of communication, transforming such practice and being authentic to the topic by involving patients. The research team was composed of a rheumatologist, a practice nurse, a medical registrar, a researcher and two patients. Using a lens of appreciative inquiry, data were collected through documenting and recording formal and informal discussions between co-researchers, observing practice and undertaking semi-structured interviews with 20 patients. Each researcher kept a reflective journal about their

experiences. Data and experiences were iteratively analysed and discussed to identify and further explore themes.

**Results:** The personalised written consultation summary was interpreted to be a *living* document, *shared* document, *valued* document, *dialogued* document and *stored* document. Our research experiences echoed these themes, in that they were *lived*, *shared*, *valued*, *dialogued* and *recorded*. The five themes, and their echoes, will be illustrated with quotes. Implications for patient-centred practice and research will be discussed.

**Conclusions:** A set of reflective questions will be posed for the consideration of patients, their families and carers and their clinicians, as well as researchers. These questions have scope to inform dialogue about patient-centred communication in rheumatology practice, and guide collaborative research in this space.

### FRI0722-HPR POSTURAL PROBLEMS AND PAIN IN PATIENTS WITH JUVENILE IDIOPATHIC ARTHRITIS

E. Tarakci<sup>1</sup>, N. Arman<sup>2</sup>, S. Sahin<sup>3</sup>, A. Adrovic<sup>3</sup>, K. Barut<sup>3</sup>, O. Kasapcopur<sup>3</sup> on behalf of cerrahpasa. <sup>1</sup>Faculty of Health Science, Division of Physiotherapy and Rehabilitation, Department of Neurologic Physiotherapy and Rehabilitation; <sup>2</sup>Faculty of Health Science, Division of Physiotherapy and Rehabilitation, Department of Physiotherapy and Rehabilitation; <sup>3</sup>Medical Faculty of Cerrahpasa, Department of Pediatric Rheumatology, Istanbul University, Istanbul, Turkey

**Background:** Juvenile idiopathic arthritis (JIA) is a chronic autoimmune condition of unknown etiology. JIA combine with joint pain and inflammation that affects children who are less 16 years of age and continue more 6 weeks. JIA is a chronic inflammatory disease resulting in joints arthritis, pain and deformities. Disturbances in the posture may occur before deformities in patients with JIA. In some cases, pain can also lead to postural deterioration. Postural control is the ability to maintain equilibrium in a gravitational field by keeping or returning the center of body mass over its base of support.

**Objectives:** The first purposes of this study was to assessed postural problems in patients with JIA and compared with healthy peers. The other objective was to examine the pain relationship with postural problems.

**Methods:** 19 patients with JIA aged 5–17 years (13 girls and 6boys) diagnosed according to ILAR classification criteria and 19 healthy controls were enrolled in this cross-sectional study. "PostureScreen Mobile<sup>®</sup>" was used to evaluate static posture, "11-point Numeric Analogue Scale (NRS)" was used to evaluate the pain (during rest, activity and exercise). The PostureScreen Mobile<sup>®</sup> an application facilitates the assessment of posture in a variety of settings. Anterior (Head, Shoulders, Ribcage, Hips) and lateral translation (Head, Shoulders, Hips, Knees) were recorded and calculated as a total score for anterior and lateral. For statistical analysis SPSS Version 21.0 program was used.

**Results:** The mean age and body mass index of patients and healthy control were 10.79±3.59 and 10.68±2.86 years, 17.05±3.88, and 18.50±2.49 kg/m<sup>2</sup>, respectively. The mean of NRS-rest, activity and exercise scores were 1.18±1.42, 3±2.64 and 1.91±2.02, respectively. As a result of postural assessment for patients and healthy control, the mean of anterior translation scores was significantly higher in patients with JIA than healthy control (p=0.014) (table 1). Two significant correlations with NRS-rest between hip anterior translation (r=0.375, p=0.029) and ribcage anterior translation (r=-0.534, p=0.027) were found.

**Table 1** Anterior and lateral translation in patients with JIA and healthy controls

	JIA mean ±SD	Healthy controls mean ±SD	t	p
Anterior translation	4.16±1.91	2.82±1.16	2.602	<b>0.014</b>
Lateral translation	9.03±4.35	8.41±3.35	0.490	0.627

**Conclusions:** We found that children with JIA have minimal postural problems according to their healthy peers. At the same time, pain during rest is associated with anterior postural deterioration. Therefore in future researches, translations in the posture should be evaluated comprehensively in children with JIA for larger sample size. If it is not intervened in the early period, it may lead to overloading of joints and increased pain in later periods.

### FRI0723-HPR PHYSICAL ACTIVITY AWARENESS AND PREFERENCES IN RHEUMATIC DISEASES: A QUALITATIVE STUDY.

P. Vitalis<sup>1</sup>, D. Kouvelas<sup>2</sup>, N. Kousouri<sup>3</sup>, I. Lahari<sup>1</sup>, Y. Koutedakis<sup>1</sup>, G. Kitas<sup>4</sup>, G. Metsios<sup>1</sup>. <sup>1</sup>Faculty of Education Health and Wellbeing, University of Wolverhampton, Walsall, United Kingdom; <sup>2</sup>Faculty of Medicine, Aristotle University of Thessaloniki, Greece; <sup>3</sup>Hellenic League Against Rheumatism, Athens, Greece; <sup>4</sup>School of Sport, Exercise and Rehabilitation Sciences, University of Birmingham, Birmingham, United Kingdom

**Background:** Physical inactivity is the fourth leading cause of death (1) and a risk factor for cardiovascular disease (CVD). Patients with rheumatic diseases (RDs), especially rheumatoid arthritis (RA), report low cardiorespiratory fitness levels (2), placing them at an increased risk of premature mortality and CVD.

**Objectives:** The aims of the present study were: a) to evaluate if patients with RDs [RA, ankylosing spondylitis (AS), systemic lupus erythematosus (SLE), osteoarthritis (OA), psoriatic arthritis (PSA), systemic sclerosis (SSC), fibromyalgia (FM), enteropathic arthritis-Crohn's disease (CD), Sjögren's syndrome (SD), Raynaud's disease (RD)] were aware of the physical activity (PA) benefits, and b) to examine their preferences in terms of PA mode and principles (i.e. intensity, duration, frequency).

**Methods:** We designed a questionnaire consisted of dichotomous, open-ended and multiple-choice questions. Patients registered with the Hellenic League Against Rheumatism (EL.E.A.N.A), participated by filling in the questionnaire a) online, or b) through phone calls. Content analysis approach was performed for data analysis.

**Results:** Out of the 625 RDs patients registered with the EL.E.A.N.A, 197 (31.5 % response rate) returned the questionnaire [137 online and 60 via phone calls (69.6% and 30.4% of the sample, respectively)]. 93 patients had RA (47.3% of the sample, age=54.9±14.5) and 104 (52.7% of the sample, age=50.2±13.9) were diagnosed with other RDs [AS (n=29, 14.7%), SLE (n=25, 12.6%), OA (n=15, 7.6%), PSA (n=10, 5%), SSC (n=8, 4%), FM (n=7, 3.5%), CD (n=4, 2%), SD (n=4, 2%) and RD (n=2, 1%)]. In all patients, subjective beliefs about the benefits of PA, concerned three main themes: a) functional ability, b) mental health and c) overall health. Swimming, was revealed as the most frequent PA mode (n=63, 38.1%). Regarding the principals of PA, patients reported that they preferred moderate intensity (n=76, 41.7%), a duration of "about an hour" (n=81, 49.3%), a frequency of "2–3 times per week" (n=71, 45.2%) and a blended intervention consisted of group-based, individualised and supervised programmes (n=56, 29.4%). The questionnaire was judged by the patients to be very or fairly understandable in almost all cases (n=196, 99.5%).

**Conclusions:** According to subjective beliefs from the self-reported data of this study, PA is considered from patients to improve physical and mental health in RDs. Additionally, individualisation and supervision of PA programmes were considered amongst the most important parameters of a program for participation. In planning successful PA regimes in RDs, more qualitative studies with representative sample sizes and demographic data are required to address patients' PA needs and preferences and help them adhere to a more physically active lifestyle.

### FRI0724-HPR DISEASE ACTIVITY AFFECTS FAT MASS INDEX AND FUNCTIONAL CAPACITY OF RA PATIENTS OVER 12 MONTHS

R.C.E. Cavalheiro Do Espírito Santo<sup>1</sup>, J. Miranda de Souza Silva, <sup>1</sup> P. Lora<sup>2</sup>, L. Isabel Filipin<sup>3</sup>, R. Machado Xavier<sup>1</sup>. <sup>1</sup>Federal University of Rio Grande do Sul, Porto Alegre; <sup>2</sup>Universidade do Vale do Rio dos Sinos, São Leopoldo; <sup>3</sup>Universidade La Salle, Canoas, Brazil

**Background:** Rheumatoid cachexia (RC) is a condition characterized by adverse changes in body composition, specifically in muscle mass and fat mass components [1]. RA patients have life quality and expectative impacted by RC [2], but there are very few prospective data analyzing the evolution of this condition.

**Objectives:** To assess body composition, RC, clinical features and functional capacity in RA patients followed for 12 months.

**Methods:** 81 patients with RA, aged between 40 and 70 years, were recruited. Body composition was assessed by total body dual-energy x-ray absorptiometry (DXA) for measurement of fat mass index (FMI;Kg/m<sup>2</sup>) and fat free mass index (FFMI;Kg/m<sup>2</sup>).The patients were categorized as rheumatoid cachectic if FFMI was below the 10th percentile and FMI above the 25th percentile[1],and if FFMI was below the 25th percentile and FMI above the 50th percentile[2].Disease features assessed were disease activity score 28 (DAS28). Functional capacity was assessed by muscle strength (hand grip test;Kg) and gait speed (Time up and Go (TUG;m/s)). Frequency analysis, McNemar test and GEE analyses were used and statistical significance was considered as p<0.05.

**Results:** Of the 81 patients analyzed, most were women (88.9%;72/81), with mean age of 56.8±7.3, mean disease duration time of 11.9±9.6 years. At baseline, the prevalences of RC using both diagnostic criteria were similar to the prevalences described in literature (table 1), and they did not change during the 12 month follow-up(p>0.05).FMI increased after 12 months and patients with moderate disease activity showed higher FMI when compared with other DAS28 categories (p<0.05).Thus, over 12 months, DAS28 affected FMI, and had no impact on FFMI (p>0.05).Muscle strength decreased significantly after 12 months, and patients with high disease activity showed less muscle strength when compared with other DAS28 categories(p<0.05).Gait speed increased after 12 months(p<0.05).

Table 1

	Baseline	12 months
FMI(kg/m <sup>2</sup> )	10.8±4.3	11.1±4.2*
FFMI(kg/m <sup>2</sup> )	16.3±1.9	16.4±1.8
RC [1]	12(13.3%)	12(13.3%)
RC [2]	27(30.0%)	22(24.4%)
DAS28	3.7±1.3	4.0±1.3*
Muscle strength(kg)	16.6±10.4	9.7±8.7*
Gait speed (m/s)	0.5±0.1	0.6±0.1*

\*p<0.05 between baseline and 12 months.

**Conclusions:** In this study, RC prevalence was similar to the prevalence described in literature. DAS28 score of our patients increased over 12 months, and it affected FMI, muscle strength and gait speed of RA patients. However, no effect was observed on FFMI. Our results show that the patients that are not in remission by DAS28 have decreased muscle strength and increased fat mass, possibly due the inflammatory process and the reduced physical activity level, creating a vicious circle.This vicious circle may negatively impact on life quality of RA patients.

#### FRI0725-HPR UNDERSTANDING THE BURDEN OF RHEUMATOID ARTHRITIS USING QUALITATIVE RESEARCH: WHICH IMPACTS ARE NOT CAPTURED BY PATIENT-REPORTED MEASURES?

Y. Shaw<sup>1</sup>, C. Zhang<sup>2</sup>, R. Schumacher<sup>1</sup>, D. McDonald<sup>2</sup>, T.A. Simon<sup>3</sup>, K. Michaud<sup>1</sup>.  
<sup>1</sup>National Data Bank for Rheumatic Diseases, Wichita; <sup>2</sup>LIFT1428, Chattanooga;  
<sup>3</sup>Bristol-Myers Squibb, Princeton, United States

**Background:** Existing measures of disease burden in rheumatoid arthritis (RA) include patient-reported measures (PRMs) of physical and mental functioning, symptoms and work disability. However, these measures may be inaccurate if interpreted by respondents in unintended ways and may not capture some impacts of RA of importance to patients.

**Objectives:** To explore the perspectives of RA patients on PRMs used in The National Data Bank for Rheumatic Diseases (Forward) registry and to identify impacts of importance to patients that may not be captured by commonly used measures.

**Methods:** Semi-structured ethnographic interviews were conducted with adult RA patients in the United States participating in Forward. Interviewees were asked to discuss the impact of RA on their lives and their perspectives on PRMs used in Forward. Interviews were audio-recorded and transcribed verbatim. Transcripts were analyzed for themes related to: 1) perspectives on PRMs, and 2) important impacts of RA.

**Results:** We interviewed 18 patients aged 27–80 years, with RA durations of 4–40 years and Forward participation of 1–19 years. Participants' perspectives on PRMs fell into 4 categories (table 1). Several patients doubted that the PRMs adequately captured the severity of their symptoms. Important impacts of RA not measured by Forward included: expenditures on adaptive devices and measures,

impact on life goals and activities (educational and career plans, family responsibilities, and valued activities) and interaction with stressful life events (such as family deaths).

Table 1 Patient Perspectives on PRMs

Category	Perspectives
<b>Ease of responding to questions</b>	<ul style="list-style-type: none"> <li>- Numerical measures are easy to comprehend</li> <li>- Anchors for scale endpoints are too vague</li> <li>- Difficulty remembering severity of past symptoms</li> <li>- Difficulty understanding questions</li> <li>- Questions could be emotionally disturbing</li> </ul>
<b>Communication of symptoms</b>	<ul style="list-style-type: none"> <li>- Numerical measures were preferred to open-ended survey questions because communicating symptoms in words can be difficult</li> <li>- Difficulty quantifying symptoms and feelings</li> <li>- Infrequent assessments cause gaps in measurement</li> </ul>
<b>Factors biasing responses</b>	<ul style="list-style-type: none"> <li>- Patients may interpret questions in unintended ways</li> <li>- Adaptation and high tolerance for symptoms may lead patients to underreport the severity of symptoms</li> <li>- Patients may underreport the severity of past symptoms not clearly remembered</li> </ul>
<b>Interpretation of responses</b>	<ul style="list-style-type: none"> <li>- PRMs do not assess shifts in expectations for health that may affect responses</li> <li>- Responses from 1 patient at different times/from different patients may not be comparable</li> </ul>

**Conclusions:** Challenges in interpreting and answering questions may reduce the accuracy of PRMs of RA symptoms. The PRMs discussed by participants may not fully capture the impact of RA on patients' financial burdens and on their pursuit of life goals and activities. Future efforts to improve the accuracy and comprehensiveness of burden of disease measurement in RA should help to address these issues. Use of qualitative methods (such as ethnography) may also help to illuminate aspects of living with RA that are not captured by existing PRMs.

#### HPR Service developments, innovation and economics in healthcare

#### FRI0726-HPR STUDY ON THE EFFICACY OF CURCUMIN THERAPY IN EARLY STAGES OF JUVENILE OLIGOARTHRITIS

C. Aliloiu, L.M. Aliloiu. *Medical Physics, "Al. I. Cuza" University, Iasi, Romania*

**Background:** Juvenile arthritis is one of the most common rheumatic diseases in childhood. With all remission drugs, a high percentage of patients continue to have an active disease as young adults and sometimes locomotor and ocular sequelae. Turmeric originated in South Asia is used as spice in these regions and has in its structure a polyphenolic compound called Curcumin, very well known for its anti-microbial, anti-inflammatory, anti-oxidative effects and anti-cancer action. Pleiotropic effects are demonstrated by inhibition of transcriptional-kappa B nuclear factor and subsequently of tumor necrosis factor, IL-12 and IL-2 cytokines involved in the inflammatory cascade. Curcumin has been successfully administered in rheumatoid arthritis, but less investigated in juvenile arthritis.

**Objectives:** Aim of study was to evaluate the effects of curcumin administration in patients with Oligoarticular Juvenile Idiopathic Arthritis (OJIA) as an integrated therapy at the onset of the disease.

**Methods:** Thirty-two children aged 8–16 years with OJIA were included in a randomized placebo controlled trial from May 2014 – May 2017. All patients were initially hospitalized at the "St. Mary" Emergency Hospital for Children, Iasi and met the criteria of the American College of Rheumatology (ACR). Patients and their parents/legal guardians signed an informative consent on the treatment with curcumin at Laser Clinic. Patients were randomly assigned to one of the two groups: Group 1 (16 patients) received UltraCur 600 mg of Protein Curcumin Complex (15,000-fold bioavailability supplement), 1.8 g per day (in 3 doses, during meals) for 9 months and Group 2 (16 patients) received *placebo*; all patients were under their standard treatment. Disease activity was evaluated at 0, 3, 6 and 9 months using ACR Pedi30 score. This score defines the improvement of at least 30% from baseline in three of the six variables in the base set, while no more than

one of the remaining variables may worsen by >30%. Core set criteria were: physician global assessment of disease activity (0–10 cm VAS); parent/patient global assessment of overall well-being (0–10 cm VAS); functional ability; number of joints with active arthritis; number of joints with limited range of motion; and ESR.

**Results:** All patients completed the study. After 3 months from the initiation of Curcumin therapy, patients in group 1 had an improvement of 75% ACR Pedi30, compared to only 37.5% ( $p=0.0353$ ) in control group. In the end, ACR Pedi30, 50, 70 and 90 scores improved by 87.50%, 81.25%, 68.75% and 43.75%; compared to only 56.25% ( $p=0.0508$ ), 50% ( $p=0.0670$ ), 37.5% ( $p=0.0813$ ) and 12.75% ( $p=0.0553$ ) in the control group. Curcumin at 1.8 g/day associated with standard therapy was well tolerated, did not induce major reactions and ultimately reduced rheumatic disease activity scores statistically significant ( $p<0.05$ ) compared to placebo.

**Conclusions:** Results proved that curcumin in combination with standard therapy is safe, well tolerated, available at a low cost and has significantly improved the outcome in early stages of OJIA.

#### FRI0727-HPR IMPLEMENTATION OF A MODEL FOR THE MEDICATION RECONCILIATION PROCESS IN PATIENTS WITH RHEUMATOID ARTHRITIS

K. Mendez<sup>1</sup>, J. Urrego<sup>1</sup>, P. Santos-Moreno<sup>2</sup>. <sup>1</sup>Pharmaceutical Chemist, <sup>2</sup>Rheumatology, Biomab, Center For Rheumatoid Arthritis, Bogota, Bogota, Colombia

**Background:** Medication reconciliation is defined as “the process of identifying the most accurate list of all medications a patient is taking, including the name, dosage, frequency, and route of each medication, and using this list to provide the correct medications for the patient anywhere within the health care system”. It has been demonstrated that inadequate prescribing due to inaccurate medication histories and reconciliation can lead to medication errors, which have been associated with increased morbidity, mortality, and healthcare costs.

**Objectives:** The aim of study was to design an intervention model led by pharmaceutical personnel in order to implement the reconciliation medication process in patients with RA in a specialized center.

**Methods:** We included patients with RA; we analyzed their particular situation regarding their pharmacological therapy, dosage, frequency among others. Additionally, we applied checklists to find out about the pharmaceutical processes previously established in the RA center and applied a SWOT analysis (strengths, weaknesses, opportunities, and threats) to plan according to the needs diagnosis.

**Results:** In our specialized RA center we found as strengths 1. the existence of analysis committee for the evaluation of patient's therapy, 2. the open mind of the managers in order to implement the reconciliation process 3. The continued education opportunities that the health professionals receive in the specialized RA center. As weaknesses we found: 1. The absence of processes regarding the reconciliation process. 2. In the medical charts there was no registry of the chemical pharmaceutical professional procedures into the patient's therapy. We performed 900 consultations as a pilot to implement the reconciliation medication process, as a result we found 73 patients with a clear need of medication reconciliation the reasons were therapeutic failure or adverse events related to medications. Probably attributed to the existence of multiple pathologies in 81% of patients. Regarding the pharmacological therapy 83% had a conventional DMARD primarily methotrexate in any pharmacological presentation, and biological therapy and, 12% had prescribed only biological DMARDs.

**Conclusions:** With these results we will implement a new model where there will be a process to perform a medication reconciliation in patients with RA, we will review the medical charts in order to identify patients that have needs with the medication process interactions among others. Additionally, we will start new research projects in order to provide evidence of the usefulness of these types of interventions.

#### FRI0728-HPR COST-REDUCING AND IMPROVING QUALITY OF LIFE IN JUVENILE ARTHRITIS BY BLUE LASER AND ULTRABIOAVAILABLE CURCUMIN

L.M. Ailioaie, C. Ailioaie. *Medical Physics, “Al. I. Cuza” University, Iasi, Romania*

**Background:** Juvenile idiopathic arthritis (JIA) is associated with significant disease- and treatment-related morbidity, despite all modern management efforts. Photo biomodulation counts today more than 5,000 peer-reviewed published papers, including randomized controlled clinical trials. A review of the literature shows that Curcumin has the potential to be a safe, effective and an affordable alternative in the treatment of chronic inflammation. Its anti-inflammatory mechanism is a molecular response to the down-regulation of enzymatic activity of COX-2, lipoxygenase, and inducible nitric oxide synthase. Photobiomodulation at the maximum absorption spectra of curcumin is an innovative approach due to its complex immuno-modulatory effect.

**Objectives:** Aim was to investigate the effects of sublingual photo biostimulation with blue laser in association with ultrabioavailable curcumin in extensive oligoarticular and polyarticular forms of JIA.

**Methods:** 48 children with an average age of 13.8 years, diagnosed with JIA were included in a randomized placebo controlled trial from January 2014 to December 2017. Patients together with the legal owners signed an informed consent. Group 1 (28 patients) was administrated along with the standard treatment, Ultra Bioavailable Curcumin (15,000-fold bioavailability) 1200 mg/day p. o. and after 30 minutes was applied sublingual blue laser (447 nm), 5 mW maximum output power continuously, 10 minutes each session. Patients received one session every two days, 5 sessions per month, repeated monthly, for 6 months. Group 2 (20 patients) as control, received only conventional therapy and placebo.

Disease activity was evaluated at 0, 4, 12 and 24 weeks with JADAS-71 scores, including: physician's global assessment and parent's global assessment of well-being, both measured on 0–10-cm VAS, normalized ESR (0–10) and active joint count. Childhood Health Assessment Questionnaire (CHAQ) – Disability Index was calculated as a mean of the eight functional areas, on a 4 point scale of difficulty, scored from 0–3 each. Pain level was quantified on 0–10-cm VAS (0-no pain, 10-severe pain).

**Results:** In the end of study, median JADAS-71 significantly improved ( $p=0.0228$ ) in Group I (from 13.8 to 2.8), comparatively with Group II, where the evolution was less favourable (from 14.2 to 7.4). Pain level initially estimated at 7.5 significantly decreased to 2.5 in Group I (66.7%), comparatively to the evolution from 7.4 to 5.2 in placebo group (29.7%) [ $p=0.0125$ ]. Daily functional activity assessed by the CHAQ score improved with 62.7% in Group I, comparatively with only 13.93% in Group II ( $p=0.0003$ ). In the end of study the most important economic aspect was that the percentage of patients receiving remissive medications and the corresponding costs per patient have decreased for methylprednisolone by 72.25% in Group 1, comparatively with only 35.04% in placebo group ( $p=0.0111$ ); methotrexate decreased by 66.7% in Group I, comparatively to only 31.25% for placebo group ( $p=0.0165$ ).

**Conclusions:** Blue laser and curcumin proved to be a safe, efficient and money saver integrative therapeutic intervention with direct impact on JIA patient's quality of life.

**FRI0729-HPR RHEUMATOLOGY ADVANCED NURSE PRACTITIONERS TREAT TO TARGET PERSON CENTERED CARE: IRELAND'S POLICY FRAMEWORK.**

P. Minnock<sup>1</sup>, A.-M. Ryan<sup>2</sup> on behalf of Irish Rheumatology Nursing Forum.  
<sup>1</sup>Rheumatic Musculoskeletal Disease Unit, Our Lady's Hospice and Care Services;  
<sup>2</sup>Deputy Chief Nursing Officer, Department of Health, Dublin, Ireland

**Background:** Advanced practice refers to a registered nurse, educated to master's degree level, with the expert knowledge base, complex decision-making skills and clinical competencies for expanded practice beyond that of the first level nurse. Advanced practice characteristics are shaped by the speciality, local context and/or country of practice. Countries, as well as speciality areas are at different stages in the development of legislation, scope of practice, roles, responsibilities, education and clinical preparation. Rheumatology nursing development continues apace internationally.

**Objectives:** To bring rheumatology advanced nurse practitioners (ANPs) to the forefront in the delivery of quality person-centered care, working to enhance patient outcomes and reduce the personal and societal burden of rheumatic musculoskeletal diseases.

**Methods:** The Irish Rheumatology Nursing Forum proposed a business case for the development of advanced nurse practitioner posts to implement, as a standardised approach to care nationally, the therapeutic strategy of treat to target for patients with inflammatory arthritis. This was endorsed by the Irish Society for Rheumatology and approved by the Rheumatology National Clinical Programme in 2015. Subsequently this proposal was chosen by the Chief Nursing Office as a demonstrator project for the Department of Health (DOH) draft policy to raise the critical mass of ANPs in healthcare delivery.

**Results:** In late 2017, the DOH allocated 22 new ANP posts to rheumatology services countrywide, aligned to the national integrated care programme for the prevention and management of chronic disease. These 22 candidate ANPs are now completing advanced practice education at MSc level run by a consortium of Irish universities (University College Dublin, Cork, Galway, and Trinity College Dublin). Supervision of the requisite 500 clinical hours at advanced practice level is being provided by local consultant rheumatologist in partnership with the universities. Local teams of key service, nursing, medical, and academic personnel have been established across all centres to oversee project development; implementation; utilisation of robust evaluation criteria to capture clinical impact and cost-effectiveness. Initial evaluation will focus on key performance indicators related to patient access such as i) ratio of new patients seen to ANPs, ii) new: return attendance ratio, iii) percentage of referrals seen within three months, iv) percentage of non-attended appointments. Intermediate-long-term evaluation will encompass patient care and health care outcome through evaluation of all nursing interventions such as health assessments; medication prescribing and optimisation; patient education; health promotion; comorbidity screening; referral to other professionals; ordering of investigations; patient and staff satisfaction survey data. Quality of care will be evaluated guided by published quality care indicators. Patient outcome will be evaluated using appropriate nursing sensitive and validated disease activity scores and patient reported outcome measures. Real-time data collection using a specifically commissioned epr will ensure cANPs are supported by the appropriate technology to treat to target.

**Conclusions:** ANP-led care underpinned by evidence based practice and guidelines, continues to grow as a model of care delivery in rheumatology.

**Disclosure of Interest:** None declared

**FRI0730-HPR THE CONCEPT OF PATIENT CENTERED CARE IN SPONDYLOARTHRITIS BASED ON A MULTIDISCIPLINARY MODEL**

P. Santos-Moreno<sup>1</sup>, L. Villarreal<sup>2</sup>, D. Buitrago-Garcia<sup>3</sup>, M. Cabrera<sup>2</sup>.  
<sup>1</sup>Rheumatology, <sup>2</sup>Health Services, <sup>3</sup>Epidemiology, Biomab, Center For Rheumatoid Arthritis, Bogota, Bogota, Colombia

**Background:** Spondyloarthritis (SpA) is one of the most prevalent musculoskeletal disease in the Americas, with an estimated prevalence of 0.5%. This group of patients presents a number of unmet needs for accessibility to the consultation, diagnosis and adequate treatments. That for this reason it is necessary to develop a program of Centers of Excellence (CoE), which allows answer to these needs and at the same time to add values for our health systems.

**Objectives:** The aim was to create a program with pilot SpA centers initially in some countries that operate under the scheme of CoE, as they are already delineated in projects like REAL-PANLAR for rheumatoid arthritis. In a second phase and under the auspices of PANLAR (Panamerican league of associations for rheumatology) create a Pan American Network of Centers of Excellence in SpA (CESPA).

**Methods:** We performed a systematic review of the literature in global and regional databases (Pubmed, Medline, Scopus, Lilacs), in order to search

information on this research question-hypothesis. Subsequently and under a Delphi-modified methodology and consensus of involved rheumatologists lay the conceptual bases on this particular subject – the Centers of Excellence in SpA (CESPA). As a result of the above was defined as should be a CESPA.

**Results:** In accordance with the principles of creation and operation of the CoE in particular, specific themes were developed by a coordinator who, after a review of the literature, presented a specific proposal on every particular topic that was discussed and then voted on and implemented within the CESPA concepts. A CESPA must have: 1. Screening Clinic and Early Diagnosis of SpA: the purpose is to rule out false positives of disease and to diagnose early SpA; 2. Model of patient-centered care: a model of frequencies of care should be implemented for SpA patients from the perspective of the different specialities involved in the multi-disciplinary team; 3. Laboratories and images: conventional laboratory tests as having a minimum of 3–4 times a year and each patient will have conventional X-ray images of cervical and lumbosacral column at the beginning and then once a year. Ultrasound of entheses: upon admission to the program and then with a certain periodicity (annual) or depending of sensitivity to change (OMERACT). The same applies to the subject of MRI of sacroiliac joints and column for both diagnosis and follow-up; 4. Clinical guideline on SpA should be adapted and customized to the particular realities of some of our countries; 5. There must be a management (disease management) program that must include Structure, Process and Result Indicators to define CESPA as Standard, Optimal and Model; 6. There must be standardized education and research programs for patients and physicians at the center

**Conclusions:** There is a global need to develop CESPAs, in order to define treatment targets type T2T-SpA, which would improve clinical outcomes and avoid so much disability and health economic costs.

**FRI0731-HPR SWITCH MANAGEMENT BETWEEN SIMILAR BIOLOGICAL MEDICINES, A COMMUNICATION INFORMATION GUIDE FOR NURSES**

J.E. Voorneveld-Nieuwenhuis<sup>1</sup>, L. Moortgat<sup>2</sup>, M. Pavic Nikolic<sup>3</sup>, P. Crombez<sup>4</sup>, B. Oomen<sup>5</sup> on behalf of European Specialist Nurses Organisations (ESNO): representatives of five organisations: Oncology, Diabetes, Dermatology, Rheumatology and Inflammatory Bowel Diseases are involved.. <sup>1</sup>Rheumatology, Maaststad Hospital Rotterdam, Rotterdam, Netherlands; <sup>2</sup>Gastroenterology, AZ Delta, Roeselare, Belgium; <sup>3</sup>Rheumatology, University Medical Centre, Ljubljana, Slovenia; <sup>4</sup>Hematology, Jules Bordet Institute; <sup>5</sup>ESNO, Brussels, Belgium

**Background:** Biologics are used in the field of rheumatology but are also important in other fields such as oncology and gastroenterology. Over the last few years, biosimilar versions of many biologicals have been launched. Patients may be switched depending on local rules and appointments. To provide support and information for nurses working with patients who are switching between similar biological medicines ESNO has taken the initiative to develop an information guide for nurses.

Nurses can take the lead in implementing the transition between branded and bio-similar biologic medicines. This includes managing the process before, during and after the switch.

**Objectives:** The guide was developed to provide support and information for nurses working with patients who are switching between similar biological medicines

The guide provides examples of projects and best practices based on different specialities to increase trust in biological medicines including biosimilars. Its aim is to contribute to the safe use of and trust in biologic medicines, and give nurses the tools to implement switching decisions in a clinical context and deal with patient concerns, drawing on the learnings from real-life experiences.

**Methods:** We collected previous experiences from nurses with switching biologics. We also developed a roadmap for how to inform patients, a set of frequently asked questions (FAQ) and points to consider when switching.

**Results:** The guide is written in English and will be translated into the 23 different languages of the EU.

With information about:

- The definitions of biological and biosimilar medicines.
- Switching and substitution.
- The benefits of biosimilars

The document also includes flow charts for switch implementation, follow up and support.

**Conclusions:** Switching between similar biologicals opened new chapter in which nurses play a crucial role in communicating with patients and providing support and reassurance, before, during and particularly after the switch. This is build on nurses' many years of education, and their experience with patients in different situations. It is a process that requires time, patience and care.

Patients may be concerned about changes in biologic medicines, and will have a lot of questions. Positive language is important in answering these questions, to provide confidence and reassurance. Patients need to know that their healthcare professionals understand the reasoning behind the change and are confident that it is the right thing to do. To avoid confusion, the team of nurses and other healthcare professionals should have a consistent explanation that is used by all.

#### FRI0732-HPR RHEUMATOLOGY NURSE SPECIALISTS AND CORTICOSTEROID PRESCRIBING – DOES IT CONFORM TO EULAR GUIDELINES

J. Begum<sup>1</sup>, M.K. Nisar<sup>1</sup>. <sup>1</sup>Rheumatology, Luton & Dunstable University Hospital, Luton, United Kingdom

**Background:** The rheumatology nurse specialist (RNS) plays a central role in the multi-professional rheumatology team. Delivering corticosteroid (CS) therapy to patients is an area where there is little understanding of RNSs confidence in managing them.

**Objectives:** Considering CSs are a cornerstone of treating rheumatic diseases where RNSs are invariably involved, we undertook a pilot survey to understand the present climate of RNSs prescribing of corticosteroids in their practice.

**Methods:** A focus group discussion was held at South West regional meeting to ascertain the minimum level of understanding required to successfully deliver CS therapy to patients. It was centred on EULAR recommendations. Nine items were identified based on three main themes – safe prescribing, optimal dosing and prevention of complications. A questionnaire was created based on this discussion and all participants of the meeting were surveyed.

**Results:** There are 21 centres providing rheumatology services in the South West England. All were represented in 30 participants of the survey. Median age of the nursing establishment was 48 years (mean 47 year, range 27–60 years). Only 6/30 (20%) were nurse prescribers.

14 (47%) did not feel comfortable advising patients on adjusting their CS dose. Only four (13%) had any patient group directive in place at their trust to enable them to amend CS dose for non-medical prescribers. 11 (36%) considered CS to be disease modifying therapy in inflammatory arthritis. 17 (56%) employed CS therapy as part of early arthritis management protocol. 4/30 (13%) considered prednisolone equivalent dose of  $\geq 10$  mg/day safe in long term and seven (23%) would be happy to utilise 120 mg IM depomedrone monthly as necessary. 10 (33%) were unaware of therapeutic co-intervention for CS related osteoporosis risk and 21 (70%) were not employing any fracture risk stratification tools.

**Conclusions:** This pioneering initiative highlights a wide variation in the prescription standards of a key job provision. Very few units have independent nurse prescribers. Others lack patient group directive to at least enable non-medical

prescribers i.e. RNSs to safely amend CS therapy prescribed by a rheumatologist. Less than a quarter of those surveyed actually consider CSs to have any disease-modifying role. Rather worryingly, some do not even recognise the safe long-term CS dose and willing to offer high doses periodically. Though most know the concomitant therapeutic options to mitigate against osteoporosis, few are actually assessing fracture risk thereby unlikely to offer the appropriate interventions.

In conclusion, there is wide variation in the service provision of RNSs. This can potentially have a negative impact on effort to promote safer use of CSs in the management of inflammatory rheumatic diseases. There is a need for improving training standards to help deliver good quality rheumatology professionals of the future and ensure safe and effective drug interventions.

#### FRI0733-HPR AN INTERACTIVE COURSE ON EXERCISE THERAPY FOR KNEE OSTEOARTHRITIS AND COMORBIDITY: A FEASIBILITY STUDY

M. De Rooij<sup>1</sup>, M. van der Leeden<sup>2</sup>, M. van der Esch<sup>1</sup>, W.F. Lems<sup>3</sup>, J. Meesters<sup>4</sup>, W. F. Peter<sup>1</sup>, L.D. Roorda<sup>1</sup>, M. Terbraak<sup>5</sup>, T. Vredevelde<sup>5</sup>, T.P. Vliet Vlieland<sup>4</sup>, J. Dekker<sup>2</sup>. <sup>1</sup>Department of Rehabilitation, Reade, center of rehabilitation and rheumatology; <sup>2</sup>Department of Rehabilitation; <sup>3</sup>Department of Rheumatology, VU Medical Centre, Amsterdam; <sup>4</sup>Department of Orthopedics, Leiden University Medical Center (LUMC), Leiden; <sup>5</sup>Faculty of Health, ACHIEVE Centre of Expertise, Amsterdam University of Applied Sciences, Amsterdam, Netherlands

**Background:** A structured, tailored exercise therapy strategy was found to significantly improve physical functioning, reduce pain and was safe for patients with knee OA and severe comorbidity. The intervention was performed in a specialized, secondary care center. Before the intervention can be implemented in primary care, appropriate education of physiotherapists (PTs) as well as insight into barriers and facilitators for using the protocol in primary care is needed.

**Objectives:** This study aimed to 1) evaluate the effect of an interactive course on the exercise therapy strategy for patients with OA and comorbidity for PTs working in primary care; and 2) map facilitators and barriers for applying the protocol in primary care.

**Methods:** A pre-posttest study was performed among PTs who were working in primary care. PTs were offered a postgraduate blended educational course consisting of an e-learning lecture (7 hours study load) and two interactive workshops (each 3 hours study load). Measures of effectiveness included a questionnaire on knowledge (60 multiple choice questions) before (T0) and two weeks after the course (T1) and a patient vignette to measure clinical reasoning (nine open questions) before the course (T0) and six months after the course (T2). Facilitators and barriers for using the protocol were measured at T2 by means of a 27 item questionnaire (each item was scored on a 5-point Likert scale, ranging from 0 totally agree to 4 totally disagree).

**Results:** Thirty-four PTs were included. Fourteen out of 34 PTs had treated at least one patient with knee OA and comorbidity according to the protocol. Statistically significant improvements were found, both for knowledge levels between baseline and T1 (N=34) (p<0.00), and for clinical reasoning between baseline and T2 (N=34) (p<0.00). With regard to facilitators to implement the protocol, the majority of PTs found the protocol feasible in daily practice (68%) and to be supportive regarding clinical reasoning and clinical decision making (77%). Perceived barriers for implementation included the small number of patients with OA and severe comorbidity being referred or referring themselves. Of the therapist who actually treated patients according to the protocol, 86% indicated that the protocol was applicable in their daily clinical practice and that they perceived to have sufficient knowledge (71%) and skills (64%) to apply the protocol. Other barriers indicated by PTs were the limited number of treatment reimbursement by the insurance companies (65%) and a suboptimal collaboration with general practitioners and physicians (65%).

**Conclusions:** An interactive educational course on exercise therapy for knee OA patients with comorbidity proved to be effective in improving knowledge and clinical reasoning skills of primary care PTs. Main barriers for protocol use included limited referrals of patients with knee OA and severe comorbidity to PTs, and limited number of treatment reimbursement by insurance companies. For larger scale implementation these barriers should be solved.

### FRI0734-HPR PHYSICAL ACTIVITY AND AEROBIC CAPACITY ASSESSMENT – A SURVEY AMONG RHEUMATOLOGY HEALTH PROFESSIONALS IN FOUR EUROPEAN COUNTRIES.

N. Kennedy<sup>1,2</sup>, S.G. McKenna<sup>1</sup>, A. O'Neill<sup>3</sup>, B.A. Esbensen<sup>4,5</sup>, T. Swinnen<sup>6,7</sup>, B. Nordgren<sup>8</sup>, S. Willemijns<sup>9</sup>, N. Hammer<sup>9</sup>, N. Brodin<sup>8,9</sup>. <sup>1</sup>School of Allied Health; <sup>2</sup>Health Research Institute; <sup>3</sup>Department of Mathematics and Statistics, University of Limerick, Limerick, Ireland; <sup>4</sup>Department of Clinical Medicine, University of Copenhagen, Copenhagen; <sup>5</sup>Copenhagen Center for Arthritis Research, Rigshospitalet, Glostrup, Denmark; <sup>6</sup>Skeletal Biology and Engineering Research Center, Department of Development Regeneration, KU Leuven; <sup>7</sup>Division of Rheumatology, UZ Leuven, Leuven, Belgium; <sup>8</sup>Division of Physiotherapy, Karolinska Institutet; <sup>9</sup>Division of Physiotherapy, Danderyd Hospital, Stockholm, Sweden

**Background:** Regular physical activity (PA) is associated with improvements in health outcomes, such as quality of life, aerobic fitness, pain, stiffness and inflammation in people with inflammatory joint disease (IJD) (1,2). Current practice in the management of patients with inflammatory arthritis emphasises the importance of health professionals (HPs) in assessing PA and aerobic capacity.

**Objectives:** The objectives of this study were to identify how HPs working with IJDs measure PA and aerobic capacity.

**Methods:** Rheumatology HPs in Denmark, Sweden, Ireland and Belgium participated in an online survey. Descriptive statistics was undertaken (SPSS v21 and SASv9.4) to describe data aggregates and range and to identify sub-classes of groups with respect to use of PA measures.

**Results:** Three hundred and twenty two (n=322, 75% female) HPs responded from Denmark (n=50, 15.5%), Sweden (n=66, 20.5%), Ireland (n=28, 8.7%), and Belgium (n=178, 55.3%). The majority of respondents (n=286, 92%) reported it was important to measure PA in people with IJDs. The mean number of years qualified was 20.08 (SD 9.37) and years working in Rheumatology was 12.29 (SD 8.27), with 32.3% reporting half of their workload coming from people who have inflammatory arthritis. Only 28.2% of HPs used simple body worn sensors to measure PA levels in their patients. Moderate levels of confidence were reported in using a simple body-worn sensor (mean 6.15/10; SD 3.63) and paper questionnaire (6.85/10; SD 3.62) to measure PA, with lower levels of confidence in using a complex body-worn sensor (3.80/10; SD 3.55) and digital diary (4.22/10; SD 3.67). When assessing aerobic capacity 58% were very familiar/somewhat familiar using a bicycle ergometer, 44% a treadmill and 56% other aerobic capacity tests. Low levels of confidence were reported in instructing their patients in performing aerobic capacity tests (4.54/10; SD 3.74) and in interpreting the results (4.79/10; SD 3.58). A large majority were interested in further education around measuring PA (83%) and aerobic capacity measurement (74%), with an online module favoured for both.

**Conclusions:** The majority of respondents reported that they considered measuring PA as important in people with IJDs; however, the majority lacked confidence in how to measure it. There is strong interest in further education around measuring PA.

### FRI0735-HPR KNOWLEDGE, CONFIDENCE AND EDUCATIONAL NEEDS OF PRIMARY CARE NURSES' ON PATIENT EDUCATION AND CONTINUITY CARE IN RHEUMATIC DISEASES

R.J.O. Ferreira<sup>1,2</sup>, A. Marques<sup>1,2</sup>, I. Barbosa<sup>3</sup>. <sup>1</sup>Rheumatology, CHUC, <sup>2</sup>UICISA:E, ESENF, Coimbra, <sup>3</sup>Rheumatology, Hospital Conde Bertiandos, Ponte de Lima, Portugal

**Background:** Primary care health professionals (HPs) are essential for continuity of care, especially for chronic conditions like rheumatic diseases. Therefore, knowledgeable and skilled HPs are needed in both settings, with close contact, to

improve quality and safety. Primary care nurses may be pivotal to assure this continuity and liaison between care players. However, there is a lack of postgraduate rheumatology education for HPs working in this field<sup>1</sup>, a lack expected to be even greater in primary care.

**Objectives:** We aimed to: 1) determine the knowledge on Disease Modifying Anti-Rheumatic Drugs (DMARDs) of nurses working in primary care in Portugal; 2) determine their confidence in providing patient education (PE) on (i) the rheumatic diseases they contact most, (ii) biological DMARDs and (iii) Methotrexate (MTX); 3) explore professional factors influencing these confidence levels; 4) explore their educational needs in rheumatology.

**Methods:** A national online survey was performed among nurses working in primary settings for ≥6 months. The survey assessed their certifications, experience in primary care, and their practice, knowledge, and confidence (from 0 to 10) in providing PE to these patients. Their educational needs and communication with their colleagues in rheumatology were also assessed. Educational leaflets were provided at the survey's end for didactic purpose. Spearman's correlation and Mann-Whitney tests were used to test nurse's confidence levels on PE.

**Results:** There were 290 individuals accessing the survey, but only 129 (44.5%) completed it [mean age (SD)=42.6 (7.8) years, experience in primary care=13.7 (8.2) years; 47.3% having a post-graduate specialization].

Osteoarthritis (69.0%), low back pain (68.2), and rheumatoid arthritis (62.8%) were the diseases that nurses contact the most. Only 5.4% of nurses recognized an image with five sc bDMARDs pens, reporting frequent contact with them; 18.6% reported rare contact. Knowledge on bDMARDs was poor (table 1). More than half of nurses reported not knowing what PE to provide (55.0%) and when these drugs should be suspended for patient's safety (63.6%); 55% never contacted with MTX and only 6.2% reported to know its side effects.

Table 1 Nurse's knowledge on bDMARDs (n=129)

bDMARDs	% yes
<b>are:</b>	27.1
Immunosuppressant's	10.1
NSAIDs	9.3
Corticosteroids	1.6
Powerful analgesics	0.8
Hormone therapy	51.1
I don't know	
<b>most common side effects are:</b>	15.5
Local reactions	20.2
Infections	7.0
Kidney insuf.	6.2
Cytopenia	3.1
Worsening of heart failure	6.2
Neoplasms	1.6
Respiratory insuf.	14.7
Tuberculosis	3.1
Gastritis and peptic ulcers	16.3
Hepatotoxicity	2.3
Demyelinating disease	58.9
I don't know	

Confidence levels in providing PE were low (figure 1) and not correlated (p>0.05) with years of experience on primary care or with post-graduate specializations.

Nurses' doubts are answered mainly via internet (68.2%) or by local colleagues (51.2%). Only 2 nurses (1.6%) had formal, although minor, rheumatology education but 88.4% would like to have it (delivery preferences were expressed).

**Conclusions:** Knowledge and confidence in key areas of rheumatology care seem to be very low in Portuguese nurses working in primary care. Unmet education and training needs exist and provide useful directions for the development of future training programmes.
