# Welcome Address

Dear Colleagues,

I wish you a warm welcome to the 19th EULAR Annual European Congress of Rheumatology in Amsterdam. Our annual EULAR Congress has become a major event in the calendar of world rheumatology, and Amsterdam 2018 will again provide a unique event for the exchange of scientific and clinical information. It offers a platform to facilitate interactions between medical doctors, scientists, health professionals, patients and professionals representing the pharmaceutical industry, from across Europe and around the world.

This will be a particularly exciting congress - we will launch the EULAR Strategy 2018-2023 and highlight remarkable progress in several recent initiatives, including the EULAR School of Rheumatology and our ground breaking "Don't Delay, Connect Today" campaign.

EULAR is built on three fundamental pillars, integrating patient (PARE), health professional and rheumatology national associations. This partnership underpinning the work of EULAR is a unique stimulus to prosper advances in our field, for example via treatment recommendations, political advocacy, and research leadership. Accordingly, our congress is of the highest quality delivering a rich resource of contemporary, yet accessible information, serving a vital role in our unstinting efforts to reduce the impact, burden and cost of rheumatic and musculoskeletal diseases for individuals and society.

EULAR 2018 will address a wide range of topics including innovation in population, health service, clinical, translational and basic science. The WIN/HOT track for the busy clinician requiring an update on What is New and How to Treat the major rheumatic diseases has become an admired and 'must see' highlight of the EULAR Congress. Sessions dedicated to People with Arthritis and Rheumatism in Europe (PARE), Health Professionals in Rheumatology (HPR) are further jewels in our programme. High quality health care industry sessions provide in depth and focussed insights. Our poster presentations and poster tours provide a highly interactive exchange of knowledge and solutions amongst participants. We will be discussing the best of the more than 5000 submitted abstracts, testament to the rich vein of creativity and energy currently evident in our discipline. In Amsterdam, together we will further promote the reputation of the EULAR Congress as the most innovative and informative venue for clinical research for the practising physician. Finally, it is a particular pleasure to celebrate the participation of the EULAR EMEUNET organisation of young rheumatologists that continues to attract young colleagues to the meeting. Together we must disseminate the message that rheumatology is one of the most attractive and successful disciplines in global medicine.

We are very happy to revisit the City of Amsterdam. In 2006, we relished the magnificent ambiance of canals and canalside houses, galleries, astonishing museums (think Rembrandt, Vermeer, Rubens, Steen and Van Gogh), the Anne Frank House, theatres, music and culinary pleasures. The city has flourished since, offering an ever more diverse and enriching experience, hopefully bathed in early summer sunshine! Whereas balmy warmth may be uncertain, there is no doubt that Amsterdam will provide an excellent background for scientific and clinical exchanges, international collaborations and renewal of friendships. We take great pleasure in welcoming you all to EULAR 2018, and hope that your stay in Amsterdam will be informative, educational and, last but not least, enjoyable.

Johannes W. J. Bijlsma  
EULAR President

## Speakers Abstracts

### Welcome Address

### EULAR 2018 Abstracts Reviewers

#### Wednesday, 13 June 2018

SP0001	WIN and HOT session .....	2
SP0002–SP0004	Little arthritis in PsA and axSpA with newly onset arthritis - does it matter? .....	2
SP0005	Cancer and inflammation .....	3
SP0006–SP0007	Psychological distress and pain; not all in the mind .....	3
SP0008–SP0009	Inflammation in the shadow of fibromyalgia .....	3
SP0010–SP0012	Shaping the future in systemic sclerosis .....	4
SP0013	Basic mechanisms of inflammation .....	4
SP0014–SP0015	Health Professionals welcome session .....	4
SP0016	Statistics made simple: a practical approach to complex concepts .....	5
SP0017–SP0018	E-health for better care .....	5
SP0019–SP0020	EULAR Projects in paediatric rheumatology and UCAN .....	5
SP0021–SP0023	Ultrasound basic I .....	6
SP0024–SP0026	New drugs - new perspectives: clinical and regulatory issues concerning biosimilars .....	7
SP0027	Don't delay, connect today! .....	7
SP0028–SP0029	Burning bones .....	8
SP0030–SP0033	Delay in treatment and the role of health professionals .....	8

#### Thursday, 14 June 2018

SP0034–SP0036	Fat and fatty acids: targets for therapy? .....	9
SP0037–SP0040	Inclusive school environment for young people with RMDs .....	10
SP0041–SP0042	WIN and HOT session .....	11
SP0043–SP0044	Can we halt progression of structural damage in axial SpA? .....	11
SP0045–SP0047	Reproductive issues in rheumatology .....	12
SP0048–SP0049	Clinical challenges in giant cell arteritis in 2018 .....	13
SP0050	Do we still need biopsies to diagnose Sjögren's and autoimmune myositis? .....	13
SP0051	How monogenetic autoinflammatory diseases help to understand and treat rheumatic diseases .....	14
SP0052–SP0054	Joint EULAR - EFIS session: I've got a B in my bonnet .....	14
SP0055–SP0056	Sustainable healthcare in rheumatology and the role of health professionals .....	15
SP0057	SSc: From registries to trials - do we have sufficient data and the appropriate design? .....	15
SP0058–SP0059	Patient involvement in research: the future of collaborative research. Lessons from the field of rheumatology and beyond .....	16
SP0060	EULAR Projects in Musculoskeletal Imaging .....	17
SP0061–SP0062	MRI .....	17
SP0063–SP0064	WIN and HOT session .....	18
SP0065–SP0067	To taper or not to taper in RA .....	18
SP0068–SP0070	Can we improve the care of gout? .....	18
SP0071–SP0072	"Why does BMI matter?" .....	19
SP0073–SP0074	Musculoskeletal pain; feeding the opioid epidemic .....	19
SP0075	What is lupus - syndrome or different entities? .....	20
SP0076	Genetics, epigenetics and disease: is it all in the genes? .....	20
SP0077–SP0079	It's your move: promoting physical activity in people with RMD's .....	21
SP0080	Data visualisation: tables and graphs for publication and presentation I .....	21
SP0081–SP0083	Challenges of patient organisations' in the 21 <sup>st</sup> century .....	22
SP0084–SP0087	The EULAR Exercise recommendations for physical activity in people with inflammatory arthritis and osteoarthritis .....	23
SP0088–SP0089	Capillaroscopy I .....	24
SP0090–SP0092	Ultrasound advanced I .....	24
SP0093	Immune senescence and ageing .....	25

## Friday, 15 June 2018

SP0094–SP0095	Special delivery: intercellular communication .....	25
SP0096–SP0098	WIN and HOT session .....	26
SP0099–SP0100	Challenges in systemic lupus diagnosis .....	26
SP0101–SP0102	Understanding the language of basic research, epidemiology and health services articles .....	27
SP0103–SP0105	Joint EULAR - ESSR session on: the role of MR imaging in rheumatic diseases and its clinical implications .....	27
SP0106	The stromal link to inflammation .....	28
SP0107–SP0108	New approaches in measuring what matters to patients .....	28
SP0109	Innovative treatments for a better quality of life .....	28
SP0110–SP0112	EULAR Projects in Investigative Rheumatology .....	29
SP0113	Laboratory course - from the clinic to the lab and back .....	30
SP0114–SP0117	New assessments in clinical practice .....	30
SP0118	WIN and HOT session .....	31
SP0119–SP0120	Advances in biologic therapy of small vessel vasculitis .....	32
SP0121–SP0122	Tapering and flaring in PsA and SpA .....	32
SP0123–SP0124	Prevention of OA: Yes we can! .....	33
SP0125–SP0126	Big data for musculoskeletal research .....	33
SP0127–SP0128	From big data to personalised medicine in paediatric rheumatic diseases .....	33
SP0129–SP0130	Triple T: T cells, technologies and therapies .....	34
SP0131–SP0133	Navigating the world of digital health .....	34
SP0134–SP0135	The rheumatologist-orthopaedic surgeon connexion in secondary fracture prevention .....	35
SP0136	What's new: latest advances in treatment in JIA and osteoarthritis .....	36
SP0137–SP0138	Assessment and prevention of RMDs, what have we learned? .....	36
SP0139–SP0141	High-end imaging: Looking for the invisible .....	36

## Saturday, 16 June 2018

SP0142	WIN and HOT Lancet session .....	37
SP0143–SP0145	The GI tract in systemic sclerosis - is there light at both ends? .....	37
SP0146	RA: Is it all in your head? .....	38
SP0147	Gut bacteria: The boss of the immune system .....	38
SP0148–SP0150	Multi-disciplinary management of complex persistent pain .....	38
SP0151–SP0152	Osteoarthritis: A vascular disease .....	39
SP0153–SP0155	Workshop: Is there a diet for people with RMDs? .....	39
SP0156–SP0157	Challenging projects in education and training .....	41
SP0158–SP0161	Recommendation session ESSCA .....	41
SP0162–SP0163	Fractures: More than bone alone .....	42
SP0164–SP0166	Emerging topics in the management of the antiphospholipid syndrome .....	43
SP0167–SP0168	The links between gout and kidney function .....	44
SP0169	Big data in pre-clinical research .....	44
SP0170–SP0172	How do you sleep? .....	45
SP0173–SP0175	Stratifying connective tissue diseases .....	46
SP0176–SP0177	Work and rehabilitation - key priorities for people with RMDs .....	47

OP0001–OP0002	Cancer and inflammation .....	50
OP0003–OP0004	Psychological distress and pain; not all in the mind .....	50
OP0005–OP0006	Shaping the future in systemic sclerosis .....	51
OP0007–OP0008	Basic mechanisms of inflammation .....	52
OP0009–OP0010	Statistics made simple: a practical approach to complex concepts .....	54
OP0011-PARE–OP0012-PARE	E-health for better care .....	55
OP0013	EULAR Projects in Paediatric Rheumatology and UCAN .....	56
OP0014–OP0021	Opening Plenary abstract session .....	56
OP0022–OP0029	From NSAIDs to bDMARDs in SpA: what is new? .....	61
OP0030–OP0037	RA therapy - new molecules and new strategies .....	65
OP0038–OP0045	Doctor, how bad will my rheumatoid become? RA - prognosis, predictors and outcomes ..	70
OP0046–OP0053	Immunobiology of vasculitis .....	74
OP0054–OP0061	Envisioning new horizons for people with osteoarthritis .....	77

OP0062–OP0069	Fracture risk and consequences .....	83
OP0070-HPR	New drugs - new perspectives: clinical and regulatory issues concerning biosimilars .....	86
OP0071–OP0078	Movement in musculoskeletal pain; from risk to management .....	86
OP0079-PARE–OP0080-PARE	Don't Delay, Connect Today! .....	90
OP0081–OP0088	Let's improve diagnosis and treatment of orphan diseases .....	91
OP0089–OP0095	New driving molecules in systemic sclerosis .....	95
OP0096–OP0103	A rollercoaster from bench to bedside and back again: paediatric rheumatology in the 21 <sup>st</sup> century .....	98
OP0104–OP0105	Burning bones .....	102
OP0106	Delay in treatment and the role of health professionals .....	103

#### Thursday, 14 June 2018

OP0107–OP0108	Fat and fatty acids: targets for therapy? .....	104
OP0109–OP0116	Biologics in RA. Improving and maintaining the response .....	104
OP0117–OP0124	SLE, Sjögren's and APS - new criteria, novel diagnostic tools and co-morbidities .....	109
OP0125–OP0132	The 'A-B-C' of PsA (Assessment, Biologicals, Co-morbidities) .....	113
OP0133–OP0140	RA: such a pain, and beyond .....	117
OP0141–OP0148	Quickly emerging: science in SSc, myositis and related syndromes .....	121
OP0149–OP0156	Can imaging improve diagnosis and outcome in rheumatic diseases .....	126
OP0157-HPR–OP0164-HPR	HPR: Singing power to the people .....	130
OP0165–OP0172	Fires and firefighters: switching the immune system on and off .....	133
OP0173-PARE	Inclusive school environment for young people with RMDs .....	136
OP0174–OP0181	The building blocks of systemic inflammation .....	136
OP0182–OP0189	The crystal maze - etiology and management .....	140
OP0190–OP0197	Treatments: friend or foe? .....	144
OP0198–OP0199	Can we halt progression of structural damage in axial SpA? .....	148
OP0200	Reproductive issues in rheumatology .....	149
OP0201–OP0202	Do we still need biopsies to diagnose Sjögren's and autoimmune myositis? .....	149
OP0203	How monogenetic autoinflammatory diseases help to understand and treat rheumatic diseases .....	150
OP0204–OP0205	Joint EULAR - EFIS session: I've got a B in my bonnet .....	151
OP0206-HPR	Sustainable healthcare in rheumatology and the role of health professionals .....	150
OP0207–OP0208	SSc: From registries to trials - do we have sufficient data and the appropriate design? .....	152
OP0209-PARE–OP0210-PARE	Patient involvement in research: the future of collaborative research. Lessons from the field of rheumatology and beyond .....	153
OP0211–OP0212	Can we improve the care of gout? .....	154
OP0213–OP0214	'Why does BMI matter?' .....	155
OP0215–OP0216	Musculoskeletal pain; feeding the opioid epidemic .....	156
OP0217	What is lupus - syndrome or different entities? .....	157
OP0218	Genetics, epigenetics and disease: is it all in the genes? .....	158
OP0219-HPR	It's your move: promoting physical activity in people with RMD's .....	159
OP0220-PARE–OP0221-PARE	Challenges of patient organisations' in the 21 <sup>st</sup> century .....	159
OP0222-HPR	The EULAR Exercise recommendations for physical activity in people with inflammatory arthritis and osteoarthritis .....	160
OP0223	Immune senescence and ageing .....	160

#### Friday, 15 June 2018

OP0224–OP0225	Special delivery: intercellular communication .....	160
OP0226–OP0233	Biologics in RA. More, more and more about safety .....	161
OP0234–OP0241	Clinical and therapeutic aspects of vasculitis .....	166
OP0242–OP0249	Axial spondyloarthritis: on the interface between healthy and diseased .....	170
OP0250–OP0257	Present and future treatments for SLE, Sjögren's and APS .....	174
OP0258–OP0265	From cartilage to bone .....	178
OP0266–OP0273	Seeking the pathophysiology of rheumatoid arthritis and spondylarthritis .....	182
OP0274-HPR–OP0281-HPR	HPR: Supporting self-management .....	185
OP0282–OP0289	From gene to function .....	189
OP0297–OP0304	More money or more education and collaboration? .....	195
OP0305–OP0312	The changing therapeutic landscape of PsA .....	199
OP0313–OP0320	T/B be or not T/B: adaptive or innate immunity - that is the question .....	203
OP0321	Pathophysiology and biomarkers in PsA: what impact? .....	206
OP0322–OP0323	The art of diagnosis of axial SpA .....	207
OP0324–OP0325	Understanding the language of basic research, epidemiology and health services articles .....	208

OP0326–OP0327	The stromal link to inflammation .....	209
OP0328-HPR–OP0329-HPR	New approaches in measuring what matters to patients .....	210
OP0330-HPR–OP0331-HPR	Innovative treatments for a better quality of life .....	211
OP0332–OP0333	Advances in biologic therapy of small vessel vasculitis .....	212
OP0334–OP0335	Tapering and flaring in PsA and SpA .....	213
OP0336–OP0337	Prevention of OA: Yes we can! .....	214
OP0338–OP0339	Big data for musculoskeletal research .....	214
OP0340	From big data to personalised medicine in paediatric rheumatic diseases .....	214
OP0341–OP0342	Triple T: T cells, technologies and therapies .....	216
OP0343-HPR	Navigating the world of digital health .....	217
OP0344–OP0345	The rheumatologist-orthopaedic surgeon connexion in secondary fracture prevention .....	217
OP0348	High-end imaging: looking for the invisible .....	219

### Saturday, 16 June 2018

OP0349–OP0350	RA: is it all in your head? .....	220
OP0351	Battling hyperinflammation in paediatric rheumatic diseases .....	221
OP0352	Gut bacteria: the boss of the immune system .....	222
OP0353-HPR	Multi-disciplinary management of complex persistent pain .....	222
OP0354	Osteoarthritis: a vascular disease .....	223
OP0355–OP0356	Emerging topics in the management of the antiphospholipid syndrome .....	223
OP0357–OP0358	The links between gout and kidney function .....	224
OP0359–OP0360	Big data in pre-clinical research .....	225
OP0361-HPR	How do you sleep? .....	226
OP0362–OP0363	Stratifying connective tissue diseases .....	226
OP0364-PARE–OP0365-PARE	Work and rehabilitation - key priorities for people with RMDs .....	228
OP0366–OP0367	The challenges of rheumatology trainees in the clinical learning environment .....	228

### Late breaking abstracts

#### Saturday, 16 June 2018

LB0001	From NSAIDs to bDMARDs in SpA: what is new? .....	70
LB0002	Envisioning new horizons for people with osteoarthritis .....	82

### Poster Presentations

#### Thursday, 14 June 2018

##### Guided Poster Tours

THU0001–THU0013	T1: Genetics - from cause to cure .....	230
THU0023–THU0032	T2: Adapting the adaptive immune system in health and disease .....	239
THU0050–THU0059	T3: Seeking the origins of rheumatoid arthritis .....	250
THU0135–THU0144	T4: RA: not just about the joints! .....	288
THU0182–THU0191	T5: Anti-TNF: old drugs now but still full of promises .....	309
THU0227–THU0236	T6: Spondyloarthritis: causes, questions and consequences .....	334
THU0280–THU0289	T7: The impact of treatment on the burden of psoriatic disease .....	358
THU0334–THU0341	T8: Cardiovascular co-morbidities in SLE .....	385
THU0387–THU0396	T9: SSc, myositis, related syndromes - a bouquet of surprises .....	408
THU0469–THU0478	T10: New data on osteoporosis and fracture prevention .....	444
THU0516–THU0525	T11: Pain in the joint; managing a widespread problem .....	463
THU0546–THU0555	T12: A colourful journey through the landscape of paediatric rheumatology .....	475
THU0671–THU0680	T13: Life is not a smooth trip - how pregnancy and life events interfere in rheumatic disease management .....	529

##### Posters

THU0001–THU0022	Genomics, genetic basis of disease and antigen presentation .....	230
THU0023–THU0049	Adaptive immunity (T cells and B cells) in rheumatic diseases .....	239
THU0050–THU0099	Rheumatoid arthritis - etiology, pathogenesis and animal models .....	250
THU0100–THU0134	Rheumatoid arthritis - prognosis, predictors and outcome .....	271
THU0135–THU0181	Rheumatoid arthritis - comorbidity and clinical aspects .....	288
THU0182–THU0226	Rheumatoid arthritis - biological DMARDs .....	309
THU0227–THU0279	Spondyloarthritis - clinical aspects (other than treatment) .....	334
THU0280–THU0333	Psoriatic arthritis .....	358
THU0334–THU0386	SLE, Sjögren's and APS - clinical aspects (other than treatment) .....	385
THU0387–THU0432	Scleroderma, myositis and related syndromes .....	408

THU0433–THU0468	Vasculitis .....	429
THU0469–THU0505	Osteoporosis .....	444
THU0506–THU0521	Fibromyalgia .....	459
THU0522–THU0545	Back pain, mechanical musculoskeletal problems, local soft tissue disorders .....	466
THU0546–THU0605	Paediatric rheumatology .....	475
THU0606–THU0639	Other orphan diseases .....	502
THU0640–THU0670	Public health, health services research and health economics .....	515
THU0671–THU0709	Epidemiology, risk factors for disease or disease progression .....	529

## Friday, 15 June 2018

### Guided Poster Tours

FRI0001–FRI0015	F1: Digging deep: basic and translational science in paediatric rheumatology .....	548
FRI0042–FRI0051	F2: Let's discuss RA outcomes .....	567
FRI0090–FRI0099	F3: The hydra beast in RA: a multifaceted disease .....	590
FRI0148–FRI0157	F4: SpA pathophysiology: of mice and men... ..	618
FRI0169–FRI0177	F5: Spondyloarthritis: it looks as if it is only imaging that matters .....	625
FRI0220–FRI0229	F6: Gout epidemiology and therapy .....	651
FRI0255–FRI0263	F7: The enemy in us .....	667
FRI0302–FRI0311	F8: Back to the future: how to mix the old and new treatments for SLE, Sjögren's and APS .....	688
FRI0396–FRI0406	F8: Shaping pathophysiology: new molecules - new views on pathways in SSc, myositis and related syndromes .....	731
FRI0474–FRI0483	F9: Clinical and therapeutic advances in vasculitis .....	765
FRI0520–FRI0529	F10: Novelties in osteoarthritis: clinical aspects .....	786
FRI0600–FRI0609	F11: You can do better studies if you know how .....	823
FRI0640–FRI0649	F12: Searching for outcome measures .....	842
FRI0691–FRI0700	F13: Education for better patients care .....	864

### Posters

FRI0001–FRI0006	Basic science in paediatric rheumatology .....	548
FRI0007–FRI0051	Rheumatoid arthritis - prognosis, predictors and outcome .....	550
FRI0052–FRI0099	Rheumatoid arthritis - comorbidity and clinical aspects .....	573
FRI0100–FRI0147	Rheumatoid arthritis - biological DMARDs .....	594
FRI0148–FRI0168	Spondyloarthritis - etiology, pathogenesis and animal models .....	618
FRI0169–FRI0219	Spondyloarthritis - clinical aspects (other than treatment) .....	625
FRI0220–FRI0254	Crystal diseases, metabolic bone diseases and bone diseases other than osteoporosis ..	651
FRI0255–FRI0301	SLE, Sjögren's and APS - etiology, pathogenesis and animal models .....	667
FRI0302–FRI0340	SLE, Sjögren's and APS - treatment .....	689
FRI0341–FRI0395	SLE, Sjögren's and APS - clinical aspects (other than treatment) .....	706
FRI0396–FRI0424	Systemic sclerosis, myositis and related syndromes - etiology, pathogenesis and animal models .....	731
FRI0425–FRI0473	Scleroderma, myositis and related syndromes .....	743
FRI0474–FRI0519	Vasculitis .....	765
FRI0520–FRI0553	Osteoarthritis .....	786
FRI0554–FRI0599	Diagnostics and imaging procedures .....	802
FRI0600–FRI0639	Public health, health services research and health economics .....	823
FRI0640–FRI0681	Validation of outcome measures and biomarkers .....	842
FRI0682–FRI0690	Rehabilitation .....	860
FRI0691–FRI0701	Education .....	864

## Saturday, 16 June 2018

### Guided Poster Tours

SAT0001–SAT0014	S1: Born to be wild .....	870
SAT0016–SAT0025	S2: The good, the bad and the ugly: soluble mediators in inflammation .....	876
SAT0048–SAT0057	S3: The joint connection: cartilage, bone and synovial tissue .....	889
SAT0073–SAT0082	S4: Predicting tomorrow today: prognosis, predictors and outcomes of RA .....	899
SAT0165–SAT0174	S5: Breakout news on non-TNF biologics in RA .....	943
SAT0212–SAT0220	S6: Novel insights on non-biologics in RA .....	966
SAT0259–SAT0268	S7: Treatment in SpA: does it matter? .....	992
SAT0302–SAT0311	S8: PsA: a whole range of (subclinical) (co)morbidities! .....	1015
SAT0380–SAT0389	S9: Beware the bug! .....	1053

SAT0414–SAT0423	S10: SLE, Sjögren's and APS - novel predictors of disease activity and long-term outcomes .....	1067
SAT0468–SAT0477	S11: SSc, myositis, related syndromes - novel ideas take place .....	1092
SAT0587–SAT0596	S12: Be familiar with orphan diseases .....	1147
SAT0630–SAT0639	S13: Imaging strategies in the management of arthritis .....	1166
SAT0677–SAT0686	S14: This poster tour might be risky! .....	1186

### Posters

SAT0001–SAT0015	Innate immunity in rheumatic diseases .....	870
SAT0016–SAT0047	Cytokines and inflammatory mediators .....	876
SAT0048–SAT0072	Cartilage, synovium and bone .....	889
SAT0073–SAT0116	Rheumatoid arthritis - prognosis, predictors and outcome .....	899
SAT0117–SAT0164	Rheumatoid arthritis - comorbidity and clinical aspects .....	921
SAT0165–SAT0211	Rheumatoid arthritis - biological DMARDs .....	943
SAT0212–SAT0258	Rheumatoid arthritis - non biologic treatment and small molecules .....	966
SAT0259–SAT0301	Spondyloarthritis - treatment .....	992
SAT0302–SAT0354	Psoriatic arthritis .....	1015
SAT0355–SAT0379	Crystal diseases, metabolic bone diseases and bone diseases other than osteoporosis ..	1043
SAT0380–SAT0413	Infection-related rheumatic diseases .....	1053
SAT0414–SAT0467	SLE, Sjögren's and APS - clinical aspects (other than treatment) .....	1067
SAT0468–SAT0515	Scleroderma, myositis and related syndromes .....	1092
SAT0516–SAT0551	Vasculitis .....	1113
SAT0552–SAT0586	Osteoarthritis .....	1130
SAT0587–SAT0629	Other orphan diseases .....	1147
SAT0630–SAT0676	Diagnostics and imaging procedures .....	1166
SAT0677–SAT0715	Epidemiology, risk factors for disease or disease progression .....	1186

### Abstracts Accepted for Publication

AB0001–AB0022	Genomics, genetic basis of disease and antigen presentation .....	1206
AB0023–AB0037	Adaptive immunity (T cells and B cells) in rheumatic diseases .....	1214
AB0038–AB0046	Innate immunity in rheumatic diseases .....	1219
AB0047–AB0085	Cytokines and inflammatory mediators .....	1223
AB0086–AB0107	Cartilage, synovium and bone .....	1240
AB0108–AB0140	Rheumatoid arthritis - etiology, pathogenesis and animal models .....	1249
AB0141–AB0147	Spondyloarthritis - etiology, pathogenesis and animal models .....	1262
AB0148–AB0181	SLE, Sjögren's and APS - etiology, pathogenesis and animal models .....	1265
AB0182–AB0198	Systemic sclerosis, myositis and related syndromes - etiology, pathogenesis and animal models .....	1278
AB0199–AB0326	Rheumatoid arthritis - prognosis, predictors and outcome .....	1285
AB0327–AB0414	Rheumatoid arthritis - comorbidity and clinical aspects .....	1339
AB0415–AB0477	Rheumatoid arthritis - biological DMARDs .....	1371
AB0478–AB0502	Rheumatoid arthritis - non biologic treatment and small molecules .....	1400
AB0503–AB0536	SLE, Sjögren's and APS - treatment .....	1411
AB0538–AB0644	SLE, Sjögren's and APS - clinical aspects (other than treatment) .....	1425
AB0645–AB0715	Vasculitis .....	1468
AB0716–AB0826	Scleroderma, myositis and related syndromes .....	1498
AB0827–AB0847	Spondyloarthritis - treatment .....	1542
AB0848–AB0899	Spondyloarthritis - clinical aspects (other than treatment) .....	1552
AB0900–AB0957	Psoriatic arthritis .....	1574
AB0958–AB0983	Osteoarthritis .....	1604
AB0984–AB1017	Osteoporosis .....	1614
AB1018–AB1046	Crystal diseases, metabolic bone diseases and bone diseases other than osteoporosis ..	1627
AB1047–AB1062	Infection-related rheumatic diseases .....	1638
AB1063–AB1069	Fibromyalgia .....	1643
AB1070–AB1077	Back pain, mechanical musculoskeletal problems, local soft tissue disorders .....	1646
AB1078–AB1126	Paediatric rheumatology .....	1649
AB1127–AB1166	Other orphan diseases .....	1669
AB1167–AB1229	Diagnostics and imaging procedures .....	1686
AB1230–AB1279	Public health, health services research and health economics .....	1712
AB1280–AB1357	Epidemiology, risk factors for disease or disease progression .....	1733
AB1358–AB1380	Validation of outcome measures and biomarkers .....	1766
AB1381–AB1396	Education .....	1775

## Health Professionals in Rheumatology Abstracts

### Oral presentations

#### Wednesday, 13 June 2018

OP0012-HPR	E-health for better care .....	55
OP0070-HPR	New drugs - new perspectives: clinical and regulatory issues concerning biosimilars .....	86

#### Thursday, 14 June 2018

OP0157-HPR–OP0164-HPR	HPR: Singing power to the people .....	130
OP0206-HPR	Sustainable healthcare in rheumatology and the role of health professionals .....	152
OP0219-HPR	It's your move: promoting physical activity in people with RMD's .....	159
OP0222-HPR	The EULAR Exercise recommendations for physical activity in people with inflammatory arthritis and osteoarthritis .....	160

#### Friday, 15 June 2018

OP0274-HPR–OP0281-HPR	HPR: Supporting self-management .....	185
OP0328-HPR–OP0329-HPR	New approaches in measuring what matters to patients .....	210
OP0343-HPR	Navigating the world of digital health .....	217

#### Saturday, 16 June 2018

OP0353-HPR	Multi-disciplinary management of complex persistent pain .....	222
OP0361-HPR	How do you sleep? .....	226

### Poster Presentations

#### Thursday, 14 June 2018

##### *Guided Poster Tours*

THU0710-HPR–THU0719-HPR	T14: Winds of change .....	1784
-------------------------	----------------------------	------

##### *Posters*

THU0710-HPR	HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative) .....	1784
THU0711-HPR	HPR Measuring health (development and measurement properties of PROs, tests, devices) .....	1784
THU0712-HPR	HPR Epidemiology and public health (including prevention) .....	1784
THU0713-HPR	HPR Interventions (educational, physical, social and psychological) .....	1785
THU0714-HPR	HPR Professional education, training and competencies .....	1785
THU0715-HPR–THU0716-HPR	HPR Interventions (educational, physical, social and psychological) .....	1785
THU0717-HPR–THU0719-HPR	HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative) .....	1786
THU0720-HPR–THU0748-HPR	HPR Interventions (educational, physical, social and psychological) .....	1788

#### Friday, 15 June 2018

##### *Guided Poster Tours*

FRI0737-HPR–FRI0746-HPR	F14: Bread and butter for clinicians .....	1815
-------------------------	--	------

##### *Posters*

FRI0702-HPR–FRI0725-HPR	HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative) .....	1800
FRI0726-HPR–FRI0730-HPR	HPR Service developments, innovation and economics in healthcare .....	1810
FRI0731-HPR–FRI0736-HPR	HPR Professional education, training and competencies .....	1812
FRI0737-HPR	HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative) .....	1815
FRI0738-HPR	HPR Epidemiology and public health (including prevention) .....	1815
FRI0739-HPR	HPR Interventions (educational, physical, social and psychological) .....	1816
FRI0740-HPR–FRI0741-HPR	HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative) .....	1816
FRI0742-HPR–FRI0743-HPR	HPR Service developments, innovation and economics in healthcare .....	1817
FRI0744-HPR–FRI0745-HPR	HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative) .....	1818

**Saturday, 16 June 2018**

**Posters**

SAT0716-HPR–SAT0736-HPR	HPR Measuring health (development and measurement properties of PROs, tests, devices) .....	1820
SAT0737-HPR–SAT0747-HPR	HPR Epidemiology and public health (including prevention) .....	1829

**Abstracts Accepted for Publication**

AB1397-HPR–AB1411-HPR	HPR Measuring health (development and measurement properties of PROs, tests, devices) .....	1834
AB1412-HPR–AB1424-HPR	HPR Epidemiology and public health (including prevention) .....	1841
AB1425-HPR–AB1440-HPR	HPR Interventions (educational, physical, social and psychological) .....	1846
AB1441-HPR–AB1472-HPR	HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative) .....	1853
AB1473-HPR–AB1477-HPR	HPR Service developments, innovation and economics in healthcare .....	1867
AB1478-HPR–AB1479-HPR	HPR Professional education, training and competencies .....	1869

**People with Arthritis and Rheumatism in Europe Abstracts**

**Oral presentations**

**Wednesday, 13 June 2018**

OP0011-PARE	E-health for better care .....	55
OP0079-PARE–OP0080-PARE	Don't delay, connect Today! .....	90

**Thursday, 14 June 2018**

OP0173-PARE	Inclusive school environment for young people with RMDs .....	136

## WIN and HOT session

### SP0001 SYSTEMIC LUPUS: ISSUES ABOUT PREGNANCY

A. Tincani. *Rheumatology and Clinical Immunology Unit, University of Brescia, Brescia, Italy*

Angela Tincani and Francesca Crisafulli

The outcome of Systemic Lupus Erythematosus (SLE) pregnancies has dramatically improved over years thanks to pregnancy planning, multidisciplinary management and close monitoring. According to EULAR recommendations,<sup>1</sup> pre-pregnancy counselling with the identification (and management) of possible disease related risk factors (such as active or past lupus nephritis and presence of antiphospholipid antibodies or antiphospholipid syndrome, APS), assessment of disease activity during pregnancy (including renal function parameters, anti-dsDNA and serum C3/C4) together with obstetrical monitoring are necessary to achieve a good pregnancy outcome. A recent evaluation of our SLE pregnancy cohort recruited from 1987 to 2017 showed a number of losses not significantly different to that observed in the general obstetric population; it is of interest that all the patients enrolled received pre-pregnancy counselling and were prospectively followed during gestation by a multidisciplinary team. According to this finding, a recent paper with data derived from Norwegian Registries<sup>2</sup> underlines that adverse pregnancy outcomes (APO) occur more frequently in SLE patients only in the presence of active disease.

However, the data are not univocal. A recent meta-analysis<sup>3</sup> still underlines the higher frequency of APO such as preeclampsia (PE), spontaneous abortion, pre-term birth and small for gestational age (SGA) newborns in SLE patients. So much effort is still devoted to identify new predictors of APO and possible protective strategies.

The uterine artery Doppler applied to SLE pregnancies shows an increased mean pulsatility index while the same patients display a higher ratio of two angiogenic biomarkers (sFlit-1/PIGF) related to placental dysfunction.<sup>4</sup>

Furthermore, an increase of Bb and sC5b-9 levels during early phases of pregnancy was observed in SLE patients who later developed APO.<sup>5</sup> A more recent work shows higher levels of Pentraxin3 (PTX3) in the general obstetric population with early-onset PE.<sup>6</sup> Studying placental histology, a higher number of neutrophils and neutrophilic extracellular traps (NETs) were detected in both SLE and non-SLE pregnancies with PE as compared with controls.<sup>7</sup> Taken together these observations suggest that also innate immunity could play a role in the occurrence of APO observed in this condition.

Many studies have assessed the beneficial role of hydroxychloroquine (HCQ) in SLE pregnancies. The use of HCQ is associated with a lower frequency of preterm birth and intrauterine growth restriction, less disease flares and reduction of the risk of fetal loss and SGA in patients with lupus nephritis. On the other hand, the use of prednisolone was associated with lower birth weight and higher rate of preterm birth.<sup>2</sup> In our cohort, the exposure to corticosteroids in doses greater than 35 mg/week in the 1st trimester was associated with preterm birth (<37 th weeks), while in the 3rd trimester with severe preterm birth (<34 th weeks). A recent study had assessed the improvement of pregnancy outcome in women with refractory obstetric APS treated with pravastatin<sup>8</sup>; given the strong association between SLE and APS, this could be an interesting topic to develop in the future.

The interest in long-term outcome of children born to mother with SLE raises from few observational studies suggesting an increased risk of neurodevelopmental disorders, congenital heart defects and autoimmune diseases. However, the risk of these adverse outcomes is small, and the large majority of children are in good health. Recently, the neurodevelopmental status of 40 children (median age 7.4 years) born to women carrying antiphospholipid antibodies (with or without SLE) was investigated by child neurologists and psychiatrists. All the children resulted normally intelligent but a slight increase in the frequency of epilepsy, sleep disorders and learning disability was observed.<sup>9</sup> In this respect, a recent study performed in animals pointed out the role of HCQ as protector of fetal brain development, offering a possible future preventive strategy.<sup>10</sup>

In conclusion, most of the young women affected by SLE can now carry out one or more pregnancies thanks to the improvement in prevention, early recognition and treatment of pregnancies complications. Nevertheless, further studies are necessary to reduce the risk of pregnancy morbidity still reported in some patients.

## Little arthritis in PsA and axSpA with newly onset arthritis – does it matter?

### SP0002 PSA BEYOND THE TYPICAL POLY-ARTICULAR PHENOTYPE: HOW TO DEAL WITH THIS IN CLINICAL PRACTICE?

E. Nikiphorou. *Academic Rheumatology, Kings College London, London, UK*

This lecture will focus on the case of a psoriatic arthritis (PsA) patient presenting primarily with entheselial disease rather than the usual poly-articular phenotype. The case discusses issues around misinterpretation of signs and symptoms leading to inappropriate diagnoses and failure to early disease recognition and therefore treatment. Consequences of delayed treatment and less typical presentations of PsA will be discussed in greater detail during the session, highlighting important diagnostic and management aspects of disease, relevant to routine clinical practice.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.7654

### SP0003 AXSPA PATIENT WITH PERIPHERAL MANIFESTATIONS

A. Sepriano. *Rheumatology, Leiden University Medical Centre, Leiden, Netherlands*

A case of a 32 year old Caucasian, female patient referred to an outpatient rheumatology clinic with a 3 month history of low back pain and a 2 week duration severe left heel pain is presented. Disease presentation, including findings on physical examination, laboratory tests and imaging are discussed, as well as their potential impact on treatment decisions.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.7653

### SP0004 EXTRA SPINAL MANIFESTATIONS IN AXIAL SPONDYLOARTHRITIS

M. Dougados. *Hopital Cochin, Paris, France*

The extra-spinal manifestations in axial spondyloarthritis can be categorised in 2 main sub-groups: the extra-spinal rheumatological manifestations on one hand and the extra rheumatological manifestations in the other hand.

The extra spinal manifestations comprise synovitis, dactylitis and enthesitis and extra rheumatological manifestations comprise mainly skin psoriasis, uveitis and inflammatory bowel disease.

In terms of diagnostic approach in case of a patient presenting with axial symptoms, the probability to detect any extra-spinal manifestations in the past-history of the patients and/or concomitantly to the axial symptoms is very high (>75% at the baseline visit of the DESIR cohort including patients with recent onset axial symptoms suggestive of spondyloarthritis). These manifestations (based on data from different databases: for example the DESIR cohort and the ASAS-COMO-SPA cross-sectional study) will be described

The long term follow-up of patients presenting with axial spondyloarthritis emphasises the possibility to observe these extra-spinal manifestations overtime (incident cases).

These data are strong arguments to

1. Justify the inclusion of these extra-spinal manifestations in the set of classification criteria of axial spondyloarthritis
2. Justify specific investigations (mainly interview and physical exam ) of the patients at the time of the diagnosis
3. Justify a systematic monitoring of these different extra-spinal manifestations during the entire course of the disease

## Cancer and inflammation

**SP0005** **INFLAMMATION AND CANCER: FRIEND OR FOE**

*C.S. Roxburgh. Academic Unit of Surgery, University of Glasgow, Glasgow, UK*

Cancer associated inflammation and the host immune response are key determinants of progression and outcome in solid malignancies. There is now persuasive evidence that inflammation is key to tumourigenesis via dna damage, stimulation of angiogenesis and proliferation, and inhibition of apoptosis. there have long been suspicions that dysregulated immune and inflammatory responses promote the progression and dissemination of established cancers and there is a heightened risk of cancer development in individuals with chronic inflammatory diseases. the tumour microenvironment is now viewed as a battleground for pro-tumour and anti-tumour responses. We now see an increase array of novel therapeutic targets targeting innate and adaptive components of the immune response to cancer. ONCO-Immunology with immunotherapy are an established part of clinical practice differing from conventional anti-cancer treatments in that the strategies do not principally target cancer cells. This talk will focus on the evidence that inflammation influences malignant progression in gi malignancy discussing novel therapeutic strategies.

## Psychological distress and pain; not all in the mind.

**SP0006** **DISTRESS AND PAIN: INTEGRATED BRAIN PATHWAYS**

*B. Sundermann. Institute of Clinical Radiology, University Hospital Muenster, Muenster, Germany*

The focus of functional and multimodal neuroimaging studies has been switching from individual brain areas to larger interacting networks in the human brain. Regions within a network as well as different networks interact with each other and are usually involved in multiple brain functions such as perception, attention or cognitive control. In this presentation we will review the current knowledge on brain networks which are involved in the processing of painful stimuli or altered in patients suffering from chronic pain and how these share network correlates implicated in distress.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.7764

**SP0007** **DEALING WITH PSYCHOLOGICAL DISTRESS TO OPTIMISE OUTCOMES FOR ARTHRITIS PAIN**

*R.J. Smeets. Rehabilitation Medicine, Maastricht University, Maastricht, Netherlands*

As clinicians we are often confronted with patients who suffer from arthritis pain. As most of us working in the field of arthritis, we are specifically trained to assess and treat medical causes in order to relieve pain. However, in daily practice we experience that many patients will develop chronic pain with huge problems in staying active and experiencing moderate to high levels of disability and lower level of quality of life.

In my opinion all clinicians should be able to identify psychosocial factors that contribute to the persistence of arthritis pain associated disability and loss of quality of

life. Besides these patient relevant psychosocial factors, I will specifically focus on the important role clinician's beliefs/attitudes regarding pain in better treating and coaching patients with chronic arthritis pain.

Participants will learn how to look for these potentially contributing factors, how to diagnose the level of functioning of these patients and how to inform patients about their pain and role of important contributing psychosocial factors. I will discuss the way how you might better prescribe pain medication and other pain relieving treatments and finally how you can help them to stay active despite being in pain, reduce the risk of iatrogenic damage, and what type of treatments exist to address contributing psychosocial factors.

Finally, I will specifically elaborate on the Fear Avoidance Model as one of the currently most often used theoretical models to assess patients and on which basis a very successful treatment called graded exposure *in vivo* has been developed.

## Inflammation in the shadow of fibromyalgia

**SP0008** **A RA WITH PERSISTANT HIGH DISEASE ACTIVITY UNDER BIOLOGICAL TREATMENT: HOW DOES CHANGING DIAGNOSIS CHANGE MANAGEMENT AND OUTCOME?**

*A.P. Trouvin. Pain Evaluation and Treatment Department, Hopital Cochin, Paris, France*

We shall discuss the clinical case of a 45 years old woman. She has been diagnosed with rheumatoid arthritis, rheumatoid factor and ACPA are positive, acute phase reactants were elevated and no erosion was detected on the initial X-Rays. After a first line treatment with a conventional DMARD during 18 months, she experienced new flares with multiple synovitis and with elevated acute phase reactants. A TNF-inhibitor treatment was initiated. After 3 months, low disease activity was not reached hence biologic treatment was switched to abatacept. After 3 months, the patient still complained of pain in her hands and feet but acute phase reactants normalised, DAS-28 score is 5,20 (TJC: 18 , SJC: 0, ESR 14 mm/h, VAS general health patient: 70/100). Question rose to change biological therapy once again. The case presentation will discuss how a possible fibromyalgia can, in this case, be confounding in the patient's clinical evaluation and therefore change the management of the patient.

**SP0009** **FIBROMYALGIA ONSET OF SYSTEMIC LUPUS ERYTHEMATOSUS?**

*N. Hassan. Rheumatology, University Hospital of Wales, Cardiff, UK*

Systemic lupus erythematosus (SLE) and fibromyalgia often pose a diagnostic challenge to clinicians. The two conditions can coexist and the presence of one can complicate the diagnosis and management of the other. There is an increased prevalence of fibromyalgia amongst SLE patients compared to the general population but the exact nature of this association is not yet fully understood. We describe a patient diagnosed with fibromyalgia who later went on to develop SLE.

**Shaping the future in systemic sclerosis**

SP0010 FIBROBLAST-MATRIX-VESSEL: THE UNHAPPY TRIAD

C.P. Denton. Centre for Rheumatology, Royal Free Hospital and UCL Medical School, London, UK

Systemic sclerosis (SSc) is a complex multisystem disease that links autoimmunity, inflammation, vascular damage to development of fibrosis or scarring in target organs. The pathogenesis of the disease involves reciprocal interaction between the immunological, vascular and mesenchymal compartments and involves processes that are central to connective tissue growth and repair. However in the context of SSc this process is dysfunctional in that the amount of tissue damage is excessive or the repair process is dysregulated. Thus it seems likely that perturbation of the cross talk between cells and pathways that regulate the cell types involved are important in pathogenesis and represent appropriate targets for therapeutic intervention. It is likely that some emerging therapies can attenuate the pathogenesis of SSc by acting on multiple cell type and this is perhaps especially relevant to an approach such as autologous haematopoietic stem cell transplant. However it is likely that individual pathways or mediators can be modified in a less extreme manner and have benefit as potential disease modifying therapy. A number of key mediators and pathways are emerging including IL6, TGFbeta and intracellular pathways linked to nuclear hormone receptors. These are being targeted experimentally. Another strategy for treatment would be targeting the initiating cells such as monocytes, especially those with a profibrotic phenotype, or the effector cells in fibrosis such as myofibroblasts. Evidence supporting these strategies is emerging and it is likely that restoration of a more balanced interaction between vessels, extracellular matrix and fibroblasts would underpin effective therapies for the fibrotic and vascular components of SSc.

SP0012 NOVEL THERAPIES THAT MAY MAKE IT INTO THE CLINIC IN SYSTEMIC SCLEROSIS

1,2,3D. Furst. <sup>1</sup>University of California Los Angeles, Los Angeles; <sup>2</sup>University of Washington, Seattle, USA; <sup>3</sup>University of Florence, Florence, Italy

**Introduction:** Many therapies have been tested in systemic sclerosis (SSc), often failing but new approaches to measuring effect may improve the probability of success. The Combined Response Index for Systemic Sclerosis (CRI SS) combines measurement of the skin, lungs, activities of daily living and global assessments of disease activity into a single number. Like the DAS 28, this measure may be more powerful than any single outcome measure such as modified Rodnan skin score (mRSS) or forced vital capacity (FVC).

Novel approaches:

Multiple therapies are being tested which modify the immune system and the vascular pathogenetic node underlying the pathogenesis of SSc. Among these are tocilizumab (an IL-6 inhibitor), abatacept (affecting CD8 receptors) and rituximab (a CD20 inhibitor), all of whom are being tested in late phase studies and for whom results can be expected soon.

A more novel approach involves inhibition of tyrosine kinases which, in turn, affect TGF-beta, PDGF, FGF beta and VEGF. Among these are nintedanib and a

nanoparticle preparation delivering imatinib selectively. Encouraging animal studies and early human studies are resulting in larger studies in SSC patients.

Other drugs affecting fibrosis and inflammation are also being tested, including a cannabinoid which has shown encouraging early results.

While hematopoietic stem cell therapy will soon become a standard of care, other cellular therapies such as adipose derived mesenchymal cells and mesenchymal products such as exosomes and microparticles are being tested in systemic sclerosis.

There may or may not be enough time to discuss even more novel approaches to treating systemic sclerosis, with good rationale and some early results, which may reach the clinic.

Overall, this is an encouraging time for novel therapies to treat systemic sclerosis.

**Basic mechanisms of inflammation**

SP0013 S100-ALARMIN: POTENTIAL THERAPEUTIC TARGETS FOR ARTHRITIS

J. Roth. Inst. of Immunology, University of Münster, Münster, Germany

Innate immunity is a pivotal factor in the pathogenesis of rheumatic diseases. During the last years there is growing evidence that pro-inflammatory alarmins of the family of calcium-binding S100-proteins promote inflammation in rheumatic, auto-inflammatory and auto-immune diseases. Serum concentrations of S100A8/S100A9 correlate with disease activity in several rheumatic diseases and are useful surrogate markers for monitoring disease activity predicting response to treatment, systemic organ involvement, or relapses in several autoimmune diseases. We have now identified a novel mechanism of auto-inhibition in mice and man restricting S100-alarmin activity to local sites of inflammation. We identified specific peptide sequences within the second calcium-binding EF-hands of S100A8 and S100A9 binding to TLR4/MD2 and triggering inflammation. However, biological activity of S100A8/S100A9 is locally restricted by calcium-induced (S100A8/S100A9)<sub>2</sub>-tetramer formation hiding the TLR4/MD2-binding site within the tetramer interphase. This auto-inhibitory mechanism is essential to prevent fatal inflammation in mice *in vivo*. Since S100A8/S100A9 complexes are the most abundant alarmins in arthritis, blocking of active S100A8/S100A9-dimers may represent an innovative approach for local inhibition of inflammatory processes in rheumatic diseases.

**Health professionals welcome session**

SP0014 HEALTH PROFESSIONALS IN RHEUMATOLOGY WELCOME

R.H. Moe<sup>1,2</sup>. <sup>1</sup>Rheumatology, NKRR, Diakonhjemmet Hospital, Oslo, Norway; <sup>2</sup>Rheumatology, NBRR, Diakonhjemmet Hospital, Oslo, Norway, Oslo, Norway

An increasing amount of people are diagnosed with Rheumatic and Musculoskeletal Diseases (RMDs). EULAR Health Professionals in Rheumatology (HPR) can through substantial knowledge and clinical expertise contribute significantly to better lives with RMDs. Examples of important HPR core competencies are education, evidence-based treatment, prevention, team-based rehabilitation, and the support of individuals to participate in work, or education. The presentation will address some of the important multidisciplinary contributions to reduce the individual and societal burden of RMDs in the future.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.7814

SP0015 WHAT'S NEW? PRESENTATION OF THE HPR NEWSLETTER

K. Betteridge. N/A, London, UK

The presentation will aim to showcase HPR News – the newsletter for EULAR's Health Professionals in Rheumatology. HPR News is available twice a year and is published to support EULAR's commitment to enable networking and learning

amongst HPRs across Europe. It also shares information about the work of the HPR Standing Committee, Study Groups as well as showcasing projects being carried out by HPR country member associations. The new design for the newsletter will be highlighted, alongside the content structure and HPRs will be encouraged to contribute to ensure the newsletter stays relevant to its audience.

## Statistics made simple: a practical approach to complex concepts

SP0016 **STEPWISE OR NOT TO STEPWISE? THE DO'S AND DONT'S OF MULTIVARIABLE MODELLING**

S. Lydersen, Norwegian University of Science and Technology, Trondheim, Norway

**Introduction:** Different types of regression analyses, including linear, logistic, and Cox regression, are commonly used methods in medical research. Usually, these analyses include more than one covariate as independent variables. This is particularly the case in observational studies: When investigating the possible association between an exposure and an outcome, there can be a large number of potential confounders. Examples are age, sex, body mass index, and lifestyle factors. How should we choose which variables to include in the model? Here I shall focus on two issues:

- Attempting to include too many covariates in the analyses
- Use of stepwise selection of covariates

These are among the most frequently encountered issues in statistical review of manuscripts submitted for the Annals of the Rheumatic Diseases Lydersen 2015 Limit the number of covariates

With a limited number of observations, how many covariates can you include? Traditional rules of thumb state that the ratio of observations per variable ought to be in the size of order 10. Some authors recommend 15, some 20, others state that 5 is sufficient. See Lydersen, 2015 and references therein.

Do not use stepwise selection

Stepwise selection of covariates basically means that only covariates that are statistically significant, typically with a p-value less than 0.05 or 0.10, are included in the model. A fundamental problem is the following: As always is the case in estimation, regression coefficients are estimated with some uncertainty. Hence, some are underestimated, and some are overestimated, that is, too far away from the null hypothesis. Including only covariates with small p-values causes overestimated coefficients to be more likely to be selected. This introduces bias away from the null hypothesis. Stepwise procedures used to be very popular, but today an increasing number of analyst criticise such methods. For example, Rothman et al. 2008 page 419 state: "There are several systematic, mechanical, and traditional algorithms for finding models (such as stepwise and best-subset regression) that lack logical and statistical justification and that perform poorly in theory, simulations and case studies ... One serious problem is that the P-values and standard errors ... will be downwardly biased, usually to a large degree".

**Recommendation:** Selection of covariates should be based on the research question at hand and on substantial knowledge such as what is biologically plausible. Chapter 10 'Predictor selection' in the book Vittinghoff et al. 2012 gives good guidance. Check that the number of covariates is small enough compared to the number of observations. Do not use stepwise selection.

## E-health for better care

SP0017 **BITS AND BYTES: FITTING MEDICAL INFORMATION – PICASO THE PLATFORM FOR IMPROVED PERSONAL, COORDINATED CARE**

J. Richter, on behalf of PICASO Consortium. *Polidinic and Hiller Research Unit for Rheumatology, Heinrich-Heine-University Duesseldorf, Duesseldorf, Germany*

Coordination of care plans between healthcare sectors and efficient management of patients with co-morbidities is of large demand. Rheumatoid arthritis (RA) patients are at increased risk of cardiovascular diseases. Different stakeholders are potentially involved in the EULAR recommended management processes. Optimised orchestration of accumulated information is of major importance to ensure data quality, meaningful management processes and cost effectiveness. A newly developed information and communications technology platform within the Horizon2020-funded PICASO-project ([www.picaso-project.eu](http://www.picaso-project.eu)) will support a continuum of care from hospitals and outpatient clinics to the home. The PICASO platform will be developed and trialled with patients and clinicians. First experiences will be reported. The platform will become available for RA-patients in routine care but also for wider applicability in Rheumatology and other chronic diseases.

SP0018 **SMART WEARABLES AND HEALTH APPS – THE RIGHT TOOL FOR HEALTH MONITORING AND IMPROVING QUALITY OF HEALTH?**

M. Silva, on behalf of E-health for better care. *ReumNet, Brussels, Belgium*

What role can technology play in enabling a shift from a traditional paternalistic model of care to a model based on empowered patient sharing ownership? In the traditional model, patients are fully reliant on the healthcare professional for information, diagnosis and treatment, with complexity to navigate through the ecosystem and where physicians are empowered rather than patients. Patient empowerment is enhanced thanks to technology enabled care, in which patients have access to their medical files, can use tools that allow them to be proactive and focus on prevention and where self-management is supported across the treatment pathway. Smart wearables and health apps are becoming more widespread and a commodity, while more and more research is being performed on the effectiveness of such devices on the quality of life of patients. The design of wearables and health apps itself can be approached in a patient-centric way, to maximise the benefits for patients and the uptake by patients. This presentation will discuss some evidences of the impact of technology on improvement of quality of life and how patients should be included in the design process.

## EULAR projects in paediatric rheumatology and UCAN

SP0019 **UCAN AND PRINTO ALIGNED TO LINK BED AND BEDSIDE: PERSPECTIVE FROM THE BENCHSIDE**

S.J. Vastert, *Pediatric Rheumatology and Laboratory for Translational Immunology, University Medical Center Utrecht, Utrecht, Netherlands*

In the past 2 decades we have gained important insights on the mechanisms of disease and therapy in children with Juvenile Idiopathic Arthritis (JIA). These insights have resulted in several game-changing therapeutic modalities in several

subtypes of JIA. In for example systemic JIA, we have learned that the systemic inflammatory mechanisms at onset of this disease, are primarily driven by innate immune cells and their inflammatory cascades. Both IL-1 and IL-6 blockade in sJIA have resulted in high response rates of sJIA patients.

Additional progress still has to be made in efficacy, cost reduction, minimization of side effects and taper and stop strategies of maintenance drugs. To ensure that the right goals are set, patients (and/or their parents in paediatric disease) should be involved in important research questions and goals. In addition, if we really aim to take the next step in improving the outcome and life of our patients, clinical innovations need to go hand in hand with basic discoveries to really affect care for patients.

Current clinical trials rely on the recognition of clinical phenotypes and have strict inclusion criteria. In these trials with more or less homogenous patient cohorts, response rates to a specific treatment are evaluated and compared to placebo or current standard therapeutics. This has resulted in the registration of multiple biologic therapies for various JIA subtypes and to significantly improved response rates and disease outcomes for most JIA patients. However, still a major question in clinical practice remains: which biological to start in which patient and when.

Agreement on several consensus treatment plans in clinical practice for different subtypes of JIA, will help in comparing responses to registered therapeutics. However, to book further progress in the care for JIA patients, what we really need is a more molecular based set of classification criteria, or disease taxonomy, of JIA subtypes and (sets of) biomarkers for disease course/therapy response and biomarkers to assess subclinical disease activity. These criteria and biomarkers will enable informed decisions on the start as well as tapering/stop of maintenance therapy. Such a classification, as well as the discovery and validation of novel/promising biomarkers are likely to be developed in collaborative cohort studies with new onset JIA patients that are prospectively followed and sampled over time.

Facilitating the translation from bench to bedside is crucial for addressing the major current challenges in JIA management. When successful, it will set new standards for safe, targeted and personalised medicine in JIA.

#### SP0020 HOW DIGITAL TOOLS CAN HELP TO CROSS BORDERS IN INTERNATIONAL COLLABORATIONS

*V. Seyfert-Margolis. My Own Med, Inc, Chevy Chase, USA*

When people think of digital health, they generally think of health and wellness mobile apps, or wearable sensor devices like Fit Bit or the Apple Watch. But digital technologies are much more than that. Today's advanced digital health has evolved into software platforms that can connect and support patients, their families and connect them to their health systems, enabling outcomes research and management with direct input from networks of patients that can connect across geographical divides. And these systems enable communication between medical systems, enabling hubs and spokes of networked researchers and their patients that promote data capture, information sharing and enhanced communications to patients- by meeting them where they are. These new models are driving the ability to study interventions in real world contexts including patients' between visit activities and their engagement with multiple layers of the healthcare teams thereby promoting integrated research and care. With all of these capabilities, the question remains, "will the medical research community be ready to embrace it?"

### Ultrasound basic I

#### SP0021 HOW TO ASSESS DACTYLITIS+DEMO

*E. Naredo. Rheumatology and Joint and Bone Research Unit, Hospital Universitario Fundacion Jimenez Diaz, Madrid, Spain*

Dactylitis is a hallmark feature of psoriatic arthritis (PsA) and other spondyloarthritides, although it can also be present in other conditions such as sarcoidosis, gout or infections. Regarding PsA, dactylitis, which occurs in 30% to 50% of patients, is a highly discriminative feature for PsA diagnosis in early disease as well as a predictor factor for structural damage development. On ultrasound, dactylitis is a complex and heterogeneous "imaging syndrome" that includes a variety of elementary lesions, i.e. enthesitis (finger extensor tendon, collateral ligaments, flexor fibrous

sheaths, flexor pulleys, functional entheses), tenosynovitis, paratenonitis, synovitis, subcutaneous/peritendon tissue inflammation, and proliferative and erosive bone changes. High resolution B-mode ultrasound offers a detailed anatomical imaging of the different lesions present in dactylitis as well as Doppler ultrasound provides information on the inflammatory activity of the involved structures and tissues.

#### SP0022 HOW TO ASSESS BONE EROSIONS – INDICATIONS, PITFALLS AND NEW TECHNIQUES + DEMO

*M. Szkudlarek. Dept. of Rheumatology, Koege Sygehus, Koege, Denmark*

Detection of bone erosions is essential for the early diagnosis, the prediction of future bone damage, and the monitoring of therapeutic outcomes in patients with rheumatoid arthritis (RA).

Yet, bone erosions are not pathognomonic for RA. They occur in many other disease entities. Presence of bone erosions is characteristic for mixed connective tissue disease, juvenile idiopathic arthritis, gout, hemochromatosis, pigmented villonodular synovitis, among others. It is not uncommon in osteoarthritis. Bone erosions can be detected at entheses in spondyloarthropathy and in the joints of patients with psoriatic arthritis. Erosive changes can also be seen in bone neoplastic disease.

Conventional radiography is still considered the basic imaging method of detection of bone erosions, as well as a monitoring tool. However, more modern imaging techniques are becoming more widely used. They include ultrasonography, magnetic resonance imaging and computed tomography. Apart from higher sensitivity for detection of bone erosions, the new techniques offer simultaneous visualisation of soft tissues. Their role in follow-up of patients with erosive disease as well as erosive progression is still a subject of research.

In the short time allowed, the presentation will also address localization, pitfalls and characteristic appearance of bone erosions in main rheumatological diseases.

#### SP0023 HOW TO ASSESS MECHANICAL AND INFLAMMATORY TENDINITIS + DEMO

*U. Fredberg. Diagnostic Centre, Universitu Research Clinic of Innovative Patients Pathways, Silkeborg Regional Hospital, Silkeborg, Denmark*

Tendinopathy is a frequent disorder that may last for several years and impair the quality of life of athletes, non-athletes and patients with inflammatory joint diseases where tendinopathy is a frequent complication.

The diagnosis can often be made alone by clinical examination, but in the selected cases, imaging can be determined for the correct diagnosis and treatment.

US has several significant advantages over MRI. The greatest strength of the US is that it is interactive and the examiner is in contact with the patient, and any site of reported pain or tenderness can be directly correlated with its real-time scan appearance on the screen. The ultrasonographer can make use of the dynamic real-time character of US, so that tendons can be studied throughout their range of motion and side-to-side comparison is always available during the US examination. This unique advantage over other cross-sectional imaging modalities like MRI is of course especially applicable in the evaluation of mobile structures such as tendons. Tissue with few mobile protons emits little or no signal and, therefore, the internal architecture of the tendon is not well demonstrated in MRI. In contrast, US shows the fine internal structure of tendons, and US therefore pictures the anatomic border of the tendon more precisely than MRI, and in agreement with this the "standard deviation" (SD) and "range of the mean difference" from repeated measurement are less in US than in MRI. It is easy to change to a higher-frequency US transducer to obtain greater spatial resolution. The spatial resolution of US is much better than that of MRI if both examinations are performed with the most modern equipment. Furthermore, US can demonstrate the neovascularisation (Doppler) and the stiffness of the tissue (elastography) in tendinopathy.

In the lecture, the ultrasound typical findings of different mechanical and inflammatory tendinopathies are reviewed and completed with a live demonstration of ultrasound scan of a tendon.

**New drugs – new perspectives: clinical and regulatory issues concerning biosimilars**

SP0024

**AN UP-DATE ON BIOSIMILARS***T.K. Kvien. Department of Rheumatology, Diakonhjemmet Hospital, Oslo, Norway*

Biosimilars represent a new opportunity for lowering the cost of treatment with biological disease-modifying antirheumatic drugs (bDMARDs). Studies have demonstrated large inequities in the access to bDMARDs across countries and this inequity is related to economic parameters such as gross domestic product. Thus, reduced costs of bDMARDs should potentially lead to better treatment for more patients, especially in countries with low economy.

The regulatory agencies in Europe and in US have set up strict guidelines for approval of biosimilars which include extensive pre-clinical examinations (structure and functional characteristics) but less clinical data than for an originator product. The clinical part of this comparability exercise focuses on efficacy, safety, pharmacokinetics as well as immunogenicity.

Three biosimilars to adalimumab have also been approved but the patent of the reference product has not yet expired (expected to occur October 2018). (expected to occur October 2018). It is a growing acceptance about the use of these biosimilars, also in extrapolated indications when treatment are started or changed for medical reasons. Most rheumatologists will consider the biosimilars on the same level as originator products in these situations.

However, replacing an originator product by a biosimilar is more controversial, but is important because of the large cost-savings. Switching evidence is available from four different types of studies which will be discussed:

- Extension of phase 3 RCTs
- Switching within RCTs
- Real life data (eg from DANBIO)
- Randomising patients on stable long-term treatment

In the NOR-SWITCH trial – totally funded by the Norwegian government – 482 patients on stable treatment with the reference product infliximab across 6 indications (RA, SpA, PsA, UC, CD, PsO) were randomised to continued treatment with the reference product or switch to the biosimilar CT-P13; Jørgensen KK et al. *Lancet* 2017;389:2304–2316). The primary endpoint was occurrence of disease worsening, defined by the disease-specific composite measures or clinically significant worsening leading to a major change in treatment. Overall, disease worsening occurred in 26.2% of patients who continued treatment with the originator infliximab and in 29.6% of patients who switched to CT-13. The adjusted treatment difference (95% CI) was  $-4.4\%$  ( $-12.7$ – $-3.9$ ) which was within the prespecified non-inferiority margin of  $-15\%$ . The occurrence of adverse events, including infusion reactions, was similar across both groups. There were no differences between the two groups in secondary endpoints, including time to study drug discontinuation, remission rates, CRP levels, anti-drug antibody formation and drug trough levels. The extension study (not yet published) showed that switching from originator to biosimilar was not inferior to continued treatment with the biosimilar.

In conclusion, the NOR-SWITCH study demonstrated that switching to CT-P13 was not inferior to continued treatment with originator infliximab, adding to the increasing real-world evidence that switching from originator to biosimilar bDMARD is safe and efficacious.

SP0025

**SHARED DECISION MAKING IN SWITCHING TO BIOSIMILARS***T. French. Rheumatology, University Hospitals Bristol NHS Foundation Trust, Bristol, UK*

This presentation will focus on the speaker's experience of switching patients who are on an originator biologic therapy to a biosimilar, using a shared decision making approach. It will initially explore what constitutes shared decision making, why it is important when switching to biosimilars and the benefits of this approach.

The speaker will discuss how this change in therapy was achieved in practice when switching patients to both intravenous and subcutaneous biosimilars. There

will be a focus on the patient consultation itself, recognising patient anxiety and an exploration of why some patients declined to switch.

The speaker will share how loss of efficacy to the biosimilar was managed, and how this influenced the shared decision making approach.

Clinician's concerns will also be considered, specifically the inability to maintain pharmacovigilance (in not having sufficient nursing resources to add patients who had switched to a biosimilar to a national register). This is relevant to shared decision making as providing evidence and reassurance to patients regarding safety of biosimilars relies on this data collection.

The guidance referred to in this presentation is from NHS England, National Institute for Health and Care Excellence and the British Society for Rheumatology, so it has a UK focus. However, the main themes of the talk should be relevant to all audience members as it considers the opposing pressures on Rheumatology nurses to be change agents and make cost savings in implementing this switch to biosimilars. Whilst nurses also need to act as the patient advocate in ensuring shared decision making is a reality: that a face-to-face consultation takes place and that the patient can decline to switch and not feel penalised. The speaker will reflect on how the trust in her relationship with her patients was tested by this experience.

The main recommendation from this presentation is that rheumatology teams need to be proactive in managing this change and securing extra funding for nursing or pharmacy support. This 'invest to save' approach will enable appropriate consultation with patients to allow them to give informed consent to switch their therapy and feel supported whilst this switch takes place. It also enables maximum cost savings by ensuring the switch occurs quickly.

SP0026

**BIOSIMILARS – THE CHANGING VIEWS OF PARE'S MEMBER ORGANISATIONS***D. Wiek. EULAR PARE, Huenxe, Germany*

After EULAR PARE's position paper "Biosimilars – what do patients need to consider" published in November 2015 more biosimilars for rheumatic diseases have been approved by EMA (European Medicine Agency), have entered the market in different European countries and more biosimilars will be marketed. New studies and data informing about the use of biosimilars, as well as feedback received from patient organisations and in particular from PARE organisations, have made it necessary to update PARE's 2015 position.

Biological therapies are enormous cost factors for the healthcare system and biological therapies have to be affordable, what is seen as difficult in various countries. But an optimal quality healthcare is enormously important for the individual patient (e.g. fewer sick days, less hospitalisation, less disabilities), prevents early retirement and thus saves costs and contributes to a country's economic and social system.

If so-called naïve patients should take a biologic, the less expensive biosimilar can be used, as long as there are no contraindications, the patient has been informed and the decision is based on a shared decision between rheumatologist and patient.

But transitioning users from an originator to a biosimilar is very controversial and seen critically by PARE's patient organisations. The talk will cover the changing views concerning extrapolation, one-time switch, multiple therapy switches, registries and the relevance of the application form for patients.

**Don't delay, connect today!**

SP0027

**DON'T DELAY, CONNECT TODAY – IMPLEMENTATION OF THE EULAR CAMPAIGN IN ROMANIA***R. Ionescu. Department of Internal Medicine and Rheumatology, University of Medicine and Pharmacy "Carol Davila", Sf. Maria Hospital, Bucharest, Romania*

**Background** 22% of the population in Europe currently has, or had experienced "long-term muscle, bone and joint problems".<sup>1</sup> Early referral to a rheumatologist for appropriate diagnosis and treatment prevent structural damage, disability and decrease mortality.<sup>2</sup>

**Objectives:** To launch a patient oriented campaign in Romania in order to increase awareness of rheumatic musculoskeletal diseases (RMDs) – early

recognition of symptoms, ways of breaking down the barriers that delay early diagnosis. Also to educate the general public that rheumatic diseases may occur at any age and severe affect both children and young people.

The long term goal of the campaign is to decrease the number of people with disabilities, work loss or early retirement as well as the health care costs.

**Methods:** The launch event of the campaign will be attended by patients, rheumatologists, GPs, HPs, media and also national and local authorities.

A coordinated media plan will consist of pre-launch teasers, appropriate broad-casting of the event and post-event reminders as well as educational flyers/materials with the slogan "Don't delay, Connect today", handed out in shopping centres and other crowded areas.

Online posts on the [www.rheumatism.ro](http://www.rheumatism.ro) website and the dedicated FB page will stimulate communication and mutual support among patients as well as spread information on RMDs to the general public.

**Results:** Up to 100 participants are expected to attend the launching event and get direct/live benefit from the information on early diagnosis and early treatment.

Over 50% of the Romanian population will audience the campaign messages covered by 50 media articles (in Romanian) and over 10 000 people will receive e-messages (online and Facebook impressions/engagement). This coordinated media plan will stimulate communication and mutual support among people with RMDs.

**Conclusions:** The implementation of the EULAR campaign in Romania "Don't delay, Connect today" aims an early referral to the rheumatologist for diagnosis and treatment and for a normal quality of life of patients with inflammatory rheumatic diseases. The campaign will have a communication peak around the launching event. Until the end of the year an on-going media and online communication strategy will be implemented.

## Burning bones

### SP0028 EFFECTS OF INFLAMMATION ON BONE IN INFLAMMATORY ARTHRITIS

*E.M. Gravallesse. Medicine/Rheumatology, University of Massachusetts Medical School, Worcester, MA 01605, USA*

Research in my laboratory is devoted to the study of the pathogenesis of rheumatoid arthritis (RA), with a particular interest in the fundamental mechanisms of bone and cartilage destruction. Key research findings include the identification of osteoclasts as the cell type responsible for bone destruction in RA, and receptor activator of NF- $\kappa$ B ligand (RANKL) as the critical cytokine produced by cells within RA synovial tissues that promotes osteoclastogenesis. More recently, we have identified the inhibitory effects of synovial inflammation on bone formation in RA, and focused on the effects of inflammation in inhibiting the Wnt signalling pathway, resulting in the impairment of osteoblast function. We have also studied the mechanisms that prevent healing of bone erosions in RA, and will discuss a completed clinical trial that addresses the question of erosion healing. Mechanisms of bone loss in RA will be contrasted to mechanisms of bone formation in spondyloarthritis. Finally, we have identified specific pathways in the innate immune system that regulate bone remodelling in the setting of inflammation, and these appear to be directly relevant to inflammatory arthritis. This lecture will thus cover what we have learned about basic mechanisms, and will discuss the clinical implications of this work for the practicing physician.

### SP0029 FINE STRUCTURE ANALYSIS TO DETECT BONE PORES

*M. Gunzer, on behalf of Basic and Translational Science Session. Institute for Experimental Immunology and Imaging, University of Duisburg-Essen, University Hospital, Essen, Germany*

The blood supply is essential for the many functions of bones. The bone marrow as well as blood cells generated within are particularly dependent on a functional circulation. Despite this fact there is a remarkable logical gap in our understanding of a closed circulatory loop in long bones. We have discovered a previously unknown type of blood vessels in long bones of mice that forms an intense connexion of bone marrow with the external circulation outside of the bone. These blood vessels transport the majority of blood into and out of bones and hence constitute an essential structural component of bone physiology. I will present a detailed characterisation of these vessels and also show evidence for similar structures in man.

## Delay in treatment and the role of health professionals

### SP0030 REASONS FOR DELAY IN HELP SEEKING AT THE ONSET OF SYMPTOMS

*R.J. Stack. Psychology, Nottingham Trent University, Nottingham, UK*

Early intervention following the onset of chronic illnesses such as rheumatoid arthritis, lupus and Sjogren's syndrome can improve disease prognosis, reduce illness related disability and improve patient quality of life. Therefore, it is vital that the time between symptom onset and treatment is short, however, many patients experience long delays. The period of time between an individual's first detection of a bodily change and the first consultation with a healthcare professional is known as patient delay, while the time between first consultation and been referred to a rheumatologist for treatment is known as healthcare professional delay.

Patient delay can be attributed to a range of barrier to consultation, these include contextual barriers (e.g. geographical location, financial barriers and availability of health services), individual barriers (e.g. demographic characteristics and health literacy) the nature of symptom onset (e.g. intermittent symptoms or the experience of a symptoms commonly associated with many conditions such as fatigue) and psychological barriers (e.g. perceptions of illness, the normalising symptoms interpretation of symptoms and fear and worries about wasting the doctor's time).

Many interventions to reduce patient delay focus on educating the public about the typical symptoms associated with a specific illnesses in the hope that greater awareness will lead to better recognition of early symptoms. These interventions are based on the premise that the general public may hold misrepresentative stereotypes of what it is like to experience an illness or may even have no stereotypical belief (also known as a prototypical belief) to compare their current symptoms to. There is very little evidence about the evolution of early symptoms over time and how patients appraise these early symptoms and then decide to seek help. Furthermore, the non-specific nature of early symptoms for many rheumatological conditions can also be a significant barrier to patients recognising that symptoms are indicative of a chronic illness. For example, patients may attribute symptoms to stress, ageing or a temporary condition and actively choose not to seek help. Therefore, we must explore patients beliefs about symptom experience and not just focus on their beliefs about specific illnesses. Understanding early symptom presentation and the way that early symptoms are interpreted by patient is important for the development of robust help seeking interventions. However, interventions to promote prompt help-seeking based on symptom presentation must also take in to account for contextual, individual and psychological barriers which may interact with individual perceptions of early symptoms.

Understanding the factors which lead to patient delays and healthcare professional delays across rheumatological conditions can ensure that interventions to reduce delay are developed using a robust evidence base. Evidence based interventions such be multifaceted and may include the development of public health information (e.g posters, tv campaigns etc), the development of robust online information and challenging mis-information online, addressing health inequalities which may lead to delay (e.g. increasing the accessibility of health services and promoting health literacy in hard-to-reach communities) and developing educational information for healthcare professionals.

**DOI:** 10.1136/annrheumdis-2018-eular.7839

**SP0031 ARE ILLNESS PERCEPTION AND COPING STYLE ASSOCIATED WITH PATIENT DELAY?**

*K. Van der Elst*<sup>1,2</sup>. <sup>1</sup>Rheumatology, University Hospitals Leuven; <sup>2</sup>Skeletal Biology and Engineering Research Centre, KU Leuven Department of Development and Regeneration, Leuven, Belgium

EULAR recommendations for rheumatoid arthritis (RA) management advocate early intensive treatment to target. Timely diagnosis and treatment initiation in RA depends on a multitude of factors, such as healthcare organisation and referral pathways. Nevertheless, individuals seem to have a large contribution themselves by delaying their first contact with a health professional after symptom onset. This pre-diagnosis period can be described as a daunting period for persons who are later diagnosed with RA, because of experiencing symptoms they do not fully understand yet. It has been shown that when confronted with particular new symptoms, persons develop or adjust certain beliefs and attitudes that determine their understanding of, and their way of dealing with these unknown symptoms. Consequently, how persons interpret (perception) and manage (coping) their initial RA-related symptoms could influence their help-seeking behaviour. The results presented in this lecture will introduce the role of illness perception and coping in the patient delay in recently diagnosed patients with early RA. The audience will learn about the role of psychosocial aspects in patients' help-seeking behaviour, and why such aspects are worthwhile to consider when aiming for a reduction in early RA treatment delay.

**SP0032 THE PATIENTS' PERSPECTIVE ON DELAY IN TREATMENT**

*S. Makri*. CYPLAR, Limassol, Cyprus

**Background:** Delay in early start of treatment could cause serious problems for the patient with an RMD such as unnecessary pain suffering, deformations, depression and even disability. Often patients visit Orthopaedic doctors mainly out of ignorance. Often GPs delay for various reasons, referral to the specialist

**Objectives:** In order to achieve the goal of good quality of life, both and patient and the GP should be informed and educated so as to recognise early symptoms and seek immediate medical advice and treatment.

**Methods:** The use of Campaigns in the context of "Don't delay connect today" Slogan. Media appearances, with the aim of raising awareness amongst the public and patients are very useful. The use of mobile Clinique staffed by Health professionals, advising on how to recognise early symptoms, use of printed material to stress the importance of early diagnosis. Training of GPs and orthopaedics. Use of examples

**Results:** The patient, through education, realises the importance of early referral to a Rheumatologist for receiving personalised and effective treatment.

**Conclusions:** Early diagnosis and timely treatment allow the patient with RMDs to live a good quality life. Campaigning in this direction, through information and raising awareness, can empower the patient to seek help at the early stages of the disease.

**SP0033 DELAY IN TREATMENT FROM THE GP PERSPECTIVE**

*B. Fautrel*. Rheumatology, Sorbonne Université – Paris 6/Assistance publique – Hôpitaux de Paris, Paris, France

Inflammatory joint disease (IJD), i.e., rheumatoid arthritis, psoriatic arthritis or spondyloarthritis, require rapid referral to rheumatologists to get optimal specialised care, since early diagnosis and early treatment are 2 key prognosis factors. To achieve this objective, education of general practitioners (GP) is of dramatic importance, since they have to detect early IJD symptoms which are sometimes partial and non specific.

The lecture will identify the key elements that have to be communicated to GPs to improve their skills in detecting IJD at very steps, as well as the most important elements to make rheumatologist appointment available to them.

**Disclosure of Interest:** None declared

**Fat and fatty acids: targets for therapy?**

**SP0034 ADIPOSE TISSUE INFLAMMATION: ONCE FAT WAS FAT AND THAT WAS THAT**

*H. Schipper*<sup>1,2</sup>. <sup>1</sup>Pediatric Cardiology; <sup>2</sup>Laboratory of Translational Immunology, Wilhelmina Children's Hospital/University Medical Center, Utrecht, Netherlands

Until only 100.000 years ago, humans hunted smaller creatures and gathered what they could, meanwhile being hunted by larger predators. *Homo sapiens* showed a spectacular leap to the top of the food chain ever since. While mankind however advanced from a cavemen diet to fast food, our adipose tissue did not adapt so quickly. Here, the evolutionary origins of adipose tissue and its implications for systemic inflammatory conditions will be discussed.

A few decades ago, adipose tissue was considered a lipid sink, evolved to store energy in times of nutritional excess and release energy in times of shortage. Indeed, multicellular organisms depend on their ability to store energy to prevent starvation. Equally important though, they rely on their ability to fight infections. Several lines of evidence illustrate that adipose tissue in fact embodies the amalgamation of highly conserved metabolic and immune pathways. Whereas the fat body in *Drosophila melanogaster* comprises adipose tissue, liver and immunological moieties in one functional unit, adipocytes in humans and other higher organisms are reminiscent of their evolutionary origins by toll-like receptor expression, cytokine production and antigen-presenting capacities. From an evolutionary perspective, adipose tissue is fully equipped to respond to inflammatory stimuli, in order to fulfil the high energy demands of an acute immune response. In modern times however, the immunological capacities of adipose tissue are more of a burden. Both in nutritional overload and systemic inflammatory conditions, the inflammatory impetus of adipose tissue can have devastating consequences.

**SP0035 INFLAMMATION-INDUCED FORMATION OF FAT ASSOCIATED LYMPHOID CLUSTERS**

*J. Caamano*, on behalf of Stroma-Immune Cell Interaction Group. Institute of Immunology and Immunotherapy, College of Medical and Dental Sciences – University of Birmingham, Birmingham, UK

Fat-associated lymphoid clusters (FALCs) are atypical lymphoid tissues located on adipose tissues in mucosal surfaces such as the mesenteries, omentum, mediastinum, pericardium, and gonadal fat in humans and mice. FALCs were originally identified in mouse and human mesenteries due to that they contain a high number of type 2 innate lymphoid cells (ILC). Our work has shown that FALCs contain B1, B2 and T lymphocytes as well as myeloid and other innate immune cell populations.<sup>1,2</sup> Inflammation induces the rapid formation of FALCs and significant changes in cellular composition. Immunizations have shown the development of adaptive immune responses including B cells undergoing a germinal centre reaction in mesenteric FALCs emphasising their function on local immunity.

Our recent results show that helminth or bacterial infections induce a significant increase in proliferation of ILC in FALCs and a massive expansion in the number of clusters at early time points. A recent report has demonstrated that mesenteric FALCs act as a reservoir of CD8 +T resident memory cells (Trm) that have been generated following infections with bacteria or parasites.<sup>3</sup>

Our current working model is that FALCs have a dual role during immune responses. At the initial stages of infection or inflammation FALCs support the activation and proliferation of innate lymphoid cells. At later stages FALCs act as reservoirs of tissue resident memory T cells through their stromal cell expression of survival factors and their association with adipocytes to support Trm metabolism and survival. Understanding what signals and cells are essential to FALC formation in homeostasis and following inflammation or infection will allow the development of therapies to reduce or prevent FALC formation during chronic inflammation and autoimmune diseases.

**SP0036 FREE FATTY ACIDS: GOOD OR BAD IN RHEUMATOLOGY?**

L.A. Joosten<sup>1</sup>, Leo AB Joosten<sup>2,3</sup>. <sup>1</sup>Internal Medicine, Radboud University Medical Center, Nijmegen, Netherlands; <sup>2</sup>Department of Internal Medicine, Radboud University Medical Center, Nijmegen, The Netherlands; <sup>3</sup>Department of Medical Genetics, Iuliu Hatieganu University of Medicine and Pharmacy, Cluj-Napoca, Romania

Free fatty acids (FFA's) are grouped based on the length of their carbon chains into short chain fatty acids (SCFAs), medium chain fatty acids (MCFAs) and long chain fatty acids (LCFAs). The most FFAs are released after breakdown of triglycerides in adipose tissue and the liver. However, SCFAs including acetate, propionate and butyrate are derived from the fermentation of fibres in the gut. In this presentation, the good or the bad properties of FFA's to control or aggravate inflammation in general will be discussed. With special focus on rheumatic disorders, such as rheumatoid arthritis and gout. In addition, the synergy of LCFAs with damage associated molecular patterns (DAMPs) will be addressed. Finally, the therapeutic value of SCFAs will be discussed in rheumatic disorders.

**Inclusive school environment for young people with RMDs****SP0037 INCLUSION OF ILL CHILDREN INTO THEIR HOME SCHOOL BY REAL TIME EDUCATION**

E. Janssens. *Bednet vzw, Bednet, Leuven, Belgium*

The right to education, even when ill

It seems self-evident. Even when you are ill for a long time, you preserve the right to learn and keep your place in the social environment of your class group.

For 25 years now the right to education has been established as a right of every child, as formulated in the Convention on the Rights of the Child. Since 2006 Bednet makes sure that this fundamental right is fulfilled. Bednet takes care that children and youngsters who are absent for a shorter or longer period because of physical or mental illness, surgery or pregnancy, can continue attending the lessons – from their home and with their own class group. In the educational law it is called: synchronous internet education (SIE).

But it is only since 1 September 2015 that synchronous internet education (SIE) is structurally embedded in the educational system of the Flemish Community. This results in the right to SIE for every child with a chronic or long term illness.

Along with lessons, and all the rest

Bednet takes care that children and youngsters who are absent for a shorter or longer period because of physical or mental illness, surgery or pregnancy, can continue attending the lessons – from their home and with their own class group.

It is available for pre-school children from the age of 5, pupils of primary and secondary schools. The equipment and the counselling is free for schools and families, and this throughout the period in which the child needs it.

Bednet aims at limiting arrears in learning by providing a set of tailor-made lessons. This way 9 children out of 10 succeed in passing on to the next class despite their absence from school. Moreover Bednet makes an opening in the isolation of the child by enabling regular contacts with peers. The illness recedes to the background and the child is temporarily back with friends 'in his or her class group'. The non-profit organisation always collaborates with the parents, the school and other partners, such as the hospital schools and volunteers.

**Bednet in practice:** Bednet creates a live connexion between the pupil with an illness and his or her class group. The pupils and the teacher see the youngster on the flat screen at the back of the classroom. The child at home can direct a camera, enabling him or her to attend the lesson and/or talk to peers. Bednet uses a system that is easy to use. The pupil participates actively in the lesson, answers questions, can send and receive documents and take part in group work. Just as if the pupil were really sitting in the classroom.

Bednet operates with regional consultants in the different provinces. They do the follow-up of the children and confer with parents, hospital and school. They plan everything and take care of the concrete organisation. A technical helpdesk supports children and school throughout the project.

**Bednet in numbers:**

- In the first full school year during which Bednet was active (2007–2008), 37 children were supported.
- Since the start more than 1,900 children with a long time or chronic illness have used Bednet in 1,250 Flemish schools with synchronous internet education.

- The children and youngsters live in all parts of Flanders and Brussels. Two out of three Bednet users attend secondary school.
- Cancer remains the most common pathology with 21% of all users. Also patients with rheumatology belong to the target group of Bednet.

**The future:** Under the authority of the Flemish Government Bednet faces the big challenge of guaranteeing the right to SIE for each and every child with a long term illness. It is gradually being extended to cover all children with a long-term absence from school in the whole of Flanders. It is estimated that numbers could grow to 1.000 children in 2018.

**SP0038 RAISING AWARENESS OF INVISIBLE ILLNESSES IN SCHOOLS AND EDUCATION**

S. Ainsworth. *RAISE, Liverpool, UK*

Introduction

RAiSE is a user-led research project inspired by the negative experiences that young people face while studying and living with an invisible illness. Many young people who live with chronic illnesses look no different to their healthy peers. The invisible nature of some illnesses can often lead to an invisible struggle, leading to misunderstandings, particularly in the case of young people. It can be a huge burden on the chronically ill to make the invisible, visible to others.

**Objective:** The main objective of RAiSE is to improve the standard of care given to young people with invisible illnesses in school and college and to create a resource to teach education professionals a series of strategies and techniques to support their students. RAiSE will also offer support to young people with invisible illnesses and aim to empower them to take control of their own health.

**Methods:** A young patient of Alder Hey NHS Children's Foundation Trust decided to raise awareness of living with an invisible illness. A network of young people, parents, education and health professionals was created and a series of workshop and focus groups allowed each stakeholder to share their experiences and expertise as they inspired and advised the production of the RAiSE information pack. It is important that young people are able to shape research based on their lived experiences. Several international charities and organisations have offered support and knowledge in advising the process.

**Results:** At early workshop meetings, young people with invisible illnesses and their parents were able to offer personal accounts and experiences which highlighted that the most common themes were problems with communication and trust, as well as difficulty in understanding the erratic nature of many chronic illnesses. From this research, a draft information pack was written by the RAiSE committee, which was later presented to young people, parents, health and education professionals and charity representatives. All stakeholders were able to offer their expertise from their respective fields. Feedback was overwhelmingly positive and any adjustments are to be made in the coming weeks. The final pack will be completed and ready for distribution by the end of summer 2018.

**Conclusion:** The project has been a successful example of young patient led research and highlights the importance of self-management in young people living with invisible chronic illnesses. The collaboration between young people, parents, and education and health professionals has highlighted the necessity for cooperation between all stakeholders for the benefit of the young person.

**SP0039 I GRADUATED! EDUCATION FOR CHILDREN AND ADOLESCENTS WITH RMDs**

T.C. Wilhelmer. *Youth Ambassador, Austrian Rheumaliga, Lauterach, Austria*

Communication is the key to success in practically every situation. Without communicating to your counterpart, how should they understand your own situation?

When it comes to studying with a chronic illness we need to know how the illness affects our ability. We need to communicate what we are able to do and where we need support. When I started my Master Degree I have been honest from the very beginning. I never kept my rheumatic disease and the disability that comes with it a secret. Being open from the very beginning gives yourself and your university, school or even workspace the opportunity to adapt to your abilities. Hiding your disability will make it hard for yourself to keep up with your class. Your fellow students and teachers not knowing what your limitations are will most certainly lead to misunderstandings.

Many pupils and students do not know that there are laws and regulations that could help them to get through school easier. For example you are allowed to have longer writing times in exams, or use your computer for typing texts instead of having to write by hand. This helps to prevent pain in your joints. There are

even more ways in which your university or school can help you to get through your day than you would think of in the first place. Without asking for help, you will never find out what is actually possible. Through communicating with a disability-spokesperson you will most likely get even greater support.

In my lecture I will talk about my own story and how I managed to finish my Bachelor Degree whilst falling chronically ill with Adult Onset Still's Disease. I will give examples on how to handle a life with chronic illness. There will be some tips on what to do when your counterpart is not as understanding as he or she should be. I will explain what I do to get me through lectures and exams.

#### SP0040 PARENTS SUPPORT FOR CHILDREN WITH RMDS IN EDUCATION

*M. Kopic. Society for Children with Immune Disease, Komenda, Slovenia*

My presentation will contain situation in schools all across the Europe (at least 13 countries/results from a survey and info which I get from our Associations, members of ENCA).

It is serious situation. First I will present the problems, we, parents, are struggling with every day. I will also prepare and present possible solutions. One country is extra good in solutions and they really take good care for children with autoimmune conditions and we can learn from them. I will also present a concrete good solution.

Solutions should be used as a prepared document for all the countries. That is a goal of ENCA.

### WIN and HOT session

#### SP0041 WIN SESSION: WHAT IS NEW IN THE TREATMENT OF MYOSITIS?

*H. Chinoy<sup>1,2</sup>. <sup>1</sup>National Institute for Health Research Manchester Biomedical Research Centre, Central Manchester University Hospitals NHS Foundation Trust, Manchester Academic Health Science Centre; <sup>2</sup>The University of Manchester, Manchester, UK*

Much progress has been made over the last decade in the understanding of the inflammatory myopathies. It is heartening to see some of these developments now in clinical practice which is hopefully increasing the quality of care for myositis patients. This talk will summary the new upcoming treatments in myositis. However, treatment of a rare disease not only involves administering pharmacotherapeutic agents, but recognising when to treat and which poor prognostic groups required intensification. Antibody testing of the spectrum of newly identified myositis serology now allows for better stratification of patients and assists the physician with treatment, monitoring and prognosis. New EULAR/ACR criteria are available for classification to assist inclusion into clinical trials, as well as agreed definitions for minimal, moderate and major response. A better understanding of the pathogenesis has now led to randomised controlled trials now being conducted in the inflammatory myopathies, including targeting the innate immune pathway that will hopefully lead to a licensed treatment for this difficult orphan disease.

#### SP0042 RECENT ADVANCES IN THE TREATMENT OF SYSTEMIC SCLEROSIS

*J.M. Van Laar. Rheumatology and Clinical Immunology, University Medical Centre Utrecht, Utrecht, Netherlands*

Few rheumatological diseases have seen as many false dawns as systemic sclerosis (SSc) and many drugs once hailed as promising have fallen by the wayside. Clinical trials have been plagued by poor accrual, difficulties with definitions of endpoints, clinical heterogeneity of disease manifestations and variability of disease course, resulting in inconclusive or negative trial results. Clinicians standing in the shadows of no man's land could be forgiven for not seeing the sparks of light around them. Yet our grasp of the pathological pathways operative in SSc,

consensus on endpoints and international collaboration have paved the way for clinical trials with novel antibiotic and immunomodulatory drugs (e.g. rociguat, JAK-STATi) that could change the way we treat SSc. For now we will have to stick to old friends such as methotrexate, MMF and cyclophosphamide in early diffuse cutaneous SSc, even though their clinical benefit is modest at best as shown in the ESOS study and expressed in recent guidelines.<sup>1-3</sup> Rituximab is increasingly being used based on observational studies in SSc and its proven potency in rheumatoid arthritis, but requires more robust data. Tocilizumab has shown unexpected benefit on lung function in a phase 2 trial,<sup>4</sup> which if confirmed with phase 3 trial could transform the way we manage SSc-ILD. As of yet, the only proven disease modifying therapy in early progressive SSc is autologous hematopoietic stem cell transplantation, shown to be effective in two prospective, controlled randomised clinical trials (ASTIS and SCOT, conducted in Europe and North America respectively).<sup>5,6</sup> Only a small group of patients qualify for this however and even fewer have access to centres with the necessary expertise. SSc continues to constitute an area of unmet need, yet progress is being made, albeit slow.

### Can we halt progression of structural damage in axial SpA?

#### SP0043 HOW TO CAPTURE CLINICALLY RELEVANT STRUCTURAL PROGRESSION IN AXIAL SPA

*D. Van Der Heijde. Leiden University Medical Center, Leiden, Netherlands*

Structural damage in axial SpA usually refers to the sacro-iliac (SI) joints or the spine. The classic order of the progress of structural damage is in the SI joints, followed by the spine. Consequently, in early disease assessment of structural damage should be focused on the SI joints and in established disease (i.e. in patients with radiographic sacroillitis) evaluation of the spine becomes more useful.

The most striking abnormality representing structural damage in axial SpA is bone formation, although in early phases bone destruction can also be seen. Typically, structural damage is assessed on radiographs.

For radiographs there are two frequently used scoring methods: grading of the SI joints according to the modified New York (mNY) criteria and assessment of the spine by the modified Stoke Ankylosing Spondylitis Score (mSASSS). The mNY grades range from 0–4 per SI joint, 0–8 in total. Although it is well known that reliability of mNY grading is poor, this continuous grading has recently been successfully used as an outcome measure. The mSASSS is mainly based on bone formation in the anterior vertebral corners in the cervical and lumbar spine (range 0–72). It is a reliable measure but the progression observed by mSASSS is rather modest, resulting in a minimum follow-up of two years.

Imaging of structural damage by MRI is another option. Due to the imaging of the whole spine and the three-dimensional technique this seems an attractive alternative. However, especially bone formation is very hard to assess. Fatty deposition is a typical MRI abnormality, which can be seen as an intermediate step between inflammation visible on MRI and bone formation on radiographs. However, this finding is insufficiently validated to be able to consider it as a true surrogate for structural damage.

Finally, a CT scan is a method having the advantages of MRI (whole spine, tomographic technique) but also the best capabilities of bone imaging. The big disadvantage of CT scan is the radiation dose. Recently, it became possible to make images with good image quality but acceptable radiation, the so-called low-dose CT. A validated scoring system for CT exists: the CT scoring system (CTSS). Only bone proliferation is assessed in this method. In a direct comparison with mSASSS more progression was observed over a 2 year period. This was mainly due to the progression observed in the thoracic spine.

Only structural damage assessed by the mSASSS has shown a clear relationship with outcomes that are important for patients such as function and quality of life. No data on MRI or CTSS exist. However, it is hard to describe what defines a clinically relevant progression. The interval to assess progression to assess a

treatment effect is typically 2 years. Only small changes can be assessed over this period, normally about 1–2 mSASSS units. It is hard to define that this is clinically relevant. The most important for treatment is to show that there is inhibition of structural progression in comparison to untreated patients, especially as axial SpA is a lifelong disease and 1 unit over 30 years still leads to severe ankylosis of the spine.

SP0044

#### WHAT DO WE LEARN FROM RCTS ON THE TREATMENT EFFECT ON STRUCTURAL PROGRESSION IN AXSPA?

*X. Baraliakos. Rheumazentrum Ruhrgebiet, Herne, Germany*

The introduction of tumour necrosis factor inhibitors (TNFi) about 20 years ago has led to the hope of disease modification of ankylosing spondylitis, since biologics showed for the first time a decrease of inflammatory activity on MRI, with the latter being theoretically also directly linked to new bone formation. However, the first open-label extensions of randomized-controlled trials with a treatment duration of 2 years failed to show any positive effect on the radiographic progression in AS patients when compared to historical cohorts that had not been exposed to biologics. Nevertheless, later data indicated that this lack of influence on radiographic progression might have been due to many different reasons that were not taken into account in these first analyses, such as the radiographic status of patients at baseline, CRP levels or insufficient duration of follow-up. Furthermore, most recent data from MRI studies also indicated that the most important link to influence radiographic progression with biologics might not be the suppression of inflammation but the protection of bone to show tissue metaplasia to post-inflammatory findings, while early suppression of inflammation might be the key to even completely inhibit radiographic progression in AS patients.

Indeed, most recent cohort data have been able to demonstrate an association between TNF-blocker treatment and reduced risk of spinal structural progression (e.g. formation of syndesmophytes). Furthermore, early escalation of treatment from NSAIDs to biologics and long-term treatment with biologics have also independently been able to show positive effects on radiographic progression in patients with AS. Finally, also newer biologics such as IL-17A inhibitors have also provided promising results in terms of overall low radiographic progression rates as measured by validated scoring systems.

Currently, first head-to-head trials of different biologics are underway to examine any possible differences between the available compounds with a primary outcome of their effect on spinal radiographic progression.

It remains to be shown whether and how these results will also become clinically relevant in terms of decrease or even inhibition of spinal mobility restrictions, in order to be able to postulate a 'real' disease modifying effect of biologic treatment in axial spondyloarthritis.

### Reproductive issues in rheumatology

SP0045

#### OESTROGENS, IMMUNE RESPONSE AND AUTOIMMUNE DISEASES

*M. Cutolo, on behalf of Eular Study Group on Neuroendocrinology of the Rheumatic Diseases. Research Lab. Division Rheumatology. Dept Internal Medicine University of Genova Italy, genova, Italy*

Sex hormones are implicated in the immune response, with estrogens as enhancers at least of the humoral immunity and androgens and progesterone (and glucocorticoids) as natural immune-suppressors. Several physiological, pathological and therapeutic conditions may change the serum oestrogen milieu including the menstrual cycle, pregnancy, postpartum period, menopause, elderly, chronic stress, altered circadian rhythms, inflammatory cytokines, use of glucocorticoids, oral contraceptives, and steroid hormonal replacements. Cortisol and melatonin circadian rhythms are altered, at least in rheumatoid arthritis (RA), and partially involve also sex hormone circadian synthesis and levels. Abnormal regulation of aromatase activity (i.e. increased activity) by inflammatory cytokines production (i.e. TNF-alpha, IL-1, IL-6) may partially explain the abnormalities of peripheral oestrogen synthesis in RA (i.e. increased availability of 17-beta estradiol and possible metabolites in synovial fluids) and in systemic lupus erythematosus (SLE). In the synovial fluids of RA patients the increased oestrogen concentration are observed in both sexes and are more specifically characterised

by the hydroxylated forms, in particular 16alpha-hydroxyestrone, that is a mitogenic and cell proliferative endogenous hormone. Local effects of sex hormones in autoimmune rheumatic diseases seems to consist mainly in modulation of cell proliferation.

Epidemiological evidence indicates that during the fertile age women are more often affected by rheumatic diseases than men, particularly autoimmune diseases. As a matter of fact, rheumatic disorders with autoimmune involvement such as RA or SLE, result from the combination of several predisposing factors, that include the relationships between epitopes of the trigger agent (i.e. virus), the status of the stress response system including the hypothalamic-pituitary-adrenocortical axis (HPA) and mainly the effects of the gonadal hormones (hypothalamic-pituitary-gonadal axis – HPG).

The pre- or post-menopausal serum sex hormonal status is a further factor influencing the rate of rheumatic diseases. It is therefore important, whenever possible, to evaluate epidemiologic data broken down into age (for example 10 year age band) and sex-specific group before making inferences. Obviously, sex hormones seem to play an important role as modulators of both disease onset and perpetuation and show circadian rhythms together with cortisol.

Sex hormones are implicated in the immune response, with estrogens as enhancers at least of the humoral immunity and androgens and progesterone (and glucocorticoids) as natural immune-suppressors. Low concentrations of gonadal and adrenal androgens [testosterone (T)/dihydrotestosterone (DHT), dehydroepiandrosterone (DHEA) and its sulphate (DHEAS), respectively] levels, as well as reduced androgens/estrogens ratio, have been detected in serum and body fluids (i.e. blood, synovial fluid (SF), smears, salivary) of male and female RA patients, as well as in SLE, supporting the possible pathogenic role for the decreased levels of the immune-suppressive androgens. However, respect to serum levels of estrogens, interestingly they are not significantly changed which is in strict contrast to androgen levels in RA patients (reduced).

As a matter of fact, sex hormones can exert also local actions (paracrine) in the tissues in which they are formed or enter the circulation and both T and 17-beta estradiol seem to exert dose and time-dependent effects on cell growth and apoptosis. These effects, as well as important influences on gene promoter of Th1/Th2 cytokines and the recently discovered increased SF oestrogen concentrations, might suggest new interesting roles for estrogens at least in RA. Finally estrogens exert important epigenetic actions on cell proliferation. Estrogens act as key factors in cellular proliferation and differentiation as well as cancer development and progression (prostate). The expression of oestrogen receptor (ER)-β appears to be lost during prostate cancer progression through hypermethylation mechanism. Epigenetic drugs such as 5-aza-2'-deoxycytidine (5-AZAC) and Trichostatin A (TSA) showed efficacy in restoring ERβ expression in prostate cancer cells. These observations highlights that the strategy of merging epigenetic and hormonal therapies might be beneficial also in inflammatory/autoimmune diseases (synovial tissue)

SP0046

#### WHAT WE NEED TO CONSIDER IN PHYSICIAN-PATIENT COMMUNICATION ON SEXUAL PROBLEMS IN DIFFERENT RHEUMATIC CONDITIONS

*M. Ostensen. Department of Rheumatology, St.Olavs Hospital, Kristiansand, Norway*

Quality of life (QOL) is often reduced in patients with chronic diseases. Sexual activity and enjoyment constitute an important aspect of QOL. Sexuality is a neglected area of QOL in patients with rheumatic disease.

Sexual problems among patients are common and often increase with disease duration. Both disease related factors and the psychological response to chronic disease can impair sexual functioning. General disease symptoms like pain, fatigue, disease activity, and impaired physical function contribute to reduced sexual activity in both genders. However, psychological factors like depression, anxiety, negative body image and low self-esteem play an important role. Sexual dysfunction can create frustration and distress, and if chronic increase anxiety and depression, and damage interpersonal relationships.

Sexual health is rarely addressed by health professionals (HP), and it is as a rule not spontaneously reported by patients. HPs may feel awkward to intrude into the intimate sphere of a patient, and patients may feel ashamed of revealing their sexual dysfunction.

A first step to improve the physician-patient communication in this area is to include sexuality in the curriculum of health professionals teaching how to address and evaluate sexual function. Assessment of sexual function by validated instruments includes both frequency of intercourse as well as sexual desire, arousal, orgasm, and sexual satisfaction. In women vaginal lubrication and in men erectile function and ejaculation are part of the evaluation. Assessment of disease activity and comorbidities helps to detect physical components of sexual dysfunction. Barriers regarding communication on sexual activity should be identified and overcome. Assessment of sexual function may be assigned to a specially trained nurse, an occupational therapist or a psychologist of the interdisciplinary team. Referral to specialists in urology, gynaecology or sexual medicine may also help patients to get a better sex life. A major point for restoring sexual and reproductive health in patients of both genders is to achieve optimal disease control.

#### SP0047 CHALLENGES IN THE MANAGEMENT OF DIFFERENT RHEUMATOLOGIC DISORDERS DURING PREGNANCY: LESSONS FROM THE REGISTRIES

*R. Fischer-Betz. Rheumatology, Heinrich-Heine-University, Duesseldorf, Germany*

Registers have considerably expanded our knowledge in many fields of rheumatology. In particular, the Biologics Registers contribute to an enormous increase in knowledge on the "real world" safety of the rapidly growing treatment options. Family planning in the case of RD is a particular challenge in the physician-patient relationship and requires an optimal strategy. The impact of pregnancy on the underlying disease or the impact of maternal disease on the outcome of pregnancy is not yet fully understood. In addition there is still a high unmet need of data on drug safety as women with wish to have children or pregnant women are excluded from registration studies for ethical reasons. Therefore, systematic and prospective observation in daily care is the best possibility to collect data on this subject. Data options range from clinical-based cohort studies (e.g. the PROMISSE study), prospective pregnancy exposure studies (e.g. the MotherToBaby studies) to national birth registries. Recently, pregnancy registers in women with RD have been established in several European countries. Together with other studies, these registers will hopefully add to improved expertise in the future

#### Clinical challenges in giant cell arteritis in 2018\_\_\_\_\_

#### SP0048 A CASE OF PULSELESS STROKE

*F. Muratore. Rheumatology Unit, Azienda USL-IRCCS di Reggio Emilia, Reggio Emilia, Italy*

Giant cell arteritis (GCA) is the most common form of vasculitis in individuals aged 50 years and over. GCA typically affects large and medium-sized arteries, with a predilection for the extracranial branches of the carotid artery. Patients with GCA usually present with symptoms and signs that are directly related to the artery that is affected, with or without constitutional manifestations. The most dreaded complication of GCA is visual loss, which affects about one in six patients and is typically caused by arteritis of the ophthalmic branches of the internal carotid artery. Before the advent of glucocorticoid treatment, the prevalence of visual complications was high. Increasing awareness by physicians of the symptoms of GCA and advances in diagnostic techniques over the past twenty years have also contributed to a substantial decline in the frequency of permanent visual loss. Ischaemic brain lesions are less common than visual lesions, and mostly result from vasculitis of the extracranial vertebral or carotid arteries. In the case of both the eye and the brain, ischaemic damage is thought to result from arterial stenosis or occlusion that occurs secondary to the inflammatory process.

A patients with giant cell arteritis with extensive extra and intracranial large vessel involvement effectively treated with cyclophosphamide followed by mycophenolate mofetil will be presented. Diagnosis and management of ischaemic complications in giant cell arteritis will be discussed.

**Disclosure of Interest:** None declared

#### SP0049 HEAD GAMES WITH GCA AND GCS

*M. Matza. Rheumatology, Massachusetts General Hospital, Boston, USA*

Case 1: This is a 65 y/o woman with osteoporosis, depression and recently diagnosed polymyalgia rheumatica characterised by shoulder and hip girdle pain and stiffness with elevated inflammatory markers. She developed recurrent symptoms and new-onset jaw and tongue claudication in the setting of a prednisone taper. She was found to have a bulging right temporal artery and biopsy confirmed giant cell arteritis. She was placed on prednisone 60 mg daily with resolution of her symptoms, but developed worsening symptoms of depression and anxiety with insomnia on high dose prednisone. She subsequently attempted suicide by intentional medication overdose and carbon monoxide poisoning. She was admitted to the psychiatry ward and additionally found to have a varicella zoster skin rash. Upon resolution of the zoster infection she was started on tocilizumab by subcutaneous injection weekly and prednisone was successfully tapered over 4.5 months without recurrence of symptoms.

Case 2: This is a 63 y/o man with ITP on monthly rituximab and chronic prednisone 10 mg daily, hypertension, hyperlipidemia and osteoarthritis who developed worsening shoulder and neck pain for two months with more recent onset of scalp tenderness and left-sided vision changes for two weeks. He was found to have left optic neuropathy, elevated inflammatory markers, and an MRI demonstrating enhancement of the left temporal artery. Left temporal artery biopsy was normal. He was given pulse dose intravenous methylprednisolone for suspected giant cell arteritis and transitioned to high dose oral prednisone with improvement in musculoskeletal symptoms, inflammatory markers and stabilisation of his vision. He subsequently developed insomnia, hyperactivity and talkativeness and was diagnosed with steroid-induced mania, which improved with antipsychotics and benzodiazepines as per the psychiatry service. He was discharged home and after three days developed new vision loss of the right eye on prednisone 60 mg daily. On exam, he was found to have progressive visual field loss of the left eye and new inferior visual field loss of the right eye with disc oedema of the right optic nerve. Right temporal artery biopsy was negative. He was again given pulse dose intravenous methylprednisolone followed by oral methylprednisolone and ultimately received tocilizumab intravenously prior to discharge.

#### Do we still need biopsies to diagnose Sjögren's and autoimmune myositis?\_\_\_\_\_

#### SP0050 OPPORTUNITIES AND CHALLENGES OF IMAGING IN PRIMARY SJÖGREN'S

*S. Jousse-Joulin. Rheumatology, Cavale Blanche Hospital, Brest, France*

Sjogren's syndrome (SS) is a chronic autoimmune inflammatory disorder of exocrine glands. Its diagnosis relies solely on a combination of clinical and laboratory findings. However, recent developments have shown that imaging techniques may have additional value in detecting salivary glands abnormalities in pSS. In general, sialography is considered to be the most reliable of the imaging methods. Salivary gland scintigraphy is very sensitive and especially useful in early stages of the disease. Nevertheless, both imaging techniques are used by only minority of rheumatologists for diagnosis of pSS because of the invasive character of sialography and the low specificity of scintigraphy. MRI has shown a good sensitivity and specificity to detect structural abnormalities in pSS but few centres have access to the specific know-how. A recent development is the increased interest in ultrasonography (US) as a tool to assess major salivary glands. Ultrasonography of the salivary glands (SGUS) appears to be an inexpensive commonly available noninvasive technique that does not cause complications and inconvenience to the patient, although the data are somewhat conflicting. Although, the recent but preliminary American classification criteria for Sjögren syndrome do not include salivary gland such imaging technique<sup>1</sup> this procedure has clearly demonstrated high impact on classification of Sjögren patients<sup>2-5</sup> and demonstrated good diagnostic properties.<sup>5</sup> A systematic literature review<sup>6</sup> has shown a paucity of data regarding the metric properties of ultrasound, making interpretation and

comparison of studies difficult. In particular, there are limited data describing a standardised scanning method and standardised definitions of US gland pathologies. Even if we obtained truth validity, discrimination validity (reliability) is not yet validated. Therefore, although SG-US is an upcoming modality in rheumatology, it is not yet ready to make diagnostic or therapeutic decisions regarding salivary glands in daily routine practice. It should still be considered to be a research tool, until we are able to demonstrate acceptable intra- and interobserver reliabilities. Preliminary work addressing these issues has been done so far by the USpSS study group consisting of both clinicians and ultrasonographers.<sup>6,7</sup>

More recently, a SG-US OMERACT task force group composed of international clinicians and ultrasonographers was created with the aim of developing a standardised scanning method using standardised definitions of gland pathology. A consensual Delphi process about definitions and scoring using B mode modality of SG-US was used and the intra and inter reliabilities between 18 sonographers showed good to excellent reliabilities (Light's kappa=0.81, Light's kappa=0.71 respectively) (article in preparation). Currently, there is an unmet need concerning the use of SGUS in the monitoring of patients. Even if it seems that structural damage are stable over time.<sup>8</sup> Another possible way to study SG in the disease course is to use Doppler. Doppler waveform analysis was found useful for detecting blood flow abnormalities in SG of patients with pSS compared to controls.<sup>9</sup> Given the importance of parotid and submandibular glands involvement in pSS, we believe that the vascularisation and B mode sonography should be evaluated routinely. A new US technique measuring the elasticity of SG parenchyma using elastography has recently emerged and could be implemented in the evaluation of SGUS pSS patients.<sup>10-12</sup> Some authors showed that stiffness of SG parenchyma was increased compared to healthy controls and suggested to adjunct this procedure to gray-scale ultrasonography for the clinical diagnosis of pSS. The last important challenge is to know if imaging techniques are capable to replace minor salivary glands biopsy. A recent study<sup>13</sup> has shown good agreement between SGUS and parotid gland and moderate with labial glands.

In conclusion, US has nearly completed the 3 pillars of the OMERACT process (truth validity, discrimination validity and feasibility). The use of different imaging technique and particularly ultrasonography should be educated and it is now of importance to train the rheumatologists to this technique as proposed by The US EULAR courses.

## How monogenetic autoinflammatory diseases help to understand and treat rheumatic diseases

SP0051 **CLINICAL PRESENTATION OF AUTOINFLAMMATORY DISEASES IN CHILDREN AND ADULTS: HOW NOT TO MISS THESE PATIENTS**

*S. Ozen. Pediatric Rheumatology, Hacettepe University, Ankara, Ankara, Turkey*

Autoinflammatory diseases are diseases of the innate immune system, characterised by attacks of inflammation. The inflammatory attacks can manifest in a variety of forms; fever, is frequent, the skin and musculoskeletal system is often affected. Acute phase reactants are increased in almost all of the patients. The autoinflammatory diseases can be classified according to their leading manifestations such as: those with periodic fevers (and other various features), those with pyogenic

features, those with psoriasis, those with features of interferopathies and those with vasculopathy. With this large range of features these diseases are in the differential of many common diseases. Genetic testing is confirmatory but may not be widely available.

The differentiating features of especially the common autoinflammatory diseases will be reviewed.

## Joint EULAR – EFIS session: I've got a B in my bonnet

SP0052 **POSTTRANSLATIONAL MODIFICATION OF AUTOANTIBODIES IN RA**

*L. Trouw<sup>1,2</sup>. <sup>1</sup>Immunohematology, <sup>2</sup>Rheumatology, LUMC, Leiden, Netherlands*

Rheumatoid Arthritis (RA) is a common autoimmune disease in which autoantibodies serve as interesting biomarkers. In a large proportion of the patients several types of autoantibodies are present that target post-translationally modified proteins. Next to antibody responses against citrullinated proteins (ACPA) we now also describe antibody responses against carbamylated proteins (anti-CarP) in RA. The use of these autoantibodies in the prediction, diagnosis and prognosis will be discussed, as well as the clues, obtained in animal models, as to how such an antibody response may be initiated.

In addition the findings that antibodies themselves are also post-translationally modified and the functional consequences of such modifications will be highlighted both regarding carbamylation of IgG and modifications of ACPA IgG.

SP0053 **MEMORY PLASMA CELLS IN CHRONIC INFLAMMATORY DISEASES – A ROADBLOCK TO TOLERANCE INDUCTION**

*<sup>1,2</sup>A. Radbruch. <sup>1</sup>Charité University Medicine; <sup>2</sup>Deutsches Rheumaforschungszentrum Berlin, a Leibniz Institute, Berlin, Germany*

Regeneration of tolerance is the Holy Grail of treating inflammatory rheumatic diseases. Obviously neither physiological nor therapeutic immunosuppression does achieve this for most patients. What are the roadblocks for therapies inducing therapy-free remission? We have identified memory plasma cells secreting pathogenic (auto)antibodies as one such roadblock. Such cells are often generated already before disease becomes clinically apparent. They persist over time in inflamed tissues and in the bone marrow, in niches which protect them from environmental stress, including conventional therapies. By constitutive secretion of pathogenic antibodies they fuel relapse and refractoriness. Any therapy aiming at induction of therapy-free remission will have to remove this roadblock. Recently we and others have developed therapeutic concepts to ablate memory plasma cells, based on a molecular understanding of their lifestyle. Such therapies, however, have two major inherent problems: they also ablate protective humoral immunity, increasing risk of infection, and the pathogenic memory plasma cells can be regenerated, if tolerance is not regenerated. To address the latter point, ablation of plasma cells has to be combined with tolerance-inducing therapeutic options, and until then, patients have to be protected passively by IV-Ig. For selective targeting of pathogenic memory plasma cells, differences in the lifestyle between protective and pathogenic plasma cells could be exploited, but few have been identified so far. We have now developed a novel technology to target plasma cells according to the specificity of the antibodies they secrete. Plasma cells are labelled *in vivo* with a given antigen, and those plasma cells secreting specific antibodies are selectively killed by their own antibodies. We have now demonstrated feasibility and efficacy of this therapeutic approach in a preclinical model. Apart from the therapeutic perspective, this technology also offers a unique option to identify pathogenic plasma cell specificities in experimental and clinical rheumatology.

**SP0054 THE CONTRIBUTION OF REGULATORY B CELLS IN PROTECTING RHEUMATIC DISEASES**

*C. Mauri. Medicine, University College London, London, UK*

B cells are considered central to the pathogenesis of patients with rheumatic diseases (RD) including Systemic lupus erythematosus (SLE) and rheumatoid arthritis (RA). In addition to producing autoantibodies, B cells suppressing inflammatory responses, known as regulatory B cells (Bregs) are numerically and functionally defective in rheumatic diseases. The production of interleukin 10 (IL-10) classically defines a Breg, however the stability and/or plasticity of this population is not well understood. In addition to producing autoantibodies, B cells suppressing inflammatory responses, known as regulatory B cells (Bregs) are numerically and functionally defective in RD patients. The production of interleukin 10 (IL-10) classically defines a Breg, however the stability and/or plasticity of this population is not well understood. Additionally, IL-10 +B cells have been shown to co-express pro-inflammatory cytokines such as TNF $\alpha$  and IL-6, further complicating Breg classification. Characterising the signals inducing Breg differentiation and the subsequent stability and/or plasticity of this population may aid in understanding the factors contributing to Breg dysfunction in RD patients. Novel findings unravelling the signals required and the stability of B regs versus B effector cells in RDs will be discussed.

**Sustainable healthcare in rheumatology and the role of health professionals**

**SP0055 HOW CAN INTEGRATED HEALTHCARE CONTRIBUTE TO SUSTAINABLE HEALTHCARE IN RHEUMATOLOGY?**

*B. Vrijhoef<sup>1,2</sup>. <sup>1</sup>Panaxea, Amsterdam; <sup>2</sup>Patient and Care, Maastricht University Medical Center, Maastricht, Netherlands*

**Introduction:** According to the World Health Organisation (WHO) "an integrated, people-centred approach is crucial to the development of health systems that can respond to emerging and varied health challenges, including urbanisation, the global tendency towards unhealthy lifestyles, ageing populations, the dual disease burden of communicable and non-communicable diseases, multi-morbidities, rising health care costs, disease outbreaks and other health-care crises". In supporting health services to become more integrated and people-centred a Framework was developed that proposes five interdependent strategies: 1. Empowering and engaging people and communities; 2. Strengthening governance and accountability; 3. Reorienting the model of care; 4. Coordinating services within and across sectors; 5. Creating an enabling environment. Given that health systems are highly context-specific, the Framework does not propose a single model but interdependent (sub) strategies, policy options, and interventions that need to be adopted.<sup>1</sup> What is known about the adoption of these strategies for people with rheumatic and musculoskeletal diseases?

**Methods:** A convenience sample of recently published reports about redesigning health care for people with rheumatic and musculoskeletal diseases is assessed against the WHO Framework on integrated-people centred health services. The five interdependent strategies, including the policy options and interventions as defined under the Framework, are assessed for presence, implementation fidelity and outcomes. Implementation fidelity refers to the degree to which an intervention is delivered as intended (i.e. in line with the Framework). Outcomes of people-centred care include: equity in access, quality, responsiveness and participation, efficiency, and resilience.

**Results:** To be presented at the conference.

**Discussion:** It is anticipated to find a plethora of examples of mainly single policy options and interventions, but hardly any examples of combinations of strategies. This would indicate a need for a systems approach in achieving sustainable healthcare in rheumatology.

**SP0056 SUSTAINABLE HEALTHCARE – IT TAKES A VILLAGE**

*B.A. Slusher. Physician Assistant Studies, University of Texas Medical Branch, Galveston, USA*

Healthcare delivery is at a crossroads for potential paradigm change due to budget constraints, complexity of care, increasing performance measures and implementation of electronic health records. Additionally, recent reports of high levels of stress and burnout amongst healthcare providers has been linked to decreased patient safety and medical errors. Complicating matters for rheumatology, is shrinking of the available workforce. The model of interprofessional healthcare delivery holds promise as a means to improve both patient outcomes and provider wellbeing. This presentation addresses implementation of interprofessional teams in rheumatology and provides a review of successful models and guidelines for implementation.

**SSc: From registries to trials – do we have sufficient data and the appropriate design?**

**SP0057 THE COURSE OF SYSTEMIC SCLEROSIS (SSC): WHAT CAN WE LEARN FROM REGISTRIES?**

*M. Matucci Cerinic. Professor of Rheumatology, Director Division of Rheumatology AOUC, University of Florence, Italy, Florence, Italy*

SSc is a heterogeneous connective tissue disease with an unpredictable course and a high mortality and morbidity. Although the identification of patients in early stages of disease is increasingly achievable thanks to the introduction of the new ACR/<sup>EULAR 2013</sup> classification criteria, the stratification of patients according to the risk of disease progression or of severity of disease is still an unmet need. Several potential predictive factors of disease evolution have been proposed over the years: SSc specific autoantibodies related to disease complications, serum biomarkers of internal organ involvement, age at diagnosis, sex, disease subset seem to have a prognostic value but unfortunately all these may be present in different combinations making it difficult to identify how the disease will evolve. Data from registries of different countries confirm that the clinical presentation depends on several factors. Data from EUSTAR group data base indicate that a late age at onset (>75 years) of SSc is associated with more aggressive disease as well as the male gender, that has a more severe phenotype and a worst prognosis than female, with an increased risk of occurrence of cardiovascular involvement. The analysis of geographic variations among different SSc presentations may suggest that eastern centres care for more severe SSc manifestations in Europe. Data from EUSTAR group reported also that the main causes of deaths in SSc are due to pulmonary fibrosis, pulmonary arterial hypertension (PAH) and heart involvement (mainly heart failure and arrhythmias). Independent risk factors for mortality and their seem to be proteinuria, the presence of PAH based on echocardiography, pulmonary, forced vital capacity below 80% of normal, dyspnoea above NYHA class II, reduction of dlco, patient age at onset of Raynaud's phenomenon and the modified Rodnan skin score. Interestingly, SSc patients show an increase risk of lung cancer (especially non small cell lung carcinoma) in association with interstitial lung disease and of esophageal or cardiac adenocarcinoma. Data from the database of the German Network for Systemic Scleroderma support the concept that SSc-overlap syndromes should be regarded as a separate SSc subset, distinct from lcSSc and dcSSc, due to a different progression of the disease, that had an intermediate rate of disease progression in between lcSSc and dcSSc, different proportional distribution of specific autoantibodies, and of different organ involvement. Therefore, the use of registries is today of paramount importance to obtain significant data about several unmet needs in SSc.

## Patient involvement in research: The future of collaborative research. Lessons from the field of rheumatology and beyond

SP0058 PATIENT INVOLVEMENT IN RESPIRATORY RESEARCH

C. Coleman. European Lung Foundation, Sheffield, UK

The European Lung Foundation (ELF) mission is to bring together the public and patients with respiratory professionals to improve lung health. ELF was founded by and works in a unique partnership with the European Respiratory Society (ERS), a membership society for respiratory professionals. A core part of ELF's activities is to ensure that the perspectives of people living with a lung condition help to inform research, treatment and policy activities at a European level. ELF has extensive experience of facilitating patient engagement in research and clinical projects, including in EU-funded consortia, and has published extensively on the topic.

During this session, ELF will share its experience of involving patients in respiratory research collaborations. Focusing on three projects as exemplars of different stages of the research process, ELF will share some of the lessons, challenges, and key benefits of involving patients in research and will highlight how these can be transferred to projects beyond the respiratory field.

Research priority setting: the European Asthma Research and Innovation Partnership (EARIP) set out to develop a coordinated and integrated approach to the future of asthma research and development by creating a roadmap of the components needed to reduce the burden of asthma, in terms of the impact on individuals and on healthcare systems across Europe. ELF led a research priority setting process in which patient perspectives played a central role. The resulting research priorities have been taken forward by research funders and consortia, helping to ensure that the future research agenda is patient-centred.

Key lessons:

- how to involve patients in research priority setting
- how to build consensus between patient, clinical, research and industry stakeholders

### Clinical trials:

the ground-breaking U-BIOPRED (Unbiased Biomarkers for the Prediction of Respiratory Disease Outcomes) project involved patients with severe asthma as equal partners. Up until this point, many projects funded by the EU Innovative Medicines Initiative (IMI) had limited or no involvement of patients. As a result of the successful partnership between patients and professionals, IMI asked the project to develop a guide to patient involvement in EU-funded research so that the experience could be transferred to other disease areas. U-BIOPRED is still considered a pioneering project in terms of its level of patient involvement and many new studies use the approach as the exemplar for how to engage patients as partners.

Key lessons:

- how to involve patients as equal partners in clinical research
- how to maximise the opportunities for patient input
- where patients can add value to clinical projects

### Disease registries:

the European Multicentre Bronchiectasis Audit and Research Collaboration (EMBARC) is an ERS Clinical Research Collaboration dedicated to improving research and clinical care for people with bronchiectasis. EMBARC has created a European Bronchiectasis Registry, funded by the ERS and by the EU IMI Programme. Patients have played a central role in defining the scope, ethics, governance and data protection processes for the registry and the next phase of the project will include a patient-powered registry in order to capture patient-important outcomes directly from people affected by bronchiectasis.

Key lessons:

- patients' and clinicians' recommendations for involvement in research – dos and don'ts
- how to involve patients from rare disease communities in research

**Conclusion:** Patient involvement in respiratory research has grown significantly over the last decade. Patient perspectives are increasingly considered to be a core component of every research project and the wider respiratory community values the important role patients now play. ELF has facilitated the involvement of people with lung conditions in a wide range of research projects and the lessons learned are highly transferable to other disease areas and settings.

SP0059 EULAR'S PATIENT RESEARCH PARTNER NETWORK – PATIENTS' FUTURE INVOLVEMENT IN RESEARCH

C. Zabalán. Romanian League Against Rheumatism, Bucharest, Romania

Research in the field of RMDs, particularly in Europe, has advanced significantly the last years. In particular, **the interest in developing Patient Reported Outcomes (PROs) and forms of participatory research has grown**. In the field of rheumatology there have been undertaken many initiatives to explore and implement participatory research.

Substantial unmet needs in the area of research, highlighted in the **RheumaMap** (developed by EULAR), will however require an altogether **higher level of commitment and innovation**. Implementation of the distinct elements contained in RheumaMap will rely on scientists, patients and health professionals.

In this regard EULAR PARE has developed **recommendations for patient-researcher collaboration** and also established a network of **40 trained patient research partners** of whom 6 have also graduated for the EUPATI training course.

Last year it was created a **platform** (under the name of **Study Group for Participatory Research**) for knowledge exchange regarding patient participation in rheumatology care and research with the aim of establishing a group of researchers and patient research partners with an interest in developing innovative methods to elicit the voice of patients in rheumatology research, to stimulate the dialogue about the rationale, principles and conditions for patient involvement in research and to discuss and develop the nomenclature and methodology of evaluating the process, results and impact of patient participation in research and health care innovation.

**The Learning Objectives** of the session are as follows:

- To learn from best practices of patient engagement in different disease areas
- To explore patient involvement in guideline development and health care innovations
- To explore how to evaluate patient involvement
- To explore how to cease the moment, how to have fun in the process

L. Fournier<sup>12</sup>, on behalf of EULAR Task Force. <sup>1</sup>Copenhagen, Denmark; <sup>2</sup>Paris, France; <sup>3</sup>Barcelona Spain; <sup>4</sup>Lund, Sweden; <sup>5</sup>Ruhr, Germany; <sup>6</sup>Leeds, UK; <sup>7</sup>Genève Switzerland; <sup>8</sup>Oxford, UK; <sup>9</sup>Keele, UK; <sup>10</sup>Cyprus; <sup>11</sup>Madrid, Spain; <sup>12</sup>Rheumatology, Center for Rheumatology and Spine Diseases, Copenhagen (Frederiksberg), Denmark

**Background:** Low back pain is common and relates to a variety of overlapping pathologies. Imaging of the spine has a high priority in the assessment of patients with low back pain. However, studies have shown that clinicians vary widely in how frequently they obtain imaging tests for assessment of low back pain. Technical advances in the field of lumbar spine imaging are made at an increasingly high rate, and it seems likely that improved imaging procedures can indeed increase the understanding of low back pain and aid the diagnostic precision to the diagnostics of mechanical low back pain. The EULAR Task Force consists of radiologists, orthopaedic surgeons, rheumatologists, doctors in physical medicine and general medicine, physiotherapist and patients and the aim of the group was to develop evidence-based recommendations for the use of imaging modalities in low back pain with or without radiculopathy

Based on PICO established at the first meeting and using European League Against Rheumatism (EULAR) standardised operating procedures a systematic literature review was conducted to retrieve data on the role of imaging modalities including both conventional, contrast enhanced and dynamic approaches in radiography, ultrasound, MRI and CT. The recommendations will be based on the results of the systematic literature review and expert opinion and will be relevant for to all health care professionals who treat mechanical low back patients due to its multifactorial nature.

SP0061

**HOW TO USE MRI IN THE DIAGNOSIS AND MANAGEMENT OF PSORIATIC ARTHRITIS + CLINICAL CASES**

M. Østergaard. Copenhagen Center for Arthritis Research, Copenhagen University Hospital Rigshospitalet, Glostrup, Denmark

Psoriatic arthritis (PsA) is an inflammatory joint disease characterised by presence of arthritis, enthesitis and/or spondylitis in patients with psoriasis. PsA presents a wide range of disease manifestations in various patterns. Imaging is an important part of management of PsA and is used for multiple reasons including establishing/confirming a diagnosis of inflammatory joint disease, determining the extent of disease, monitoring activity and damage, assessing therapeutic

efficacy, and identifying complications of disease or treatment, in the setting of clinical practice or clinical studies.

Magnetic resonance imaging (MRI) allows detailed assessment of all peripheral and axial joints and entheses involved in PsA and can visualise both inflammation and structural changes. This talk will provide an overview of the status and perspectives of MRI in diagnosis and management peripheral and axial PsA.

SP0062

**HOW TO USE MRI IN THE DIAGNOSIS AND MANAGEMENT OF OSTEOARTHRITIS**

P.G. Conaghan. University of Leeds, Leeds, UK

The recent EULAR recommendations for the use of imaging in the clinical management of peripheral joint osteoarthritis (OA) provide an excellent, evidence-based, multi-disciplinary way background to this topic.

For diagnosis, the importance of a detailed history and thorough examination can never be underrated. Imaging should be used as only part of the diagnostic criteria for any rheumatic disease. One of the key EULAR recommendations is that imaging is often not required to make the diagnosis when patients present with a typical presentation of OA, with short-duration morning stiffness and increasing pain with prolonged weight bearing. The major benefit for imaging is in helping differential diagnosis in atypical presentations, and generally radiographs (weight-bearing for the knee) would be used first.

MRI brings its unique 3D strengths to diagnosis. MRI may play a role in the diagnosis of a meniscal tear, but this should only be considered where there is a clear history of locking or blocking to joint extension, rather than gelling (after prolonged immobility) or 'giving way', the latter being usually a sign of muscle weakness. When using MRI it is useful to remember that some degree of synovitis is common in osteoarthritis, and the presence of effusion or synovial hypertrophy does not automatically mean a primary inflammatory arthritis. Another common imaging feature is the bone marrow lesion (BML). This has similar juxta articular location in OA and rheumatoid arthritis, though the pathology is markedly different: BMLs represent osteitis in rheumatoid arthritis but areas of micro-fracture, necrosis and fibrosis in osteoarthritis. So clinical context is critical.

Routine imaging for OA follow up is usually not required unless there is an unexpected rapid progression of symptoms in which case a number of diagnoses should be considered. BMLs show areas of osteonecrosis, so a biopsy report suggesting this is should not be confused with avascular necrosis (AVN). AVN is a condition resulting from the disruption from the vascular supply to a particular bone, often the femoral head, leading to resorption of subchondral trabeculae and clinically related to prolonged corticoid use, alcohol excess or previous surgery. It's also been seen in connective tissue diseases. Patients may be under the age of 50, unlike the average age of rapidly progressive osteoarthritis (RPOA). RPOA is relatively uncommon and figures on its incidence vary widely. It is most commonly described again in the hip joint, and it may be the result of secondary osteonecrosis after subchondral fracture. This lesion is of importance because increased frequency of RPOA has been seen in trials of the anti-nerve growth factor monoclonal antibodies in the last decade, where there may be a link to concomitant NSAID use. Subchondral insufficiency fractures (SIF) are another cause of sudden onset pain, usually in the medial side of the knee and not associated with a previous history of trauma. There is a high prevalence of related meniscal tears. This tends to be seen in older females and is associated with the subchondral crescent sign indicating a fracture.

In terms of guiding treatment, at present we do not have evidence that the presence of particular pathologies such as BMLs or synovitis should indicate targeted therapies for those pathologies, though (appropriately) a lot of research is currently underway to see if these do represent legitimate targets for existing and novel therapies.

**WIN and HOT session**

SP0063

**WIN SESSION: ABOUT DIAGNOSIS AND CLASSIFICATION OF SPONDYLOARTHRITIS**

*V. Navarro Compán. Rheumatology, University Hospital La Paz, IdPaz, Madrid, Spain, Madrid, Spain*

In patients with axial spondyloarthritis (axSpA) an early diagnosis is becoming progressively more relevant. Nowadays, several therapies have shown to be efficacious to control disease symptoms and signs and they are even more useful if administered in early stages of the disease. However, the aim of an early diagnosis is not easy to achieve. Similar to the majority of rheumatic diseases, axSpA is heterogeneous in its presentation, course, and outcome, and does not have a single clinical, laboratory, pathological, or radiological feature to serve as a gold standard in support of diagnosis. With the new therapies available, many research studies are focusing on how to make an early diagnosis of axSpA.

Additionally, some confusion remains about differences between classification and diagnosis of axSpA. In clinical practice, in the absence of diagnostic criteria, the classification criteria are often used to assist in the diagnostic process of a disease. Based on this, there is an ongoing debate about whether or not the current classification criteria should be revised. During this session, the new insights on diagnosis and classification in axSpA will be highlighted.

**HOT SESSION: RECENT ADVANCES IN THE MANAGEMENT OF SPONDYLOARTHRITIS**

*S. Ramiro<sup>1,2</sup>. <sup>1</sup>Rheumatology, Zuyderland Medical Center, Heerlen; <sup>2</sup>Rheumatology, Leiden University Medical Center, Leiden, Netherlands*

In the last years the treatment armamentarium for spondyloarthritis (SpA) has been expanded. In addition to non-steroidal anti-inflammatory drugs (NSAIDs) and tumour necrosis factor (TNF)-inhibitors, we nowadays count in daily clinical practice with IL-17-blockers for the treatment of patients with axial SpA. This increase in treatment options has led to an update of the ASAS-EULAR management recommendations, which will be discussed in this lecture, together with the evidence supporting them.

Currently, several studies on tapering to stop biologics in patients with axial SpA with inactive disease are being conducted and the first results available will be discussed. The path is being paved for a treat-to-target approach that is gaining shape in SpA. More evidence towards such an approach has been gathered throughout the last years and strategy trials are now ongoing.

Inhibition of structural progression remains a hot topic in SpA. Whether or not the current interventions we have can achieve such an outcome is not yet fully clear, and the challenges related to this will be discussed in this lecture. More data has come out to help us gain more insight into this complex relationship between disease activity and structural damage and the effect of therapy on it.

**To taper or not to taper in RA**

SP0065

**TO TAPER OR NOT TO TAPER NON BIOLOGICAL DMARDS IN RA REMISSION?**

*K.F. Baker, J.D. Isaacs. Musculoskeletal Research Group, Newcastle NIHR Biomedical Research Centre, Newcastle University and Newcastle upon Tyne Hospitals NHS Foundation Trust, Newcastle upon Tyne, UK*

Remission is now a realistic goal in rheumatoid arthritis (RA), with a third of patients achieving sustained remission through the use of conventional synthetic disease-modifying anti-rheumatic drugs (csDMARDs) in modern treat-to-target strategies. Nevertheless, csDMARDs pose a risk of severe side-effects and require regular blood safety monitoring, which is both intrusive for patients and expensive for healthcare systems. This poses a therapeutic challenge – when is it appropriate to withdraw csDMARDs from patients with RA in sustained disease remission?

In the first part of this presentation we will use case histories to contrast the possible outcomes following withdrawal of csDMARDs from patients in sustained remission, highlighting the uncertainty facing patients and their clinicians in this scenario (presented by Dr Kenneth Baker). In the second section of this lecture (presented by Prof John Isaacs) we will discuss the criteria to consider when stopping csDMARDs, any potential risks to the strategy, and the potential to identify informative biomarkers to help guide management of the patient in remission.

SP0066

**BIOLOGICAL DMARD CASE PRESENTATION**

*J. Kedra. Rheumatologie, Hôpital Pitié-Salpêtrière, Paris, France*

We present the case of a male patient, who developed in 2002 (at the age of 37) rheumatoid arthritis, at that time positive for RF and ACPA without erosions on X-rays. He was first treated with salazopyrine, stopped in 2003 because of residual disease activity and structural damage progression on X-rays (MTP 5 erosion, JSN on both carpal joints), then methotrexate, which was efficient but was finally stopped in 2004 for suspicion of MTX pulmonary toxicity (cough, short breath, with CT-scan abnormality). Leflunomide 20 mg/day was started with adequate response up to 2009, when loss of efficacy was recorded. Addition of adalimumab 40 mg every other week was decided, leading to sustained remission.

In 2011, he was on remission with this combination of treatments, and he stopped adalimumab abruptly on his own, resulting in a flare after 4 months (7 tender joints and 5 swollen joints). Adalimumab every other week was restarted, and remission was obtained a few weeks later.

In 2013, he remained on sustained remission, which led to his inclusion in a trial testing the progressive spacing of adalimumab. Every 6 months, the disease activity was assessed in consultation, and hands and feet X-rays were repeated every year: the patient remained on sustained remission according to DAS28, and there was no additional structural damage. Finally, in May 2017, DAS28 was at 1.71 with leflunomide 20 mg/day and adalimumab 40 mg every 2 months, so we were proposed to stop adalimumab.

When last seen, in November 2017, the patient was still on remission with leflunomide monotherapy.

SP0067

**TO TAPER OR NOT TO TAPER BIOLOGICAL DMARD**

*B. Fautrel. Rheumatology, Sorbonne Université – Paris 6/Assistance publique – Hôpitaux de Paris, Paris, France*

Remission is more and more achievable in the course of rheumatoid arthritis (RA) or spondyloarthritis (SpA). Tapering strategies have been proposed to reduce the risk of overtreatment of patients with inactive disease. They have been tested in several observational or randomised controlled trials. On this basis, EULAR guidelines recommend to consider careful DMARD tapering in people with sustained remission.

The lecture will develop the potential benefits and risks of a tapering strategy for people affected by RA or SpA, in remission thanks to biologic agents. It will also highlight the residual unmet needs for the care of RA or SpA patients in remission.

**Can we improve the care of gout?**

SP0068

**DECT IMAGING IN GOUT – READY FOR PRIME TIME?**

*N. Dalbeth. University of Auckland, Auckland, New Zealand*

Dual energy computed tomography (DECT) allows visualisation of urate crystal deposition in people with hyperuricaemia and gout. This technology is increasingly used in clinical practice for gout diagnosis, and can also guide treatment decisions in gout. The diagnostic properties of DECT will be described and compared with other advanced imaging methods such as ultrasonography. The potential for false positive results due to artefact, and false negative results in the case of small urate crystal deposits will be demonstrated. The role of DECT in

monitoring of treatment response, understanding mechanisms of disease, and facilitating patient understanding of the condition will be explored.

#### SP0069 IMPROVING ADHERENCE IN GOUT THERAPY

**A. Abhishek.** *Academic Rheumatology, The University of Nottingham, Nottingham, UK*

Gout is the commonest inflammatory arthritis and affects between 2.5% and 3.9% of the adult population in the western world, with even higher prevalence estimates reported elsewhere. It is the only form of arthritis that can be "cured" with simple, inexpensive pharmacologic urate lowering treatment. Such medicines offer the potential for "cure" to most people with gout. However, despite this, gout patients have the lowest adherence to long-term pharmacologic treatment among people with different rheumatic diseases. The reasons for this are multifactorial but include misconceptions about the disease and its treatment among patients, physicians and the wider community.

The long-term management of gout is overseen by primary care physicians in most countries. Recent studies have explored alternate models of gout management and care, such as by community pharmacists and nurses. Such interventions have associated with a high uptake of urate lowering treatment and excellent persistence with treatment for upto five years.

This lecture will summarise the key barriers to the uptake of and adherence with urate lowering treatment. Recent randomised controlled trials and pilot studies examining the role of nurses and pharmacists in the management of gout using a treat-to-target approach will be discussed. New data about the mechanism by which such interventions may promote adherence with urate lowering treatment will be presented.

#### SP0070 WHAT ARE GOUT GUIDELINES GOOD FOR ?

**T. Bardin.** *Rheumatology, hôpital Lariboisière, Paris, France*

Guidelines aim to help physicians to make decisions in daily practice for an individual patient with a given condition. Guidelines should therefore be clear, easily readable and understandable by all physicians involved in disease care. They should also be as simple and brief as possible to be easily memorised by physicians, and this is a real challenge when guidelines aim at a full coverage of gout management. Most importantly, they cannot be taken as strict rules with legal implications. The final decisions concerning an individual patient remain in the hands of the responsible physician.

Guideline methodology has improved over years but still varies across recently published works. Ad hoc committees regularly involve all specialities involved in the disease care, and in the case of gout, general practitioners, who take care of most gout patients are now included but their number vary. Patients are not always included, despite being the final target of guidelines. Conflicts of interest of participating physicians are taken into account to a varying extent. The guideline development process involves an evaluation of all evidence available at the time of writing. Treatment impact on outcome, and assessment of drug benefit ratios are unanimously considered as important in the elaboration of guidelines. Factors such as drug pricing, availability and local regulatory agency recommendations, for instance about reimbursement, also matter, as guidelines should be practical in order to help physicians, but are rarely taken into account in guidelines.

There are several levels of evidence and the best ones, such as randomised placebo-controlled trials (RCT) or RCT meta-analyses are not available in all aspects of gout management. A large part of the published guidelines on the management of gout therefore relies on expert opinion, which remains fragile and may vary from one group to the other.

The numerous guidelines presently available for gout management exhibit more or less striking differences, and this diversity does not help guidelines to reach their goal. In this regard, the major differences observed between the simple and short guidelines issued by the American College of Physicians and the usually more complicated recommendations from the Rheumatology societies are the most detrimental. Pursuing therapeutic research on gout management and improving guideline methodology appear as sine qua non conditions to reach consensus and improve gout management.

#### "Why does BMI matter?"

#### SP0071 IS OBESITY A RISK FOR RA?

**T. Uhlig.** *Rheumatology, Diakonhjemmet Hospital, Oslo, Norway*

According to the World Health Organisation (WHO) guidelines, individuals with a BMI of >30 kg/m<sup>2</sup> are classified as obese. Obesity is on a global scale rising in prevalence and is a recognised as a cause of chronic disability. As it threatens public health, obesity has attracted significant attention in the general population, especially due to its association with significant metabolic and cardiovascular complications.

In research on rheumatoid arthritis (RA) BMI is frequently reported as a demographic variable, but obesity has not been thoroughly studied. A link between obesity and RA is plausible, as in adipose tissue biologic mechanisms of inflammation exist and may be linked to chronic systemic inflammation.

Obesity has in performed studies been considered a controversial risk factor for RA. While several studies have examined the potential influence of obesity on the development of RA, the results have been inconsistent.

While a few studies from the United States have found no or only modest association between obesity and the risk of RA, some European studies found significant risks for an association between RA and obesity. The prevalence of obesity has risen sharply in recent years which may increase our ability to better study possible associations between obesity and RA in the future. Existing evidence may thus point toward a slightly increased of obesity for the risk of RA.

#### SP0072 DOES OBESITY INFLUENCE RA OUTCOMES ?

**P.D. Kiely.** *Rheumatology, St Georges University Hospitals NHS Foundation Trust, London, UK*

The prevalence of obesity at diagnosis of rheumatoid arthritis (RA) has doubled in N. European and N. American populations from ~14% ten years ago to ~30% now. Several prospective studies of patients with early RA, treated with csDMARD regimens, have found an association of baseline obesity with worse short and long term outcomes including DAS28 remission, low DAS, HAQ, pain assessed by VAS and SF36 physical and mental components. The most recently published cohorts report O.R. of obese RA patients at baseline achieving DAS28 remission of 0.71 (0.55–0.93) at 2 years (versus non obese) and 0.53 (0.39–0.71) at 3 years (versus normal BMI). A variety of composite responses (DAS28, CDAI, SDAI, EULAR) to TNF inhibitors, whether given in fixed dose s.c. or weight dosed i.v. formulations are significantly worse in obese RA patients from trial and registry data. In contrast the DAS28 response to Rituximab in RA patients is not affected by BMI, and ACR responses in Abatacept and Tocilizumab treated RA patients, whilst numerically less good in obese patients, are not disadvantaged by fixed s.c. dosing in comparison to i.v. dosing adjusted by weight.

Obesity is an increasingly prevalent co-morbidity and is associated with worse outcomes, including DAS28 remission, HAQ and pain scores.

#### Musculoskeletal pain; feeding the opioid epidemic

#### SP0073 OPIOID PRESCRIBING: WHAT'S THE PROBLEM?

**B.H. Smith<sup>1,2</sup>**, on behalf of Scottish Pain Research Community (SPaRC). <sup>1</sup>Pain Service, NHS Tayside; <sup>2</sup>Division of Population Health Sciences, University of Dundee, Dundee, UK

Opioids have been used for at least 7,000 years in the treatment of acute pain, to aid sleep and to promote euphoria. Their short-term benefits are well-recognised, but longer-term benefits are less well understood and associated harms well-known. For pain lasting beyond the acute period, the prescribed use of strong opioids was, until recently, mainly restricted to cancer and palliative care, when life expectancy is limited. More recently, however, we have seen rapidly increasing use of both strong and weak opioids for chronic non-malignant pain. This has particularly been in North America where an "opioid epidemic" is apparent, but similar patterns are emerging across the world, including Europe.

The commonest problems with long-term use of opioids include constipation, nausea and sedation. Other, perhaps more serious problems include hyperalgesia,

endocrine and immune dysfunction, mood disorders, tolerance, addiction and death. Our systematic review estimated an incidence of iatrogenic misuse or addiction of ~4% among all people prescribed an opioid. The other problem is with the lack of high quality evidence to support their effectiveness in the long-term relief of pain, as we will hear later. These concerns have prompted the International Association for the Study of Pain to issue a recent carefully-worded statement on the use of opioids in chronic pain, advising caution and close monitoring. This presentation will summarise these issues, and present evidence of the increasing use of opioids in recent years, focusing on Europe and particularly Scotland, where prescribing rates rose 65% in a 10 year period. I will present evidence of both good and potentially harmful prescribing, evidence that most prescribing is "appropriate" in that it is associated with severe chronic pain, and, despite this, that a very large proportion of people with chronic pain are not prescribed any opioid. Opioids may still have a role in chronic non-malignant pain, but the goals of their use need to be increased function and improved quality of life, and we need careful selection of patients and evaluation of outcomes.

**Disclosure of Interest:** B. Smith Grant/research support from: Scottish Government, Chief Scientist Office

**DOI:** 10.1136/annrheumdis-2018-eular.7668

### SP0074 ARE ALL OPIOIDS THE SAME?

C. Stein. *Anesthesiology and Intensive Care Medicine, Charité – Freie Universität Berlin, Berlin, Germany*

Indiscriminate activation of opioid receptors provides pain relief but also severe central and intestinal side effects such as respiratory depression, sedation, addiction, nausea and constipation. Novel strategies to avoid adverse effects include the design of "biased agonists" and of environment-sensitive ligands. Exploiting pathological (rather than physiological) conformation dynamics of opioid receptor-ligand interactions might yield ligands without adverse actions. By computer simulations at low pH, a hallmark of injured tissue, we designed an agonist that, due to its low pKa, selectively activates peripheral mu-opioid receptors in injured/infamed tissue, i.e. at the source of pain generation. Unlike conventional opioids, this agonist showed pH-sensitive binding, G-protein subunit dissociation, and cAMP inhibition *in vitro*. It produced injury-restricted analgesia in rats with different types of inflammatory pain without exhibiting respiratory depression, sedation, constipation or addiction potential.

## What is lupus – syndrome or different entities?\_\_\_\_\_

### SP0075 AUTOANTIBODIES – NOT ALWAYS WHAT THEY SEEM

P.L. Meroni. *Immunorheumatology Research Laboratory, IRCCS Istituto Auxologico Italiano, 20095 Cusano Milanino, Milan, Italy*

Autoantibodies (autoAbs) are the most popular and used biomarkers for systemic rheumatic diseases (SRD). AutoAbs are becoming more and more important for: i) classification (including identification of disease subtypes), ii) diagnosis, iii) prognosis, iv) monitoring activity/organ-tissue damages as well as v) response to therapy. Moreover, autoAbs have been recently used as inclusion criteria in clinical trials and their presence is a formal requisite for prescribing some new drugs. The advent of new techniques, as well as the increasing number of autoimmune diagnostic laboratories, raise the issues of assay variability and reproducibility. In addition, the new techniques need to be validated versus the standard ones in order to determine and possibly improve the correct interpretation of their results. Harmonisation of the assays for autoAbs is becoming increasingly urgent and the availability of suitable reference material for calibration and quality control is emerging as a valuable tool for increasing assay reliability. Several international committees are joining their efforts in order to improve harmonisation and at the same time to avoid misdiagnosis, unnecessary repetition of tests and ultimately to optimise patient care and costs. On the other hand, the correct interpretation of the results depends on the technique used for detecting a given autoantibody and on its own characteristics (Meroni et al. *Nat Rev Rheumatol*. 10:35–43; 2014). The best example is the screening tests for antinuclear antibodies (ANA). Indirect immunofluorescence (IF) ANA testing has been suggested to be the golden

standard technique for ANA screening by the American College Rheumatology task force in 2010 (Meroni and Schur *Ann Rheum Dis*. 69:1420–2; 2010). While the sensitivity of IF ANA is high, its specificity is low as well as its post-test probability. So, the strength of a positive ANA should be evaluated in the clinical context to avoid mistakes (Mahler et al *J Immunol Res*. 2014:315179 2014). In addition, the isolated ANA positivity with specific staining pattern (i.e. dense fine speckled 79 – DFS70) does not support the diagnosis of a SARD and should not be taken into consideration for both classification and inclusion criteria (Mahler et al. *Autoimmun Rev*. 15:198–01; 2016). IF offered advantages in comparison with the screening solid phase assays (SPA) available at the moment of the ACR position paper; however the improvement of the solid phase assays in the last years changed the situation in a substantial way. Advantages and disadvantages of the two techniques have been reviewed and discussed by several groups and none of the two tests appears to satisfy completely our needs. However, the combination of IF and SPA that include the main nuclear (cytoplasmic) antigens diagnostic for SARD, has been reported to display higher specificity and post-test probability than the use of the single tests (Bossuyt et al *Ann Rheum Dis*. 73:e10; 2014). New tests that employ a panel of autoantigens specific for a given subset of SARD (e.g. lupus-like, scleroderma, myositis, anti-phospholipid syndrome) are now available or are going to be launched soon increasing their specificity/post-test probability in a significant manner. For example, the combination of IF and SPA for ANA screening could decrease the risk of "false positive or negative" results, while the use of one screening assay and the new ANA profiles in the context of a specific clinical setting might increase the diagnostic power. In conclusion, our strategy to autoAb testing is changing and we should take advantage of the combination of the new serological tools for better understanding the meaning of a given positive result. The combination of the new tests will be pivotal for addressing the need for a *Personalised Medicine* in rheumatology.

## Genetics, epigenetics and disease: is it all in the genes?\_\_\_\_\_

### SP0076 GENOMIC DISSECTION OF IMMUNE-MEDIATED DISEASE: PROGNOSIS, VASCULITIS AND EOSINOPHILS

K.G. Smith. *Department of Medicine, University of Cambridge, Cambridge, UK*

Modern medicine has developed by classifying disease into defined diagnostic categories on clinical grounds. Even within a specific clinical diagnostic category, however, the features of a disease and the clinical course it takes can vary greatly between individuals. I will examine two examples of how application of genomic technologies to patient cohorts has provided insight into disease behaviour.

1. A distinct biology underlying immune-mediated disease prognosis?

This presentation will explore transcriptome data that defines a clinically useful prognostic biomarker in IBD, but also addresses the specific immunological mechanisms driving long-term outcome many immune-mediated diseases (including SLE and ANCA-associated vasculitis (AAV)), and the genetics that underpins this. Evidence will be presented suggesting that the biology underlying long-term disease outcome, or prognosis, is distinct from that driving specific diagnosis, and represent an under-investigated but clinically relevant aspect of disease pathogenesis.

2. Patient stratification in ANCA-associated vasculitis: GWAS highlights new disease entities.

AAV has been defined using pathological criteria into granulomatosis with polyangiitis (GPA, formerly Wegener's), microscopic polyangiitis (MPA) and eosinophilic granulomatosis with polyangiitis (EGPA, or Churg-Strauss syndrome). GWAS studies performed by the European Vasculitis Genetics Consortium have revealed 4 genetically distinct syndromes within AAV – which are aligned with autoantibody specificity, and better align with clinical phenotype, patient outcome and treatment response than the traditional clinically-defined syndromes. GWAS can therefore be a tool for enhancing patient stratification, and revealing new insights into disease susceptibility and perhaps therapy.

## It's your move: promoting physical activity in people with RMD's

SP0077 NEW INSIGHTS INTO STRATEGIES TO EFFECTIVELY PROMOTE PHYSICAL ACTIVITY

K. Knittle. University of Helsinki, Helsinki, Finland

Physical activity is generally safe and beneficial for people with rheumatic diseases. Despite this, people with rheumatic diseases commonly engage in physical activity at levels which fall below common recommendations. Recent advances in behavioural science and health psychology offer healthcare professionals new tools and methods for promoting physical activity among people with rheumatic conditions. This lecture will present the most recent evidence on the interventions and behaviour change techniques that are most likely to increase motivation for physical activity, help individuals translate their motivation into action, and promote long-term maintenance of physical activity.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.7777

SP0078 THE PATIENTS PERSPECTIVE ON PHYSICAL ACTIVITY AND WORK PARTICIPATION IN RMDs

K. Hamblly. School of Sport and Exercise Sciences, University of Kent, Medway, UK

Fatigue and musculoskeletal symptoms are shared features of many rheumatic and musculoskeletal diseases (RMDs) that often impact on physical activity and work participation. Physical activity is particularly important in the management and quality of life of people with RMDs. Participation in regular exercise can facilitate positive adaptations<sup>1</sup>, but people with RMDs tend to be less physically active than the general population.<sup>2,3</sup>

Two hundred and sixty-eight individuals with antiphospholipid syndrome (APS) participated in a cross-sectional online survey (85% female, mean age 47±11 years, 59% primary APS) on physical activity and exercise. It was found that 82% of participants wanted to increase the amount of physical activity and exercise that they do and 71% of participants were either motivated or very motivated to participate in physical activity and exercise. However, a range of barriers to increasing levels of physical activity and exercise were expressed as summarised in table 1.

**Abstract SP0078 – Table 1.** What is preventing you from increasing the amount of physical activity and exercise that you do?

<b>Energy Levels</b>	Exhaustion, tiredness, no energy after work, ADLs draining, 'payback', fatigue, mentally and physically exhausted, stressful job
<b>Symptoms</b>	Pain, aching, flare, muscle spasms, headaches, migraines, stiffness
<b>Strength, balance and mobility</b>	Bad falls, jelly legs, legs dead weight, balance, dizziness, giddiness, loss of control, mobility, light headed, lack of strength
<b>Fitness</b>	Level of fitness poor, lack of stamina/endurance, overweight, deconditioned
<b>Psychological</b>	Anxiety, depression, worry about side effects, stressful, scary, uncertain what can do, not sure if safe, no willpower, no motivation, no confidence, laziness, worry about negative effect on work
<b>Environment</b>	Resources, membership cost, travel costs
<b>Time</b>	Lack of time, work, carer, dependents, family demands, life too hectic, busy life, have to balance activities, do enough already

From a patient perspective, managing home and work priorities to get things done without compromising health is a tricky task! Self-management is an important skill for anyone with an RMD, but it is a challenging skill to learn as RMDs are often unpredictable and the art of listening to your body takes time and experience. Having the flexibility to adjust the cumulative load and stressors placed on your body and mind in response to your current health status is crucial. Exercise interventions need to be personalised and, importantly, be flexible so that they can be easily adjusted to reflect the health uncertainties and disruptions associated with many RMDs. These adjustments can be made to a variety of parameters including scheduling, type of exercise, volume, frequency, intensity or duration all of which need guidance for the patient. Flexibility can also be incorporated into work participation through changes to work tasks, location, start/finish times, breaks and working from home. In many countries, it is now a legal right to request flexible working and employers have legal obligations to provide reasonable adjustments for individuals with health conditions such as RMDs.

In our APS study, two-thirds of people said that they had not been given any advice regarding participation in physical activity and exercise and of those who

had received advice only 30% thought they had received adequate advice. The latest BMJ Best Practice for APS recommends in patient instructions "exercise regularly".<sup>(4)</sup> However, evidence from our study suggests that people are uncertain as what physical activity they can or should do and the specifics of exercise in terms of type, frequency, duration or intensity. People wanting to exercise looked for guidance from health care professionals as well as online, but found a lack of information regarding the types of exercise they should be doing and how to determine if they were doing too much or too strenuous exercise.

SP0079 MAJOR ACHIEVEMENTS AND FUTURE CHALLENGES IN PHYSICAL ACTIVITY

M.D. Iversen, on behalf of Physical activity working group. Department of Physical Therapy, Movement and Rehabilitation Sciences, Northeastern University, Bouve College of Health Sciences, Boston, USA

Research demonstrates that physical activity and exercise yield numerous health benefits for individuals with arthritis without adversely impacting joint health. Despite these data, individuals with arthritis remain less physically active than their healthy counterparts. Over the past decade, professional organisations and researchers have synthesised these data and incorporated information on the role of physical activity in management guidelines for clinicians and patients, and developed public health campaigns to motivate individuals to become more physically active. Corporations and researchers have also created and launched new software applications to measure, monitor, and promote physical activity for persons with arthritis that are easy to use and readily accessible. This presentation will highlight the major accomplishments related to the measurement of physical activity, promotion of knowledge and self-management skills to promote physical activity at the individual and population level and discuss future challenges regarding the development of effective population-based and individualised interventions to improve physical activity engagement among individuals with arthritis.

SP0080 DATA VISUALISATION: TABLES AND GRAPHS FOR PUBLICATION AND PRESENTATION

M. Boers. Epidemiology and Biostatistics; Amsterdam Rheumatology and immunology Center, VU University Medical Center, Amsterdam, Netherlands

This workshop (held both on Thursday and on Friday) is an introduction to the principles of good graph and table design as pioneered by Cleveland<sup>1</sup> and Tufte<sup>2</sup> and updated by Few<sup>3</sup> so that the participant can better answer the following questions: Which of the messages in my research results requires a graph or table?

Recognising how graphs improve on simple statistics and convey much more information. Knowing when a table is better, or when to keep the data in the body text.

How can I best convey the message?

Striving for clear vision by choice of graph, scaling, discrimination of data series, minimising non-data ink, avoiding chart junk. Striving for clear understanding through a balance between data and explanation. Using order, subheadings, formatting and rules to guide your reader through your table data.

Is my graph/table truthful?

Creating a direct proportion between graph and data quantities, avoiding forms prone to misinterpretation, labels to prevent ambiguity; keeping data in context,

avoiding more dimensions in the graph than in the data. Visualisation in Tables is further discussed in my recent article that is freely downloadable.<sup>4</sup>

This year's course will extend introductory material available via YouTube clips on the ARD website (ard.com)! Direct link: [https://www.youtube.com/playlist?list=PLXU14EQbU\\_V9JpmoAKsaCC0VjZbxzAN](https://www.youtube.com/playlist?list=PLXU14EQbU_V9JpmoAKsaCC0VjZbxzAN)

Note that you can also sign up for a **special lecture**,

"Theory of poster design and presentation" followed by a **poster tour** after the session, devoted to poster design!

Session Title: EULAR Projects – Challenging Projects in Education and Training

Date/Time: Saturday 16.06.2018 08:30–10:00

Room: Room: E106/E107

Followed by Poster Tour, sign up required!

## Challenges of patient organisations' in the 21 st century

### SP0081 PATIENT ORGANISATIONS' CHALLENGES IN A WORLD THAT IS GETTING OLDER – LESS – MORE COLOURFUL

*W. Koesters. Independent, Bergheim, Germany*

We have to see the demographic facts. The most important fact continues to be the birth rate, that is, how many children are born in a country. Because only when children are born, they can start their vocational training or go to college 16 to 18 years later and will be available as qualified workers a few years later. Only those people can in turn have children and bring them up in a way that is sustainable. Only those can become a member of a patient organisation, can be engaged voluntarily.

When you look at the 28 countries in the EU, you will notice that on the one hand the average birth rate is 1.55 (2013) while on the other hand there are still significant differences even within Europe. To keep a population stable, we need 2.08 children per woman aged 15 to 49 years.

The consequences are evident: in almost all European countries the population will shrink without further immigration from abroad or no longer grow on its own. In almost all countries more people will die than be born. This will also have repercussions on the ageing of society and naturally on the demand for products and services too, but also on the potential labour force. This will have consequences for patient organisations too.

At the same time the needs will change because in all countries people continue to get older and live longer. In their old age they will therefore require services for a longer period of time than previous generations: health, nursing care, culture, leisure, housing, support and assistance, travel.

The economy, all companies and professions, the public health, the organisation of daily life will have to face profound changes with long-term effects as well as the associated challenges.

This also against the background of medical doctors becoming older and scarcer as well.

### SP0082 HOW A USER-LED ORGANISATION FOR RMDs ENABLES CITIZEN PARTICIPATION IN PORTUGAL

*E.F. Mateus. Liga Portuguesa Contra As Doenças Reumáticas, Lisbon, Portugal*

One of the first challenges faced by patients' organisations may be to become a user-led organisation. In Portugal, for instance, there is still a strong culture of paternalistic relationship between doctors and patients, which can be a barrier when it comes to recognising leadership skills in a patient. This means that

achieving a user-led model within the organisation depends on a) at least one person (patient or carer) feeling able to come forward and assume the leadership, b) this person's ability to gather more peers for the governing bodies, and c) that this team is accepted by the members of the organisation who are used to the paternalistic model. The important role of PARE and EULAR in providing tools and opportunities for developing skills for the empowerment of patients in advocacy, lobbying and as research partners, will be addressed in this lecture, since it can contribute to overcome some of the identified barriers.

Another challenge may be that the desirable concept of patients' organisations as user-led organisations should be duly recognised, for their acknowledgement as stakeholders in the decision-making processes, representing the people affected by those processes. In Portugal, although the National Health Plan for 2012–2016 and its extension to 2020 considers citizenship-based strategies, the predicted involvement of patients/citizens and their representatives, as a key strategic axis to maximise health gains, had been limited to a couple initiatives without significant patient or public. Several patient and citizen organisations have been advocating for increased and meaningful involvement in health decision-making. In 2015, a working group was established with representatives from 13 patient organisations (including the Portuguese League Against Rheumatic Diseases – LPCDR), one consumer organisation and a research centre. The main objective was to develop a Charter for Public Involvement in Health that could be widely accepted and recognised by health stakeholders. However, the group also felt the need to define a consensus on Eligibility Criteria for the Representation of People with or without Disease in Health Decision-Making in Portugal. The final version of the Charter was discussed with political and health stakeholders in a Forum held at the Portuguese parliament that count about 150 participants. The document will now be presented for a legislative procedure in Portugal and it has been accepted in the public consultation on information to be considered during the preparation of the draft guidelines on the effective implementation of the right to participate in public affairs by the Office of the United Nations High Commissioner for Human Rights (OHCHR). This lecture will also focus on lobbying with several tools, from EULAR EU Affairs, Stene competition, PARE conferences and engagement programme, to patients' organisations networks, as a process for a user-led organisation to be acknowledged as such.

The final challenge to be addressed will be the need to empower the citizens' involvement, through education, training and networking for patient advocacy, patients' involvement on health policy decision-making processes and on research. Several empowerment tools to help applying the «users'» arguments and getting involved in multiple areas, to improve access to care, social protection, sustainability, citizens' rights and patients' quality of life will be presented.

This lecture aims to address some strategies, sharing the Portuguese League Against Rheumatic Diseases (LPCDR) experience on engaging the «users», changing mindsets and tackling the citizen participation of people with Rheumatic and Musculoskeletal Diseases (RMDs) in Portugal.

### SP0083 GAPS IN PATIENT TREATMENT – WHAT PATIENT ORGANISATIONS CAN DO?

*K. Koutsogianni, on behalf of the Arthritis Foundation of Crete. The Arthritis Foundation of Crete, Heraklion, Crete, Greece*

**Background:** Access to healthcare is a basic human right and one of the fundamental principles of European health systems, together with safety, quality, and equity. Unfortunately due to economic crisis and the cuts in healthcare budgets in many countries, inequalities in healthcare have been made worse. Furthermore the healthcare systems are facing increasing demands due to demographic change and the fact that the number of patients with chronic diseases is growing.

**Objectives:** To identify the inequalities in healthcare system and the degree to which the standards of care are affected.

To outline patients organisations challenges in such a demanding environment and their efforts to overcome the gaps in patients' healthcare.

**Methods:** Describe the gaps in patients' access to health care and the degree of their satisfaction from the offered health care services as reflected by the relative EPF survey conducted in 2016 among patients in European countries.

In these challenging conditions, patient organisations should help to fill the gaps and suggest specific solutions by raising awareness about the problems of the patients and the consequences of inadequate healthcare. At the same time they should develop collaborations with the scientific and academic community as well as with other patients' organisations.

**Conclusion:** Patients with chronic and long term conditions have valuable experience as a result of their interaction with the healthcare system and can identify important gaps and propose solutions in order to improve access to healthcare.

## The EULAR Exercise recommendations for physical activity in people with inflammatory arthritis and osteoarthritis

SP0084 WHY PHYSICAL ACTIVITY EXERCISE WORKS

M.D. Iversen, Department of Physical Therapy, Movement and Rehabilitation Sciences, Northeastern University, Bouve College of Health Sciences, Boston, USA

Pain, inflammation, and decreased physical function are consequences of musculoskeletal disorders (MSDs), limiting patients' daily activities and restricting their participation in society. Physical activity and exercise have positive health effects for the circulatory, digestive, endocrine, excretory, immune, integumentary, muscular, nervous, respiratory and skeletal systems. Given the benefits of physical activity and exercise, physical activity is a primary component of symptom management for individuals with musculoskeletal disorders. This presentation will review the short- and long-term effects of physical activity and exercise in general and specifically, for individuals with musculoskeletal disorders, with a focus on the cardiovascular, immune and musculoskeletal systems.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.7837

SP0085 THE EVIDENCE FOR PHYSICAL ACTIVITY IN INFLAMMATORY ARTHRITIS AND OSTEOARTHRITIS

A.-K. Rausch<sup>1,2</sup>, on behalf of Task Force Members of the EULAR endorsed project "EULAR recommendations for physical activity in people with inflammatory arthritis and osteoarthritis". <sup>1</sup>Department of Orthopaedics, Rehabilitation and Physical Therapy, Leiden University Medical Center, Leiden, Netherlands; <sup>2</sup>Institut of Physiotherapy, Zurich University of Applied Sciences, Winterthur, Switzerland

**Objective:** To evaluate the effectiveness of physical activity in people with rheumatoid arthritis, spondyloarthritis and osteoarthritis.

**Methods:** A Systematic review and meta-analysis were performed searching the databases Pubmed/Medline, CENTRAL, Embase, Web of Science, Emtree, PsycInfo up to April 2017. We included randomised controlled trials (RCTs) in adults ( $\geq 18$  years) with rheumatoid arthritis (RA), spondyloarthritis (SpA) and osteoarthritis (OA) investigating the effect of exercise or physical activity (PA) promotion on cardiovascular fitness, muscle strength, flexibility, neuromotor performance, and daily PA. Additionally we applied public health recommendations for PA based on the American College of Sports Medicine (ACSM) principles for effective interventions. Outcomes included assessments done directly after the intervention; If suitable, pooled in a meta-analysis using a random-effect model presented as standardised mean difference (SMD). Study registration in PROSPERO (CRD42017082131).

**Results:** The systematic review included 63 RCTs, of which 44 (3469 people with RA, SpA, OA) were included in the meta-analysis. Moderate effects were found of aerobic exercises and resistance training on cardiovascular fitness (SMD 0.6 (95% CI 0.38 to 0.81)) and muscle strength (SMD 0.54 (95% CI 0.35 to 0.72)) respectively, but no effect of combined exercises on flexibility (SMD 0.12 (95% CI -0.16 to 0.41)). PA promotion interventions produced a small increase in PA behaviour (SMD 0.21 (95% CI 0.03 to 0.38)).

**Conclusion:** Exercising and PA promotion according to public recommendations for PA were effective on cardiovascular fitness and muscle strength, with moderate, and thus clinically relevant effect sizes in people with SpA, RA and OA.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.7804

SP0086 THE DEVELOPMENT AND PURPOSE OF THE EULAR RECOMMENDATIONS FOR PHYSICAL ACTIVITY IN PEOPLE WITH INFLAMMATORY ARTHRITIS AND OSTEOARTHRITIS

K. Niedermann, on behalf of Task Force of the project "EULAR recommendations for physical activity in people with inflammatory arthritis and osteoarthritis". School of Health Professions, Zurich University of Applied Sciences, Winterthur, Switzerland

**Objective:** Regular physical activity (PA) is increasingly promoted for people with rheumatic and musculoskeletal diseases as well as the general population. We evaluated if the public health recommendations for PA are applicable for people

with inflammatory arthritis (iA; Rheumatoid Arthritis and Spondyloarthritis) and osteoarthritis (OA) in order to develop evidence-based recommendations for advice and guidance on PA in clinical practice.

**Methods:** The EULAR standardised operating procedures for the development of recommendations were followed. A task force (including rheumatologists, other medical specialists and physicians, health professionals, patients and methodologists) from 16 countries met twice. In the first task force meeting, 13 research questions to support a systematic literature review (SLR) were identified and defined. In the second meeting, the SLR evidence was presented and discussed before the recommendations, research agenda and education agenda were formulated.

**Results:** The task force developed and agreed on four overarching principles and ten recommendations for PA in people with iA and OA. The mean level of agreement between the task force members ranged between 9.8 to 8.8. Given the evidence for its effectiveness, feasibility and safety, PA is advocated as an integral part of standard care throughout the course of these diseases. Finally, the task force agreed on a related research and education agenda.

**Conclusion:** Evidence and expert opinion inform these recommendations to provide guidance in the development, conduct and evaluation of PA interventions and promotion in patients with iA and OA. It is advised that these recommendations should be implemented considering individual needs and national health systems.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.7807

SP0087 HOW TO DEAL WITH CARDIOVASCULAR RISK FACTORS FOR PHYSICAL ACTIVITY AND IMPLEMENT THE PA RECOMMENDATIONS IN THE RHEUMATOLOGIC PRACTICE?

M. Nurmohamed, on behalf of E-RAC study Group: Edelaar L, van der Esch M, Nurmohamed M. Amsterdam Rheumatology immunology Center | VUmc and Reade, Amsterdam, Netherlands

How to deal with cardiovascular risk factors for physical activity and implement the PA recommendations in the rheumatologic practice?

Nowadays, physical activity is increasingly advocated not only for the general population but also for patients with inflammatory arthritis as well as osteoarthritis. Generally, physical activity has favourable effects on cardiovascular risk factors. A recent systematic review revealed moderate, statistically significant improvements in blood pressure, LDL-cholesterol, and total cholesterol levels after about one year (additional) physical activity. Also the BMI improved and the effects appear to be a dose-related but not with all cardiovascular risk factors. Nevertheless, these favourable modest effects on cardiovascular risk factors could result in a clinically relevant reduction of cardiovascular events, provided that the physical activity remains enhanced albeit that thus far the evidence towards a reduction of cardiovascular events is not unequivocal.

It is important to realise that this review generally comprised persons without cardiovascular disease or risk factors for cardiovascular disease. It's well known that (very) high intensity exercise results in a small absolute increase of myocardial infarction in comparison to those who have less strenuous physical exertion. The risk is the highest in those who exercised less than one time per week.

Therefore, the American College of Sports Medicine (ACSM) developed an exercise preparticipation health screening process to mitigate these risks. Recommendations were developed for those 1) who should receive medical permission before starting a physical exercise program 2) with clinically significant disease(s) who may benefit from physical activity under medical supervision and 3) with medical conditions that excludes them from participation in physical activity programs. The health screening advices of the ASCM are based on an health screening logic model for aerobic exercise participation that takes the current level of physical activity, 2) presence of signs or symptoms and/or known cardiovascular disease/risk factors and 3) desired physical activity into account.

However, the ASCM guidelines do not apply for patients with inflammatory joint disorders such as rheumatoid arthritis (RA). RA is associated with increased overall mortality compared to the general population, with cardiovascular diseases as one of the main causes.

The optimisation of management of cardiovascular risk in RA patients is an important aim in the treatment. Active counselling is indispensable, including also attention to exercise, particularly in RA patients with a high CV risk, defined as a 10 year CV risk of 20% or higher. Physical exercise for these patients is necessary and challenging since professionals should take multiple factors into account, such as comorbid conditions related to CV risk (e.g. hypertension, diabetes mellitus and obesity). However, the effects of exercise therapy on CV risk in RA patients are unknown and the required intensity is also unknown.

Therefore, we are currently developing a tailor-made exercise therapy program for these complex patients that will evaluate the effects of exercise therapy on cardiorespiratory fitness and several secondary outcomes.

## Capillaroscopy I

### SP0088 THE IMPORTANCE TO DIFFERENTIATE NORMAL FROM ABNORMAL CAPILLAROSCOPIC IMAGES FOR AN EARLY DIAGNOSIS OF DISEASE

V. Smith<sup>1,2</sup>, on behalf of the EULAR Study Group on microcirculation in Rheumatic diseases. <sup>1</sup>Department of Rheumatology, Ghent University Hospital; <sup>2</sup>Department of Internal Medicine, Ghent University, Ghent, Belgium

Medical doctors frequently get patients with Raynaud's phenomenon (RP), a frequent symptom in the general population, referred. The importance of distinguishing normal capillaroscopic findings from (pathognomonic) abnormal (pathological) findings, lies in the fact that this distinction allows the differentiation between a primary RP (not connected to any connective tissue disease [CTD]) from a secondary RP due to systemic sclerosis (SSc) and diseases of the scleroderma spectrum.

What is normal in primary RP?

A normal capillaroscopic pattern, by qualitative assessment, is characterised by a homogeneous distribution of hairpin shaped capillaries as a "comb-like structure", with a density of between 9–14 capillaries per mm. Yet, there exists a wide intra- and inter-individual variety in a normal population which will be discussed in this session.

What is pathognomonic abnormal in patients with RP due to SSc?

Patients with the RP who have an underlying clinically recognisable (=with skin involvement) SSc show a very characteristic combination of capillary abnormalities in the nailfold, which can easily be assessed through qualitative assessment (=pattern recognition). Maricq et al. described last century, with the widefield technique (magnification X12–14) the scleroderma pattern. This pathognomonic combination contains the following: a striking widening of all three segments of the capillary loop (arterial, venous and intermediate), loss of capillaries and disorganisation of the nailfold capillary bed. Many branched "bushy" capillaries may also be observed.

In 2000, Cutolo et al. qualitatively assessed the nailfolds of an SSc cohort with patients fulfilling the American College of Rheumatology (ACR) criteria for SSc with the nailfold videocapillaroscopic (NVC) technique (magnification X200). According to the different proportions of the hallmark parameters of the scleroderma pattern (giants, capillary loss, haemorrhages and (neo) angiogenesis Cutolo et al. defined three patterns "early", "active" and "late".

The central role of capillaroscopy in distinction between a primary and secondary RP due to SSc is reflected by the fact that capillaroscopy is one of the new ACR/EULAR criteria for classifying a patient as having SSc.

Besides playing a paramount role in distinguishing a primary from secondary RP, capillaroscopy has an additional role. It can inform the rheumatologist dealing with a patient population with merely the RP and no other signs of a CTD, who will futurely develop SSc. This role is reflected by capillaroscopy playing a central role in the LeRoy and VEDOSS criteria for (very) early diagnosis of SSc.

What about capillaroscopic morphology in connective tissue diseases other than SSc?

No large scale prospective cohorts exist describing capillaroscopic morphology in connective tissue diseases other than SSc. Moreover, several morphologic

definitions exist across literature of different schools. The EULAR Study Group on microcirculation in Rheumatic diseases was set up in 2014 to tackle, in between others these working points.

### SP0089 HOW TO DISTINGUISH THE MAJOR CAPILLAROSCOPIC PATTERNS

A.L. Herrick. *University of Manchester, Manchester, UK*

The most well-known pattern of capillaroscopic abnormality is the 'systemic sclerosis-pattern', characterised by dilated capillary loops, areas of avascularity, haemorrhages and distortion of the normal nailfold architecture. Cutolo and colleagues have described three patterns within this spectrum: 'early', 'active' and 'late', on the basis of numbers of giant capillaries and of microhaemorrhages, the extent of capillary loss and of disorganisation of the capillary architecture, and the presence of angiogenesis.<sup>1</sup> Systemic sclerosis-pattern abnormalities are also seen in patients with inflammatory muscle disease, especially in those with dermatomyositis, when areas of angiogenesis ('bushy' or 'ramified' capillaries), are very commonly seen.

Abnormalities have also been described in other diseases, but these are less specific. This lecture will illustrate the different patterns of abnormality with a focus on systemic sclerosis and inflammatory muscle disease. Capillaroscopic patterns which have been reported in systemic lupus erythematosus, antiphospholipid syndrome, and childhood connective tissue diseases will also be described.

## Ultrasound advanced I

### SP0090 US FOR PULLEY LESIONS – CLINICAL RELEVANCE

L. Möller, on behalf of the EULAR Study Group on microcirculation in Rheumatic diseases. *Rheumatology, anatomy, Instituto Poal de Reumatologia, Universidad de Barcelona, Spain*

In the human body the pulleys are represented as structures that change the path of a tendon as they pass over them. The pulleys are composed of fibrocartilage (finger pulleys), cartilage (trochlea of the eye), ligament (extensor retinaculum) or bone (lateral malleolus). The clinical relevance of the pulleys of the flexor digitorum tendons (FDT) of the hand is indisputable in that it affects the flexion and excursion efficiency of the FDT and can generate pain. This system is composed of the transverse carpal ligament, the palmar aponeurosis pulley, and the digital flexor pulley system. There is some controversy about the functional relevance of the injury of the different FDT pulleys including the palmar aponeurotic pulley.

Pulleys can be affected by different conditions including chondroid metaplasia, tenosynovial ganglions, traumatic or inflammatory lesions of the FDT sheet, sport practice or work activities. Changes in thickness have recently been identified in flexor pulleys in patients with psoriasis arthropathy with a history of dactylitis and have been related to the so-called Koebner response.

Musculoskeletal ultrasound allows the visualisation of these structures statically and dynamically while at the same time it is an instrument to increase the precision in steroid injection of the trigger finger when is needed

**SP0091 US FOR PERIPHERAL NERVE ENTRAPMENTS + DEMO**

D.A. Bong<sup>1,2</sup>, on behalf of Euler Working Group-anatomy for the Image. <sup>1</sup>Institut Poal de Reumatologia, Barcelona; <sup>2</sup>Facultat de Medicina, Universitat de Barcelona, Spain

Symptoms related to entrapment of the peripheral nerves of the upper and lower extremity are common in rheumatologic practice and are often misinterpreted as articular or non neurologic periarticular pathology. Owing to the variable trajectory and mobility of the peripheral nerves, high resolution musculoskeletal ultrasound (US) has many advantages over other imaging modalities including superior resolution, ability to perform a dynamic real-time examination, precise sonopalpation and comparison with the contralateral structures. Its availability, relative ease of application in experienced hands and tolerance argue for its use as the initial "intervention" when compared to electrophysiologic testing. Large, medium and many smaller nerves can be imaged directly (along with the musculoskeletal terrain through which they pass ) depending on the quality of the instrumentation, skill and anatomic knowledge of the sonographer. Even pathologic involvement of smallest "nonvisualized" small nerves may be deduced by secondary changes of the innervated musculature, the so-called "echo-myogram". Obviously a thorough knowledge of the peripheral neuroanatomy and musculoskeletal relationships along the nerve trajectory is the key to an enhanced and reliable evaluation. This presentation will focus on the principles of neuro-sonoanatomy of the major peripheral nerve of the extremities and the fundamentals of the peripheral nerve US examination will be demonstrated.

**SP0092 US FOR SCORING SJÖGREN DISEASE**

S. Jousse-Joulin, on behalf of omeract task force. *rheumatology, cavale blanche hospital, brest, France*

Sjogren's syndrome (SS) is a chronic autoimmune inflammatory disorder of exocrine glands. Its diagnosis relies on solely a combination of clinical and laboratory findings. Recently, new imaging techniques as MRI or ultrasound, known to be less invasive than sialography have shown a good sensitivity and specificity to detect structural abnormalities in pSS. Ultrasonography of the salivary glands (SGUS) appears to be the most attractive imaging approach: it is an inexpensive commonly available noninvasive technique that does not cause complications and inconvenience to the patient, although the data are somewhat conflicting. A systematic literature review has highlighted the main keypoints to validate salivary glands ultrasonography has an outcome measure in particular, there are limited data describing a standardised scanning method and standardised definitions of US gland pathologies.<sup>1</sup> Until now, both parotid glands and submandibular glands were assessed using a scoring system first developed by de Vita et al.<sup>2</sup> later modified by other investigators. Five scoring systems are now published which are frequently modified by different operators<sup>3-6</sup> but their reliability were not always evaluated. In order to use SGUS in clinical routine, we need to have standardisation of the US procedure to assess SG and to be capable to have a simple and reliable score to rate structural damage of each. A SGUS OMERACT task force was created in 2016 and produce consensual US definitions of the 6 major salivary glands and a semi quantitative scoring. The intra and inter reliability of this scoring between international experts showed good inter reliability and excellent intra reliability. We will present to you the definitions and the new semi quantitative scoring with a live demo.

**THURSDAY, 14 JUNE 2018****Immune senescence and ageing****SP0093 RESETTING THE IMMUNE SYSTEM IN AUTOIMMUNITY**

E. Van Wijk. *Laboratory of Translational Immunology, University Medical Centre Utrecht, Utrecht, Netherlands*

Autologous hematopoietic stem cell transplantation (HSCT) is a last resort treatment for refractory autoimmune patients and the only therapy so far that can induce long-term drug-free remission in these patients. Understanding the mechanisms responsible for this regained immune tolerance may help to develop other, less aggressive immune-mediated interventions with a similar outcome. Although the underlying mechanisms are incompletely understood, extensive immune ablation followed by autologous stem cell infusion seems to be able to rewire a faulty immune system. It is so far unknown which cells need to be removed prior to autologous transplantation and which cells are important in controlling disease after transplantation. We have previously shown that transplantation restores immune tolerance by renewal and modulation of both the CD4 effector T cell (Teff) and FOXP3 Treg compartment in a proteoglycan induced arthritis (PGIA) mouse model. In the human setting we further looked into T cell renewal by TCR CDR3 b chain repertoire sequencing prior to and post HSCT of juvenile idiopathic arthritis and dermatomyositis patients. We found that TCR beta chain diversity of Treg was highly restricted prior to transplantation and that the TCR b chain diversity of Treg increased post-transplantation. The TCR beta chain diversity of the CD4 non-Treg compartment also expanded after aSCT, although not as strikingly as the Treg compartment, indicating that the Treg compartment is more affected. Interestingly, in patients these highly dominant T(reg) cell clones persist over time and (locally) expand with every relapse of disease. The question is now how HSCT or related therapies can efficiently target and stimulate T cell renewal in chronic autoimmune inflammation, with limited toxicity.

**FRIDAY, 15 JUNE 2018****Special delivery: Intercellular communication****SP0094 NEW INSIGHTS INTO ANTIBODY-BASED THERAPIES AND DISEASE SUSCEPTIBILITIES REVEALED BY MICROSCOPY OF HUMAN NK CELLS**

D.M. Davis. *Manchester Collaborative Centre for Inflammation Research, University of Manchester, Manchester, UK*

**Background:** Natural Killer (NK) cells express the Fc receptor CD16 (FcγRIIIa), which can trigger antibody-dependant cellular cytotoxicity (ADCC) against opsonized cells. ADCC is clinically important as one of the mechanisms by which therapeutic antibodies work. The anti-CD20 mAb rituximab is, for example, widely used for targeting B cells in treatments of autoimmune disease and non-Hodgkin's lymphoma. Here, we set out to study individual NK cell-target cell interactions by microscopy to determine what happens as NK cells meet different target cells sequentially, some opsonised and some not.

In addition, genetic diversity in human NK cell receptors has been linked with resistance and susceptibility to many diseases, but underlying mechanisms remain unclear. The effect of this genetic diversity on the cell surface organisation and signalling of receptors is a major unknown. Thus, we set out to study the organisation and signalling of inhibitory Killer Ig-like receptors (KIR) encoded by different genes and alleles using super-resolution microscopy.

**Results:** We found that repeated activation via CD16 decreased the amount of perforin secreted. However, perforin secretion was restored upon subsequent activation via a different NK cell activating receptor, NKG2D. Repeated stimulation via NKG2D also decreased perforin secretion but this was not rescued by stimulation via CD16. These different outcomes of sequential stimulation could be accounted for by shedding of CD16 being triggered by cellular activation. Shedding of CD16 also increased NK cell motility and allowed for detachment of NK cells from target cells. In turn, this aided NK cell survival and boosted serial engagement of target cells.

In addition, we report that inhibitory NK cell receptors encoded by different genes and alleles organise differently at the surface of primary human NK cells. In particular, expression level has major effects on receptor organisation. KIR that are expressed at a low level assemble in smaller clusters than KIR that are highly expressed. Unexpectedly, upon receptor triggering, low-expressed receptors in smaller clusters generate more phosphorylated Crk than highly expressed receptors.

**Conclusions:** <sup>(1)</sup> Shedding of the Fc receptor CD16 has an unexpectedly complex impact on NK cell responses. Shedding this receptor renders NK cells less potent at CD16-mediated activation, as expected, but promotes the detachment from opsonized targets to aid sequential target cell surveillance. Thus, counter-intuitively, shedding of Fc receptor CD16 can positively impact immune responses.

<sup>(2)</sup> Genetic variation modulates the nanoscale organisation of inhibitory NK cell receptors, which in turn impacts receptor signalling. This may be important in how genetic variation impacts immune responses and disease susceptibilities.

#### SP0095 INFLAMMATORY CYTOKINES AS KEY MESSENGERS OF THE IMMUNE SYSTEM

M.I. Koenders, *Experimental Rheumatology, Radboud university medical center, Nijmegen, Netherlands*

Intercellular communication is mediated by direct cell contact as well as via soluble factors like cytokines. Cytokines are signalling proteins that bind to a receptor on a recipient cell, thereby activating an intracellular signalling pathway. This in turn may affect various biological functions like activation, differentiation or proliferation of the cell.

In this lecture, the role of inflammatory cytokines as key messengers of the immune system will be discussed. Targeting of hallmark cytokines in rheumatic diseases, like TNF, IL-6, GM-CSF, and IL-17, has changed the therapeutic landscape, and novel pro-inflammatory cytokines are currently under investigation as therapeutic targets. Furthermore, anti-inflammatory cytokines may be applied as therapeutic agents.

Cytokines act on the innate and adaptive immune system, as well as on non-immune cells. How exactly do these key messengers control our immune system in health and disease?

To unravel the cytokine network that drives the dysregulated immune system in rheumatic diseases, findings from *in vitro* studies, animal experiments and clinical trials will be combined.

### WIN and HOT session

#### SP0096 ADVANCES IN THE MANAGEMENT OF OSTEOPOROSIS

C. Roux, *Rhumatologie, Hôpital Cochin, Paris, France*

The number of fractures related to osteoporosis is expected to increase in the next few decades, because of the increasing number of frail elderly patients at high risk of falls and fractures. Guidelines are available worldwide for the screening of patients at high risk of fracture, and for appropriate treatment including non pharmacological treatments for falls prevention: A number of questions will be discussed during the session. Why should we treat? Because the burden of osteoporosis is related to fractures, and their consequences on morbidity, and even on mortality for the more severe ones. When should we treat? There is an immediate increase of sustaining a new fracture in the 2–3 years following a first one; this represents a unique window of opportunity for treatment. How should we treat? Treatments are effective in prevention of fracture, and re fracture, providing that we use the more effective treatment, with the appropriate sequences. How long should we treat? The treat to target strategy must be used in patients having a low bone mineral density, and obtaining a T score above –2 is a reachable target. A current challenge is the patients' view on side effects of the treatments; although they are very rare, their perception is very high. A number of qualitative studies sought to assess patients' fears and beliefs and provide wordings to clarify the fracture risk concept. The prevention of fragility fractures is now within our reach.

#### SP0097 CHECK-POINT INHIBITORS: WHAT ARE THEY USED FOR, ABOUT SIDE-EFFECTS AND PREDICTION OF EFFICACY

E. Kapiteijn, *Medical Oncology, LUMC, Leiden, Netherlands*

The development of immune checkpoint inhibitors targeting cytotoxic T-lymphocyte antigen 4 (CTLA-4), programmed cell death-1 (PD-1) and programmed

death-ligand 1 (PD-L1) have significantly improved the treatment of a variety of metastasized cancers, such as melanoma, lung cancer, renal and bladder cancer. Immune checkpoint inhibitors enhance antitumor immunity by blocking negative regulators of T-cell function that exist both on immune cells and on tumour cells. Although these agents can lead to remarkable responses, their use can also be associated with unique immune-related adverse effects (irAEs).

Consensus guidelines regarding the treatment of the most common irAEs including rash, colitis, hepatitis, endocrinopathies, and pneumonitis have been established. The mainstay of irAE treatment consists of immunosuppression with corticosteroids or other immunosuppressant agents such as infliximab; most irAEs will resolve with appropriate management.

Nevertheless, a substantial proportion of patients treated with checkpoint inhibitors do not respond. Several markers have shown promising predictive value, including baseline and post-treatment changes in leucocyte counts, lactate dehydrogenase and C-reactive protein. To date, research on routinely available blood, biopsies and clinical markers has focused primarily on checkpoint inhibitors use in melanoma and lung cancer, but preliminary evidence is emerging for other cancer types.

#### SP0098 HOT SESSION: IMMUNE RELATED ADVERSE EVENTS FROM CHECKPOINT INHIBITOR THERAPY

L. Calabrese, on behalf of IRaeS eular. *Rheumatology, Cleveland Clinic, - Cleveland, USA*

Advances in cancer immunotherapy have made it now one of the cornerstones of care for patients with malignancies. Much of these advances have come through the development of checkpoint inhibitors which target negative regulatory signals in the adaptive immune response leading to re-invigoration of cell mediated immunity which had become suppressed or exhausted within the tumoral environment. With such reinvigorated immune response a collateral effect has been the development of autoimmune and or autoinflammatory complications (known as immune related adverse events or irAEs) seen in virtually every organ system. Among these are rheumatic complications estimated to observe in 4%–7% of the exposed population and often requiring acute and chronic immunosuppression to adequately manage. Numerous rheumatic irAEs have been reported the most common of which is inflammatory arthritis as well as myositis, PMR, vasculitis and sicca and others. Rheumatologists are now increasingly seeing such patients as the proliferation of checkpoint therapy increases (three are estimated to be several hundred thousand patients on such therapy in the US with another 1 00 000 patients in varying clinical trial of cancer immunotherapeutics). irAEs in general have been posited to be the potential Achilles heel of cancer immunotherapy. Rheumatologist will be increasingly called upon to take key roles in the management of irAEs with a broad spectrum of immunosuppressive and targeted therapies.

### Challenges in systemic lupus diagnosis

#### SP0099 A CASE OF PAINFUL DYSPNEA

M. Gatto, *Unit of Rheumatology, University of Padova, Padova, Italy*

A 20-year-old female patient was admitted to ER due to dyspnea and stinging chest and interscapular pain, associated with neck pain worsened by physical exercise.

She reported worsening of respiratory symptoms in the past ten days and concomitant onset of acrocyanosis. At physical examination she displayed tachycardia and tachypnea, no abnormalities at lung auscultation, with oxygen saturation 94% at pulse oxymeter. Arterial blood gas tests showed a decreased pO<sub>2</sub> and pCO<sub>2</sub>. Urgent blood examination showed low leucocyte count 2900/mm<sup>3</sup> and mild normocytic anaemia Hb 10.8 g/dl. Due to chest pain, dyspnea and concomitant gas findings, a CT scan was prompted in the suspicion of pulmonary embolism, yet no vascular abnormalities were shown, but a small rim of pleural fluid at the right base.

The patient was admitted to Internal medicine department where she underwent pulmonary function tests showing a restrictive respiratory pattern with decreased TLCO and but normal KCO. HRCT was performed ruling out interstitial lung disease. Elevation of right emidiaphragm was shown at AP imaging.

Upcoming blood and urine analysis showed increased serum creatinine with proteinuria 1 g/day and hematuria. Following interdisciplinary consultation immunologic investigations were performed showing elevated titres of ANA, anti-dsDNA and decreased complement levels.

The patient was diagnosed with SLE with shrinking lung and active renal involvement and was referred to Rheumatology Unit where treatment was initiated with prednisone 0.5 mg/kg/day and mycophenolate mofetil 2 g/day. Respiratory symptoms as well as pulmonary function tests improved within some days after initiation of steroid treatment.

After 12 months the patient displayed still abnormally restrictive respiratory pattern at pulmonary function tests, despite clinical improvement. She was also displaying proteinuria 0.8 g/day with active urinary sediment and rising anti-dsDNA antibodies. Thus, she underwent Rituximab 1 g 2 weeks apart with subsequent improvement of both renal and respiratory signs and symptoms. Improvement remained stable at 2 years.

**Disclosure of Interest:** None declared

#### SP0100 NEUROPSYCHIATRIC LUPUS OR NOT?

A. Fanouriakis. *Rheumatology and Clinical Immunology, 4th Department of Internal Medicine, "Attikon" University Hospital, Athens, Greece*

A 30 year old woman with a 10 year history of SLE was admitted in the Emergency Department with severe headache, drowsiness and vertigo. Brain magnetic resonance imaging revealed an extensive ischaemic stroke in the cerebellum. During the month prior to the episode, the patient had not been feeling well, complaining for arthralgias, fatigue, hair-loss, low grade-fever and the progressively deteriorating headache.

Should this patient's ischaemic stroke be attributed to lupus? Moreover, if yes, does it represent a thrombotic or an inflammatory process?

The second patient, a 38 year old woman of Asian descent, was referred to our Unit due to refractory seizures and status epilepticus for the past two years. On initial presentation, she had fever, mild leukopenia, low C3 and C4 levels and positive ANA (titer 1:320). She had been previously treated by different neurologists, with a combination of antiepileptic drugs, with no success. Brain magnetic resonance imaging was repeatedly unremarkable and electroencephalogram revealed mild epileptiform changes.

Does this patient represent a case of *bona fide* neuropsychiatric lupus?

### Understanding the language of basic research, epidemiology and health services articles

#### SP0101 UNDERSTANDING THE LANGUAGE OF EPIDEMIOLOGY ARTICLES

W.G. Dixon. *The University of Manchester, Manchester, UK*

'Clinical and Epidemiological Research' is one of two headings for original articles in the Annals of Rheumatic Disease. But what *is* epidemiological research? What do all those different types of bias mean? And what do all of those bizarre statistical terms mean? How can I make sense of the research, and how is it relevant to my practice? Answer: Attend the lecture and find out.

**Disclosure of Interest:** W. Dixon Consultant for: Google, Bayer

**DOI:** 10.1136/annrheumdis-2018-eular.7801

#### SP0102 UNDERSTANDING THE LANGUAGE OF HEALTH SERVICES ARTICLES

L. Carmona. *IMusc, Madrid, Spain*

The only difference of Health services Research with other types of research is the study unit observed. This goes beyond individuals and it may likely refer to doctors, their clinics, or even countries. We still need to work on hypotheses, although some exploratory research can be done; and we always need to start with a research question. If you are unable to find a research question in an original article, remember: stop reading. We will review some of the top questions answered by health services research, such as performance of doctors and services, efficacy of complex interventions, and inequalities. In addition, we will review basic concepts, such as what is an indicator, very frequently used as outcome

measures, or what makes a best practice, as well as some special difficulties, such as multilevel (AKA hierarchical) models or instrumental variables. To end, we will review basic concepts in qualitative research, needed to understand the papers dealing with health services research.

### Joint EULAR – ESSR session on: The role of MR imaging in rheumatic diseases and its clinical implications

#### SP0103 INDICATIONS AND CLINICAL IMPLICATIONS OF MR IMAGING IN RA

B. Ostendorf. *Rheumatology, Dept. of Rheumatology and Hiller-Institute for Experimental Rheumatology, Düsseldorf, Germany*

In clinical practice, rheumatologists most frequently use imaging techniques to explore bone and soft-tissue involvement in RA. MRI is the best noninvasive, observer-independent imaging modality technique that has advantages over clinical examination and conventional radiographs for assessing joint damage and soft tissue inflammation, which are common features even in the earliest stages of RA. MRI provides multiplanar images with a high degree of resolution without ionising radiation. Based on these characteristics, MRI identifies early signs of arthritis where other imaging modalities failed. Main indications for MRI in RA consequently are to determine joint involvement, differential diagnosis and early diagnosis of inflammation, such as synovial changes, changes in tendon sheaths and bursae, as well as bone marrow oedema (BME), not detected by clinical examination, BME even also not by ultrasound. The presence of BME has added benefits to modern diagnostic criteria, and anti-citrullinated peptide antibody positive patients have demonstrated higher osteitis scores. Additionally, MRI helps to assess and define prognosis and outcome, because synovitis and BME are risk factors for the progression of structural changes. Growing data on the validity of MRI in predicting and assessment of treatment response are available as well. Recent evidence has demonstrated that MRI inflammatory parameters are frequent findings in RA with clinical remission and low disease activity states, which has impact on treatment changes. MRI helps to identify at-risk individuals with arthralgia without clinical arthritis, furthermore these patients with defined RA and high risk for disease progression leading to therapy escalation and also may limit unnecessary treatment with potentially expensive biologic drugs. Studies that directly assess how MRI use in clinical care might even influence decision making, quality of care and cost effective delivery of that care. Clinical studies answering these questions of regular use of MRI are warranted.

#### SP0104 INDICATIONS AND CLINICAL IMPLICATIONS OF MAGNETIC RESONANCE IMAGING IN SPONDYLOARTHRITIS

M. Østergaard. *Copenhagen Center for Arthritis Research, Copenhagen University Hospital Rigshospitalet, Glostrup, Denmark*

Axial spondyloarthritis (axSpA) is a chronic inflammatory disease that affects the sacroiliac joints and the spine. Whereas early disease is characterised by inflammation, severe structural damage may occur later in the disease course.

Magnetic resonance imaging (MRI) can detect inflammatory lesions (bone marrow oedema (BME)/osteitis), and structural lesions (erosions, bone spurs, ankylosis and fat metaplasia).

In patients suspected for axial spondyloarthritis (axSpA) in clinical practice, MRI has a key role for early diagnosis of axial SpA, since MRI is by far the best available method for early detection of inflammation in the spine and sacroiliac joints. MRI is also more sensitive and accurate for assessment of structural sacroiliac changes than conventional radiography. Differential diagnoses, including anatomical variations, degenerative disease, osteitis condensans ilii, infections and others, should of course always be considered.

In patients with diagnosed axial SpA, MRI is the method of choice for sensitive objective monitoring of axial inflammation, and also peripheral inflammation and damage can be assessed. Whole-body MRI is a promising method, which may become important for simultaneous assessment of axial and peripheral disease manifestations in one examination. Furthermore, MRI can provide information which may help predict the response to therapy and the risk of subsequent progression of structural damage.

The present talk will describe the indications and implications of using MRI in spondyloarthritis in the diagnosis and management of SpA, taking a starting point in the "EULAR recommendations for the use of imaging in the diagnosis and management of spondyloarthritis in clinical practice"; Mandl et al, *Ann Rheum Dis* 2015 74:1327–1339), the "Recommendations of the ESSR Arthritis Subcommittee for the Use of Magnetic Resonance Imaging in Musculoskeletal Rheumatic Diseases"; Sudot-Szopińska et al, *Semin Musculoskelet Radiol* 2015 19:396–411) and the recent update from The Assessment in SpondyloArthritis International Society (ASAS) MRI working group; Lambert et al. *Ann Rheum Dis* 2016 75:1958–1963). However, selected data from important clinical studies will also be described.

**Disclosure of Interest:** None declared

#### SP0105 MRI IN EARLY AND ESTABLISHED SPA: WHAT IS THE ADDED VALUE?

*I. Eshed. Diagnostic Imaging, Sheba Medical Center, Ramat Gan, Israel*

MRI of the sacroiliac joints (SIJ) and of the spine has revolutionised diagnosis of early spondyloarthritis (SpA).

With its high contrast resolution, it is able to detect inflammation of the SIJ in its early stage before structural damage occurs. The introduction of biological drugs from the has further emphasised the need for early diagnosis of sacroiliitis. Since the treatment is to be used in a narrow window of opportunity to reach disease control, MRI was rapidly embraced as a dominant diagnostic tool and at the same time included into the classification criteria for axSpA becoming the cornerstone of SpA diagnosis. In this presentation, the early and more established imaging characteristics of sacroiliitis will be discussed in context of other imaging modalities and potential differential diagnoses.

### The stromal link to inflammation

#### SP0106 FIBROBLASTS: THEIR ROLES IN MATRIX AND VESSELS

*J. Distler. Department of Internal Medicine 3, University of Erlangen, Erlangen, Germany*

Persistent activation of fibroblasts is a common denominator of fibrotic diseases but mechanistically incompletely defined. In contrast to physiologic tissue repair responses, fibroblasts remain persistently active in fibrotic diseases and continue to release excessive amounts of extracellular matrix. We will discuss novel insights into the molecular mechanisms underlying the uncontrolled activation of fibroblasts in fibrotic diseases and potential implications of those findings for targeted antifibrotic therapies.

### New approaches in measuring what matters to patients

#### SP0107 WHAT CAN BAYESIAN STATISTICS CONTRIBUTE TO MEASURING PATIENT PERSPECTIVES?

*V. Ritschl. Section for Outcomes Research, CMSIIS – Center for Medical Statistics, Informatics, and Intelligent Systems, Medical University of Vienna, Vienna, Austria*

Thomas Bayes (1701–1761) founded the Bayesian approach, published as "Essay Towards Solving a Problem in the Doctrine of Chances" in 1763 as a new philosophy in inferential statistics opposed to the classical, frequentist approach. Frequentists test whether a hypothesis is true or false with a certain probability. The Bayesian approach depends on conditional probability which takes prior

knowledge (a prior distribution of probabilities) into account. An example for the use of the Bayesian approach is a self-reported instrument that assesses function in rheumatic and musculoskeletal diseases. This instrument produces worse scores with higher age due to the increasing incidence of physical disability. The prior knowledge (higher age leading to a worse function score) should be taken into account when the scores of the instruments are interpreted.

**Disclosure of Interest:** None declared

#### SP0108 NEW APPROACHES IN MEASURING WHAT MATTERS TO PATIENTS – DECISION AID TOOLS

*H. Bekker. Chair in Medical Decision Making, School of Medicine – University of Leeds, Leeds, UK*

**Purpose:** To explain what patient decision aids are, why they help patients engage more effectively with healthcare, and how their use enables health professionals to meet clinical guidance on delivering shared decision making about treatment choices.

People's healthcare decisions are emotionally and cognitively demanding, involving trade-offs between treatment options with negative consequences for themselves and their families. Health professionals are delivering increasingly complex care; patients live longer with co-morbidities and increased frailty, and new technologies lead to more treatments being offered. Decision science provides insight into how people make these decisions, and what can influence people's thinking encouraging them to make more or less reasoned choices.

Patient decision aids are resources developed with reference to decision science evidence on how to structure the health problem, present information about risks, benefits and consequences of options, elicit patient values and guide people to reach treatment choices that fit best in their lives (<http://onlinelibrary.wiley.com/doi/10.1002/14651858.CD001431.pub5/full>). This talk provides an overview of the components within patient decision aids (<http://ipdas.ohri.ca/who.html>) known to support people make more reasoned decisions about their healthcare, using examples taken from patient decision aids developed and evaluated within the UK.

### Innovative treatments for a better quality of life

#### SP0109 INVOLVEMENT OF A PATIENT ORGANISATION IN HEALTH TECHNOLOGY ASSESSMENT

*J. Clausen. Scientific Adviser, Deutsche Rheuma-Liga Bundesverband e.V., Bonn, Germany*

The term "Health Technology Assessment" (HTA) designates the systematic evaluation of therapies (drugs and non-drug interventions) and technologies for cost effectiveness, clinical effectiveness and safety to form the basis for evidence-based priority setting and policy decisions (reimbursement and coverage decisions). Usually, therapeutic or diagnostic interventions are subject to the assessment, but also complex programs (e.g. prophylactic screening programs) may be investigated. The involvement of patient organisations in Health Technology Assessments improves outcomes and offers additional insights. It guarantees that the perspective of the most important group – the patients as consumers – is adequately addressed.

A patient organisation may be involved in various ways in Health Technology Assessments: Patient organisations can identify gaps in healthcare coverage and initiate the generation of a respective Health Technology Assessment; they can provide additional registry data, complementing study data from randomised controlled trials for the Health Technology Assessment. The provision of information on patient-relevant outcomes and other patient-relevant aspects (e.g. mode of administration) is crucial to assess the benefit for patients of the therapy (or technology/program) under evaluation. Moreover, patient organisations may also be involved in the evaluation of the assessment report and in the execution of the results.

Generation of an HTA can be a time-consuming process and a very demanding one for patient organisations and the involved volunteers. Staff members of the patient organisation can be involved directly in the various tasks, or indirectly, supporting voluntary patients. If voluntary patients attend panel groups, most of them will need intensive support by their respective patient organisation depending on the complexity of the respective topic. Finding qualified volunteers, willing to

spend a substantial amount of their time and able to travel frequently, is another obstacle to overcome.

This presentation provides some examples of the involvement in Health Technology Assessments of the German Rheumatism League, Germany's largest patient organisation with about 3 00 000 members, and the essential prerequisites for the participation of patient organisations in that process.

## EULAR Projects in investigative rheumatology

### SP0110 AUTOANTIBODY STANDARDISATION IN RHEUMATIC DISEASES. THE ROLE OF THE EUROPEAN CONSENSUS FINDING STUDY GROUP ON AUTOANTIBODIES IN RHEUMATIC DISEASES (ECFSG)

J. Rönneklid, on behalf of The European Consensus Finding Study Group on autoantibodies in rheumatic diseases (ECFSG). *Department of immunology, genetics and pathology, Uppsala University, Uppsala, Sweden*

The aim of the European Consensus Finding Study Group on autoantibodies in rheumatic diseases (ECFSG), a.k.a the EULAR autoantibody study group, is to achieve a common consensus in autoantibody diagnostics: a laboratory result should be the same, independent of the country or laboratory where the result is obtained. Since 1988, the ECFSG has yearly distributed unknown sera to European laboratories (presently 43) for evaluation in a clinical context. These sera are chosen to reveal differences between different laboratories. The results are discussed in conjunction to the European Workshop for Rheumatology Research (EWRR) every year. Use of reference materials helps to align test results by adopting internationally used measurement units, but reference materials are missing for many autoantibody specificities. Since 2014 an ECFSG focus has been on evaluating samples that might constitute new reference materials for companies producing autoantibody measurement assays, as well as for clinical laboratories. Hitherto investigated autoantibody specificities are provided in the table 1. In my talk I will present the work of ECFSG, including the characterisation of the samples that have constituted raw material for currently available reference materials. I will also tell about our first characterisation of a tentative new reagent sample, that thereafter was produced as reference material by the National Institute of Biological Standards and Control (NIBCS) in the UK. In November 2017 that reagent was endorsed by the World Health Organisation (WHO) to become the new international reference reagent for anti-double stranded DNA (anti-dsDNA) antibodies.

**Abstract SP0110 – Table 1.** Hitherto tested tentative or now existing reference reagents

2014	anti-dsDNA (now publicly available WHO standard, NIBSC 15/174)
2015	ACPA
2016	anti-PR3 (standard available from the EU Science Hub, ERM-DA483/IFCC)
2016	anti-MPO (standard available from the EU Science Hub, ERM-DA476/IFCC)
2016	IgG anti-b2GP1
2017	anti-GBM
2018	anti-DFS70

### SP0111 HOW NEURO ENDOCRINE IMMUNOLOGY IMPACT RHEUMATIC DISEASES?

M. Cutolo, on behalf of EULAR Study Group on Neuroendocrine Immunology of Rheumatic Diseases (NEIRD). *Research Laboratory Division Rheumatology Dept Internal Medicine University of Genova Italy, Unicersity of Genova Italy, Genova, Italy*

The Neuro Endocrine Immune Network (NEI) is the most important communication-system in human body to maintain the health status. NEIRD evaluate the relationships between NEI and Rheumatic and Musculoskeletal Diseases (RMDs). The altered interaction between the nervous system, the immune/inflammatory cells and the endocrine system plays an important role in the pathophysiology of autoimmunity and chronic inflammation. The involvement of the adrenal steroid

hormones in the immune response is fundamental and follow a circadian rhythm (circadian rhythm studies obtained the Nobel Prize for Medicine in 2017). As Matter of fact, the nocturnal ability of the NEI system to mount an efficient immune and inflammatory response, with related clinical consequences, is matter of important chronotherapeutical approaches with exogenous steroids, in particular with glucocorticoids (GCs) (their discovery obtained the Nobel Prize in 1950 and still a pillar in the treatment of RMDs and not only). Other important steroid hormones involved in the NEI are the sex hormones (estrogens. E2 OH-metabolites are potent enhancers of cell proliferation) and the d-hormone (steroidal hormone structure of the final metabolite of Vitamin D). Clinical observations indicate a strong influence of the neuroendocrine system on immune function and *vice versa* in chronic inflammatory rheumatic diseases. The influence of hormones and neuronal pathways happens before and after the outbreak of the disease. Very recent data demonstrate the modulatory role of estrogens on epigenetic mechanisms (ie DNA methylation and gene upregulation). For example differentially expressed miRNA pathways linked to E2 in human endothelial cells through ER have been shown, and provide new insights by which oestrogen can modulate endothelial function. This point might be crucial in autoimmune diseases like systemic sclerosis (SSc) a disease prevalent in females and that start from damaged endothelium. We have started a large study on epigenetic and pregnancy on patients with RMDs such as rheumatoid arthritis (RA) and systemic lupus erythematosus (SLE). On the other hand, the disease process with an activated immune system influences several hormonal and neuronal pathways. In addition, the energy bottleneck leads to important disease sequelae such as sickness behaviour/fatigue/depressive symptoms, sleep disturbances, anorexia and malnutrition, bone loss, muscle wasting and cachectic obesity, insulin resistance with hyperinsulinemia (insulin-like growth factor-1 resistance), dyslipidemia, alterations of steroid hormone axes, disturbances of the hypothalamic-pituitary-gonadal (HPG) axis, elevated sympathetic tone, hypertension and volume overload, decreased parasympathetic tone, inflammation-related anaemia, and finally circadian (circannual) rhythms of symptoms. New therapeutic strategies should respect these findings because rheumatic patients die earlier due to the mentioned disease sequelae. It is suggested that disease sequelae must be treated more consequentially because they are inherent to chronic inflammatory systemic diseases (possible evolution for some of them in cancer). Therapeutic strategies in this field of NEIRD are slowly developing. Low-dose glucocorticoid therapy as supplementation of the "small adrenal engine", chronotherapy with glucocorticoids (night release) and vitamin D supplementation are the best examples of the successful utilisation of demonstrated concepts.

### SP0112 MICROCIRCULATION IN RHEUMATIC DISEASES

V. Smith<sup>1,2</sup>, on behalf of the EULAR Study Group on Microcirculation in Rheumatic Diseases. <sup>1</sup>*Department of Internal Medicine, Ghent University;* <sup>2</sup>*Department of Rheumatology, Ghent University Hospital, Ghent, Belgium*

**Background:** The EULAR Study Group on Microcirculation in Rheumatic Diseases (SG MC/RD) aims to build an international network of expert centres to facilitate and exchange knowledge. It is a non-profit group and has no financial support. Both altered microvascular morphology and peripheral flow are the main focus of research.

**Objectives:** 1) To integrate different expertises to study the pathophysiology of disease processes. 2) To exchange knowledge and to facilitate standardisation concerning different techniques to assess the (micro)circulation such as nailfold capillaroscopy, laser doppler and laser speckle contrast analysis (LASCA). 3) To elaborate predictive indexes for disease progression and follow-up based on the integration of different tools and biomarkers. 4) To develop intervention protocols based upon an understanding of and targeting disease mechanisms (i.e. microvascular damage progression to fibrosis).

**Methods:** The EULAR SG MC/RD was accepted by the EULAR Executive committee in March 2014 and is being supervised by the EULAR Committee on Investigative Rheumatology, currently chaired by Prof. X. Mariette. Anno 2018 the number of members has risen to 79 (out of which 26 from 14 non-European countries). The EULAR study group meets half yearly (every EULAR/ACR) and

organises training courses every two years at Genova and supplies continuous training through the EULAR imaging library.

**Results:** The following projects resulted in publications: As standardisation of techniques to evaluate the microcirculation is one of the aims of the study group, a first activity was a multi-centre study to assess the reliability of simple capillaroscopic definitions to evaluate morphologies of single capillaries.<sup>1</sup> Optimisation of reliability of initial definitions has been obtained at the 7th EULAR course on capillaroscopy.<sup>2</sup> Secondly, the evaluation of interrater reliability of microcirculatory flow evaluation by LASCA was piloted by 2 of the founding members and has been published.<sup>3</sup> Thirdly, a cross-sectional, international SURvey on non-iNvaSive techniques to assess which tools are being used to evaluate the microcirculation in patients with Raynaud's phenomenon has been performed in between 471 eligible physicians.<sup>4</sup> A 4th publication resulted from a systematic review, analysing the role of capillaroscopy in systemic lupus erythematosus, based on standard interpretation of capillaroscopy according to the EULAR SG MC/RD.<sup>5</sup>

**Conclusions:** The relatively young EULAR SG MC/RD is thriving well, based on multi-centre joint forces to achieve standardisation of microcirculatory evaluation of rheumatic diseases as well as in achieving clinical as well as basic science research.<sup>6</sup>

#### SP0113 NEW TRENDS IN BIOMARKERS IN INFLAMMATORY JOINT DISEASE

E. Feist. *Charite Department of Rheumatology, Berlin, Germany*

This lecture provides an overview on new developments in biomarker research and standardisation in inflammatory joint diseases. The presentation includes an introduction of established and new biomarkers in serum and synovial fluid as well as methods for their detection. Furthermore, an overview on different modifications of auto-antigens (including citrullinated and carbamylated isoforms) and their role in immune response and pathogenesis of disease will be given. The diagnostic performance of new and established biomarkers will be discussed including antibodies against modified antigens also illustrated by difficult to diagnose cases. In this context, special attention will be attributed to the predictive value of biomarkers for diagnosis of disease and treatment response.

**Disclosure of Interest:** None declared

### New assessments in clinical practice

#### SP0114 HOW TO PERFORM A QUICK AND RELIABLE PHYSICAL EXAMINATION IN RHEUMATOLOGY

M. Doherty. *Academic Rheumatology, University of Nottingham, Nottingham, UK*

The GALS (Gait, Arms, Legs, Spine) screen is a quick, reasonably sensitive way to detect common musculoskeletal (MSK) abnormalities as part of a wider medical assessment.<sup>1</sup> However, for someone with MSK complaints a detailed assessment is required to determine the diagnosis and impact of the condition on that person. The history is the key starting point. This needs to be holistic and individualised as the enquiry proceeds, since the impact of any condition is person-specific and influenced by many factors (e.g. psychosocial, illness perceptions, sleep, comorbidity etc.). A thorough history usually suggests the single most likely cause for the patient's problem(s) and should then guide the examination – an efficient

targeted “rapier” approach where the practitioner selects appropriate skills from a range of competencies according to specific history elements. This contrasts with a longer hypothesis-free “screen” where an identical set of procedures is undertaken in each patient.

This presentation covers key principles and considerations of assessment and illustrates how the history guides the subsequent “rapier” examination.<sup>2</sup> Examples include:

(1) in the *history*: determination of pain localisation and features associated with radiated pain; pain and stiffness characteristics that differentiate mechanical usage-related pain, inflammatory pain, acute crystal synovitis, destructive bone pain and neurogenic pain; non-specific symptoms of inflammation.

(2) in the *examination*: usual order of inspection at rest, inspection during movement, then palpation at rest and during movement of symptomatic regions; contrasting clinical findings that quickly differentiate joint and peri-articular problems; initial selection of the movement(s) that is affected first and most severely by arthritis – the tight pack position(s); detection of “stress pain” (pain worse in tight-pack but reduced/absent in loose-pack positions – the most sensitive sign of inflammation); examination for effusion, soft-tissue and firm swelling; use of resisted active movements and stress tests for peri-articular lesions; a targeted screen for asymptomatic disease prompted by the main diagnosis.

EULAR learning resources available at [http://www.eular.org/edu\\_training\\_dvd.cfm](http://www.eular.org/edu_training_dvd.cfm) include:<sup>1</sup> The “GALS” screen and<sup>2</sup> Principles of the musculoskeletal history and examination.

#### SP0115 VALUE OF INFLAMMATORY BIOMARKERS IN CLINICAL DECISION MAKING

M. Sefik Bukilica. *Institute of Rheumatology, Belgrade, Belgrade, Serbia*

Inflammation is known to play a major role in rheumatologic disorders. Inflammatory biomarkers can help clinicians diagnose rheumatic diseases and assess disease activity more accurately. These markers have been incorporated into classification criteria of several diseases to enable early diagnosis and timely initiation of treatment. Quantification of inflammation has become essential to tailor the treatment strategy, especially in patients with rheumatoid arthritis, polymyalgia rheumatica and vasculitides. Inflammation can be measured from different perspectives – the measures that quantify biomarkers participating in inflammation, surrogate markers of inflammation, and the by-products of the inflammation process.

Erythrocyte sedimentation rate (ESR) and C-reactive protein (CRP) levels are among the most commonly used acute phase reactants in the detection and follow-up of rheumatologic disorders. These markers are not specific to trigger factors of inflammation, limiting their capacity to discriminate the cause for stimuli as well as the organs involved.

In the current presentation the advantages and limitations of new and established inflammatory biomarkers in clinical decision making will be discussed illustrated by case reports.

#### SP0116 VALUE OF ULTRASOUND IN CLINICAL DECISION MAKING

L. Terslev. *Center for Rheumatology and Spine Diseases, Rigshospitalet, Copenhagen, Denmark*

The use of ultrasound (US) has increased over the past 20 years for clinical decision making and for optimised patient care. The utility of US for correctly diagnosing the cause of musculoskeletal symptoms is known by many clinicians but little published data exist in this area. However, the value of US for diagnosing and handling treatment decisions especially in patients with rheumatoid arthritis (RA) has been well documented. US has been proven to be more sensitive than clinical joint evaluation.<sup>1,2</sup> This has resulted in the acknowledgement of US as an addition to the clinical joint evaluation in suspected RA patients for assessing a more elaborate joint involvement helping the clinician to correctly classify the patients according to the new RA classification criteria.<sup>3</sup> Likewise, in early undifferentiated inflammatory arthritis the use of US may assist in pinpointing those patients who will develop persistent inflammatory arthritis over time.<sup>4</sup> US may also impact diagnosis and treatment decisions. This has been shown both in situations with regional pain such as the painful foot in chronic inflammatory diseases and the possible need for corticosteroid injections but also in global disease activity assessment in RA patients where US provides additional disease activity information leading to altered treatment decisions as compared to regularly DAS28 assessment.<sup>5,6</sup> Also, in remission US may – by assessing subclinical inflammation

– detect those patients with the highest risk of flare.<sup>7</sup> US is a valuable part of future decision making in rheumatology.

#### SP0117 ULTRASOUND SCANNING OF RA PATIENTS IN REMISSION

*A. Iagnocco. Dept. Scienze Cliniche e Biologiche, Università degli Studi di Torino, Turin, Italy*

The optimisation of the current therapeutic strategies for RA, with the establishment of early intensive treatment and with the availability of new drugs, has led to a dramatic change in the management of RA, and remission is the target of modern treatment in patients with RA.<sup>1,2</sup>

Remission is ideally characterised by the absence of clinically detectable disease activity, the absence of radiographic progression and the improvement of physical function.<sup>3</sup> However, in clinical practice it is frequently difficult to use a comprehensive definition of this condition and apply objective systems for assessing it. Then, subclinical disease activity may be present, even in patients who are in clinical remission, leading to joint damage progression<sup>4</sup> and disease flare.<sup>5</sup>

EULAR recommendations for the use of imaging in RA patients include ultrasound (US) as an assessment tool for inflammatory activity and remission, as it is able to detect joint inflammation and predict subsequent joint damage.<sup>6</sup> Recent studies have shown that US provides diagnostic and prognostic data in terms of risk of flare, disability and damage progression in RA.<sup>8</sup> Furthermore, in addition to joints, US allows the assessment also of periarticular structures, such as tendons, that have been demonstrated to be the site of inflammatory changes also in patients in clinical remission.<sup>7</sup>

Recently, 427 RA patients in clinical remission have been evaluated in a multicentre study which included the US assessment of wrist and hand tenosynovitis and synovitis by grey scale (GS) and power Doppler (PD).<sup>2</sup> Results of this study showed a high prevalence of tenosynovitis (52.5%–95% CI 0.48, 0.57 for GS and 22.7%–95% CI 0.19, 0.27 for PD) and synovitis (71.6%–95% CI 0.67, 0.76 for GS and 42%–95% CI 0.37, 0.47 for PD). Among clinical correlates, PD tenosynovitis associated with lower remission duration and morning stiffness while PD synovitis did not. Only PD tenosynovitis showed a significant association with the flare

questionnaire [OR 1.95 (95% CI 1.17, 3.26)]. No cross-sectional associations were found with the HAQ. The presence of radiographic erosions associated with GS and PD synovitis but not with tenosynovitis. This study demonstrated that US-detected tenosynovitis is a frequent finding in RA in clinical remission. Compared with intra-articular synovitis, active tenosynovitis was more associated with RA patients reporting unstable remission. Based on those results, US demonstrated to be a useful imaging modality for assessing tenosynovitis which may help in sub-setting RA patients in clinical remission.<sup>2</sup>

More recently, a multicentre longitudinal study in 361 consecutive patients with RA in clinical remission demonstrated that the conjunct presence of PD positive tenosynovitis and synovitis predicts flare in patients with RA in clinical remission.<sup>7</sup> US scanning of RA patients in remission has a crucial role in order to demonstrate active joint and tendon inflammation that are able to predict flare.

During this practical skills session at EULAR Congress 2018 the role of US in detecting subclinical inflammation at joint and tendon level will be discussed and practical demonstration on how to scan patients in remission will be performed.

#### WIN and HOT session

#### SP0118 RECENT ADVANCES IN THE TREATMENT OF RHEUMATOID ARTHRITIS

*M.H. Buch<sup>1,2</sup>. <sup>1</sup>NIHR Leeds Biomedical Research Centre, Leeds Teaching Hospitals NHS Trust; <sup>2</sup>Leeds Institute of Rheumatic and Musculoskeletal Medicine, University of Leeds, Leeds, UK*

Modern management of rheumatoid arthritis (RA) is underpinned by the principle of establishing a clear treatment goal through the efficient strategic use of DMARDs in order to minimise adverse outcomes. With evolving ambitions and new targeted therapies, ongoing advances in the management of RA continue to be made: this HOT session will summarise our progress in the understanding and management across the RA disease continuum; including the state of at risk of RA status to early and later RA disease. In particular, the session will focus on studies that inform on (i) the ability to potentially abrogate progression from autoimmunity to development of RA disease (ii) currently identified strategies that offer the optimal opportunity for remission induction in ERA (iii) ability to drug taper and (iv) use of recently introduced synthetic and biologic targeted therapies. Finally, with co-morbidity outcomes including cardiovascular disease, another key focus in the contemporary management of RA, developments in improving this area of health concern will also be presented.

## Advances in biologic therapy of small vessel vasculitis

### SP0119 THE EVOLVING ROLE OF MEPOLIZUMAB IN EGPA

F. Moosig. *Rheumazentrum Schleswig-Holstein Mitte, Neumünster, Germany*

There is overwhelming evidence that eosinophiles play a key role in the pathogenesis of EGPA. IL-5 is the central cytokine for eosinophil maturation, eosinophil release from the bone marrow and eosinophil survival. Mepolizumab is an antibody neutralising IL-5, which proved efficient in the hyper-eosinophilic syndrome and eosinophilic asthma, amongst other conditions. Targeting this cytokine in EGPA therefore seemed plausible. Two small uncontrolled trials demonstrated the safety of mepolizumab in EGPA and indicated the potential for induction of remission, maintenance and steroid sparing. A randomised controlled trial (MIRRA) confirmed those findings and showed higher rates of accrued remission for mepolizumab when given as ad-on medication to conventional immunosuppressants and/or glucocorticoids. Steroid sparing properties were also confirmed. MIRRA and previous trials in different indications issued no major safety concerns. Based on this trial drug approval for EGPA might be feasible.

To date the major problems in the treatment of EGPA are 1) refractory disease 2) a high frequency of relapses and 3) the need for high glucocorticoid doses in many patients.

Mepolizumab could be used for induction of remission in addition to glucocorticoids. However, its not yet clear, which subgroup of patients might profit most. Especially patients with severe disease have not been investigated. For patients with refractors non-severe disease mepolizumab is a potential option. Mepolizumab also was efficient in preventing relapses and therefore may also be used for maintenance of remission, especially in patients suffering from prevalent relapses. Finally, patients with high need for glucocorticoids could profit from mepolizumab, particularly in case of steroid-sensitive comorbidities or steroid-induced complications.

### SP0120 CURRENT CONTROVERSIES IN THE USE OF RITUXIMAB FOR INDUCTION AND MAINTENANCE OF AAV DISEASE

B. Terrier, on behalf of French Vasculitis Study Group. *Internal Medicine, Cochin Hospital, Paris, France*

Rituximab has now taken one of the first places in induction remission treatment of ANCA-associated vasculitides (AAVs) and is challenging cyclophosphamide. Rituximab is an anti-CD20 IgG1 mouse-human chimeric antibody that selectively depletes mature and memory B-cells.

Use of rituximab for induction

In AAVs, rituximab non-inferiority to cyclophosphamide as induction agent was clearly established. In the RAVE trial, which compared oral cyclophosphamide to rituximab as induction regimen, the remission rate at 6 months was 64% in the rituximab group and 53% in the cyclophosphamide group. Consequently, rituximab has revolutionised AAVs' standard-of-care and is now recommended as first-line therapy for many patients with granulomatosis with polyangiitis (GPA) and microscopic polyangiitis (MPA).

The RAVE trial prospectively compared two arms: induction with glucocorticoids combined with oral cyclophosphamide for 3–6 months followed by 12–15 months of azathioprine versus glucocorticoids and rituximab (375 mg/m<sup>2</sup>/week for 4 consecutive weeks) followed by placebo. At 12 and 18 months respectively, 48% and 39% of the rituximab–placebo recipients had sustained complete remission vs. 39% and 33% of the cyclophosphamide–azathioprine group. Those outcomes demonstrated that, after rituximab induction, azathioprine maintenance therapy is not useful. Nonetheless, both groups still had very high relapse rates, meaning that an effective maintenance regimen had not yet been found.

In contrast, these findings in induction phase could not be applied to AAVs forms excluded from the RAVE study, i.e. EGPA, vasculitis associated with anti-glomerular basement membrane antibodies (Goodpasture's syndrome), patients with alveolar haemorrhage requiring mechanical ventilation or those with rapidly progressive renal failure with creatinine exceeding 350 micromol/L. Also, studies are lacking to demonstrate that rituximab should be recommended as first-line therapy for patients who do not require cyclophosphamide for remission induction or patients with predominant granulomatous manifestations (granulomatous ear, nose and throat (ENT) lesion(s), isolated tracheal or bronchial stenosis, orbital tumour or pachymeningitis) that are life-and/or function-threatening.

Use of rituximab for maintenance

The idea to maintain remission with low-dose rituximab every 6 months for 18 months seemed reasonable than no intervention, as shown by MAINRITSAN trial results. In that prospective RCT, rituximab maintenance consisted of semestrial 500 mg infusions for 18 months. The first rituximab infusion was given 3–4 weeks after the end of cyclophosphamide induction therapy, followed by the second 2 weeks later and semestrial infusions thereafter. At the end of follow-up, 28 months post-randomization and 10 months after the last rituximab infusion, 5% of rituximab recipients vs. 28% of azathioprine-treated patients had relapsed. Prolonged follow-up of those patients showed that, at 60 months, although relapses had occurred in both groups, rituximab remained superior to azathioprine for sustaining remission. Although the results highlighted rituximab superiority in maintaining remission, it also became clear that relapses still occurred, frequently 18 to 24 months after the last rituximab infusion.

An answer to the optimal rituximab duration will be partially obtained with the MAINRITSAN 3 trial (ongoing), which is comparing, after randomization, four additional semestrial rituximab infusions (500 mg) to placebo, after patients had previously received rituximab during 18 months. It seems reasonable that, in the future, treatment duration will be adapted to prognostic factors and predictors of relapses.

Also, the impact of using higher dose of rituximab during maintenance will be addressed by the RITAZAREM trial (ongoing). This protocol evaluates rituximab infusions of 1 gram every 4 months for 20 months compared to oral azathioprine. Use of rituximab for EGPA

Data on rituximab's clinical benefits for eosinophilic granulomatosis with polyangiitis (EGPA) patients is currently restricted to low-evidence-based open-label studies and case reports. The main findings of these studies indicate a potential benefit in severe refractory/relapsing EGPA, especially in patients with positive ANCA. Two ongoing prospective studies in France are comparing rituximab to conventional immunosuppressants as induction (REOVAS trial) and maintenance phase (MAINRITSEG trial). It will help to define more precisely the indication of rituximab in EGPA patients and eventually highlight which patients would benefit from the drugs.

## Tapering and flaring in PsA and SpA

### SP0121 TAPERING IN PSA – TO DO OR NOT TO DO?

L. Coates. *Nuffield Department of Orthopaedics, Rheumatology and Musculoskeletal Sciences, University of Oxford, Oxford, UK*

This talk will discuss the current evidence regarding tapering or drug withdrawal in patients with psoriatic arthritis. With increasing numbers of patients achieving good outcomes such as remission, the issue of how long to continue treatment for has been raised. Given the cost of some of the newer therapies, this question also has significant cost effectiveness implications.

There is a limited amount of evidence but data from randomised and observational studies will be discussed as well as key research questions that remain outstanding.

**Disclosure of Interest:** None declared  
**DOI:** 10.1136/annrheumdis-2018-eular.7821

### SP0122 TAPERING IN AXIAL SPONDYLOARTHRITIS – TO DO OR NOT TO DO?

D. Poddubnyy. *Charité Universitätsmedizin Berlin, Berlin, Germany*

According to the current version of the ASAS-EULAR management recommendations for axial spondyloarthritis, tapering of a biological disease modifying anti-rheumatic drug (bDMARD) can be considered once a remission is achieved. Tapering is opposed to a complete discontinuation that is associated with a very high disease flare risk (70%–100%) in axial spondyloarthritis. The question of tapering in axial spondyloarthritis has been addressed in a number of small clinical trials: in the majority of the them, tapering (either dose reduction or increase of the injection/infusion interval) could be done without a disease flare. It is, however, not clear, whether the tapering has any beneficial effect for a patient (i.e., in terms of safety) in addition to a cost-saving effect. Further, a number of questions related to tapering still requires an evidence-based answer: a) what is the optimal time-point of the initiation of tapering (e.g., 3, 6 or 12 months after remission achievement)? b) what is the optimal tapering regimen? c) are there reliable predictors of sustained remission/disease flare during tapering? The question of a bDMARD tapering after remission achievement will be at least partially answered in ongoing

phase 4 trials with TNF blockers in non-radiographic axial spondyloarthritis. An appropriately designed and powered long-term trial is needed to investigate possible long-term benefits and risks of treatment tapering in axial spondyloarthritis.

## Prevention of OA: yes we can!

SP0123

### WHY IS THE PREVALENCE OF KNEE OSTEOARTHRITIS INCREASING?

*D. Felson. Clinical Epidemiology Unit, Boston University School of Medicine, Boston, USA*

Invited speaker abstract submission

EULAR18-7734

WHY IS THE PREVALENCE OF KNEE OSTEOARTHRITIS INCREASING?

D. Felson

**I will give my lecture on:** Friday, 15 June 2018

**Disclosure of Interest:** None declared

Populations throughout the world are ageing and with ageing comes an increase in knee osteoarthritis. The prevalence of obesity is also rising and this further contributes to an increased risk of disease. Not surprisingly, the demand for knee replacements is rising quickly and is projected to increase further.

While the increase in osteoarthritis may be due in part to ageing and obesity of the population, there may be other causes. In a recent study, cadavers whose age and weight at the time of death were known were examined for evidence of knee osteoarthritis. It was found that, after adjustment for age and weight, knee osteoarthritis in our current postindustrial era was twice as common as knee osteoarthritis in the early industrial era. Reasons for this increase include changes in diet or in physical activity. They might also include changes in effects or severity of obesity. Understanding the increase in prevalence might provide new clues to osteoarthritis prevention.

### PHYSICAL ACTIVITY AND EXERCISE: OPPORTUNITIES AND CHALLENGES

*M. Englund. Clinical Epidemiology Unit, Orthopedics, Department of Clinical Sciences Lund, Lund University, Lund, Sweden*

Osteoarthritis (OA) is a steadily growing public health concern in particular as there is still a lack of curative therapeutic options in a biological sense. Thus, prevention of OA becomes an increasingly important topic.

Physical activity, and exercise are among the key modifiable risk factors associated with OA. Joints are built to be used, but overuse and joint injuries are also linked with incident OA. This presentation will provide some key opportunities with exercise to maintain joint health, but also the challenges when the window of opportunity is exceeded.

## Big data for musculoskeletal research

SP0125

### HOW BIG DATA AND MACHINE LEARNING COULD CHANGE THE GAME

*S. Khalid. Nuffield Dept of Orthopaedics, Rheumatology and Musculoskeletal Sciences, University of Oxford, Oxford, UK*

With recent advances in the acquisition and digitisation of medical data, the use of routinely collected health data for research is on the rise. Routinely collected data comes with the promise of the 3 V's of "big data": volume, velocity, and variety. Recent recommendations by the UK National Institute for Health and Care Excellence and the Academy of Medical Sciences have therefore acknowledged the potential for data science methods to play an increasingly important role in health-care research.

Against this backdrop of growing data and increasing computational resources, the use of data science methods including machine learning is becoming popular for analysing large-scale medical datasets.

This talk provides a brief overview of machine learning methods for healthcare applications including an introduction to supervised and unsupervised learning, followed by real-world examples of data analysis using machine learning, such as (a) the development of prognostic models for clinical risk assessment, and (b) mining of electronic health records for detecting patterns and phenotypes within a population.

**Disclosure of Interest:** None declared

SP0126

### BIG DATA FOR TREATMENT EFFECTIVENESS AND SAFETY

*L. Tomlinson. Epidemiology and Population Health, London School of Hygiene and Tropical Medicine, London, UK*

While randomised clinical trials remain the gold-standard for examining drug-effects, there are limitations to the evidence they provide. For example, studies are usually too small or too short to detect rare and long-term adverse effects. This is particularly true for kidney-related outcomes where many trials were under-powered to detect outcomes of interest such as end-stage renal disease, too historic to collect data on newly-defined entities such as acute kidney injury or simply excluded patients with chronic kidney disease. In addition, disproportionate recruitment of Caucasian men in mid- to older-life limits the evidence base for understanding risk of adverse-effects in other population groups such as women, the elderly and people of non-Caucasian ethnicity. Determining these outcomes requires long-term surveillance of population databases, usually anonymised health care records, once a drug is in routine use.

In this talk I will discuss recent work from our group where we have used routinely collected renal function measurements from primary care to precisely examine kidney-related and other adverse effects. I will discuss some of the difficulties of this approach as well as the potential it offers to understand better the balance between risks and benefits of many drugs in common use.

## From big data to personalised medicine in paediatric rheumatic diseases

SP0127

### FROM MENDELIOME TO PERSONALISED MEDICINE IN CHILDHOOD SLE

*A. Belot<sup>1,2</sup>, on behalf of Genial/Lumigene working group. <sup>1</sup>Pediatric Rheumatology Unit – National Reference Centre for Rheumatism and Autoimmune diseases – Raise, Chu Lyon; <sup>2</sup>U1111, INSERM, Lyon, France*

Pediatric-onset SLE is a rare condition where genetics traits are believed to play an important causal role. A few monogenic causes of SLE have been described mostly in familial forms, including complement deficiencies, so-called type I interferonopathies, and B cell-related defects. Genetic studies in mouse models and genome-wide associations studies in patients have also pointed to other genes potentially involved in juvenile SLE. However, large-scale sequencing analyses of paediatric SLE are lacking, and the overall contribution of genetic factors in disease onset is therefore unknown. Personalised medicine relies on the understanding of underlying mechanisms. Genetic discovery and functional characterization of the variants prefigure the precision medicine in complex diseases such as SLE.

We have designed a NGS panel comprising genes for which mutations are known lupus causing (KLC) (also reported as the Mendeliome) as well as prospective candidate genes, potentially lupus causing (PLC), and analysed 117 children who fulfilled ACR criteria for SLE from two large cohorts of pediatric-onset SLE in the UK and France. Genetic variants were identified and filtered to select rare (ExAC database frequency of <1% for homozygous variants and <0.01% for heterozygous variants) and predicted *in silico* as damaging by different algorithms.

We identified mutations in KLC genes for 8 patients. Variant segregation within families and functional analyses supported the causal role of these mutations. Other patients had monoallelic variants in recessive KLC genes, which may have contributed to disease onset and other patients displayed rare and pathogenic variants in PLC genes. This enrichment was specific to the lupus cohort compared to a control cohort of healthy patients.

This large-scale analysis led to the identification of monogenic causes of lupus in about 7% of analysed patients in an unselected paediatric population of *sLE*. 7/8 causes are related to an innate immune disorder with efferocytosis deficiency, emphasising the importance of apoptotic body clearance in the pathogenesis of lupus. Other variants in *KLC* or *PLC* genes may represent novel monogenic causes of lupus or could influence disease-onset by increasing the penetrance of more severe mutations. The treatment is still poorly adapted to the underlying mechanisms but progress in immunomonitoring together with the revolution in the field of genetics prompt clinician to set up targeted therapies considering genetic background and biomarkers.

#### SP0128 FINDING THE NEEDLE IN THE HAYSTACK AND USING IT: GALECTIN-9 AS A BIOMARKER IN JUVENILE DERMATOMYOSITIS

*A. Van Royen-Kerkhof. Pediatric Immunology and Rheumatology, Wilhelmina children's Hospital of the University Medical Center Utrecht, Utrecht, Netherlands*

**Background:** Juvenile dermatomyositis (JDM) is a rare systemic immune-mediated disease involving skin and muscle. A high disease burden exists with risk of both under- and overtreatment due to the lack of reliable biomarkers.

**Methods:** A multiplex immunoassay was performed in a discovery cohort for plasma levels of 45 proteins related to inflammation in 25 well-defined JDM patients, determined by clinical activity and treatment.

Results were validated in two independent international external and internal validation cohorts (n=125).

In a longitudinal cohort (n=30), the performance of this biomarker over time was assessed with a median 2.8 years follow-up.

**Results:** In the discovery cohort we found a clustering of 10 mediators of which Galectin-9 and CXCL10 distinguished best between active disease and remission. Both biomarkers had a strong correlation with clinical parameters (Spearman *r* with Physician's global assessment (PGA)=0.75 for both). This was confirmed in the validation cohorts (Spearman *r*=0.7 with PGA, for both). In the longitudinal cohort galectin-9 and CXCL10 correlated with disease activity over time, and elevated levels could predict flares several months before clinical symptoms. Both cross-sectionally and longitudinally, galectin-9 and CXCL10 outperformed creatine kinase activity.

**Conclusion:** Galectin-9 and CXCL10 are robust biomarkers for disease activity in JDM. A short-term implementation into clinical practice is feasible and can facilitate individualised treatment.

### Triple T: T cells, technologies and therapies

#### SP0129 STUDYING T CELL FUNCTION IN RA AND PSA

*L. Taams. Inflammation Biology, King's College London, London, UK*

Rheumatoid arthritis (RA) and spondyloarthritis (SpA) describe a group of inflammatory joint diseases affecting ~2% of the population. RA has strong genetic associations with *HLA-DR*, indicating a role for CD4 +T cells. CD4 +T cells are prominently present in the RA joint, where they can contribute to the inflammatory milieu. I will present recent data from our lab regarding the presence, regulation and function of different CD4 +T cell subsets that are present in the RA joint.

In contrast, SpA has strong genetic associations with *HLA-B/RUNX3* which imply a role for CD8 +T cells. Furthermore, genetic associations with *IL23R/TRAFF3IP2* and the clinical efficacy of IL-17 blockade in SpA, indicate a role for IL-17 in SpA. This provides a strong rationale to investigate the presence, phenotype and functional capacity of IL-17 +CD8+T cells in the joints of patients with SpA. I will present novel data regarding the presence, phenotype and potential function of IL-17 +CD8+T cells in the joints of patients with SpA. Collectively, our data indicate that IL-17 +CD8+T cells may be important contributors to the pathogenesis of SpA.

**Disclosure of Interest:** L. Taams Grant/research support from: GSK, UCB, Novo Nordisk A/S, Novartis

#### SP0130 TOWARDS T CELL TOLERANCE IN RHEUMATOID ARTHRITIS

*R. Thomas. Diamantina Institute, University of Queensland, Brisbane, Australia*

Disease modifying strategies are available for treatment of rheumatoid arthritis (RA), and good response rates are achieved. However, limitations include toxicity, a response rate ceiling, cost and rationing of biologic therapies, inability to cure or permanently reverse RA pathology, and inability to prevent disease. Immunotherapies targeting checkpoint molecules are markedly changing the landscape of clinical oncology. In autoimmune diseases such as RA, dendritic cells represent an important target for antigen-specific immunotherapy for T cell tolerance. Antigen-specific strategies promise greater specificity and safety, without general immune suppression, and thus the potential for intervention in at-risk subjects before disease onset. In a proof-of-concept trial, delivery of autoantigenic peptides and autologous tolerogenic dendritic cells was safe and had immunomodulatory effects on T cells including reduction of effector T cells and a relative increase in regulatory T cells. We have developed and are trialling in RA patients, antigen-specific immunotherapy targeting dendritic cells *in situ* with liposomes encapsulating autoantigenic peptide and calcitriol with the aim of antigen-specific T cell tolerance. I will discuss the development of antigen-specific tolerance strategies and the parallel development of immune monitoring assays to determine T cell outcomes in clinical trials in RA.

### Navigating the world of digital health

#### SP0131 ONLINE SOCIAL MEDIA PLATFORMS AND PUBLIC HEALTH INFORMATION: AN EXPLORATION INTO ARTHRITIS RELATED VIDEOS ON YOUTUBE IN 2017

*E. Heron. The University of Southampton, Southampton, UK*

**Background:** YouTube is one of the most used social media platforms from a desktop computer. YouTube provides a virtual platform that allows users to upload and view video content. Due to this functionality, YouTube is a valuable method for sharing and disseminating health information.

Patients with chronic conditions (including arthritis) are increasingly relying on online health information to help manage their symptoms, with 75% of patients living with chronic conditions reporting their healthcare decisions are influenced by information found online.

To date there have been no studies that have explored the information available for people searching for advice and support about arthritis on YouTube.

**Methods:** Patient and public involvement (PPI) representatives contributed to defining terms likely to be used by members of the public with arthritis searching for self-management strategies on YouTube. These included "joint pain", "knee pain", "hip pain", "hand pain" AND "helping" or "improving". From each of these search terms the top 10 videos sorted by view counts were chosen. Videos were included if the content was related to arthritis, in English and published in 2017. Videos were excluded if they were inappropriate or offensive, not related to humans or duplicates. The top 50 videos sorted by view count were included for analysis. This data set was systematically coded by the team lead (EH) and cross-checked by an additional team member (AC). Coded data were analysed using SPSS.

**Results:** Eighty videos were retrieved, 7 videos were irrelevant, 9 were duplicates and 11 were non-English language videos. Sixty-three videos were included for analysis. From the top fifty videos (sorted by view count), "Herbal Medicine" (n=14; 28%) was the most common category, followed by "Exercise and Stretching" (n=12; 24%). The most watched video relating to the self-management of arthritis was related to "Herbal Medicine" with a view count close to two million (n=1,930,905) within the four months since it had been posted online. Twenty five (69%) of the arthritis management related videos originated from the USA, with the UK producing only one video. Fifteen (30%) of the videos had been posted by self-reported health professionals. Nineteen (38%) of the videos were commercial. None of the videos produced links to research to back up their claims.

**Conclusion:** Sharing of health information on YouTube is unregulated. The most accessed videos include alternative approaches to self-management and are not posted by registered health care professionals (HCPs). Whilst a wide range of arthritis-related videos were retrieved, few were created by HCPs or reputable health care organisations. YouTube is a powerful tool for people with arthritis to

access and use health information. Current findings demonstrate scope for HCPs and established healthcare organisations to further utilise YouTube for the dissemination of quality-controlled, evidence-based information.

#### SP0132 MEASURING DIGITAL HEALTH LITERACY, WHY AND HOW?

C. Drossaert. *Psychology Health and Technology, University of Twente, Enschede, Netherlands*

Digital health literacy or eHealth Literacy refers to a person's ability to search, select, appraise and apply online health information or appropriately use digital health applications. In this presentation I will address the issue of measurement of these skills. First, we will explore why it is important to measure digital health literacy and discuss the different aims of measuring. Second, we will address some of the currently available instruments, including the oldest and most used instrument, the eHealth Literacy Scale or EHEALS Norman & Skinner, 2006 and some more recent instruments, including the eHealth Literacy Questionnaire, eHLQ Kayser et al. 2018 and the Digital Health Literacy Instrument, DHLI. Van der Vaart & Drossaert, 2017. Of each instrument, I will briefly discuss its underlying theory, some empirical findings, and its strengths and weaknesses. I will conclude with discussing some general challenges in measuring digital health literacy and directions for future research.

#### SP0133 PATIENT EXPERIENCES FROM A TELE-HEALTH INTERVENTION ON DISEASE ACTIVITY IN RA: THE KEEN AND THE RELUCTANT PATIENT

L.R. Knudsen. *Department of Rheumatology, Aarhus University Hospital, Aarhus, Denmark*

**Background:** Recently, the effectiveness of monitoring disease activity in rheumatoid arthritis (RA) through a patient-reported outcome (PRO)-based tele-health follow-up strategy was compared to usual outpatient follow-up in the TeRA trial.<sup>1</sup> Telemedicine interventions require patients taking an active role in the disease course and treatment, and assuming more responsibility for monitoring and identifying signs and symptoms of disease activity.<sup>2-3</sup> The TeRA study examines the effectiveness of tele-health follow-up, but provides no insight into how patients experience this new approach to disease control.

**Objectives:** To explore the experiences of a PRO-based tele-health follow-up from the perspective of patients with RA and their experiences of increasing their active role and responsibility for disease control in particular.

**Methods:** Adopting a strategy of *interpretive description*,<sup>4</sup> we conducted individual, semi-structured interviews with 15 RA patients participating in the tele-health follow-up. Participants were selected purposively and consecutive from both genders and with various ages, disease durations and disease severity. The analysis was inductive with a constant comparative approach. First, we identified the main themes conveying the participants' experiences. Then, we constructed patient typologies to explain different perspectives on the tele-health follow-up.

**Results:** Five themes covered the participants' experiences: 'A flexible solution', 'Responsibility', 'Knowledge of RA', 'Communication and involvement' and 'Continuity'. Two typologies: 'the keen patient' and 'the reluctant patient' represented opposite perspectives and preferences regarding the core value of and approach to the tele-health follow-up.

**Conclusions:** The participants had positive perceptions of the PRO-based tele-health follow-up and saw it as a flexible and resource-saving solution that can reduce the burden of unnecessary interruptions in everyday life. They reported disadvantages related to missing face-to-face contact with health professionals.

The two typologies, 'the keen' and 'the reluctant' patient, help us understand the patients' different needs, wishes and abilities to take part in tele-health follow-up. Our findings reveal a need for more insight into how tele-health follow-up could be integrated in routine clinical practice, paying special attention to how reluctant patients may be supported.

## The rheumatologist-orthopaedic surgeon connexion in secondary fracture prevention

#### SP0134 THE CONNEXION BETWEEN FRACTURE CARE AND SECONDARY FRACTURE PREVENTION

K. Åkesson. *Dept Clinical Sciences Malmö, Lund University, Malmö, Sweden*

That fracture begets fracture, is today an acknowledged reality. Nevertheless, there are still gaps in fracture care and many are far from reaching the optimal treatment pathway. Ultimately, each fracture should be appropriately managed from the moment of the fracture, through the acute management of the patient and the fracture, through to rehabilitation and secondary prevention. Optimisation of every step leads to better post-fracture functioning and quality of life, in addition to a reduced risk of new fracture events where the next fracture often is more severe than the previous.

Fracture treatment has improved with newer implants (plates, screws, nails, joint replacements etc) being developed specifically for fragile bone. Standardising procedures and checklists have made a difference in reducing complications. In the field of anaesthesia advances allows for surgery in the increasingly frail older person with acceptable perioperative risks and outcome. Similarly, tailored medical management is essential also to improve rapid post-operative recovery. The team approach to prompt regaining of function and rehabilitation allows for faster return to the home.

However, it has been more difficult to systematically improve the final step – prevention to avoid recurrence. It is a fact that patients at the highest risk of fracture, those who have already sustained a fracture, have overwhelmingly remain unidentified for osteoporosis treatment and falls prevention. Exceptions exist and they have become examples of best practice; whereby integrated, systematic identification, investigation and intervention were key components for secondary prevention of fractures. The cornerstone in such programs is the fracture coordinator; hence, they are commonly referred to as a fracture liaison service (FLS). They are the link between the orthopaedics and the osteoporosis clinic. Through the development of a best practice framework, the key components for developing secondary fracture prevention programs are outlined and tool kits on how to get started are available. The fundamental component is however, acceptance by the system in order to incorporate prevention as a required part of fracture management.

The presentation will provide an overview of main advances as well as tips on how to move forward.

#### SP0135 THE EULAR/EFORT RECOMMENDATIONS FOR PATIENTS WITH RECENT FRACTURE

W.F. Lems, on behalf of Working Group in EULAR EFORT recommendations in patients 50 years and over with a fracture. *Rheumatology, location VUmc, Amsterdam Rheumatology and immunology Center, Amsterdam, Netherlands*

The European League Against Rheumatism (EULAR) and the European Federation of National Associations of Orthopaedics and Traumatology (EFORT) have recognised the importance of optimal acute care for the patient 50 years and over with a recent fragility fracture and the prevention of subsequent fractures in high risk patients, which can be facilitated by close collaboration between orthopaedic surgeons and rheumatologists or other metabolic bone experts. Therefore, the aim was to establish for the first time collaborative recommendations for these patients.

According to the EULAR standard operating procedures for the elaboration and implementation of evidence-based recommendations, 8 rheumatologists from 8

countries and 10 orthopaedic surgeons from 10 countries met twice under the leadership of 2 conveners, a senior advisor, a clinical epidemiologist and 3 research fellows. After defining the content and procedures of the task force, 10 research questions were formulated, a comprehensive and systematic literature search was performed, and the results were presented to the entire committee. Subsequently, 10 recommendations were formulated based on evidence from the literature and after discussion and consensus building in the group.

The 10 recommendations will be discussed at the meeting; they included appropriate medical and surgical peri-operative care which requires, especially in the elderly, a multidisciplinary approach including orthogeriatric care. A coordinator should build up an organisation with systematic investigations for future fracture risk in all elderly patients with a recent fracture. High-risk patients should have appropriate non-pharmacological and pharmacological treatment to decrease the risk of subsequent fracture.

## What's new: Latest advances in treatment in JIA and osteoarthritis

### SP0136 LAST ADVANCES IN TREATMENT AND MANAGEMENT OF OSTEOARTHRITIS

*M. Kloppenburg. Rheumatology, Leiden University Medical Center, Leiden, Netherlands*

Osteoarthritis is a highly prevalent disease that results in a considerable disease burden for patients that suffer from this disease. Osteoarthritis can affect any joint, but is especially prevalent in the knee, hips and hands. The management for osteoarthritis includes non-pharmacological, pharmacological and surgical options. But options depend on the location of osteoarthritis, since not all treatment options are equally effective for patients with different osteoarthritis phenotypes. Fortunately, the number of high-quality clinical trials has increased in the last years and have increased our insight in potential effective treatments for osteoarthritis. Non-pharmacological options include information and education, exercise possibly in combination with weight reduction in overweight patients with knee osteoarthritis or assistive technology in patients with hand osteoarthritis. Regarding effective pain alleviating medication research, including systematic reviews, network analyses and randomised clinical trials, has increased our insight in the clinical efficacy of different medications. This has led to the discussion about the role of acetaminophen in osteoarthritis. New pain alleviating medication has been developed and is currently investigated. Furthermore, currently used medication is investigated for alternative ways of application. The ultimate requirement to have a disease modifying drug available is not yet met, but studies have been undertaken and are ongoing to investigate disease modifying potential.

## Assessment and prevention of RMDs, what have we learned?

### SP0137 PREVENTION OF RMDs – WHAT HAVE WE LEARNED?

*S.M. Verstappen<sup>1,2</sup>. <sup>1</sup>NIHR Manchester Biomedical Research Centre, Central Manchester University Hospitals NHS Foundation Trust, Manchester Academic Health Science Centre; <sup>2</sup>Arthritis Research UK Centre for Epidemiology, Centre for Musculoskeletal Research, Division of Musculoskeletal and Dermatological Sciences, The University of Manchester, Manchester, UK*

Rheumatic and Musculoskeletal Diseases (RMDs) cause the greatest burden of disability in Europe and is increasing. The WHO Europe Action Plan for the Prevention and Control of Non-communicable Diseases recently recognised this burden and recommends action to promote prevention and improve health in the

general population and those with musculoskeletal health. Targeted screening and prevention in individuals at high-risk of developing RMDs will only be successful if there is a good understanding of the underlying mechanisms of the disease and of possible genetic and environmental risk factors associated with the risk of developing RMDs. The main focus of this presentation is on the evidence of the association between modifiable lifestyle factors and the risk of developing RMDs and the effectiveness of drugs administered during the preclinical phase of RMDs.

### SP0138 WHY NOT ALL EFFECTIVE INTERVENTIONS ARE WORTHWHILE

*F. Guillemin. Université de Lorraine, APEMAC, Nancy, France*

Economic decisions in the health sector should be made to reach both efficiency and improvement of health in the most equitable way in the population. Comparative assessment of innovation with usual or current standard practice allows measuring the incremental benefit per individual. The comparison should bear both on effectiveness, ie health effect, and on costs of alternatives, considering appropriate stakeholders and payers. Moreover, according to diseases and treatment target, the time horizon should be relevant to its expected effect, from a few weeks for painkillers to a lifetime for disease modifying drugs in inflammatory arthritis, joint prosthesis in osteoarthritis, or prevention of osteoporosis.

Various scenarios can result from an economic analysis, with four possibilities for a new treatment or health care technology: more efficient at lower cost (optimal), less efficient at higher cost (worse issue), less efficient at lower cost (needing a decision to lose some effectiveness), or more efficient at higher cost – ie cost-effective – (needing to identify what the society is ready to pay off). This is done by calculating an incremental cost-effectiveness ratio, illustrating a marginal benefit per individual, at best using data from clinical trials. Therefore, not all effective interventions can be candidate for diffusion.

Because there is a need to make decisions before larger diffusion of the innovation, a set of methods are also available to anticipate its potential benefit, using a modelling approach. Sensitivity analyses are also conducted in varying conditions of application in reasonable range, using deterministic and stochastic methods. More recently, another perspective has been developed, ie the calculation of the net budgetary impact. This approach allows an extension of the costs to the targeted people in the whole population at a country level. It should take all indirect costs into account. Using these approaches, it is possible to observe that sometimes promising health technology sometimes need to be abandoned, given the too high cost to society for low additional benefit to individuals.

## High-end imaging: looking for the invisible

### SP0139 THE ROLE OF PHAGOCYTES AT THE INFLAMMATORY SITE

*S. Uderhardt, on behalf of Ronald N Germain. Laboratory of Systems Biology, National Institute of Allergy and Infectious Diseases, Bethesda, USA*

Inflammation is a highly conserved, multicellular response to infection or injury ensuring host defense and tissue integrity. Immune cell activation, however, can cause substantial collateral damage, often further amplifying the inflammatory response and significantly contributing to disease pathology (e.g. influenza, myocardial infarction). Hence, mechanisms are required not only to promote and resolve inflammation, but also to regulate the primary events that initiate this process in order to avoid unwanted and potentially harmful immune responses.

Using state-of-the-art intravital and static multi-parameter imaging techniques in mice, our lab seeks to understand the complex interactions and functions of different immune cells types in the execution and regulation of the inflammatory responses to sterile damages in peripheral tissues. With primary focus on the innate immune system, we're particularly interested in the dynamic interplay of embryonically-derived tissue macrophages and recruited neutrophils, which can prevent unwanted immune cell activation and thereby fine-tune the threshold for the onset of damaging inflammation.

This presentation will provide novel insights into the multi-layered regulation of the very initial steps in an inflammatory response to tissue damage, and will further discuss the differential roles of different populations of phagocytes at sites of inflammation.

This research was supported by the Intramural Research Program of the NIAID.

**Disclosure of Interest:** None declared

#### SP0140 IMAGING THE ARTHRITIC JOINT

**J. Brewer.** *Institute of Infection, Immunity and Inflammation, University of Glasgow, Glasgow, UK*

Advanced imaging approaches such as multiphoton laser scanning microscopy (MPLSM) enable the real-time visualisation of cellular behaviour throughout the development of immune responses *in vivo*. These techniques have brought new insights into the spatial and temporal organisation of the immune system, for example the T cell/Dendritic cell interactions in the lymph node during the decision to induce immunological priming versus immunological tolerance. We believe that understanding cellular interactions in the joint will similarly transform our understanding of the importance of time and tissue specific regulation of the immune system in homeostasis and in diseases such as Rheumatoid Arthritis. Furthermore, using cell fate mapping, we have integrated imaging data in different cellular locations with transcriptional analysis to reveal the underlying molecular basis of these interactions. We propose that the key T cell/DC interactions controlling the development of immune responses and their molecular basis are influenced by the distinct anatomical and temporal context in which they take place, providing targets for therapeutic intervention as well as indicating biomarkers to report immune function.

#### SP0141 IMPROVING THE STUDY OF BONE DISEASES BY CORRELATIVE ELECTRON-, ION- AND X-RAY MICROSCOPY INCLUDING THEIR ANALYTICAL TECHNIQUES

**S.H. Christiansen,** on behalf of S.H. Christiansen, L. Kling, G. Sarau, R. Keding, L. Pillatsch, J. Michler, P. Milovanovic, B. Busse, M. Herrmann, G. Schett. *Helmholtz Zentrum Berlin für Materialien und Energie, 14109 Berlin, Germany*

In the last decades a lot of knowledge was gathered on the structure and composition of bone. Cutting-edge correlative high-resolution microscopy and spectroscopy permits reaching the next level of understanding: Correlative workflows starting from X-ray microscopy volume analysis with voxel sizes of <1 μm, over large scale scanning electron data acquisition, to dual beam microscope analysis (focused electron- and ion beam) permit the scale bridging investigation of bone architectures and thus merging the “big picture” and the underlying ultrastructure with statistical significance. In combination with additional analytical add-ons, physical properties such as optical, mechanical, compositional, structural etc. deliver a highly detailed correlative dataset of bone.

The present paper utilises the comprehensive data acquisition to study bone degradation as it occurs in diseases such as osteoporosis and inflammatory osteoarthritis in mouse models.

### WIN and HOT Lancet session

#### SP0142 WHAT CAN NEW INSIGHTS IN THE PATHOGENESIS OF PSORIATIC ARTHRITIS TELL US?

**D. Veale**<sup>1,2</sup>. <sup>1</sup>University College Dublin; <sup>2</sup>St. Vincent's Hospital, Dublin, Ireland

Psoriatic arthritis is a chronic immune-mediated inflammatory arthropathy, of unknown cause that presents with low grade inflammation of the skin, joints and/or entheses including the axial skeleton. Psoriatic arthritis is associated with increased mortality from cardiovascular disease. Diagnosis is primarily according to clinical phenotype due to the diverse clinical features. Increased understanding of the pathogenesis has led to specific new therapeutic agents and treatment strategies that prevent disease progression and improve quality of life, however 40% or more subjects show partial response or fail to respond. Despite this several unmet needs remain. There are no validated biomarkers for diagnosis, prediction of therapeutic response or remission, therefore it remains difficult to accurately assess disease activity, predict which subjects will respond to a specific therapy, and identify those in remission. This review will address specific recent advances in translational research that inform the pathogenesis of psoriatic arthritis.

SATURDAY, 16 JUNE 2018

### The GI tract in systemic sclerosis – is there light at both ends?

#### SP0143 ARMFUL HIDDEN TELANGIECTASIA

**C. Frantz.** *Rheumatology A, Cochin Hospital, Paris Descartes University, Paris, France*

Patients with systemic sclerosis (SSc) develop a broad spectrum of vascular manifestations including the almost universal Raynaud's phenomenon, commonly digital ulceration and more rarely critical digital ischaemia. In parallel, within this very heterogeneous disease, some patients will develop vascular related organ damages leading to heart or kidney failure. In addition, SSc patients commonly exhibit telangiectasia that are visible macular, dilated superficial blood vessels. They can develop near the surface of the skin or the mucous membranes. Cutaneous telangiectasia are now included in the classification criteria and may be a marker of more aggressive vascular phenotype. Furthermore, telangiectasia can occur in the gut and promote the development of more structured damages like vascular ectasias and sometimes the very specific gastric antral vascular ectasia. All these vascular lesions induce severe and recurrent chronic iron-deficiency anaemia that can require specific local treatments to stop the bleeding. They also occur in subsets of SSc patients at risk of other SSc complications that will be highlighted in the clinical cases to be presented.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.7662

**SP0144 THE IMPORTANCE OF MAINTAINING CONTROL**K.E.N. Clark. *University College London, London, UK*

The clinical impact of lower gastrointestinal tract involvement in systemic sclerosis will be illustrated by case presentations. This will describe problems including pseudo-obstruction, severe malnutrition, and electrolyte imbalance and anorectal disease. The interplay with comorbidities such as cardiac scleroderma will also be described. Potential therapeutic strategies for these different complications will be introduced through these cases.

**Disclosure of Interest:** None declared**DOI:** 10.1136/annrheumdis-2018-eular.7672**SP0145 LIGHT AT THE LOWER GASTROINTESTINAL TRACT IN SYSTEMIC SCLEROSIS**C.P. Denton. *Centre for Rheumatology, Royal Free Hospital and UCL Medical School, London, UK*

Gastrointestinal tract manifestations of systemic sclerosis are common and represent a high burden of the disease. Whilst some aspects can be treated the lower bowel involvement is especially challenging. The midgut is affected with dysmotility and functional impairment including the consequences of impaired absorption and exocrine pancreatic insufficiency. Midgut hypomotility can lead to stagnation of bowel contents and small intestinal bacterial overgrowth that contributes to bloating, diarrhoea and malnutrition. Colonic involvement contributes to chronic constipation and anorectal disease is a major non-lethal burden leading to incontinence. This has enormous impact on quality of life. The end result is a constellation of symptoms and clinical problems that require integrated management to ensure appropriate investigation and treatment. Strategies that can be helpful include broad spectrum antibiotics to address small intestinal bacterial overgrowth and prokinetics to address issues of pseudo-obstruction. The latter is best managed conservatively. Occasionally patients develop nutritional failure that requires parental nutrition. This can be successfully delivered as part of a home care programme and is generally parenteral supplementation, for example with overnight feeds, rather than total parenteral nutrition. Constipation and diarrhoea require opposite strategies for treatment and often a high degree of patient self-management. Recent trials of techniques to improve anorectal incontinence have been promising for strategies such as posterior tibial nerve stimulations and this may represent useful option in some cases.

**DOI:** 10.1136/annrheumdis-2018-eular.7621**SATURDAY, 16 JUNE 2018****RA: is it all in your head?****SP0146 THE LINK BETWEEN INFLAMMATION AND DEPRESSION**N. Harrison. *Neuroscience, Brighton and Sussex Medical School, Brighton, UK*

Inflammation is increasingly implicated in the etiology of depression. Patients with idiopathic depression have been shown to express increased circulating pro-inflammatory cytokines and 30% of patients receiving chronic Interferon-alpha for the treatment of Hepatitis-C develop major depression. Recently, anti-inflammatory agents, including 'biologics' developed for rheumatoid arthritis, have shown potential efficacy for the treatment of idiopathic depression. However, the utility of these medications is highly variable emphasising the importance of identifying biomarkers that may predict treatment response. Interestingly, neuroimaging studies have recently demonstrated that increases in inflammation can rapidly alter brain function and microstructural integrity. Further, these acute changes in brain structure/function can additionally predict the later development of depressive response during sustained inflammatory challenge. For example, in patients with Hepatitis-C given Interferon-alpha over a prolonged period, acute changes in ventral striatal microstructure (observed within 4 hours of the first injection of Interferon) predict the magnitude of fatigue/motivational impairment experienced 4 weeks later while acute changes in amygdala processing of emotionally valenced stimuli predicts the magnitude of depressive symptoms. Conversely, inhibitors of Tumour Necrosis Factor (TNF) reduce amygdala reactivity to emotional stimuli, which correlate with improvement in mood. Together, these studies

highlight the importance of inflammatory processes in depression and support ongoing trials of anti-inflammatory agents in this common and functionally impairing disorder.

**DOI:** 10.1136/annrheumdis-2018-eular.7813**SATURDAY, 16 JUNE 2018****Gut bacteria: the boss of the immune system****SP0147 HOW THE GUT MICROBIOTA AND ITS METABOLITES IMPACT ON BONE HOMEOSTASIS**M.M. Zaiss. *Department of Internal Medicine 3 – Rheumatology and Immunology, Friedrich-Alexander-University Erlangen-Nürnberg (FAU), Erlangen, Germany*

Microbial metabolites are known to modulate immune responses of the host. The main metabolites derived from microbial fermentation of dietary fibres in the intestine, short-chain fatty acids (SCFA), affect local and systemic immune functions. Here we show that SCFA are regulators of osteoclast metabolism and bone mass *in vivo*. Treatment of mice with SCFA as well as feeding with a high-fibre diet significantly increases bone mass and prevents postmenopausal and inflammation-induced bone loss. The protective effects of SCFA on bone mass are associated with inhibition of osteoclast differentiation and bone resorption *in vitro* and *in vivo*, while bone formation is not affected. Mechanistically, propionate (C3) and butyrate (C4) induce metabolic reprogramming of osteoclasts resulting in enhanced glycolysis at the expense of oxidative phosphorylation, thereby downregulating essential osteoclast genes such as TRAF6 and NFATc1. In summary, these data identify SCFA as potent regulators of osteoclast metabolism and bone homeostasis.

Pain is a multidimensional experience, and chronic ongoing pain may have wide-ranging social and psychological implications. A biopsychosocial model of understanding is generally considered to be the best pain model, and it is well-established that interdisciplinary pain management is the most effective treatment approach. Psychological management plays an important role in such treatment. This lecture will cover the link between psychological factors and pain as well as psychological pain management.

**Disclosure of Interest:** None declared**DOI:** 10.1136/annrheumdis-2018-eular.7799**SP0149 THE PATIENT'S PERSPECTIVE OF LIVING WITH COMPLEX REGIONAL PAIN SYNDROME**R. Connert. *Select, Royal Devon and Exeter Hospital, Exeter, Devon, UK, Exeter, UK*

There is wide acknowledgement in medical literature that CRPS is a very painful condition that can be severely debilitating and adversely affect quality of life. In an attempt to assist the many highly caring, gifted and dedicated clinicians who want to understand what this actually means from the perspective of those who live with the condition relentlessly day by day, I shall attempt to bring such a statement to life. I shall speak mainly from my own journey of learning to live with CRPS since 2001, but shall also draw on the experiences fellow sufferers have shared with me, and humbly contribute some key messages for the clinicians who come into contact with patients pre or post diagnosis.

**SP0150 FUNCTIONAL REHABILITATION FOR THE RELIEF OF COMPLEX PERSISTENT PAIN**

*C. McCabe. Royal National Hospital for Rheumatic Diseases, Royal United Hospitals Nhs Foundation Trust, Bath, UK*

Persistent pain, by definition, is a long-term condition that cannot be resolved by available medical or other treatments. Historically, the focus for pain and rehabilitation specialities has been on management, to improve quality of life and function in the presence of pain. However, most patients seek pain relief.

Research by the Bath Pain group, and other published literature indicates that people make hypotheses about bodily feelings based on prior performance and the current environment. This is an active process. Pain related adaptations to the sensory and motor systems ensure we act to minimise potential threats. These adaptations impact on bodily feelings and modify autonomic and limbic systems. The degree of adaptation can be minor and brief, or significant and persistent. Where adaptive mechanisms continue to engage beyond what is deemed as useful, this can be considered hyper-adaptive.

I will present clinical evidence of pain related hyper-adaptations that people with persistent pain describe in clinic. For example, perceived changes in the painful limb, ownership, temperature, and size, as well as feelings of peculiarity, discomfort, pain, and altered movement trajectory when motor output does not match expected sensory feedback. People with Rheumatoid Arthritis, Fibromyalgia, Complex Regional Pain Syndrome, or after limb fracture all describe altered body perceptions. Individuals may, for example, perceive a painful hand (and an object held within it), as excessively heavy and enlarged (when in reality it is not), report clumsiness, and difficulty moving the hand due to a perceived inability to 'engage' with it. We have described visual neglect and emotional changes about the painful limb, and consequent impacts on motor and autonomic function.

The sensory system encodes the characteristics and location of stimuli and determines if these are harmful or innocuous. This process is impaired in a painful body part. The ability to determine the texture or temperature of materials applied to the painful skin is commonly lost; or non-painful stimuli, such as light touch, are perceived as painful (allodynia).

This session will describe work that has focused on aiming to increase our understanding of the pain-related adaptations in sensorimotor processing and associated behaviours, in order to design interventions that help to redefine this hyper-adaptive response, essentially broadening sensorimotor function, and relieving persistent pain.

**Osteoarthritis: a vascular disease**

**SP0151 DOES IMAGING SUPPORT THE VASCULAR NATURE OF OSTEOARTHRITIS?**

*P.G. Conaghan. Leeds Institute of Rheumatic and Musculoskeletal Medicine, University of Leeds, Leeds, UK*

There are a number of ways in which vascular disease may contribute to either the initiation or structural progression of osteoarthritis (OA). We should keep in mind that atherosclerotic vascular disease, like OA, occurs with increasing frequency as people age and consequently understanding their inter-relationship and any potential causal relationship is difficult. Of interest is the suggested epidemiological links between cardiovascular mortality and OA, though again this is difficult to discern the casual part of the relationship. Links between vascular disease and osteoarthritis may of course be mediated through a common disease association, obesity. One hypothesis is that osteoarthritis is a differentiation disorder involving altered lipid metabolism.

It should also be remembered that articular cartilage is avascular, and it receives much of its nutrition from the subchondral bone or synovial fluid. Vascular disease in the subchondral bone may accelerate structural progression through alterations in cartilage nutrition or through direct ischaemic effects on bone. Imaging plays a key role in hypotheses about vascular involvement in OA, since it is commonly used for diagnosis and assessing progression. It has been suggested that the MRI subchondral bone changes typical of OA (termed bone marrow lesions) are similar to those seen in avascular necrosis, especially in the hip.

How might vascular changes effect OA? Certainly OA structural changes have been proposed because of secondary vascular changes in the high-pressure subchondral bone environment. These have been described in terms such as 'venous outflow obstruction' and also 'localised hypercoagulabilities', and have been described in animal and human studies. Venous outlet syndrome in the subchondral region can result in ischaemia of bone and the adjacent cartilage. Dynamic contrast enhanced (DCE-)MRI and positron emission tomography (PET) have

demonstrated that venous outflow obstruction results in decreased perfusion and that venous stasis is associated with trabecular remodelling, in animal OA models. Another potential role for vascular perturbation is in the synovitis commonly seen in OA. Given the frequency of synovitis in (especially knee) OA, it is possible that a patchy distribution of reduced blood flow (local ischaemia) happens in areas of greater inflammation. Greater levels of synovial inflammation have been associated with OA progression.

Another hypothesis is that atheromatous disease might directly effect OA pathology progression. Computed tomography (CT) has been used in the spine to demonstrate an association between arterial calcification and the degree of disc degeneration, and there has also been shown to be a relationship between disc degeneration and adjacent bony end plate damage. These spinal changes are similar to OA joint pathologies. Another study demonstrated an association between hand osteoarthritis imaging findings and aortic calcification.

**SP0152 HYPERTENSION, BONE MARROW LESIONS AND OSTEOARTHRITIS (OA)**

*<sup>1,2</sup>D. Felson. <sup>1</sup>Clinical Epidemiology Unit, Boston University School of Medicine, Boston, USA; <sup>2</sup>Arthritis Research UK Centre for Epidemiology, University of Manchester, Manchester, UK*

Elements of the metabolic syndrome except for hypertension such as dyslipidemia and central adiposity are not consistently associated with knee osteoarthritis once obesity is adjusted for. However, after adjustment for obesity, hypertension is modestly associated with an increased risk of knee and even, in some studies, hand OA. A recent meta-analysis reported consistency across large cohort and case control studies; those with hypertension had a 1.49 fold increased odds of OA ( $p < 0.001$ ).

There are several possible explanations for this association especially if hypertension compromises the supply of nutrients to the joint. First, as OA develops, subchondral bone remodelling is accompanied by angiogenesis which could be inhibited by vascular insufficiency. In findings that are probably related, bone marrow lesions seen on MRI in OA represent lesions of bone trauma and, in these lesions, the number of vessels increases and the vessels have especially thick walls for their size. Bone marrow lesions have been linked to intraosseous hypertension that is probably not a consequence of arterial but rather of venous hypertension within bone. Further, NSAID use in persons with OA could raise blood pressure and create a spurious association of OA with hypertension. Given this range of potential explanations and the potential for identification of causal factors that may offer clues to OA treatment, further exploration of the biology of this relationship is needed.

**Workshop: Is there a diet for people with RMDs?**

**SP0153 WHAT EVIDENCE IS THERE THAT DIETS HELP PEOPLE WITH RMDs?**

*<sup>1,2</sup>A. Linauskas. <sup>1</sup>Department of Rheumatology, Aarhus University Hospital, Aarhus; <sup>2</sup>Department of Rheumatology, North Denmark Regional Hospital, Hjoerring, Denmark*

Throughout history patients with Rheumatic diseases (RMD) have used different diets trying to improve the symptoms and dietary manipulation is still widely used today. There are several potential mechanisms by which diet may be related to pathways involved in inflammation, such as decreasing the inflammatory process, increasing antioxidant levels, changing the lipid profile, influencing composition of the intestinal bacterial flora.

The common dietary programs used by people with RMD include vegetarian or vegan, Mediterranean, elimination diets or fasting periods. Moreover, many

dietary supplements are available both as combination formulas and as single-ingredient supplements.

The most studies, investigating diet influence on RMD symptoms in human, were conducted among Rheumatoid Arthritis (RA) patients as an adjunctive therapy. Further, there is a wide variation in evidence robustness probably due to the complexity of studying the relationship between diet and disease activity.

**Diets:** Several controlled studies among RA patients have been performed.

Mediterranean diet intervention studies have shown tendency to pain reduction and improvement of physical function after 3–6 months.

An intervention study, comparing 7–10 days fasting followed by 13 months vegetarian diet and the ordinary diet, showed significant pain reduction in the intervention group. Though, there was no significant difference in physical function or morning stiffness compared to RA patients adhered to an ordinary diet.

Vegan diet intervention studies did not report statistical significant difference in pain, physical activity or morning stiffness compared to an ordinary diet.

One study compared 6 weeks of elimination diet to an ordinary diet. Due to inadequate data reporting, no between-group analyses were possible, the authors of the study concluded: "When the dietary and placebo groups were compared the dietary group did better for all 13 variables for which differences between them were significant".

Cholesterol lowering diet study among 17 Systemic Lupus Erythematosus (SLE) patients showed increased quality of life (measured by questionnaire) after 12 weeks study period compared to the control group.

Ramadan fasting study among 40 SLE patients did not reveal any influence of fasting on disease activity or patients' quality of life during the fasting period or 3 months after fasting compared to non-fasting SLE patients.

Non-randomised controlled low-salt, uncooked vegan diet study among 53 fibromyalgia patients revealed improvements in pain, joint stiffness, quality of sleep, quality of life and general health after 3 months of study period.

**Dietary supplements:** Several studies of fish oil supplementation have been performed among RA patients and have generally shown positive results on pain reduction, morning stiffness, and improvement in physical activity and decreased use of pain relief medications. The potential benefit of eating whole foods with high omega-3 content has not been evaluated.

Studies, investigating Vitamin D supplementation in RA patients did not find any disease modifying effect.

Interventional studies of antioxidant supplementation in patients with RMD have been inconclusive.

Current data regarding potential therapeutic effects of probiotics suggest plausible benefits, though evidence grade is still low.

There is some evidence that herbal therapy containing Gama Linolenic Acid oils (evening primrose, borage, or blackcurrant seed oil) reduce some RA symptoms.

**Alcohol:** Studying effects of alcohol on RMD activity is complicated not least in relation to the treatment. Two observational studies among RA patients, showed tendency towards an inverse association between alcohol use and disease severity.

**Conclusion:** The effects of dietary manipulation in RMD patients are still uncertain due to small study samples and potential risk of bias. Higher drop-out rates and weight loss in the groups with manipulated diets indicate that potential adverse events should not be ignored.

However, there is some evidence that fasting followed by a vegetarian diet and Mediterranean diet improve pain, but not stiffness and physical function among RA patients, when compared to an ordinary diet.

Several controlled studies showed that dietary supplements of moderate-to-high doses of omega-3 fatty acids have a beneficial effect on several parameters of RA activity.

Evidence regarding diet influence on RMD's other than RA is very weak.

## SP0154 HOW TO OFFER SEMINARS ON NUTRITION

C. Elling-Audersch, *Deutsche Rheuma-Liga (German Rheumatism League), Berlin, Germany*

Deutsche Rheuma-Liga (German Rheumatism League)

Deutsche Rheuma-Liga (DRL) is a patient organisation that offers support to people with all rheumatic and musculoskeletal diseases (RMDs). We offer to our members information, various seminars, exercise classes and advice services. The main goal is to improve a patient's self-management.

Most patients have questions concerning medication, but would like to know as well what other measures can be taken to improve their health. Nutrition and the question of a rheumatism diet is one of the great patients' demands.

Based on a survey of our organisation (DRL) patients' information priorities are obvious and have led to offerings for patients.

Our seminars for patients about nutrition are based on our nutrition booklet, on evidence-based information and on avoiding an esoteric content.

All seminars deal with three key elements of self-management: nutrition, exercise and ergonomic kitchen aids.

Based on the key messages of nutrition, the important aspects are not only to educate, but also to exercise, to communicate, to exchange experiences, to cook, to taste, to smell and to enjoy. We show ergonomic kitchen aids and explain their daily usefulness.

My talk will consider organisational aspects as well, if an organisation wants to offer such seminars.

In our experience combining nutrition, exercise and ergonomic aids are essential aspects of a healthy life and contribute to a person's rheumatic and/or musculoskeletal treatment successfully.

## SP0155 NUTRITION – HOW TO TALK ABOUT IT

V. Krafft, *Rheumaliga Schweiz, Zurich, Switzerland*

When it comes to the subject of nutrition and rheumatism, particularly in relation to inflammatory rheumatism, opinions are sharply divided. Holistically oriented physicians and therapists believe that a change in diet can replace medication in the treatment of chronic inflammation and they thus pursue the goal of reducing the need for medication through an anti-inflammatory diet. Rheumatologists by contrast staunchly defend drug therapy and still approach the subject of nutrition with great reserve, disinterest, or even reject its effects out of hand. Some warn that patients who stray from a balanced diet with a mix of foods may risk nutritional deficiencies.

These opposing views leave many of those affected by rheumatism unsure of how to approach nutrition. Can a change in diet really help alleviate the symptoms of inflammatory rheumatism? Which diet rules can I trust? And what's more: How do I speak about it with my rheumatologist? Will he advocate a change in diet and view it as part of my arthritis therapy – or see it merely as a supporting measure, quite a nice idea but without any therapeutic value?

Anyone wanting to provide rheumatism patients with some guidance in this regard must ward against possible bias. The Swiss League against Rheumatism makes sure its communications on this controversial issue take into account the whole spectrum of existing medical pluralism. On the question of nutritional benefits, it thus provides information from the point of view of conventional medicine as well as that of complementary medicine and all the shades in between.

Objectives of the Swiss League against Rheumatism

The Swiss League against Rheumatism endeavours on the one hand to ensure that its communication about nutrition is not one-sided but rather presents the different viewpoints. On the other hand, those affected should be given access to knowledge that can help them to form their own opinion.

To achieve these goals, the Swiss League against Rheumatism continually invests human and financial resources into research on this topic, interviews and exchanges with experts, as well as ongoing updates of their contributions.

**Communication channels:** The Swiss League against Rheumatism informs people about the topic of nutrition through the following communication channels:

- Website
- Facebook
- Brochures
- Lectures

The main focus is on articles on the website.

Standpoint of the Swiss League against Rheumatism

The Swiss League against Rheumatism includes the subject of nutrition in its communications because there is a great need for information among those affected.

The Swiss League against Rheumatism itself takes no position for or against a described measure but rather only makes recommendations based on scientific criteria. On the basis of these scientific criteria, it can be assumed that nutrition, in particular a Mediterranean diet, can have a "positive influence" on various rheumatic diseases.

**Challenging projects in education and training****SP0156 THEORY OF POSTER DESIGN AND PRESENTATION**

*M. Boers, Epidemiology and Biostatistics; Amsterdam Rheumatology and Immunology Center, VU University Medical Center, Amsterdam, Netherlands*

This lecture introduces basic elements of poster design, and is followed after the session by a special poster tour devoted to design. It strongly links to the concepts discussed in my workshop on data visualisation.

To design an effective poster, its message and the intended audience must be clear. Effective posters stand out because they convey their main message almost instantly, and then seduce participants to stay longer and learn more. Much more than oral presentations, posters are about selling your work in competition with all those other people presenting in your session.

In a good poster, all elements work together like a symphony orchestra:

Title, headings, text, tables, graphs, format, colours, layout, handouts, gimmicks, and ... you!

For the design process, you need a good plan (including timelines!), good tools (templates, software!) and a ruthless editor. Editing is about throwing out more and more stuff, until finally you reach the point where throwing out more destroys understanding. So the 'orchestra' has single instrumentation, and is wonderfully transparent.

Posters are not 'comprehensive'! All the details you love can go into a specially designed handout (NOT an exact replica of your poster).

Your role as presenter is special: you must be visible but unobtrusive, and flexible to accommodate different viewer styles, and have different modes of presentation (eg. walkthrough, answer questions, respond to critique). Also make sure your contact details are visible and correct (if no handout, be sure to have business cards). If you are playful you can use gimmicks to increase your visibility: match your clothes to your colour scheme, make something in real 3D on your poster, use sound, etc. But don't overdo it: this is just the icing on the cake: this is a science, not a commercial exhibit.

When we go to assess posters in the upcoming poster tour, we will be looking for the following elements:

1. Overall message clear?
2. Text quality: brevity, clarity
3. Table quality: clear vision, clear understanding
4. Graph quality: clear vision, clear understanding
5. Design elements: layout, choice of font, color
6. Handout: not a replica, elements 1–5 repeated
7. Presenter: style, contact details

**SP0157 THE EULAR SCHOOL OF RHEUMATOLOGY. A CHALLENGING EDUCATIONAL EULAR PROJECT. WHERE ARE WE NOW?**

*A. Iagnocco, Scienze Cliniche e Biologiche, Università degli Studi di Torino, Turin, Italy*

EULAR has traditionally been a strong advocate of training and education in rheumatology, which has made EULAR the pre-eminent provider and facilitator of high-quality educational offerings for physicians, health professionals in rheumatology, and people with rheumatic and musculoskeletal diseases. Indeed, the international rheumatology community is set to benefit from high levels of education in rheumatology, with the aim of delivering significant relief to the lives of people with musculoskeletal and rheumatic diseases worldwide.

In June 2017, the EULAR School of Rheumatology was launched at the Annual EULAR Congress. This is as a fully integrated operational entity contained within EULAR which combines all educational offers, whether they are live courses, online courses, books, webinars or any other material, under one roof. This new system has the aim of greatly facilitating access to all products, giving personalised overviews and allowing, for those who sign up for a membership, to use the various incentives and special offers. The School will also provide the members a secure means of storing their gained certifications and other personal information. In addition, members of the EULAR School of Rheumatology will be able to benefit from a new accumulative credit point system, which adds points according to educational hours spent in EULAR courses, either live or on-line. Members will also

be regularly informed regarding the developments of the School and new educational and training materials.

With the purpose of optimising and improving the already very solid educational offerings of EULAR, during the last two years, seven groups of eminent experts in education actively worked to develop new products to be added to the existing educational material of EULAR. Many different projects are currently being developed by these "classrooms" and are addressed to the whole rheumatology community (i.e. rheumatologists, undergraduates, trainees, teachers, researchers, health professionals, and people with rheumatic and musculoskeletal diseases). Indeed, in today's digital era, education and training possibilities are undergoing constant changes with new approaches, products and technologies coming up. Thus, the EULAR School of Rheumatology represents a model of future learning, reflecting the changing needs of the rheumatology community through offering new educational materials across this medical discipline and the greatest levels of access to the highest quality of education in the field.

With the modern developments of the rheumatology discipline, EULAR School of Rheumatology is today taking its educational offerings, services and products to a global audience worldwide.

For information about ongoing and new initiatives of the EULAR School of Rheumatology, please go to [www.eular.org/school\\_of\\_rheumatology.cfm](http://www.eular.org/school_of_rheumatology.cfm).

SATURDAY, 16 JUNE 2018

**Recommendation session ESSCA****SP0158 UPDATE OF EULAR RECOMMENDATIONS FOR VACCINATION OF PATIENTS WITH AUTOIMMUNE INFLAMMATORY RHEUMATIC DISEASES**

*O. Elkayam, on behalf of Eular task force. Rheumatology, Tel Aviv Medical Center, Tel Aviv, Israel*

**Objectives:** A European League Against Rheumatism (EULAR) Task Force was established to update the recommendations for vaccination of patients with autoimmune inflammatory rheumatic diseases (AIIRD) published in 2011.

**Methods:** Following the latest version of the EULAR Standardised Operating Procedures (SOP), three systematic literature reviews were conducted to present the new evidence published between 2009–2017 regarding the prevalence of vaccine preventable diseases among patients with AIIRD, the efficacy and safety of vaccines recommended for adults, and the effect of disease modifying drugs on the response to vaccines. After the presentation of the new evidence to the Task Force, overarching principles and recommendations were formulated. Evidence was graded in categories I–IV, the strength of recommendations was graded in categories A–D, and Delphi voting was applied to determine the level of agreement between the experts of the Task Force.

**Results:** A total of 6 overarching principles and 9 recommendations were formulated. The first two overarching principles focus on the responsibility of the treating physician for a yearly assessment of the vaccination status of AIIRD patients. An individualised vaccination program should be suggested and explicitly discussed with all patients. The next overarching principles address the timing of vaccination. Preferably patients are vaccinated during stable disease and prior to planned immunosuppression, in particular prior to B-cell depleting treatment. Non-live vaccines can be safely provided to AIIRD patients under immunomodulating treatments, whereas the administration of live attenuated vaccines should be avoided under immunomodulating treatment, with the possible exceptions of herpes zoster and MMR. Recommendations 1 to 7 refer to the administration of specific vaccines. Influenza and pneumococcal (a combination of PCV 13 and PPSV23) vaccines should be strongly considered for all patients with AIIRD. Herpes zoster, human papilloma virus, hepatitis A and B, yellow fever, and tick-borne encephalitis vaccines should be considered in AIIRD patients at risk. Newly formulated recommendations 8 and 9 address the vaccination approach to household members and newborns of patients with AIIRDs. Immunocompetent household members of patients with AIIRD should be encouraged to receive vaccines according to national guidelines with the exception of oral poliomyelitis vaccine. Live attenuated vaccines should be avoided during the first 6 months of life in newborns of mothers treated with biologics during the second half of pregnancy

**Conclusions:** The 2017 EULAR recommendations provide an up-to-date guidance on the management of vaccinations in patients with AIIRDs. The dissemination of the data to health professionals and patients and implementation of the recommendations will help to prevent vaccine preventable diseases in the AIIRD population.

**SP0159 EULAR RECOMMENDATIONS FOR THE MANAGEMENT OF SJÖGREN'S SYNDROME**

S. Retamozo<sup>1,2</sup>. <sup>1</sup>Department of Autoimmune Diseases, ICMiD, Laboratory of Autoimmune Diseases Josep Font, IDIBAPS-CELLEX, Hospital Clínic, Barcelona, Spain; <sup>2</sup>Rheumatology Unit, Hospital Privado Universitario de Córdoba. Instituto De Investigaciones En Ciencias De La Salud (INICSA), Consejo Nacional de Investigaciones Científicas y Técnicas (CONICET) – Córdoba – Argentina., Córdoba, Argentina

Sjögren's syndrome (SjS) is a systemic autoimmune disease that affects 0.1% of the European population and that presents with a wide spectrum of clinical manifestations. Primary SjS has no cure, and their therapeutic management has not changed significantly over the past decades. The current approach is still based upon symptomatic treatment of sicca symptomatology and broad-spectrum immunosuppression directed against systemic disease. In spite of the several therapeutic options available, there is insufficient information on their differential efficacy and safety, making that treatment decisions remain challenging in clinical practice. Over the last decade, research has centred on investigating more effective SS-targeted therapies, with the development of various randomised controlled trials (RCT) unfortunately with the absence of game-changing results. With these discouraging results, national effort promoted by some scientific societies have led to the development of several sets of recommendations.

The European League Against Rheumatism (EULAR) promoted and supported in 2010 an international collaborative study (EULAR SS Task Force) aimed at developing consensual disease activity indexes in SS. This work was very successful with the development of the first international specific scores for SjS (ESSPRI and ESSDAI), now widely used both in clinical and research settings. The wide consensus obtained on the development of the ESSDAI/ESSPRI scores provided an excellent opportunity to advance in the development of international recommendations for the therapeutic management of SS. Therefore, we continued the work of the Task Force with the development of evidence-, consensus-based official EULAR recommendations following the Delphi methodology, with the aim to provide physicians and patients with a rational therapeutic approach to SjS patients.

**SP0160 2018 EULAR RECOMMENDATIONS FOR THE USE OF GLUCOCORTICOID THERAPY**

F. Buttgerit. Department of Rheumatology and Clinical Immunology, Charité University Medicine Berlin, 10117 Berlin, Germany

Glucocorticoids (GC) are potent anti-inflammatory and immunosuppressive drugs which are used successfully to treat many disorders, including rheumatoid arthritis, polymyalgia rheumatica, giant cell arteritis, myositis, systemic lupus erythematoses and other rheumatic diseases. However, these drugs also have the potential to cause severe adverse effects, particularly if high doses are used for prolonged periods. Therefore, the benefits of GC therapy must be balanced against the potential risks. Key strategies to achieve this goal include (i) following guideline recommendations regarding GC therapy dosing, monitoring for potential adverse events, and adverse event prevention and management, (ii) using or developing new therapeutic advances to improve the therapeutic balance.

The EULAR Glucocorticoid Task Force has already published several recommendations over the last years such as those on the standardised nomenclature for GC dosages and treatment regimens, on the management of systemic GC therapy in rheumatic diseases, and on monitoring adverse events of low-dose GC therapy. Recent work of this group dealt with the question under which conditions long-term treatment with GC has an acceptably low level of harm. As a result, the task force members agreed that the risk of harm is low for the majority of patients at long-term dosages of  $\leq 5$  mg prednisone equivalent per day, whereas at dosages of  $>10$  mg/day the risk of harm is elevated. At dosages between  $>5$  and  $\leq 10$  mg/day, patient-specific characteristics determine the risk of harm. This means general and glucocorticoid-associated risk factors and protective factors such as a healthy lifestyle should be taken into account when evaluating the actual and future risk.

Another new information on the use of GCs has been recently provided by EULAR 2016 update of RA recommendations: "Short-term GCs should be considered when initiating or changing csDMARDs, in different dose regimens and routes of administration, but should be tapered as rapidly as clinically feasible." This wording does acknowledge that there are several different regimens for oral use, intramuscular injection, and intravenous pulse therapy. It is now also being stated more clearly that GCs should be given as bridging therapy together with csDMARDs, either as part of the initial strategy or subsequently if this has failed.

In contrast, GCs are usually not needed as a bridging therapy when bDMARDs or tsDMARDs are used. This recommendations reconfirms that GCs should be gradually reduced and ultimately stopped, ideally within 3 to 6 months.

Finally, the role of GCs in the management of polymyalgia rheumatica as has been described and discussed by the recent EULAR/ACR recommendations will be briefly discussed.

**SP0161 2018 EULAR RECOMMENDATIONS FOR THE MANAGEMENT OF HAND OSTEOARTHRITIS**

M. Kloppenburg, on behalf of Task force for the update of EULAR recommendations for the management of hand osteoarthritis. *Rheumatology, Leiden University Medical Center, Leiden, Netherlands*

Hand osteoarthritis is a prevalent osteoarthritis phenotype, with high disease burden. With regard to the management of patients with hand osteoarthritis European League Against Rheumatism (EULAR) recommendations have been formulated in 2007. However, new evidence has emerged and therefore the recommendations have been updated by an international task force of experts, including rheumatologists, health professionals, plastic surgeon and patient representatives.

First, a systematic literature review was performed, collecting evidence regarding non-pharmacological, pharmacological and surgical treatment options. Second, based on the evidence and expert opinion, five overarching principles were formulated, referring to treatment goal, information provision, individualised treatment, shared-decision making and need to consider multidisciplinary and multimodal treatment approaches. In addition ten recommendations were formulated, describing non-pharmacological, pharmacological and surgical options, and considerations about follow-up. Finally, a level of evidence, grade of recommendation and level of agreement were allocated by all experts to each statement.

With the updated EULAR recommendations evidence-based up-to-date guidance can be provided on the management of hand OA.

**Fractures: more than bone alone**

**SP0162 LOOK AT THE CASCADE : CLINICAL OBSERVATIONS**

K. Briot. *Rheumatology, Cochin Hospital, Paris, France*

Vertebral fracture (VF) is the most common osteoporotic fracture, and a strong risk factor of subsequent vertebral fracture. Prospective studies have shown that a recent VF increases an imminent risk of a subsequent one, and attention has been paid recently to a possible cascade phenomenon i.e. the occurrence of multiples VFs in less than one year after discontinuation of denosumab (rebound vertebral fractures) in postmenopausal osteoporosis and in patients receiving aromatase inhibitors. Vertebral fracture cascade has been reported in secondary causes of osteoporosis (after the initiation of systemic glucocorticoids, in endocrine disease, benign hemopathies as mastocytosis and in pregnancy-and lactation-associated osteoporosis). We reported the clinical observations of patients with multiples vertebral fractures occurring over one year and we discussed the causes, the potential risk factors and the appropriate management.

**Disclosure of Interest:** None declared

**DOI:** 10.1136/annrheumdis-2018-eular.7775

**SP0163 A CASE OF SEVERE OSTEOPOROSIS AND ISCHAEMIC HEART DISEASE; WHAT WILL BE THE FUTURE CARDIOVASCULAR RISK?"**

G. Weerasinghe, on behalf of Fracture prevention service, Oxford. *Oxford University Hospitals NHS Trust, Oxford, UK*

**Case description:** A 63-year-old female recently presented to metabolic bone clinic with vertebral fractures at L4 and L5. DEXA scan showed osteoporosis with T-scores at the spine  $-4.0$  and left hip  $-3.8$ . Patient was commenced on weekly

Alendronic acid 70 mg, calcium and vitamin D supplements. Patient had severe vitamin D deficiency and was commenced on treatment at primary care. She is on analgesics and physiotherapy for back pain, which was of moderate severity. She was on oral prednisolone for 5 years for polymyalgia rheumatica in the past and weaned off year ago. Other past medical history includes coronary artery disease; a myocardial infarction requiring coronary artery bypass graft 3 years back. She does not have diabetes or hypertension. She has hypercholesterolaemia; probably polygenic in origin and is on lipid lowering medications since the age of 50 years.

Her alcohol intake is minimal, and is a non-smoker. There is no family history of osteoporosis or cardiovascular disease. Her milk consumption accounted for 300 mg of calcium per day. She has reached menopause at 43 years of age and has not been on hormonal replacement therapy. Her current medications are Aspirin, Atorvastatin, Bisoprolol and Omeprazole. There is no history of indigestion or dental concerns.

Except mild local tenderness at L4–5 region, rest of the clinical examination is unremarkable.

Recent blood investigations showed normal calcium, inorganic phosphate, PTH and vitamin D. Alkaline phosphatase (195 IU/L) and P1NP (55 ug/L) were raised. Renal functions showed normal creatinine with eGFR of 62 mL/min. Full blood count is unremarkable. Serum and urine electrophoresis excluded multiple myeloma.

**Summary:** This is a case of severe osteoporosis involving vertebral fractures requiring osteoporosis treatment. Possible causes for osteoporosis would be previous use of oral steroids for long time and severe undiagnosed vitamin D deficiency. Hypercholesterolaemia and significant history of ischaemic heart disease are other concomitant diagnoses.

## Emerging topics in the management of the antiphospholipid syndrome

### SP0164 HOW TO MANAGE ASYMPTOMATIC CARRIERS OF ANTIPHOSPHOLIPID ANTIBODIES

L. Andreoli<sup>1,2</sup>. <sup>1</sup>Department of Clinical and Experimental Sciences, University of Brescia; <sup>2</sup>Unit of Rheumatology and Clinical Immunology, Spedali Civili Hospital, Brescia, Italy

Individuals who do not display the classical features of the Antiphospholipid Syndrome (APS) (vascular and obstetric disease)<sup>1</sup> are referred to as “aPL carriers”. They can be patients affected by systemic autoimmune diseases who are screened for antiphospholipid antibodies (aPL). aPL may be found in patients with “non-criteria” manifestations or in women undergoing investigations for infertility. The presence of aPL can be serendipitously discovered before a surgical procedure because of a prolonged thromboplastin time. Are these subjects at increased risk for thrombosis and adverse pregnancy outcomes (APO)? Since aPL are pathogenic autoantibodies, the answer should be “yes”. However, the magnitude of the risk can be variable from patient to patient, accordingly to the multifactorial origin of aPL-related vascular and obstetric manifestations.

According to international consensus,<sup>2</sup> the thrombosis risk stratification should consider: 1) the aPL profile (type, titer, persistence), 2) the coexistence of other thrombotic risk factors, and 3) the presence of an underlying autoimmune disease, mainly systemic lupus erythematosus (SLE). The definition of “high-risk” aPL profile comprises positivity for Lupus Anticoagulant (LA), or ‘triple positivity’, i. e. LA+anti cardiolipin antibodies (aCL) +anti-beta2glycoprotein I antibodies (anti-B2GPI) or medium-high titers of IgG aCL or IgG anti-B2GPI. Conversely, patients with isolated, intermittently positive aCL or anti-B2GPI at low-medium titers could be considered at low risk for thrombosis.

According to the literature, aPL carriers seem to have a low annual incidence of acute thrombosis, ranging from 0% to 3.8%.<sup>3</sup> These figures are not much different from the estimated incidence of thrombosis in unselected cases (about 1% patient-years), which is also equivalent to that of major bleeding associated with the use of low dose aspirin (LDA), the most frequently used drug for primary prophylaxis.<sup>4</sup> Therefore, the dilemma in clinical practice is to correctly select those aPL carriers for whom the expected benefit of therapy outweigh the risk.

Over years, the management of aPL carriers have been investigated in several studies enrolling different patients groups (SLE, pure obstetric APS, asymptomatic aPL carriers) and evaluating the efficacy of various interventions: LDA,<sup>5</sup> low intensity warfarin,<sup>7</sup> low molecular weight heparin (LMWH) in high risk situations such as surgery, prolonged immobilisation, and puerperium.<sup>8,9</sup>

Aside from drugs acting on platelets and on the coagulation system, there is evidence that immunomodulatory agents may be beneficial in primary prophylaxis of aPL carriers. Hydroxychloroquine (HCQ) is a well-recognised key-drug in the management of SLE patients and has an anti-thrombotic effect.<sup>10</sup> The use of HCQ as primary prophylaxis has been proposed also for non-SLE patients.<sup>11</sup> Statins may be useful in aPL carriers not only for the correction of a proatherogenic lipid profile, but also for reducing proinflammatory and prothrombotic biomarkers.<sup>12,13</sup>

Turning to the obstetric field, the detection of aPL antibodies has been increasingly performed in asymptomatic women, mainly for obstetrical reasons (e.g. before assisted reproductive techniques, after APO that are not included in APS classification criteria). Therefore, it is not infrequent to take the responsibility to recommend or not a treatment in “healthy” pregnant women carrying aPL. General obstetric risk should be assessed (age, hypertension, obesity, etc.). It is currently under discussion whether different aPL profiles confer the same degree of obstetric risk.<sup>14</sup> LA<sup>15</sup> and triple aPL positivity<sup>16</sup> seem to be the major predictors of APO, although APO have been described also in patients with a “low-risk” aPL profile (e.g., IgM isotype or medium to low aPL titers).<sup>17,18</sup> A key drug for primary obstetric prophylaxis is LDA and many physicians prescribe it to pregnant aPL carriers.<sup>20</sup> The immunomodulatory properties of HCQ have been advocated to be beneficial in pregnant patients with aPL<sup>21</sup> and clinical retrospective studies supported its effectiveness in refractory obstetric APS.<sup>22,23</sup> Puerperium is considered a high-risk period for thrombosis for all women. Women who carry aPL should be considered for LMWH for 4–6 weeks after delivery.<sup>19</sup>

### SP0165 THE COMPLEX INTERPLAY BETWEEN SYSTEMIC LUPUS ERYTHEMATOSUS AND ANTIPHOSPHOLIPID SYNDROME

E. Svenungsson. Medicine Solna, Unit of Rheumatology, Karolinska Institutet, Stockholm, Sweden

The antiphospholipid syndrome (APS) was first described in the 1980's. It is diagnosed when antiphospholipid antibodies (aPL) i.e. anti-cardiolipin (aCL), anti-β<sub>2</sub>Glycoprotein-I (aβ<sub>2</sub>GPI) or positivity in the functional lupus anticoagulant test (LA) occur together with any type of thrombosis (e.g. myocardial infarction(MI), stroke, venous or microvascular thromboses) or obstetric complications.<sup>5</sup> aPL recognise protein co-factors, most importantly the scavenger protein β<sub>2</sub>GlycoproteinI (β<sub>2</sub>GPI), that bind to membrane phospholipids. It is not fully understood how complexes of β<sub>2</sub>GPI and anti-β<sub>2</sub>GPI antibodies initiate a pro-thrombotic state, but activation of platelets, endothelial cells and the complement cascade are associated features.

Approximately 80% of APS patients are women, many are young and severely ill. There is a considerable overlap between APS and SLE. Approximately 30%–40% of SLE patients are aPL positive but only about half of them develop clinical symptoms fulfilling the APS classification criteria.

Several prospective studies have demonstrated that aPL are predictive of vascular events in patients with SLE. Though conflicting results exist, we have not noted positive associations between aPL and accelerated atherosclerosis in SLE, rather we believe that it is the pro-thrombotic state, which is the major cause of vascular events in the aPL positive SLE subgroup. Microvascular disease is an often unrecognised and difficult to diagnose feature in the aPL positive SLE subgroup. We have noted that up to 15% of patients diagnosed with nephritis have microvascular pathology in accordance with APS nephropathy in renal biopsies.

The aPL positive SLE subgroup has also been demonstrated to have a more rapid accrual of damage, where in addition to vascular damage neuropsychiatric damage makes a notable contribution.

When investigating primary APS patients, we and others have noted traits that are normally seen and attributed to SLE, such as low platelets, complement consumption, a low grade of systemic inflammation and even low titers of anti-DNA antibodies. Thus, the distinction between these two groups, APS secondary to SLE and primary APS, is not always clear.

### SP0166 ALL YOU NEED TO KNOW ABOUT KIDNEY DISEASE IN ANTIPHOSPHOLIPID SYNDROME

*M. Tektonidou. First Department of Propaedeutic and Internal Medicine, Medical School, National and Kapodistrian University of Athens, Athens, Greece*

Antiphospholipid syndrome (APS) can affect any vascular bed and is characterised by a plethora of clinical manifestations related with different organ systems involvement. Accordingly, APS can affect any part of kidney vasculature and parenchyma such as renal arteries and veins, intra-renal arteries and arterioles, and glomerular capillaries. APS-associated nephropathy was first described in patients with primary APS, characterised by acute thrombotic lesions in glomeruli and/or arterioles (thrombotic microangiopathy) and chronic vascular lesions such as fibrous intimal hyperplasia of arterioles and interlobular arteries, organised thrombi with or without recanalisation, and fibrous arterial and arteriolar occlusions or focal cortical atrophy.<sup>1</sup> APS nephropathy lesions have also been later described in patients with SLE-associated APS and SLE patients with positive antiphospholipid antibodies but without APS, independently of lupus nephritis.<sup>2, 3</sup> The most common clinical manifestations of APS nephropathy include hypertension, microscopic hematuria, proteinuria (from mild to nephrotic range), and a usually mild renal insufficiency. Arterial thromboses (especially stroke), pulmonary embolism, livedo reticularis, anticardiolipin antibodies, and lupus anticoagulant were strongly associated with histologic lesions of APS nephropathy. During the follow-up period, manifestations of APS (especially arterial thromboses) developed more frequently in SLE/non-APS patients with APS nephropathy than in those without APS nephropathy lesions. In the Sydney classification criteria for APS, APS nephropathy has been included in non-criteria APS manifestations.<sup>4</sup> The significant association between the presence of APS nephropathy and antiphospholipid antibodies suggests a pathogenetic role of antiphospholipid antibodies in the development of this nephropathy. Data from experimental and clinical studies support also a potential role of complement cascade activation, tissue factor activation, and activation of mTORC in APS nephropathy pathogenesis. Currently, there is no consensus on the treatment of APS nephropathy. Updated evidence about the role of anticoagulation, hydroxychloroquine, statins, and targeted therapies such as B-cell directed therapies, complement inhibition, tissue factor inhibition, and mTOR pathway inhibition will be discussed.

## The links between gout and kidney function

### SP0167 RENAL URATE TRANSPORTERS (SUMMARY FOR CLINICIANS)

*F. Perez Ruiz. Department of Medicine, University of the Basque Country, Baracaldo, Spain*

Gout was, and still is in some academic environments, a “metabolic” disease. The advent of allopurinol in the mid of the XXth century, the first xanthine-oxidase inhibitor, precluded that most subjects with “primary gout” were to suffer from overproduction of uric acid. No actual overproduction was neatly demonstrated and some empiric observations showed that “renal underexcretion” was working in most patients with gout.

In 2002, Enomoto and coworkers characterised the first renal urate transporter, URAT1, encoded by SL22A12, showing that the human knockout for URAT1 was associated with familial hypouricemia. A bunch of uric acid transporters have been characterised since then, polymorphisms of some of them being associated with variability in renal handling of urate. The function of transporters is complex: PDZK1 (also known as NHERF3) is a scaffolding protein that binds to several urate transporters such as URAT1, OAT4, and NPT1. Therefore, PDZK1 plays a pivotal role in forming a urate-transporting multimolecular complex (also named “urate transportome”) in humans. Hyperuricemia is no more a metabolic disease: it is a “transportopathy”. In addition, linkage of urate transporters to Na, P, and sugars may help understanding some comorbid conditions associated to hyperuricemia and gout, such as diabetes and hypertension.

In addition to the previously referred, ABCG2 is a cassette binding protein expressed in the kidney and more importantly in the intestine, where is involved with active excretion. The discovery of ABCG2 helped to explain that apparent overproduction in some patients is a “renal overload” due to impaired intestinal excretion.

A summarised knowledge on the urate transporters may be useful for clinicians implicated in the management of gout, as it may explain why XOIs efficacy does differ in patients with apparent overproduction, why allopurinol response may be blunted in some patients, how targeting transporters may be helpful for the development of new urate-lowering molecules, and how to explain efficacy and safety models for uricosurics and combination therapies.

### SP0168 THE USE OF XO INHIBITORS IN CKD – PROS AND CONS

*N. Dalbeth. University of Auckland, Auckland, New Zealand*

The association of chronic kidney disease (CKD) and hyperuricaemia is well established, and many observational studies have reported that hyperuricaemia is associated with development and progression of CKD. Potential mechanisms of this observation will be discussed, including the potential for urate as an ‘innocent bystander’ or as a causal mediator contributing directly to kidney injury. Xanthine oxidase inhibitors (XOIs) are the most widely used urate-lowering drugs. Current evidence for efficacy and safety of XOIs for preventing or delaying progression of chronic kidney disease will be presented, both in the general population and in people with gout. The challenges of XOI use in people with CKD will also be discussed, with specific reference to allopurinol dosing in CKD, and cardiovascular safety of febuxostat.

## Big data in pre-clinical research

### SP0169 INTEGRATION OF OMICS DATA FOR PREDICTING RESPONSE TO ANTI TNF TREATMENT

*L. Padyukov. Rheumatology Unit, Department of Medicine Solna, Karolinska Institutet, Stockholm, Sweden*

Successful development of biologics for targeting specific molecules, like TNF, was a hallmark of new era in therapy of inflammatory and rheumatic diseases.

However, the approach based on interfering with TNF exceeds simple neutralisation of inflammatory cytokine and, possibly, this is why the prediction of response remains elusive. High costs of the treatment and irreversible tissue damage in non-responders have forced multiple attempts to predict response to anti TNF treatment using clinical, laboratory and molecular markers. There are several issues related to this type of studies that may include genetically heterogeneous groups of patients, different types of anti-TNF treatment, multiple types of response measures and are typically underpowered. Nowadays, an enormous amount of genetic, epigenetic and genomic data revived new expectations and stimulates producing of models for prediction of anti TNF response. We performed several studies based on different omics data in genetically homogeneous Swedish population that raises importance of disease subgrouping and interference of environmental factors on prediction values.

## How do you sleep?

### SP0170 RE-EVALUATE LIFE WHEN BROKEN SLEEP HAS A NEGATIVE EFFECT ON INFLAMMATORY ARTHRITIS

*B.A. Esbensen. Rigshospitalet – Glostrup, Copecare, Centre for Rheumatology and Spine Diseases and Research Unit, Glostrup, Denmark*

Despite improved possibilities for early diagnosis and medical treatment rheumatoid arthritis (RA) still causes stiffness and swelling in the joints. Poor sleep, chronic pain, fatigue, reduced physical function, depression and reduced quality of life are consequences of these symptoms and the inflammation is.<sup>1-3</sup> About 60%–80% of patients with RA report poor sleep compared to 10%–30% in the background population.<sup>4-6</sup> Patients with RA indicate sleep as one of the most important parameters evaluating their medical treatment with anti-rheumatics, which indicate the impact sleep can have on physical and mental well-being.<sup>7</sup> Common meanings of good and bad sleep in a healthy population is characterised by subjective satisfaction, appropriate timing, adequate duration, high efficiency, and sustained alertness during waking hours.<sup>8</sup> Thereby, sleep health is seen as a multidimensional pattern of sleep-wake-fulness, adapted to individual, social, and environmental demands, that promotes physical and mental well-being.

Initially, this lecture will focus on “state of the art” regarding sleep and inflammatory joint diseases. Also different suggestions of non-pharmacological treatments targeting improved sleep quality will be presented.

Subsequently, experiences from a nurse-led sleep outpatient clinic which was established in 2016 in the Department of Rheumatology and Spine diseases, Rigshospitalet – Glostrup, will be presented focusing on how the clinic is organised and how specialised nurses are meeting patients with poor sleep with non-pharmacological interventions. We have systematically collected data about the patients sleep when included in the clinic for treatment and when discharged from the clinic. We will present results from these patients.

### SP0171 SLEEP DISTURBANCES IN PRIMARY SJÖGREN’S SYNDROME: EVIDENCE FROM THE LITERATURE, PATIENT SLEEP DIARIES AND A QUALITATIVE FOCUS GROUP STUDY

*K.L. Hackett<sup>1,2,3</sup>. <sup>1</sup>Department of Social Work, Education and Community Wellbeing, Northumbria University; <sup>2</sup>CRESTA Fatigue Clinic, Newcastle upon Tyne NHS Foundation Trust; <sup>3</sup>Musculoskeletal Research Group, Institute of Cellular Medicine, Newcastle University, Newcastle upon Tyne, UK*

Primary Sjögren’s syndrome is a systemic autoimmune disease which targets secretory glands resulting in dryness. Extra-glandular features include fatigue, pain and sleep disturbances. There are few studies exploring the specific sleep disturbances experienced by PSS patients; the impact of these disturbances and the potential acceptability of interventions to address some of these problems. In this talk, I will present work which begins to map the landscape of sleep disturbances in PSS:

Firstly, a systematic review of the literature explores sleep disturbances in PSS patients and identifies particular sleep symptoms which are problematic in these patients.<sup>1</sup>

Secondly, I will explore the relationship between daytime sleepiness (hyper-somnolence) and other clinical parameters in patients recruited to the UK Primary Sjögren’s Syndrome Registry.

Thirdly, I will report on sleep diary data from 30 patients attending a multidisciplinary fatigue clinic in the North East of England.

Finally, I will present findings from focus groups conducted with PSS patients and their partners. In this qualitative study, we explored the impact of sleep disturbances on patients and their families and potential acceptability of a non-pharmacological intervention (cognitive behavioural therapy for insomnia) to address specific sleep disturbances.<sup>2</sup>

### SP0172 WHAT EFFECT DOES EXERCISE HAVE ON SLEEP IN RMD?

*S.G. Mckenna. Discipline of Physiotherapy, School of Allied Health, University of Limerick, Limerick, Ireland*

Circadian rhythms are physical, mental and behavioural changes that follow a daily cycle. Sleep is an essential aspect in maintaining the body’s circadian rhythm and maintain health-related quality of life (HQoL) therefore, sleep disturbances can have a detrimental impact on same. The Outcome Measures in Rheumatology (OMERACT) has identified sleep as one of the key outcomes important to RMD patients.<sup>1</sup> Patients with various immune-mediated inflammatory diseases, including rheumatoid arthritis, have reported disturbed sleep and reduced sleep duration, further adding to their disease burden.<sup>2, 3</sup> It has been well established that being physically active and taking regular exercise are important for those who have been diagnosed with RMD’s.<sup>4</sup> Exercise has been identified as an important part of the nonpharmacological management of poor sleep duration and in improving sleep quality however, in a 2013 Cochrane review that examined exercise and fatigue in RA, it was noted by the authors that sleep quality was yet to be examined in this population.<sup>5</sup> Moreover, it is known that in general exercise improves mood state, which can also be an additional factor in improving sleep duration and sleep quality.<sup>5</sup>

Exercise offers a potentially attractive alternative or adjuvant treatment for those people with RMD who have sleep issues. The position stand from the American College of Sports Medicine (ACSM) regarding exercise for those with chronic conditions is categorised by cardio-respiratory exercise, resistance exercise, flexibility exercise and neuro-motor exercise. This presentation will consider the evidence regarding the effect exercise has on sleep in general and how the examination of a participants exercise habits prior to any study might be important, as it may have an impact on its effectiveness. A key message from the talk will be the presentation of evidence of exercise programmes in people with RMD, according to the Frequency, Intensity, Time and Type (FITT) principle will be presented.<sup>8</sup>

## Stratifying connective tissue diseases

### SP0173 STRATIFYING PRIMARY SJÖGREN'S SYNDROME PATIENTS

W.-F. Ng. *Institute of Cellular Medicine, Newcastle University, Newcastle Upon Tyne, UK*

The clinical manifestations of primary Sjögren's syndrome (PSS) vary considerably between individual patients. The pathogenesis of PSS is not fully understood and although many aberrant biological pathways have been identified, the relationships between these pathways and clinical manifestations remain unclear. Furthermore, there is substantial heterogeneity in long-term outcomes and in health economic cost among patients with PSS. Stratification of PSS into more homogeneous subsets will facilitate better understanding of the pathogenesis of the disease, development of more cost-effective management strategies and accelerate therapeutic development programmes of targeted therapies in PSS. The establishment of several large cohorts of clinically well characterised PSS cohorts with associated biobanked materials has provided a rich resource for stratified medicine research in PSS. The growing number of datasets from clinical trials in PSS provide an excellent opportunity to evaluate the potential impact of stratified approach to therapy development in PSS.

In this presentation, different approaches to identify clinically and biologically meaningful PSS subsets will be considered. In addition, the key challenges and potential future directions in Stratified Medicine in PSS will be discussed.

### SP0174 THE VALUE OF TYPE I INTERFERON SIGNATURE TO STRATIFY PATIENTS

L. Rönnblom. *Uppsala University, Uppsala, Sweden*

Since the first reports 2003 of an increased expression of type I interferon (IFN) regulated genes in cells from patients with SLE, a number of studies have demonstrated that many systemic inflammatory autoimmune diseases display this over-expression of type I IFN regulated genes, now known as an IFN signature. This is

true for a majority of patients with SLE, but also large proportion of patients with primary Sjögren's syndrome, myositis, systemic sclerosis and rheumatoid arthritis (RA). The so called type I interferonopathies is a group of rare Mendelian diseases with a very strong IFN signature. Other autoimmune diseases, such as type I diabetes, also display an IFN signature. Type I IFN seems to be most important for inducing the IFN signature, but it's clear that type II and type III IFNs can contribute to the IFN signature. Besides the expression of type I IFN regulated genes, recent studies have shown that patients with SLE and other autoimmune disease, have epigenetic changes in IFN regulated gene, which are hypomethylated. Thus, there are strong evidences that type I IFN system activation is a key event in many autoimmune diseases. Can the IFN signature help us to stratify patients in order to predict risk for major organ manifestations, disease outcome or response to treatment? Early studies showed that patients with active disease and more severe disease manifestations usually have a more prominent IFN signature, which still is true. However, recent studies have revealed that the IFN signature needs to be combined with a broader analysis of expressed genes. For instance, a plasmablast signature seems to correlate best with SLE disease activity and a neutrophil signature associates with lupus nephritis. For treatment stratification, it's perhaps not surprising that SLE patients with a high IFN signature have a better treatment response to type I IFN inhibition, compared to IFN low patients. At least when type I IFN receptor inhibition has been used to downregulated the type I IFN response. In RA, the IFN signature at baseline predict a poor response to TNF-alpha treatment as well as nonresponse to B-cell depleting therapy. In conclusion, there are several indications that the type I IFN signature is a valuable biomarker for patient stratification. However, we are just at the brink of the understanding how to apply this signature in clinical practice.

### SP0175 HETEROGENEITY OF MYOSITIS AND THERAPEUTIC CONSEQUENCES

J. Vencovsky. *Institute of Rheumatology, Prague, Czech Republic*

Idiopathic inflammatory myopathies, or myositis, are a heterogeneous group of chronic inflammatory disorders affecting striated muscle leading to muscle weakness and impaired function. In addition, other organs are variably involved including the skin, lungs, heart, joints, and the gastrointestinal tract contributing to morbidity and mortality and to low health-related quality of life. Treatment decisions are often guided by the most prominently affected organ. The best recognised disease subsets are polymyositis (PM), dermatomyositis (DM), juvenile PM and DM, sporadic inclusion body myositis (sIBM), and immune-mediated necrotizing myopathy (IMNM). Muscle specific autoantibodies and muscle associated autoantibodies are frequently found in different forms of myositis and collectively they can be detected in approximately 80% adults and 60% children with myositis. They can identify homogeneous subsets, and have both diagnostic and prognostic value. The worst functional outcomes in terms of muscle involvement are often seen in patients with sIBM and with anti-SRP antibodies. sIBM patients are notoriously non-responsive to any treatment. Patients with anti-SRP display necrotizing myopathy in the muscle biopsy and treatment effect is usually low. In some patients an improvement or at least stabilisation can be achieved with the use of rituximab. The other patients with IMNM are those with anti-HMGCR antibodies and with statin medication history. Here the response to glucocorticoids (GC) and immunosuppressives (IS) is mostly good, although some patients require treatment with intravenous immunoglobulins (IVIg) to which they respond very well even without concomitant GC. Patients with antisynthetase syndrome are characterised by the presence of interstitial lung disease, which may be in some cases the prevailing manifestation of the disease with only mild or none muscle weakness. Treatment is often successful with calcineurin inhibitors, mycophenolate mofetil (MMF), cyclophosphamide, or rituximab in these patients. Subgroup of patients with anti-NXP2 antibodies is characterised with strong association with calcinosis, both in children and adults, and the treatment represents a difficult problem. The effect was reported with the use of calcium channel blockers, warfarin, bisphosphonates, sodium thiosulfate, aluminium hydroxide, probenecid, colchicine as well as IVIGs, rituximab, abatacept, infliximab, and thalidomide. In any case, patients need to be treated aggressively if calcinosis progresses. Muscle disease in dermatomyositis is often responsive but the treatment of cutaneous manifestations may occasionally prove difficult. Antimalarials are usually prescribed first, sometimes in combination with systemic treatment using IVIGs, tacrolimus, MMF, or other IS. Patients with anti-MDA5 antibodies often develop clinically amyopathic or hypomyopathic DM, but at the same time their ILD can be rapidly progressive. Aggressive treatment with high dose GC and IS needs to be started early to increase the chance for survival. A proportion of patients with myositis manifests high type I interferon signature and the clinical trial suggests that these are the patients who benefit most from the treatment with interferon type I inhibition. In the future careful considerations based on the disease subsets,

presence of autoantibodies, transcriptome and proteomic analysis will facilitate stratification into defined disease subtypes and help to guide targeted therapies in idiopathic inflammatory myopathies.

## Work and rehabilitation – key priorities for people with RMDs

**SP0176** **IT WORKS?! EMPLOYMENT SUPPORT FOR PEOPLE WITH RMDs**

*G. Bendzuck. Deutsche Rheuma-Liga e.V., 10439 Berlin, Germany*

**Background:** In Germany, approximately 17 million people are suffering from RMDs (Rheumatic and Musculoskeletal Diseases). Due to the ageing society, increasing numbers are to be expected. As all people with disabilities and chronic diseases, patients suffering from RMDs have a significantly higher risk of unemployment or invalidity pension and they take slower profit of economic recovery in the job market.

**Objectives:** Give an overview on German efforts to get patients with RMDs back into work again or to sustain their ability to work

**Methods:** Main results of recent surveys will be presented. In the light of these data, current changes of the German social and health legislation will be discussed, as well as connected pilot projects.

**Results:** The online survey "Rheuma eine Stimme geben" of Deutsche Rheuma-Liga was conducted between March and May 2017 including 930 participants. Work is identified as an important issue and identified as target for highly needed improvements. After medical care and pensions, work is considered the most important topic. Well known problems are reflected: during a rheumatoid flare, still more than 50 percent of patients are waiting more than seven days for an appointment with a rheumatologist. Two of three patients have had problems with the approval of medical rehabilitation. More than 80 percent would appreciate to be entitled to work from home. As benefits, participants name the prolongation of their working life, more flexibility of working hours in accordance with their illness as well as being better able to combine work and necessary therapies. With regard to negative consequences, three out of five patients fear that they (would have to) work also in case of illness. Another problem is stigmatisation: still, one out of five patients does not inform their colleagues and the management. Most important reasons are fears of job loss and fear of troubles in the job.

Following the new ...Bundesteilhabegesetz" (from 01/2018), several measures were introduced to improve access and participation of people with disabilities to work. One of these, the "Budget for work", will improve possibilities for people with disabilities working in sheltered workshops to access the job market. In the spirit of CRPD Article 27, this instrument should be accessible to all people with disabilities, who are capable to work at least some hours a day under normal work conditions. Furthermore, it will be outlined, how the new programme rehapro intends to evaluate new models, methods and measures to prevent an (impending) disability or reduction in earning capacity as early as possible.

**Conclusions:** Action Plan for People with Rheumatic Diseases (2017)

In order to overcome these problems, the Deutsche Rheuma-Liga, representing 300.000 individual members and 11.000 volunteers, has issued an action plan. Key Claims connected to improvement of work conditions for people with RMDs are ...

- Ensure good and early treatment and improved medical care for people with RMDs in order to maintain their ability to work.
- Promote better collaboration between health care providers and health services (e.g. introduction of DMPs)
- Implement more consequently the principle "rehabilitation instead of invalidity pension" as well as a patient-centred rehabilitation
- Promote knowledge on grants e.g. for work place adjustments or trainee programs
- Optimize job trainings with regard to the real needs of people with RMDs
- Enhance the use of the instrument "Betriebliches Eingliederungsmanagement", especially for small and medium enterprises
- Promote the use of flexible working time models or support workers
- Evaluate and implement new forms of working models for people with chronic diseases
- Create incentives for jobs, that may be combined with partial instead of full invalidity pension

**SP0177** **QUALITY OF LIFE AT THE WORKPLACE – HOW EARLY INTERVENTIONS OF HEALTH PROFESSIONALS CAN SUPPORT PEOPLE WITH RMDs**

*E. Mosor. Section for Outcomes Research, CMSIIS – Center for Medical Statistics, Informatics, and Intelligent Systems, Medical University of Vienna, Vienna, Austria*

It is widely acknowledged that work has huge impact on health and well-being. As people affected by rheumatic and musculoskeletal diseases (RMDs) often have problems in participating in work, they should be supported by the multidisciplinary health care team. Health professionals in rheumatology play an important role in early interventions to support people with RMDs at their work places. This presentation will set out to explore important issues which need to be addressed when enabling people with RMDs to stay employed or return to work from the perspective of health professionals in rheumatology. The presentation will focus on paid work, but also include unpaid work.

With reference to ongoing clinical and research work in this field, the author will discuss possibilities and challenges in identifying work related problems, setting goals in a collaborative way, as well as providing different secondary and tertiary preventive strategies, interventions and workplace adaptations. By using a participatory multi-methods approach, facilitating self-management, evaluating and adapting work tasks and the environment, and providing ergonomic devices, people with RMDs can be supported.

And as the right time point for doing something for health and more quality of life at the work place is now, some innovative, easy-to-transfer ideas for patients, health professionals and rheumatologists will also be presented.

### Cancer and inflammation

OP0001

#### RISK OF MALIGNANCY IN CHILDREN WITH JUVENILE IDIOPATHIC ARTHRITIS: A REGISTER-BASED COHORT STUDY

B. Delcoigne<sup>1</sup>, A. Horne<sup>2</sup>, J. Askling<sup>1</sup>. <sup>1</sup>Karolinska Institutet; <sup>2</sup>Karolinska Universitetssjukhuset, Stockholm, Sweden

**Background:** The risk of malignancies, in particular malignant lymphomas, in Juvenile Idiopathic Arthritis (JIA) patients is low but has been reported to be elevated compared to the general population.

**Objectives:** To assess the risk of cancer in patients with JIA in comparison to non-JIA individuals.

**Methods:** Register-based cohort study of patients with a first JIA diagnosis recorded from 1987 to 2015, based on data retrieved from the Swedish Patient Register (with information on hospitalizations (1987 and onwards) and outpatients visits (2001 and onwards)), and the Swedish Cancer Register (compiling data on all invasive cancers in Sweden (since 1958)). JIA patients were matched (on sex and age) to five non-JIA individuals sampled from the Swedish child population. All participants were followed up from six months after date of 2nd visit with a JIA diagnosis (for JIA patients) or the corresponding date (for non-JIA individuals) until the first date of the following events: cancer diagnosis, migration, death, 18 years of age, or 31 December 2015. The occurrence of malignancies was compared through standardised incidence rates (SIR). The same analysis was rerun allowing participants to be followed up through adult ages (age at 31 December 2015).

**Results:** 7461 JIA patients and 36 747 non-JIA individuals were identified and followed up, with a median follow up time of 4.7 years. Twelve malignancies (among which 6 lymphomas) were recorded among the JIA patients and 40 (7 lymphomas) among the non-JIA individuals, giving a rate for all cancers of 30/100000 person-years and 20/100000 person-years respectively, and a rate ratio of 1.48 (95% Confidence Interval (CI): 0.78 to 2.82). When defining the outcome as a malignant lymphoma, the rates for JIA and non-JIA were 15 and 3.5/100000 person-years, respectively, and the rate ratio was 4.2 (95% CI: 1.4 to 12.5).

Allowing the follow-up to cover ages above 18 did not substantially alter these two rate ratios.

When restricting the study period to new-onset JIA diagnosed from July 2005 to December 2015, the rate for all cancers were 19.8/100000 person-years (JIA) and 21.1/100000 person-years (non-JIA), providing a rate ratio of 0.94 (95% CI: 0.27 to 3.22) when the age at the end of follow-up was 18 years. The rate ratio was 1.60 (95% CI: 0.68 to 3.74) when the follow-up covered all ages until end of 2015 (maximum 29 years of age). There were too few outcome cases to further restrict to malignant lymphomas.

**Conclusions:** JIA patients are at increased risk to develop malignant lymphoma. The low numbers of cancer cases in JIA patients underscores that the absolute risk is low, but hampered modelling inferences on the association between cancer and DMARDs in this cohort of JIA patients followed from disease onset.

OP0002

#### NO DIFFERENCE IN THE RISK OF MALIGNANCY IN TOCILIZUMAB VERSUS TNF INHIBITOR INITIATORS IN PATIENTS WITH RHEUMATOID ARTHRITIS: A MULTI-DATABASE COHORT STUDY

S.C. Kim<sup>1</sup>, A. Pawar<sup>1</sup>, R.J. Desai<sup>1</sup>, S. Gale<sup>2</sup>, M. Kleerman<sup>2</sup>, K. Sarsour<sup>2</sup>, D. H. Solomon<sup>1</sup>, S. Schneeweiss<sup>1</sup>. <sup>1</sup>Brigham and Women's Hospital, Boston; <sup>2</sup>Genentech, South San Francisco, USA

**Background:** Few studies have conducted head-to-head comparisons of malignancy risk between different types of biologics in rheumatoid arthritis (RA).

**Objectives:** To examine the rate of incident malignancy excluding non-melanoma skin cancer (NMSC) in RA patients newly treated with tocilizumab (TCZ) versus TNF inhibitors (TNFi).

**Methods:** We conducted a cohort study using data from 3 U.S. healthcare claims databases (2010–2015) – Medicare, IMS PharMetrics Plus or Truven MarketScan. Adults aged  $\geq 18$  years with RA who newly started TCZ or a TNFi after

failing a different TNFi, abatacept or tofacitinib were included. The primary outcome was incident malignancy excluding NMSC based on 2 diagnosis codes within 2 months (specificity >98%). The 10 most frequently occurring cancers, leukaemia and human papilloma virus-related cancer and all-cause mortality were analysed as individual secondary endpoints. (table 1). For the primary as-treated analysis, follow-up time started the day after cohort entry and ended on treatment discontinuation, outcome occurrence, disenrollment, death, or the end of study period. To control for >60 potential confounders, TCZ starters were propensity score (PS)-matched to TNFi starters with a variable ratio of 1:3 within each database. Hazard ratios (HR) from the 3 PS-matched cohorts were combined by a fixed-effects model.

**Results:** We included a total of 10,393 TCZ initiators PS-matched to 26,357 TNFi initiators. A total of 118 malignancies occurred in TCZ starters and 322 in TNFi starters across the three databases. The IR of malignancy per 100 person-years ranged from 0.81 (IMS) to 2.18 (Medicare) in TCZ and from 0.98 (MarketScan) to 2.16 (Medicare) in TNFi. The risk of incident malignancy was similar between the two groups across all three databases (table 1), with a combined HR of 0.92 (95% CI: 0.74 to 1.14) in TCZ versus TNFi. Secondary analyses by cancer subtype and all-cause mortality showed similar results.

**Abstract OP0002 – Table 1.** Combined HR (95% confidence interval) of incident malignancy: a 1:3 variable ratio PS matched analysis comparing TCZ to TNFi.

Outcome	TCZ (n=10,993)		TNF inhibitors (n=26,357)
	As Treated	ITT-365d

### Psychological distress and pain; not all in the mind.

OP0003

#### ASSOCIATION BETWEEN DISEASE SEVERITY AND ONSET OF DEPRESSION IN KNEE OSTEOARTHRITIS

A.M. Rathbun<sup>1</sup>, Z. Evans<sup>1</sup>, M. Shardell<sup>2</sup>, M. Yau<sup>3</sup>, J. Gallo<sup>4</sup>, E. Stuart<sup>4</sup>, M. Schuler<sup>5</sup>, M. Hochberg<sup>6</sup>. <sup>1</sup>Epidemiology and Public Health, University of Maryland School of Medicine; <sup>2</sup>Translational Gerontology Branch, National Institute on Aging, Baltimore; <sup>3</sup>Musculoskeletal Research Center, Hebrew SeniorLife Institute for Aging Research, Boston; <sup>4</sup>Mental Health, Johns Hopkins Bloomberg School of Public Health, Baltimore; <sup>5</sup>RAND Corporation, Boston; <sup>6</sup>Medicine, University of Maryland School of Medicine, Baltimore, USA

**Background:** Osteoarthritis (OA) is a heterogenous condition characterised by structural pathology of the joint and pain and disability that represent patients' experience of the illness. Disease progression may lead to deteriorating

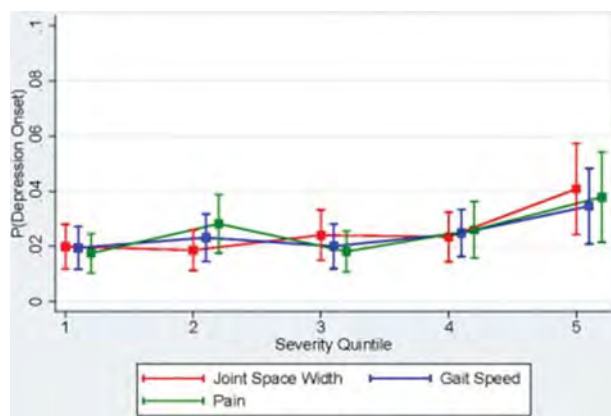

psychosocial health, but it is not clear what components of OA disease severity are related to depression onset in these patients.

**Objectives:** The aim was to determine the components of OA disease severity that contribute to depression onset among individuals with radiographic knee OA.

**Methods:** Eligible participants (n=1,652) were from the Osteoarthritis Initiative with radiographic disease (Kellgren-Lawrence [K-L] grade 2, 3, or 4), complete baseline covariate data, and were below the screening threshold for probable depression (Centre for Epidemiological Studies Depression [CES-D] Scale≤16). OA disease severity was assessed at baseline and three annual follow-up visits using minimum joint space width (millimetres), 20-metre gait speed (metres per second), and pain subscale of the Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC). OA disease severity predictors were evaluated as a moving average at each time point then categorised in quintiles. Joint space width and gait speed categories were inverted so that increasing quintile corresponded to greater disease severity. Depression onset was assessed at four annual follow-up visits using the CES-D. Potential confounders included time-invariant and time-varying measures: demographics, lifestyle factors, socioeconomic status, Charlson comorbidity index, K-L grade, and WOMAC functional disability and joint stiffness; and CES-D score, body mass index, analgesic use, and knee injuries, respectively. Marginal structural models that account for time-dependent confounding and selective attrition modelled the association between each time-varying disease severity predictor and depression onset.

**Results:** There was a non-linear probability (figure 1) for onset of depression by disease severity quintiles for the three predictors. Moreover, the risk of depression was greatest in the highest severity quintiles and reached statistical significance for all three predictors. Odd ratios comparing highest to lowest severity quintiles in order of increasing magnitude were 1.80 (95% confidence interval [CI]: 1.00, 3.24) for gait speed, 2.10 (95% CI: 1.17, 3.75) for joint space width, and 2.21 (95% CI: 1.14, 4.30) for pain.

**Conclusions:** Findings demonstrate that the presence of greater structural disease severity and pain and decreased physical performance increases the risk of depression onset among individuals with radiographic knee OA. Thus, it is necessary to also intervene on OA disease severity when treating depression to effectively manage these patients. A combined treatment strategy consisting of two interventions delivered in parallel to simultaneously treat each condition may be the most effective form of medical care for OA patients who have comorbid depression.

#### OP0004 COGNITIVE IMPAIRMENT IN RHEUMATOID ARTHRITIS PATIENTS: A CASE-CONTROL STUDY

B.K. Vitturi<sup>1</sup>, B.A.C. Nascimento<sup>2</sup>, B.R. Alves<sup>2</sup>, F. Campos<sup>2</sup>, D.Y. Torigoe<sup>2</sup>.  
<sup>1</sup>Division of Neurology, <sup>2</sup>Division of Rheumatology, Irmandade da Santa Casa de Misericórdia de São Paulo, São Paulo, Brazil

**Background:** Rheumatoid arthritis (RA) is the most common autoimmune inflammatory arthritis in adults.<sup>1</sup> Extra-articular manifestations of RA can occur in about 40% of patients, either in the beginning or during the course of their disease.<sup>2</sup> Recent studies have suggested that RA may have an important relation in the

development of cognitive and neurological dysfunction.<sup>3</sup> However, the bond between RA and the brain is still uncertain.

**Objectives:** The purpose of this study was to assess the frequency and the clinical predictors of cognitive impairment in rheumatoid arthritis (RA) patients.

**Methods:** A cross-sectional and case-control study was performed including consecutive RA patients seen in a rheumatology outpatient clinic of referral tertiary hospital. The control group included 100 healthy subjects. We registered clinical and demographic data including age, sex, level of education, time of disease, time of diagnosis, drugs in use, cardiovascular risk factors and other comorbidities. Functional capacity was assessed using the Health Assessment Questionnaire (HAQ). Neurological appraisal was made with standardised questionnaires: Mini-Mental State Examination (MMSE), Montreal Cognitive Assessment (MoCA) and the Hospital Anxiety and Depression (HAD). Analysis of the data was performed using chi-square and t-tests and a multivariate analysis (SPSS 22.0). Significance level was set as <0.05.

**Results:** We included 102 patients (88 were female) with a mean age of 57.4 (±10.7) years; among these patients, 92 (90.2%) used corticosteroids, 66 (64.7%) methotrexate, 5 (4.9%) sulfasalazine, 43 (42.1%) leflunomide, 18 (17.6%) chloroquine and 25 (24.5%) biologic therapy. The mean age of RA diagnosis was 42.9 (±12.7) years. In both univariate and multivariate analysis, compared to the control group, patients with RA presented significant lower MMSE (22.5±4.0) and MoCA (17.1±4.5) scores (p<0.05). Adjusting for level of education, just 31 and 25 patients presented normal MMSE and MoCA scores (p<0.01), respectively. Cognitive decline was associated with higher HAQ scores (functional outcome due to RA) and prolonged time of disease (p<0.05). No correlation was found between sex, disease-modifying antirheumatic drugs, rheumatoid factor, C-reactive protein levels and the neurological impairment. The mean HAD score was 17.2 (±8.2) and anxiety and depression were more prevalent in RA patients than in control group (p<0.01).

**Conclusions:** Patients with rheumatoid arthritis may present with cognitive decline and dementia as extra-articular manifestations of the disease. Neurological impairment is usually disregarded and might be under-diagnosed in RA patients. Future studies are necessary in order to better understand the relationship between RA and the Brain.

#### Shaping the future in systemic sclerosis

#### OP0005 PATTERNS OF 31 NEW AUTOANTIBODIES AGAINST G PROTEIN-COUPLED RECEPTORS AND GROWTH FACTORS IN SYSTEMIC SCLEROSIS CAN BE DESCRIBED BY LATENT FACTORS

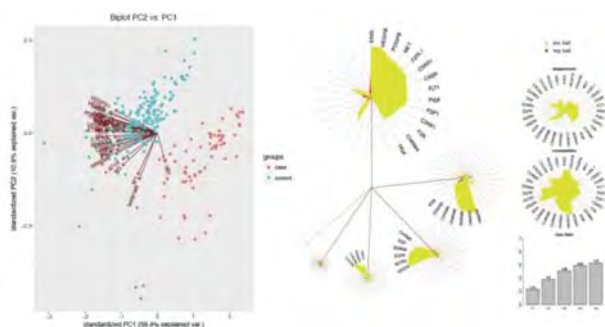

H. Bittern<sup>1</sup>, A. Carvalho-Marques<sup>1</sup>, O. Cabral-Marques<sup>1</sup>, C. Fouodo<sup>2</sup>, I. König<sup>2</sup>, H. Heidecke<sup>3</sup>, G. Riemekasten<sup>1</sup>, S. Schinke<sup>1</sup>. <sup>1</sup>Rheumatology and Clinical Immunology UKSH Lübeck; <sup>2</sup>Institute of Medical Biometry and Statistics, -, Lübeck; <sup>3</sup>CellTrend GmbH, Biotechnology, Luckenwalde, Germany

**Background:** Systemic sclerosis (SSc) is a rare autoimmune multisystemic disease with a significant disease burden and impact on life quality and survival. Disease specific, diagnostic and prognostic antibodies (ab) are known such as Scl70 and centromere (ACA) ab<sup>1</sup> or recently endothelin or angiotensin receptors.<sup>2</sup> Functional ab can bind G protein-coupled receptors (GPCR) regulating immune function and were reported in the pathogenesis of various inflammatory and non-inflammatory diseases.<sup>3</sup>

**Objectives:** We analysed 31 ab against GPCRs and growth factors in a retrospective cohort of 71 SSc patients compared to 196 sera from healthy controls (HC). Ab levels were related to disease manifestations such as sex, age, SSc phenotype in order to hypothesise functional ab and new pathogenic targets in SSc.

**Methods:** The retrospective clinical characterisation of 14 male and 57 female SSc patients (26–82 years) included mRSS, organ involvement assessed by laboratory tests, spirometry and imaging such as CT-scan or echocardiography. 30/71 had active disease (EUSTAR activity score). Ab were measured by ELISA and normalised to a standard serum. Median ab levels from SSc were compared to HC (Mann Whitney Test). Ab patterns were analysed using different statistical approaches (factor analysis, principal component analysis (PCA), linear discriminant analysis (LDA), cluster analysis and biserial correlation).

**Results:** Clinical SSc subgroups (diffuse/limited cutaneous, male/female) differ in ab levels and form separate clusters (LDA method). Moreover, 5 resp. 7 latent factors group ab and clinical disease manifestations. Factor analysis reveals VEGFR2 and YBX1 ab to be more unique with the lowest communalities. The biserial correlation shows moderate associations between ab patterns and SSc specific symptoms such as Raynaud's, calcinosis or akroosteolysis but also unspecific symptoms such as polyneuropathy. Compared to association of ETAR ab with Raynaud's and skin sclerosis HGFR ab are inversely correlated. In HC most ab levels against GPCR and growth factors are higher than in SSc except for YBX1 which has the highest ab levels in SSc patients. In HC ab levels against YBX1 ab are associated with male sex and family history of rheumatic diseases. Yet, ADRB2 ab are linked to the absence of GI symptoms or depression and ab against ENG, ETAR, PAR2, PAR1 with normal troponine levels (absence of heart involvement).

**Abstract OP0005 – Figure 1.** (a) Projection of individuals (points) and variables (arrows), representing the measured proteins, in the space of the two principle components. The almost perfect separation between controls (cyan) and cases (orange) is explained by higher protein levels for almost all proteins in the HD groups against lower values in the SSc group. By contrast, only the YBI\_P18 protein presents a tendency to be higher in the SSc group and lower in the other group. *M1* and *betaladr* proteins have lowest contributions for separating HG from SSc participants. (b) Dandelion plot displays 5 latent factors the cluster antibodies against GPCR and growth factors in SSc

**Conclusions:** We describe 31 new ab against GPCR and growth factors in SSc. Ab as well as SSc disease manifestations could be clustered by latent factors. Most ab titers in SSc were lower than in HC. Some ab were linked to the absence of SSc manifestations. Thus, we postulate that a dysbalance of functionally protective autoantibodies, that can be found in healthy individuals, and the appearance of SSc specific ab such as Scl70 contribute to its pathogenesis. Considering the preliminary character of our data, the functional impact of ab against GPCR and growth factors has to be validated *in vitro* and statistical correlations to be confirmed in a prospective independent patient cohort.

OP0006

#### SAFETY AND EFFICACY OF LENABASUM (JBT-101) IN DIFFUSE CUTANEOUS SYSTEMIC SCLEROSIS SUBJECTS TREATED FOR ONE YEAR IN AN OPEN-LABEL EXTENSION OF TRIAL JBT101-SSC-001

R. Spiera<sup>1</sup>, L. Hummers<sup>2</sup>, L. Chung<sup>3</sup>, T. Frech<sup>4</sup>, R. Domsic<sup>5</sup>, V. Hsu<sup>6</sup>, D.E. Furst<sup>7</sup>, J. Gordon<sup>1</sup>, M. Mayes<sup>8</sup>, R. Simms<sup>9</sup>, E. Lee<sup>10</sup>, N. Dgetluck<sup>10</sup>, S. Constantine<sup>10</sup>, B. White<sup>10</sup>. <sup>1</sup>Hospital for Special Surgery, New York City; <sup>2</sup>Johns Hopkins, Baltimore; <sup>3</sup>Stanford University, Palo Alto; <sup>4</sup>University of Utah, Salt Lake City; <sup>5</sup>University of Pittsburgh, Pittsburgh; <sup>6</sup>Rutgers Robert Wood Johnson Medical School, New Brunswick; <sup>7</sup>Arthritis Association of Southern California, Los Angeles; <sup>8</sup>University of Texas, Houston; <sup>9</sup>Boston University, Boston; <sup>10</sup>Corbus Pharmaceuticals, Inc., Norwood, USA

**Background:** Lenabasum (JBT-101) is a selective cannabinoid receptor type 2 agonist that activates resolution of innate immune responses in humans and reduces inflammation and fibrosis in animal models of SSc. It is a synthetic, oral, non-immunosuppressive small molecule. Lenabasum had acceptable safety and tolerability and showed evidence of clinical benefit in diffuse cutaneous SSc (dcSSc) in Phase 2 trial JBT101-SSC-001 (NCT02465437).

**Objectives:** The objective of this study was to provide long-term open-label safety and efficacy data in dcSSc subjects who received lenabasum in that trial.

**Methods:** Subjects who completed the double-blind placebo-controlled (DBPC) part of JBT101-SSC-001 were eligible to receive lenabasum 20 mg BID in an open-label extension (OLE).

**Results:** 36/38 (95%) eligible subjects enrolled in the OLE and 34/36 (94%) were on baseline immunosuppressive drugs. The mean interval off study drug from the end of DBPC dosing to the start of OLE dosing of 9.5 weeks (range 4.7 to 56 weeks). At the time of data cut-off, the duration of OLE dosing was median 51.4 weeks, mean 45 weeks (range 26, 418 weeks), and 19 subjects had completed Week 60. Three subjects discontinued, 2 for AEs and 1 for withdrawal of consent. Adverse events (AEs, n=171) occurred in 33/36 (92%) subjects in the OLE. By maximum severity, 1 (3%) subject had life threatening AE, 3 (8%) subjects had severe AEs, 21 (58%) subjects had moderate AEs and 8 (22%) had mild AEs. Seven (19%) subjects had AEs considered related to lenabasum. The AEs that occurred in ≥10% of subjects (n,% of subjects) were upper respiratory tract infection (8, 22%), urinary tract infection (5, 14%), diarrhoea (4, 11%) and skin ulcers (4, 11%). Mild intermittent dizziness occurred in 3 (8%) subjects. One subject developed renal crisis 7 days after starting 60 mg/day prednisone prescribed by a non-study physician and had 2 severe and 1 life-threatening/serious AEs related to the renal crisis and deemed unrelated to lenabasum. During the OLE, there was improvement in multiple efficacy outcomes from both the study start and the OLE start. For example, in the 25 subjects who had completed OLE Week 52 at the time of data cut-off, the mean (SE) improvements from study start were: ACR CRISS score=56% (9%); modified Rodnan Skin Score=-8.6 (1.5); HAQ-DI=-0.14 (0.11), Physician Global Assessment=-0.9 (0.5), and 5-D Itch Questionnaire=-2.3 (0.8). Forced vital capacity% predicted was stable from study start with mean (SE) change=0.4% (0.7%).

**Conclusions:** In OLE of Phase 2 trial JBT101-SSC-001, lenabasum continues to have acceptable safety and tolerability in dcSSc with no severe or serious AEs. Multiple efficacy outcomes improved, although open-label nature of dosing with lenabasum is acknowledged. These data support Phase 3 testing of lenabasum for treatment of dcSSc.

#### Basic mechanisms of inflammation

OP0007

#### GROWTH DIFFERENTIATION FACTOR 11 ATTENUATES INFLAMMATORY ARTHRITIS THROUGH ANTAGONISING NF-KB SIGNALLING PATHWAY

Y. Zhao<sup>1</sup>, W. Li<sup>2</sup>, K. Vasilev<sup>3</sup>. <sup>1</sup>Department of Orthopaedics; <sup>2</sup>Department of Pathology, Shandong University Qilu Hospital, Jinan, China; <sup>3</sup>School of engineering, University of South Australia, Mawson Lakes, Australia

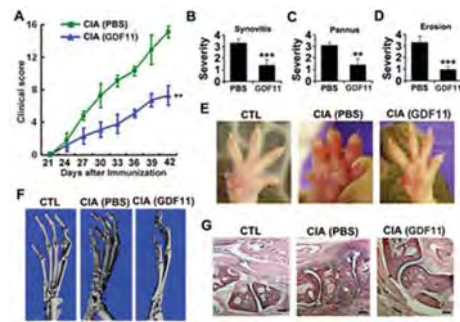

**Background:** It is well established that the tumour necrosis factor- $\alpha$  (TNF- $\alpha$ ) plays a dominant role in rheumatoid arthritis (RA)<sup>1</sup> and other arthritis models.<sup>2,3</sup> Growth Differentiation Factor 11 (GDF11) is recently reported to be closely

associated with various inflammatory diseases. However, whether GDF11 interacts with TNF- $\alpha$  and plays a role in RA still remains unknown.

**Objectives:** To investigate the potential role of GDF11 in development of RA, and to testify the underlying mechanisms involved.

**Methods:** NF- $\kappa$ B-luciferase transgenic mice (Balb/c strain), DBA-1 mice, micro-CT, *in vivo* imaging system (IVIS), mice bone marrow-derived macrophages (BMDM), cell immunostaining, collagen induced arthritis model (CIA), collagen antibody induced arthritis model (CAIA), GDF11 recombinant protein, co-immunoprecipitation Co-IP, Western blot, real time PCR, Histology, immunohistochemistry, unpaired t-tests (Mann-Whitney), paired t-tests, and ANOVA.

**Results:** The interaction between GDF11 and TNFR1/TNFR2 in BMDM was implied by co-immunoprecipitation (Co-IP) (figure 1A-B). BMDM cells were cultured with stimulation of 10 ng/ml TNF- $\alpha$ , in the presence or absence of 10  $\mu$ g/ml GDF11. Inflammation-associated cytokines, including IL-1 $\beta$ , IL-6 and inducible nitric oxide synthase (iNOS) were assessed at 12 hour time point through real time PCR (figure 1C-1E), and expression level of IL-1 $\beta$  was assayed through ELISA at 72 hour time point (figure 1F). As a result, GDF11 suppressed TNF- $\alpha$ -induced expression of inflammatory cytokines. Every experiment was repeated for three times. Collagen-induced arthritis (CIA) mice model was established in DBA-1 mice, and intraperitoneal injection of GDF11 attenuated clinical score (figure 2A), synovitis, pannus and bone erosion (figure 2B-2D) compared with PBS control group (n=7 for each group). Representative pictures of the paw (figure 2E), micro-CT (figure 2F) as well as HE staining (figure 2G) revealed that GDF11 greatly suppressed joint destruction in CIA model. In addition, GDF11 inhibited TNF- $\alpha$ -induced expression of biomarkers for activation of NF- $\kappa$ B signalling pathway, including NF- $\kappa$ B2 (figure 3A), phosphorylation of I $\kappa$ B $\alpha$  (figure 3B) and nuclear translocation of p65 (figure 3C) in BMDM, which were tested through real time PCR, Western blot and cell immunostaining, respectively. To testify the function of GDF11 in activation of NF- $\kappa$ B signalling pathway *in vivo*, p-I $\kappa$ B $\alpha$  expression was detected through immunohistochemistry in CIA model, and GDF11 diminished phosphorylation of I $\kappa$ B $\alpha$  (figure 4A) compared with PBS group (n=5). Moreover, CAIA arthritis model was established in BALB/C strain-based NF- $\kappa$ B luciferase mice, and GDF11 markedly repressed intensity of bioluminescence signal in the paws of CAIA model (figure 4B-4C). The values are the mean  $\pm$ SD. \*p<0.05, \*\*p<0.01 and \*\*\*p<0.005 vs control group.

**Conclusions:** These results reveal GDF11 as potential antagonist for inflammatory function of TNF- $\alpha$ . Besides, GDF11 displays promising protective function in inflammatory arthritis mice models. In conclusion, GDF11 may shed light on treatment of inflammatory arthritis and provide a potential therapeutic instrument for RA in the future.

**OP0008 MODELLING AN AUTOINFLAMMATORY IMMUNOPROTEASOME DISEASE NAKAJO-NISHIMURA SYNDROME WITH HUMAN PLURIPOTENT STEM CELL-DERIVED MYELOID CELL LINES**

*M. Saito. Center for PS Cell Research and Application, Kyoto University, Kyoto, Japan*

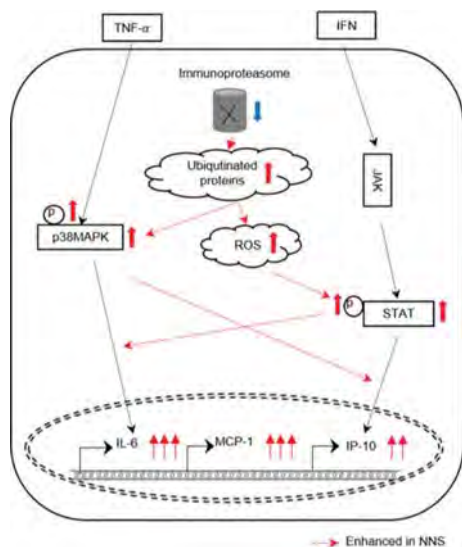

**Background:** Nakajo-Nishimura syndrome (NNS) is an immunoproteasome-associated autoinflammatory disorder caused by a mutation of PSMB8 gene.<sup>1</sup> Although dysfunction of immunoproteasome causes various cellular stresses attributed to the overproduction of inflammatory cytokines and chemokine in NNS, precise underlying mechanisms of autoinflammation are still largely unknown.

**Objectives:** We aim to investigate and understand the detailed mechanisms and signal pathways in NNS and to seek potential therapeutic candidates.

**Methods:** We established a panel of isogenic pluripotent stem cell (PSC) lines with the homozygous G201V mutation in PSMB8 gene using CRISPR/Cas9-mediated genome editing system. Myeloid cell lines (MLs) were established from each clone and used for functional analysis.<sup>2,3</sup>

**Results:** Immunoproteasome activity of PSMB8-mutant PSC-derived MLs (MTMLs) reduced even without stimulation, compared to that of the isogenic wild-type counterparts. When stimulated, MT-MLs showed overproduction of inflammatory cytokines and chemokines, with elevated reactive oxygen species (ROS). The levels of phosphorylated p38 MAPK and STAT1 also increased. Treatment with a p38 MAPK inhibitor, a JAK inhibitor and anti-oxidants dose-dependently decreased the abnormal production of cytokines and chemokines in MT-MLs. Both unstimulated and stimulated MT-MLs showed distinct transcriptional profiles, indicating the ML-MLs were already in a 'primed' state before stimulation.

**Conclusions:** The current PSC models revealed a specific ROS-mediated inflammatory pathway and provide a platform for studying the pathophysiology of NNS and searching for the alternative therapeutic options for NNS and related immunoproteasome disorders.

## Statistics made simple: a practical approach to complex concepts

OP0009

### RISING PREVALENCE OF FUNCTIONAL DISABILITY IN PATIENTS WITH RHEUMATOID ARTHRITIS OVER 20 YEARS

E. Myasoedova<sup>1</sup>, J.M. Davis, III<sup>1</sup>, S.J. Achenbach<sup>2</sup>, E.L. Matteson<sup>1</sup>, C. S. Crowson<sup>2</sup>. <sup>1</sup>*Rheumatology*; <sup>2</sup>*Health Sciences Research, Mayo Clinic College Of Medicine, Rochester, MN, USA*

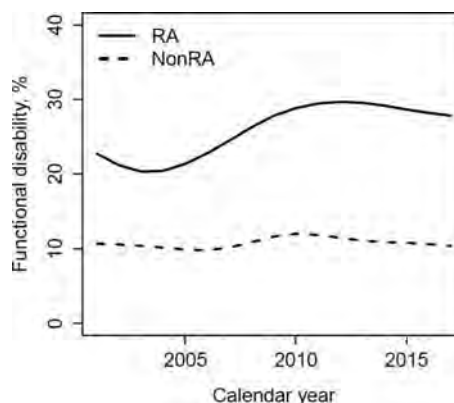

**Background:** Despite the advances in treatment of rheumatoid arthritis (RA) over the recent decades many patients with RA do not achieve remission or full physical functioning. The trends in prevalence of functional disability (FD) in patients with RA are not fully understood.

**Objectives:** To assess the prevalence of patient-reported FD in patients with RA compared to subjects without RA over the past two decades of calendar time, across different age categories and over the duration of RA disease.

**Methods:** This retrospective population-based cohort study included Olmsted County, MN residents who met 1987 ACR criteria for RA from 1/5/1999 to 12/31/2013 and a cohort of subjects without RA matched by age and sex from the same underlying population. Each non-RA subject was assigned an index date matching RA incidence date of a corresponding RA patient. Activities of Daily Living (ADL) were recorded annually over the past 20 years at patients' routine medical care visits based on patient provided information about performing six ADL without assistance including feeding oneself, dressing, using the toilet, bathing, walking, housekeeping. FD was defined as having difficulty with  $\geq 1$  of the six ADLs. Analyses were performed using age- and sex-adjusted logistic regression models with random subject effects to account for multiple measures per patient.

**Results:** Five hundred eighty-six patients with RA (mean age 55, 70% females) and 531 non-RA subjects (mean age 56, 70% females) have completed 7446 questionnaires (4,301 RA and 3145 non-RA) from 1/5/1999 to 1/5/2018 on or

following their RA incidence/index date. There has been a significant increase in the prevalence of FD among patients with RA compared to the non-RA cohort over the past two decades ( $p=0.003$ , figure 1). When analysing by age group, patients with RA compared to the non-RA subjects had at least a 15% excess in the proportion of FD at any given age up to the 8–9th decade of life while the proportions were similar in both cohorts. When analysing FD over the duration of RA disease, its prevalence was significantly higher in the RA compared to non-RA subjects, starting at RA incidence/index date (26% in RA vs 11% in non-RA subjects,  $p<0.001$ ), with persistent excess in prevalence over the entire follow-up time. When FD was defined as having difficulty with  $\geq 2$  of the six ADLs the trends were similar for calendar year, age categories and RA disease duration, although the proportion of patients affected with functional disability was smaller.

**Conclusions:** Patients with RA have significantly higher prevalence of FD compared to their non-RA counterparts. The prevalence of FD in RA has increased in the recent decades with a persistent excess in the proportion of affected patients in the RA compared to the non-RA cohort across the age-range and over RA disease duration. This substantial and growing FD burden is despite the recent advances in controlling RA disease activity with modern antirheumatic therapies. More studies are needed to understand the underlying causes for these trends in FD and to improve outcomes in patients with RA.

**Disclosure of Interest:** None declared

OP0010

### USE OF CLAIMS AND ELECTRONIC MEDICAL RECORD DATA TO PREDICT RA DISEASE ACTIVITY

C.H. Feldman<sup>1</sup>, K. Yoshida<sup>1</sup>, B. Pan<sup>1</sup>, M. Frits<sup>1</sup>, N. Shadick<sup>1</sup>, M.E. Weinblatt<sup>1</sup>, S. E. Connolly<sup>2</sup>, E. Alemao<sup>2</sup>, D.H. Solomon<sup>1</sup>. <sup>1</sup>*Brigham and Women's Hospital, Boston*; <sup>2</sup>*Bristol-Myers Squibb, Princeton, USA*

**Background:** Prior studies have demonstrated challenges in developing and validating claims-based algorithms that accurately predict RA disease activity.<sup>1,2</sup> The ability to adjust for and predict RA disease activity would be a powerful epidemiological tool for studies that lack direct disease activity measures such as the DAS28.

**Objectives:** We used machine-learning methods to incorporate claims and electronic medical record (EMR) data to develop models to predict DAS28 (CRP) as a continuous measure, and to distinguish moderate-to-high disease activity from low activity/remission.

**Methods:** We identified 300 adults ( $\geq 18$  years of age) with RA enrolled in a single academic centre cohort with  $\geq 1$  year of linked Medicare insurance claims preceding a DAS28 (CRP) measurement between 2006 and 2010. Of these, 95 had Medicare Part D pharmacy data. From claims we included demographics, co-morbidities, joint replacement surgery, physical therapy visits, numbers of RA-related codes, laboratory values and imaging studies, and healthcare utilisation. For those with Part D pharmacy data we included medications (steroids, analgesics, DMARDs) and switches between drugs. From the EMRs we obtained smoking status, BMI, blood pressure, medication use, laboratory values for seropositivity (RF or anti-cyclic citrullinated peptide antibodies), haematocrit, ESR and CRP. We constructed models with claims only, claims with medications and claims with EMR data. We examined these models with DAS28 (CRP) as a continuous measure and as a binary outcome (moderate/high activity vs low activity/remission). We used adaptive least absolute shrinkage and selection operator (LASSO), which avoids model overfitting by penalising large coefficients and selects a subset of variables by shrinking some coefficients to zero. We used adjusted  $R^2$  to compare continuous model fit and C-statistics to compare binary models.

**Results:** In models that included DAS28 as a continuous measure, using claims alone explained 11% of the DAS28 variability. Adding medications and EMR data to claims improved the adjusted  $R^2$  by 6% (table 1). In models that included DAS28 as a binary outcome (moderate/high activity vs low activity/remission), our claims-only model yielded a C-statistic of 0.68, which increased to 0.79 after inclusion of medications and EMR data.

**Abstract OP0010 – Table 1.** Model Fit Statistics for Continuous DAS28 (CRP) (Adjusted  $R^2$ ) and Binary Categories (Moderate/High vs Low/Remission; C-Statistic)\*

	Model 1: claims only	Model 2: claims +Medicare medications	Model 3: claims +Medicare and EMR medications	Model 4: EMR data**	Model 5: claims +Medicare medications +EMR data**
<b>Adjusted <math>R^2</math></b>	0.11	0.12	0.14	0.16	0.17
<b>C-statistic</b>	0.68	0.74	0.77	0.76	0.79

\*n=300 except for Model 2 (n=95)

\*\*EMR data includes medications, laboratory tests, BMI, blood pressure and smoking status

**Conclusions:** Incorporating medications, EMR data and laboratory values into a claims-based index did not significantly improve the ability to predict DAS28 scores as a continuous measure. However, models that include claims, medications and EMR data may be used to reasonably distinguish moderate-to-high disease activity from low disease activity/remission.

## E-health for better care

### OP0011-PARE A WEEK TO TWEET: FINDINGS FROM YOUNG PARE'S ONLINE COURSE FOR TWITTER NOVICES

S.R. Stones<sup>1,2,3</sup>, on behalf of Young PARE Working Group. <sup>1</sup>*Fibromyalgia Action UK, Paisley, UK*; <sup>2</sup>*Young PARE, Zürich, Switzerland*; <sup>3</sup>*School of Healthcare, University of Leeds, Leeds, UK*

**Background:** Twitter is a social networking platform that enables individuals to publish short posts called tweets. Twitter enables individuals to reach over 270 million active users on the platform each month.<sup>1</sup> A useful way to develop individuals' confidence on Twitter can be through participating in tweet chats and by conversing at conferences through the use of a preselected hashtag.<sup>2</sup> Young PARE identified a need among the patient community to provide some training for individuals to get started on Twitter. This mirrored the ongoing work provided by EMEUNET for rheumatology professionals.

**Objectives:** The aim of the course was to deliver a structured online Twitter learning experience, and to evaluate participants' use and perceptions of the course.

**Methods:** The course was hosted on Mailchimp over a period of seven days, from Thursday 16 until Wednesday 22 February 2017. Participants wishing to take part signed up to the course via a form advertised by email and online. Participants received an email with a task to complete at 09:00 each day. Despite the daily prompt, the course was self-paced, enabling participants to participate at their own convenience. An anonymous evaluation survey, hosted by bos, was distributed to participants immediately after the course. A combination of 5-point Likert scales, multiple allowable answers and open-ended comments were employed.

**Results:** A total of 95 individuals subscribed to the course, with 11% responding to the survey (n=11). Of the respondents, 63.7% were aged 35 years or older. The course was rated as either good (63.6%) or excellent (36.4%), with 63.6% stating that the course met their expectations. The most favoured topics rated as strongly liked or liked by 90.9% of respondents were: (i) Using twitter at conferences; (ii) Public and protected tweets; (iii) Embedding Twitter feeds; (iv) Hashtags; and (v) Sending tweets. However, some participants felt that Twitter was not applicable to their country. Participants also provided constructive feedback for future courses; including more screenshots to guide textual prompts, and the option to house the course in a single, online location that can be accessible at any time.

**Conclusions:** 'A week to tweet' challenged the misconception that social media is just for young people under 35. The course provided a simplified account of Twitter, from the basics of getting started, through to more complex functions. It appeared to be a welcomed resource for twitter novices, though the instructional content could be simplified, particularly for participants whose first language is not English. Cultural issues were also raised, with some participants feeling that Twitter wasn't relevant in their country. This highlights the need for better awareness of the global functionality of Twitter, and the capabilities of this social networking platform. For future instances, course content should be accessible from an online repository, so that participants can access the course at their own pace. There may be scope for the course to be hosted under the EULAR School of Rheumatology in the future.

Lacoste<sup>6</sup>, V. Weill<sup>6</sup>, G. Thibaud<sup>1</sup>, on behalf of ANDAR patient organisation. <sup>1</sup>*ANDAR, Paris*; <sup>2</sup>*Hospital, Montpellier*; <sup>3</sup>*St Antoine Hospital, Paris*; <sup>4</sup>*Hospital, Metz*; <sup>5</sup>*hospital, Brest*; <sup>6</sup>*Dr SPOC, Paris, France*

**Background:** People with chronic conditions face the disease more effectively when they develop psychosocial skills and self-care. Health authorities thus recommend the organisation of therapeutic patient education (TPE)... suffering from different limitations.

**Objectives:** A patient organisation had the idea to develop a digital training solution, accessible everywhere, complementary to TPE, for patients with rheumatoid arthritis.

**Methods:** The choice was made for an online training program such as Massive Open Online Courses (MOOC).

A preliminary survey was carried out among the patients via an electronic questionnaire via social networks and an emailing to the organisation members.

A steering committee (COPIL) made up of representatives of the patients' association, expert patients and rheumatologists with the support of a specialised agency, determined the timetable, the educational objectives, the contents, the speakers and the evaluations.

**Results:** The initial investigation was stopped at 100 responses, obtained in 3 days. 85.9% planned to follow the MOOC on their computer, but to meet the needs of all, the device is responsive. 61% had never participated in a TPE program and 94% were interested in joining MOOC to learn new information about the disease (78.8%), treatments (71.7%), have expert views (67.7%), share experience with other patients (56.6%), and better live with the disease (50.5%).

The MOOC: Using the Learning Management System platform drspoc.com, Intervention of the experts via videos and live courses, evaluation of the achievements and, during two annual sessions, tutoring by patients trained specifically. At the beginning and end of the session, learners are invited to answer different questionnaires (knowledge, skills, satisfaction).

COPIL identified 15 experts (patient-experts, rheumatologists, occupational therapist, physiotherapist, nutritionist, social worker, psychologist, sexologist, nurse) who wrote the content of their speech. All texts have been validated by a pedagogical engineer and the director of the association.

215 people pre-registered during the month preceding the launch, 154 persons active and 446 posts shared during the first session. 217 pre-registered, 238

actives, 1 257 posts during the second sessions, tutored by peer patients with a dedicated training.

Some participants were health care professionals and their extremely positive feedbacks prove the value in offering MOOC access to every people interested in. **Conclusions:** This is the first digital training strategy for people with rheumatoid arthritis. It proved to be useful to patients, offering an alternative or complement to TPE.

It will be necessary to evaluate the impact of this MOOC on the quality of life of the patients and their perception on its usefulness after several sessions. We decided to propose an e-learning version without peer patient intervention and accessible at any time in addition to the MOOC version with a specific educational path.

**Acknowledgements:** This project received an institutional grant from Abbvie, Biogen, Lilly, Nordic, Pfizer, Roche-Chugai, Sandoz, Sanofi. All medical and patient experts volunteers.

### PREGNANCY OUTCOMES IN DMARD EXPOSED PATIENTS WITH JUVENILE IDIOPATHIC ARTHRITIS – RESULTS OF THE BIOLOGIC REGISTER JUMBO

P. Drechsel<sup>1</sup>, J. Klotsche<sup>1</sup>, M. Niewerth<sup>1</sup>, G. Horneff<sup>2</sup>, K. Minden<sup>1</sup>. <sup>1</sup>Epidemiology, German Rheumatism Research Centre Berlin, Berlin; <sup>2</sup>Asklepios Clinic Sankt Augustin GmbH, Sankt Augustin, Germany

**Background:** Juvenile idiopathic arthritis (JIA) often persists into adult life. Young women and men with JIA are often still exposed to disease modifying anti-rheumatic drugs (DMARDs). Little is known about the impact of DMARDs on pregnancy and its outcome, and there has been no approved DMARD for pregnant or lactating women so far.

**Objectives:** To investigate the course and outcome of pregnancies in female JIA patients and male JIA patients with pregnant partners who were exposed to DMARDs.

**Methods:** In the JIA biologic registry JuMBO (Juvenile arthritis MTX/Biologics long-term Observation), patients (or partners of patients) with pregnancies were identified. Standardised patient interviews were conducted and the course and outcome of pregnancy inquired. In addition, prospectively collected physician-reported data were considered in the analysis.

**Results:** Out of the 1300 patients enrolled in JuMBO, a total of 222 pregnancies in 116 women and in 25 partners of men with JIA were reported. Until January 2018, information was available for 149 pregnancies of 96 women with JIA and for 34 pregnancies of 20 male patients with pregnant partners.

The majority of the 96 women had polyarticular JIA (75%). The median age at first conception was 24 years (ys, IQR 20–27) and the median disease duration was 14 ys (IQR 9–18). All women were ever exposed to DMARDs, 84% to a biological (b) DMARD. Among the 149 pregnancies, 64 occurred upon DMARD exposure (29 bDMARDs, 23 bDMARDs plus synthetic (s)DMARDs, 12 sDMARDs). DMARDs were discontinued in most exposed patients 6 weeks (median, IQR 4–9) after conception. In the groups of pregnancy exposed (n=64) and unexposed (n=85) to a DMARD at conception were the outcomes as follows: 36 and 64 live births, 16 and 6 elective pregnancy terminations, 8 and 12 spontaneous abortions, 2 and 0 extra-uterine gravidity, and 0 and 1 stillbirth, respectively. Among the 100 pregnancies with live births, most frequent complications were gestational diabetes in 9 cases and bleeding in 7 cases. Three women suffered from preeclampsia. Twelve children were born before the 37th week of gestation (5 (13.9%) of exposed and 7 (10.9%) of unexposed mothers) and 38 were born by Caesarean section. Six children were born with malformations, of which four are to be considered as major anomalies according to the EUROCAT classification<sup>1</sup> (2 (5.5%) in exposed patients and 2 (3.1%) in unexposed patients).

Of the 34 pregnancies in partners of male patients, in 26 cases the expectant fathers had been exposed to DMARDs at conception. Most pregnancies (29/34, 85.2%) resulted in a live birth, 3 (8.8%) ended in a spontaneous abortion and 1 (2.9%) pregnancy was terminated. Two (6.9%) children were born with congenital malformation

**Conclusions:** Women and men with JIA who are still undergoing treatment in young adulthood often become pregnant or procreate children under medication, why more information on drug safety in pregnancy is needed. For this, more patient data must be evaluated in connexion with therapy, disease activity and the JIA category.

OP0014

### SERUM URATE, GOUT, AND CARDIOVASCULAR DISEASE IN A RANDOMISED CONTROLLED TRIAL OF CANAKINUMAB: A CANTOS SECONDARY ANALYSIS

D. Solomon<sup>1</sup>, R.J. Glynn<sup>1</sup>, J.G. MacFadyen<sup>1</sup>, P. Libby<sup>1</sup>, T. Thuren<sup>2</sup>, B.M. Everett<sup>1</sup>, P.M. Ridker<sup>1</sup>. <sup>1</sup>Harvard Medical School, Boston, USA; <sup>2</sup>Novartis, Basel, Switzerland

**Background:** Serum urate is a risk marker for both gout and cardiovascular disease, but trial data demonstrating that drugs which reduce gout also reduce cardiovascular event rates is scarce. It is also uncertain if any such effects are mediated through urate levels.

**Objectives:** We examined the relationships between serum urate (SUA), canakinumab, and incidence rates for gout and cardiovascular events in the Canakinumab Anti-inflammatory Thrombosis Outcomes Study (CANTOS), a randomised double-blind placebo controlled trial of IL-1 $\beta$  inhibition.

**Methods:** 10 061 patients with stable atherosclerosis (prior myocardial infarction) and hsCRP  $\geq 2$  mg/L were randomly allocated to placebo or to one of three doses of canakinumab (50 mg, 150 mg, or 300 mg), administered subcutaneously once every three months. Serum urate and hsCRP were tested at baseline and every 3 months for the first year and then annually. A physician diagnosed history of gout was ascertained at baseline and subsequent attacks were assessed during follow-up as part of the systematic adverse event reporting. The rates of gout and major adverse cardiovascular events (myocardial infarction, stroke, re-vascularisation, and cardiovascular death) were compared across different baseline SUA levels and by randomised treatment assignment.

**Results:** The groups were well balanced with respect to baseline characteristics with a median follow-up of 3.7 years. Median age was 61 years, 74% were male, median BMI was 29.8kg/m<sup>2</sup>, and median SUA at baseline was 6.1 mg/dl (IQR: 5.2, 7.2). In the placebo group, rates for both gout and major adverse cardiovascular events increased across baseline SUA strata. Rates were 0.28, 1.36, and 5.94 per 100 person years for gout and 4.1, 5.3, and 5.6 for major adverse cardiovascular events per 100 person years for SUA levels of <6.9, 6.9–8.9, and  $\geq 9.0$  mg/dL, respectively. Random allocation to all dosages of canakinumab reduced rates of incident gout (see figure 1). This reduction in gout by canakinumab was observed at all baseline SUA levels (see table 1), and canakinumab had no effect on SUA levels over time but did reduce hsCRP.

**Abstract OP0014 – Table 1.** Gout risk by treatment assignment, stratified by baseline serum urate

		Placebo		Canakinumab (all dosages)			
		N	Events	N	Events	Rate (95% CI)	HR (95% CI)
<b>Gout events</b>							
SUA	<6.9 mg/dl	2326	24	4614	19	0.28 (0.18–0.41)	0.40 (0.07–0.73)
	6.9–8.9 mg/dl	831	41	1684	41	1.36 (1.00–1.85)	0.65 (0.48–0.74)
	$\geq 9.0$ mg/dl	186	34	418	36	5.94 (4.25–8.32)	2.55 (1.84–3.54)

SUA, serum urate; Rate per 100 person-years; HR, hazard ratio; CI, confidence interval. Hazard ratios calculated using placebo as reference.

**Conclusions:** The CANTOS trial confirms that serum urate is a risk marker for both gout and cardiovascular events and demonstrates that IL-1 $\beta$  inhibition is effective in preventing both of these inter-related conditions. However, canakinumab had no effects on serum urate itself.

#### OP0015 MORTALITY OF THE COBRA EARLY RHEUMATOID ARTHRITIS TRIAL COHORT AFTER 23 YEARS FOLLOW UP

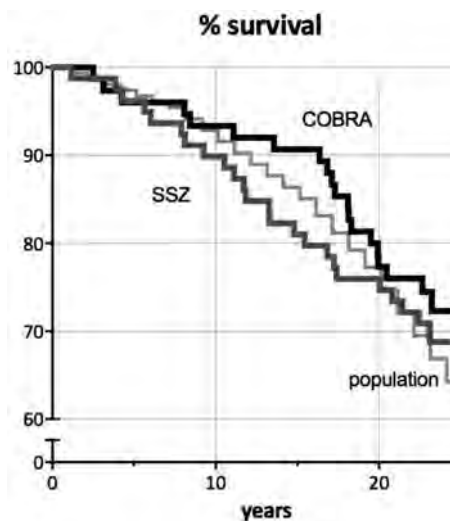

P.B.M. Poppelaars<sup>1</sup>, L.H.D. van Tuyl<sup>1</sup>, M. Boers<sup>1,2</sup>. <sup>1</sup>Amsterdam Rheumatology and Immunology Center | VU University Medical Center; <sup>2</sup>Epidemiology and Biostatistics, VU University Medical Center, Amsterdam, Netherlands

**Background:** Mortality in patients with rheumatoid arthritis (RA) is higher than the general population. Most cohorts show that the adverse effect of RA becomes apparent only after more than a decade of follow up. Whether early, intensive treatment can improve this is still unknown. COBRA combination therapy (COmbinatietherapie Bij Rheumatoïde Artritis) showed long-term effectiveness for treatment of early RA without undue harm.<sup>1</sup> In 2010, after 11 years of follow up, the COBRA follow up study showed lower mortality in patients with COBRA treatment compared to patients with sulphasalazine monotherapy.<sup>2</sup>

**Objectives:** Our aim was to investigate mortality in the COBRA-trial cohort after 23 years and compare this mortality to a reference sample of the general population in the Netherlands.

**Methods:** In the COBRA trial, patients with early RA (median disease duration, 4 months) were treated with sulphasalazine monotherapy (SSZ, n=79) or a combination of SSZ, low-dose methotrexate and initially high, step-down prednisolone (COBRA, n=76). In the current study, we investigated mortality in the COBRA trial with the help of the Dutch state registry for mortality (Centrum van familiegeschiedenis, CBG). We compared the mortality in this cohort to a reference sample of the general population in the Netherlands matched for age and gender (data from Statistics Netherlands). The Standardised Mortality Ratio (SMR) compared the trial groups and the general population.

**Results:** With data of 154 out of the 155 patients, follow up was nearly complete. Duration of follow up was mean 23 (in patients alive, range 22–24) years. In total 44 patients died (28%, SMR=0.80 [95% CI: 0.59 to 1.06]); 20 of 75 COBRA patients (27%, SMR 0.75; [0.47–1.14]) and 24 of 79 SSZ patients (30%, SMR 0.85 [0.56–1.25]); the difference in mortality was not significant (p=0.61). In the reference sample of the general population (n=154) 55 people (36%) died. The positive trend for COBRA over SSZ decreased over time (figure 1).

**Conclusions:** This prospective cohort study of early RA is one of the first to show a normalisation of RA mortality compared to the general population after 23 years of follow up. In fact, this trial population had a numerically lower mortality than expected. This confirms that early, intensive treatment of RA (that can include glucocorticoids) has long-term benefits, and strongly suggests these benefits include normalisation of mortality.

#### OP0016 A MULTICENTRE RANDOMISED CONTROLLED TRIAL OF ZOLEDRONIC ACID FOR OSTEOARTHRITIS OF THE KNEE WITH BONE MARROW LESIONS

G. Cai<sup>1</sup>, D. Aitken<sup>1</sup>, L. Laslett<sup>1</sup>, C. Hill<sup>2</sup>, L. March<sup>3</sup>, A.E. Wluka<sup>4</sup>, Y. Wang<sup>4</sup>, L. Blizzard<sup>1</sup>, F. Cicuttini<sup>4</sup>, T. Winzenberg<sup>1</sup>, G. Jones<sup>1</sup>. <sup>1</sup>Menzies Institute for Medical Research, University of Tasmania, Hobart; <sup>2</sup>The Queen Elizabeth Hospital, Woodville; <sup>3</sup>Royal North Shore Hospital, University of Sydney, Sydney; <sup>4</sup>Department of Epidemiology and Preventive Medicine, Monash University, Melbourne, Australia

**Background:** No disease-modifying drugs are currently available for the treatment of osteoarthritis (OA). Bone marrow lesions (BMLs) visualised on magnetic resonance imaging (MRI) have been identified as a promising therapeutic target. Our pilot study showed that a single infusion of zoledronic acid (ZA) reduced knee pain and BML size in knee OA patients over 6 months.<sup>1</sup> A longer, larger study was required to assess whether these improvements can be reproduced in a larger multicentre design.

**Objectives:** To compare the effect of once-yearly intravenous infusion of ZA to placebo on knee pain and BML size over 24 months in knee OA patients with significant knee pain and BMLs.

**Methods:** The Zoledronic Acid for Osteoarthritis Knee Pain (ZAP2) study is a multicentre, randomised, double-blinded, placebo-controlled trial over 24 months. Patients  $\geq 50$  years who had significant knee pain (defined as a visual analogue scale (VAS)  $\geq 40$  mm) and MRI-detected knee BML were randomised to receive either ZA (5 mg in 100 ml saline) or placebo (100 ml saline) once-yearly. Those with severe knee OA (joint space narrowing (JSN) on X-ray of Grade 3 using the Osteoarthritis Research Society International (OARSI) atlas) were excluded. Outcomes included knee pain and function by the Western Ontario and McMasters Universities Osteoarthritis Index (WOMAC), knee pain by VAS and change in knee total BML size (sum of medial femoral, lateral femoral, medial tibial, lateral tibial and patellar sites) by proton density weighted MRI from baseline to 24 months. Effect modification of the absence or presence of radiographic OA (JSN grade 0 or grade 1–2) was pre-specified. Mixed effect modelling using an intent-to-treat design was performed for data analyses. Adjustment for baseline values were performed for knee pain and function outcomes due to baseline imbalances.

**Results:** 223 patients (mean  $\pm$ SD age 62.0 $\pm$ 8.0 years, 117 females) were enrolled. At baseline, mean  $\pm$ SD knee WOMAC pain (0–500), WOMAC function (0–1700) and VAS pain scores (0–100) were 200.0 $\pm$ 105.0, 656.9 $\pm$ 352.9 and 51.0

$\pm 20.5$ , and median BML size was 489.6 mm<sup>2</sup>. After 24 months, there was no significant difference in changes in knee pain (WOMAC pain: -37.5 vs -58.0,  $p=0.205$ ; VAS pain: -11.5 vs -16.8,  $p=0.17$ ) or function scores (-134.9 vs -159.2,  $p=0.65$ ), or knee BML size (-33.5 mm<sup>2</sup> vs -11.7 mm<sup>2</sup>,  $p=0.68$ ) between the ZA group and the placebo group. Pre-specified analyses consistently showed that ZA was more effective than placebo in patients without radiographic OA (JSN Grade 0) on changes in WOMAC pain (-88.3 vs -42.6,  $p=0.21$ ), VAS pain (-21.8 to -8.3,  $p=0.11$ ), WOMAC function (-296.9 vs -78.5,  $p=0.06$ ) and BML size (-67.4 vs 98.2,  $p=0.14$ ). Adverse events were more frequent in the ZA group, primarily flu-like symptoms and musculoskeletal pain and stiffness.

**Conclusions:** Once-yearly infusion of ZA did not significantly reduce knee pain or BML size overall in knee OA patients over 24 months but may have symptomatic benefit in milder disease.

### OP0017 THE IMPACT OF THE DURATION OF BISPHOSPHONATE DRUG HOLIDAYS ON HIP FRACTURE RATES

J.R. Curtis<sup>1</sup>, R. Chen<sup>1</sup>, Z. Li<sup>1</sup>, T. Arora<sup>1</sup>, K.G. Saag<sup>1</sup>, N.C. Wright<sup>1</sup>, S. Daigle<sup>1</sup>, M. Kilgore<sup>1</sup>, E. Delzell<sup>2</sup>. <sup>1</sup>University of Alabama at Birmingham; <sup>2</sup>University of Alabama at Birmingham - Retired, Birmingham, USA

**Background:** Given FDA warnings, drug holidays (temporary or permanent discontinuation) of bisphosphonates (BPs) after long-term (3-5 years) continuous therapy is becoming increasingly common in the United States (US). However, the benefits and risks of stopping BPs, and the optimal timing to restart, remain unclear.

**Objectives:** We conducted a population-based cohort study of women on long term BP therapy to evaluate the rate of hip fracture following a drug holiday.

**Methods:** We used Medicare data (2006-2014) to identify all women with medical and pharmacy coverage who initiated a BP and were at least 80% adherent for  $\geq 3$  years ('baseline'), at which follow-up time began. Patients using other bone therapies (e.g. denosumab, oestrogen, teriparatide, calcitonin) were excluded or censored if they started after follow-up began. We calculated crude rates of hip fracture for continuing BP therapy and among those who discontinued, for categories of time since discontinuing (i.e., length of drug holiday), extending up to 3 years. We used Cox proportional hazards models to evaluate the risk of discontinuing per the length of the drug holiday, using age as the time axis and controlling for potentially confounding factors, with and without adjusting for death as a competing risk.

**Results:** We identified 1 56 236 women who were highly adherent, long-term BP users. The mean (SD) age was 78.5 (7.5) years. The most commonly used BPs were alendronate (71.7% ever use, 52% exclusive use) and zoledronic acid (16.2% ever use, 8.9% exclusive use). During a median (IQR) followup of 2.1 (1.0, 3.3) years, 62 676 (40.1%) of women stopped BP therapy for at least 6 months or more. Among these women, 7947 (12.7%) subsequently restarted any BP. Overall, 16 904 (10.8%) died.

A total of 3745 hip fractures occurred during follow-up. Hip fracture rates were lowest among women who were current users, and gradually increased as the length of the drug holiday increased, achieving their maximum with a drug holiday >2 years (table 1).

**Abstract OP0017 - Table 1.** Hip fracture rate by duration of BP drug holiday, adjusting for competing risk of death

Time since Bisphosphonate Discontinuation (yrs)	Number of hip fractures, n	Crude Incidence Rate per 1000 person-years	Adjusted* Hazard Ratio (95% CI)
0 (i.e. current use)	1958	9.6 (9.2-10.1)	1.0 (reference)
>0 to $\leq 3$ months	530	13.1 (12.0-14.3)	1.29 (1.17-1.42)
>3 months $\leq 1$ year	539	12.0 (11.0-13.1)	1.12 (1.02-1.24)
>1 to $\leq 2$ years	422	13.3 (12.0-14.6)	1.21 (1.09-1.35)
>2 to $\leq 3$ years	235	15.7 (13.7-17.8)	1.39 (1.21-1.59)

\*adjusted for age, region, race, rural or urban, median income, calendar year, comorbidity (fragility fracture, charlson comorbidity index score), DXA, number of physician visits, care by a rheumatologist or endocrinologist, long term care residence, vitamin D deficiency, glucocorticoids, and proton pump inhibitors

**Conclusions:** In a large cohort of U.S. women, a BP drug holiday greater than 2 years was associated with a significantly increased risk for hip fracture of up to 39% compared to continued BP use.

### OP0018 THE VALUE OF ADDING MRI TO A CLINICAL TREAT-TO-TARGET STRATEGY IN RHEUMATOID ARTHRITIS PATIENTS IN CLINICAL REMISSION: CLINICAL AND RADIOGRAPHIC OUTCOMES FROM THE IMAGINE-RA RANDOMISED CONTROLLED TRIAL

S. Møller-Bisgaard, K. Hørslev-Pedersen, B. Ejbjerg, M. Hetland, L. Ørnbjerg, D. Glinatsi, J. Møller, M. Boesen, R. Christensen, K. Stengaard-Pedersen, O. R. Madsen, B. Jensen, J. Villadsen, E.-M. Hauge, P. Bennett, O. Hendricks, K. Asmussen, M. Kowalski, H. Lindegaard, S.M. Nielsen, H. Bliddal, N. Krogh, T. Ellingsen, A.H. Nielsen, L. Balding, A.G. Jurik, H. Thomsen, M. Østergaard. *Depts of Rheumatology and Radiology, Musculoskeletal Statistics Unit, Hospitals at Slagelse, Graasten, Gentofte, Aarhus, Frederiksberg, Silkeborg, Hjørring, Odense, Herlev, the Parker Institute and Rigshospitalet, Zealand, Funen and Jutland, Denmark*

**Background:** Targeting MRI remission in rheumatoid arthritis (RA) patients in clinical remission may improve clinical outcome and halt joint damage progression.

**Objectives:** To determine whether a treat-to-target (T2T) strategy based on structured MRI assessments targeting absence of osteitis/bone marrow oedema (BME) would lead to improved clinical and radiographic outcomes, compared with a conventional T2T strategy in RA patients in clinical remission.

**Methods:** The IMAGINE-RA study was a 2 year investigator-initiated, randomised, open-label multicentre study. Two hundred RA patients in clinical remission (defined as: DAS28-CRP < 3.2 and no swollen joints) receiving conventional synthetic disease-modifying antirheumatic drugs (csDMARDs) were randomly assigned 1:1 to a conventional DAS28-CRP guided T2T strategy, targeting

**Abstract OP0018 - Table 1.** Primary and secondary outcomes at 24 months

	MRI T2T	Conventional T2T	Difference between groups	P value*

Change in EQ-5D	0.040 (0.015)	0.019 (0.013)	0.021 (-0.017 to 0.060)	0.279

95% CI, 95% confidence interval; ACR=American College of Rheumatology; CDAI=Clinical Disease Activity Index; CRP=C-reactive protein; DAS28-CRP=Disease activity score in 28 joints based on four variables, including CRP; EQ-5D=EuroQol-5 dimensions; EULAR=EULAR Boolean remission; HAQ=Health Assessment Questionnaire; MCS=Mental Component Summary score; MRI=Magnetic Resonance Imaging; PCS=Physical Component Summary score; RA=RA; RAI=RAI remission; SDAI=Simplified Disease Activity Index; SF-36=Short Form 36 item questionnaire; T2T=treat-to-target; TSS=Total Sharp/van der Heijde score; VAS=Visual Analogue Scale. Data are presented as least square means (SE) unless otherwise stated. Analyses are based on full analysis set (patients having a baseline visit and at least one follow-up visit) with no data imputation to replace missing data. \*P values are based on repeated-measures logistic regression models. For some of the variables, fewer patients were included in the analyses due to missing data, with the minimum being 86 patients in the MRI T2T arm (range 86-98) and 91 (range 91-99) in the conventional T2T arm.

DAS28-CRP<3.2 and no swollen joints or an MRI guided T2T strategy based on the same clinical T2T strategy and MRI targeting absence of BME. Patients were followed every 4 months over a 2 year follow-up period. In the MRI T2T arm contrast-enhanced MRI of the dominant hand 2nd-5th metacarpophalangeal joints and wrist was performed ahead of the clinical visit and evaluated for presence/absence of BME. Treatment was escalated according to a predefined treatment algorithm if target was not reached, starting with increments in csDMARD mono/combination therapy and then adding biologic DMARDs. The co-primary endpoints were 1) proportion of patients achieving DAS28-CRP remission (DAS28-CRP<2.6) and 2) proportion of patients with no radiographic progression (change in total Sharp/vdHeijde score  $\leq 0$ ) 24 months from baseline. Secondary outcomes included various clinical, functional, radiographic and MRI variables. Pearson's chi-square statistics and repeated-measures logistic regression models were used to assess primary and secondary outcomes.

**Results:** Primary and secondary clinical and radiographic outcomes at 24 months are presented in the table 1. 76 patients in the MRI T2T arm and 95 patients in conventional T2T arm completed the study. Of them 64 patients (85%) in the MRI T2T arm and 83 patients (88%) in the conventional T2T arm reached the primary clinical endpoint (chi-square=0.324,  $p=0.569$ ) and 49 patients (66%) in the MRI T2T arm and 58 (62%) in the conventional T2T arm reached the primary radiographic endpoint (chi-square=0.265,  $p=0.606$ ). ACR/EULAR remission rates, swollen joint count, patient VAS global and HAQ favoured the MRI T2T arm ( $p<0.038$ ).

**Conclusions:** Targeting absence of MRI BME in addition to a conventional T2T strategy in RA patients in clinical remission had no effect on the probability of achieving DAS28-CRP remission or halt radiographic progression. However, more patients achieved ACR/EULAR remission and improvements in physical function when MRI was used for treatment guidance.

Abstract OP0019 – Table 1

	PBO (n=105)	Bari 2 mg (n=105)	Bari 4 mg (n=104)
<b>Efficacy measure</b>		<b>Week 24</b>	
Resolution of arthritis or rash (SLEDAI-2K)	56 (53.3)	61 (58.1)	70 (67.3)*
SRI-4	50 (47.6)	54 (51.4)	67 (64.4)*
Flare (SFI, any severity)	54 (51.4)	45 (42.9)	34 (32.7)*
Flare (SFI, severe)	12 (11.4)	10 (9.5)	6 (5.8)
LLDAS	27 (25.7)	35 (33.3)	40 (38.5)*
DTJC	-5.59	-6.50	-6.86*
DSJC	-4.60	-4.12	-4.76
DCLASI activity score	-2.80	-1.66	-2.27
DWorst pain	-0.56	-1.17	-1.31*
DWorst fatigue	-1.18	-1.13	-1.52
<b>Safety measure</b>		<b>Weeks 0–24<sup>‡</sup></b>	
TEAEs	68 (64.8)	75 (71.4)	76 (73.1)
SAEs	5 (4.8)	11 (10.5)	10 (9.6)
Serious infections	1 (1.0)	2 (1.9)	6 (5.8)
Deep vein thrombosis	0	0	1 (1.0)

Disease Activity State (LLDAS), and tender joint count (TJC) change from baseline were also significantly improved for Bari 4 mg compared to PBO (table 1). No statistically significant differences were observed between Bari 2 mg and PBO in any of the above endpoints. Rates of AEs leading to treatment discontinuation and SAEs were higher for both Bari dose groups compared to PBO. There were no deaths, malignancies, major adverse cardiovascular events, tuberculosis, or serious herpes zoster infections; one SAE of deep vein thrombosis was reported in a patient with risk factors (Bari 4 mg group).

Data are n (%) patients, unless otherwise indicated. D=least squares mean change from baseline. <sup>‡</sup>Includes up to 30 days post treatment. CLASI=Cutaneous Lupus Erythematosus Disease Area and Severity Index; n=number of patients in the analysis population; n=number of patients in the specified category; TEAE=treatment emergent adverse event. \* $p\leq 0.05$ .

**Conclusions:** In patients with SLE receiving standard background therapy, once-daily oral Bari 4 mg was associated with significant clinical improvements compared to PBO and an acceptable benefit/risk profile. These findings support further study of Bari 4 mg as a potential therapy for patients with SLE.

**Background:** Baricitinib (Bari), an oral selective inhibitor of Janus kinase (JAK)1 and JAK2, has been approved for the treatment of RA in the EU and Japan.

**Objectives:** To report results from a 24 week (wk) global, Phase 2, double-blind, placebo (PBO)-controlled study of Bari in patients with SLE receiving standard therapy.

**Methods:** Patients with SLE (positive ANA or anti-dsDNA, clinical SLEDAI-2K $\geq 4$ , arthritis or rash required) receiving stable background SLE therapy were randomised 1:1:1 to PBO, or Bari (2- or 4 mg) once daily. The primary endpoint was resolution of SLEDAI-2K arthritis or rash at wk 24.

**Results:** Of 314 patients randomised, 79%, 82%, and 83% completed 24 wks of treatment in PBO, Bari 2 mg, and Bari 4 mg groups, respectively. At wk 24, a significantly greater proportion of patients in Bari 4 mg group compared to PBO achieved resolution of SLEDAI-2K arthritis or rash (67% vs 53%,  $p<0.05$ ); and SRI-4 response (64% vs 48%,  $p<0.05$ ). At Wk24, the proportion of patients achieving flare reduction (SELENA-SLEDAI Flare Index [SFI]), Lupus Low

**Background:** This 4 phase project<sup>1</sup> jointly supported by EULAR and ACR has led to draft criteria.<sup>2</sup>

**Objectives:** To simplify and validate the new criteria in a large international cohort.

**Methods:** 23 expert centres each contributed up to 100 patients with SLE and with non-SLE diagnoses. Diagnoses were verified by 3 independent reviewers for 1,193 SLE and 1059 non-SLE patients. 500 randomly selected SLE and non-SLE patients formed the derivation cohort and the remainder the validation cohort.

**Results:** The criteria were fine-tuned and simplified, using ANA of  $\geq 1:80$  as entry criterion and a classification threshold of 10.

Renal	Class III/IV nephritis	10	Class II/V nephritis	8	Proteinuria $\geq 0.5$ g/day	4
Specific antibodies	Anti-Sm or Anti-dsDNA	6				
Mucocutaneous	ACLE	6	SCLE or DLE	4	Alopecia or oral ulcers	2
Serosa	Acute pericarditis	6	Effusion	5		
Musculoskeletal	Arthritis	6				
CNS	Seizures	5	Psychosis	3	Delirium	2
Blood	Autoimmune hemolysis or thrombocytopenia	4	Leukopenia	3		
Complement	Low C3 and C4	4	Low C3 or C4	3		
Anti-phospholipid	Anti-Cardiolipin or anti- $\beta$ 2-GPI or lupus anticoagulant	2				
Constitutional	Fever	2				

Sensitivity was close to the SLICC 2012 criteria, specificity maintained at the level of the ACR 1997 criteria. This performance was independently confirmed in the validation cohort.

	ACR 1997 criteria	SLICC criteria	New criteria
<b>Derivation</b>			
Sensitivity	84.63	96.81	98.00
Specificity	95.20	90.00	96.40
<b>Validation</b>			
Sensitivity	82.76	96.70	96.12
Specificity	93.38	83.62	93.38

**Conclusions:** The new criteria developed with EULAR/ACR support achieved sensitivity close to the SLICC criteria, while maintaining the specificity of the ACR criteria.

### DRAFT CLASSIFICATION CRITERIA FOR THE ANCA ASSOCIATED VASCULITIDES

J.C. Robson<sup>1</sup>, P.C. Grayson<sup>2</sup>, C. Ponte<sup>3</sup>, R. Suppiah<sup>4</sup>, A. Craven<sup>5</sup>, S. Khalid<sup>5</sup>, A. Judge<sup>5</sup>, A. Hutchings<sup>6</sup>, D. Gray<sup>5</sup>, J. Rosa<sup>5</sup>, J. Barrett<sup>5</sup>, R.A. Watts<sup>5</sup>, P. A. Merkel<sup>7</sup>, R. Luqmani<sup>5</sup>. <sup>1</sup>Rheumatology Unit, Faculty of Health and Applied Sciences, University of the West of England, Bristol, Bristol, UK; <sup>2</sup>NIAMS/National Institutes of Health, Bethesda, USA; <sup>3</sup>Lisbon Academic Medical Centre, Lisbon, Portugal; <sup>4</sup>Auckland District Health Board, Auckland, New Zealand; <sup>5</sup>University of Oxford, Oxford; <sup>6</sup>London School of Hygiene and Tropical Medicine, London, UK; <sup>7</sup>University of Pennsylvania, Philadelphia, USA

**Background:** Classification criteria for the ANCA-associated vasculitides (AAVs) were developed in the 1980s prior to the use of ANCA testing and newer imaging techniques. The Diagnostic and Classification of the Systemic Vasculitides (DCVAS) study is an international project to update classification criteria for the systemic vasculitides.

**Objectives:** Development of draft classification criteria for Granulomatosis with Polyangiitis (GPA), Microscopic Polyangiitis (MPA) and Eosinophilic Granulomatosis with Polyangiitis (EGPA).

**Methods:** Three phases: 1) Expert panel review of cases to identify gold standard set of new cases of small vessel vasculitis; 2) Item reduction of >8000 individual DCVAS items using data-driven and consensus methodology; 3) Lasso logistic regression models within each development set comparing each of the AAV types to other small and medium vessel vasculitides. Final criteria derived through clinical consensus, tested in validation set. The classification project has received financial support from the ACR and EULAR.

**Results:** The expert review process approved 2072/2871 (72%) of physician diagnosed DCVAS cases, including [724 GPA, 291 MPA, 226 EGPA, 51 polyarteritis nodosa (PAN), 220 other small vessel disease (SVV)]. Data driven and expert consensus resulted in 91 items retained. Draft criteria, and sensitivity and specificity in table 1.

**Abstract OP0021 – Table 1.** Draft classification criteria for the ANCA-associated vasculitides. \*Cartilagenous involvement: Inflamed ear or nose cartilage or hoarse voice/stridor, endobronchial involvement or saddle nose deformity

Granulomatosis with polyangiitis (GPA)	Microscopic polyangiitis (MPA)	Eosinophilic granulomatosis with polyangiitis (EGPA)
Blood nasal discharge, ulcers, crusting, congestion or blockage, or septal defect/perforation+3	Pauci-immune glomerulonephritis+3	Obstructive airways diseases+3
Cartilagenous involvement*+2	Bloody nasal discharge, ulcers, crusting, congestion or blockage, septal defect/perforation –3	Nasal polyps+3

WEDNESDAY, 13 JUNE 2018

## From NSAIDs to bDMARDs in SpA: what is new?\_\_\_

### OP0022 IS A PRIMARY GOOD RESPONSE TO NSAIDS PREDICTIVE OF THE SUBSEQUENT RESPONSE TO THE FIRST TNF INHIBITOR IN PATIENTS WITH RECENT AXIAL SPONDYLOARTHRITIS?

L. Couvaras<sup>1</sup>, D. Wendling<sup>2</sup>, V. Pauly<sup>3</sup>, V. Pradel<sup>3</sup>, A. Moltó<sup>4</sup>, P. Lafforgue<sup>1</sup>, T. Pham<sup>5</sup>. <sup>1</sup>Aix-Marseille University, APHM, Marseille; <sup>2</sup>Bourgogne-Franche-Comté University, CHRU Besançon, Besançon; <sup>3</sup>APHM, Marseille; <sup>4</sup>Cochin Hospital, Paris; <sup>5</sup>Aix-Marseille University, APHM, Marseille, France

**Background:** Good response to NSAIDs is a SpA feature included in classification criteria for axial spondyloarthritis (axSpA). Among patients eligible for a TNF inhibitor (TNFi), some patients may have never responded to NSAIDs (non-responders to NSAIDs) while others initially responded (responders to NSAIDs) but have secondarily escaped and need to be treated with biologics.

**Objectives:** Our aim was to determine if the initial response to NSAIDs is an independent predictive factor of a subsequent good response to the first TNFi in axSpA.

**Methods: Patients:** Patients from the prospective observational DESIR cohort of early axSpA cohort who started a TNFi over the 5 years of follow-up.

NSAIDs response and TNFi response definitions

NSAIDs response was defined by the item 'good response to NSAIDs according to Amor's criteria' at the inclusion visit. TNFi response was defined by the BASDAI50 response between the 'baseline' visit (last cohort visit before TNFi initiation) and the 'follow-up' visit (visit taking place after at least 8 weeks of TNFi treatment).

**Analysis:** We compared the characteristics of the NSAIDs responder to the non-responders and their response to the first TNFi.

We performed a multivariate logistic regression modelling the impact of an NSAID response to the TNFi response. We included known predictive factors of TNFi response in this model (age, gender, HLAB-B27, activity of the disease [ASDAS-CRP], CRP, X-ray and MRI sacroiliitis). To account for selection bias and for confirmation purpose, we applied a propensity score with Inverse Probability Weighting (IPW) method to predict TNFi response (SAS, version 9.2).

**Results:** Among the 708 patients of the cohort, 236 were included in the analysis. At the inclusion, the main characteristics were the following: 106 (44.7%) males, mean age 33.8±3.9 years, mean BASDAI 54.5±17.3 and 202 (85.6%) were NSAIDs responders.

The NSAIDs responder and non-responder groups were comparable at M0 except for HLA-B27 positive status: 59.9% vs 40.1%, p=0.041, CRP level: 13.4±20.3 mg/L vs 6.3±6.6 mg/L, p=0.027, history of psoriasis: 17.8% vs 35.3%, p=0.001 and BASDAI: 53.0±18.1 vs 61.8±13.2, p=0.001, in responder and non-responder patients, respectively.

The percentage of TNFi responders was 32.2% (65/202) and 23.5% (8/34) in the NSAIDs responder and non-responder groups, respectively (univariate analysis [OR 1.54 [95% CI: 0.7 to 3.6], p=0.313).

The multivariate logistic regression found the following independent factors of the TNFi response: gender [adjusted OR (aOR)=2.9 [CI95%: 1.4–6.0], p=0.004], age [aOR=0.9 [95% CI: 0.91 to 0.99], p=0.026], HLA-B27 status [aOR=2.5 [CI95%: 1.2–5.3], p=0.02], ASDAS-CRP score [aOR=1.6 [95% CI: 1.1 to 2.4], p=0.016], and MRI sacroiliitis [aOR=2.0 [CI95%: 1.0–4.2], p=0.054]. Response to NSAIDs was not significantly associated to the response to the TNFi [aOR=1.93 [95% CI: 0.6 to 6.3], p=0.275]. The IPW aOR confirmed the non-association between NSAIDs good response and TNFi good response: 1.60 [CI95%: 0.7–3.3], p=0.20.

**Conclusions:** The good response to NSAIDs according to the Amor's criteria does not seem to be an independent predictive factor of a good response to the first TNFi in early axSpA patients.

**Disclosure of Interest:** None declared

### OP0023 EFFECT OF ANTERIOR UVEITIS, PSORIASIS AND INFLAMMATORY BOWEL DISEASE ON DRUG-SURVIVAL FOR TNF-INHIBITORS IN ANKYLOSING SPONDYLITIS

U. Lindström<sup>1</sup>, T. Olofsson<sup>2</sup>, S. Wedrén<sup>1</sup>, I. Qirjazo<sup>3</sup>, J. Askling<sup>1</sup>, on behalf of ARTIS. <sup>1</sup>Rheumatology Unit and Clinical Epidemiology Unit, Department of Medicine, Karolinska Institutet, Stockholm; <sup>2</sup>Department of Clinical Sciences, Lund University, Lund; <sup>3</sup>Rheumatology Department, Linköping University Hospital, Linköping, Sweden

**Background:** Tumour necrosis factor inhibition (TNFi) is the mainstay treatment for ankylosing spondylitis (AS) with a high disease activity. Whereas disease activity and sex have been shown to affect drug-survival for TNFi in AS, the impact of typical AS-comorbidities, such as anterior uveitis, psoriasis and inflammatory bowel disease (IBD), on the drug-survival of TNFi in AS is less well understood.

**Objectives:** To determine the impact of comorbidity with anterior uveitis, psoriasis and IBD on drug-survival in patients with AS starting treatment with a first TNFi.

**Methods:** Swedish biologics-naïve patients with AS starting a 1st TNFi July 1 2006 – December 31 2015, were identified in the Rheumatology Quality Register, and followed from treatment start until treatment discontinuation. Censoring occurred at the first of: December 31 2015, death, emigration, or loss of follow-up. Comorbidities, and potential confounders, were identified through linkage to six other national registers.

We calculated survival curves and hazard ratios (HRs) for each comorbidity and the risk of TNFi discontinuation. HRs were adjusted for sex, age, CRP, peripheral arthritis, type of TNFi and BASDAI at baseline. Additional models were also adjusted for other chronic morbidities (cardiovascular disease, affective disease, diabetes, malignancies, chronic lung disease and chronic kidney failure), and for socioeconomic status (length of education, household income, sick-leave, country of birth and civil status), respectively.

**Results:** 2577 patients (71% men) were identified, 27% had a previous history of anterior uveitis, 7% IBD and 6% psoriasis. A history of anterior uveitis was associated with a lower risk of TNFi discontinuation (HR 0.72; 0.62–0.83), whereas presence of psoriasis was associated with an increased risk (HR 1.48; 1.18–1.86). No association was found between presence of IBD and risk of TNFi discontinuation. Models adjusting for disease activity, morbidities, and socioeconomic status resulted in an attenuated association for psoriasis (table 1). The impact of each comorbidity on drug-survival is visualised in figure 1.

**Abstract OP0023 – Table 1.** HR for association between inflammatory comorbidities and risk of discontinuation of TNFi treatment in AS

Comorbidity	A	B	C	D
Anterior uveitis	0.72 (0.62–0.83)	0.71 (0.60–0.84)	0.72 (0.61–0.85)	0.75 (0.62–0.90)
Psoriasis	1.48 (1.18–1.86)	1.35 (1.04–1.76)	1.28 (0.98–1.67)	1.33 (0.99–1.78)
IBD	0.91 (0.71–1.16)	0.84 (0.65–1.09)	0.82 (0.63–1.07)	0.83 (0.62–1.10)

A)univariable; B-D) adjusted for baseline measures; C) also adjusted for other morbidity and D) also adjusted for socioeconomic status.

**Abstract OP0023 – Figure 1** Survival probability (Kaplan-Meier plots) for persisting on a first-line TNFi, for patients with ankylosing spondylitis, dependant on having a history of (A) anterior uveitis, (B) psoriasis or (C) inflammatory bowel disease.

**Conclusions:** Comorbidities typically associated with AS affect TNFi drug survival, but in different directions. Possible explanations include a differential effect of TNFi on these morbidities themselves, or other inherent differences in the AS inflammatory phenotype. The association with psoriasis decreased after adjustment, suggesting the influence of other factors. The role of inflammatory comorbidities in determining response and persistence of TNFi should be further examined.

OP0024

#### WHAT HAPPENS TO PATIENTS WITH ANKYLOSING SPONDYLITIS WHO START A FIRST BIOLOGIC? A SWEDISH STUDY OF TREATMENT TRAJECTORIES IN CLINICAL PRACTICE

U. Lindström<sup>1</sup>, T. Olofsson<sup>2</sup>, S. Wedrén<sup>1</sup>, I. Qirjazo<sup>3</sup>, J. Askling<sup>1</sup>, on behalf of ARTIS. <sup>1</sup>Rheumatology Unit and Clinical Epidemiology Unit, Department of Medicine, Karolinska Institutet, Stockholm; <sup>2</sup>Department of Clinical Sciences, Lund University, Lund; <sup>3</sup>Rheumatology Department, Linköping University Hospital, Linköping, Sweden

**Background:** Clinical trials have shown that 40%–50% of patients with ankylosing spondylitis (AS) achieve a good response ( $\geq 40\%$  improvement) to treatment with tumour necrosis factor inhibitors (TNFi). By contrast, observational studies indicate that less than two out of three patients continue their first biological disease modifying anti-rheumatic drug (bDMARD) up to two years. During the past six years, five TNFi and one IL-17-inhibitor have been marketed for AS in Sweden. Yet, an assessment of long-term treatment trajectories in AS is lacking. In particular, there is a need for a better understanding of the proportion of patients who fail their first bDMARD, when this happens, and which drugs become their ensuing treatments.

**Objectives:** To describe contemporary five-year treatment trajectories for patients initiating a first ever bDMARD in AS, and to explore whether the dose of bDMARD is gradually tapered in those patients who remain stable on their bDMARD treatment.

**Methods:** Swedish patients with AS starting a first ever bDMARD in 2010–2015 were identified in the Swedish Rheumatology Quality Register (SRQ). At the end of each full year (1–5 years) after treatment start, the treatment status of each patient was determined. Censoring occurred at the first of: death, emigration, 31 December 2015 or loss to follow-up. In addition, data on collected prescriptions for the subcutaneous bDMARDs were retrieved from the National Prescribed Drug Register. For patients remaining on their first subcutaneous bDMARD, according to SRQ, the proportion of patients collecting  $\geq 75\%$  of the yearly 'defined daily doses' (DDD) at a pharmacy during each full year was determined.

**Results:** 1698 patients with AS starting a first bDMARD in the study-period were identified, all of which were TNFi. After the end of the first year, 74% remained on their first bDMARD and after five years 38% (figure 1). Of the 72% of patients who remained on any bDMARD after five years, 85% were on their first or second bDMARD. After five years 24% were not on any DMARD and around five percent of the patients discontinuing bDMARD treatment did so due to low disease activity or remission. Among those remaining on their first subcutaneous bDMARD the proportion collecting  $\geq 75\%$  of the yearly DDD gradually decreased from 88% to 56% over the 5 years of follow-up (black line in figure 1).

**Abstract OP0024** – Figure 1 Proportion of patients with ankylosing spondylitis on each treatment after 1–5 years of follow-up from initiating their first bDMARD

**Conclusions:** While a minority of patients with AS remain on their first-line bDMARD after 5 years of treatment, most are still on any bDMARD. Further, despite a low rate of discontinuation due to remission, one fourth of patients no longer use any bDMARDs treatment after 5 years. Patients remaining stable on treatment gradually but substantially decrease their use over time.

OP0025

#### IDENTIFICATION OF PREDICTORS OF STRUCTURAL DAMAGE PROGRESSION IN THE SACROILIAC JOINTS IN PATIENTS WITH EARLY AXIAL SPONDYLOARTHRITIS ON A LONG-TERM ANTI-TNF TREATMENT

V. Rios Rodriguez<sup>1\*</sup>, K.-G. Hermann<sup>2</sup>, H. Haibel<sup>1</sup>, C. Althoff<sup>2</sup>, O. Behmer<sup>3</sup>, J. Sieper<sup>1</sup>, D. Poddubnyy<sup>1,4</sup>, <sup>1</sup>Rheumatology; <sup>2</sup>Radiology, Charité Universitätsmedizin; <sup>3</sup>Pfizer Pharma; <sup>4</sup>German Rheumatism Research Centre, Berlin, Germany

**Background:** Several observational studies showed a low, but still detectable progression of structural damage in the sacroiliac joints (SIJ) in patients with axial spondyloarthritis (axSpA) over 2 to 5 years. Few predictors of progressions, such as elevated C-reactive protein (CRP) and active inflammation on magnetic resonance imaging (MRI), have been identified, mostly in patients not treated with TNF inhibitors. To date, it is not clear whether these predictors also work in patients treated with anti-TNF agents and whether anti-TNF therapy is able to retard such a progression.

**Objectives:** To evaluate the radiographic progression in the sacroiliac joints (SIJ) and to identify predictors of such a progression during long-term (up to six years) treatment with tumour necrosis factor (TNF) blocker etanercept in patients with early axSpA.

**Methods:** In the ESTHER trial<sup>1</sup> a total of 76 patients with early (up to 5 years symptom duration) and active axSpA were randomised to be treated with either etanercept or sulfasalazine for one year. Between year 1 and year 6, all patients who continued in the study were treated with etanercept. X-rays of SIJ were collected at baseline and every 2 years thereafter. Two trained readers, who were blinded for all clinical data, scored independently the SIJ x-rays in a concealed and randomly selected order, according to the grading system of the modified New York (mNY) criteria (grade 0 to 4). Patients with bilateral sacroiliitis of grade  $\geq 2$  or unilateral of grade  $\geq 3$  were classified as radiographic axSpA (r-axSpA), and as non-radiographic axSpA (nr-axSpA) otherwise. The sacroiliitis sum score (0–8) was calculated as a sum of means of both readers for the left and right SIJ. Active and chronic inflammatory changes on MRI of SIJ were assessed at baseline, year 2 and year 4 according to the Berlin MRI scoring system. A longitudinal mixed model analysis was performed to identify predictors of the radiographic sacroiliitis progression.

**Abstract OP0025 – Table 1.** Longitudinal mixed model analysis of the association between structural damage in the sacroiliac joints (sacroiliitis sum score) and disease-related parameters in patients with early axSpA treated with etanercept for up to 6 years.

Disease-related parameters	Univariable analysis $\beta$ (95% CI)	Model 1 $\beta$ (95% CI)	Model 2 $\beta$ (95% CI)
Elevated CRP ( $>5\text{mg/l}$ )	0.44 (0.13 – 0.75)	-	0.45 (0.11 – 0.78)
SIJ osteitis score on MRI (0-24)	0.05 (0.01 – 0.09)	0.04 (0.01 – 0.08)	-
Age, years	0.00 (-0.02 – 0.01)	-0.00 (-0.02 – 0.01)	-0.00 (-0.02 – 0.01)
Male sex	-0.03 (-0.35 – 0.27)	-0.18 (-0.53 – 0.16)	0.00 (-0.33 – 0.33)
HLA-B27 positivity	-0.07 (-0.47 – 0.32)	-0.08 (-0.55 – 0.38)	-0.08 (-0.54 – 0.36)
Treatment duration with ETN, years	-0.04 (-0.13 – 0.03)	-0.03 (-0.15 – 0.09)	-0.01 (-0.12 – 0.09)
Symptoms duration, years	-0.01 (-0.07 – 0.05)	0.01 (-0.07 – 0.11)	0.01 (-0.07 – 0.10)

axSpA, axial spondyloarthritis; CRP, C-reactive protein; CI, confidence interval; ETN, etanercept; MRI, magnetic resonance imaging; SIJ, sacroiliac joints.

**Results:** Totally, 55 patients with axSpA contributing with 159 SIJ radiographs were included in the analysis. At baseline, 19 patients were classified as r-axSpA and 36 as nr-axSpA based on the independent SIJ reading. Radiographic progression from nr- to r-axSpA was observed in 5 (18%) patients between baseline and year 2. Progression decelerated to 4.1% between year 2 and 4, and no further progression was observed up to year 6. The mean  $\pm$ SD change of sacroiliitis sum score was  $0.13 \pm 0.73$ ,  $-0.26 \pm 0.76$  and  $-0.09 \pm 0.67$ , in the time intervals baseline-year 2, year 2 year 4, and year 4 year 6, respectively. In the longitudinal mixed model analysis, elevated CRP (model 2) and osteitis on MRI (model 1) were independently and significantly associated with a higher sacroiliitis sum score (table 1).

**Conclusions:** Long-term therapy with a TNF blocker seems to decelerate progression of structural damage in the SIJ. Elevated CRP and presence of osteitis in MRI were independently associated with SIJ radiographic progression.

#### OP0026 ADALIMUMAB SERUM CONCENTRATION FAILS TO PREDICT ACHIEVEMENT OF SUSTAINED REMISSION OR ABSENCE OF FLARE FOR PATIENTS WITH NON-RADIOGRAPHIC AXIAL SPONDYLOARTHRITIS IN THE ABILITY-3 STUDY

N.V. Kwatra<sup>1</sup>, M. Magrey<sup>2</sup>, P.J. Mease<sup>3</sup>, J. Sieper<sup>4</sup>, R. Landewe<sup>5</sup>, X. Wang<sup>1</sup>, A. Lertratanakul<sup>1</sup>, J.K. Anderson<sup>1</sup>, N.M. Mostafa<sup>1</sup>. <sup>1</sup>Abbvie Inc., North Chicago; <sup>2</sup>Case Western Reserve University School of Medicine at MetroHealth Medical Center, Cleveland; <sup>3</sup>Swedish Medical Center and University of Washington, Seattle, USA; <sup>4</sup>Charité Universitätsmedizin Berlin, Berlin, Germany; <sup>5</sup>Amsterdam Rheumatology and Clinical Immunology Center, Amsterdam, Netherlands

**Background:** In patients (pts) with active non-radiographic axial spondyloarthritis (nr-axSpA) in the ABILITY-3 study who achieved sustained remission with adalimumab (ADA), continued ADA therapy was associated with significantly fewer pts flaring than treatment withdrawal. Sustained remission is an important treatment goal in pts with nr-axSpA, but factors predicting sustained remission and absence of flare are unknown.

**Objectives:** To determine whether an ADA concentration threshold is predictive of achievement of sustained remission and absence of flare in pts with nr-axSpA.

**Methods:** ABILITY-3 included a 28-wk open-label (OL) ADA (40 mg every other wk) lead-in in which pts who achieved sustained remission (ASDAS <1.3 at wks 16, 20, 24, and 28) were randomised to double-blind (DB) placebo (PBO) or continued ADA for 40 wks (68 wks total). Pts not achieving remission were discontinued at wks 20, 24, or 28. The primary efficacy variable was the proportion of pts who did not experience a flare (ASDAS  $\geq 2.1$  at 2 consecutive visits) by wk 68. Pts who flared received OL ADA rescue. ADA trough concentrations at wks 12 or 28 were used to predict achieving sustained remission by wk 28 (all OL patients, n=673) and absence of flare at wk 68 (patients randomised to DB ADA, n=152). Threshold analysis was conducted by constructing receiver operating characteristic (ROC) curves (R Ver 3.3.3) to assess predictive ADA trough concentration thresholds based on specificity and sensitivity values.

**Results:** Of 673 pts enrolled in the OL phase, 305 met criteria for remission at wk 28 and were randomised to DB treatment. Mean  $\pm$ SD ADA trough concentrations were  $6.68 \pm 5.23$   $\mu$ g/mL at wk 12 and  $8.36 \pm 5.27$   $\mu$ g/mL at wk 28. During the DB phase, 81 and 45 pts flared and 68 and 36 pts received  $\geq 12$  wks of OL ADA rescue in PBO (n=153) and ADA (n=152) arms, respectively. ADA mean  $\pm$ SD trough concentration at wk 68 for pts randomised to DB ADA with flare ( $7.64 \pm 5.22$   $\mu$ g/mL) was slightly lower than for DB ADA pts without flare ( $8.12 \pm 4.35$   $\mu$ g/mL). ROC curves showed AUC values  $\leq 0.6$  for achieving sustained remission by wk 28 and absence of flare at wk 68, with no concentration threshold meeting sensitivity and specificity criteria for reliable prediction of such endpoints (figure 1).

Abstract OP0026 – Figure 1 Receiver operating characteristic curves to predict sustained remission by week 28 and absence of flare at week 68 by adalimumab serum concentration

**Conclusions:** ROC analyses did not identify an ADA trough concentration threshold that reliably predicted whether a pt with nr-axSpA would achieve sustained remission (by wk 28) or absence of flare (at wk 68).

#### OP0027 CHARACTERISTICS OF CYTOKINES AND CHANGES IN INTERLEUKIN-17 LEVELS IN THE SYNOVIAL FLUID OF PATIENTS WITH ANKYLOSING SPONDYLITIS ON TREATMENT WITH BIOLOGICS

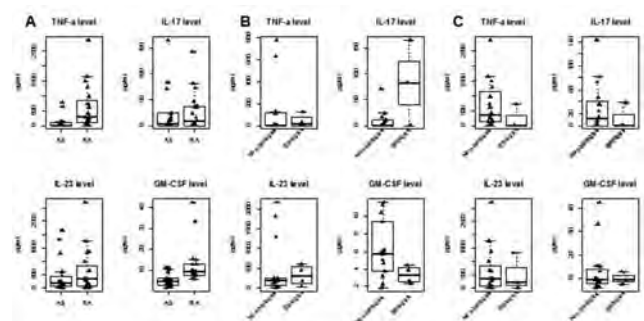

B.S. Koo<sup>1</sup>, S. Jo<sup>2</sup>, E. Kwon<sup>2</sup>, J.H. Shin<sup>2</sup>, T.-H. Kim<sup>2</sup>. <sup>1</sup>Rheumatology, Inje University Seoul Paik Hospital, Inje University College of Medicine; <sup>2</sup>Rheumatology, Hanyang University Hospital for Rheumatic Diseases, Seoul, Korea, Republic Of

**Background:** Biologic drugs targeting the inflammatory cytokines have been recommended in rheumatoid arthritis (RA) and ankylosing spondylitis (AS). Yet, some patients require a change in treatment because an adequate response is not achieved.

**Objectives:** The current study aimed to evaluate the levels of tumour necrosis factor alpha (TNF- $\alpha$ ), interleukin (IL)-17, IL-23, and granulocyte-macrophage colony-stimulating factor (GM-CSF) in the joint fluid in patients with AS and RA and identify the important cytokines related with treatment-response.

**Methods:** Synovial fluid was obtained from 18 patients with AS and 19 with RA who suffered from arthritis of the knee; and the levels of the cytokines were measured. The differences in their levels between patients with AS and RA, and between patients treated with and without biologics (biologics group and non-biologics group) were analysed.

**Results:** TNF- $\alpha$  and GM-CSF levels in patients with AS were significantly lower than those in patients with RA (figure 1A, both  $p < 0.01$ ); however, IL-17 and IL-23 levels were not significantly different between the two groups. Furthermore, levels of IL-17 were markedly elevated in the biologics group compared with the non-biologics group in AS (figure 1B,  $p = 0.04$ ). However, in RA, there were no significant differences between the non-biologics and biologics group (figure 1C).

**Conclusions:** In AS, IL-17 in synovial fluid is a good marker of non-response to biologics and may be a good target for non-responders to TNF inhibitor.

**Disclosure of Interest:** None declared

OP0028

### EFFICACY AND SAFETY OF BCD-085, A NOVEL IL-17 INHIBITOR, IN ANKYLOSING SPONDYLITIS. RESULTS OF PHASE 2 CLINICAL STUDY

V. Mazurov<sup>1</sup>, S. Erdes<sup>2</sup>, E. Kunder<sup>3</sup>, N. Soroka<sup>4</sup>, P. Shesternya<sup>5</sup>, S. Smakotina<sup>6</sup>, T. Raskina<sup>7</sup>, D. Krechikova<sup>8</sup>, T. Dubinina<sup>2</sup>, A. Ereemeeva<sup>9</sup>, E. Dokukina<sup>9</sup>, E. Chernyaeva<sup>9</sup>, R. Ivanov<sup>9</sup>. <sup>1</sup>North-Western State Medical University named after I.I. Mechnikov, Saint-Petersburg; <sup>2</sup>V.A. Nasonova Research Institute of Rheumatology, Moscow, Russian Federation; <sup>3</sup>Clinical Hospital 1; <sup>4</sup>Clinical Hospital 9, Minsk, Belarus; <sup>5</sup>Prof V.F. Voyno-Yasenetskiy Krasnoyarsk State Medical Univ, Krasnoyarsk; <sup>6</sup>S.V. Belayev Kemerovo Regional Hospital; <sup>7</sup>Kemerovo State Medical University, Kemerovo; <sup>8</sup>Department Hospital at Smolensk Station of JSC 'Russian Railways', Smolensk; <sup>9</sup>JCS BIOCAD, Saint-Petersburg, Russian Federation

**Background:** BCD-085 is an innovative humanised monoclonal antibody against interleukin-17 with genetically modified Fc- and CDR-regions, aimed to improve treatment outcomes in patients with several autoimmune disorders.

**Objectives:** This abstract presents the results of double-blind placebo controlled dose-finding phase II clinical study of efficacy and safety of subcutaneous BCD-085 in patients with ankylosing spondylitis.

**Methods:** The study was conducted as international multicenter randomised double-blind placebo controlled study. The study enrolled 88 adults with active AS. Patients were randomised in 4 study arms in 1:1:1:1 ratio to receive 40, 80 or 120 mg of BCD-085 or placebo. In the active period of the study, patients received the test drug/placebo SC injections once weekly for the first three weeks of treatment and then every other week till Wk 12. After Wk 12 all patients underwent follow-up for 4 weeks.

**Results:** Efficacy: BCD-085 is superior to placebo in doses 80 and 120 mg. ASAS20 at wk 16 was reached by 81.82%, 90.91% and 42.86% of patients in BCD-085 80 mg, 120 mg and placebo arm respectively ( $p=0.008$ , 95% CI for difference in proportion [12.36%; 65.56%];  $p=0.001$ , 95% CI: 23.71% to 72.39%), superiority margin 10%). Significant reduction of AS activity was revealed for all BCD-085 arms: by Wk 4 BASDAI and ASDAS-CRP scores decreased and maintained achieved levels till the end of the study. Other secondary endpoints (ASAS40, ASAS5/6, BASMI, BASFI, BASDAI, MASES, chest expansion, QoL, spinal pain) had the corresponding dynamics: by the time of second evaluation (Wk 1 for spinal pain, Wk 4 for other endpoints) significant improvement with no further negative changes was revealed. For all evaluated endpoints the most pronounced response was established for BCD-085 120 mg arm. In placebo arm no significant dynamics was shown.

**Safety:** All arms had highly similar safety profiles. Most of AEs were presented as mild or moderate laboratory abnormalities (ANC decreased, WBC increased) and moderate arterial hypertension. The rates of AEs were equivalent for all BCD-085 doses and placebo. There were no cases of SAEs, treatment discontinuation due to safety reasons or local reactions. Immunogenicity assessment did not detect formation of binding antibodies.

Abstract OP0028 – Table 1. Summarised safety data

Parameter	Arm				P-value
	BCD-085 40 mg (n=22)	BCD-085 80 mg (n=22)	BCD-085 120 mg (n=22)	Placebo (n=22)	
Any AE	11 (50.00%)	6 (27.27%)	4 (18.18%)	7 (31.82%)	0.183
Therapy-related AEs	5 (22.73%)	4 (18.18%)	1 (4.55%)	5 (22.73%)	0.354
Grade 3-4 AEs	1 (4.55%)	2 (9.09%)	0	1 (4.55%)	0.900

Abstract OP0028 – Figure 1. ASAS20 response throughout the study (\* – statistically significant difference between BCD-085 and placebo arms).

**Conclusions:** Treatment with BCD-085 leads to significant improvement in all AS symptoms in comparison with placebo. The dose of 120 mg of BCD-085 had

the most pronounced effect. The drug was well tolerated in all doses with no differences with placebo in safety profiles.

OP0029

### CLINICAL EFFECT OF VEDOLIZUMAB ON ARTICULAR MANIFESTATIONS IN PATIENTS WITH SPONDYLOARTHRITIS ASSOCIATED WITH INFLAMMATORY BOWEL DISEASE

J. Paccou, M. Nachury, C. Duchemin, P. Desreumaux, R.-M. Flipo, B. Pariente. Lille University Hospital, Lille, France

**Background:** Data on the effects of vedolizumab on joint manifestations remain controversial.<sup>1,2</sup>

**Objectives:** The purpose of this study was to evaluate baseline characteristics of crohn's disease (CD) and ulcerative colitis (UC) patients treated with vedolizumab, assess the effect of vedolizumab on joint manifestations in patients with inflammatory bowel disease (IBD)-associated Spondyloarthritis (SpA), and evaluate new onset of SpA under VDZ.

**Methods:** This single-centre, retrospective and observational study was conducted from July 2014 to July 2017. The charts of all patients with IBD who had undergone treatment with vedolizumab for more than 3 months were reviewed. The patients' demographic and clinical characteristics were collected. Data on IBD-associated SpA were collected as well as new onset of SpA under VDZ. The ASAS criteria were used to establish the diagnosis of SpA.

**Results:** Patient characteristics and main results are shown in table 1. A total of 171 patients diagnosed with IBD were treated with vedolizumab from July 2014 to July 2017. Notably, 97.1% of patients had been previously treated with at least one TNF- $\alpha$  inhibitor. All patients included in this study completed the induction phase at last observation, and the mean follow-up of the entire cohort was 14.3  $\pm$  12.0 months. Ten (5.8%) patients had a history of IBD-associated SpA but were in clinical remission at the time of initiation of VDZ, whereas 4 (2.4%) had active SpA when VDZ was started. First, no clinical benefit on SpA following initiation of VDZ was found in those 4 patients with active SpA. Second, exacerbation of SpA in patients with clinical remission at initiation of VDZ was found in 6/10 patients whereas no effect was reported in the remaining 4/10 patients. All those 14 patients with IBD-associated SpA were under TNF inhibitors just before starting VDZ. Finally, new onset of SpA induced by VDZ was reported in 1 patient.

Abstract OP0029 – Table 1. Characteristics of patients and main results

Variable	n=171
Age (years), mean $\pm$ SD	37.8 $\pm$ 12.9
Female gender, n (%)	110 (64.3)
Body mass index (kg/m <sup>2</sup> ), mean $\pm$ SD	23.7 (4.8)
Type of disease, n (%)	104 (60.8)
- Crohn's disease	67 (39.2)
- Ulcerative colitis	
Duration of disease (years), mean $\pm$ SD	10.5 (7.6)
Duration of follow-up under vedolizumab (months), mean $\pm$ SD	14.3 (12.0)
IBD-associated SpA, n (%)	157 (91.8)
- No history	10 (5.8)
- History (inactive at initiation of VDZ)	4 (2.4)
- Active at initiation of VDZ	
Clinical benefit on SpA following initiation of VDZ (n=4)	4/4 (100)
- No clinical benefit	0/4 (0)
- Improvement	
Exacerbation of SpA in patients with clinical remission at initiation of VDZ (n=10)	6 (60)
- Yes	4 (40)
- No	
New onset of SpA induced by VDZ	1 (<1)

**Conclusions:** Vedolizumab does not seem to show any efficacy in IBD-associated SpA and might even induce exacerbation or new onset of SpA. Inception cohort studies are needed to better evaluate the effect of vedolizumab on joint manifestations.

**Background:** What is the optimal glucocorticoid (GC) bridging therapy with MTX monotherapy in early arthritis?

**Objectives:** To compare short term clinical efficacy of high and low dose GC tapering schedules with MTX monotherapy in 2 clinical trials in early rheumatoid arthritis (RA) and undifferentiated arthritis (UA) patients.

**Methods:** In tREACH, early RA and UA (arthritis in  $\geq 1$  joint(s), <1 year symptoms) patients were randomised to 3 different treatment arms. For this analysis we only use the data of arm C: oral GCs (prednisone) (15 mg/day, tapered to 0 in 10 weeks) with MTX monotherapy (25 mg/week); low dose GC tapering schedule (LDGC).

In IMPROVED RA and UA (arthritis in  $\geq 1$  joint and  $\geq 1$  other painful joint, <2 years symptoms) patients were treated with prednisone (60 mg/day, tapered in 7 weeks to 7.5 mg/day, continued to 4 months)+MTX monotherapy (25 mg/week); high dose GC tapering schedule (HDGC). We compared %DAS-remission (<1.6) and low disease activity ( $\leq 2.4$ ) at first evaluation (3 months tREACH, 4 months IMPROVED) and DAS and HAQ over time. After multivariate normal imputation we applied generalised estimating equations (GEE) for linear outcomes and logistic regression models for binary outcomes, adjusted for potential baseline confounders (figure 1). Adverse events were compared between treatment arms using  $\chi^2$ -square tests.

**Results:** Patients with a HDGC (n=610) had shorter symptom duration and higher HAQ, were less often seropositive (ACPA positive 56.0% vs 77.3%, RF positive 58.1% vs 65%) and more often had UA (20.3% vs 2.1%) than patients with a LDGC (n=97). Baseline DAS was comparable.

At the first evaluation time point (median 3.06 (IQR 2.99–3.22) months in LDGC, 4.01. (3.8–4.17) in HDGC) DAS and HAQ had decreased significantly less after 3 months LDGC: DAS  $\beta$  (95% CI) 0.500 (0.276; 0.725), and HAQ 0.330 (0.189; 0.470) than after 4 months HDGC (figure 1).

Compared to the HDGC patients, patients with the LDGC had a significantly lower chance of achieving DAS-remission 63.4% vs 28.9% (OR (95% CI) 0.215 (0.124; 0.373) and low disease activity 80.6% vs 55.7% ((OR (95% CI) 0.249 (0.143; 0.435)). Presence of ACPA was positively associated with achieving DAS-remission in the HDGC group, but not in the LDGC group. Per 100 patient years, 7.98 serious adverse events were reported in the HDGC and 23.4 in the LDGC (p=0.004). Hypertension, hyperglycemia (>7.8 mmol/L), gastrointestinal complaints and liverenzymes above normal were reported in similar frequencies across all groups. In patients with a LDGC more headaches, skin rashes, creatinine above normal range and any decrease in haematology blood counts were reported (data not shown).

**Abstract OP0030** – Figure 1 A: Predicted DAS over time, B: Predicted HAQ over time. All predictions are from multiple imputed models, adjusted for age, gender body mass index, presence of ACPA, presence of rheumatoid factor, symptom duration, effect over time (in GEE) and baseline DAS (for binary out-comes). DAS, Disease Activity Score; HAQ Health Assessment Questionnaire; HD GC, high dose glucocorticoids, LD GC, low dose glucocorticoids

**Conclusions:** In early arthritis patients, GC bridging therapy with prednisone 60 mg daily tapered in 7 weeks to and continued at 7.5 mg daily in combination with MTX monotherapy was associated with better clinical outcomes and without additional effects than prednisone 15 mg daily tapered to nil in 10 weeks in combination with MTX monotherapy, after correction for baseline age, gender, DAS, body mass index, presence of ACPA, presence of rheumatoid factor, symptom duration, and (in GEE) time from baseline.

OP0031

**THE IMPORTANCE OF ASSESSING MULTIPLICATIVE AND ADDITIVE INTERACTION: EXAMINING THE EFFECT OF GLUCOCORTICOID THERAPY ON MORTALITY IN PATIENTS WITH RHEUMATOID ARTHRITIS AND CONCOMITANT TYPE II DIABETES**

R. Costello<sup>1</sup>, A. Marsden<sup>2</sup>, M. Movahedi<sup>3</sup>, M. Lun<sup>1</sup>, R. Emsley<sup>2</sup>, W.G. Dixon<sup>1</sup>. <sup>1</sup>Arthritis Research UK Centre for Epidemiology, <sup>2</sup>Centre for biostatistics, The University of Manchester, Manchester, UK; <sup>3</sup>Ontario Best Practices Research Initiative, University Health Network, Toronto, Canada

**Background:** Glucocorticoids (GC) are widely used to treat rheumatoid arthritis (RA), however they are known to have risks associated with them. It has been shown that GCs increase the risk of diabetes mellitus (DM). A few studies have investigated the long-term effects of GC use on outcomes in DM, but not in RA specifically. As people with RA already have increased risk of cardiovascular (CV) disease, the additional burden of DM and GCs may be important. If the effect of GCs was dependent on DM we would say there is effect modification and this can be on the additive scale, corresponding to variation in the absolute treatment effect, e.g. the risk difference (RD), across DM status, or the multiplicative scale, corresponding to variation in the relative treatment effect e.g. the rate ratio (RR).<sup>1</sup>

**Objectives:** To examine in patients with RA 1) whether all-cause and CV mortality rates differ by GC and DM status, and 2) whether DM modifies the relationship between GC and all-cause and CV mortality on multiplicative and additive scales.

**Methods:** Patients with RA and linkage to mortality data were identified from the Clinical Practice Research Datalink (n=9085), a database of primary care electronic medical records in the UK. RR and RD for ever GC use were calculated by DM status. Cox proportional hazards (PH) regression models were fitted with an interaction term for DM and use of GC to assess multiplicative interaction. Additive interaction was measured with the Relative Excess Risk due to Interaction (RERI)<sup>2</sup> where a value different from zero indicates a difference in the absolute effect of treatment.

**Results:** Those with DM and ever treated with GCs had a 3-fold increased all-cause mortality RR (95% CI: 2.27, 4.09) whilst those without DM had a slightly higher RR (3.46 (95% CI: 2.95, 4.07)). However those with DM had a higher RD: 36.46 deaths per 1000 patient years (pyrs) (95% CI: 27.5, 45.41) compared to those without DM: RD 22.83 deaths per 1000 pyrs (95% CI: 19.83, 25.82) because of higher baseline mortality rates. A similar pattern was seen for CV mortality. The adjusted Cox PH model for all-cause mortality showed no evidence of multiplicative interaction, but there was significant additive interaction (RERI 0.86 (95% CI: 0.18, 1.54)). For CV mortality there was no interaction on either scale.

**Conclusions:** Methodologically, this study showed assessing interaction on the additive and multiplicative scales can lead to different conclusions and should be considered carefully. In this study significant interaction was seen on additive scale but not on the multiplicative scale due to higher baseline rates in patients with DM. Clinically, this study provides some evidence that long-term GC therapy may be particularly harmful in patients with RA and DM.

### MALIGNANCIES AND SERIOUS INFECTIONS IN RANDOMISED CONTROLLED TRIALS OF JANUS KINASE INHIBITORS IN PATIENTS WITH RHEUMATOID ARTHRITIS: A SYSTEMATIC REVIEW AND META-ANALYSIS

M.A. Lopez-Olivo<sup>1</sup>, J.H. Tayar<sup>1</sup>, N.V. Zamora<sup>2</sup>, G. Pratt<sup>3</sup>, M.E. Suarez-Almazor<sup>1</sup>.  
<sup>1</sup>General Internal Medicine, The University of Texas, MD Anderson Cancer Center, Houston, USA; <sup>2</sup>Rheumatology Section, Instituto de Rehabilitación Psicosfísica, Buenos Aires, Argentina; <sup>3</sup>Research Medical Library, The University of Texas, MD Anderson Cancer Center, Houston, USA

**Background:** Two JAK inhibitors are currently approved by different agencies worldwide for their use in patients with rheumatoid arthritis. The safety profile of these agents has been of interest since the approval of the first JAK inhibitor, particularly the risk of developing malignancies or serious infections.

**Objectives:** We conducted a systematic review and meta-analysis of phase 2 and phase 3 trials to evaluate these two outcomes in patients receiving JAK inhibitors for rheumatoid arthritis.

**Methods:** We performed a search in 5 electronic databases and also searched clinicaltrials.gov, Food and Drug Administration, and European Medicines Agency. In addition, the bibliography list of included studies was also screened to search for further citations not retrieved from other sources. We included controlled trials evaluating the efficacy of a JAK inhibitor (i.e., tofacitinib baricitinib, filgotinib, peficitinib, ABT-494, or decenotinib). Two reviewers independently screened studies, evaluated their risk of bias, and extracted data. Primary outcome data included number and type of malignancies and infections and time point of occurrence when available. The reported publications was considered the primary source of data for all trials. Serious infections were defined as those meeting the criteria for a serious adverse events such as a fatal, life threatening, or leading to hospitalisation.

**Results:** Thirty-one trials were analysed, reporting data on 13 945 patients. Follow-up of the included trials ranged between 4 and 52 weeks with a median of 24 weeks. The risk of attrition bias was judged low for most studies. The reported rates of malignancies and serious infections across studies ranged from 0% and 0.7% to 2.0%, and 5.4%, respectively. Most commonly reported malignancies were lung cancer, melanoma, nonmelanoma skin cancer, basal cell and squamous cell carcinoma. Patients receiving the combination of JAK inhibitor plus methotrexate or JAK inhibitor monotherapy had higher rates of malignancies, compared with methotrexate between 12 and 24 weeks before the rescue treatment was implemented, but the difference did not reach statistical significance (odds ratio (OR) 2.48, 95% confidence interval (CI) 0.76 to 8.11 and 1.39, 95% CI: 0.21 to 9.11, respectively). Regarding serious infections, the JAK inhibitor groups had similar rates to those observed in the control groups (OR 0.90, 95% CI: 0.38 to 0.92, 95% CI: 0.35 to 2.43, respectively). However, there was a dose-response effect with higher rates of serious infections observed in those patients receiving higher doses of JAK inhibitors.

**Conclusions:** Although not reaching statistical significance, in the currently available RCTs, the rates of malignancy were higher in the JAK inhibitors groups compared to their controls. The rates of serious infections were similar between JAK inhibitor groups and their controls, but were dose-dependent. Future studies should aim to indirectly compare each JAK inhibitor to evaluate if these safety signals are also drug dependent and to assess risk per type of malignancy or infection.

### EFFECT OF A STEP-UP OR STEP-DOWN IN TOFACITINIB DOSE ON EFFICACY AND SAFETY IN PATIENTS WITH RHEUMATOID ARTHRITIS IN LONG-TERM EXTENSION STUDIES

R.B. Mueller<sup>1</sup>, H. Schulze-Koops<sup>2</sup>, D.E. Furst<sup>3</sup>, S. Cohen<sup>4</sup>, K. Kwok<sup>5</sup>, A. Maniccia<sup>5</sup>, L. Wang<sup>6</sup>, E. Akylbekova<sup>7</sup>, G. Ackermann<sup>8</sup>, J. von Kempis<sup>1</sup>.  
<sup>1</sup>Kantonsspital St. Gallen, St. Gallen, Switzerland; <sup>2</sup>Klinikum der Universität München, Munich, Germany; <sup>3</sup>UCLA, Los Angeles, CA; <sup>4</sup>Metroplex Clinical Research Center and University of Texas Southwestern Medical Center, Dallas, TX; <sup>5</sup>Pfizer Inc, New York, NY; <sup>6</sup>Pfizer Inc, Groton, CT; <sup>7</sup>IQVIA, Durham, NC, USA; <sup>8</sup>Pfizer AG, Zurich, Switzerland

**Background:** Tofacitinib is an oral Janus kinase inhibitor for the treatment of rheumatoid arthritis (RA). Efficacy and safety of tofacitinib 5 and 10 mg BID have been shown in long-term extension (LTE) studies up to 114 months.<sup>1</sup>

**Objectives:** To assess the impact of tofacitinib dose changes on efficacy and safety in patients (pts) who increased (step-up) or who decreased (step-down) dose, vs pts who remained on the same dose when entering LTE studies.

**Methods:** In this exploratory, post hoc analysis, data were pooled from 2 open-label LTE studies (NCT00413699 [ongoing; database not locked at Jan 2016 data-cut]; NCT00661661) of pts with RA who had participated in Phase (P) 1/2/3 tofacitinib index studies and had  $\geq 81$  days of tofacitinib exposure (to allow  $\geq 2$  assessments) in each period (P1/2/3 index and LTE). Dose changes from index study dose were mandated by protocol (at LTE entry) or at the investigator's discretion (during LTE). This analysis only included pts who remained on their initial/changed dose in the LTE. Pts were analysed in 4 groups: 5 mg BID [index]  $\rightarrow$  10 mg BID [LTE] (Step-up; n=833); 5 mg BID [index]  $\rightarrow$  5 mg BID [LTE] (Remain 5; n=248); 10 mg BID [index]  $\rightarrow$  10 mg BID [LTE] (Remain 10; n=951); 10 mg BID [index]  $\rightarrow$  5 mg BID [LTE] (Step-down; n=234). To determine if initial efficacy (last index study assessment) affects response following dose change on LTE entry, sub-groups for the Step-up and Remain 5 groups were defined based on initial ACR20 response, and sub-groups for the Step-down and Remain 10 groups were defined based on initial ACR50 response. Efficacy was assessed up to Month 12 in the LTE based on  $\Delta$ DAS28-4(ESR). Exposure-adjusted event rates (pts with events/100 pt-yrs) are presented for the most common adverse events (AEs) for the entire LTE study exposure.

**Results:** No statistically significant differences in  $\Delta$ DAS28-4(ESR) were observed between the Step-up and Remain 5 groups (figure 1A), whether or not they had an initial ACR20 response (data not shown). In general, no significant differences in  $\Delta$ DAS28-4(ESR) were observed between the Step-down and Remain 10 groups (figure 1B), whether or not they had an initial ACR50 response (data not shown). The rates and types of AEs were similar across all groups (table 1).

Abstract OP0033 – Table 1. Summary of AEs in the LTE study

	Step-up: 5 to 10 mg BID N=833	Remain on 5 mg BID N=248	Step-down: 10 to 5 mg BID N=234	Remain on 10 mg BID N=951
Total years of exposure	2729	807	822	3030
Discontinued due to AEs, n	207	53	46	221
Most common AE system organ classes, n (EASR) EASR >10.00 in any group				
Infections and infestations	578 (21.18)	171 (18.88)	141 (17.16)	563 (21.88)
Gastrointestinal disorders	257 (8.41)	92 (10.25)	93 (10.10)	295 (8.77)
Musculoskeletal and connective tissue disorders	223 (11.83)	78 (8.59)	58 (6.81)	286 (12.58)
Most common AE preferred terms, n (EASR) EASR >3.00 in any group

Herpes zoster	94 (3.44)	34 (3.74)	18 (2.19)	95 (3.13)

EASR, events per 100 pt-yrs; AE, adverse event; EASR, exposure-adjusted event rate; LTE, long-term extension; pt, patient

Abstract OP0033 – Figure 1. Mean  $\Delta$ DAS28-4(ESR) over time for A) Step-up pts and those who remained on tofacitinib 5 mg BID and B) Step-down pts and those who remained on tofacitinib 10 mg BID

**Conclusions:** In pts with RA, the safety profile was similar regardless of dose change. Step-up from tofacitinib 5 to 10 mg BID, or step-down from 10 to 5 mg BID, did not affect efficacy over 12 months vs remaining on the same dose, and was not influenced by initial response. Conclusions were limited by small pt numbers in some groups, the open-label design and inclusion of pts in the LTE who showed tolerability for tofacitinib and drug retention.

**LONG-TERM EFFECTIVENESS OF THE COBRA SLIM REMISSION INDUCTION AND TREAT TO TARGET STRATEGY IN PATIENTS WITH EARLY RHEUMATOID ARTHRITIS LACKING CLASSICAL MARKERS OF POOR PROGNOSIS: 2 YEAR RESULTS OF THE CARERA TRIAL**

V. Stouten<sup>1</sup>, J. Joly<sup>2</sup>, S. Pazmino<sup>1</sup>, K. Van der Elst<sup>1,2</sup>, D. De Cock<sup>1</sup>, R. Westhovens<sup>1,2</sup>, P. Verschueren<sup>1,2</sup>, on behalf of the CareRA study group.  
<sup>1</sup>Skeletal Biology and Engineering Research Centre, KU Leuven; <sup>2</sup>Rheumatology, University Hospitals Leuven, Belgium

**Background:** EULAR guidelines recommend to treat all patients with early Rheumatoid Arthritis (eRA) with a combination of methotrexate (MTX) and a short-term course of Glucocorticoids (GC). The COBRA Slim strategy with MTX and a moderately dosed tapering down scheme of GC was effective, also in patients without classical markers of poor prognosis during the first year.

**Objectives:** To compare the outcomes of MTX with or without initial step-down GC in Low-Risk patients during the second year of the CareRA trial, in terms of disease control, safety and DMARD use.

**Methods:** CareRA is a two-year prospective investigator-initiated pragmatic multicentre RCT. DMARD naïve eRA patients were stratified into a High- or Low-Risk group based on classical prognostic markers (presence of erosions, RF, anti-CCP and DAS28-CRP). Low-Risk patients (n=90) were randomised to either Tight-Step Up (TSU) with MTX 15 mg weekly without GC or to COBRA Slim, a combination of MTX 15 mg weekly and prednisone tapering down scheme starting at 30 mg, tapered to 5 mg daily from w6 and stopped at w34. A treat-to-target approach was applied until year 1 and afterwards treatment was at the discretion of the rheumatologist. Proportions of DAS28-CRP remission at year 2 was a co-primary CareRA endpoint. Secondary outcomes were efficacy according to other remission criteria, EULAR/ACR response rates and functionality measured by HAQ (ITT analysis, last observation carried forward). Adverse events (AEs) and concomitant medication were registered.

**Results:** At year 2, 67.4% of Slim and 70.2% of TSU patients were in remission according to DAS28CRP (p=0.777). Out of patients in DAS28CRP remission at year 1, 80.0% (24/30) in the Slim group, versus 69.0% (20/29) in the TSU group remained in remission at every three-monthly evaluation until year 2. Remission rates defined by Boolean criteria were higher in patients of the Slim (39.5% versus TSU group (19.1%) (p=0.033). Functionality measured by mean area under the HAQ curve over 2 years was better in Slim patients (38.3±47.2) than in TSU patients (56.4±48.7) (p=0.025). Other secondary efficacy outcomes did not differ

Abstract OP0034 – Table 1 Clinical outcomes during the second year per treatment arm

	COBRA slim (n=43)	TSU (n=47)	p-value
Remission DAS28-CRP year 2	29 (67.4%)	33 (70.2%)	0.777
DAS28-CRP change BL-year 2	2.2±1.8	2.2±2.0	0.929
DAS28-CRP change year 1-year 2	0.1±0.8	0.0±0.9	0.486
Mean AUC of DAS28CRP	248.9±110.8	266.1±82.3	0.119
Good EULAR response at year 2	55.8%	61.7%	0.571
ACR50 improvement at year 2	25 (58.1%)	23 (48.9%)	0.382
ACR70 improvement at year 2	19 (44.2%)	15 (31.9%)	0.230
Remission CDAI year 2	20 (46.5%)	15 (31.9%)	0.156
Remission SDAI year 2	20 (46.5%)	15 (31.9%)	0.156
Remission Boolean year 2	17 (39.5%)	9 (19.1%)	0.033
Mean AUC of HAQ	38.3±47.2	56.4±48.7	0.025
Clinically meaningful HAQ change at year 2	53.5%	59.6%	0.561
HAQ = 0 at year 2	48.8%	36.2%	0.224

DAS28-CRP= 28 Joint disease activity score calculated with C-reactive protein; good EULAR response = low disease activity with a DAS28-CRP change (BL-year 2) >1.2; AUC = Area Under the Curve (BL-year 2); HAQ= health assessment questionnaire; clinically meaningful HAQ change (BL-year 2) = HAQ change >0.22.

between the treatment arms. The total numbers of AEs reported as related to study therapy, were 69 in 34 TSU patients and 63 in 28 Slim patients. Biologicals were started in 14 Low-Risk patients (15.6%), more specifically in 8 Slim and 6 TSU patients during the CareRA trial. At the year 2 visit 62.5% of Slim patients were on MTX monotherapy and 12.5% on a combination of csDMARDs. In the TSU group 58.5% was taking MTX as only DMARD, and 19.5% took a combination of csDMARDs. Out of all Low-Risk patients 11.0% (8/73) was taking oral GC at the year 2 visit, 5 patients in the TSU group and 3 patients in Slim group, all at a low dosages.

**Conclusions:** In eRA patients lacking classical markers of poor prognosis COBRA Slim showed persistently high remission rates and good disease control 2 years after initiating therapy in a treat to target setting. COBRA slim seems to be slightly more effective than TSU according to the year 2 Boolean remission criteria and the 2 year functionality AUC but the CareRA study was not powered for this analysis.

OP0035

**UPADACITINIB AS MONOTHERAPY: A PHASE 3 RANDOMISED CONTROLLED DOUBLE-BLIND STUDY IN PATIENTS WITH ACTIVE RHEUMATOID ARTHRITIS AND INADEQUATE RESPONSE TO METHOTREXATE**

J. Smolen<sup>1</sup>, S. Cohen<sup>2</sup>, P. Emery<sup>3</sup>, W. Rigby<sup>4</sup>, Y. Tanaka<sup>5</sup>, Y. Zhang<sup>6</sup>, A. Friedman<sup>6</sup>, A. Othman<sup>6</sup>, H. Camp<sup>6</sup>, A. Pangan<sup>6</sup>. <sup>1</sup>Med Univ of Vienna, Vienna, Austria; <sup>2</sup>Metrex Clin Res Ctr, Dallas, USA; <sup>3</sup>Leeds Inst of Rheum and Musculoskeletal Med, Leeds NIHR BRC, UK, Leeds, UK; <sup>4</sup>Dartmouth Coll, Hanover, USA; <sup>5</sup>Univ of Occ and Env Health, Kitakyushu, Japan; <sup>6</sup>AbbVie, N Chicago, USA

**Background:** Upadacitinib (UPA), an oral JAK inhibitor, showed efficacy in rheumatoid arthritis (RA) patients (pts) with an inadequate response to csDMARDs or bDMARDs on continuing stable csDMARD(s).<sup>1,2</sup>

**Objectives:** Safety and efficacy of switching to UPA 15 mg or 30 mg monotherapy vs continuing methotrexate (MTX) as a blinded study drug was evaluated in pts with inadequate response to MTX (MTX-IR).

**Methods:** Pts with active RA (TJC ≥6, SJC ≥6, hsCRP ≥3 mg/L) on stable MTX were enrolled and randomised 1:1:1 in a double-blind manner to once-daily (QD) UPA 15 mg or 30 mg monotherapy or to continue MTX (cMTX) at their prior stable dose. At BL, all pts discontinued prior MTX without washout and received PBO (for pts on UPA) or MTX at prior dose (cMTX) as blinded study drug. The primary endpoints at Week (Wk) 14 were the proportion of pts achieving ACR20, and the proportion achieving DAS28-CRP ≤3.2 (NRI).

**Results:** 648 pts were randomised, all received study drug; 598 (92.3%) completed 14 wks. BL demographics and disease characteristics were generally similar across arms. Both primary endpoints were met (p<0.001); at Wk 14, a significantly greater proportion of pts receiving UPA monotherapy (15 mg and 30 mg) vs cMTX achieved ACR20 (67.7% and 71.2% vs 41.2%), and DAS28-CRP ≤3.2 (44.7% and 53.0% vs 19.4%) (table 1). All key secondary endpoints also showed UPA 15 and UPA 30 monotherapy to be superior to cMTX, including ACR50 (41.9% and 52.1% vs 15.3%), ACR70 (22.6% and 33.0% vs 2.8%), DAS28-CRP <2.6 (28.1% and 40.5% vs 8.3%), ΔHAQ-DI (-0.65 and -0.73 vs -0.32). ΔSF-36 PCS and ΔMorning Stiffness data are also shown (table 1). The proportion of pts achieving CDAI ≤10 was significantly greater with UPA 15 and 30 vs cMTX (34.6% and 46.5% vs 24.5%).

Adverse events (AEs) were reported at similar frequencies across arms; serious AEs were numerically higher in UPA 15 but similar between cMTX and UPA 30 (table 1). Numerically more infections were reported in cMTX and UPA 30 vs UPA 15. One serious infection each was reported in UPA 15 and cMTX, and none in UPA 30. Herpes zoster was more frequent in UPA 30 vs UPA 15 or cMTX. 3 malignancies (1 in cMTX and 2 in UPA 15) and 3 adjudicated MACE (1 in UPA 15 and 2 in UPA 30) were reported. One adjudicated pulmonary embolism was reported (UPA 15) in a pt with known risk factors (BMI 36; on oestrogen therapy). One death (haemorrhagic stroke due to ruptured aneurysm) was reported in UPA 15. No TB, renal dysfunction or GI perforation was reported. Rates and types of laboratory abnormalities were consistent with prior UPA RA studies to date.

Abstract OP0035 – Table 1

EFFICACY ENDPOINTS AT WEEK 14 <sup>a</sup>			
	cMTX, N=216	UPA 15, N=217	UPA 30, N=215

Death	0	1 (0.5)	0

cMTX, Continuing MTX as a blinded study drug; LSM, least square means; Δ, Change from baseline; CPK, creatine phosphokinase; NMSC, non-melanoma skin cancer; MACE, major adverse cardiovascular event (cardiovascular death, non-fatal MI, non-fatal stroke)

<sup>a</sup>Results for binary endpoints are based on NRI. Results for DAS28-CRP and HAQ-DI are based on Multiple Imputation. Results for other endpoints are based on Mixed Effect Model Repeat Measurement. \*, \*\*, \*\*\* p < 0.05, < 0.01 and 0.001 respectively

<sup>†</sup>Serious infection events: cMTX: uricospirit; UPA 15: abscess limb

<sup>‡</sup>Opportunistic infection events: cMTX: fungal oesophagitis; UPA 30: 2 oral candidiasis, 1 oropharyngeal candidiasis

<sup>§</sup>Hepatic disorders: Except for 1 case of mild hepatic cyst, all due to liver enzyme elevation

<sup>¶</sup>Malignancies: cMTX: basal cell carcinoma; UPA 15: 1 non-Hodgkin's lymphoma, 1 breast cancer

<sup>||</sup>MACE (adjudicated): UPA 15: 1 hemorrhagic stroke due to ruptured aneurysm (fatal), investigator deemed as unrelated to study drug; UPA 30: 1 myocardial infarction, 1 stroke; investigators reported both events as unrelated to study drug

<sup>||</sup>VTE: Pulmonary embolism (BMI 35, estrogen hormone therapy); investigator deemed as unrelated to study drug

**Conclusions:** In this MTX-IR study population, switching to UPA as monotherapy at 15 mg and 30 mg QD showed significant improvements in RA signs and symptoms vs continuing MTX. Numerically higher responses were observed for UPA 30 mg vs 15 mg, particularly for more stringent efficacy criteria. Safety observations were similar to those in prior UPA studies.

OP0036

## A PHASE 3 RANDOMISED, PLACEBO-CONTROLLED, DOUBLE-BLIND STUDY OF UPADACITINIB (ABT-494), A SELECTIVE JAK-1 INHIBITOR, IN PATIENTS WITH ACTIVE RHEUMATOID ARTHRITIS WITH INADEQUATE RESPONSE TO CONVENTIONAL SYNTHETIC DMARDS

G. Burmester<sup>1</sup>, J. Kremer<sup>2</sup>, F. van den Bosch<sup>3</sup>, Y. Li<sup>4</sup>, Y. Zhou<sup>4</sup>, A. Othman<sup>4</sup>, A. Pangan<sup>4</sup>, H. Camp<sup>4</sup>, <sup>1</sup>Charité – Universitätsmedizin, Berlin, Germany; <sup>2</sup>Albany Medical College, Albany, USA; <sup>3</sup>Ghent University Hospital, Ghent, Belgium; <sup>4</sup>AbbVie Inc., North Chicago, USA

**Background:** Upadacitinib (UPA) is an oral, selective JAK-1 inhibitor in development for the treatment of patients (pts) with moderate to severe rheumatoid arthritis (RA) and other immune-mediated diseases.

**Methods:** This Phase 3 study in pts with inadequate response (IR) to csDMARDs included a double-blind placebo (PBO)-controlled period (Period 1, reported here), during which pts were randomised 1:1:1 to receive once-daily (QD) extended-release formulation of UPA at 15 mg or 30 mg, or PBO for 12 weeks (wks). The primary efficacy endpoints were the proportion of pts who achieved an ACR20 response and the proportion who achieved DAS28-CRP low disease activity (LDA, ≤3.2) at Wk 12, using non-responder imputation (NRI).

**Results:** Of 661 pts who were randomised, all received study drug, and 618 (93.5%) completed Period 1. At baseline, demographics and disease characteristics were similar across arms. The study met all primary and key secondary endpoints with p values < 0.001 for both doses. At Wk 12, significantly more pts receiving UPA 15 mg and 30 mg QD vs PBO achieved an ACR20 response (63.8% and 66.2% vs 35.7%, p < 0.001), and DAS28-CRP LDA (48.4% and 47.9% vs 17.2%, p < 0.001) (table 1). Onset of action was rapid with significantly more pts in both UPA arms achieving ACR20 at Wk 1 vs PBO. At Wk 12, significantly more pts met ACR50 and ACR70 in the UPA 15 mg (38% and 20.8%) and 30 mg QD arms (43.4% and 26.5%) vs PBO (14.9% and 5.9%). Significantly more patients receiving UPA 15 mg and 30 mg QD vs PBO achieved DAS28-CRP < 2.6 (30.8% and 28.3% vs 10%, p < 0.001) and CDAI-LDA (40.3% and 42% vs 19%, p < 0.001), and pts receiving UPA at both doses experienced significantly greater improvements in DAS28-CRP, HAQ-DI, morning stiffness and FACIT-F vs PBO (p < 0.001).

Adverse events (AEs) and serious AEs were numerically higher with UPA than PBO (table 1). The overall incidence of infection was higher for UPA 15 mg and 30 mg QD vs PBO, but few were serious infections. There were 4 cases of herpes zoster/Varicella Zoster Virus infection (1 on PBO). Asymptomatic CPK elevations were only reported for patients on UPA. Two malignancies and 3 adjudicated cardiovascular events were reported. No PE/DVT were reported. There were no deaths, cases of TB or GI perforations. Types and frequency of laboratory abnormalities were similar to findings in Phase 2 studies with UPA.

Δ, Change from baseline; \*\*\*p < 0.001

<sup>a</sup>Results for binary endpoints are based on NRI analysis. Results for continuous endpoints based on Multiple Imputation or Mixed Effect Model Repeat Measurement analysis

<sup>†</sup>Serious infection events: PBO: pneumonia; UPA 15 mg: enterococcal infection; UPA 30 mg: 1 bacterial zoster; 1 viral upper respiratory tract infection; 1 Mycoplasma pneumoniae infection

<sup>‡</sup>Opportunistic infection events: PBO: oral candidiasis; UPA 30 mg: 2 oral candidiasis; 1 varicella zoster pneumonia

<sup>§</sup>1 patient on UPA 30 mg was exposed to chicken pox and had primary varicella infection

<sup>¶</sup>All asymptomatic

<sup>||</sup>Malignancies: UPA 30 mg: 1 case of basal cell carcinoma in patient with history of skin cancer; 1 case of chronic lymphocytic leukemia/lymphoma. Both were deemed unrelated to study drug by the investigator

<sup>||</sup>Cardiovascular events (adjudicated): MACE: ischemic stroke in patient with history of hypertension (upadacitinib 30 mg); Other adjudicated CEs: 1 congestive cardiac failure (upadacitinib 15 mg); 1 stroke (placebo in patient with prior history of angina, coronary artery disease and transient ischemic attack (upadacitinib 15 mg))

Abbreviations: CPK, creatine phosphokinase; NMSC, non-melanoma skin cancer

**Conclusions:** The efficacy of UPA at 15 mg and 30 mg QD vs PBO was demonstrated in this csDMARD-IR study population. The most notable responses were observed in the more stringent endpoints of LDA (by either DAS28-CRP or CDAI)

and ACR70. The safety and tolerability profile was consistent with observations in the Phase 2 studies with UPA.

OP0037

#### EFFICACY OF TOFACITINIB AFTER TEMPORARY DISCONTINUATION IN PATIENTS WITH RHEUMATOID ARTHRITIS: ANALYSIS OF DATA FROM OPEN-LABEL LONG-TERM EXTENSION STUDIES

J. Kaine<sup>1</sup>, J. Tesser<sup>2</sup>, R. DeMasi<sup>3</sup>, L. Takiya<sup>3</sup>, L. Wang<sup>4</sup>, M. Snyder<sup>3</sup>, H. Fan<sup>4</sup>, V. Bandi<sup>5</sup>, J. Wollenhaupt<sup>6</sup>. <sup>1</sup>Sarasota Arthritis Research Center, Sarasota, FL; <sup>2</sup>Arizona Arthritis and Rheumatology Associates, Glendale, AZ; <sup>3</sup>Pfizer Inc, Collegeville, PA; <sup>4</sup>Pfizer Inc, Groton, CT; <sup>5</sup>Eliassen Group Inc, New London, CT, USA; <sup>6</sup>Schön-Klinik Hamburg-Eilbek Teaching Hospital of the University of Hamburg, Hamburg, Germany

**Background:** Tofacitinib is an oral Janus kinase inhibitor for the treatment of rheumatoid arthritis (RA). Given the chronic nature of RA, there may be situations when therapy is temporarily discontinued. It is important to understand loss of response during temporary discontinuation and the ability to regain disease control following treatment reinitiation. Re-establishment of tofacitinib efficacy following temporary discontinuation/reinitiation has been previously demonstrated in patients (pts) with RA participating in the vaccine sub-study of the long-term extension (LTE) study ORAL Sequel.<sup>1</sup>

**Objectives:** To further assess tofacitinib efficacy and safety after temporary discontinuation and reinitiation in pts with RA in LTE studies.

**Methods:** Data were pooled from two open-label LTE studies (NCT00413699 [database lock: March 2017] and NCT00661661) of pts with RA who had completed qualifying Phase 1/2/3 index studies. Pts received tofacitinib 5 or 10 mg twice daily as monotherapy or with conventional synthetic disease-modifying antirheumatic drugs. Pts who received continuous tofacitinib for  $\geq 4$  months, temporarily discontinued tofacitinib for 14–30 days and then resumed treatment were included in the analysis. Efficacy outcomes were analysed at the pre-interruption visit ( $\leq 90$  days before discontinuation) and at the post-interruption visit (within 14–42 days of resuming treatment); data from the interruption period were not analysed. Efficacy outcomes included: ACR20/50/70 response rates, mean tender and swollen joint counts, mean C-reactive protein levels and mean DAS28–4 (ESR), CDAI, HAQ-DI, Patient Global Assessment of arthritis, Pain and Physician Global Assessment of arthritis scores. Safety was analysed from Day 1 of temporary discontinuation to the post-interruption visit and included adverse events (AEs), serious AEs (SAEs) and discontinuations due to AEs that occurred within the time range.

**Results:** 261 pts met the criteria for temporary discontinuation. Median (range) duration of temporary discontinuation was 19<sup>14–30</sup> days. Pt demographics are shown in table 1. Efficacy outcomes were generally similar at pre- and post-interruption visits (table 2). From Day 1 of discontinuation to the post-interruption visit, AEs, SAEs and discontinuations due to AEs occurred in 142 (54.4%), 29 (11.1%) and 4 (1.5%) pts, respectively.

Abstract OP0037 – Table 1 Patients demographics and baseline disease characteristics<sup>1</sup>

	All tofacitinib (N=261)
Age (years), mean (SD)	53.7 (11.3)

Pain-VAS, mean (SD)	58.8 (23.3)
PGA, mean (SD)	61.1 (16.9)
Background csDMARD use, n (%) <sup>b</sup>	181 (69.3)

<sup>a</sup>Baseline values were those of the index study if patients began LTE study treatment  $\leq 14$  days from the last tofacitinib dose in the index study. Otherwise, LTE baseline values were used; <sup>b</sup>At LTE baseline

BMI, body mass index; CDAI, Clinical Disease Activity Index; CRP, C-reactive protein; csDMARD, conventional synthetic disease-modifying antirheumatic drug; DAS28-4(ESR), Disease Activity Score in 28 joints, erythrocyte sedimentation rate; HAQ-DI, Health Assessment Questionnaire-Disability Index; LTE, long-term extension; PGA, Physician Global Assessment of arthritis; PtGA, Patient Global Assessment of arthritis; SD, standard deviation; SJC, swollen joint count; TJC, tender joint count; VAS, visual analogue scale

Abstract OP0037 – Table 2 Efficacy endpoints at the pre-interruption visit ( $\leq 90$  days before temporary discontinuation) and post-interruption visit (within 14–42 days of resuming treatment)

	All tofacitinib (N=261)	
	Pre-interruption visit	Post-interruption visit
ACR20, % (95% CI)	75.5 (69.8, 80.6)	74.3 (68.6, 79.5)
ACR50, % (95% CI)	54.4 (48.2, 60.6)	51.0 (44.7, 57.2)
ACR70, % (95% CI)	31.8 (26.2, 37.8)	31.4 (25.8, 37.4)
TJC, mean (95% CI)	6.1 (4.9, 7.2)	8.0 (6.4, 9.6)
SJC, mean (95% CI)	3.4 (2.8, 4.1)	5.0 (3.9, 6.2)
CRP (mg/L), mean (95% CI)	0.48 (0.38, 0.58)	0.46 (0.37, 0.56)
DAS28-4(ESR), mean (95% CI)	3.6 (3.4, 3.7)	3.9 (3.7, 4.0)
CDAI, mean (95% CI)	10.0 (8.9, 11.1)	11.8 (10.3, 13.2)
HAQ-DI, mean (95% CI)	0.94 (0.85, 1.03)	0.98 (0.88, 1.07)
PtGA, mean (95% CI)	28.4 (25.8, 31.0)	29.3 (26.6, 32.1)
Pain (VAS), mean (95% CI)	28.1 (25.4, 30.8)	28.8 (26.0, 31.7)
PGA, mean (95% CI)	17.1 (15.3, 18.9)	18.0 (16.0, 19.9)

Median (range) time from the pre-interruption visit to Day 1 of temporary discontinuation was 43 (0–90) days and the median (range) time from resuming treatment to the post-interruption visit was 28 (14–42) days

N is the total number of patients in the analysis; the number of patients evaluable for each endpoint may be fewer than N

ACR, American College of Rheumatology; CDAI, Clinical Disease Activity Index; CI, confidence interval; CRP, C-reactive protein; DAS28-4(ESR), Disease Activity Score in 28 joints, erythrocyte sedimentation rate; HAQ-DI, Health Assessment Questionnaire-Disability Index; PGA, Physician Global Assessment of arthritis; PtGA, Patient Global Assessment of arthritis; SJC, swollen joint count; TJC, tender joint count; VAS, visual analogue scale

**Conclusions:** In pts with RA who temporarily discontinued tofacitinib, similar efficacy responses were observed at pre- and post-interruption visits, suggesting that there is no loss of efficacy after temporary withdrawal and reinitiation of tofacitinib. The safety profile was consistent with previous tofacitinib reports in LTE studies over 9 years.<sup>2</sup>

LB0001

### DUAL NEUTRALISATION OF IL-17A AND IL-17F WITH BIMEKIZUMAB IN PATIENTS WITH ACTIVE ANKYLOSING SPONDYLITIS (AS): 12-WEEK RESULTS FROM A PHASE 2B, RANDOMISED, DOUBLE-BLIND, PLACEBO-CONTROLLED, DOSE-RANGING STUDY

D. van der Heijde<sup>1</sup>, L.S. Gensler<sup>2</sup>, A. Deodhar<sup>3</sup>, X. Baraliakos<sup>4</sup>, D. Poddubnyy<sup>5</sup>, M. K. Farmer<sup>6</sup>, D. Baeten<sup>7</sup>, T. Kumke<sup>8</sup>, M. Oortgiesen<sup>6</sup>, M. Dougados<sup>9</sup>. <sup>1</sup>Leiden University Medical Center, Leiden, Netherlands; <sup>2</sup>University of California, San Francisco; <sup>3</sup>Oregon Health and Science University, Portland, USA; <sup>4</sup>Ruhr-University Bochum, Herne; <sup>5</sup>Charité – Universitätsmedizin Berlin, German Rheumatism Research Centre, Berlin, Germany; <sup>6</sup>UCB Pharma, Raleigh, USA; <sup>7</sup>UCB Pharma, Brussels, Belgium; <sup>8</sup>UCB Pharma, Monheim, Germany; <sup>9</sup>Cochin Hospital, Paris, France

**Background:** Dual neutralisation of IL-17F, in addition to IL-17A, reduces inflammation<sup>1</sup> to a greater extent than inhibition of IL-17A alone in disease-relevant cell models. Bimekizumab, a monoclonal antibody that potently and selectively neutralises both IL-17A and IL-17F, provided rapid and substantial clinical improvements in studies evaluating patients with psoriasis<sup>2</sup> and psoriatic arthritis.<sup>1</sup>

**Objectives:** Assess 12 week efficacy and safety of bimekizumab in patients with active AS; the primary objective was to assess the ASAS40 dose-response relationship at Week 12.

**Abstract LB0001** – Figure 1 A) non-responder imputation, full analysis set; B) observed data, full analysis set

**Methods:** In this ongoing 48 week study (NCT02963506: double blind to Week 12 then dose blind to Week 48), 303 patients with active (BASDAI  $\geq 4$ ; spinal pain  $\geq 4$  [0–10 numerical rating scale]) AS, fulfilling the modified New York criteria, were randomised 1:1:1:1:1 to receive subcutaneous bimekizumab 16 mg, 64 mg, 160 mg, 320 mg or placebo Q4W, for 12 weeks. Prior exposure to 1 anti-TNF therapy was permitted. The primary endpoint was ASAS40 response rate at Week 12. Secondary endpoints (ASAS20 and ASAS5/6 response rate and change from baseline in BASDAI and ASDAS-CRP at Week 12) and safety were also assessed.

**Results:** Overall, 297 (98.0%) patients completed the 12 week double-blind period. The majority of patients were male (84.5%) with a mean (SD) age of 42.2 (11.8) and median (min, max) symptom duration of 13.3 (0.3, 48.2) years; baseline characteristics were similar among treatment groups (median [min, max] hs-CRP: 12.1 [0.3, 130.6] mg/L; mean [SD] BASDAI: 6.5 [1.4]; ASDAS-CRP: 3.9 [0.8]; prior anti-TNF exposure: 11.2%). At Week 12, there was a significant ( $p < 0.001$ ) dose-response for ASAS40. A greater percentage of bimekizumab-treated patients achieved ASAS40 (primary endpoint) than placebo (Figure:  $p < 0.05$ , all doses). More patients receiving bimekizumab than placebo also achieved ASAS20 (figure 1;  $p < 0.05$ , 64 mg–320 mg doses) and ASAS5/6 (16mg: 29.5%; 64 mg: 39.3%; 160 mg: 50.0%; 320 mg: 52.5%; placebo: 5.0%;  $p < 0.05$ , all comparisons). Compared with placebo, greater reductions from baseline were achieved with bimekizumab for both BASDAI (figure 1) and ASDAS-CRP (LS mean [SE] change from baseline: 16 mg:  $-1.0$  [0.15]; 64 mg:  $-1.6$  [0.15]; 160 mg:  $-1.4$  [0.16]; 320 mg:  $-1.5$  [0.16]; placebo:  $-0.4$  [0.16];  $p < 0.001$ , all doses). The overall incidence of TEAEs was 86/243 (35.4%) for bimekizumab-treated patients versus 22/60 (36.7%) for placebo. No unexpected safety risks were observed; the most frequently reported events were nasopharyngitis and headache.

**Conclusions:** The primary and key secondary objectives were achieved; dual neutralisation of IL-17A and IL-17F with bimekizumab provided clinically meaningful improvements in disease outcome measures. No new safety signals were observed versus previous studies.<sup>1,2</sup>

### Doctor, how bad will my rheumatoid become? RA – prognosis, predictors and outcomes

OP0038

#### DOSE TAPERING AND DISCONTINUATION OF BIOLOGICAL THERAPY IN RHEUMATOID ARTHRITIS PATIENTS IN REMISSION IN ROUTINE CARE – 2-YEAR OUTCOMES AND IDENTIFICATION OF PREDICTORS

C.H. Brahe, S. Krabbe, M. Østergaard, L. Ørnbjerg, D. Glinatsi, H. Røgind, H. S. Jensen, A. Hansen, J. Nørregaard, S. Jacobsen, L. Terslev, T.K. Huynh, D. V. Jensen, N. Manilo, K. Asmussen, P.B. Frandsen, M. Boesen, Z. Rastiomadabadi, L.M. Carlsen, J. Møller, N.S. Krogh, M.L. Hetland. *Departments of Rheumatology and Radiology, Hospitals at Bispebjerg-Frederiksberg, Gentofte, Hillerød, Herlev and Rigshospitalet, Capital Region, Denmark*

**Background:** A cohort of routine care rheumatoid arthritis (RA) patients in sustained remission had biological disease-modifying anti-rheumatic drugs (bDMARDs) tapered according to a treatment guideline. Little is known about predictors of successful tapering and discontinuation of bDMARDs.

**Objectives:** We studied: 1) the proportion of patients whose bDMARD could be successfully tapered or discontinued; 2) unwanted consequences of tapering/discontinuation; 3) potential baseline predictors of successful tapering and discontinuation.

**Abstract OP0038** – Figure 1 Observed association between potential predictors and the proportion patients with successful tapering (i.e. less than full dose) versus full dose at year 2

**Methods:** One-hundred-and-forty-three patients with sustained disease activity score (DAS28-CRP) ≤ 2.6 and no radiographic progression the previous year were included. bDMARD was reduced to 2/3 of standard dose at baseline, 1/2 after 16 weeks, and discontinued after 32 weeks. Patients who flared (defined as either DAS28-CRP > 2.6 and DAS28-CRP ≥ 1.2 from baseline, or erosive progression on X-ray and/or MRI) stopped tapering and were escalated to the previous dose level.

**Results:** One-hundred-and-forty-one patients completed 2 year follow-up. At 2 years, 87 patients (62%) had successfully tapered bDMARDs, with 26 (18%) receiving 2/3 of standard dose, 39 (28%) 1/2 dose and 22 (16%) having discontinued; 54 patients (38%) were receiving full dose. DAS28-CRP<sub>0-2yrs</sub> was 0.1 ((-0.2)–0.4) (median(interquartile range)) and mean Total-Sharp-Score<sub>0-2yrs</sub> was 0.01 (1.15) (mean(SD)). Radiographic progression was observed in 9 patients (7%). Successful tapering was independently predicted by: ≤ 1 previous bDMARD, male gender, low baseline MRI combined inflammation score and low MRI combined damage score. Negative IgM-rheumatoid factor predicted successful discontinuation. The association between potential predictors and the proportion of patients with successful tapering of bDMARDs is shown in figure 1.

**Conclusions:** By implementing a clinical guideline, 62% of RA patients in sustained remission in routine care were successfully tapered, including 16% successfully discontinued at 2 years. Radiographic progression was rare. IgM-RF was an independent predictor for successful discontinuation of bDMARDs. Maximum one bDMARDs, male gender, and low baseline MRI combined inflammation and MRI combined damage scores were independent predictors for successful tapering.

**OP0039 HIGH DISEASE ACTIVITY AND DISABILITY AT ONE YEAR IN TWO CLUSTERS OF PATIENTS WITH RHEUMATOID ARTHRITIS DEFINING THEMSELVES AS IN AN ACCEPTABLE STATE AT TREATMENT INITIATION**

J. Gwinnutt<sup>1</sup>, K. Hyrich<sup>1,2</sup>, M. Lunt<sup>1</sup>, A. Barton<sup>2,3</sup>, S. Verstappen<sup>1,2</sup>, on behalf of RAMS coinvestigators. <sup>1</sup>Arthritis Research UK Centre for Epidemiology, The University of Manchester; <sup>2</sup>NIHR Manchester Biomedical Research Centre, Manchester University Hospitals NHS Foundation Trust; <sup>3</sup>Arthritis Research UK Centre for Genetics and Genomics, The University of Manchester, Manchester, UK

**Background:** A significant proportion of patients with rheumatoid arthritis (RA) define themselves as in a ‘patient acceptable symptom state’ (PASS) at methotrexate (MTX) initiation. Within this heterogeneous group, there are likely to be clinical phenotypes associated with poor outcome.

**Objectives:** To identify distinct phenotypes of symptoms within patients in PASS at baseline and to compare disability and disease activity scores of these patients over one year.

**Methods:** The Rheumatoid Arthritis Medication Study (RAMS) is a one year prospective cohort of patients with RA starting MTX. At baseline, patients reported demographics, completed the Health Assessment Questionnaire (HAQ), pain/fatigue visual analogue scales (VAS) and the Hospital Anxiety and Depression Scale (HADS). A research nurse conducted a 28 swollen and tender joint count and the Disease Activity Score (DAS28) was calculated. DAS28 and HAQ were assessed again at 12 months. Patients also answered the dichotomous question ‘Is your current condition satisfactory, when you take your general functioning and your current pain into consideration?’ Only those answering yes at baseline were

included in the analysis. Phenotypes were identified using K-medians cluster analysis based on baseline swollen/tender joint count, HAQ, VAS-pain, VAS-fatigue and HADS-depression. The ‘elbow method’ was used to select the number of clusters. Quantile regression was used to compare the 12 month HAQ and DAS28 scores between clusters, controlling for age and gender.

**Results:** Five clusters were identified within the 300 patients in PASS at baseline (mean (sd) age=61.4 (12.1) years, 186 (62%) women) (table 1). Compared to Cluster 1, patients in higher clusters had worse HAQ (median difference (95% CI) vs Cluster 1: Cluster 2=0.36 (0.11, 0.61); Cluster 3=0.19 (-0.11, 0.49); Cluster 4=0.74 (0.47, 1.00); Cluster 5=0.89 (0.54, 1.24)) and worse DAS28 at 12 months (median difference (95% CI) vs Cluster 1: Cluster 2=0.43 (-0.06, 0.91); Cluster 3=0.40 (-0.19, 0.99); Cluster 4=0.89 (0.36, 1.41); Cluster 5=1.28 (0.59, 1.96).

**Abstract OP0039** – Table 1 Baseline characteristics of the five clusters

Cluster	N	Baseline scores, Medians						Clinical characteristics matrix §					
		SJC28	TJC28	HAQ	Pain	Fatigue	Dep	SJC28	TJC28	HAQ	Pain	Fatigue	Dep
1	50	2	1	0	8	8	0	M	L	L	L	L	L
2	109	2	3	0.5	25	25	4	M	M	M	M	M	M
3	44	13.5	10.5	0.5	20	12.5	2	H	H	M	M	M	M
4	71	4	5	1.13	50	64	7	M	M	H	H	M	H
5	26	12	23	1.25	56.5	66	5	H	H	H	H	H	M

§ Dep = depression, measured using the Hospital Anxiety and Depression Scale; HAQ = Health Assessment Questionnaire; N = number; SJC28 = swollen joint count (28); TJC28 = tender joint count (28); L = Low (L), Medium (M) and High (H) defined based on median and interquartile of each characteristic in the total cohort of patients in a PASS; SJC28: L=0-1, M=2-3, H=4-10; TJC28: L=0-1, M=2-7, H=8-26; HAQ: L=0.00-0.19, M=0.20-1.12, H=1.13-3.00; pain: L=0-14, M=15-46, H=47-100; Fatigue: L=0-10, M=11-55, H=56-100; depression: L=0-1, M=2-6, H=7-24

**Conclusions:** Despite all patients reporting they were satisfied with their condition at baseline, five distinct clinical phenotypes were identified. These clusters can identify ‘reticent’ patients who are likely to have poor outcomes in the future.

**OP0040 SYNOVIAL CELL INFILTRATION IN ACPA-VE PATIENTS DISPLAYS SIMILAR SIGNATURES TO OTHER SERONEGATIVE INFLAMMATORY ARTHRITIS. RESULTS FROM THE PATHOBIOLOGY OF EARLY ARTHRITIS COHORT (PEAC)**

G. Liso-Ribera<sup>1</sup>, F. Humby<sup>1</sup>, A. Nerviani<sup>1</sup>, M.A. Boutet<sup>1</sup>, S. Kelly<sup>2</sup>, M. Bombardieri<sup>1</sup>, M. Lewis<sup>1</sup>, R. Hands<sup>1</sup>, V. Rocher<sup>1</sup>, F. Bene<sup>1</sup>, C. Buckley<sup>3</sup>, P.C. Taylor<sup>4</sup>, I. B. McInnes<sup>5</sup>, C. Pitzalis<sup>6</sup>. <sup>1</sup>Experimental Medicine and Rheumatology, William Harvey Research Institute, Queen Mary University London; <sup>2</sup>Rheumatology Department, Barts Health NHS Trust, London; <sup>3</sup>Division of Immunity and Infection, University of Birmingham, Birmingham; <sup>4</sup>Kennedy Institute of Rheumatology, University of Oxford Botnar Research Centre, Oxford; <sup>5</sup>Glasgow Biomedical Research Centre, University of Glasgow, Glasgow; <sup>6</sup>Experimental Medicine and Rheumatology, William Harvey Research Institute, Queen Mary University London, London, UK

**Background:** There is increasing evidence to suggest that ACPA +ve and ACPA-ve RA are distinct diseases. Current data demonstrates overlap in classification criteria between ACPA-ve RA and other sero negative inflammatory arthritides such as PsA. Associated with this is a variable prognosis and response to treatment for patients with ACPA-ve RA. Biomarkers capable of refining diagnosis and improving on current classification criteria early in the disease course for patients with ACPA-ve RA are thus urgently needed. Data examining the synovial pathophysiological relationship between PsA and ACPA ±RA is currently limited although has the potential to identify disease specific synovial cellular and molecular signatures.

**Objectives:** Therefore, the aim of this study is to examine in a cohort of therapy naïve, early inflammatory arthritis patients, whether ACPA-ve RA can be defined at disease initiation according to synovial pathobiological signatures.

**Methods:** A total of 186 consecutive DMARD naïve inflammatory arthritis patients (disease duration <1 year) recruited as part of the multicentre PEAC study at Barts Health NHS Trust were evaluated. All patients underwent a baseline synovial biopsy of a clinically active joint along with collection of inflammatory markers (CRP). Following H and E staining, sections underwent immunohistochemical staining and semi-quantitative scoring (0–4) to determine the degree of CD20 +Bcells, CD3 +T cells, CD68 +lining (l) and sublining (sl) macrophage and CD138 +plasma cell infiltration. Sections were categorised into three phenotypes: (i) Fibroid(F):(CD68 SL <2 and or CD3, CD20, CD138 <1), (ii) Myeloid(M):(CD68SL >2, CD20 <1 and or CD3 >1) and (iii) Lymphoid(L):(grade 2–3 CD20 +aggregates, CD20 >2).

**Results:** 90/186 patients were classified as ACPA+ve RA, 55/186 as ACPA-ve RA and 41/186 as PsA. 80% of synovial samples were collected from small joints (wrist, MCP, PIP). All 186 samples were suitable for analysis. Results confirmed that C-reactive protein (CRP) as inflammatory marker does not differentiate between subgroups (p 0.41). Significantly higher degree of immune cell infiltration was seen between ACPA+ve vs ACPA-ve and ACPA+ve vs PsA but not between ACPA-ve and PsA (figure 1). When grouping patient between clinical subgroups

(ACPA+ve vs ACPA-ve vs PsA) and pathotypes (fibroid, myeloid and lymphoid) (table1) we demonstrated a significantly higher prevalence of a lymphoid pathotype in ACPA+ve RA vs ACPA-ve or PsA.

	RA acpa + N90 9ungraded	RA acpa- N55 12ungraded	PsA N41 0ungraded	P value fisher test	P value acpa+vs acpa-	P value acpa+vs PsA	P value acpa- vs PsA
F	15 (16%)	17 (31%)	15 (36%)	0.01*	0.03*	0.005*	0.41
M	25 (28%)	14 (25%)	11 (27%)				
L	41 (45%)	12 (22%)	10 (24%)				

**Conclusions:** Our results suggest that the synovial cell infiltrate (B cells, T cells, macrophages and plasma cells) in ACPA-ve RA is significantly different from ACPA +ve patients. They also suggest shared pathophysiological mechanisms between PsA and ACPA-ve RA and support a role for future refinement of diagnosis of ACPA-ve RA according to synovial pathobiology.

OP0041

#### DOES TREATMENT STRATEGY INFLUENCE THE ABILITY TO ACHIEVE AND SUSTAIN DMARD-FREE REMISSION IN RA?; RESULTS OF A LONGITUDINAL STUDY COMPARING AN INTENSIVE DAS-STEERED TREATMENT STRATEGY WITH TREAT-TO-TARGET IN ROUTINE CARE

L.E. Burgers<sup>1</sup>, J.A. van der Pol<sup>2</sup>, T.W.J. Huizinga<sup>1</sup>, C.F. Allaart<sup>1</sup>, A.H.M. van der Helm-van Mil<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Leiden University Medical Centre, Leiden, Netherlands

**Background:** Disease-modifying anti-rheumatic drug (DMARD)-free remission is an achievable outcome in rheumatoid arthritis (RA). The influence of treatment strategy on the ability to achieve and sustain this outcome is unclear. Therefore, we compared the prevalence and sustenance of DMARD-free remission in RA-patients treated in a trial with intensive DAS-steered care aimed at DMARD-free remission versus RA-patients treated to target in routine care.

**Methods:** 279 consecutive RA-patients (2010-criteria), diagnosed in the Leiden University Medical Centre between March 2007-September 2010, were studied. Of these, 155 participated in a DAS <1.6 steered trial aimed at DMARD-free remission (IMPROVED-study). These patients were initially treated with high-dose prednisone (60 mg/day) and methotrexate. Medication was intensified in case of a DAS ≥1.6 and tapered in case of a DAS <1.6. The other 124 RA-patients were treated according to routine care, consisting of initial methotrexate and subsequent DAS <2.4 steered treatment. The median follow-up was 7.8 years. Medical records were studied on achieving DMARD-free remission, defined as the absence of synovitis for ≥1 year after DMARD-cessation, and 'late flares', defined as recurrence of clinical synovitis ≥1 year after DMARD-cessation. Sustained DMARD-free remission was defined as the sustained absence of clinical synovitis after DMARD-cessation for ≥1 year and the total follow-up duration; i.e. patients with a late flare were not in this group. Percentages of remission and late flares were compared between the two treatment strategies, in all patients and after stratification by ACPA.

**Results:** Patients receiving intensive treatment were more often ACPA-positive (59% vs 40%). DMARD-free remission was achieved by 35% of patients receiving intensive treatment and by 29% of patients receiving routine care (HR 1.2, 95% CI: 0.8 to 1.8). Within the ACPA-positive and ACPA-negative strata patient characteristics were similar, except for a younger age in patients receiving intensive treatment. Within ACPA-positive patients, DMARD-free remission was achieved more often in the intensive treatment group than in the routine care group (25% vs 6%, HR 4.9, 95% CI: 1.4 to 17, corrected for age). In ACPA-negative patients no differences were observed (49% vs 44%, HR 1.1, 95% CI: 0.6 to

1.8, corrected for age). A late flare occurred in 20% of patients receiving intensive treatment and in 8% of patients receiving routine care (HR 2.3, 95% CI: 0.6 to 8.3). After excluding late flares from the remission group, the prevalence of DMARD-free sustained remission was not different for both treatment strategies in the total group (28% vs 27%, HR 1.0, 95% CI: 0.6 to 1.5). Also in the ACPA-positive group no significant effect remained (17% vs 6%, HR 3.1, 95% CI: 0.9 to 11, corrected for age).

**Conclusions:** An intensive treatment strategy was not associated with a higher prevalence of DMARD-free sustained remission compared to up-to-date routine treatment. Within ACPA-positive RA, intensive treatment resulted in more remission but also in more late flares. Together these data do not provide evidence to prioritise the studied intensive treatment strategy above current routine care.

OP0042

#### IN ACPA POSITIVE AT-RISK INDIVIDUALS, WHICH MRI AND US FINDINGS BEST PREDICT DEVELOPMENT OF CLINICAL SYNOVITIS?

L. Hunt, J. Nam, E.M. Hensor, K. Mankia, E. Rowbotham, A.J. Grainger, P. Emery. Leeds Institute of Rheumatic and Musculoskeletal Medicine and NIHR Leeds Biomedical Research Centre, LHTT, Leeds, UK

**Background:** ACPA +individuals with non-specific MSK symptoms are at risk of inflammatory arthritis (IA) and may benefit from early intervention. Clinical, serological and US markers have previously been assessed to determine risk of progression.<sup>1</sup>

**Objectives:** Evaluate the value of MR and US imaging in characterising and quantifying risk in a large ACPA +cohort.

**Methods:** Eligible ACPA +individuals without clinical synovitis had gadolinium enhanced 3.0 T MRI of the dominant hand and wrist. Images were scored by 2 radiologists for synovitis, bone marrow oedema (BME), erosions and tenosynovitis (TSV) according to OMERACT RAMRIS. Joint counts for each abnormality at each joint were corrected for age using a healthy controls reference range.<sup>2</sup> US of the same regions were scored using OMERACT definitions. Maximum MRI and US abnormality scores observed per patient across all joints scored were dichotomised <2, ≥2. Potential associations between baseline US (greyscale (GS) and powerDoppler (PD)) and MRI findings and i) progression to IA and ii) development of clinical synovitis within a joint were identified using Cox and penalised regression.

**Results:** Imaging of 98 individuals (mean age 47, 69% female) was available. 30% (29/98) progressed to IA. Median time to progression was 31 weeks (IQR 24, 67). BME and erosions scores ≥2 were reported in 10%, preferential location to the carpal bones/wrist joints. Synovitis score ≥2 was present in 9%, preferential location at MCP5 and radial carpal/intercarpal joints. TSV was the most frequent reported abnormality with 22% scoring ≥2, 40% scoring 1. US GS and PD scores ≥2 were reported in 23% and 9% respectively. The unadjusted analysis HRs for all imaging abnormalities were high, indicating potential association with risk of progression. Controlling for variables, MRI TSV was associated with time to IA with an increased HR. US GS and PD were also independently associated with time to progression and confirmed on penalised regression, table 1. At the joint level MRI TSV, BME and US GS were associated with the risk of progression to clinical synovitis, HR=7.03 p<0.001, HR 4.22 p=0.076 and HR 8.04 p<0.001 respectively.

**Abstract OP0042 – Table 1.** Patient-level Cox regression proportional hazard modelling of associations between maximum observed score per patient for baseline MRI abnormalities and time to IA (n=95)

Abnormality	No IA% (n=66)	IA% (n=29)	Unadjusted HR (90% CI), P value	Adjusted HR (90% CI), P value	Penalised HR
Small joint tenderness	44(29)	55(16)	1.60 (0.87,2.97), p=0.207	1.20 (0.58,2.46), p=0.679	1
RF and/or ACPA>3ULN	83(55)	93(27)	2.14 (0.64,7.16), p=0.301	1.02 (0.27,3.80), p=0.981	1
EMS≥30 min	27(18)	45(13)	2.00 (1.08,3.71), p=0.064	1.52 (0.69,3.37), p=0.384	1
US PD≥2	2 (1)	28(8)	7.21 (3.62,14.36), p<0.001	5.09 (1.93,13.44), p=0.006	4.37
US GS≥2	11(7)	52(15)	4.97 (2.69,9.19), p<0.001	2.69 (1.14,6.34), p=0.059	2.17
MRI erosion≥2	6 (4)	17(5)	2.15 (0.96,4.82), p=0.120	0.59 (0.20,1.76), p=0.431	1
MRI BME≥2	8 (5)	17(5)	2.30 (1.01,5.23), p=0.097	1.55 (0.56,4.27), p=0.482	1
MRI synovitis≥2	3 (2)	24(7)	4.22 (2.03,8.75), p=0.001	1.08 (0.46,2.54), p=0.881	1
MRI TSV≥2	14(9)	41(12)	3.51 (1.89,6.55), p=0.001	4.02 (1.91,8.44), p=0.002	3.16

**Conclusions:** ACPA +at risk individuals have features on imaging which assists prediction of development to IA. MRI TSV provides additional predictive ability over and above the clinical and US variables.

#### OP0043 PREDICTORS OF DRUG-FREE REMISSION IN RHEUMATOID ARTHRITIS: RESULTS FROM THE PROSPECTIVE BIOMARKERS OF REMISSION IN RHEUMATOID ARTHRITIS(BIORRA) STUDY

K.E. Baker, A. Skelton, D. Lendrem, B. Thompson, A.G. Pratt, J.D. Isaacs. *Musculoskeletal Research Group, Newcastle NIHR Biomedical Research Centre, Newcastle University and Newcastle upon Tyne Hospitals NHS Foundation Trust, Newcastle upon Tyne, UK*

**Background:** Remission is now a realistic and achievable target for many patients with rheumatoid arthritis (RA) using disease-modifying anti-rheumatic drugs (DMARDs) prescribed in modern treat-to-target regimens. However, DMARDs carry risks of potentially serious adverse effects, and require regular and expensive blood monitoring. Recent studies suggest that half of patients with RA in remission can discontinue DMARDs without a flare of arthritis activity, though this cannot currently be reliably predicted.

#### Abstract OP0043 – Table 1

Demographic	Value
Satisfied 2010 ACR/EULAR classification criteria: n (%)	44 (100%)
Age: median (IQR) [range]	66.5 (54.5–71.3) [35 – 82]
Female: n (%)	23 (52%)
Years since RA diagnosis: median (IQR) [range]	5.5 (3–11) [1–40]
Seropositive (rheumatoid factor and/or anti-citrullinated peptide antibody): n (%)	32 (73%)
Current methotrexate use: n (%)	38 (86%)
Baseline DAS28-CRP: median (IQR) [range]	1.07 (0.99–1.63) [0.96–2.34]
ACR/EULAR Boolean remission: n (%)	29 (66%)
Presence of joint erosion on baseline 7-joint ultrasound scan: n (%)	29 (70%)

**Objectives:** To identify baseline biomarkers that can predict sustained drug-free remission (DFR) versus arthritis flare following DMARD cessation.

**Methods:** Patients with established RA satisfying clinical (disease activity in 28 joints with CRP [DAS28-CRP]<2.4) and ultrasound (absence of power Doppler synovitis on a blinded 7-joint scan) remission criteria discontinued conventional synthetic DMARDs (methotrexate, sulfasalazine, and/or hydroxychloroquine) and

were monitored for 6 months. The primary outcome was time-to-flare, defined as DAS28-CRP $\geq$ 2.4. Baseline clinical and ultrasound parameters (synovial/tenosynovial greyscale and joint erosions), circulating levels of 26 cytokines/chemokines, and gene expression by peripheral CD4 +T cells (RNA sequencing) were assessed for their ability to predict time-to-flare and flare/DFR status by multivariate Cox regression and receiver-operating characteristic (ROC) analysis.

**Results:** 44 patients were eligible for DMARD cessation (table 1); 23 (52%) experienced an arthritis flare at a median (IQR) of 48 (31.5–86.5) days. A composite score incorporating five variables (three genes [currently subject to patent application], one cytokine [IL-27], and one clinical [ACR/EULAR Boolean remission]) differentiated future flare and DFR with an area under the ROC curve of 0.96 (95% CI: 0.92 to 1.00), sensitivity 0.91 (0.78–1.00) and specificity 0.95 (0.84–1.00) (figure 1).

**Conclusions:** Our study provides proof-of-concept evidence for the existence of biomarkers of DFR in RA. If validated in an external cohort, these biomarkers may hold promise in guiding DMARD withdrawal, with consequent minimisation of medication adverse events and healthcare costs.

**Acknowledgements:** KB was supported by the Wellcome Trust [102595/Z/13/A] and the NIHR Newcastle Biomedical Research Centre [BH136167/PD0045]. A patent application is currently in process regarding the gene expression biomarkers, the identify of which will subsequently be disclosed.

#### OP0044 AFTER HOW LONG OF DISEASE DURATION DOES THE INCREASED MORTALITY RISK APPEAR IN RECENT ONSET RHEUMATOID ARTHRITIS?

J. Widdifield<sup>1</sup>, S. Bernatsky<sup>2</sup>, A. Huang<sup>3</sup>, E.C. Sayre<sup>4</sup>, M. Paterson<sup>3</sup>, D. Laccaille<sup>4</sup>.

<sup>1</sup>Sunnybrook Research Institute, Toronto; <sup>2</sup>McGill University, Montreal; <sup>3</sup>Institute for Clinical Evaluative Sciences, Toronto; <sup>4</sup>Arthritis Research Canada, Vancouver, Canada

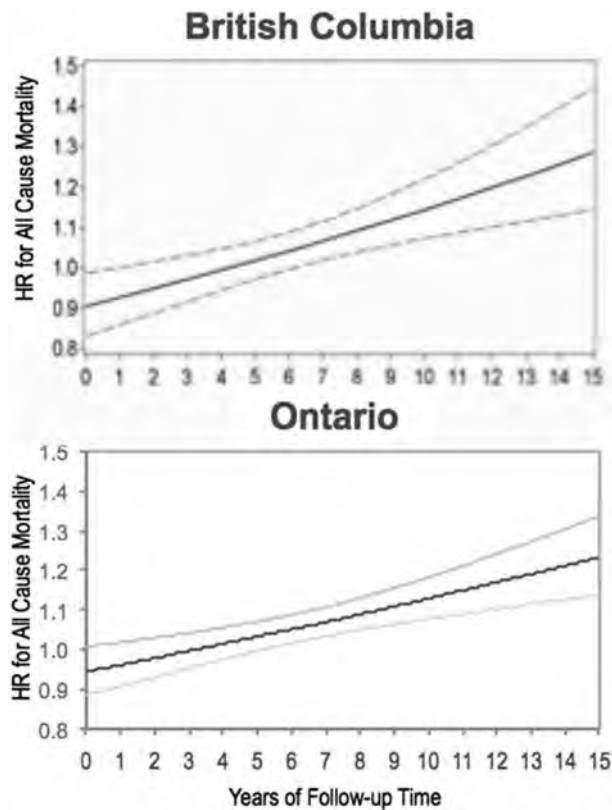

**Background:** For decades studies showed that rheumatoid arthritis (RA) patients died earlier than their general population counterparts. Some inception cohorts have failed to detect an increased mortality risk, possibly due to limited followup or to improvement in mortality risk in cohorts of more recent onset.

**Objectives:** To evaluate the risk of all-cause mortality in incident RA patients and to estimate when the increased risk appears amongst two Canadian inception cohorts with RA onset after 2000

**Methods:** Using a common protocol, we conducted 2 independent population-based cohort studies, using administrative health data, of incident RA patients in British Columbia (BC) and Ontario (ON), Canada over 2000 to 2015. In each province, we identified all RA patients (using validated criteria) diagnosed between 2000 and 2005 (to allow a minimum of 10 years of follow-up), and identified non-RA general population comparators for each RA patient, matched 1:2 on age, sex and index years. All patients were followed from index date until death (ascertained from vital statistics), out-migration, or end of study period (2015). Adjusted hazard ratios (HRs) and 95% CIs were estimated using multivariable Cox regression, controlling for baseline comorbidities, healthcare use, and socio-demographic factors. To estimate when the increased mortality risk appeared in incident RA patients, and to assess the proportional hazards assumption, we included an interaction between RA diagnosis and follow-up time in the multivariable model, to detect if and how the HR varied according to RA duration. Quadratic and logyear interactions were tested in the multivariable Cox models to assess linearity of the interaction.

**Results:** Among 13 834 incident RA patients in BC (27 668 matched comparators), 66% were female with a mean (SD) age of 58<sup>16</sup> years at cohort entry. Among 27 405 incident RA patients in ON (54 810 matched comparators), 70% were female with a mean (SD) age of 56<sup>16</sup> years. The prevalence of individual comorbidities at baseline was comparable across RA cohorts. During follow-up, 3139 (23%) of BC RA patients and 6270 (23%) ON RA patients died, with corresponding crude mortality rates of 2.3 deaths per 100 person-years in both provinces. Crude mortality rate ratios for BC and ON were 1.11 (95% CI: 1.07 to 1.16) and 1.27 (95% CI: 1.23 to 1.31), respectively. Multivariable analyses detected an increased risk of all-cause mortality in incident RA (relative to non-RA) patients by 6 years of follow-up, with a linear relationship suggesting further increase over time (figure 1). By 10 years of followup, the adjusted HR for RA was 1.14 (95% CI: 1.07 to 1.22) in BC and 1.13 (95% CI: 1.08 to 1.18) in ON.

**Abstract OP0044** – Figure 1 Adjusted HR (solid black line) and 95% CIs (grey line) for all-cause mortality, over time since cohort entry

**Conclusions:** In 2 large Canadian RA population-based inception cohorts, a small increased mortality risk appeared after 6 years of RA duration and increased to a 14% (in BC) and 13% (in ON) increased risk after 10 years. While these findings represent an improvement in the mortality risk associated with RA compared to previous reports in older historical cohorts, the increasing mortality risk associated throughout the disease course suggests increased efforts to prevent disease progression and optimise comorbidity management are needed.

#### OP0045 ADVERSE EVENT REPORTING RATES AND PLACEBO/STANDARD-OF-CARE-ARM ACR RESPONSES VARY BY REGION IN RHEUMATOID ARTHRITIS TRIALS

D. Keebler, E. Teng, J. Chia, D. Lee, J. Galanter, J. Peake, K. Tuckwell. Genentech, South San Francisco, USA

**Background:** Clinical trials are increasingly globalised, with more trials conducted in Asia, Latin America, and the Russian Federation and Eastern Europe (RFEE).<sup>1</sup> Adverse event (AE) reporting rates and placebo (or standard-of-care-arm) response may differ by geographic region and level of economic development<sup>2-4</sup>; efficacy and safety may not be generalizable across regions. This potential heterogeneity and its implications for rheumatoid arthritis (RA) trials have not been studied in detail.

**Objectives:** To assess potential regional differences in rates of ACR responses and AE reporting using patient-level data (PLD) from RA trials in the TransCelerate initiative.<sup>5</sup>

**Methods:** We obtained PLD for all 17 RA trials available through TransCelerate as of August 2017 and analysed data from 7 trials with geographic information available (NCT01198002, NCT01202760, NCT01202773, NCT01404585, NCT00605735, NCT00048581, NCT00647270). We grouped patients by region and evaluated differences in demographics, AE reporting rates, and ACR response. Pairwise comparisons were made between regions using Fisher's exact test, with false discovery rate (FDR) correction for multiple comparisons. All patients were included in analyses of AE reporting. Only patients with data sufficient to calculate ACR scores were included in analyses of ACR response. Demographics for patients in each region are shown in table 1.

**Results:** The lowest rates of AE reporting and ACR50 response were seen in RFEE. The highest rate of ACR20 response was seen in Asia. After FDR

correction, significantly lower 12 week and 52 week AE reporting rates were seen in RFEE than in Asia, Latin America, or the United States. Only the ACR50 response difference between RFEE and Latin America survived FDR correction; however, ACR20 rates in Asia remained significantly higher than in RFEE and the United States (table 2).

**Abstract OP0045** – Table 1 Patient demographics by region

Region	AE Analysis, n	ACR Response Analysis, n	Female, %	Median Age, y (SD; range)
US	369	268	81	55 (11; 21-78)
RFEE	213	160	81	51 (12; 25-79)
Latin America	167	132	89	51 (12; 22-76)
Asia	164	107	88	52 (12; 18-83)

**Abstract OP0045** – Table 2 Proportions of patients attaining ACR50/20 response at 12 week and/or reporting  $\geq 1$  AE at 12 and 52 weeks across regions

Attaining ACR50	6	9*	7	1
Attaining ACR20	17	24	29**	15
With AE at 12 weeks	53*	49*	51*	22
With AE at 52 weeks	68*	58**	65*	39

\*p < 0.05 vs RFEE. \*\*p < 0.05 vs US. All p values corrected for multiple comparisons.

**Conclusions:** Patient-level data from placebo arms in the TransCelerate initiative revealed significant regional differences in AE reporting rates and ACR50/ACR20 response rates. Differences in Latin America, RFEE, and Asia were especially notable; future patient populations from these regions may show distinct efficacy/safety profiles regardless of treatment. Given ongoing globalisation of clinical trials, country- and region-specific treatment patterns, patient populations, and safety issues should be explored to avoid misguided inferences across regions. Capping recruitment by region to balance these factors may be warranted.

#### OP0046 EFFECT OF A SELECTIVE C5aR ANTAGONIST, AVACOPAN (CCX168), ON PLASMA COMPLEMENT LEVELS IN ANCA ASSOCIATED VASCULITIS (AAV)

D.O. Bunch<sup>1</sup>, J. Deng<sup>2</sup>, E.A. McInnis<sup>1</sup>, P. Bekker<sup>2</sup>, J.L. Hillson<sup>2</sup>, T.J. Schall<sup>2</sup>, C. J. Jennette<sup>3</sup>, P. Nachman<sup>1</sup>, J. Deng<sup>4</sup>, on behalf of the CLEAR Study Group.  
<sup>1</sup>Kidney Center, University of North Carolina, Chapel Hill; <sup>2</sup>Chemocentryx, Chemocentryx, Mountain View; <sup>3</sup>Department of Pathology, University of North Carolina, Chapel Hill; <sup>4</sup>850 Maude Ave, Chemocentryx, Mountain View, USA

**Background:** The interaction between primed neutrophils and anti-neutrophil cytoplasmic autoantibodies (ANCA) releases factors that activate the alternative complement pathway, initiating an amplification loop that is thought to sustain necrotizing inflammation during flares of AAV.<sup>1</sup> Avacopan (CCX168), a selective, orally available, small molecule C5aR1 antagonist, was associated with rapid clinical benefit in the Phase 2 CLEAR trial in patients with AAV,<sup>2</sup> indicating that therapeutic intervention in this pathogenic process can be accomplished by inhibiting the C5aR1-dependent cellular response to C5a, without broad inhibition of upstream complement functions important to host defense.

**Objectives:** The present study was designed to confirm the reported elevated levels of complement activation products in AAV,<sup>2</sup> demonstrate that inhibiting cellular (e.g. neutrophil) activation by C5a with avacopan is effective in AAV while preserving upstream functions of complement, and compare effects of avacopan to those of high dose prednisone.

**Methods:** The CLEAR trial compared 3 regimens in 67 patients with AAV:<sup>1</sup> full dose prednisone (60 mg daily, tapered);<sup>2</sup> avacopan 30 mg twice daily plus low dose prednisone (20 mg, tapered);<sup>3</sup> avacopan 30 mg twice daily plus no

prednisone. All also received either cyclophosphamide or rituximab. Bb, C3a, C5a, sC5b-9 and properdin were analysed by ELISA in plasma collected at baseline and at intervals in AAV patients, and in 20 healthy controls matched for age, gender and ethnic background. Paired t-test was used for within group comparison and unpaired t-test was used for between group comparisons using log transformed data. P-values were corrected for multiple comparisons.

**Results:** Before treatment, levels of C3a, C5a, sC5b-9 and properdin were significantly elevated in AAV patients compared to matched healthy controls (geomean [95%], C3a, 67.2 [57.5–78.7] vs 23.2 [16.9–31.9] ng/mL,  $p < 0.001$ ; C5a, 7.55 [6.50–8.78] vs 5.19 [3.87–6.95] ng/mL,  $p < 0.05$ ; sC5b-9, 241(222–262) vs 155 (136–178) ng/mL,  $p < 0.001$ ; Properdin, 18.4 [16.9–20.0] vs 13.1 [11.4–15.6]  $\mu\text{g/mL}$ ,  $p < 0.001$ ). In subjects treated with full dose prednisone, levels of Bb, C3a, and C5a decreased significantly on Day 8 and 29 rising again at day 85, coincident with tapering. Consistent with its mode of action (inhibition of C5aR1, the receptor at the terminus of the complement cascade), avacopan did not impact circulating complement levels. There were no changes from baseline in mean plasma sC5b-9 or properdin levels in any treatment group.

**Conclusions:** Avacopan was associated with rapid improvement in AAV disease activity without apparent impact on assembly of C5b-9 (the membrane attack complex) or upstream activities of the complement system important for host defense (e.g. bacterial infections) and tissue repair. In contrast, glucocorticoids were associated with dose-dependent reduction of circulating levels of upstream complement activation products.

#### OP0047 CIRCULATING CD24<sup>hi</sup>CD38<sup>hi</sup> REGULATORY B CELLS INFLUENCE TH17 CELL RESPONSES IN PATIENTS WITH ANCA-ASSOCIATED VASCULITIDES

A. von Borstel<sup>1</sup>, L.L. Lintermans<sup>2</sup>, P. Heeringa<sup>3</sup>, A. Rutgers<sup>2</sup>, C.A. Stegeman<sup>1</sup>, J. S. Sanders<sup>1</sup>, W.H. Abdulahad<sup>2,3</sup>. <sup>1</sup>Internal Medicine/Division of Nephrology; <sup>2</sup>Rheumatology and Clinical Immunology; <sup>3</sup>Pathology and Medical Biology, University Medical Center Groningen, Groningen, Netherlands

**Background:** CD24<sup>hi</sup>CD38<sup>hi</sup> regulatory B cells (Bregs) exhibit suppressive function and modulate pathogenic T cell responses. Persistent expansion of pathogenic IL-17-producing T cells (Th17) has been demonstrated in patients with anti-neutrophil cytoplasmic autoantibody (ANCA)-associated vasculitides (AAV). In addition, a reduction in numbers of CD24<sup>hi</sup>CD38<sup>hi</sup> Bregs was described in active AAV patients whereas no difference was found in patients in remission compared to healthy controls (HCs).

**Objectives:** To investigate whether there is a direct relation between increased proportions of Th17 cells and diminished proportions Bregs in AAV patients.

**Methods:** Frequencies of both Bregs and Th17 cells were determined by FACS in blood samples from 44 AAV patients in remission. None of the AAV patients received immunosuppressive treatment. Bregs were defined within the CD19<sup>+</sup> population as CD24<sup>hi</sup>CD38<sup>hi</sup> cells, and Th17 cells were defined within the CD3<sup>+</sup>CD4<sup>+</sup>CD45RO<sup>+</sup> population by their specific chemokine receptor expression as CXCR3<sup>+</sup>CCR4<sup>+</sup>CCR6<sup>+</sup> cells. In addition, CD3<sup>+</sup>CD4<sup>+</sup> Th cells were sorted from 4 AAV patients and 3 HCs and co-cultured with either Breg-depleted B cells or total B cells. Cultured cells were stimulated with SEB and CpG-ODN and frequencies of both IL-17<sup>+</sup> (Th17) and IFN $\gamma$ <sup>+</sup> (Th1) T cells were determined at baseline and day 5 upon restimulation with PMA and Ca<sup>2+</sup> ionophore.

**Results:** The frequency of circulating Bregs in AAV-patients correlated negatively with circulating Th17 cells ( $r = -0.390$ ;  $p = 0.009$ ), whereas no such correlation was observed with other B cell subtypes. The co-culture experiments revealed that the frequency of IFN $\gamma$ <sup>+</sup> T cells was unaffected when Bregs were depleted in both HCs and AAV patients (undepleted samples median: 10.6%; range: 5.5%–19.7% vs Breg-depleted samples median: 11%; range: 4.9%–19.2%). Remarkably, a significant increase in the frequency of IL-17<sup>+</sup> Th cells was detected in Breg-depleted samples (median: 1.6%; range: 1%–3.8%) compared to undepleted samples in both HCs and patients ( $p = 0.03$ ; undepleted samples median: 1.2%; range: 0.9%–2.9%). Moreover, the IFN $\gamma$ <sup>+</sup>:IL-17<sup>+</sup> T cell ratio was not different between

undepleted (median: 13.8, range: 5.1–39.3) and Breg-depleted samples at baseline (median: 11, range: 7.3–30), whereas a significant decrease was found in the Breg-depleted samples (median: 5.6; range: 3.3–9.1) after 5 days of culture ( $p = 0.016$ ; undepleted median: 6.3; range: 4.2–10.6) indicating a change in the Th1:Th17 ratio.

**Conclusions:** CD24<sup>hi</sup>CD38<sup>hi</sup> Bregs modulate Th17 responses in AAV patients. Future treatment of AAV could aim at expanding CD24<sup>hi</sup>CD38<sup>hi</sup> Bregs to suppress pathogenic Th17 cells.

#### OP0048 THE UTILITY OF SERUM ANGIOPOIETIN-1 AND ANGIOPOIETIN-2 IN PATIENTS WITH ANTI-NEUTROPHIL CYTOPLASMIC AUTOANTIBODY-ASSOCIATED VASCULITIS

Y. Wada, M. Sudo, T. Kuroda, M. Nakano, I. Narita. *Division of Clinical Nephrology and Rheumatology, Niigata University Graduate School of Medical and Dental Sciences, Niigata, Japan*

**Background:** Angiotensin-1 (Ang-1) and Angiotensin-2 (Ang-2) are antagonistic ligands which bind with similar affinity to the extracellular domain of the tyrosine kinase with Ig-like and epidermal growth factor-like domains 2 (Tie-2) receptor, which is almost exclusively expressed by endothelial cells. Ang-1/Tie-2 signalling maintains vessel integrity, inhibits vascular leakage, suppresses inflammatory gene expression and prevents recruitment and transmigration of leukocytes. In contrast, binding of Ang-2 disrupts protective Ang-1/Tie-2 signalling and facilitates endothelial inflammation. Recently, serum Ang-2 levels have been reported to be elevated in autoimmune disorders such as rheumatoid arthritis, systemic lupus erythematosus, and anti-neutrophil cytoplasmic autoantibody-associated vasculitis (AAV).

**Objectives:** To examine the serum Ang-1 and Ang-2 levels in patients with AAV, and investigate the utility as biomarkers.

**Methods:** Seventy-one patients who had been diagnosed as AAV and referred to Niigata University Medical and Dental Hospital between 2009 and 2017, were participated in this study. Serum Ang-1 and Ang-2 levels were measured by enzyme-linked immunosorbent assay, before the initiation of remission-induction therapy. Laboratory findings, disease activity using Birmingham vasculitis activity score (BVAS) at the time of diagnosis, and patients' kidney and overall prognosis at August 2017, were corrected from patients' clinical records. The correlations between these findings and serum Ang-1, Ang-2 levels, and Ang-1/Ang-2 ratio were analysed by Pearson correlation coefficient and stepwise multiple regression analysis. A value of  $p < 0.05$  was taken to indicate statistical significance.

**Results:** In Pearson correlation coefficient analysis, serum Ang-1 was negatively correlated with serum creatinine (Cr) ( $r = -0.3490$ ,  $p = 0.0151$ ), urinary protein/Creatinine ratio (UP/Cr) ( $r = -0.3147$ ,  $p = 0.0312$ ), and positively correlated with estimated glomerular filtration ratio (eGFR) ( $r = 0.4091$ ,  $p = 0.0039$ ). Serum Ang-2 was positively correlated with BVAS ( $r = 0.3024$ ,  $p = 0.003$ ), serum Cr ( $r = 0.3778$ ,  $p = 0.0081$ ), and the initiation of hemodialysis therapy ( $r = 0.4196$ ,  $p = 0.0151$ ), and negatively correlated with eGFR ( $r = -0.2999$ ,  $p = 0.0383$ ). The Ang-1/Ang-2 ratio was positively correlated with BVAS ( $r = 0.3527$ ,  $p = 0.0139$ ), serum Cr ( $r = 0.7419$ ,  $p < 0.0001$ ), UP/Cr ( $r = 0.4799$ ,  $p = 0.0006$ ), and the initiation of hemodialysis therapy ( $r = 0.6151$ ,  $p < 0.0001$ ), and negatively correlated with eGFR ( $r = -0.4758$ ,  $p = 0.0006$ ). In stepwise multiple regression analysis, eGFR was selected as a positive independent variable for serum Ang-1 levels ( $\beta = 0.3769$ ,  $p = 0.0014$ ) and Ang-1/Ang-2 ratio ( $\beta = 0.4060$ ,  $p = 0.0005$ ), whereas the initiation of hemodialysis therapy was selected as a positive independent variable ( $\beta = 0.5850$ ,  $p < 0.0001$ ), and UP/Cr ( $\beta = -0.5780$ ,  $p < 0.0001$ ) and eGFR ( $\beta = -0.4311$ ,  $p = 0.0003$ ) were selected as negative independent variables for serum Ang-2 levels.

**Conclusions:** These findings showed the protective effect of kidney functions for Ang-1 and the utility of Ang-2 as a predictive factor for kidney prognosis.

**OP0049** **ABERRANT VISTA EXPRESSION ON CD45RA+CD25DIM TH-CELLS IN GIANT CELL ARTERITIS**

R. Hid Cadena<sup>1</sup>, R.D. Reitsem<sup>2</sup>, W.H. Abdulhad<sup>1,2</sup>, M.G. Huitema<sup>2</sup>, A.M. Boots<sup>2</sup>, P. Heeringa<sup>1</sup>, E. Brouwer<sup>2</sup>. <sup>1</sup>Pathology and Medical Biology; <sup>2</sup>Rheumatology and Clinical Immunology, University Medical Center Groningen, Groningen, Netherlands

**Background:** A broad naïve Th-cell repertoire is needed to face novel antigenic challenges and mounting an optimal immune response.<sup>1,2</sup> The replenishment of naïve T-cells is severely restricted by thymic involution with ageing.<sup>3</sup> In the past, our group provided new insight into the homeostasis of human Th-cells, identifying CD45RA<sup>+</sup>CD25<sup>dim</sup>Th-cells as a subset of post-thymically expanded naïve Th-cells in healthy aged individuals.<sup>4</sup> Immune homeostasis of naïve Th-cells is especially important to understand defective immune responses in age-related immune disorders such as Giant Cell Arteritis (GCA). Recently, a loss of immunoinhibitory checkpoints has been implicated in GCA.<sup>5,6</sup> The possible contribution of immune checkpoint pathways to the dysregulation of Th-cells, especially in CD45RA<sup>+</sup>CD25<sup>dim</sup>Th-cells in GCA has not yet been studied.

**Objectives:** In this study, we aimed to investigate the expression of different immune checkpoint molecules on circulating CD45RA<sup>+</sup>CD25<sup>dim</sup>Th-cells of GCA-patients and compare it with matched healthy controls (HCs).

**Methods:** In a cross-sectional study, fresh blood samples were obtained from 33 GCA-patients with/without immunosuppressive treatment (glucocorticoids) and 12 sex/age-matched HCs. The frequency of the expression of different immune checkpoints including CD28, Cytotoxic T-Lymphocyte-associated antigen-4 (CTLA-4), Programmed death-1 (PD-1), and V-domain Ig suppressor of T cell activation (VISTA) were determined on CD45RA<sup>+</sup>CD25<sup>dim</sup>Th-cells of GCA-patients and HCs by flow cytometry.

**Results:** Proportion of circulating CD45RA<sup>+</sup>CD25<sup>dim</sup>Th-cells in GCA-patients was not different when compared to HCs, whereas significant increase in these cells was observed only in treated GCA-patients when compared to HCs. The proportion of CD28, CTLA-4 and PD-1 expression on CD45RA<sup>+</sup>CD25<sup>dim</sup>Th-cells did not differ between GCA-patients and HCs. Interestingly, proportion of VISTA expression on these cells was significantly decreased in GCA-patients. Furthermore, decreased frequency of VISTA expression was seen in both untreated and treated patients.

**Conclusions:** In GCA-patients (untreated and treated), lower frequencies of VISTA<sup>+</sup>CD45RA<sup>+</sup>CD25<sup>dim</sup>Th-cells were noted. Decreased VISTA expression in GCA-patients could play a role in the regulation of Th-cell activation/inhibition. The functional consequences of immune checkpoint modulation within particular subsets requires further investigation.

Rutgers<sup>2</sup>. <sup>1</sup>Internal Medicine – Nephrology; <sup>2</sup>Rheumatology, University Medical Center Groningen, Groningen; <sup>3</sup>Internal Medicine – Endocrinology, Erasmus Medical Center, Rotterdam; <sup>4</sup>Internal Medicine – Endocrinology, University Medical Center Groningen, Groningen, Netherlands

**Background:** High doses of exogenous glucocorticoids (e.g., prednisolone) are a standard part of treatment for ANCA-associated vasculitis.<sup>1</sup> Efficacy and toxicity of glucocorticoid treatment differ widely between individuals.<sup>2</sup> We hypothesised

that this can be partly explained by genetic polymorphisms of the glucocorticoid receptor (GR) and 11 $\beta$ -hydroxysteroid dehydrogenase type 1 (HSD11B1) that influence glucocorticoid sensitivity.

**Objectives:** To investigate whether five haplotypes of the Glucocorticoid Receptor gene (NR3C1) and a single nucleotide polymorphism of 11 $\beta$ -hydroxysteroid dehydrogenase type 1 (HSD11B1) are associated with treatment efficacy and toxicity in ANCA associated vasculitis.

**Methods:** A total of 241 ANCA associated vasculitis patients were genotyped for five polymorphisms of the glucocorticoid receptor gene and one polymorphism of the HSD11B1 gene. Glucocorticoid receptor gene haplotypes were predicted based on genotyping results. Relapse free survival, mortality, renal survival, metabolic adverse events and infections were compared between carriers and non-carriers of glucocorticoid receptor haplotypes and the HSD11B1 genotype.

**Results:** Carriers of the ER22/23EK haplotype of the glucocorticoid receptor had a significantly higher risk of 10 year mortality (Hazard Ratio (HR) 3.0, 95% confidence interval, CI: 1.2 to 7.3), more frequently required plasmapheresis treatment (p=0.04) and had a higher risk of developing end-stage renal disease (HR 7.4, 95% CI: 1.9 to 28.7). Carriers of a minor variant of HSD11B1 more frequently experienced relapse (HR 2.5, 95% CI: 1.5 to 4.1), except if they also carried the BcI haplotype of the glucocorticoid receptor. Homozygous carriers of the BcI haplotype had a higher risk of developing hypertension (HR 2.7, 95% CI: 1.2 to 5.7) and dyslipidemia (HR 4.1, 95% CI: 1.8 to 9.6). Occurrence of infections neither differed between GR haplotypes, nor between HSD11B1 genotypes.

**Conclusions:** The ER22/23EK and BcI haplotype of the glucocorticoid receptor and a polymorphism of the gene for HSD11B1 are associated with clinically relevant inflammatory and metabolic outcomes in ANCA associated vasculitis.

**Background:** Giant cell arteritis (GCA) is a large-vessel vasculitis which can involve the aorta and/or its major branches. Tocilizumab (TCZ) seems to be effective in giant cell arteritis (GCA).<sup>1–4</sup>

**Objectives:** Our aim was to assess if the clinical and analytical improvement yielded in patients with GCA treated with TCZ is accompanied by a reduction of the vascular inflammation evaluated by PET/CT.

**Methods:** Study of 36 patients who had a baseline and follow-up PET/CT from a multicenter series of 134 patients with GCA in treatment with TCZ. The evolution of the vascular involvement objectified by PET/CT was assessed. In addition clinical efficacy, analytical improvement (acute phase reactants) and the reduction of corticosteroid dose was studied.

**Results:** The 36 patients (28 women and 8 men) had an mean age of 69.83±8.66 years. After TCZ onset, a rapid and maintained clinical improvement was observed (table 1). In addition, during the first twenty-four months of follow-up, C-reactive protein decreased from 2.4 [0.9–6.8] to 0.1 [0.0–0.5] mg/dL and the erythrocyte sedimentation rate from 41.5 [16.7–58.5] to 4 [2–12.5] mm/1 st hour. On the other hand, the levels of haemoglobin experienced an increase from 12.3 [11.3–13.0] to 13.3 [13.0–13.9] g/dL. The median dose of prednisone decreased from 12.5 [9.4–26.2] to 0.0 [0.0–0.0] mg/day. However, the decrease in F18-fluorodeoxyglucose uptake in the PET/CT study was not as evident.

## Abstract OP0051 – Table 1

	Baseline	Month 6	Month 12	Month 18	Month 24
<b>Clinical improvement n, (%)</b>					
Complete		26/26 (80)	24/27 (88.9)	21/23 (95.4)	17/18 (94.4)
Partial		5/35 (14.3)	3/27 (11.1)	1/22 (4.5)	1/18 (5.5)
No improvement		2/35 (5.7)	0 (0)	0 (0)	0 (0)
<b>Laboratory markers, median [IQR] #</b>					
ESR	41.5 [16.7-58.5] (36)	4 [2-8] (36)*	4.5 [2-12] (28)*	5 [2.5-11] (23)*	4 [2-12.5] (19)*
CRP	2.4 [0.9-6.6] (36)	0.1 [0.0-0.7] (33)*	0.3 [0.1-0.6] (27)*	0.1 [0.1-0.5] (23)*	0.1 [0.0-0.5] (18)*
Dose of corticosteroids (mg/day), median [IQR] #	12.5 [8.4-28.2] (36)	5.0 [1.2-6.0] (33)*	0.0 [0.0-4.2] (28)*	0.0 [0.0-2.5] (21)*	0.0 [0.0-0.6] (19)*
<b>Improvement in PET/CT</b>					
Complete		0/8 (0)	3/13 (23)	3/11 (27.3)	1/4 (25)
Partial		6/8 (75)	6/13 (46.1)	7/11 (63.6)	2/4 (50)
No improvement		2/8 (25)	4/13 (30.8)	1/11 (9.1)	1/4 (25)

\*p&lt; 0.0001 (Wilcoxon test)

**Conclusions:** Although TCZ seems to be an important therapeutic agent in the treatment of GCA, achieving a rapid and sustained clinical and analytical improvement, the decrease in vessel inflammation assessed by F18-fluorodeoxyglucose uptake seems to take a slower course.

OP0052

### MICROPARTICLES AS POTENTIAL BIOMARKERS OF DISEASE ACTIVITY IN ANTI-NEUTROPHIL CYTOPLASMIC ANTIBODY – ASSOCIATED VASCULITIS

A. Antovic<sup>1</sup>, M. Kostic<sup>2</sup>, F. Mobarrez<sup>1</sup>, A. Nordin<sup>1</sup>, J. Vojinovic<sup>2</sup>, A. Bruchfeld<sup>3</sup>, I. Gunnarsson<sup>1</sup>. <sup>1</sup>Department of Medicine, Rheumatology Unit, Karolinska Institutet, Stockholm, Sweden; <sup>2</sup>Department of Pediatrics, Medical Faculty, University of Niš, Nis, Serbia; <sup>3</sup>Department of Renal Medicine, Karolinska Institutet, Stockholm, Sweden

**Background:** Microparticles (MPs) are submicron particles, which are released from plasma membrane upon cell activation and during the early phase of apoptosis. Increased levels of circulating MPs, mainly of endothelial cell origin, but also platelet derived, have been shown to correlate with autoinflammatory disease activity, such as anti-neutrophil cytoplasm antibody (ANCA) – associated vasculitis (AAV).

**Objectives:** The aim was to evaluate levels of activity markers expressed on MPs from patients with AAV, during active disease and remission, compared to healthy control subjects.

**Methods:** Our study included 46 AAV patients and 23 healthy age and gender matched control subjects. We analysed the concentration of MPs in plasma by flow cytometry. MPs were phenotyped by expression: CD142 (tissue factor-TF), anti-H3cit (citruinated Histone 3 directed against neutrophil extracellular traps – NETs), anti-pentraxin3 (pentraxin3), HMGB1 (high mobility group box 1 protein-HMGB1), anti-TWEAK (tumour necrosis factor-like weak inducer of apoptosis-TWEAK), anti-plasminogen (plasminogen), anti-C3a (C3a) and anti-C5a (C5a). The assessment of vasculitis disease activity was performed using the Birmingham Vasculitis Activity Score (BVAS), where active disease was defined as BVAS ≥ 1 and inactive (remission) as BVAS=0.

**Results:** Half of the patients group<sup>23</sup> had active vasculitis (13 male/10 female, mean age 61±14 years) and 23 had inactive disease (12 male/11 female, mean age 64±13 years). Concentration of MPs expressing TF, H3cit, pentraxin-3 and HMGB1 in active patients were significantly higher than in those in remission and healthy controls (p<0.01, p<0.0001, respectively). MPs expressing C5a and C3a were significantly higher in both active and inactive patients compared to controls (p<0.001). Additionally, levels of MPs expressing C5a and C3a strongly correlated with BVAS in patients with active disease (r=0.78, p<0.0001; r=0.5, p<0.01, respectively), while there was no significant correlation between other explored markers and BVAS.

**Conclusions:** Our results support recently postulated role of the complement system in AAV pathogenesis and disease activity. Evaluated proteins expressed

on MPs, especially C5a and C3a, could be used as potential biomarkers which might reflect inflammation and disease activity in AAV patients. Further investigations are necessary to confirm our preliminary results and to validate the most promising biomarker in AAV.

Carrat<sup>2</sup>, P. Fenaux<sup>13</sup>, A. Mekinian<sup>1</sup>, O. Fain<sup>1</sup>. <sup>1</sup>Internal Medicine, Inflammation-Immunopathology-Biotherapy Department (DHU i2B); <sup>2</sup>Hôpital Saint Antoine; <sup>3</sup>Hôpital Cochin, Paris; <sup>4</sup>Hôpital Ambroise Paré, Boulogne Billancourt; <sup>5</sup>Hôpital Foch, Paris; <sup>6</sup>CHU, Caen; <sup>7</sup>CH, Lons le Saunier; <sup>8</sup>Hôpital Ambroise Paré, Boulogne Billancourt; <sup>9</sup>CHU, Amiens; <sup>10</sup>CHU, Limoges; <sup>11</sup>CH, Le Mans; <sup>12</sup>Hôpital Necker Enfants Malades; <sup>13</sup>Hôpital St Louis, Paris, France

**Objectives:** We report myelodysplastic syndrome (MDS)-associated systemic inflammatory and autoimmune diseases (IADs) with cytogenetic trisomy 8, and describe their outcome, treatments efficacy and impact on MDS survival in a French multicenter retrospective study.

**Methods:** In this study, 21 patients with trisomy 8-MDS and IADs were analysed and compared to 103 MDS patients with trisomy 8 without IADs.

**Results:** The median age was 67 [59 – 80] years and the male/female ratio 0.9. The IADs were Behçet's or Behçet's-like disease in 11 (52%) cases, inflammatory arthritis in 4 (19%) cases, Sjögren's syndrome, autoimmune hemolytic anaemia, aseptic abscesses, polyarteritis nodosa, Sweet's syndrome and unclassified vasculitis in one case each. Trisomy 8 karyotype was isolated in 8 cases (38%) and associated with other abnormalities in remaining cases. Seventeen (81%) IADs patients were treated (88% with steroids) with complete and partial response in 35% and 47%, respectively. A second-line therapy was required for steroid dependence or relapse in 38% of cases. The effect of MDS treatment on IADs could be assessed in 7 patients treated with Azacitidine : 5/13 (38%) achieved remission and 2/13 (15%) partial response of IADs. Compared with 103 trisomy 8-MDS/CMML patients without IADs, IADs patients were more often non-Caucasian (p=0.004), MDS subtype tended to be more frequently CRDM (p=0.09) and had more often a poor karyotype (p<0.001). No survival difference was seen between patients with trisomy 8-MDS-associated IADs and without IADs.

**Conclusions:** The spectrum of IADs associated to trisomy 8-MDS is dominated by Behçet's disease, but may also be other various immune disorders. Steroid therapy is often effective, but sparing therapies are mostly necessary.

### Envisioning new horizons for people with osteoarthritis

OP0054

### PAIN IN HAND OSTEOARTHRITIS AND THE ASSOCIATIONS WITH RADIOGRAPHIC OSTEOARTHRITIS SEVERITY AND PSYCHOLOGICAL FACTORS

E. Mulrooney<sup>1</sup>, K. Magnusson<sup>2</sup>, H.B. Hammer<sup>1</sup>, T.L. Gaarden<sup>3</sup>, K. Engedal<sup>4</sup>, T. K. Kvien<sup>1</sup>, I.K. Haugen<sup>1</sup>. <sup>1</sup>Department of Rheumatology; <sup>2</sup>National Advisory Unit on Rehabilitation in Rheumatology; <sup>3</sup>Department of Geriatric Psychiatry, Diakonhjemmet Hospital, Oslo; <sup>4</sup>Norwegian Advisory Unit of Ageing and Health, Vestfold County Hospital, Tønsberg, Norway

**Background:** Pain is the most preferred area of improvement for patients with hand osteoarthritis (OA). Whereas only weak associations have been found between radiographic OA severity and pain, few studies have explored whether psychological factors are associated with pain.

**Objectives:** To examine whether radiographic severity, depression, anxiety and pain catastrophizing are associated with self-reported pain in patients with hand OA, and to explore possible interactions between psychological factors and radiographic severity.

**Methods:** The Nor-Hand study is an observational cohort study of 300 (89% women) hand OA patients with median (IQR) age of 61 [57–66] years. Participants completed questionnaires, including Numeric Rating Scale (NRS, 0–10 scale) about hand pain, Australian/Canadian (AUSCAN) hand pain subscale (0–20 scale), Hospital Depression and Anxiety Scale (HADS, 0–42 scale) and Pain

Catastrophizing Scale (PCS, 0–52 scale) at the baseline examination in 2016–2017. Bilateral interphalangeal, metacarpophalangeal, first carpometacarpal and the scaphotrapezotrapezoidal joint were scored for radiographic OA according to the Kellgren-Lawrence (KL) index (sum score: 0–132 scale). Using linear regression analyses, we analysed whether KL sum score, HADS sum score and PCS sum score (independent variables) were associated with AUSCAN pain (dependent variable). Separate models were applied for each independent variable with adjustment for age, sex and body mass index (BMI). Thereafter, all independent variables were included in the same model. Analyses were repeated using NRS hand pain as the dependent variable. Interactions between KL sum score and HADS/PCS were explored.

**Results:** Patients reported wide range of pain severity with mean (SD) AUSCAN pain of 8.2 (4.0) and mean (SD) NRS hand pain of 3.8 (2.3). Their radiographic severity ranged from minimal to severe with a median (IQR) KL sum score of 28 (15–44). Most patients reported low levels of anxiety, depression and pain catastrophizing with median (IQR) HADS sum score of 6 (3–10) and PCS sum score of 9 (5–15).

The HADS and PCS sum scores were associated with hand pain, both when analysed separately and in the same model together with KL sum score (table 1). Increasing radiographic severity was not associated with hand pain in the age, sex and BMI-adjusted models. When including HADS and PCS in the models, the associations between radiographic severity and pain became stronger for both pain outcomes and statistically significant for AUSCAN pain (table 1).

We found interactions between KL sum score and HADS. In the 61 persons with HADS depression and anxiety subscale scores below 8, the KL sum score was significantly associated with AUSCAN pain ( $B=0.03$ , 95% CI: 0.003 to 0.06,  $p=0.03$ ) and NRS pain ( $B=0.02$ , 95% CI: 0.002 to 0.03,  $p=0.03$ ) (adjusted for age, sex, BMI and PCS), whereas no associations between radiographic severity and pain was found in persons with HAD depression and/or anxiety subscale scores of 8 or more.

Abstract OP0054 – Table 1

	AUSCAN pain (B, 95% CI)		NRS hand pain (B, 95% CI)	
	Model 1*	Model 2**	Model 1*	Model 2**
KL sum score	0.01 (-0.01, 0.04); $p=0.35$	0.03 (0.001, 0.05); $p=0.04$	0.005 (-0.01, 0.02); $p=0.52$	0.01 (-0.002, 0.03); $p=0.09$
HADS sum score	0.19 (0.11, 0.26); $p<0.001$	0.12 (0.04, 0.20); $p=0.01$	0.11 (0.07, 0.15); $p<0.001$	0.08 (0.03, 0.12); $p=0.001$
PCS sum score	0.17 (0.12, 0.23); $p<0.001$	0.14 (0.08, 0.20); $p<0.001$	0.10 (0.07, 0.13); $p<0.001$	0.07 (0.04, 0.11); $p<0.001$

\* separate models for KL, HADS and PCS, respectively, with adj. for age, sex and BMI \*\* KL, HADS and PCS included in the same model with adj. for age, sex and BMI.

**Conclusions:** Depression, anxiety and pain catastrophizing were associated with pain in hand OA, emphasising that pain in hand OA should be treated in a biopsychosocial framework. Importantly, radiographic severity was associated with pain only in persons with no or low levels of depression and anxiety.

**Disclosure of Interest:** None declared

### OP0055 A NOVEL METHOD FOR ASSESSING PROXIMAL TIBIOFIBULAR JOINT ON MR IMAGES IN PATIENTS WITH KNEE OSTEOARTHRITIS

Z Zhu<sup>1,2</sup>, J. Chang<sup>2</sup>, Z. Liao<sup>2</sup>, T. Meng<sup>2</sup>, S. Zheng<sup>2</sup>, F. Cicutti<sup>3</sup>, T. Winzenberg<sup>2</sup>, A. Wluka<sup>3</sup>, D. Jiang<sup>4</sup>, W. Han<sup>2</sup>, C. Ding<sup>1,2</sup>. <sup>1</sup>Clinical Research Center, Zhujiang Hospital, Guangzhou, China; <sup>2</sup>Menzies Institute for Medical Research, University of Tasmania, Hobart; <sup>3</sup>Department of Epidemiology and Preventive Medicine, Monash University, Melbourne; <sup>4</sup>School of Engineering and ICT, University of Tasmania, Hobart, Australia

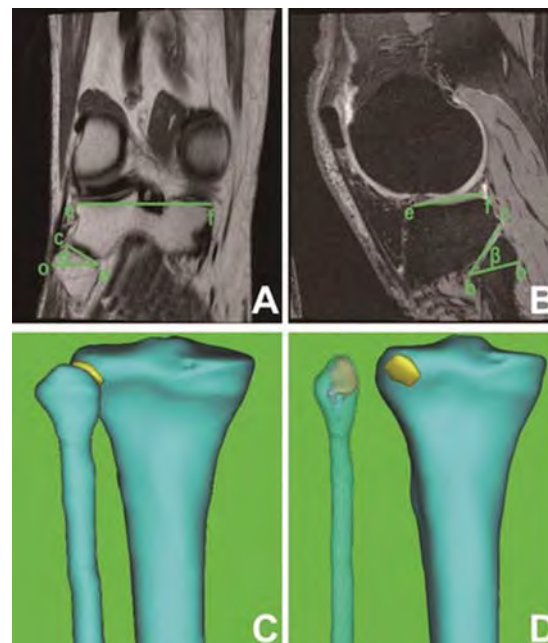

**Background:** Proximal tibiofibular joint (ProxTibFibJ) is a synovial sliding joint that has been estimated to transmit one-sixth of the leg's static load. One study has reported that proximal fibular osteotomy could significantly improve the clinical outcomes in patients with medial compartment OA. However, no study has delineated the measurement of ProxTibFibJ morphological parameters (ProxTibFibJ contacting area, load-bearing area, lateral stress-bolstering area and posterior stress-bolstering area) on magnetic resonance imaging (MRI) and investigated their correlations with knee OA structural abnormalities.

**Objectives:** To validate a pragmatic method to measure the morphological parameters of the ProxTibFibJ and to describe their associations with knee structural abnormalities in patients with knee osteoarthritis (OA).

**Methods:** A total of 408 participants with knee OA were selected. The morphological status of ProxTibFibJ were measured on coronal and sagittal magnetic resonance images (MRI). We calculated the contacting area of ProxTibFibJ (S), and its projection areas onto the horizontal (load-bearing area, St), sagittal (lateral stress-bolstering area, S $\varphi$ ) and coronal plane (posterior stress-bolstering area, S $\nu$ ), respectively. Knee structural abnormalities including cartilage defects, bone

marrow lesions (BMLs) and cartilage volume were evaluated. Clinical construct validity was examined through describing the associations between the morphological parameters of ProxTibFibJ and knee structural abnormalities. The reliabilities were examined by calculating the intra- and inter-observer correlation coefficients.

**Results:** The average ProxTibFibJ fibular contacting area was  $2.4\pm 0.7$  cm<sup>2</sup>. The intra- and inter-observer correlation coefficients for all measures were excellent (all  $\geq 0.90$ ). In cross-sectional analyses, the ProxTibFibJ morphological parameters (S, St, S $\nu$  and S $\varphi$ ) were significantly associated with radiographic medial JSN (OR 1.72 for S; 2.20 for St; 1.65 for S $\nu$ ), radiographic medial osteophyte (OR 0.51 for S $\varphi$ ) and MRI-assessed knee joint structural abnormalities including cartilage volume ( $\beta -0.07$  for S;  $-0.09$  for St), cartilage defects (OR 1.63 for S; 1.95 for St) and BMLs (OR 1.54 for S; 1.74 for St) at medial tibiofemoral compartment. In longitudinal analyses, S (RR, 1.45) and St (RR, 1.55) of ProxTibFibJ were significantly and positively associated with an increase in medial tibial cartilage defects over 2 years, after adjustment for age, gender, height, weight, ROA, tibial plateau bone area and intervention. St ( $\beta, -0.07$ ), S $\nu$  ( $\beta, -0.07$ ) and S ( $\beta, -0.06$ ) of ProxTibFibJ were significantly and negatively associated with change in medial tibial cartilage volume, after adjusted for above covariates. St (RR, 1.55) of ProxTibFibJ was positively associated with an increase in medial tibial BML, and S $\varphi$  (RR, 0.35) was negatively associated with an increase in medial femoral BMLs.

**Conclusions:** This novel method to assess the morphological parameters of ProxTibFibJ using MRI is reproducible, and has clinical construct validity. The longitudinal associations with osteoarthritic changes suggest that higher load-bearing area of ProxTibFibJ is a potential risk factor for medial compartment OA.

### OP0056 MOLECULAR AND STRUCTURAL BIOMARKERS OF INFLAMMATION AT 2 YEARS AFTER ACUTE ACL INJURY DO NOT PREDICT STRUCTURAL KNEE OSTEOARTHRITIS AT 5 YEARS

F Roemer<sup>1,2,3</sup>, M. Englund<sup>4</sup>, A. Turkiewicz<sup>4</sup>, A. Struglics<sup>1</sup>, A. Guemazi<sup>2</sup>, L. S. Lohmander<sup>1</sup>, S. Larsson<sup>1</sup>, R. Frobell<sup>1</sup>. <sup>1</sup>Orthopaedics, Department of Clinical Sciences Lund, Lund University, Lund, Sweden; <sup>2</sup>Radiology, Boston University School of Medicine, Boston, USA; <sup>3</sup>Radiology, University of Erlangen-Nuremberg, Erlangen, Germany; <sup>4</sup>Clinical Epidemiology Unit, Orthopaedics, Department of Clinical Sciences Lund, Lund University, Lund, Sweden

**Background:** Trauma-induced cytokine response and local inflammation after knee injury may be important in the development of posttraumatic osteoarthritis (OA). It has been reported that synovial fluid levels of inflammatory markers remain increased up to 5 years after anterior cruciate ligament (ACL) injury, indicative of extended local inflammation in the injured joint.<sup>1</sup> Inflammation potentially represents a valid target for treatment in the early and subacute phase after joint trauma in order to prevent or delay onset of post-traumatic knee OA.

**Objectives:** To determine the role of inflammatory biomarkers at 2 years after anterior cruciate ligament (ACL) injury for predicting radiographic and magnetic resonance imaging (MRI)-defined knee OA 5 years post injury. Secondary aim was to estimate the concordance of inflammatory biomarkers assessed by MRI and in synovial fluid.

**Methods:** We studied 113 patients with acute ACL injury. 1.5 Tesla knee MRIs were read for Hoffa- and effusion-synovitis. Biomarkers of inflammation included IL-6, IL-8, IL-10, TNF- $\alpha$  and IFN- $\gamma$  in serum and synovial fluid, and IL-12p70 in serum. The outcome was radiographic knee OA (ROA) or MRI-defined OA (MROA) at 5 years. Area under receiver operating characteristic curve (AUC), sensitivity and specificity were evaluated in models including MRI features only (M1), inflammation biomarkers only (serum [M2a] – synovial [M2b]) or both MRI and serum [M3a] or synovial [M3b] markers. Linear regression was used for evaluating association between MRI and synovial biomarkers.

**Results:** At 5 years, ROA was present in 26% and MROA was present in 32% of patients' injured knee. The AUCs (95% CI) for ROA were 0.44 (0.42–0.47;M1), 0.62 (0.59–0.65;M2a), 0.58 (0.55–0.61;M2b), 0.53 (0.50–0.56;M3a) and 0.50 (0.46–0.53;M3b) for each model. The corresponding AUCs for MROA were 0.67 (0.64–0.70), 0.49 (0.47–0.52), 0.65 (0.61–0.68), 0.56 (0.52–0.59) and 0.69 (0.66–0.72) (table 1). The associations between MRI and synovial biomarkers were weak and not statistically significant, apart from effusion-synovitis and IL-8 (log 10 IL8 levels were 0.23 and 0.43 higher in persons with grade 1 or 2/3, respectively).

**Abstract OP0056** – Table 1 Discriminatory accuracy of imaging and serum/synovial fluid biomarkers at 2 years with respect to knee osteoarthritis (OA) development at 5 year according to 4 definitions using logistic regression model maximising area under receiver operating characteristic curve (AUC)

Outcome @ 5 years	MRI features only (Model 1)		Serum biomarkers only (Model 2a)		MRI and serum biomarkers (Model 3a)		Synovial biomarkers only (Model 2b)		MRI and synovial biomarkers (Model 3b)

ROA= radiographic OA, TF=tibiofemoral, PF=patellofemoral, AUC= area under the receiver operating characteristic curve

**Conclusions:** Neither MRI-defined inflammation, nor synovial/serum inflammation biomarkers at 2 years as analysed here predicted ROA or MROA at 5 years. The concordance between MRI and synovial inflammatory biomarkers was weak. Additional studies with longer follow-up will be needed to confirm or refute our findings and to more firmly define the role of inflammation for OA development following acute ACL injury.

**Background:** According to EULAR and OARS1 guidelines, evidence is inconclusive for the symptomatic benefits of an unloader knee brace in medial knee osteoarthritis (OA).

**Objectives:** The objective of this multicenter randomised controlled trial (RCT) (*ClinicalTrials Id. NCT02765685*) was to compare the efficacy and safety of the ODRA brace, a distraction-rotation custom-made knee brace versus usual care over one year in medial knee OA.

**Methods:** Patients with symptomatic medial knee OA (VAS pain scores at rest >40/100 for the medial compartment) and Kellgren-Lawrence (KL) grade II-IV were randomised in two groups: brace group (ODRA +usual care) vs usual care alone (UCA). Patients were followed up every two months for one year. Usual care consisted of all the pharmacological and non-pharmacological treatments used for the management of knee OA. The primary end-point was the difference of VAS-pain between M0 and M12. Secondary end-points included patient global assessment of disease severity (PGA) on VAS,% of patients reaching the PASS (VAS-pain <30/100) and MCII (delta VAS-pain >20/100) thresholds at M12, KOOS scores, OA-specific quality of life questionnaire (OAKHQOL), as well as drug intake. Safety and compliance were evaluated by recording side effects and average knee brace duration of wear, respectively.

**Results:** Overall 120 patients (57% women) from 7 centres were included. Their characteristics were the following: mean age 63.6±11.4 years; BMI 29.6±5.5 kg/m<sup>2</sup>; OA duration 5.8±6 years; 52% KL III; 21% KL IV. The VAS pain decrease was statistically higher in the ODRA group (from 61.9±17.4 (M0) to 38.8±25.3 (M12) than in the UCA group (54.9±18.2 to 45.5±23.8) in the intent to treat bivariate and multivariate analyses (delta VAS-pain: 13.1±4.9, p<0.01). At M12, ODRA patients experienced a significant higher improvement than the UCA patients for PGA, all KOOS domains and for 3 of 5 domains of OAKHQOL (Pain, Physical activities, Mental health). Patients reaching PASS threshold at M12 were 42% in ODRA group vs 27% in UCA group (OR=3.04; 95% CI: 1.11 to 8.30; p<0.05) and were 46% vs 28% for MCII respectively (OR=2.65, 95% CI: 1.01 to 6.96; p<0.05). The overall analgesic use decreased more frequently in the ODRA group at M12 than in the UCA group (32.7% vs 15.4%, p<0.05) except for NSAIDs, HA or steroid injections. The compliance was good: the brace was worn for a median [IQR] duration of 5.7 [4.0–7.0] hours a day between M0 and M6 and 5.3 [3.7–6.3] hours a day between M6 and M12. Non-serious side effects were more common in the ODRA group (p<0.05) which justified the definitive withdrawal of the brace in 8 ODRA patients (13%), mainly for cutaneous side effects.

**Conclusions:** In this RCT, the use of the ODRA brace in addition to usual care was shown to be superior to usual care alone in reducing symptoms and improving quality of life of patients suffering from medial knee OA, with good compliance.

OP0058

#### LOW-DOSE RADIATION THERAPY AS TREATMENT FOR HAND AND KNEE OSTEOARTHRITIS: TWO DOUBLE-BLIND RCT'S

M. Minten<sup>1</sup>, E. Mahler<sup>1</sup>, M. Leseman-Hoogenboom<sup>2</sup>, S. Boks<sup>3</sup>, M. Kloppenburg<sup>4</sup>, J. W. Lee<sup>2</sup>, P. Poortmans<sup>5</sup>, F. van den Hoogen<sup>1,6</sup>, A. den Broeder<sup>1,6</sup>, C. van den Ende<sup>1,6</sup>. <sup>1</sup>Rheumatology, Sint Maartenskliniek; <sup>2</sup>Radiation Oncology, Radboud university medical centre; <sup>3</sup>Radiology, Sint Maartenskliniek, Nijmegen; <sup>4</sup>Rheumatology, Leiden university medical centre, Leiden, Netherlands; <sup>5</sup>Radiation Oncology, Institut Curie, Paris, France; <sup>6</sup>Rheumatology, Radboud university medical centre, Nijmegen, Netherlands

**Background:** Synovial inflammation plays an important role in osteoarthritis (OA) pathophysiology. In some countries, low-dose radiation therapy (LD-RT) is widely used as treatment for OA, while relatively unknown in others. Studies *in vitro* and in OA animal models have shown anti-inflammatory effects of LD-RT. However, systematic literature review has shown that high-level evidence for beneficial effects in clinical practice is lacking.

**Objectives:** To assess the effect of LD-RT on clinical outcomes and inflammation in patients with hand or knee OA, using two parallel prospective RCTs.

Abstract OP0058 – Responders over time with 95%CI

Abstract OP0058 – Table 1

	Hand OA		Knee OA	
	LD-RT (n=28)	Sham (n=28)	LD-RT (n=27)	Sham (n=28)
Male/Female, n	4/24	8/20	12/15	15/13
Age (years)	67 (1)	62 (12)	62 (9)	68 (9)
BMI (kg/m <sup>2</sup> )	26 <sup>24-27</sup>	29 <sup>26-31</sup>	29 <sup>25-30</sup>	26 <sup>24-31</sup>
Pain (0–100) #	54 (19)	56 (15)	41 (14)	39 (17)
Functioning (0–100) #	55 (25)	59 (16)	40 (17)	38 (19)
Effusion*	6 <sup>5-8</sup>	5 <sup>5-8</sup>	6 <sup>4-8</sup>	5 <sup>4-7</sup>
Synovial thickening*	3 <sup>1-4</sup>	1 <sup>1-3</sup>	2 <sup>1-3</sup>	2 <sup>1-3</sup>
Power Doppler*	1 [0–2.5]	1 [0–3]	NA	NA
MRI effusion/synovitis (0–12)	NA	NA	5 <sup>5-8</sup>	4 <sup>2-7</sup>

Mean (sd) or median [25%–75%]; lower scores indicate better health status  
#: AUSCAN or WOMAC, respectively; \* Hand: joint count (0–18), Knee: thickness (mm); NA: not assessed

**Methods:** Patients with hand OA (n=56) or knee OA (n=55) according to ACR-criteria, with a pain score  $\geq 5/10$ , not responding to analgesics and exercise therapy were included. They were randomly allocated 1:1 to the LD-RT (6 × 1 Gy LD-RT in two weeks) or sham (6 × 0 Gy in two weeks) intervention, stratified for pain score (<8 vs  $\geq 8$ ). The primary outcome was the number responders according to the OMERACT-OARSI responder criteria, 3 months post-intervention. Secondary outcomes were inflammatory aspects assessed by ultrasound (US; both knee and hand) and MRI (knee only). In hand OA, joints were scored semi-quantitatively (0–3) for US effusion, synovial thickening and power Doppler signal. In knee OA, we assessed the mean US effusion and synovial thickness (mm) at three locations, and the summed MRI effusion/synovitis (semi-quantitatively; 0–3) from four locations. Logistic and linear regression analyses were used to assess differences in dichotomous and continuous outcomes, respectively. Analyses were adjusted for pain stratum.

**Results:** Baseline characteristics are shown in table 1. The proportion of responders over time is shown in figure 1. After 3 months, in hand OA, there were 8 (29%) responders in the LD-RT group and 10 (36%) in the sham group (OR 0.69; 95% CI: 0.22 to 2.17). In knee OA, there were 12 (44%) responders in the LD-RT

group and 12 (43%) in the sham group (OR 1.09; 95% CI: 0.37 to 3.19). In both hand and knee OA, no significant changes in clinical outcomes and inflammatory aspects were observed in both groups.

**Conclusions:** We were unable to demonstrate a beneficial effect of LD-RT on pain and functioning, nor on inflammatory processes, in patients with hand or knee OA. In light of absence of other high-level evidence, we advise against the use LD-RT as treatment for hand and knee OA.

#### OP0059 EFFICACY AND SAFETY OF INTRA-ARTICULAR SPRIFERMIN IN SYMPTOMATIC RADIOGRAPHIC KNEE OSTEOARTHRITIS: PRE-SPECIFIED ANALYSIS OF 3-YEAR DATA FROM A 5-YEAR RANDOMISED, PLACEBO-CONTROLLED, PHASE II STUDY

M. Hochberg<sup>1</sup>, A. Guermazi<sup>2</sup>, H. Guehring<sup>3</sup>, A. Aydemir<sup>4</sup>, S. Wax<sup>4</sup>, P. Fleuranceau-Morel<sup>4</sup>, A. Reinstrup Bihlet<sup>5</sup>, I. Byrjalsen<sup>5</sup>, J. Ragnar Andersen<sup>5</sup>, F. Eckstein<sup>6,7</sup>.

<sup>1</sup>University of Maryland School of Medicine, Baltimore; <sup>2</sup>Boston University School of Medicine and Boston Imaging Core Lab, LLC, Boston, USA; <sup>3</sup>Merck KGaA, Darmstadt, Germany; <sup>4</sup>Global Clinical Development Center, EMD Serono, Inc., Billerica, USA; <sup>5</sup>Nordic Bioscience, Herlev, Denmark; <sup>6</sup>Institute of Anatomy, Paracelsus Medical University Salzburg and Nuremberg, Salzburg, Austria; <sup>7</sup>Chondrometrics GmbH, Ainning, Germany

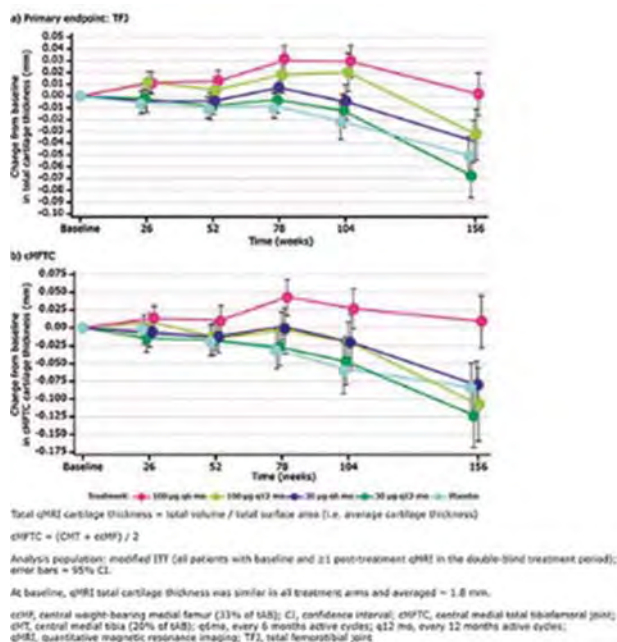

**Background:** Sprifermin, a novel recombinant human fibroblast growth factor 18, is currently being investigated as a potential disease-modifying osteoarthritis (OA) drug. Two-year results of the 5 year phase II FORWARD study showed a statistically significant dose-dependent cartilage thickness increase in the total femorotibial joint (TFJ), and in the medial, lateral and central medial sub-region TFJ compartments by quantitative magnetic resonance imaging (qMRI).

**Objectives:** Here we report the pre-specified 3 year results.

**Methods:** Patients (pts) aged 40–85 years with symptomatic radiographic knee OA, Kellgren-Lawrence grade (KLG) 2 or 3, and medial mJSW  $\geq 2.5$  mm in the target knee were randomised (1:1:1:1) to receive 3 weekly i.a. injections with double-blinded placebo (PBO) or sprifermin, administered q6mo (0, 6, 12, and 18 months) or q12mo (0 and 12 months). The primary endpoint was the change in TFJ cartilage thickness from baseline (BL) to Year 2 with pre-specified analyses at Year 3. The intent-to-treat (ITT) population (all randomised pts) was used for non-qMRI endpoints; and the modified ITT population (all ITT pts with BL and  $\geq 1$  post-treatment MRI up to Year 2) for qMRI endpoints.

**Results:** 549 pts were randomised (median age 65 years, 69% women, 80% white, 69% KLG2, and ~70% predominantly medial disease); of which 18.4% (sprifermin) and 24.1% (PBO) discontinued the study within 3 years. TFJ cartilage thickness decreased from Year 2 to 3 in all treatment groups; however, the 0.05 mm difference between sprifermin 100  $\mu$ g q6mo and PBO was maintained (0.00 vs –0.05 mm; p<0.001; figure 1a). Additionally, significant differences in mean cartilage thickness change from BL to Year 2 were maintained up to Year 3 with sprifermin 100  $\mu$ g vs PBO in both the medial (100  $\mu$ g q6mo –0.01 vs –0.06 mm; p=0.025) and lateral TFJ compartments (100  $\mu$ g q6mo and q12mo: +0.01 and 0.00 vs –0.04 mm; p<0.001 and p=0.003, respectively), and central medial (100  $\mu$ g q6mo: +0.009 vs –0.084 mm; p=0.008; figure 1b) and central lateral (100  $\mu$ g q6 and q12mo: +0.038 and +0.017 vs –0.053 mm; p<0.001 and p=0.003, respectively) TFJ sub-regions. The significant mean change from BL to Year 2 in lateral (but not medial) mJSW by X-ray was maintained up to Year 3 with both sprifermin 100  $\mu$ g groups vs PBO (100  $\mu$ g q6 and q12mo: +0.13 and +0.10 vs –0.11 mm; p=0.014 and p=0.040, respectively). By Year 2 total WOMAC scores were improved by ~50% in all treatment groups including PBO, and maintained up to Year 3 (18 months after last injection) without a significant difference between treatment groups. AEs and serious AEs remained balanced between groups at Years 2 and 3.

**Abstract OP0059** – Figure 1 Mean change from baseline in cartilage thickness (by qMRI) over 3 years in: a) and b)

**Conclusions:** The 3 year results of the FORWARD study are consistent with the 2 year results: although cartilage thickness declined in all treatment groups between Year 2 and 3, the difference at Year 2 with sprifermin 100 µg vs PBO was maintained up to Year 3. Based on qMRI sprifermin is effective at increasing cartilage thickness in a dose-dependent manner in knee OA patients, and has an acceptable safety profile.

## OP0060 KNEE JOINT DISTRACTION COMPARED WITH HIGH TIBIAL OSTEOTOMY AND TOTAL KNEE ARTHROPLASTY: TWO-YEAR CLINICAL, STRUCTURAL, AND BIOMARKER OUTCOMES

M. Jansen<sup>1</sup>, N. Besselink<sup>1</sup>, R. Van Heerwaarden<sup>2</sup>, R. Custers<sup>3</sup>, J.-T. Van der Woude<sup>1</sup>, K. Wiegant<sup>1</sup>, S. Spruijt<sup>2</sup>, P. Emans<sup>4</sup>, P. Van Roermund<sup>3</sup>, S. Mastbergen<sup>1</sup>, F. Lafeber<sup>1</sup>. <sup>1</sup>Rheumatology and Clinical Immunology, University Medical Center Utrecht, Utrecht; <sup>2</sup>Department of Orthopedic Surgery, Maartenskliniek Woerden, Woerden; <sup>3</sup>Department of Orthopedics, University Medical Center Utrecht, Utrecht; <sup>4</sup>Department of Orthopedics, Maastricht University Medical Center, Maastricht, Netherlands

**Background:** Knee joint distraction (KJD) is a new joint-preserving surgery technique that, like high tibial osteotomy (HTO), aims to delay total knee arthroplasty (TKA) especially in younger patients with knee osteoarthritis (OA). One year after treatment, KJD demonstrated similar beneficial outcomes compared to HTO and compared to TKA.<sup>1,2</sup>

**Objectives:** To compare radiographic joint space width and clinical outcome over two-years for KJD vs TKA and for KJD vs HTO and to additionally study KJD cartilage repair by evaluation of systemic collagen type II markers.

**Methods:** End-stage knee OA patients considered for TKA were randomised to KJD (n=20; KJD<sub>TKA</sub>) or TKA (n=40). Medial compartmental knee OA patients with a varus deviation of <10° considered for opening wedge HTO were randomised to KJD (n=23; KJD<sub>HTO</sub>) or HTO (n=46). Distraction surgery was performed by use of

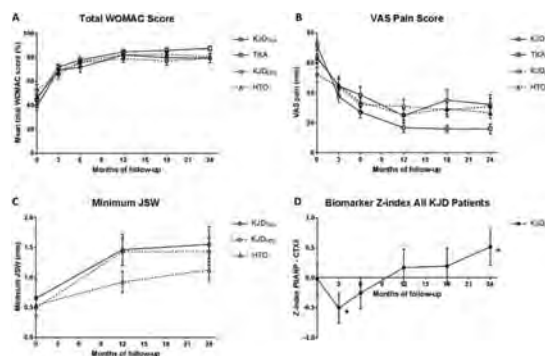

two external fixators with built in springs, placed lateral and medial of the knee joint. The knee was distracted 5 mm for 6 weeks and weight-bearing was encouraged.

WOMAC questionnaires (100 best) and VAS pain scores (0 best) were assessed at baseline (0), 3, 6, 12, 18 and 24 months. In the KJD groups, serum PIIANP and urine CTXII levels, as markers for collagen type II synthesis and breakdown, were determined over time. Normalised Z-indexes were calculated ( $Z_{index} = Z_{PIIANP} - Z_{CTXII}$ ) to express net collagen type II synthesis. The minimum and mean joint space width (JSW) of the most affected compartment (MAC) were measured with KIDA software on standardised radiographs taken at 0, 12 and 24 months.

**Results:** Of the 129 included patients, 1, 6, 3, and 5 patients were lost in the KJD<sub>TKA</sub>, TKA, KJD<sub>HTO</sub>, and HTO group respectively, for various reasons. One-year structural and clinical outcomes were statistically significantly improved as reported before, and these beneficial effects sustained for at least two years after treatment when compared to baseline (figure 1A-C).

At 24 months, there were no significant differences between the KJD<sub>HTO</sub> and HTO groups (all p>0.25) and between the KJD<sub>TKA</sub> and TKA group, except for VAS pain score in favour of TKA at 24 months (p=0.037; figure 1B).

Compared to baseline, the ratio of synthesis over breakdown of collagen type II biomarkers (figure 1D) was significantly decreased at 3 months (-0.45±0.20; p=0.032) after which this reversed towards an increase over time (at 24 months +0.59±0.19; p=0.004).

**Abstract OP0060** – Figure 1 Change in A) total WOMAC score and B) VAS pain score after treatment with knee joint distraction (KJD), total knee arthroplasty (TKA) and high tibial osteotomy (HTO). KJD patients are divided in KJD<sub>TKA</sub> (from the trial including patients for KJD and TKA) and KJD<sub>HTO</sub> (from the trial including patients for HTO and TKA). C) change in minimum joint space width (JSW) measured on radiographs after KJD and HTO. D) biomarker Z-index changes for all KJD patients (KJD<sub>TKA</sub> and KJD<sub>HTO</sub> combined) after treatment.  $Z_{index} = Z_{PIIANP} - Z_{CTXII}$ , where the Z-values for both biomarkers are relative to baseline and (\*) indicates statistically significant changes compared to baseline. In all graphs, the mean values ±SEM are given.

**Conclusions:** Sustained improvement of clinical benefit and increase in JSW after KJD is demonstrated for over 2 years of follow-up in case of treatment of patients with medial compartmental knee OA indicated for HTO or patients with end-stage knee OA indicated for TKA. The structural cartilage repair observed on radiographs is supported by a beneficial change in systemic biomarkers for collagen type II. For the HTO-indicated population, results of KJD patients were similar to those of HTO. For the TKA-indicated patients, TKA appeared to result in a slightly better clinical outcome, however at the expense of the native knee joint.

## OP0061 TREATMENT OF KNEE OSTEOARTHRITIS WITH SM04690 IMPROVED WOMAC A1 'PAIN ON WALKING' – RESULTS FROM A 52 WEEK, RANDOMISED, DOUBLE-BLIND, PLACEBO-CONTROLLED, PHASE 2 STUDY OF A NOVEL, INTRA-ARTICULAR, WNT PATHWAY INHIBITOR

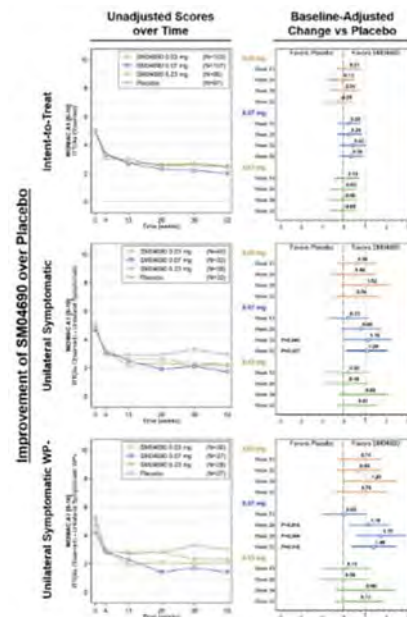

S. Kennedy<sup>1</sup>, H. Ghandehari<sup>1</sup>, C. Swearingen<sup>1</sup>, J. Tambiah<sup>1</sup>, M. Hochberg<sup>2</sup>. <sup>1</sup>Samumed, LLC, San Diego; <sup>2</sup>University of Maryland School of Medicine, Baltimore, USA

**Background:** Knee osteoarthritis (OA) is characterised by pain, disability and joint deformity due to articular cartilage degradation and bone remodelling. Wnt

signalling is involved in these cellular processes. SM04690, a small molecule, intra-articular (IA), Wnt pathway inhibitor, is in development for treatment of knee OA as a potential disease modifying drug.

**Objectives:** A phase 2, multicenter, 52 week, randomised, double-blind, placebo-controlled (PBO) trial of SM04690 was conducted. Safety and efficacy outcomes including the Western Ontario and McMaster Universities Arthritis Index (WOMAC) question A1 were evaluated.

**Methods:** Subjects with ACR-defined knee OA, Kellgren-Lawrence (KL) grades 2–3, received a single 2 mL IA injection of SM04690 (0.03, 0.07 or 0.23 mg) or PBO in the target (most painful) knee. WOMAC was assessed at baseline and 4, 13, 26, 39 and 52 weeks post-injection. WOMAC question A1, ('how much pain have you had when walking on a flat surface?'), was analysed as an exploratory outcome. Analysis of covariance adjusted for WOMAC A1 baseline in the intent-to-treat (ITT) population was conducted. Two subgroups identified in the primary analysis<sup>1</sup> were also explored: 1) subjects with unilateral symptomatic knee OA (pre-specified) and 2) subjects with unilateral symptomatic knee OA without widespread pain or comorbid symptoms (Widespread Pain Index $\leq$ 4 and Symptom Severity $\leq$ 2 [WP-], post-hoc).

**Abstract OP0061 – Figure 1.** Change and ladder plots depicting average WOMAC A1 improvement in SM04690 over placebo adjusted for baseline WOMAC A1. \*Minimal clinically improvement difference (MCID) defined as 10% of WOMAC A1.

**Results:** 455 subjects, mean age 60.3 [ $\pm$ 8.7] years, BMI 29.9 [ $\pm$ 4.6] kg/m<sup>2</sup>, female 58.9%, KL 3 [64.1%], with unilateral symptomatic OA [36.0%] were enrolled (n=402 [88.4%] completers). No safety signals were observed.

For WOMAC A1, in the ITT population, no statistically significant differences between treatment groups and PBO were seen, although the 0.07 mg dose demonstrated improvements compared to PBO at all timepoints (figure 1). In unilateral symptomatic subjects, 0.07 mg showed statistically significant improvements in WOMAC A1 compared to PBO at Weeks 39 (-1.2, 95% CI: [-2.3 to -0.0], p=0.043) and 52 (-1.1, 95% CI: -2.0 to -0.1, p=0.027).

In unilateral symptomatic WP- subjects, the 0.07 mg dose showed statistically significant improvements in WOMAC A1 compared to PBO at Week 26 (-1.2, 95% CI: -2.1 to -0.2, p=0.015), through Weeks 39 (-1.8, 95% CI: -3.0 to -0.6, p=0.004) and 52 (-1.4, 95% CI: -2.5 to -0.4, p=0.010).

**Conclusions:** In this phase 2 study, improvements compared to PBO in WOMAC A1 were seen in clinically relevant unilateral symptomatic and unilateral symptomatic WP- subgroups. The improvements seen in this combined, multi-dimensional outcome of pain and function suggested SM04690 has a potential role in the treatment of signs and symptoms of knee OA.

#### LB0002 BIOMECHANICAL THERAPY FOR OSTEOARTHRITIS OF THE KNEE: A RANDOMISED CONTROLLED TRIAL (BIOTOK)

S. Reichenbach<sup>1</sup>, S. Heldner<sup>1</sup>, A. Lenz<sup>1</sup>, D. Felson<sup>2,3</sup>, P. Jüni<sup>4</sup>. <sup>1</sup>University of Bern, Bern, Switzerland; <sup>2</sup>Clinical Epidemiology Unit, Boston University, Boston, USA; <sup>3</sup>Arthritis Research UK Centre for Epidemiology, Manchester, UK; <sup>4</sup>Applied Health Research Centre (AHRC), Toronto, Canada

**Background:** Biomechanics plays an important role in knee osteoarthritis (OA). A new biomechanical footwear system aims at altering knee loading patterns and retraining neuromuscular control of the lower extremities. It consists of shoes with two adjustable convex pods at the soles, which are adjusted based on gait analysis, with the hypothesis that adjustments of the location of the pods will alter limb biomechanics so as to unload diseased compartments of the knee and that walking on the convex pods will facilitate muscular retraining.

**Objectives:** The aim of this trial was to compare the efficacy and safety of the new biomechanical footwear with an identical appearing shoe with flat pods (the sham device) in relieving pain and improving physical function in patients with knee OA.

**Methods:** In this randomised sham-controlled trial, patients with radiological knee OA (Kellgren-Lawrence grade  $\geq$ 2), knee pain lasting for  $\geq$ 6 months, and moderate pain on the WOMAC pain subscale ( $\geq$ 3 on a standardised scale from 0 to 10) were randomly assigned 1:1 to the biomechanical footwear or the sham device. The same shoe or device was provided for bilateral use. Patients in both groups were instructed to use the footwear for 30 minutes/day during the first week, and to increase use by 10 minutes/day each week to a maximum of 5 hours/day at 24 weeks. After 4, 8, 12, and 16 weeks, each patient's footwear

**Abstract LB0002 – Figure 1**

was re-calibrated by technicians. Because the sham device had no adjustable pods on the soles, technicians pretended to make appropriate changes.

The primary endpoint was knee pain at the end of treatment in the knee with more pain at screening, assessed with the WOMAC pain subscale. Secondary outcomes were WOMAC physical function and stiffness subscales. All subscales were standardised to range from 0 to 10. These outcomes were analysed using linear models adjusted for baseline values and the two stratification factors uni- vs. bilateral, and medial vs. lateral osteoarthritis at randomization, using multiple imputation.

**Results:** Of 697 patients assessed for eligibility, 220 were randomised: 111 to the experimental footwear and 109 to the sham device. The mean age was 65.2 years (SD 9.2) and the mean body mass index was 28.0 (SD 4.6). Overall, 47.3% were women and 88.2% had medial knee OA in the index knee. The mean WOMAC pain score at baseline was 4.1 (SD 1.9). Seven patients in the experimental group and 13 in the sham group dropped out. At the end of the trial, the adjusted mean difference for WOMAC pain was 1.34 (95% CI: 0.92 to 1.77) in favour of the experimental footwear. The adjusted mean difference was 1.42 (0.93 to 1.91) for WOMAC stiffness and 1.12 (0.73 to 1.50) for WOMAC physical function (figure 1). Three serious adverse events occurred in the experimental group, compared with 9 in the sham group; none were treatment-related. Thirty adverse events occurred in the experimental group, compared with 36 in the sham group; 18 and 17 of these, respectively, were possibly treatment-related.

**Conclusions:** This trial suggests that the new biomechanical footwear system is both efficacious and safe in relieving knee pain in patients with knee OA.

## Fracture risk and consequences

### OP0062 OSTEOPOROTIC HIP FRACTURES IN MEN: A RISING CONCERN

M. Sehgal<sup>1</sup>, A. Mithal<sup>2</sup>, A. Mithal<sup>3</sup>, G. Singh<sup>4</sup>. <sup>1</sup>Menlo Atherton High School, Atherton; <sup>2</sup>UCLA, Los Angeles; <sup>3</sup>ICORE, Woodside; <sup>4</sup>Stanford University, Palo Alto, USA

**Background:** Osteoporosis screening and treatment is often exclusively targeted at post-menopausal women. The US Preventive Task Force guidelines recommend bone density screening in women starting at age 65, but do not make any similar recommendation for men, even though men have higher mortality than women after a hip fracture.<sup>1</sup> Recent improvements in health care has led to increasing lifespan of men in US. As more men enter the seventh and eighth decades of their life, they are at more risk for developing osteoporosis and osteoporotic hip fractures.

**Objectives:** To study the number and prevalence of hospitalizations for osteoporotic hip fractures in the men and women aged 50 years and up in the US over 23 years (1993–2015).

**Methods:** The National Inpatient Sample (NIS) is a stratified random sample of all US community hospitals and is the only US national hospital database with information on all patients, regardless of payer, including persons covered by Medicare, Medicaid, private insurance, and the uninsured. We examined all inpatient hospitalizations in NIS from 1993 to 2015 with a primary diagnosis of non-traumatic (osteoporotic) hip fractures in individuals 50 years and older. Patients were excluded if there was any evidence of major trauma, open fractures, or primary or secondary femoral tumours. US population estimates and projections for the resident US population were obtained from the US Census Bureau. All prevalence rates were expressed per 1 00 000 of the US population.

**Results:** From 1993 to 2015, we studied 6.3 million osteoporotic hip fracture hospitalizations in 1.99 billion person-years of observation in individuals who were 50 years or older. Of these, 74% occurred in women. Hip fracture hospitalizations in women decreased from 2 09 052 in 1993 (prevalence 562 per 1 00 000 person-years) to 2 01 435 in 2015 (340 per 1 00 000 person-years), even as the population of 50 years and older women increased from 37 million in 1993 to 59 million in 2015 (59% increase in population), perhaps reflecting increasing awareness, screening and treatment for osteoporosis in elderly women. However, in men aged 50 years and older, osteoporotic hip fracture hospitalizations increased from 64 339 in 1993 to 83 885 in 2015, even as the prevalence decreased from 218 per 1 00 000 person-years in 1993 to 162 per 1 00 000 person-years in 2015. The 30% increase in the absolute number of hip fracture hospitalizations, despite decreasing prevalence, is coincident with the 75% rise in the number of the 50 years and older men population, from 29.6 million in 1993 to 51.7 million in 2015.

Abstract OP0062 – Figure 1. Hip fracture hospitalisation in the US

**Conclusions:** Despite an overall decrease in prevalence, the absolute number of osteoporotic hip fracture hospitalizations increased in 50 years and older men. More attention needs to be paid to prevention of osteoporotic hip fractures in this cohort.

### OP0063 PERIPHERAL ARTERIAL DISEASE AND RISK OF OSTEOPOROTIC HIP FRACTURE: A SYSTEMATIC REVIEW AND META-ANALYSIS OF COHORT STUDIES

P. Ungprasert<sup>1</sup>, K. Wijarnpreecha<sup>2</sup>, C. Thongprayoon<sup>2</sup>, W. Cheungpasitporn<sup>3</sup>.

<sup>1</sup>Research and development, Faculty of Medicine Siriraj Hospital, Mahidol University, Bangkok, Thailand; <sup>2</sup>Medicine, Bassett medical center, cooperstown; <sup>3</sup>Medicine, University of Mississippi Medical Center, Jackson, USA

**Background:** Previous studies have demonstrated that patients with peripheral arterial disease (PAD) had lower bone mineral density, particularly in the femur, compared with general population. Therefore, it is possible that patients with PAD may have a higher risk of osteoporotic hip fracture.

**Objectives:** To compare the risk of developing hip fracture between patients with PAD and individuals without PAD.

**Methods:** A systematic literature search was conducted using EMBASE and MEDLINE database from inception to November 2017 to identify all cohort studies that investigated the risk of incident hip fracture among patients with PAD compared with individuals without PAD. The systematic literature review was independently conducted by the first two investigators using the search strategy that included the terms for 'peripheral arterial disease' and 'hip fracture'. Eligible studies must be cohort studies (either prospective or retrospective) that reported the risk of incident hip fracture among patients with PAD. Comparators must be individuals without PAD. Eligible studies must provide the effect estimates (relative risks (RR) or hazard ratios (HR)) with 95% confidence intervals (CI) for the calculation of pooled effect estimates. Adjusted point estimates from each study were combined together using the random-effect, generic inverse variance method as described by DerSimonian and Laird.

**Results:** Of 8464 retrieved articles, 6 cohort studies (3 prospective cohort studies and 3 retrospective cohort studies) involving 15 895 patients with PAD and 2 33 835 comparators without PAD met the eligibility criteria and were included in the meta-analysis. We found a significantly increased risk of incident hip fracture among patients with PAD compared with individuals without PAD with the pooled RR of 1.64 (95% CI: 1.17 to 2.29). The statistical heterogeneity was high with an  $I^2$  of 80%. Subgroup analysis by study design showed a significantly increased risk of incident hip fracture among patients with PAD for both prospective studies (pooled RR 1.60; 95% CI: 1.12 to 2.28;  $I^2$ 0%) and retrospective studies (pooled RR 1.72; 95% CI: 1.07 to 2.77;  $I^2$ 92%) as shown in figure 1.

**Conclusions:** In summary, this study demonstrated a significantly increased risk of incident hip fracture among patients with PAD compared with individuals without PAD.

### OP0064 GENERAL BONE LOSS IN PATIENTS WITH EROSIVE AND NON-EROSIVE HAND OSTEOARTHRITIS DURING THREE YEARS

O. Ruzickova, K. Pavelka, L. Senolt, O. Sleglova. *revmatology, Institute of revmatology, Prague 2, Czech Republic*

**Background:** Hand osteoarthritis (OA) and its more severe subset erosive hand OA are common causes of pain and morbidity. Some metabolic factors were suggested to be implicated in erosive disease. Few studies investigated differences in systemic bone loss between erosive and non-erosive hand OA.

**Objectives:** To compare the change of bone mineral density (BMD) between patients with erosive and non-erosive hand OA in a longitudinal study after three years.

**Methods:** American College of Rheumatology (ACR) criteria were used to assess hand OA. Erosive hand OA was defined by at least one erosive interphalangeal joint. All patients underwent clinical assessments of joint swelling and radiographs of both hands. DEXA examination of lumbar spine, total femur and femur neck was performed at baseline and after three years. Metabolic risk factors (body mass index, hypertension, diabetes, dyslipidaemia) were collected.

**Results:** Altogether, 144 patients (15 male) with symptomatic nodal HOA were included in this study and followed between April 2012 and January 2018. Out of these patients, 82 had erosive disease after three years. The disease duration (p<0.01) was significantly higher in patients with erosive compared with non-erosive disease.

Most patients took symptomatic slow acting drugs (SYSADOA) twice a year, non-steroidal anti-inflammatory drugs (NSAIDs) and analgesics on demand.

Baseline population characteristics did not differ between both groups. Osteoporosis (T-score <-2.5 SD) was diagnosed in 12.5% (9/72) of patients with erosive hand OA and in 8.06% (5/57) of patients with non-erosive hand OA. Although BMD did not significantly differ between the groups (BMD of lumbar spine 1,05 g/cm<sup>2</sup> vs 1,13 g/cm<sup>2</sup>, p<0.05, total femur 0,90 g/cm<sup>2</sup> vs 0,97 g/cm<sup>2</sup>, p<0.01 and femur neck 0,86 g/cm<sup>2</sup> vs 0,91, p<0.05), T-scores of lumbar spine (-0.96 vs -0,41 SD, p<0.05), total femur (-0.69 vs

-0,33SD, p<0.05) and femur neck (-1,14 vs -0,88 SD, p<0.05) were significantly lower in patients with erosive compared with non-erosive disease.

After three years, the decrease in T- score of lumbar spine was significantly higher in erosive hand OA compare to non-erosive disease (-3,66% vs 15,52%, p<0.01), also the decrease of T-score in total femur was significantly higher in erosive hand OA compare to non-erosive disease (-4,29% vs 7,68%, p<0.05).

The decrease of bone mineral density was also significantly higher in patients with erosive hand OA after three years. The decrease of BMD of lumbar spine was significantly higher in erosive hand OA after three years compare to non-erosive disease (-3,30% vs 1,06%, p<0,05), the decrease of BMD in femur neck was significantly higher in erosive hand OA after three years compare to non-erosive disease (-3,2% vs 0,02%, p<0,05), the decrease of BMD total femur neck was significantly higher in erosive hand OA after three years compare to non-erosive disease (-1,58% vs 0,82%, p<0,05).

**Conclusions:** These results suggest that patients with erosive hand OA are at higher risk for development of deep general bone loss.

### OP0065 OSTEOPOROSIS AND VERTEBRAL FRACTURES ARE ASSOCIATED WITH DISEASE ACTIVITY AND RADIOGRAPHIC DAMAGE IN PATIENTS WITH AXIAL SPONDYLOARTHRITIS

C. Romera-Lopez<sup>1</sup>, C. Fernández-Carballido<sup>2</sup>, M. Martínez-Vidal<sup>3</sup>, T. Pedraz<sup>2</sup>.

<sup>1</sup>Reumatología, Hospital Vinalopo, Elche, Alicante; <sup>2</sup>Reumatología, Hospital General Universitario de Elda, Alicante, Elda, Alicante; <sup>3</sup>Reumatología, Hospital general Universitario de Alicante, Alicante, Spain

**Background:** Osteoporosis (OP) and vertebral fractures (VF) are common comorbidities of axial Spondyloarthritis (axSpA) with deleterious effects for the physical function of the patients.

**Objectives:** To evaluate the relationship between disease activity and radiographic damage and bone mineral density (BMD), 25 (OH) vitamin D levels and VF in patients with axSpA (ASAS Criteria).

**Methods:** Cross-sectional study. Activity variables: Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) and Ankylosing Spondylitis Disease Activity Score (ASDAS); ESR and CRP. Vitamin D insufficiency if <30 ng/mL. Lumbar Spine (LS) and femoral neck (FN) Dual X-ray absorptiometry (DXA) performed. Evaluation of VF with semiquantitative method (Genant) in thoracolumbar X-rays. Bivariate analysis to evaluate the associations with the presence of OP and/or VF, then binary and multiple logistic regression models, by using SPSS (v23); p values<0.05 considered significant.

**Results:** We studied 206 patients (62 women/144 men); 86% AS/14% nr-axSpA and associated peripheral involvement in 42%. Mean ±standard deviation (SD) values: age 52±14; activity (BASDAI 3.6±2.2, ASDAS-CRP 2.2±0.95, ASDAS-ESR 2.5±0.99, CRP 4.97±8.97 mg/L, ESR 18.2±14, 8 mm); physical function (BASFI 3.3±2.7); radiographic damage: mSASSS total 20.46±19.14, lumbar 10.41±9.89 and cervical 10.05±10.78; 25 (OH)vitD 19.83±9.25 ng/mL, 85.7% of the patients had insufficiency. Low LS BMD in 25.7% (z-score) and 28.9% (t-score) and low FN BMD in 45.2% (z) and 28.9% (t) of the patients. OP prevalence in LS 3.2%(z)/6.9%(t) and in FN 9.1% (z)/13.4% (t). Morphometric VF were identified in 34% of the patients.

Bivariate analysis: ESR, ASDAS-ESR, age, male sex, low 25 (OH) vitD levels and the mSASSS were associated with low FN BMD. Multivariate models confirmed the association between disease activity (ASDAS-ESR [OR 3.32 (95% CI: 2.35 to 4.55); p=0.016], 25(OH)D [OR 0.95 (95% CI: 0.86 to 0.98); p=0.029] and low FN BMD (z score).

An association was confirmed between CRP [OR 2.34 (95% CI: 1.10 to 4.98); p=0.027], radiographic damage [lumbar mSASSS OR 1.06 (95% CI: 1.03 to 1.10) p=0.001], high LS BMD [OR 296 (95% CI: 5.07 to 12258); p=0.006] and low FN BMD [OR 0.11 (95% CI: 0.03 to 0.12); p=0.000] and the presence of VF.

**Abstract OP0065 – Table 1.** Differences between patients without or with VF

	Without VF	With VF	p value
CRP (mg/L)	5.10±1.6	9.51±2.1	p=0.003
ESR (mm/h)	15.87±4.8	23.12±6.2	p=0.002
25OHvitD (ng/mL)	20.80±4.6	18.04±3.7	p=0.049
cervical mSASSS	8.02±2.5	13.11±4.8	p=0.002
lumbar mSASSS	8.93±3.7	12.36±6.5	p=0.000
total mSASSS	17.66±7.3	27.13	p=0.000
		±10.7	
LS BMD	1.090	1.191	p=0.002
	±0.09	±0.13	
FN BMD	0.912	0.773	p=0.000
	±0.11	±0.18	

**Conclusions:** In patients with axSpA, low FN BMD is associated with disease activity and vitamin D insufficiency and VF are associated with CRP and low hip bone mass. Furthermore, the presence of radiographic damage, even when 'falsely' increases LS BMD, is associated with the presence of fractures.

OP0066

### RISK OF FRACTURE AND LOW MINERAL DENSITY IN ADULTS WITH INFLAMMATORY BOWEL DISEASES. A SYSTEMATIC LITERATURE REVIEW WITH META-ANALYSIS

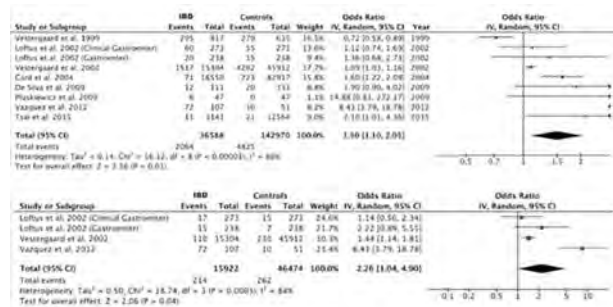

P. Szafors<sup>1</sup>, C. Lukas<sup>1</sup>, T. Barnetche<sup>2</sup>, J. Morel<sup>1</sup>, C. Gaujoux-Viala<sup>3</sup>, B. Combe<sup>1</sup>, H. Che<sup>1</sup>. <sup>1</sup>Lapeyronie Hospital and University of Montpellier, Montpellier; <sup>2</sup>FHU ACRONIM, Pellegrin University Hospital, Bordeaux; <sup>3</sup>Nîmes University Hospital, Nîmes, France

**Background:** Inflammatory bowel disease (IBD) such as Crohn's disease (CD) and ulcerative colitis (UC) is associated with decreased mineral density caused by chronic inflammation and corticosteroid use. However, the increase of fracture risk is unknown and differs according to studies.

**Objectives:** The aim of our study is to assess the risk of fracture and low bone mineral density (BMD) in patients with IBD compared to the general population.

**Methods:** A systematic search of literature up to 1 st February 2017 was conducted using databases including: MEDLINE (via PUBMED), EMBASE, the Cochrane library and abstracts from the ACR, ASBMR and EULAR congresses from 2014 to 2016. Prospective and retrospective cohort studies were included if they reported the incidence of fractures and/or the measure of BMD by dual energy X-ray absorptiometry (DEXA) (expressed in g/cm<sup>2</sup>) in IBD patients in comparison with healthy controls. Meta-analysis was performed to assess odds-ratios (OR) for each studied group using the inverse variance approach to estimate pooled OR with their 95% confidence interval. Heterogeneity was assessed according to Cochran's Q-test and I<sup>2</sup> values. Calculations were made with the Cochrane RevMan 5.3 software. P-values less than 0.05 were considered as significant. Data was extracted by two independent investigators.

**Results:** The literature search identified 1165 articles and no congress abstracts; a manual search did not retrieve any articles. Finally, 25 studies met the inclusion criteria. 9 of them reported 2065 fracture events among 42,615 IBD patients and 4825 fracture events among 2 03 240 healthy controls. Global risk of fracture was increased in IBD patients compared with controls with pooled OR at 1.50 (95% CI: 1.10 to 2.05; p=0.01). The pooled OR of vertebral fracture was 2.26 (95% CI: 1.04 to 4.90; p<0.001). Fracture risk was not significantly increased for any other site (arm, hip, wrist). The analysis of 17 studies concerning BMD showed the significant decrease of BMD and Z-score at three sites. At femoral neck, mean difference (MD) of BMD was -0.05 (95% CI: -0.08 to -0.02; p=0.001) and MD of Z-score -0.48 (95% CI: -0.64 to -0.33 P<0.00001). At total femur, this values was respectively -0.08 (95% CI: -0.11 to -0.05, p<0.00001) and -1.01 (95% CI: -1.52 to -0.50 ; p=0.07), and at lumbar spine -0.06 (95% CI: -0.10 to -0.03, p=0.0003) and -0.51 (95% CI: -0.68 to -0.34 ; p<0.0001).

**Conclusions:** IBD patients have an increased risk of fractures, especially vertebral ones, suggesting the need for regular follow-up and preventing measures.

OP0067

### DICKKOPF-1 (DKK1) SERUM LEVELS AND BONE QUALITY (TBS EVALUATION) IN PATIENTS WITH SYSTEMIC SCLEROSIS AND RHEUMATOID ARTHRITIS

A. Casabella<sup>1</sup>, B. Ruaro<sup>1</sup>, S. Paolino<sup>1</sup>, C. Pizzorni<sup>1</sup>, E. Alessandri<sup>1</sup>, C. Serio<sup>2</sup>, D. Fasciolo<sup>1</sup>, G. Botticella<sup>2</sup>, L. Molfetta<sup>2</sup>, P. Odetti<sup>2</sup>, B. Serio<sup>2</sup>, M. Cutolo<sup>1</sup>. <sup>1</sup>Department of Internal Medicine, Di.M.I. Polyclinic Hospital, San Martino, University of Genoa, Genoa Italy, Research Laboratory and Academic Division of Clinical Rheumatology; <sup>2</sup>Department of Internal Medicine, Di.M.I. Polyclinic Hospital, San Martino, University of Genoa, Genoa Italy, Osteoporosis, Bone and Joint Disease Research Center, CROPO, Genova, Italy

**Background:** Systemic sclerosis (SSc) as well as rheumatoid arthritis (RA) patients present an increased risk of osteoporosis (OP) as a result of the chronic inflammatory state, low vitamin D, immobilisation and other causes. The Wnt/ $\beta$ -catenin pathway is signalling identified like a key promoters of the osteoblastogenesis hence of the new bone formation in inflammatory conditions. Dickkopf-1 (DKK1) is a natural inhibitor of Wnt signalling pathway that could be involved in promoting osteoclastogenesis through suppression of osteoprotegerin.<sup>1</sup> Trabecular Bone Score (TBS) is an index of bone quality extracted from dual-energy X-ray absorptiometry (DXA) analysis.<sup>2</sup>

**Objectives:** In this study, bone mineral density (BMD) and Dkk-1 levels were evaluated in SSc patients, in order to investigate possible associations between systemic OP and/or osteopenia and Dkk-1 concentrations, according to their different nailfold videocapillaroscopic (NVC) patterns of microangiopathy (NVC patterns 'Early', 'Active', and 'Late')<sup>3</sup> in SSc patients and to compare the results regarding bone quality with RA patients and healthy subjects (CNT).

**Methods:** Eighty-four SSc patients, 98 rheumatoid arthritis (RA) and 60 CNT were studied. Dkk-1 serum levels were measured by ELISA methods (Quantikine Human DKK-1 Immunoassay R and D System, Minneapolis, USA). Bone Mineral Density (BMD, g/cm<sup>2</sup>) of the lumbar spine (L1-L4) was analysed by dual-energy X-ray absorptiometry (DXA) scan. Lumbar spine bone quality was derived from each spine DXA examination using the TBS analysis. Nailfold videocapillaroscopic (NVC) patterns were analysed as previous reported.<sup>3</sup> 25 hydroxyvitamin D (25(OH)D ng/ml) serum concentration was evaluated in all subjects.

**Results:** Serum DKK-1 levels were significantly higher in patients with SSc than in CNT (2892±1121 pg/ml vs 2044±692 pg/ml, p<0.007). Dkk-1 levels were statistically significantly higher in patients with 'Late' SSc pattern than in those both 'Active' and 'Early' pattern (3467±954.1 pg/ml, 2290±487.8 pg/ml, 1827±888.3 pg/ml respectively, p<0.0001). A negative correlation between Raynaud's phenomenon duration (years expressed) (p<0.01) and Dkk-1 levels (p<0.001) was also observed. TBS values were found statistically higher in SSc with a 'Early' NVC pattern, compared to the 'Active' or 'Late' pattern. (p<0.001). Only in the 'Late' NVC pattern group a significant negative correlation was observed between TBS and Dkk-1 values (p<0.001). No statistical significant difference was observed in the three groups about DXA values (p=0.13, for all areas). Serum levels of 25 (OH) D were statistically significantly higher in patients with 'Early' SSc pattern than in those both 'Active' and 'Late' NVC pattern (19.1±7.5, 15.1±5.3, 12.1±7.1 respectively, p=0.002).

**Conclusions:** The data obtained showed a significantly increased of Dkk-1 serum concentrations together and a decreased bone mass (lower TBS and BMD) in SSc patients compared to CNT. The bone quality seems lower in SSc patients with more altered microvasculature ('Late' NVC pattern).

OP0068

### SHORT TERM EFFECTS OF AMBIENT AIR POLLUTION ON OSTEOPOROTIC HIP FRACTURE. AN ECOLOGICAL STUDY IN A PERIOD OF 16 YEARS

R. Mazzucchelli<sup>1</sup>, E. Pérez-Fernández<sup>1</sup>, J. Quirós<sup>1</sup>, N. Crespi Villarias<sup>2</sup>, A. García-Vadillo<sup>3</sup>. <sup>1</sup>Hospital U. Función Alcorcón; <sup>2</sup>C.S La Rivota, Alcorcón; <sup>3</sup>H. U. La Princesa, Madrid, Spain

**Objectives:** To examine the short-term effects of outdoor air pollution on the incidence of osteoporotic HFx in a southern European region.

**Methods:** This is a retrospective cohort study based on data from three databases. Daily HFx incidence was calculated using discharge data from the hospital of Alcorcón for the period 2000–2015. Daily weather conditions were compiled from records of the national meteorological station (AEMET). Daily air pollutant levels (mcg/m<sup>3</sup>) were calculated from data from the Ministry of Environment for the Madrid Community: sulfur dioxide (SO<sub>2</sub>), nitrogen monoxide (NO), nitrogen dioxide (NO<sub>2</sub>), ozone (O<sub>3</sub>) and particulate matter in suspension <2.5 µm (PM<sub>2.5</sub>) and <10 µm (PM<sub>10</sub>), for the same period. Pollutant concentrations were categorised into quartiles (Q1 to Q4, lowest to highest). Associations between HFx incidence and air pollutant levels were examined through Generalized Additive Models (GAM) at a daily level with Poisson link function. Models were adjusted for a penalised spline function of time.

**Main outcome measures:** Daily hospital admissions for hip fracture.

**Results:** HFx incidence showed a direct association with NO, NO<sub>2</sub>, PM<sub>2.5</sub> and PM<sub>10</sub> and inverse association with O<sub>3</sub> levels. Incidence rate ratios for Q1vsQ2, Q1vsQ3 and Q1vsQ4 respectively were: 1.171 (1.103–1.244), 1.245 (1.173–1.322) and 1.331 (1.253–1.414) for NO; 1.057 (0.996–1.122), 1.185 (1.116–1.259) and 1.276 (1.199–1.357) for NO<sub>2</sub>; 1.028 (0.943–1.12), 1.092 (1.006–1.185) and 1.146 (1.049–1.253) for PM<sub>2.5</sub>; 1.083 (1.016–1.155), 1.099 (1.034–1.168) and 1.213 (1.136–1.294) for PM<sub>10</sub>; and 0.975 (0.914–1.04), 0.868 (0.815–0.924) and 0.814 (0.765–0.867) for O<sub>3</sub>. These associations persisted when the models were corrected for season, day of the week and weather conditions. When participants were stratified by age and sex, associations persisted only in women older than 75 years.

**Conclusions:** A short-term effect was observed of several indicators of air pollution on hip fracture incidence. This is the first study that finds this association.

OP0069

#### THE RELATIONSHIP BETWEEN ESTIMATED BONE STRENGTH BY FINITE ELEMENT ANALYSIS AT THE PERIPHERAL SKELETON TO AREAL BMD AND TBS AT LUMBAR SPINE IN ADULTS

J.C. Alvarenga<sup>1</sup>, S. Boyd<sup>2</sup>, R. Pereira<sup>1</sup>. <sup>1</sup>Faculty of Medicine/University of Sao Paulo, Sao Paulo, Brazil; <sup>2</sup>McCaig Institute for Bone and Joint Health, University of Calgary, Calgary, Canada

**Background:** Bone strength, estimated by finite element (FE) analysis based on high resolution peripheral quantitative computed tomography (HR-pQCT) images is an important contributor to understanding risk of fracture. However, it is a peripheral device and cannot be evaluated *in vivo* at lumbar spine L1-L4.

**Objectives:** The aim of this study was to investigate if the axial bone quality can be predicted by strength measurements of peripheral bone.

**Methods:** Peripheral bone microarchitecture, areal bone mineral density (aBMD) and trabecular bone score (TBS) were measured in adults individuals (n=262, 60 years and older; 63% women). Stiffness and failure load were estimated by FE analysis at HR-pQCT images at radius and tibia. Areal BMD and TBS were measured by dual energy X-ray absorptiometry (DXA) at L1-L4. Correlations between peripheral and axial data were estimated for each gender adjusted by age, weight, and height.

**Results:** Areal BMD L1-L4 resulted in weak to moderate significant correlations with stiffness and failure load at radius (women: R<sup>2</sup>=0.178, p<0.05 and R<sup>2</sup>=0.187, p<0.001, respectively; men: R<sup>2</sup>=0.454 and R<sup>2</sup>=0.451, p<0.001, respectively) and at tibia (women: R<sup>2</sup>=0.211 and R<sup>2</sup>=0.216, p<0.001, respectively; men: R<sup>2</sup>=0.488 and R<sup>2</sup>=0.502, p<0.001, respectively). TBS showed a very weak or no correlation with stiffness and failure load at radius (women: R<sup>2</sup>=0.148 and R<sup>2</sup>=0.150, p<0.05, respectively; men: R<sup>2</sup>=0.108 and R<sup>2</sup>=0.106, p<0.05, respectively) and at tibia (women: R<sup>2</sup>=0.146 and R<sup>2</sup>=0.150, p<0.05, respectively; men: R<sup>2</sup>=0.072 and R<sup>2</sup>=0.078, respectively).

**Conclusions:** These data suggest that aBMD L1-L4 was better explained by peripheral bone strength characteristics than the TBS, mainly in men and tibia is generally the site with a better relationship.

## New drugs – new perspectives: clinical and regulatory issues concerning biosimilars

### OP0070-HPR IS PATIENTS' SATISFACTION WITH BEING SWITCHED TO A BIOSIMILAR MEDICATION ASSOCIATED WITH THEIR LEVEL OF HEALTH LITERACY? RESULTS FROM A NORWEGIAN USER SURVEY

M. Cvancarova Småstuen<sup>1</sup>, M. Brandvold<sup>2</sup>, R. Andenæs<sup>1</sup>. <sup>1</sup>Public Health, Oslo Metropolitan University; <sup>2</sup>Intensive Care, Oslo University Hospital, Oslo, Norway

**Background:** Economically motivated switching to biosimilar medication has been practiced in Norway since March 2016. There are several studies comparing the efficacy, safety and immunogenicity of biosimilars, however no studies have yet described patients' experiences and attitudes towards economically motivated switching.

**Objectives:** The aim of this study was to describe patients' experiences regarding being switched to an alternative medication (the switch) and further to investigate possible associations between such switching and health literacy.

**Methods:** Potential users of Etanercept or Infliximab were asked to participate using three patients' interest associations. Data from this convenience sample was collected using a web-survey in January 2017. Attitudes and experiences with a possible switch to an alternative medications were assessed using several questionnaires. In addition, data on gender, age and marital status were collected. Patients' experiences, attitudes and satisfaction were assessed using a self-developed questionnaire. In addition, health related literacy was measured using The Health Literacy Questionnaire<sup>1</sup> a multi-dimensional validated questionnaire. We used three domains covering patients' ability to actively engage with health care providers (Scale 6), ability find good health information (Scale 8) and understanding health information well enough to know what to do (Scale 9). Data were analysed using multiple logistic regression and the results expressed as odds for being satisfied with the switch.

**Results:** Of all included responders (n=290), 155 reported being switched to a biosimilar medication in 2016. Median age was 51 years, range 20–74. The majority of responders were females, 61% (n=176) and more than half (51%) completed higher education. Over 80% of those who were switched (economically motivated switch to a biosimilar drug) were neutral or satisfied with their new medication. Patients who were dissatisfied with being switched had lower levels of health related literacy compared to patients who were satisfied. Further, older patients reported more often being satisfied compared to younger patients. Only 14% reported that they were involved when a decision to being switched was made, male patients significantly more often compared to female patients (p=0.02). Self-assessed good health was strongly associated with higher probability of being satisfied with the switch, only 9/74 patients who reported bad health also reported being satisfied. When adjusted for age and self-assessment of one's own health, scales 6 and 8 but not scale 9, were significantly associated with higher odds for being satisfied with being switched (OR=2.5, 95% CI: [1.2 to 5.2] and OR=2.7, 95% CI: [1.2 to 5.9], for scale 6 and 8, respectively).

**Conclusions:** A great majority of patients reported being satisfied with being switched to a cheaper biosimilar medication, however, almost one in five (19%) reported being dissatisfied. Our findings suggest that patients' attitudes and level of satisfaction are associated with being given sufficient and necessary information concerning their health.

## Movement in musculoskeletal pain; from risk to management

OP0071

### THE PREVALENCE OF PAIN FLARES: IMPACT OF DEFINITION

A.L. Beukenhorst<sup>1</sup>, J. McBeth<sup>1</sup>, J.C. Sergeant<sup>2</sup>, D.M. Schultz<sup>3</sup>, W.G. Dixon<sup>1</sup>. <sup>1</sup>Arthritis Research UK Centre for Epidemiology; <sup>2</sup>Centre for Biostatistics; <sup>3</sup>Centre for Atmospheric Science, University of Manchester, Manchester, UK

**Background:** Rapid acute pain exacerbations, colloquially called *pain flares*, affect quality of life and are a key driver for patients to seek healthcare. There is no standardised definition of pain flare.<sup>1</sup> Daily collection of patient-reported symptoms with mobile technology enables monitoring pain flares in real-time. The

choice of definition may identify different people and patterns of pain severity. If remote monitoring of flares is to inform clinical practice and research, it is important to understand the implications of these choices.

**Objectives:** Investigate the frequency of pain flares from daily pain symptoms under various definitions in a population with chronic pain.

**Methods:** Participants with chronic ( $\geq 3$  months) musculoskeletal pain in the smartphone study Cloudy with a Chance of Pain<sup>2</sup> reported daily pain severity and impact of pain on a 5-point scale. Pain flares were defined in five ways:

1. *Worse than average:* pain severity higher than personal median
  2. *Above threshold:* pain value 4 or 5
  3. *Move to above threshold:* pain value 1 or 2 or 3 yesterday to 4 or 5 today
  4. *Absolute change:* 2-point increase in pain since yesterday
  5. *Composite:* 2-point increase in pain severity since yesterday and impact 4 or 5
- Daily pain-flare rate was calculated by dividing the number of pain flares by the number of days a pain flare would have been possible, hereafter called *at-risk days* (def. 1+2: total days of symptom entry; def 3 to 5: days of data entry for which participant also entered data on preceding day). Monthly pain-flare rates per person were calculated by multiplying the rate by 30.

**Results:** The study smartphone app was downloaded by 13 256 people. After excluding people that never reported pain severity ( $n=2020$ ), did not complete the baseline questionnaire ( $n=947$ ), stayed in the study for less than 7 days ( $n=3418$ ), and reported non-musculoskeletal chronic pain ( $n=728$ ), 6143 were eligible for analysis.

**Abstract OP0071 – Table 1.** Participants with pain flares and monthly pain flare rates under 5 definitions

	Participants with $\geq 1$ flare (%)	Flares	Monthly pain flare rate
<b>Worse than average</b>	5304 (86.3)	1 09 616	8.0
<b>Above threshold</b>	5627 (91.6)	1 18 596	8.7
<b>Move to above threshold</b>	4246 (69.1)	33 661	3.2
<b>Absolute change</b>	3940 (64.1)	22 173	2.1
<b>Composite</b>	2577 (42.0)	9531	0.9

Table 1 shows that the portion of eligible people with at least one pain flare varies by definition, with 42% reporting at least one pain flare according to the most restrictive classification criterion. Depending on the criterion used, the monthly pain-flare rate per ranges from 0.9 to 8.7.

Under the 'worse than average' and 'above threshold' definition, most participants have more than 10 pain flares per month (figure 1). Under the two most stringent definitions, most participants have between 0 and 3 pain flares per month.

**Conclusions:** The five plausible definitions for a pain flare are demonstrated to generate quite different flare rates through time. Pain flares in people with chronic musculoskeletal pain, however, remain common even as classification criteria become increasingly strict. As daily data collection of patient-generated data becomes possible, careful thought must be given to flares should best be defined for clinical practice and research.

#### OP0072 SLEEP PROBLEMS AND FATIGUE AS A PREDICTOR FOR THE ONSET OF CHRONIC WIDESPREAD PAIN OVER A 5- AND 18-YEAR PERSPECTIVE. A 20-YEAR PROSPECTIVE STUDY

K Allij<sup>1,2</sup>, M. Andersson<sup>2,3</sup>, A. Bremander<sup>2,4</sup>, E. Haglund<sup>2,4</sup>, I. Larsson<sup>2,5</sup>, S. Bergman<sup>2,6</sup>, <sup>1</sup>Institute of Environmental Medicine, Karolinska Institutet, Stockholm; <sup>2</sup>FoU Spenshult, Halmstad; <sup>3</sup>Department of Clinical Sciences, Lund University, Lund; <sup>4</sup>Engineering and Science; <sup>5</sup>School of Health and Welfare, Halmstad University, Halmstad; <sup>6</sup>Department of Public Health and Community Medicine, University of Gothenburg, Gothenburg, Sweden

**Background:** If localised pain represent one end of a pain spectra, with overall better general health, chronic widespread pain (CWP) and fibromyalgia represent the other end of the spectra with worse general health and more comorbidities with other somatic diseases and mental illness. Sleep problems and fatigue are common among individuals reporting CWP and previous research indicate that sleep problems may be an important predictor for pain prognosis.

**Objectives:** The aim of this population-based study was to investigate if sleep problems and fatigue predict the onset of CWP 5 and 18 years later.

**Methods:** In order to get more stable baseline classifications of CWP, a wash-out period was used, including only individuals who had not reported CWP (according to <sup>ACR 1990</sup> criteria for fibromyalgia) at baseline (-98) and three years prior baseline (-95). In all, data from 1249 individuals entered the analyses for the 5 year follow-up (-03) and 791 entered for the 18 year follow-up (-16). Four parameters related to sleep (difficulties initiating sleep, maintaining sleep, early morning awakening and non-restorative sleep), and one parameter related to fatigue (SF-36 vitality scale) were investigated as predictors for CWP. Binary logistic regression analysis were used for analyses.

**Results:** All investigated parameters predicted the onset of CWP five years later (problems with initiating sleep (OR 1.91; 1.16–3.14), maintaining sleep (OR 1.85; 1.14–3.01), early awakening (OR 2.0; 1.37–3.75), non-restorative sleep (OR 2.27; 1.37–3.75) and fatigue (OR 3.70; 1.76–7.84)) in a model adjusted for age, gender, socio-economy and mental health. All parameters except problems with early awakening predicted the onset of CWP also 18 years later. In all, 785 individuals did not report any of the sleeping problems at baseline (fatigue not included), 268 reported one of the problems, 167 two, 128 three and 117 subjects reported to have all four sleep problems. Reporting all four sleep problems was significantly associated with CWP at follow-up at both time points when adjusting for age, gender, socio economy and mental health (OR 4.00; 2.03–7.91 and OR 3.95; 1.90–8.20); adjusting for age, gender, socio economy and number of pain regions (OR 2.94; 1.48–5.82 and OR 2.65; 1.24–5.64) and in a model adjusting for age, gender, socio economy and pain severity (OR 2.97; 1.53–5.76; and OR 3.02; 1.47–6.21) for the 5 year and 18 year follow-up respectively, compared to not reporting any of the sleep problems at baseline.

**Conclusions:** Both sleeping problems and fatigue predicts the onset of CWP 5- and 18 years later. The results highlight the importance of the assessment of sleep quality in the clinic.

**Disclosure of Interest:** None declared

#### OP0073 CENTRAL SENSITISATION PREDICTS FATIGUE INDEPENDENTLY OF MUSCULOSKELETAL PAIN

K.L. Druce, J. McBeth. Arthritis Research UK Centre for Epidemiology, Faculty of Biology, Medicine and Health, University of Manchester, Manchester, UK

**Background:** Fatigue is a common musculoskeletal (MSK) pain comorbidity that is associated with increased healthcare use and poor quality of life. Central sensitisation (CS), the amplification of sensory input across multiple systems, has been associated with MSK pain. It has been hypothesised that similar mechanisms may explain the co-occurrence of fatigue, but data are conflicting.

**Objectives:** To test the hypothesis that CS was associated with the presence of fatigue, and to establish whether the relationship was independent of the relationship between MSK pain and fatigue.

**Methods:** 2455 participants in a prospective cohort study completed a baseline questionnaire collecting data on fatigue (Chalder Fatigue Scale, score 0–33 (CFQ); pain (body map, score range 0–44); demographics (date of birth, sex); Rapid Assessment of Physical Activity (RAPA); analgesic use; and mental health (Hospital Anxiety and Depression (HAD) scale). During a clinic visit a random sample of participants ( $n=290$ , 11.8%) had a wind-up ratio test (the perceived intensity of a single 256mN pinprick/intensity of a series of 10 pinpricks) at the thenar eminence of the right hand (WUR-H) and dorsum of the left foot (WUR-F) to assess CS, and bioelectric impedance (Tanita BC-418 Segmental Body

Composition Analyzer) to determine proportion body fat. All participants were followed up 12 months later, at which time they completed the CFQ. Linear regression, with inverse probability sampling weights, tested the relationship between WUR at baseline and CFQ at 12 months, adjusted for baseline CFQ, demographics, lifestyle factors, HAD and in a final model baseline MSK pain. Results are expressed as beta coefficients with p values.

**Results:** The median (IQR) WUR-H and WUR-F were similar (2.4 (1.5, 3.8) and 2.5 (1.6, 4.0) respectively), did not differ by sex but were significantly lower in older people. After adjusting for age and sex, WUR-H ( $\beta=0.17$ ,  $p=0.00$ ) and WUR-F (0.18, 0.00) predicted CFQ at follow-up. In a fully adjusted model, WUR-H (Model 1: 0.13, 0.00) and WUR-F (Model 2: 0.13, 0.00) predicted CFQ at follow-up, independently of baseline MSK pain. Independent predictors of CFQ were age, MSK pain, depression, anxiety, physical activity and body fat (table 1).

#### Abstract OP0073 – Table 1

Baseline predictors of fatigue at 12 months		
	Model 1 – Hand ( $\beta$ , p-value)	Model 2 – Foot ( $\beta$ , p-value)
Wind-up ratio	0.13–0.00	0.13–0.00
Age	0.03–0.00	0.04–0.00
Gender	–0.41, 0.05	–0.46, 0.05
HAD Depression	0.18–0.00	0.18–0.00
HAD Anxiety	0.30–0.00	0.30–0.00
RAPA	–0.25, 0.00	–0.19, 0.00
% body fat	0.03–0.004	0.04–0.002
Analgesic use	0.03–0.34	0.05–0.12
MSK pain	0.11–0.00	0.10–0.00

**Conclusions:** Fatigue is predicted by CS, independently of the presence of MSK pain. For those seeking to treat fatigue, the potential benefit of interventions which reduce sensitisation should be investigated.

#### OP0074 ASSOCIATION BETWEEN BRAIN-DERIVED NEUROTROPHIC FACTOR GENE POLYMORPHISMS AND FIBROMYALGIA IN A KOREAN POPULATION: A MULTI-CENTRE STUDY

J.-H. Kang<sup>1\*</sup>, K.-E. Lee<sup>1</sup>, D.-J. Park<sup>1</sup>, S.-H. Kim<sup>2</sup>, S.-S. Nah<sup>3</sup>, J.H. Lee<sup>4</sup>, S.-K. Kim<sup>5</sup>, Y.-A. Lee<sup>6</sup>, S.-J. Hong<sup>6</sup>, H.-S. Kim<sup>7</sup>, H.-S. Lee<sup>8</sup>, H.A. Kim<sup>9</sup>, C.-I. Joung<sup>10</sup>, S.-H. Kim<sup>11</sup>, S.-S. Lee<sup>1</sup>. <sup>1</sup>Chonnam National University Medical School and Hospital, Gwangju; <sup>2</sup>Inje University Haeundae Paik Hospital, Busan; <sup>3</sup>Soonchunhyang University, College of Medicine, Cheonan; <sup>4</sup>Maryknoll Medical Center, Busan; <sup>5</sup>Catholic University of Daegu, Daegu; <sup>6</sup>Kyung Hee University; <sup>7</sup>Soonchunhyang University Seoul hospital; <sup>8</sup>Hanyang University College of Medicine and the Hospital for Rheumatic Diseases, Seoul; <sup>9</sup>Ajou University Hospital, Ajou University School of Medicine, Suwon; <sup>10</sup>Konyang University Medical School, Daejeon; <sup>11</sup>Keimyung University, Daegu, Korea, Republic of Ireland

**Objectives:** Several lines of evidence suggest that brain-derived neurotrophic factor (BDNF) is involved in the pathophysiology of fibromyalgia (FM) and studies have found that FM patients have altered serum and plasma BDNF levels. However, it is not known whether polymorphisms of the *BDNF* gene are associated with FM. In this study, we explored the association between polymorphisms of the *BDNF* gene with FM susceptibility and the severity of symptoms.

**Methods:** The study enrolled 409 patients with FM and 423 controls from 10 medical centres that participated in the Korean nationwide FM survey study. Alleles at 10 positions in the *BDNF* gene were genotyped: rs2883187 (C>T), rs7103873 (G>C), rs7103411(C>T), rs10835210 (C>A), rs11030104 (A>G), rs12273539 (C>T), rs11030102(C>G), rs11030101 (A>T), rs6265 (G>A), and rs7124442 (C>T).

**Results:** The allele and genotype frequencies of *BDNF* rs11030104 differed significantly between the FM patients and controls ( $p=0.031$ ). The GG genotype of rs11030104 had a protective role against FM ( $p=0.016$ ) and the G allele of rs11030104 was negatively associated with the presence of FM compared with the A allele ( $p=0.013$ ). In comparison, although the allele and genotype frequencies of *BDNF* rs12273539 did not differ between the FM patients and controls, the TT genotype of *BDNF* rs12273539 was associated with susceptibility to FM ( $p=0.038$ ). Haplotype analyses suggested that some *BDNF* haplotypes have a protective role against FM. Finally, we found that that some genotypes and haplotypes of the *BDNF* gene contribute to the specific symptoms of FM.

**Conclusions:** This study is the first to evaluate the associations of *BDNF* gene polymorphisms with FM. Our results suggest that some *BDNF* single-nucleotide polymorphisms and haplotypes are associated with susceptibility to, and contribute to the symptoms of, FM.

#### OP0075 ULTRASOUND-DETECTED SHOULDER PATHOLOGIES CLUSTER INTO GROUPS WITH DIFFERENT CLINICAL ASSOCIATIONS: DATA FROM A PROSPECTIVE STUDY OF 500 COMMUNITY REFERRALS FOR SHOULDER PAIN

G. Tran, E. Hensor, P. O'Connor, S. Kingsbury, P. Conaghan. Leeds Institute of Rheumatic and Musculoskeletal Medicine, Leeds, UK

**Background:** Shoulder pain is common and its management remains challenging, often resulting in poor outcomes: 50% of people continue to have shoulder pain at 18 months. This may be in part due to inaccurate clinical diagnosis. Ultrasound offers accurate detection of pathology and its use is increasing. However, the relationship between ultrasound findings and clinical phenotype is unclear.

**Objectives:** A prospective study was undertaken to explore latent class groupings and explore the association between patient reported outcome measures and the different groups.

**Methods:** 500 primary care patients attending for shoulder ultrasound were prospectively recruited. Radiologists and sonographers underwent training to ensure standardised reporting. Baseline data was collected via self-reported questionnaires. Outcome measures collected included pain, function, quality of life, treatments received, activity, self-efficacy and levels of acceptable symptom states. These measures underwent Rasch analysis. Latent class analysis was undertaken to identify groups.

**Results:** Mean age was 53.6% and 52% were female. Latent class analysis confirmed the existence of 4 groups: limited bursitis; extensive inflammation; RC tears; limited pathology. The oldest age group were those with RC tears, and the youngest was those with limited bursitis. The rotator cuff tear group had the highest levels of pain and disability, and the lowest levels of acceptable symptom states. Those with limited pathology had the highest levels of acceptable symptom states. The extensive inflammation group had the lowest activity scores.

Summary statistics for classes obtained prior to covariate adjustment (complete data only)

	Bursitis (limited inflammation)	Bursitis (extensive inflammation)	RC tear	Limited pathology
% of sample	49	18	15	18
Age, years: mean (95% CI)	47.4 (45.3–49.6)	64.4 (61.1–67.7)	66.1 (63.4–68.9)	49.1 (46.3–51.9)
Female:%	53	58	41	52
Duration of symptoms, months: median (IQR)	6 (3–14)	7 (4–23)	5 (3–12)	6 (4–15)
RC tear (y/n):%	4	44	>99	2
Full thickness RC tear:%	<1	20	92	<1
Bursitis:%	>99	88	34	6
Impingement:%	70	58	94	2
Calcific tendinitis:%	10	6	2	12
ACJ degeneration:%	34	83	63	33
Glenohumeral OA:%	1	2	15	2
Adhesive capsulitis:%	3	5	6	25
Biceps tenosynovitis:%	<1	17	10	<1
Rotator cuff tendinopathy:%	22	81	12	14
EQ5D-5L VAS: median (IQR)	75 (61–85)	66 (49–80)	80 (70–90)	75 (60–85)
Brophy activity score: mean (95% CI)	7.2 (6.9–7.5)	5.5 (4.9–6.0)	7.1 (6.6–7.7)	6.7 (6.2–7.2)
Total SPADI: mean (95% CI)	49.9 (48.6–51.1)	51.8 (48.6–55.1)	56.2 (54.0–58.4)	50.2 (47.7–52.6)
P-SEQ: mean (95% CI)	34.7 (33.3–36.1)	32.2 (29.3–35.1)	33.2 (30.6–35.7)	34.3 (31.8–36.8)
PASS:%	17	30	11	34

VAS=visual analogue scale; SPADI=shoulder pain and disability index; P-SEQ=patient self-efficacy questionnaire; HADS=hospital and depression scale; PASS=patient acceptable symptom state

**Conclusions:** This study confirms that ultrasound pathologies cluster into groups. These groups appear to differ in symptom associations at baseline; expanding the LCA to include covariates will allow us to formally explore these associations. A longitudinal study will provide understanding of the relevance of these groups to long-term patient outcomes.

**Disclosure of Interest:** None declared

### ISOTEMPORAL SUBSTITUTION OF SEDENTARY TIME WITH PHYSICAL ACTIVITY IN FIBROMYALGIA: ASSOCIATION WITH QUALITY OF LIFE AND DISEASE IMPACT. THE AL-ANDALUS PROJECT

B. Gavilán-Carrera<sup>1</sup>, R.A. Mekary<sup>2,3,4</sup>, M. Borges-Cosic<sup>1</sup>, P. Acosta-Manzano<sup>1</sup>, I. C. Álvarez-Gallardo<sup>1,5</sup>, V. Segura-Jiménez<sup>1,5</sup>. <sup>1</sup>Department of Physical Education and Sport, University of Granada, Granada, Spain; <sup>2</sup>Department of Pharmaceutical Business and Administrative Sciences, MCPHS University; <sup>3</sup>Harvard T.H. Chan School of Public Health; <sup>4</sup>Computational Neuroscience Outcomes Center, Brigham and Women's Hospital, Harvard Medical School, Boston, USA; <sup>5</sup>Department of Physical Education, University of Cádiz, Cádiz, Spain

**Background:** There is an awareness of detrimental health effects of sedentary time (ST) in fibromyalgia.<sup>1</sup> However, data are limited on how replacing ST with physical activities of different intensities may be related to the typically reduced quality of life of these patients. Increasing time in one behaviour requires decreasing time in another but classic regression models are not able to directly target these substitutions. Hence, the isomodal substitution paradigm (a novel model to study the estimated effects of one activity for another<sup>3</sup>), might allow us to better understand the relationship between ST, physical activity and perceived health status in fibromyalgia.

**Objectives:** To investigate the association of replacing ST with light physical activity (LPA) or moderate-to-vigorous physical activity (MVPA) with quality of life and disease impact in women with fibromyalgia.

**Methods:** In total, 407 women with fibromyalgia (51.4±7.6 years old) were included in this cross-sectional study. The time spent in ST and PA intensity levels was objectively measured with triaxial accelerometry. Quality of life and disease impact were assessed using the 36-item Short-Form Health Survey (SF-36) and the Revised Fibromyalgia Impact Questionnaire (FIQR), respectively. An isomodal substitution approach was used to estimate the associations between the substitution of 30 min of ST with an equivalent time of LPA or MVPA and the outcomes. Analyses were controlled for age, current occupational status, fat percentage, and antidepressant consumption.

**Results:** Substituting 30 min of ST with LPA in the isomodal model was associated with better bodily pain ( $B=0.55$ ), vitality ( $B=0.74$ ) and social functioning ( $B=1.45$ ) of SF-36 and better scores at all of the domains of FIQR (function, overall impact, symptoms severity, and total impact) ( $B$  ranging from  $-0.95$  to  $-0.27$ ), all  $p<0.05$ . When 30 min of ST were replaced with MVPA, significantly better physical role ( $B=2.30$ ) and social functioning ( $B=4.11$ ) of the SF-36 and function of FIQR ( $B=-0.73$ ) were observed (all  $p<0.05$ ).

**Conclusions:** Allocating time of sedentary behaviour to either LPA or MVPA was generally associated with better quality of life and lower disease impact in women with fibromyalgia. The isomodal models suggest that LPA may be beneficial for a larger number of domains, while MVPA may establish greater changes in the outcomes. These results reinforce the importance of moving towards less sedentary lifestyle in fibromyalgia, although these findings should be investigated in longitudinal, experimental research.

OP0077

### EFFECTIVENESS OF 8-WEEKS SUPERVISED AND NON-SUPERVISED AEROBIC EXERCISE PROGRAMSON CLINIC FINDINGS,FUNCTIONAL STATUS AND QUALITY OF LIFE IN THE PATIENTS WITH FIBROMYALGIA SYNDROME

A. Ozyasar, A.G. Karatepe. Physical medicine and rehabilitation, izmir, Turkey

**Background:** Fibromyalgia syndrome, aerobic exercise.

**Objectives:** This study was planned to evaluate the effectiveness of 8 weeks supervised and non-supervised aerobic exercise programs on clinic findings, functional status and quality of life in the patients with fibromyalgia syndrome.

**Methods:** A total of 120 patients who received the diagnosis of fibromyalgia syndrome according to <sup>ACR 2010</sup> Fibromyalgia classification criteria were enrolled into the study. Patients were randomised into three groups ;Supervised aerobic exercise group (Group 1, 40 subjects), non-supervised aerobic exercise group (Group 2, 40 subjects), and control group (Group 3, 40 subjects). Fatigue, depression,

functional status, physical function, and quality of life of patients were evaluated before and after the treatment. Visual Analogue Scale (VAS) was used to assess the fatigue level. The level of depression was evaluated by Zung Depression Scale (ZDS). The evaluation of functional status was performed using Fibromyalgia Impact Questionnaire (FIQ). The quality of life of patients was investigated by Nottingham Health Profile (NHP). 6-metre walking distance test was used for the assessment of the physical function.

**Results:** After the exercise program, it was observed that there was a statistically significant improvement in both exercise groups for all evaluated parameters (fatigue, depression,functional status, physical function and quality of life), compared to the baseline ( $p<0.05$ ).When compared with control group, it was found that the improvement in both groups was statistically significant better than control group ( $p<0.05$ ).The improvement in fatigue,depression, functional status, physical function, and the Physical mobility subgroup of the quality of life was found to be better in supervised exercise group compared to the non-supervised home-based exercise group ( $p<0.05$ ). As for the patients in the control group, it was observed that there was no improvement in any of the evaluated parameters.

**Conclusions:** In this study it was demonstrated that both supervised and non-supervised aerobic exercisepograms have positive effects on clinic findings, functional status and quality of life ofpatients with fibromyalgia. However, further-studies with a larger sample size and with a longer follow-up period are needed to support the findings of our study about the positive effects of supervised and non-supervisedaerobic exercises.

OP0078

### IS THE EFFICACY OF PHYSICAL THERAPY RELATED TO THE PAIN IN THE PATIENT'S MIND?

A. Caliskan Uckun<sup>1</sup>, B. Köse<sup>2</sup>, F.G. Yurdakul<sup>1</sup>, Y. Garip<sup>1</sup>, H. Bodur<sup>1</sup>. <sup>1</sup>Physical Medicine and Rehabilitation, Ankara Numune Research and Education Hospital; <sup>2</sup>Physical Medicine and Rehabilitation, Duru Medical Center, Ankara, Turkey

**Background:** The degree of improvement in functionality and pain after physical therapy in the patients with knee osteoarthritis (OA) may be due to various peripheral factors and used modalities. Additionally, in some patients, modifiable psychological factors such as pain catastrophizing and depression may influence the therapy outcome.<sup>1</sup>

**Objectives:** The aim of this study was to investigate the impact of pain catastrophizing and depression on pain and functionality in the patients with knee OA who were treated with physical therapy.

**Methods:** The prospective cohort study participants were 89 patients with knee OA who underwent 10 sessions of physical therapy consist of hot-pack, transcutaneous electrical nerve stimulation (TENS), and ultrasound (US). Socio-demographic and clinical data were initially recorded. At baseline, pain catastrophizing and depression were measured with the standardised questionnaires including Pain Catastrophizing Scale (PCS) and Beck Depression Inventory-II (BDI-II).The Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC) and the visual analogue scale (VAS) were performed at baseline, at the end of therapy and at first month after therapy.

**Results:** The patients' mean age was 60.38 (0.97), 82% were women, and 58.4% were not working. At baseline, the mean VAS and WOMAC scores were 7.39 (1.07) and 43.03 (19.47), respectively. 47.20% of the patients had clinically proper catastrophizing. The baseline demographic and clinical characteristics, except BDI-II score, VAS, and WOMAC were not different among the low catastrophizing and high catastrophizing groups (table 1). The patients who had high

scores on pain catastrophizing had a lower improvement in VAS and WOMAC scores at the end of therapy and at first month after therapy (figure 1).

**Abstract OP0078 – Table 1.** Demographic data of all patients

	Low catastrophizing (n:47)	High catastrophizing (n:42)	Total (n:89)	p
Age, mean±SD (years)	58.93±9.68	62.00±8.54	60.38 ±0.97	0.11
Gender n (%)	37 (78.7)	36 (85.7)	73 (82)	0.39
Female	10 (21.3)	6 (14.3)	16 (18)	
Male				
BMI, mean±SD	29.18±3.62	29.51±3.72	29.34 ±0.38	0.52
BDI-II, mean±SD	9.19±5.69	16.30±8.41	12.55 ±7.91	<0.001*
Employment Status n (%)	21 (44.7)	31 (73.8)	52 (58.4)	0.096
Not working	3 (6.4)	1 (2.4)	4 (4.5)	
Labourers	6 (12.8)	3 (7.1)	9 (10.1)	
Retail trading	13 (27.7)	5 (11.9)	18 (20.2)	
Retired	4 (8.5)	2 (4.8)	6 (6.7)	
Government employee				
Initial VAS, mean ±SD	6.97 (1.01)	7.85 (0.95)	7.39 (1.07)	<0.001*
Initial WOMAC, mean±SD	31.63 (15.03)	55.78 (15.65)	43.03 (19.47)	<0.001*

PCS: Pain Catastrophizing Scale, VAS: Visual Analogue Scale, WOMAC: Western Ontario and McMaster Universities Osteoarthritis Index

High catastrophizing was described as total PCS score  $\geq 30$ .

Low catastrophizing was described as total PCS score  $< 30$ .

\* Statistically significant value ( $p < 0.05$ )

**Abstract OP0078 – Figure 1** The comparing of differences of VAS and WOMAC scores among low catastrophizing and high catastrophizing groups.

**Conclusions:** We suggest that high levels of initial PCS score may cause lower improvement on pain and functional levels in the patients who underwent physical therapy. Screening for pain catastrophizing and depression in the patients who receive physical therapy and taking necessary precautions may improve outcomes.

#### OP0079-PARE 'AWARENESS WEEK FOR RHEUMATIC DISEASES- 8–14 MAY 2017'

B. Boteva, H.L. Bankova. Sofia, Bulgaria

**Background:** Among the main priorities that Bulgarian Organisation for people with rheumatic diseases follow is the dissemination of knowledge and information about RMD's.

An important initiative is the annual awareness week about RMD's which is organised since 2015. The awareness week is organised in May and the idea occurred after EULAR's Knowledge transfer program in which BOPRD took part in 2013.

**Objectives:** In 2017 the focus was on two of the rheumatic diseases – SLE and fibromyalgia. SLE and fibromyalgia are not well known in our country that is why we decided to spread awareness among general public and policymakers.

The main goal of the 2017 awareness week for RMD's was to:

- inform the society and policymakers about the social significance of SLE and fibromyalgia
- Spread awareness about the most common symptoms of SLE and fibromyalgia
- Inform people with SLE, fibromyalgia and other RMDs how they can manage symptoms as anxiety, depression, and tension.

**Methods:** The 2017 awareness week about RMDs was organised in the period 8–14 May 2017.

One of the most important accents was a seminar, organised on 8 of May. We have invited as lecturer Gergana Radovich who is one of the international T-Tapp trainers. She holds a Master degree in Cognitive science, as well as certificates for Psych-K Facilitator and EFT Practitioner.

T-Tapp is a series of movements designed to put the body in proper functional alignment, restore metabolic function and stands on its own as a complete workout. Such a seminar for people with RMDs was not organised before. The participants had the chance to learn more about EFT and T-Tapp and how these techniques can benefit their condition and help them fight fear, tension, and anxiety.

At 10-th of May – World lupus day a discussion about the problems that people with SLE face was organised.

In the evening the National Palace of Culture (a famous building in the capital of Bulgaria) was lit in purple light to support people with SLE.

**Results:** The 2017 awareness week for RMDs was very successful.

All publications and media interviews that were published at the organisation's website and in other websites reached more than 4000 people in total.

88 people liked the organisation's Facebook page in the period 8–14 May 2017.

We have managed to continue to offer online EFT and T-Tapp lessons to the members of the organisation

#### OP0080-PARE PHOTO ALBUM OF PEOPLE WITH RHEUMATIC DISEASES UNDER THE TITLE: 'THERE ARE SOME PEOPLE... OUR PEOPLE!!!'

K. Koutsogianni, E. Tsourlidaki, J. Papadakis, R. Stara, L. Papadaki, on behalf of The Arthritis Foundation of Crete. *The Arthritis Foundation of Crete, Heraklion, Crete, Greece*

**Background:** The impact of rheumatic diseases in the daily life of people is sometimes quite dramatic, causing abundance of everyday pleasures and activities even one's hobbies. The burden of RMDs is not adequately communicated to the public or to the state, so that this important aspect is not generally met with relevant seriousness.

**Objectives:** The goal of our campaign was: a. to give a clear picture of the difficulties that people with rheumatic diseases face in their everyday life and b. to prove that some people manage to overcome their serious movement problems, their pain and dysfunction and show, with dignity and strength, that the artistic part inside them is vividly alive. The message we would like to communicate here is: THE POWER OF MIND IS STRONGER THAN BODY WEARENESS AND CHRONIC PAIN.

**Methods:** Firstly we got in touch with members of our Association that their skills could be presented in the album and discussed our idea, which was gladly accepted by them.

10 members of the association are included in the album, all of which are people with severe inflammatory rheumatic diseases. Ignoring their obvious moving problems and putting aside their other engagements, these wonderful people follow their talents and become sculptors, icon painters, pastry chefs etc. After the nomination of the sponsor for the project, a professional photographer was selected to capture the talents, the dedication to their art and the inner feelings of those people, in a way that can only be detected through the photographer's eye.

The shooting started in March 2017 and was finished in September 2017. Each of the artists had the chance to spend time with the photographer, express their feelings and show their way of life to him. This face to face contact enabled George (the photographer) to depict on his photos the real personality of these special people.

After the shooting, a website was created where the pictures were uploaded with underlined personal remarks of both the artists and the professional photographer. Information about the inflammatory rheumatic diseases and the importance of early diagnosis was added to the album. Additionally, during October 2017, a 45 s video was promoted through TV, targeting the serious problems that people with RMDs are facing in their everyday life but also revealing the strength and courage of this great artists' team. A press conference was as well organised to support the visit of the particular website.

**Results:** Results: 173.000 people have visited the website from October to January, with another 16.800 visits through YouTube.

**Conclusions:** Through an artistic approach a patient organisation can trigger the awareness of the public, communicate the important message of the seriousness of RMDs and also underline the endless dedication and the seek for dreams to come true, even if one has to live along with a rheumatic disease all your life.

WEDNESDAY, 13 JUNE 2018:

## Let's improve diagnosis and treatment of orphan diseases

### OP0081 PHENOTYPIC SUBGROUPS IN IGG4-RELATED DISEASE – A CLUSTER ANALYSIS

Z.S. Wallace<sup>1</sup>, Y. Zhang<sup>1</sup>, C.A. Perugini<sup>1</sup>, R. Naden<sup>2</sup>, H. Choi<sup>1</sup>, J.H. Stone<sup>1</sup>, on behalf of For the EULAR/ACR IgG4-Related Disease Classification Criteria Development Group<sup>1</sup>. <sup>1</sup>Massachusetts Gen Hosp Rheumatol Unit, Harvard Med School, Boston, USA; <sup>2</sup>University of Hamilton, Hamilton, Canada

**Background:** IgG4-related disease (IgG4-RD) is a multi-organ immune-mediated condition of uncertain etiology characterised by substantial organ-specific morbidity if not diagnosed and treated promptly. Identifying IgG4-RD subgroups based on the distribution of organ involvement may influence the understanding of pathogenesis and guide clinical management.

**Objectives:** To identify phenotypic clusters of IgG4-RD that may differentiate clinically meaningful subgroups using an unbiased method.

**Methods:** The study cohort consisted of 493 IgG4-RD subjects diagnosed by 76 IgG4-RD specialists from North America, South America, Europe, and Asia. For each case, investigators included details regarding age at disease onset and diagnosis, race/ethnicity, organ involvement, biopsy findings, and lab results. We performed latent class analysis (LCA) using SAS procedure PROC LCA to identify subgroups representing distinct patterns of organ involvement by IgG4-RD (figure 1). We fitted LCA models with 2–5 subgroups and chose the best model based on Akaike information criteria and adjusted Bayesian information criterion. The posterior probability of subgroup (cluster) membership for all cases was determined and cases were assigned to the cluster in which they had the highest probability of membership. We compared the distribution of organ involvement and other baseline features between clusters using Chi square tests and analysis of variance, where appropriate.

**Results:** Of the 493 IgG4-RD subjects, 65% were male, 40% were Caucasian, 45% were Asian, and 12% were Hispanic. The mean age at diagnosis was 59.5 (±14.0) years. Using LCA, we identified four clusters of IgG4-RD (table 1), each of which accounted for between 19% and 32% of the cohort. Cluster 1

('Hepatobiliary') included 158 (32%) patients characterised by hepatobiliary involvement. Cluster 2 ('Orbital') included 88 (19%) patients characterised by orbital and/or sinus disease. Cluster 3 ('Mikulicz') included 109 (22%) patients who had features of classic Mikulicz (dacryoadenitis plus major salivary gland involvement), often accompanied by renal and lung disease. Cluster 4 ('Retroperitoneal Fibrosis (RPF)') included 138 (28%) patients with RPF and/or aortic involvement. The clusters differed significantly with regard to age at symptom onset ( $p<0.001$ ), gender and race distribution ( $p<0.001$ ), serum IgG4 concentration ( $p=0.02$ ), and presence of hypocomplementemia ( $p<0.001$ ). In contrast to the other clusters, cluster 2 ('Orbital') included a majority of female patients who tended to be younger. Cluster 3 ('Mikulicz') was characterised by the highest serum IgG4 concentrations and cluster 4 ('RPF') by the lowest. Hypocomplementemia, which occurred in only a minority of patients overall (9%), tended to segregate in cluster 3 ('Mikulicz'), a group in which renal disease was common.

Abstract OP0081 – Table 1

Variable (mean ±SD or median [IQR])	Cluster 1	Cluster 2	Cluster 3	Cluster 4	P-Value
Sample Size	158 (32%)	88 (19%)	109 (22%)	138 (28%)	
Organ Involvement	Hepatobiliary	Orbital - Sinusitis	Mikulicz - Renal - Lung	RPF - Aorta	
Male	79%	35%	52%	72%	<0.0001
Age at Diagnosis	62 (12.8)	56 (14.1)	60.1 (12.9)	58.3 (14.5)	0.008
Age at Symptom Onset	61.2 (13.0)	53.3 (14.5)	57.7 (13.9)	56.5 (15.7)	0.0004
Diagnostic Delay	0.87 (1.7)	2.7 (3.7)	2.5 (3.8)	1.9 (3.9)	<0.001
Race/Ethnicity					
White	46%	35%	19%	53%	<0.0001
Asian	39%	52%	51%	31%	
Hispanic	10%	9%	20%	9%	
Number of Organs	2.2 (1.0)	2.3 (1.3)	5.0 (1.9)	2.3 (1.3)	<0.0001
IgG4 (mg/dL) Concentration	325 (160, 667)	334.5 (169.8, 943)	809 (300, 1365)	216 (85, 640)	0.02
Hypocomplementemia	5%	5%	20%	6%	<0.0001

**Conclusions:** Using an unbiased method, we identified four phenotypic clusters of IgG4-RD patients. In addition to the differences in organ involvement, clusters were distinguished by age at diagnosis as well as race/ethnicity and gender distribution, serum IgG4 concentrations, and frequency of hypocomplementemia. These clusters may identify patients with IgG4-RD resulting from different risk factors or exposures and those likely to respond differently to treatment.

### OP0082 APREMILAST FOR BEHÇET'S SYNDROME: A PHASE III RANDOMISED, PLACEBO-CONTROLLED, DOUBLE-BLIND STUDY (RELIEF)

G. Hatemi<sup>1</sup>, A. Mahr<sup>2</sup>, M. Takeno<sup>3</sup>, D.-Y. Kim<sup>4</sup>, M. Melikoglu<sup>1</sup>, S. Cheng<sup>5</sup>, S. McCue<sup>5</sup>, M. Paris<sup>5</sup>, Y. Wang<sup>5</sup>, Y. Yazici<sup>6</sup>. <sup>1</sup>Istanbul University Cerrahpasa Medical School, Istanbul, Turkey; <sup>2</sup>Hôpital Saint-Louis, University of Paris 7, Paris, France; <sup>3</sup>Nippon Medical School Graduate School of Medicine, Tokyo, Japan; <sup>4</sup>Yonsei University College of Medicine and Severance Hospital, Seoul, Korea, Republic Of; <sup>5</sup>Celgene Corporation, Summit; <sup>6</sup>New York University School of Medicine, New York, USA

**Background:** Oral ulcers (OU) are the most common sign of Behçet's syndrome (BS) and are observed in nearly every patient. Due to their severity and frequency of recurrence, OU can be disabling and have a substantial effect on quality of life. There is an unmet need for effective treatment for OU in BS. Apremilast (APR), an oral phosphodiesterase 4 inhibitor that modulates inflammatory pathways, demonstrated efficacy in the treatment of oral and genital ulcers of BS in a phase II study.

**Objectives:** Phase III study to further evaluate the efficacy and safety of APR for OU in BS pts with active OU previously treated with  $\geq 1$  medication.

**Methods:** In this phase III, multicenter, randomised, placebo (PBO)-controlled study, 207 eligible pts were randomised (1:1) to APR 30 mg BID (n=104) or PBO (n=103) for 12 weeks, followed by a 52 week active-treatment extension. Pts had active BS, with  $\geq 3$  OU at randomization or  $\geq 2$  OU at screening +randomization, without active major organ involvement. Primary endpoint was area under the curve (AUC) for total number of OU over 12 weeks. AUC reflects the change in the number of OU over time, accounting for the clinical characteristic that OU repeatedly remit and recur. Secondary endpoints assessed other measures of OU, including pain, OU resolution (OU-free), maintenance of OU resolution, and time to resolution. Effects on genital ulcers were also assessed. A prespecified hierarchical testing procedure was used for multiplicity adjustment.

**Results:** AUC for total number of OU over 12 weeks was statistically significantly lower in the APR group compared with the PBO group (table 1). This treatment effect is supported by statistically significant benefits in the APR group compared with PBO for secondary endpoints assessing OU, including pain, OU resolution, maintenance of OU resolution, and time to resolution. A numerically greater proportion of pts achieved resolution of genital ulcers at Week 12 in the APR group compared with PBO.

The incidence of treatment-emergent adverse events (AEs) was comparable between APR and PBO during the PBO-controlled period (78.8% vs 71.8%, respectively). Serious AEs were observed in 3 APR pts (migraine, oral ulcer flare, genital ulcer, arthralgia, soft tissue injury) and 4 PBO pts (diarrhoea, genital and fungal infections, oral ulcer flare, acne, acute febrile neutrophilic dermatosis, erythema multiforme).

Endpoints	P Value	Adjusted Treatment Difference (or HR)	APR vs. PBO (LS Mean, Median Time or %)
AUC for the number of OU from baseline through Week 12	<0.0001	-92.6	129.5 vs 222.1
Change from baseline in the pain of OU as measured by VAS at Week 12	<0.0001	-24.8	-40.7 vs -15.9
Proportion of subjects achieving OU resolution by Week 6 who remain OU free for ≥6 additional weeks (maintenance of OU resolution)	<0.0001	25.1%	29.8% vs 4.9%
Time to OU resolution, during the PBO-Controlled Treatment Phase	<0.0001	HR = 2.400	Median time in weeks: 2.1 vs 8.1
Proportion of subjects achieving resolution of OU at Week 12	<0.0001	30.6%	52.9% vs 22.3%
Proportion of subjects achieving resolution of genital ulcers at Week 12 for subjects who had genital ulcers at baseline	0.1100	28.4%	70.6% vs 41.2%

**Conclusions:** APR effectively reduced the number and pain of OU, improved time to oral ulcer resolution, and maintained the resolution of OU, the most common manifestation of BS. Favourable treatment effects were also observed for genital ulcer resolution. The safety profile was consistent with the known safety profile of APR.

### OP0083 TEMPORAL TRENDS AND MORTALITY OF HOSPITALISED PATIENTS WITH ADULT ONSET STILL'S DISEASE: A NATIONWIDE ESTIMATE

B. Mehta<sup>1,2</sup>, W. Briggs<sup>3</sup>, P. Efthimiou<sup>4</sup>. <sup>1</sup>Hospital for Special Surgery; <sup>2</sup>Weill Cornell Medicine; <sup>3</sup>New York Presbyterian Hospital; <sup>4</sup>NYU Langone Medical Center, New York, USA

**Background:** There is a dearth of epidemiological studies on Adult Onset Still's Disease (AOSD). Majority of studies are from single centres or are regional. The largest AOSD epidemiological study till date describes 512 patients.<sup>1</sup>

**Objectives:** To describe the demographics, complications, mortality and trends of hospitalised patients with AOSD in United States. Also, to understand the factors associated with mortality in these patients.

**Methods:** All adult (>18 years) hospitalised patients between 2009 and 2013 from a nationwide inpatient sample (NIS) database were captured. AOSD patients were identified using the ICD-9 code 714.2. Patients also coded for Rheumatoid Arthritis, Lupus, Myositis, Polymyalgia Rheumatica, Ankylosing Spondylosis and Psoriatic Arthritis were excluded. This was done in order to capture patients with strictly AOSD. NIS is the largest all-payer inpatient care database in the United States with approximately 8 million hospitalizations each year. Discharge weights were used to enable nationwide estimates. Descriptive statistics were represented as means/medians for continuous and as frequencies and percentages for categorical variables. A survey weighted logistic regression model was used to describe the associations with in-hospital death.

**Results:** Between 2009 and 2013, 5,820 AOSD patients were hospitalised (table 1). AOSD patients had a mean age of 53.6 (SE - 0.61) years, 3817 (65.6%) were females. The racial/ethnic distribution showed that 56% white, 15% African American, 11.7% Hispanic and 3% Asian patients were affected. Over the years, the number of white patients that are hospitalised seems to have increased. 37.6% were hospitalised in urban teaching hospitals. 100 (1.7%) of patients developed Macrophage Activating Syndrome (MAS). 66 (1.1%) patients had disseminated intravascular coagulation (DIC) and 25 (0.4%) had thrombotic thrombocytopenic purpura (TTP). Mean length of stay was 6.9 days. There were 154 inpatient deaths in 5 years (mortality 2.6%). The patients who died in the hospital had a higher mean age of 62.4 (SE- 3.1) years, had a higher proportion of Asians

(13.9%) and had increased number of comorbid conditions. Asians had 6.4 times the risk of in-hospital death compared to Whites. The risk for in-hospital death is 30 times higher if a AOSD patient had concurrent DIC.

**Abstract OP0083 – Table 1 AOSD characteristics**

Variables, n (%) / Mean (SD) when specified	2009 n = 846	2010 n = 995	2011 n = 1434	2012 n = 1380	2013 n = 1265	Total N = 5820

Disseminated Intra-vascular Coagulation	29.69 (5.5-160.4)				<0.001	

**Conclusions:** In hospitalised American AOSD patients, the average age was higher than previously described in cross sectional studies. This may indicate an ageing population with a higher number of comorbidities that justify hospitalisation. More patients were in large or urban teaching hospitals compared to small or rural hospitals. In-hospital death was associated with increased comorbid conditions and was significantly higher among Asians and patients with DIC. To our knowledge, this is the largest epidemiological study of AOSD.

### OP0084 SERUM FIBROBLAST GROWTH FACTOR 2 IS A USEFUL BIOMARKER TO DISTINGUISH ADULT ONSET STILL DISEASE FROM SEPSIS

T. Koga<sup>1</sup>, R. Sumiyoshi<sup>1</sup>, S. Sato<sup>2</sup>, K. Migita<sup>3</sup>, T. Shimizu<sup>4</sup>, M. Umeda<sup>1</sup>, F. Nonaka<sup>5</sup>, S. Fukui<sup>1</sup>, S.-Y. Kawashiri<sup>1</sup>, N. Iwamoto<sup>1</sup>, K. Ichinose<sup>1</sup>, M. Tamai<sup>1</sup>, H. Nakamura<sup>1</sup>, T. Origuchi<sup>1</sup>, A. Yachie<sup>6</sup>, T. Maeda<sup>7</sup>, A. Kawakami<sup>1</sup>. <sup>1</sup>Division of Rheumatology, Department of Medicine; <sup>2</sup>Clinical Research Center, Nagasaki University, Nagasaki; <sup>3</sup>Department of Rheumatology, Fukushima Medical University School of Medicine, Fukushima; <sup>4</sup>Department of Rheumatology, Nagasaki University, Nagasaki; <sup>5</sup>Department of Internal Medicine, Sasebo City General Hospital, Sasebo; <sup>6</sup>Department of Pediatrics, School of Medicine, Institute of Medical, Pharmaceutical and Health Sciences, Kanazawa University, Kanazawa; <sup>7</sup>Department of Community Medicine, Nagasaki University Graduate School of Biomedical Sciences, Nagasaki, Japan

**Background:** The precise cytokine networks in the serum of individuals with adult onset still disease (AOSD) that are associated with its pathogenesis have been unknown. Serum levels of interleukin (IL)-1β, IL-6 and IL-18 have been reported as useful serum biomarkers for diagnosis and disease evaluation among AOSD patients,<sup>1,2</sup> but these cytokines are also elevated in other inflammatory diseases including severe infection.

**Objectives:** We attempted to identify specific biomarkers to distinguish AOSD from sepsis.

**Methods:** We measured serum levels of 45 cytokines in 66 AOSD patients, 17 sepsis patients and 133 age-matched controls by multi-suspension cytokine array. Japan College of Rheumatology-certified rheumatologists diagnosed with AOSD based on the Yamaguchi criteria. Cytokines were ranked by their importance by a multivariate classification algorithm. We performed a logistic regression analysis to determine specific biomarkers for discriminating AOSD from sepsis patients. To identify specific molecular networks, we performed a cluster analysis of each cytokine.

**Results:** Serum fibroblast growth factor 2 (FGF-2), vascular endothelial growth factor (VEGF), granulocyte-colony stimulating factor (G-CSF), and IL-18 levels were significantly elevated in the AOSD group versus the sepsis group. Multivariate classification algorithms followed by a logistic regression analysis revealed that the measurement FGF-2 distinguished AOSD patients from sepsis patients with the highest accuracy (cut-off value=28.5 pg/mL, sensitivity 100%, specificity 88.2%, accuracy 96.7%).

Abstract OP0084 – Table 1

variables (AOSD vs sepsis)	sensitivity	specificity	accuracy	AUC	AIC
FGF-2	1.000	0.882	0.967	0.972	24.50
IL-18	0.930	0.824	0.900	0.895	50.90
G-CSF	0.837	0.706	0.800	0.721	75.30
FGF-2 + IL-18	0.977	0.941	0.967	0.986	21.70

**Conclusions:** We have demonstrated that FGF-2 can be the best biomarker for differential diagnosis between AOSD and sepsis based on the measurement of multiple cytokines. Although the differential diagnosis between rheumatic diseases and infectious conditions is a great challenge in clinical practice, these findings help to improve the diagnostic performance of AOSD in daily practice.

OP0085

#### SAFETY OF LONG-TERM (UP TO 6 YEARS) CANAKINUMAB THERAPY (<2, 2–<4 AND 4–<8MG/KG) IN PATIENTS AGED <4 TO 65 YEARS FROM BETA-CONFIDENT REGISTRY

J.B. Kuemmerle-Deschner<sup>1</sup>, U.A. Walker<sup>2</sup>, H.H. Tilson<sup>3</sup>, P.N. Hawkins<sup>4</sup>, T. van der Poll<sup>5</sup>, K. Franke<sup>6</sup>, A. Speziale<sup>7</sup>, E. Vrizali<sup>7</sup>, H.H. Hoffman<sup>8</sup>. <sup>1</sup>Pediatrics, University Hospital Tuebingen, Tuebingen, Germany; <sup>2</sup>Rheumatology, University Hospital Basel, Basel, Switzerland; <sup>3</sup>University of North Carolina, Chapel Hill, USA; <sup>4</sup>University College London Medical School, London, UK; <sup>5</sup>Academic Medical Center, University of Amsterdam, Amsterdam, Netherlands; <sup>6</sup>Quintiles IMS, Durham, USA; <sup>7</sup>Novartis Pharma AG, Basel, Switzerland; <sup>8</sup>Rheumatology, Allergy, and Immunology, University of California at San Diego, La Jolla, USA

**Background:** The  $\beta$ -confident registry (NCT01213641), a multicenter, long-term (6 years; yrs), prospective, observational study has demonstrated the safety and effectiveness of canakinumab (CAN) in real life CAPS patients (pts) according to their phenotypes.<sup>1</sup> Here we report long-term safety of CAN in pts with CAPS and other autoinflammatory syndromes, enrolled in the  $\beta$ -confident registry, according to their age and dose administered.

**Objectives:** To monitor the long-term safety of different CAN doses (<2, 2–<4 and 4–<8 mg/kg) across different age groups (<4 to 65 years) in pts with CAPS and other autoinflammatory syndromes.

**Methods:** Cumulative safety data were reported as exposure adjusted incidence rate per 100 pt-years (IR/pyr) from the enrollment of the first pt (November 2009) until end of study (December 2015). Pts were followed up for at least 1 year. The protocol did not mandate any visits or procedures. All observed and reported AEs and SAEs were recorded for the following age groups:<4-, 4–<12-, 12–<18-, 18–<65 and  $\geq$ 65 years.

**Results:** Of the 285 pts enrolled, 21% (n=60) discontinued the study mainly due to loss of follow-up (35%, n=21) followed by AEs (10%, n=6), poor efficacy (8%, n=5) and pt preference (3%, n=2). In total, 1114 AEs and 155 SAEs were reported in 223 pts (110.7 IR/100 pyr) and 83 pts (15.4 IR/100 pyr), respectively. Exposure adjusted incidence rate of AEs (IR/100 pyr) among pts in the <4 and 4–<12 year age group, were lowest in the pts who received <2 mg/kg dose (130.3 and 59.7, respectively) compared to pts who received 2–<4 mg/kg (450.8 and 169.6, respectively) and 4–<8 mg/kg (121.5 and 90.0, respectively) CAN dose. In pts

aged 12–<18 years, IR/100 pyr were lowest in pts who received 2–<4 mg/kg dose (118.2) compared to pts who received <2 mg/kg (169.6) and 4–<8 mg/kg (139.4) CAN dose. Similarly, in the 18–<65 year age group, IR/100 pyr were lowest in pts who received <2 mg/kg dose (93.1) compared to pts who received 2–<4 mg/kg (100.7) and 4–<8 mg/kg (154.4) CAN dose. In the  $\geq$ 65 year age group, IR/100 pyr decreased with increase in dose (<2 mg/kg: 26, 2–<4 mg/kg: 17). Overall, 5, 13, 19, 84 and 7 SAEs were reported in <4-, 4–<12-, 12–<8-, 18–<65 and  $\geq$ 65 year age groups, respectively. One death (metastatic rectal adenocarcinoma in a 76-yr-old MWS patient) was reported.

**Conclusions:** The  $\beta$ -confident registry is the largest CAPS cohort documented in a registry. In general, incidence of adverse events in each dose group increased with age (<4–<65 years). However, no meaningful pattern of AEs was observed with increased dose for each age group. Long-term treatment with canakinumab demonstrated favourable safety profile which was similar to that reported earlier<sup>2</sup> and is well tolerated in CAPS patients aged <4 to 65 years.

#### LONG-TERM EFFICACY AND SAFETY OF ADALIMUMAB BY IMMUNOSUPPRESSANT USE IN PATIENTS WITH NON-INFECTIOUS UVEITIS IN THE VISUAL III TRIAL

Y. Guex-Crosier<sup>1</sup>, C.S. Foster<sup>2,3</sup>, K. Nakai<sup>4</sup>, H. Goto<sup>5</sup>, K. Douglas<sup>6</sup>, S. Pathai<sup>7</sup>, M. Kron<sup>8</sup>, A.P. Song<sup>9</sup>, J. Van Calster<sup>9</sup>, A. Adán<sup>10</sup>. <sup>1</sup>Jules Gonin Eye Hospital, University of Lausanne, Lausanne, Switzerland; <sup>2</sup>Massachusetts Eye Research and Surgery Institution (MERSI), Ocular Immunology and Uveitis Foundation (OIUF), Waltham; <sup>3</sup>Harvard Medical School, Boston, USA; <sup>4</sup>Yodogawa Christian Hospital, Osaka; <sup>5</sup>Tokyo Medical University, Tokyo, Japan; <sup>6</sup>AbbVie Inc., North Chicago, USA; <sup>7</sup>AbbVie Ltd., Maidenhead, UK; <sup>8</sup>AbbVie Deutschland GmbH and Co KG, Ludwigshafen, Germany; <sup>9</sup>University Hospitals Leuven, Leuven, Belgium; <sup>10</sup>Hospital Clinic de Barcelona, Barcelona, Spain

**Objectives:** To evaluate the long-term safety and efficacy of adalimumab in patients with non-infectious intermediate, posterior, or panuveitis, by immunosuppressant (IMM) use.

**Methods:** Adult patients who completed or had a treatment failure in the VISUAL III trials were eligible to enter the Phase III open-label extension study, VISUAL III. Patients received adalimumab 40 mg every other week in VISUAL III, and interim follow-up data were collected through Weeks 0 to 78. Efficacy measures assessed included proportion of patients with: no active inflammatory lesions in both eyes; anterior chamber (AC) cell grade  $\leq$ 0.5 + in both eyes; vitreous haze (VH) grade  $\leq$ 0.5 + in both eyes; quiescence (defined as no active inflammatory lesions AND AC cell grade  $\leq$ 0.5 + AND VH grade  $\leq$ 0.5+); and steroid-free quiescence. Mean steroid dose and mean best corrected visual acuity (BCVA) were also assessed. Missing data were imputed using non-responder imputation for categorical endpoints, last observation carried forward for continuous variables, and as-observed for steroid dose. Efficacy was analysed by IMM (methotrexate, cyclosporine, mycophenolate mofetil, or azathioprine) use. Adverse events (AEs) were reported from first adalimumab dose in VISUAL III through interim cut-off date of Oct 31, 2016, with analysis by IMM use.

**Results:** Of 371 patients included in the intent-to-treat analysis, 117 (31.5%) were using IMM at VISUAL III baseline (BL) and 30 (8.1%) started IMM during VISUAL III. The proportion of patients with quiescence improved over time irrespective of IMM use; compared with Week 0, 95% confidence intervals were non-overlapping at most time points (figure 1). Numeric improvements were achieved in steroid-free quiescence, steroid dose reduction, and BCVA, with no difference by IMM use. No new safety signals were detected through 130 weeks of treatment and AE rates were generally consistent with previous VISUAL trials; some AEs, notably serious infections and malignancies, were slightly higher with concomitant IMM use.

**Abstract OP0086 – Figure 1.** proportion of patients in quiescence by IMM use in VISUAL III

**Conclusions:** Exploratory analyses from the VISUAL III trial demonstrated that efficacy in adalimumab-treated patients was sustained or improved through 78 weeks of treatment, irrespective of IMM use. AE rates were consistent with previous VISUAL trials, although numerically higher rates for a subset of AEs were observed in patients taking IMM.

OP0087

### INCREASED RISK OF ISCHAEMIC HEART DISEASE AND MORTALITY AMONG FMF PATIENTS – PERSPECTIVE FROM A BIG DATABASE

S. Tiosano<sup>1,2</sup>, R. Shapira<sup>1,2</sup>, O. Gendelman<sup>1,2</sup>, D. Comaneshter<sup>3</sup>, E. Pras<sup>2,4</sup>, A. D. Cohen<sup>3,5</sup>, H. Amital<sup>1,2</sup>, <sup>1</sup>Internal Medicine 'B', Sheba Medical Center, Tel-Hashomer, Ramat-Gan; <sup>2</sup>Sackler School of Medicine, Tel-Aviv University; <sup>3</sup>Chief Physician's office, Clalit Health Services, Tel-Aviv; <sup>4</sup>Genetic Institute, Sheba Medical Center, Tel-Hashomer, Ramat-Gan; <sup>5</sup>Sial Research Center for Family Medicine and Primary Care, Faculty of Health Sciences, Ben-Gurion University of the Negev, Beer-Sheva, Israel

**Background:** Familial Mediterranean fever (FMF) is a systemic autoinflammatory monogenic disease. It has been previously reported that FMF patients are prone to develop ischaemic heart disease (IHD),<sup>1,2</sup> mostly due to increased inflammatory activity and endothelial dysfunction.<sup>3,4</sup> However, large-scale information regarding the extent and prognosis of IHD among FMF patients is lacking.

**Objectives:** To check whether an association exists between FMF and IHD, and to assess the long-term prognostic significance of IHD among FMF patients using a big data registry with a 15 year follow-up period.

**Methods:** Utilising the medical records of Clalit Health Services, the largest HMO in Israel, we extracted a cohort of FMF patients along with their age-and-sex matched controls. Dates of registration in the medical records of FMF, IHD and death, as well as anthropometric information and medical comorbidities were extracted from the database. To compare the distribution of variables across the cohort strata, univariate analysis was performed using Chi-square and student t-test. Multivariate analysis using a logistic regression model was used to find variables associated with IHD. Survival analysis using Cox proportional hazards method and a log-rank test was performed to find variables associated with increased risk of all-cause mortality.

**Results:** The cohort included 7,670 FMF patients and 7670 age-and-sex matched controls. The mean age of both groups was 39.1, and both consisted 50.1% females. IHD was observed among 491 FMF patients (6.4%) vs 375 controls (4.89%),  $p < 0.001$ . In multivariate logistic regression, FMF was found to be

independently associated with a diagnosis of IHD (OR 1.44, 95% CI: 1.21 to 1.72). After over 15 years of follow-up, 345 (4.5%) of FMF patients had died, compared to 271 (3.53%) of the controls ( $p < 0.001$ ). In multivariate survival analysis, both FMF and IHD were found to be significantly associated with increased risk to all-cause mortality (HR 1.29, 95% CI: 1.10 to 1.53 and HR 1.57, 95% CI: 1.29 to 1.9, respectively).

**Conclusions:** IHD is associated with worse prognosis among FMF patients compared to controls. Proper screening methods are recommended to assess whether early identification and treatment may improve life expectancy.

OP0088

### IMMUNE-RELATED ADVERSE EVENTS OF CANCER IMMUNOTHERAPY – WHEN INFLAMMATORY SIDE EFFECTS ARE ASSOCIATED WITH SURVIVAL: A SINGLE-CENTRE PROSPECTIVE COHORT STUDY

M. Kostine, E. Mauric, L. Rouxel, T. Barnette, R. Veillon, F. Martin, C. Dutriaux, L. Dousset, A. Pham-Ledard, S. Prey, M. Beylot-Barry, A. Daste, M. Gross-Goupil, J. Lallier, A. Ravaud, E. Forcade, B. Bannwarth, M.-E. Truchetet, C. Richez, N. Mehzen-Cetre, T. Schaevebeke, on behalf of the FHU ACRONIM. *Bordeaux University Hospital, Bordeaux, France*

**Background:** Immune checkpoint inhibitors (ICI) represent a new standard of care for the treatment of selected advanced cancers and are still being investigated in many other tumour types. By enhancing the T-cell activation, a unique spectrum of inflammatory side effects has emerged, also known as immune-related adverse events (irAEs), including various well-described rheumatic manifestations. Data regarding the association between irAEs and patient outcomes are conflicting.

**Objectives:** To evaluate the incidence and characteristics of irAEs in patients receiving ICI, as well as the correlation with tumour response and patient survival.

**Methods:** This was a single-centre prospective observational study including all cancer patients receiving ICIs. The occurrence of irAEs, tumour response and patient outcomes were assessed on a regular basis. Overall survival has been considered from the start of ICI.

**Results:** From May 2015 to September 2017, 636 patients (70% male, mean age 64 years) have been included in this cohort while receiving anti PD-1 (n=435), anti PD-L1 (n=66) or anti CTLA-4 (n=3) as single agent or as sequential (n=100) or combined (n=32) therapies. Cancer types were mainly melanoma (n=293), non-small cell lung cancer (n=150) and renal carcinoma (n=83). Overall, 274/633 patients (43%) experienced irAEs, either 1 irAE (n=162), 2 irAEs (n=78) or  $\geq 3$  irAEs (n=34), with a median exposure time of 52 days<sup>30-31</sup> for the first irAE. Dermatological irAEs were by far the most frequent (n=160), followed by digestive

(n=80), endocrine irAEs (n=67), rheumatic (n=49) and pulmonary irAEs (n=17). So far, evaluation of tumour response was available for 551 patients, including 190 responders (complete response n=36 and partial response n=154), 192 patients with stable disease and 169 with progressive disease. 122/189 responders (65%) and 107/192 with stable disease (56%) experienced at least one irAE while reported only in 40/169 non responders (24%). Patients experiencing at least one irAE had an increased overall survival (median of 1169 days versus 224 days,  $p < 0.0001$ , figure 1), without statistical difference according to organ system. Of note, there was also no statistical difference regarding tumour response or irAEs occurrence among the 9.4% of patients with preexisting inflammatory or autoimmune disease (60/636).

Abstract OP0088 – Figure 1. Overall survival according to irAE occurrence

**Conclusions:** Although irAE occurrence is not required for treatment benefit, it strongly associates with overall survival. Optimal multidisciplinary management of irAEs, including rheumatologists when needed, is worthwhile to maintain beneficial responses.

WEDNESDAY, 13 JUNE 2018:

## New driving molecules in systemic sclerosis

### OP0089 ABATACEPT IS EFFECTIVE IN EXPERIMENTAL DIGESTIVE AND LUNG TISSUE FIBROSIS

G. Boleto<sup>1,2</sup>, C. Guignabert<sup>3,4</sup>, S. Pezet<sup>2</sup>, A. Cauvet<sup>2</sup>, J. Sadoine<sup>5</sup>, L. Tu<sup>3,4</sup>, C. Nicco<sup>2</sup>, C. Gobeaux<sup>6</sup>, F. Batteux<sup>2</sup>, Y. Allanore<sup>1,2</sup>, J. Avouac<sup>1,2</sup>. <sup>1</sup>Department of Rheumatology A, Cochin Hospital; <sup>2</sup>INSERM U1016, Institut Cochin, CNRS UMR8104, Paris Descartes University, Paris; <sup>3</sup>Université Paris-Sud, Université Paris-Saclay, Le Kremlin-Bicêtre; <sup>4</sup>INSERM UMR\_S 999, Paris Sud University, Le Plessis-Robinson; <sup>5</sup>EA 2496 Pathologie, Imagerie et Biothérapies Orofaciales, UFR Odontologie, Université Paris Descartes and PIDV, PRES Sorbonne Paris Cité, Montrouge; <sup>6</sup>Clinical Chemistry Laboratory, Cochin and Hôtel-Dieu Hospitals, Paris Descartes University, Paris, France

**Background:** Cytotoxic T-lymphocyte associated molecule-4 (CTLA-4) is an immunoregulatory membrane receptor resulting in the down-regulation of T-cell responses. A previous report showed that abatacept (CTLA4-Ig) prevented and induced regression of inflammation-driven dermal fibrosis in two different mouse models of systemic sclerosis (SSc).<sup>1</sup>

**Objectives:** We aimed to assess the effects of abatacept in two complementary mouse models reflecting digestive involvement, lung fibrosis and pulmonary hypertension (PH), mimicking severe SSc organ damage.

**Methods:** Abatacept was given in the chronic graft-versus-host disease (cGvHD) mouse model, characterised by digestive involvement, and in the Fra-2 mouse model which is characterised by non-specific interstitial pneumonia and pulmonary vascular remodelling leading to PH. Mice were treated by intraperitoneal injections of abatacept (1 mg/mL in the cGvHD model for 6 weeks; 1 mg/mL or 10 mg/mL in the Fra-2 mouse model for 4 weeks) or human IgG1 (100 mg) used as a negative control.

**Results:** In the cGvHD model, treatment of allogeneically mice with abatacept led to a significant reduction of alanine aminotransferase (24%,  $p=0.014$ ) and aspartate aminotransferase levels (61%,  $p<0.001$ ). Pathological analysis of colon revealed decreased inflammatory infiltrates and destruction of crypts in allogeneically mice receiving abatacept.

When assessed by chest micro-CT imaging, Fra-2 mice treated with abatacept displayed a 12% decrease in lung density (10 mg/ml,  $p=0.037$ ) as well as an increase in functional residual capacity as compared to IgG1-treated mice (16% for 1 mg/ml,  $p=0.001$  and 14% for 10 mg/ml,  $p=0.005$ ).

Consistent with these results, abatacept 10 mg/L decreased histological fibrosis score (Ashcroft score) as well as hydroxyproline content by 79% ( $p=0.009$ ) and 31% ( $p=0.044$ ) respectively, as compared to IgG1-treated mice.

Treatment with abatacept 10 mg/mL markedly reduced protein levels in the lesional lungs of Fra-2 mice of the fibrogenic markers MCP1 by 79% ( $p=0.043$ ) and osteopontin by 87% ( $p=0.039$ ). Levels of TGF- $\beta$  were also reduced with abatacept (61% for 1 mg/mL,  $p=0.037$  and 69% for 10 mg/mL,  $p=0.013$ ). Further, abatacept decreased M1 and M2 macrophages infiltration as well as T-cell proliferation in the lesional lungs of Fra-2 mice.

Upon treatment with abatacept a reduction of right ventricular systolic pressure ( $28.1 \pm 1.5$  mmHg vs  $36.0 \pm 5.1$  mmHg,  $p=0.037$  for 10 mg/mL) and right ventricular hypertrophy ( $0.29 \pm 0.01$  vs  $0.33 \pm 0.010$ ,  $p=0.037$  and  $29 \pm 0.01$  vs  $0.33 \pm 0.01$  for 10 mg/mL,  $p=0.037$ ) was observed compared to IgG1-treated mice. Consistent with these findings, abatacept 10 mg/mL was associated with significant decrease in percent medial wall thickness and numbers of muscularized distal pulmonary arteries.

**Conclusions:** We demonstrate that treatment with abatacept improves digestive involvement, prevents lung fibrosis and attenuates PH in SSc pre-clinical mice models. These findings suggest that abatacept might be an appealing therapeutic approach for severe internal organ involvement in SSc beyond its already demonstrated effects on skin fibrosis.

### OP0090 MITOCHONDRIAL DNA MUTATIONS AND RESPIRATORY CHAIN DYSFUNCTION IN LUNG FIBROSIS OF SYSTEMIC SCLEROSIS

V.K. Jaeger<sup>1</sup>, D. Lebrecht<sup>2,3</sup>, A.G. Nicholson<sup>4,5</sup>, A.U. Wells<sup>4,6</sup>, S. George<sup>7</sup>, A. Gazdhar<sup>8</sup>, M. Tamm<sup>9</sup>, N. Venhoff<sup>9</sup>, T. Geiser<sup>10</sup>, U.A. Walker<sup>1</sup>. <sup>1</sup>Department of Rheumatology, University Hospital Basel, Basel, Switzerland; <sup>2</sup>Department of Pediatrics and Adolescent Medicine, Division of Pediatric Hematology and Oncology, Medical Center, Faculty of Medicine, University of Freiburg; <sup>3</sup>Department of Rheumatology and Clinical Immunology, Faculty of Medicine, University of Freiburg, Freiburg, Germany; <sup>4</sup>National Heart and Lung Institute, Imperial College; <sup>5</sup>Department of Histopathology; <sup>6</sup>Interstitial Lung Disease Unit, Royal Brompton Hospital, Royal Brompton and Harefield NHS Foundation Trust; <sup>7</sup>Royal Brompton and Harefield NHS Foundation Trust, London, UK; <sup>8</sup>Department of Pulmonary Medicine, University Hospital Bern, Bern; <sup>9</sup>Department of Pneumology, University Hospital Basel, Basel; <sup>10</sup>Department of Pneumology, University Hospital Bern, Bern, Switzerland

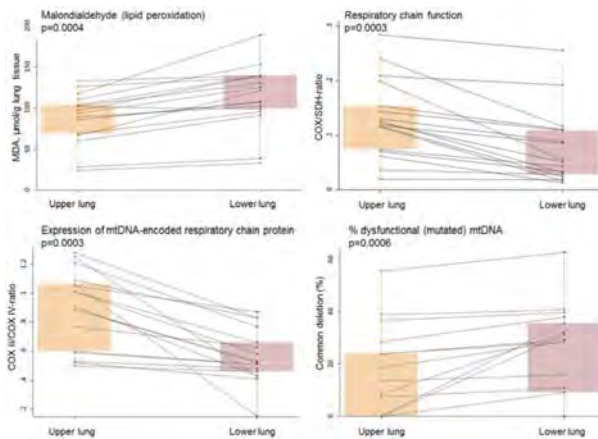

**Background:** Recent data have implemented reactive oxygen species (ROS) in the etiology of interstitial lung disease (ILD) in systemic sclerosis.

**Objectives:** To investigate a role of large-scale somatically acquired mutations in mitochondrial DNA (mtDNA) and consecutive respiratory chain dysfunction as a trigger of ROS formation and lung fibrosis.

**Methods:** Lung biopsies from patients with idiopathic interstitial pneumonitis and systemic sclerosis (n=31) were analysed for mitochondrial functions and compared with biopsies from 13 healthy controls (HC). From 17 patients we had simultaneous biopsies from the upper and lower lung.

**Results:** Malondialdehyde as a marker of ROS formation was increased in ILD ( $p=0.007$ ). The median proportion of mtDNA containing the pathogenic common deletion was 22.5% in ILD patients, compared to 0% in HC. This translated into a 3.8-fold diminishment of mtDNA-encoded cytochrome c-oxidase (COX2), but not nucleus-encoded (COX4) respiratory chain subunits in ILD compared to controls ( $p<0.0001$ ) and a 33% diminishment of mtDNA-encoded cytochrome c-oxidase activity ( $p=0.001$  vs controls). In all patients, the more fibrotic lower lungs had significantly more malondialdehyde ( $p=0.0004$ ), mtDNA deletions ( $p=0.0006$ ), and cytochrome c-oxidase dysfunction ( $p=0.0003$ ) than the less-fibrotic upper lung counterparts. Conversely, lower lungs had significantly less ( $p=0.0003$ ) mtDNA-encoded COX2 subunits in comparison to non-mtDNA-encoded COX4 subunits (figure 1). There was no association of any mitochondrial parameter with smoking status or age, and no difference between biopsies from patients with systemic sclerosis and non-specific interstitial pneumonitis.

**Abstract OP0090 – Figure 1.** Mitochondrial parameters in lung biopsies simultaneously obtained in both, upper and lower lungs, of patients with fibrotic lungs. Lines connect values of the same patients.

**Conclusions:** Our data support a role of mtDNA-mutations and consecutive respiratory chain dysfunction as a trigger and perpetuator of ROS formation in both, idiopathic interstitial pneumonitis and ILD of patients with systemic sclerosis.

#### OP0091 CXCL10/CXCL11 SERUM MEASUREMENT AS POTENTIAL PREDICTOR OF SYSTEMIC SCLEROSIS

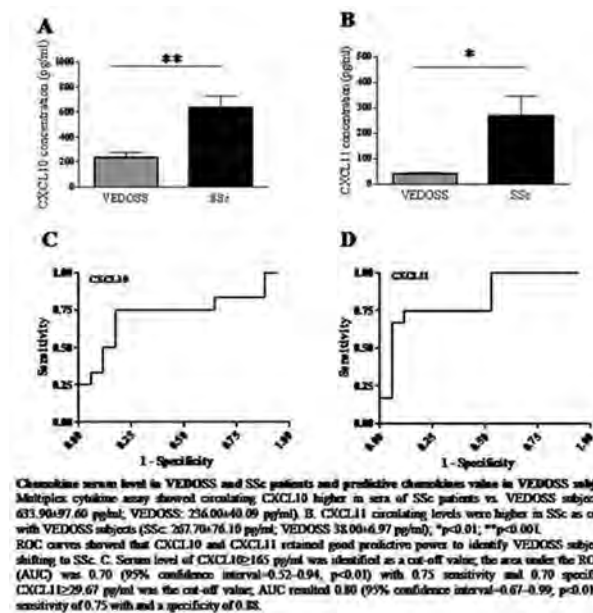

C. Antinozzi<sup>1</sup>, C. Corinaldesi<sup>1,2</sup>, V. Ricciari<sup>3</sup>, V. Raparelli<sup>3</sup>, M. Vasile<sup>3</sup>, F. Del Galdo<sup>2</sup>, G. Valesini<sup>3</sup>, A. Lenzi<sup>3</sup>, S. Basili<sup>3</sup>, C. Crescioli<sup>1</sup>. <sup>1</sup>University of Rome Foro Italico, Rome, Italy; <sup>2</sup>University of Leeds, Leeds, UK; <sup>3</sup>Sapienza University of Rome, Rome, Italy

**Background:** Systemic sclerosis (SSc), amongst autoimmune rheumatic disorders, shows a heterogeneous and unpredictable course from stable/mild involvement to progressive/late stage, when irreversible multiorgan fibrosis occurs.<sup>1</sup> Early SSc diagnosis remains a clinical challenge; a delay in diagnosis leads, in turn, to therapy delay and more severe patient disability.<sup>2-3</sup> Earliest vascular immune-mediated alterations are critical in SSc, which, indeed, has been referred to as a 'vascular' disease.<sup>4</sup> Recognition of biomarker(s) involved in earliest vascular derangements might represent a clinical tool potentially useful for therapeutic approach. Blood level of chemokines IFN $\gamma$ -inducible protein 10 (IP-10/CXCL10) and IFN-inducible T cell alpha chemoattractant (I-TAC/CXCL11), both involved in endothelial dysfunction, has been shown to associate with worse SSc prognosis.<sup>5,6</sup>

**Objectives:** To investigate possible modifications of circulating CXCL10/CXCL11 in the shift from very early diagnosis of SSc (VEDOSS), when vasculopathy and fibrosis are still at very low degree, to definite SSc. Associations between chemokines and capillaroscopic pattern, autoantibody positivity were evaluated.

**Methods:** Multiplexed luminex technology was used to analyse CXCL10/CXCL11 in total 62 sera, 34 from VEDOSS and 28 from SSc patients, fulfilling the new ACR/EULAR 2013 classification criteria; none of the subjects were treated for SSc. Within VEDOSS group, we selected 29 sera of subjects with follow up (40.67 $\pm$ 5.46 months) and, for each patient of this subcohort, chemokine levels were assessed at follow up (T1) and compared with basal level (T0). Appropriate tests were used for sample distribution and statistical analysis.

**Results:** Serum CXCL10/CXCL11 were significantly lower in all VEDOSS (CXCL10: 236.00 $\pm$ 40.09 pg/ml; CXCL11: 38.00 $\pm$ 6.97 pg/ml) vs all SSc sera (CXCL10: 633.90 $\pm$ 97.60 pg/ml; CXCL11: 267.70 $\pm$ 76.10 pg/ml; p<0.001 and p<0.01, respectively). Moreover, in VEDOSS subcohort, basal chemokine values (T0) were significantly higher (p<0.001) in sera of subjects who subsequently shifted to SSc (CXCL10: 237.34 $\pm$ 27.34 pg/ml; CXCL11: 45.12 $\pm$ 7.18 pg/ml) vs subjects not developing SSc (CXCL10: 140.06 $\pm$ 16.17 pg/ml; CXCL11: 20.17 $\pm$ 4.06 pg/ml). Sera analysed at follow up (T1) showed a significant increase of both chemokines vs T0 values only in patients who developed SSc (CXCL10: 536.18 $\pm$ 54.98 pg/ml; CXCL11: 250.21 $\pm$ 86.53 pg/ml; p<0.001). CXCL10/CXCL11 retained significant predictive values for SSc development with 165 pg/ml and 29.67 pg/ml cut-off values, respectively, as shown by receiver operating characteristic (ROC) analysis. Significant correlation of CXCL10/CXCL11 with nailfold capillaroscopic pattern was observed.

Correlations	Rho ( $\rho$ )	P
CXCL10/CXCL11	0.6 (Pearson)	<0.0001
CXCL10/NVC	0.6 (Spearman)	<0.0001
CXCL11/NVC	0.5 (Spearman)	<0.001

Serum CXCL10 and CXCL11 concentrations also significantly correlated (Pearson's Rho  $\rho$  0.6; <0.0001) and correlated with capillaroscopic pattern (Spearman's  $\rho$  0.6 and 0.5, respectively; p<0.001 and p<0.0001). NVC=nailfold videocapillaroscopy

**Conclusions:** CXCL10/CXCL11 blood level measurement in VEDOSS patients potentially represents a noninvasive biomarker associated with vascular modifications – as shown by capillaroscopic pattern – predictive of SSc.

#### OP0092 DECREASED DICKKOPF-1 EXPRESSION IN CLINICALLY UNINVOLVED SKIN FROM PATIENTS WITH SYSTEMIC SCLEROSIS

D. Daoussis<sup>1</sup>, D.J. Papachristou<sup>2</sup>, T. Dimitroulas<sup>3</sup>, T. Sidiropoulos<sup>4</sup>, I. Antonopoulos<sup>1</sup>, S.-N. Liossis<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Department of Anatomy-Histology-Embryology, Laboratory of Bone and Soft Tissue Studies, University of Patras Medical School, Rio, Patras; <sup>3</sup>Rheumatology, 4th Department of Internal Medicine Hippokraton Hospital/Medical School, Aristotle University of Thessaloniki; <sup>4</sup>Dermatology, Hospital of Skin and Venereal Diseases, Thessaloniki, Greece

**Background:** Evidence suggests that the Wnt pathway is a critical mediator of the fibrotic process. The activity of the pathway is tightly regulated by several soluble inhibitors such as Dickkopf-1 (Dkk-1). We, among others, have previously shown that Dkk-1 is absent from scleroderma skin in sharp contrast to skin from healthy subjects where it is clearly expressed.<sup>1,2</sup>

**Objectives:** Up until now, Dkk-1 skin expression has only been assessed in established fibrosis, in biopsies obtained from clinically involved areas. We aimed to assess whether the striking lack of Dkk-1 skin expression is also evident in a)

clinically uninvolved skin from patients with SSc and b) very early disease at the puffy/edematous phase, prior to skin thickening.

**Methods:** Skin biopsies were obtained from a) 12 patients with SSc from lesional skin of the forearm, b) 5 patients with SSc from the upper back which was not affected clinically, c) 2 patients with systemic sclerosis (SSc) with very early disease (<12 months). These patients had puffy hands but no skin thickening; the biopsy was obtained from the distal part of the forearm, in close proximity to the edematous area d) 5 healthy subjects. Dkk-1 expression was immunohistochemically assessed using a mouse anti-human monoclonal antibody (R and D Systems) by a semi-quantitative method (high/moderate/weak/no expression).

**Results:** Healthy skin displayed a high Dkk-1 immunoreactivity in basal cells of the epidermis as well as in the fibroblasts of the dermis in sharp contrast to clinically involved scleroderma skin that displayed no Dkk-1 immunoreactivity. Clinically uninvolved skin was obtained from 5 patients with SSc (4 diffuse-1 limited) with a median age of 50<sup>46-72</sup> and disease duration of 6<sup>2-13</sup> years. In all 5 biopsies Dkk-1 was only moderately expressed in basal cells of the epidermis and dermal fibroblasts. Clinically uninvolved scleroderma skin could be differentiated by immunohistochemical means from both skin from healthy subjects (high Dkk-1 expression) and clinically involved scleroderma skin (no Dkk-1 expression). Skin from very early disease at the edematous phase, prior to skin thickening, displayed only a weak Dkk-1 immunoreactivity in basal cells of the epidermis as well as in the fibroblasts of the dermis.

**Conclusions:** The decrease in Dkk-1 expression in clinically uninvolved scleroderma skin substantiates previous evidence that the skin in SSc is universally affected underlying the systemic nature of the disease. The downregulation of Dkk-1 at the edematous phase of the disease indicates that the Wnt pathway is involved early in the disease process, prior to establishment of fibrosis a finding with potential pathogenetic implications

#### OP0093 LOW RUNX3 EXPRESSION ALTERS DENDRITIC CELL FUNCTION IN PATIENTS WITH SYSTEMIC SCLEROSIS AND CONTRIBUTES TO ENHANCED FIBROSIS

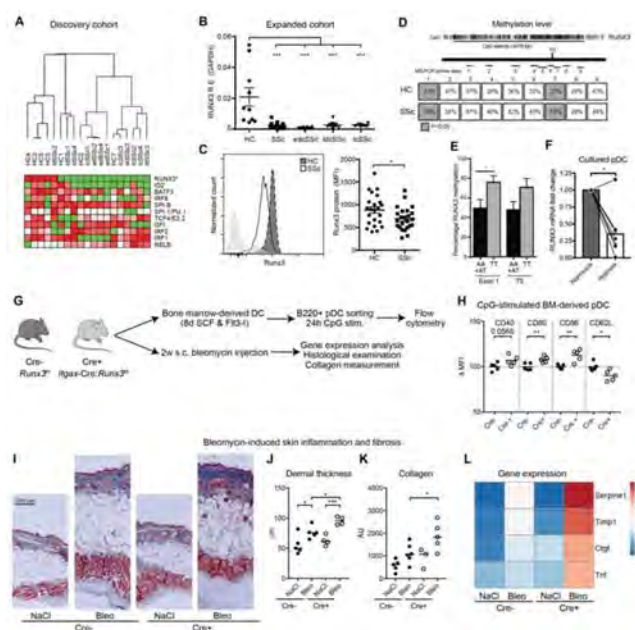

W. Maruti<sup>1</sup>, A. Affandi<sup>1</sup>, J. Broen<sup>1</sup>, L. Bossini-Castillo<sup>2</sup>, A. Ottria<sup>1</sup>, R. Tieland<sup>1</sup>, L. van Bon<sup>1</sup>, M. Rossato<sup>1</sup>, L. de Kroon<sup>3</sup>, J. van Roon<sup>1</sup>, J. Martin<sup>2</sup>, R. Lafyatis<sup>3</sup>, T. Radstake<sup>1</sup>. <sup>1</sup>Laboratory for translational immunology, University Medical Center Utrecht, Utrecht, Netherlands; <sup>2</sup>Consejo Superior de Investigaciones Científicas, Instituto de Parasitología y Biomedicina López-Neyra, Granada, Spain; <sup>3</sup>Rheumatology Section, Department of Medicine, Boston University School of Medicine, Boston, USA

**Background:** Systemic sclerosis (SSc) is an autoimmune disease with unknown pathogenesis manifested by inflammation, vasculopathy, and fibrosis in skin and internal organs. The type I IFN signature found in SSc propelled us to study plasmacytoid dendritic cells (pDCs) in this disease.

**Objectives:** To identify candidate pathways underlying pDC aberrancies in SSc and to validate its function on pDC biology.

**Methods:** PCR-based transcription factor profiling and methylation status analyses, SNP genotyping by sequencing, and flow cytometry analysis were performed in pDCs from healthy controls or SSc patients. pDCs were also cultured under hypoxia and RUNX3 levels were determined. To study Runx3 function in DCs, *Ilgax-Cre:Runx3<sup>fl/fl</sup>* mice were used in an *in vitro* functional assays and bleomycin-induced SSc skin inflammation and fibrosis model.

**Results:** Transcription factor RUNX3 was significantly downregulated in SSc pDCs on RNA and protein levels. A higher methylation status of the *RUNX3* gene correlated with RUNX3 gene expression level and disease susceptibility. After sequencing of the *RUNX3* promoter region, we identified a non-synonymous SNP rs6672420 associated with SSc and hypermethylation of *RUNX3*. Additionally, pDCs cultured in hypoxic conditions showed a significantly lower RUNX3 expression. Furthermore, mouse pDCs deficient of *Runx3* showed enhanced expression of co-stimulatory molecules upon CpG stimulation. Finally, in SSc bleomycin model, mice with DC-specific deletion of *Runx3* showed increased skin inflammation and fibrosis.

**Conclusions:** We found low RUNX3 expression in pDCs of SSc patients. The presence of a SNP and higher methylation status of RUNX3, and downregulation in hypoxic condition, suggest at least three pathways underlying the low RUNX3 expression observed in SSc pDCs. We demonstrate a detrimental role of RUNX3-obliterated DCs in a mouse SSc model further underscoring the role of pDCs in this disease. Further research is warranted to explore the potential therapeutic effect of RUNX3 targeting in fibrotic disease.

#### OP0094 SLIT2/ROBO4 AXIS MAY CONTRIBUTE TO ANGIOGENESIS DISTURBANCE IN SYSTEMIC SCLEROSIS (SSc)

E. Romano, M. Manetti, I. Rosa, B.S. Fioretto, L. Ibba-Manneschi, M. Matucci-Cerinic, S. Guiducci. Department of Experimental and Clinical Medicine, University of Florence, Florence, Italy

**Background:** In SSc, vascular involvement is a primary event characterised by vascular tone dysfunction and microcirculatory abnormalities. Many classes of guidance molecules, such as members of the secreted glycoproteins Slits and their Roundabout (Robo) receptors, play critical roles in angiogenesis. Among these, Robo1 and Robo4 are expressed in endothelial cells. In particular, it has been demonstrated that the interaction of Slit2 with Robo1 promotes angiogenesis, while the Slit2/Robo4 axis inhibits VEGF-mediated endothelial cell migration and tube formation *in vitro* and neovascularization *in vivo*.

**Objectives:** To evaluate the possible involvement of the Slit/Robo axis in SSc defective angiogenesis.

**Methods:** Serum Slit2 levels were measured by ELISA in 78 SSc patients, 64 patients with a very early diagnosis of SSc (VEDOSS) and 74 age- and sex-matched healthy controls. Slit2, Robo1 and Robo4 protein expression was evaluated by immunofluorescence in skin biopsies from 15 SSc patients and 10 controls. Slit2 and Robo4 expression in dermal microvascular endothelial cells isolated from 5 SSc patients (SSc-MVECs) and 5 healthy controls (H-MVECs) was analysed by quantitative real-time PCR, Western blot and immunocytochemistry. Proliferation, wound healing and capillary-like tube formation were assessed in H-MVECs challenged with recombinant human (rh) Slit2 or SSc sera (n=6) in the presence/absence of an anti-Slit2 blocking antibody, as well as in SSc-MVECs treated with anti-Slit2 antibody or Robo4 siRNA.

**Results:** Circulating Slit2 levels were significantly increased in either SSc (median 11.12 ng/ml, IQR 8.02–16.25 ng/ml) or VEDOSS (median 11.27 ng/ml, IQR 8.46–18.60 ng/ml) compared with healthy controls (median 8.79 ng/ml, IQR

6.68–12.13 ng/ml) ( $p=0.002$  and  $p=0.001$ , respectively). Serum Slit2 was elevated in SSc patients irrespective of the nailfold videocapillaroscopy (NVC) pattern or the presence/absence of digital ulcers. Interestingly, differences in serum Slit2 levels were found between VEDOSS patients with early/active NVC pattern and controls ( $p<0.0005$ ), while Slit2 concentrations were similar in VEDOSS with normal NVC and controls. In SSc, Slit2 and Robo4 expression was higher in clinically affected skin and cultured MVECs in respect to controls. No difference was found in Robo1 expression. Cell viability, wound healing capacity and capillary-like tube formation in H-MVECs were all significantly reduced after challenge with rh Slit2 or SSc sera. These inhibitory effects were significantly attenuated when SSc sera were preincubated with anti-Slit2 blocking antibody. Cell viability, wound healing capacity and *in vitro* angiogenesis were severely compromised in SSc-MVECs and could be significantly ameliorated by Slit2 neutralisation or Robo4 gene silencing.

**Conclusions:** In SSc, increased circulating levels of Slit2 and activation of the Slit2/Robo4 antiangiogenic axis may contribute to peripheral microangiopathy since the very early phase of the disease.

**Disclosure of Interest:** None declared

#### OP0095 SOLUBLE CD163 AS A POTENTIAL BIOMARKER IN SYSTEMIC SCLEROSIS

C. Frantz, S. Pezet, J. Avouac, Y. Allanore. *INSERM U1016, UMR8104, Paris Descartes University, Rheumatology A department, Cochin Hospital, Paris, France*

**Background:** Recent accumulating evidences indicate a crucial role of macrophage lineage in the pathogenesis of fibrotic diseases including systemic sclerosis (SSc). CD163 is a surface marker expressed by M2 macrophages that accumulate during the healing phase of acute inflammation. It is actively released from the plasma membrane in response to certain inflammatory stimuli and enters the circulation in its soluble form (sCD163).

**Objectives:** In this study, we aimed to evaluate the performance of serum and urinary sCD163 concentrations as possible biomarker in SSc.

**Methods:** Urine and serum samples were obtained from SSc patients, fulfilling the 2013 ACR/EULAR classification criteria for SSc, and age- and sex-matched controls. Serum and urinary sCD163 concentrations were measured by commercially available ELISA kit (R and D systems) and evaluated for their significance as potential biomarkers. Statistical analysis was carried out using Mann-Whitney U test and the relationship between parameters was statistically examined by Spearman's rank test.

**Results:** Two hundred and three SSc patients were included, 163 (80%) were female, with a mean  $\pm$ standard deviation (SD) age of  $59\pm 13$  years and a mean  $\pm$ SD disease duration of  $12\pm 9$  years. Eighty-one (41%) patients had diffuse cutaneous SSc and mean  $\pm$ SD mRSS was  $6.6\pm 7.7$ . Lung fibrosis on imaging was observed in 33% of the patients, 7% had pulmonary arterial hypertension, 44% had history of digital ulcers and 41% were taking immunosuppressive therapy. Control group consisted of 47 age- and sex-matched patients with non-inflammatory diseases, being osteoporosis for the very large majority.

Serum sCD163 levels were significantly higher in SSc patients compared with controls (mean  $\pm$ SD:  $529\pm 251$  vs  $385.1\pm 153$  ng/ml;  $p<0.001$ ). Urinary sCD163 concentrations in SSc patients were also higher than those in controls, but this did not reach significance ( $236.9\pm 498$  vs  $176.2\pm 173$  ng/mg uCr;  $p=0.580$ ). When looking at the subsets according to skin disease or disease duration, no difference could be identified. Furthermore, when the organ involvements were investigated, no subpopulation could be identified as having higher concentrations.

**Conclusions:** To our knowledge this is the first evaluation of both serum and urinary sCD163 levels in SSc. Our results show a significant difference for sera values that should be prioritised for further studies as compared to urinary concentrations conversely to what has been described in lupus. Our results further support that the M2 macrophages/CD163 signalling system may play a role in the pathogenesis of SSc. However, further studies are required to address the exact role of CD163 in the pathogenesis of SSc and to determine whether it could help in the risk-stratification of the patients in this heterogeneous disease.

**Disclosure of Interest:** None declared

## A rollercoaster from bench to bedside and back again: paediatric rheumatology in the 21st century...

#### OP0096 ADENO-ASSOCIATED VIRUS VECTOR-MEDIATED INTERLEUKIN-10 INDUCTION PREVENTS VASCULAR INFLAMMATION IN A MURINE MODEL OF KAWASAKI DISEASE

J. Nakamura<sup>1,2</sup>, S. Watanabe<sup>1</sup>, H. Kimura<sup>1</sup>, H. Mizukami<sup>3</sup>, N. Nagi-Miura<sup>4</sup>, N. Ohno<sup>4</sup>, M. Takahashi<sup>1</sup>, S. Minota<sup>2</sup>. <sup>1</sup>Division of Inflammation Research; <sup>2</sup>Rheumatology and Clinical Immunology; <sup>3</sup>Division of Genetic Therapeutics, Jichi Medical University, Shimotsuke, Tochigi; <sup>4</sup>Laboratory for Immunopharmacology of Microbial Products, School of Pharmacy, Tokyo University of Pharmacy and Life Sciences, Hachioji, Tokyo, Japan

**Background:** Kawasaki disease (KD), which is a common paediatric heart disease, is characterised by coronary vasculitis and subsequently aneurysm formation. Although the administration of intravenous immunoglobulin (IVIG) is effective for reducing aneurysm formation, approximately 10%–20% of patients are resistant to this therapy. Therefore, additional therapeutic approaches for treating the IVIG-resistant patients need to be developed.

*Candida albicans* water-soluble fraction (CAWS)-induced vasculitis on coronary arteries and root of aorta is a frequently used murine model of KD. It has been considered that C-type lectin receptor Dectin-2 recognises CAWS. Recent studies showed CAWS-resistant strains of mice have higher serum IL-10 levels, which suggested that IL-10 might negatively regulate the development of CAWS-induced vasculitis.

**Objectives:** The aim of the study is to investigate the therapeutic effect of IL-10 in CAWS-induced vasculitis and elucidate the underlying pathogenesis of KD.

**Methods:** To induce the expression of IL-10 *in vivo*, Adeno-associated virus (AAV) vectors encoding IL-10 were injected into DBA/2 mice. After the induction of IL-10, the mice were treated intraperitoneally with CAWS to induce vasculitis. Cardiac functions by echocardiography, inflammation and fibrosis by histological analyses, gene expression of inflammatory cytokines and fibrosis-related factors in the heart, and infiltrating cells by flow cytometry were assessed to evaluate the effects of IL-10.

For *in vitro* study, bone marrow-derived macrophages (BMDM) were stimulated with CAWS in presence or absence of IL-10. TNF- $\alpha$  and IL-6 produced by the BMDM and Dectin-2 expressions on the BMDM were assessed.

**Results:** AAV-mediated induction of IL-10 significantly attenuated CAWS-induced cardiac functions (%FS and LVEDD). Histological analyses revealed that IL-10 markedly attenuated the vascular inflammation and fibrosis in the aortic root and coronary artery. Accordingly, increased gene expressions of inflammatory cytokines or fibrosis-related factors in the heart of CAWS-treated mice were significantly reduced by IL-10. The predominant infiltrating inflammatory cells in vascular walls were Dectin-2<sup>+</sup>CD11b<sup>+</sup> macrophages, and they were also decreased by IL-10.

Furthermore, we showed GM-CSF induced Dectin-2 expression on BMDM, and the GM-CSF-treated BMDM produced TNF- $\alpha$  and IL-6 upon CAWS-stimulation. IL-10 had no effect on the Dectin-2 expression but significantly inhibited the production of the cytokines. Finally, the AAV-mediated induction of IL-10 prevented the expression of TNF- $\alpha$  and IL-6 in the heart of the mice treated with CAWS for 24 hours (at the early phase), but not GM-CSF and Dectin-2. These results suggest that GM-CSF mediates CAWS-induced vasculitis via Dectin-2 upregulation and IL-10 inhibits the downstream of GM-CSF and Dectin-2 signalling.

**Conclusions:** Our study has shown that IL-10 may have therapeutic application in the prevention of coronary vasculitis and aneurysm formation, and provided new insights into the mechanism underlying the pathogenesis of KD.

#### OP0097 STIMULATED MONOCYTE-DERIVED MACROPHAGES FROM PATIENTS WITH ENTHESITIS RELATED ARTHRITIS SECRETE HIGHER LEVELS OF IL23 AND LOWER LEVELS OF INTERFERON GAMMA COMPARED TO HEALTHY CONTROLS

C. Fisher<sup>1,2</sup>, D. Eleftheriou<sup>1</sup>, D. Sen<sup>1,2</sup>, Y. Ioannou<sup>1</sup>. <sup>1</sup>Arthritis Research UK Centre for Adolescent Rheumatology, University College London; <sup>2</sup>National Institute for Health Research University College London Hospitals Biomedical Research Centre, University College London and University College London Hospital, London, UK

**Background:** Enthesitis related arthritis (ERA) is the subtype of juvenile idiopathic arthritis most closely related to adult spondyloarthritis (SpA).

Macrophages, the IL23/IL17 pathway and dysregulation of IFN $\gamma$  are strongly implicated in the pathogenesis of adult SpA but remain relatively unexplored in ERA.

**Objectives:** To compare levels of IL23 and IFN $\gamma$  produced by monocyte-derived macrophages (MDMs) in the presence of lipopolysaccharide (LPS) from patients with ERA compared to healthy controls. The effect of clinical features such as enthesitis, peripheral and axial arthritis on IL23 and IFN $\gamma$  expression was also studied.

**Methods:** Peripheral blood monocytes from 39 patients (68% HLA B27 positive, 84% male, median age 16 years 4 months, median disease duration 3 years 10 months) and 21 age and gender-matched healthy controls were differentiated *in vitro* with macrophage-colony stimulating factor in to macrophages. Differentiated cells were treated with IFN $\gamma$  for 24 hours to upregulate HLA B after which the cells were washed and stimulated with LPS (50 ng/mL). IL23 and IFN $\gamma$  expression from the cell culture supernatants were measured by ELISA and luminex assay respectively.

**Results:** IL23 expression was significantly higher in patients with ERA [median 53580 pg/mL (IQR 35735–83945 pg/mL) vs 32110 pg/mL (IQR 13745–48235 pg/mL),  $p=0.01$ ], particularly in patients who were HLA B27 positive [median 64650 pg/mL (IQR 36400–99650 pg/mL),  $p=0.0067$ ]. IL23 was not significantly different between patients with and without peripheral arthritis or axial arthritis. However, patients who had active enthesitis (assessed clinically or on scan within 6 months of the sample) had significantly higher IL23 expression compared to patients without enthesitis [median 75905 pg/mL (IQR 36728–99425 pg/mL) vs 38485 pg/mL (IQR 29923–63725 pg/mL),  $p=0.014$ ] and healthy controls [ $p=0.0017$ ]. Interestingly, patients who had both HLA B27 and active enthesitis had even higher levels of IL23 [median 79380 pg/mL (IQR 36540–103200 pg/mL),  $p=0.0018$ ]. Conversely, levels of IFN $\gamma$  were found to be lower from MDMs of patients with ERA compared to healthy controls, at baseline [median 3985 pg/mL (IQR 2820–6849 pg/mL) vs 6305 pg/mL (IQR 3938–8744 pg/mL),  $p=0.0054$ ] and after LPS stimulation [median 9146 pg/mL (IQR 7438–11255 pg/mL) vs 11693 pg/mL (IQR 9481–13435 pg/mL),  $p=0.013$ ]. No difference was found between patients who were HLA B27 positive and negative, although there was a trend towards lower levels of IFN $\gamma$  in patients with enthesitis, this was not statistically significant.

**Conclusions:** IL23 expression is significantly higher from stimulated MDMs of patients with ERA compared to healthy controls, especially in HLA B27 positive patients with active enthesitis. This suggests a role for IL23 in the pathogenesis of ERA and supports the hypothesis that this sub-population of patients might benefit from IL23 blockade. Interestingly, IFN $\gamma$  expression is lower in patients with ERA. Dysregulation of IFN $\gamma$  has been shown to cause upregulation of the IL23/17 pathway in animal models<sup>1</sup> and thus may also contribute to the pathogenesis of ERA.

#### OP0098 CLINICAL PICTURE AND SPECTRUM OF CONDITIONS ASSOCIATED WITH NLRP12 GENE MUTATIONS

M. Kostik<sup>1</sup>, E. Suspitsin<sup>1,2</sup>, A. Levina<sup>1</sup>, M. Guseva<sup>1</sup>, M. Dubko<sup>1</sup>, L. Snegireva<sup>1</sup>, T. Likhacheva<sup>1</sup>, A. Kazantseva<sup>1</sup>, M. Makhova<sup>1</sup>, A. Sokolenko<sup>1,2</sup>, E. Imyanitov<sup>1,2</sup>, V. Chasnyk<sup>1</sup>. <sup>1</sup>Saint-Petersburg State Pediatric Medical University; <sup>2</sup>N.N. Petrov Research Institute of Oncology, Saint-Petersburg, Russian Federation

**Background:** NLRP12-related autoinflammatory disease (NLRP12-AID) is an exceptionally rare autosomal-dominant disorder caused by germ-line mutations in NLRP12 gene. Very few patients with NLRP12-AD have been identified worldwide, therefore there is a scarcity of data on phenotypic presentation of this syndrome.

**Objectives:** Here we provide evidence that NLRP12-AID may have clinical manifestations characteristic for primary immune deficiencies (PID).

**Methods:** 246 children with periodic fever (PF) of unknown origin were subjects to the next generation sequencing (NGS) analysis; 213 of these patients had signs of primary immunodeficiency (PID) manifested by recurrent infections, while 33 kids had isolated PF. The NGS panel was composed of 302 genes implicated in PID and/or AID.

**Results:** NLRP12 variants were detected in 20 cases (see the table 1). Median age of first AID-related fever episode was 12 months, ranging from 2 months to 13 years. Increased association with immune-mediated diseases ( $n=15$ , 75%) was observed. Nine patients demonstrated increased susceptibility to infection and two children suffered from Crohn's disease. Administration of short courses of

NSAID or corticosteroids resulted in resolution of the disease flare. In one severe case canakinumab (anti-interleukine-1 $\beta$  antibody) was successfully used.

#### OP0099 REMISSION IN JIA CAN BE PREDICTED FROM ONE YEAR FOLLOWING DIAGNOSIS IN A UK MULTICENTRE INCEPTION COHORT

S.J.W. Shoop-Worrall<sup>1,2</sup>, S.M.M. Verstappen<sup>1,2</sup>, J.E. McDonagh<sup>1,2</sup>, W. Thomson<sup>1,2</sup>, K.L. Hyrich<sup>1,2</sup>, on behalf of CAPS. <sup>1</sup>The University of Manchester; <sup>2</sup>Manchester Foundation Trust, Manchester, UK

**Background:** One of the primary aims for children and young people with JIA is remission. Early improvement in disease likely predicts greater chance of remission in the longer-term.

**Objectives:** To assess the association between change in disease activity over the first year of disease and later occurrence of remission.

**Methods:** Children and young people with oligoarticular, RF-negative or RF-positive polyarticular JIA recruited to the Childhood Arthritis Prospective Study prior to January 2014 were selected for analysis.

Two definitions of remission based on clinically inactive disease at two consecutive study follow-ups were explored: 1) Wallace's preliminary criteria and 2) the clinical Juvenile Arthritis Disease Activity Score in 10 joints (cJADAS10). Association between changes in JIA core outcome variables and pain over the first year of disease and later occurrence of remission were analysed using logistic regression models, adjusting additionally for age, gender, symptom duration and predictor value at presentation. Oligoarticular and polyarticular JIA were modelled separately. Multiple imputation accounted for missing data.

**Results:** A total of 1045 children were included. Of these, 70% were female and the majority had oligoarticular JIA (67%). The median age at presentation was 7 years (IQR 3, 11). Within three years, 25% achieved remission according to Wallace's criteria and 39% according to cJADAS10. More children with oligoarticular JIA achieved remission than those with polyarticular JIA (table 1).

Remission using Wallace's criteria was predicted in oligo and polyarthritis respectively by improvements in physician's global (OR: 3.1, 95% CI: 1.9 to 5.3; OR: 4.8, 95% CI: 1.4 to 16.7) and parental global (OR: 1.5, 95% CI: 1.2 to 1.8; OR: 1.4, 95% CI: 1.5 to 2.0). For oligoarthritis, additional predictors included improvement in active joint count (OR: 1.7, 95% CI: 1.0 to 2.3) and ESR (OR: 1.1, 95% CI: 1.0 to 1.2). Improvement in limited joint count also predicted remission in polyarticular JIA (OR: 1.2, 95% CI: 1.0 to 1.4) (table 1).

Remission using cJADAS10 was predicted in oligo and polyarthritis respectively by improvements in physician's global (OR: 2.1, 95% CI: 1.6 to 2.8; OR: 2.3, 95% CI: 1.5 to 3.6), parental global (OR: 1.9, 95% CI: 1.4 to 2.6; OR: 2.0, 95% CI: 1.3 to 3.0), active joint count (OR: 1.6, 95% CI: 1.1 to 2.2; OR: 1.3, 95% CI: 1.1 to 1.7), limited joint count (OR: 1.4, 95% CI: 1.1 to 1.9; OR: 1.1, 95% CI: 1.3 to 2.3), CHAQ (OR: 2.2, 95% CI: 1.4 to 3.3; OR: 2.7, 95% CI: 1.5 to 5.0) and pain (OR: 1.2, 95% CI: 1.1 to 1.4; OR: 1.3, 95% CI: 1.1 to 1.5) (table 1).

**Abstract OP0099** – Table 1 Achievement and predictors for remission according to wallace's preliminary criteria and the cJADAS10

	Oligoarthritis (n=704)		Polyarthritis (n=341)	
	Wallace's preliminary criteria	cJADAS10	Wallace's preliminary criteria	cJADAS10
Follow-up	Percent remission			
2 years	19	35	15	21
3 years	19	35	15	22
Ever	27	45	20	28
Improvement over the first year in one unit of:	Odds ratios for ever remission (95% CI)			
Active joint count	1.7 (1.0, 2.3)	1.6 (1.1, 2.2)	1.4 (0.9, 2.0)	1.3 (1.1, 1.7)
Limited joint count	1.3 (0.58, 1.7)	1.4 (1.1, 1.9)	1.2 (1.0, 1.4)	1.1 (1.3, 2.3)
Physician global assessment (cm)	3.1 (1.9, 5.3)	2.1 (1.6, 2.8)	4.8 (1.4, 16.7)	2.3 (1.5, 3.6)
Parent global assessment (cm)	1.5 (1.2, 1.8)	1.9 (1.4, 2.6)	1.4 (1.5, 2.0)	2.0 (1.3, 3.0)
CHAQ	1.3 (0.8, 2.0)	2.2 (1.4, 3.3)	1.6 (0.9, 2.9)	2.7 (1.5, 5.0)
ESR (mm/hr)	1.1 (1.0, 1.2)	1.0 (1.0, 1.1)	1.1 (1.0, 1.2)	1.0 (1.0, 1.1)
Pain (cm)	1.1 (1.0, 1.1)	1.2 (1.1, 1.4)	1.1 (1.0, 1.3)	1.3 (1.1, 1.5)

cJADAS10: Clinical Juvenile Arthritis Disease Activity Score in 10 joints; CI: Confidence Interval; CHAQ: Childhood Health Assessment Questionnaire; ESR: Erythrocyte Sedimentation Rate

**Conclusions:** Both improvements in the physician's and parental global assessments over the first year of disease predict remission in JIA. However, improvements in function and pain predict higher odds of remission on the cJADAS10 but not Wallace's preliminary criteria. These factors may be helpful in predicting well-being but not a lack of inflammation.

### INCREASE IN DIRECT HEALTHCARE COSTS IN JUVENILE IDIOPATHIC ARTHRITIS OVER THE PAST 10 YEARS – RESULTS OF A HEALTH INSURANCE CLAIMS DATA ANALYSIS

L. Redeker<sup>1</sup>, F. Hoffmann<sup>2</sup>, K. Albrecht<sup>1</sup>, J. Klotsche<sup>1,3</sup>, A. Zink<sup>1,4</sup>, K. Minden<sup>1,4</sup>.

<sup>1</sup>Epidemiology Unit, German Rheumatism Research Centre, Berlin; <sup>2</sup>Department of Health Services Research, Carl von Ossietzky University, Oldenburg; <sup>3</sup>Institute for Social Medicine, Epidemiology and Health Economics; <sup>4</sup>Department of Rheumatology and Clinical Immunology, Charité – Universitätsmedizin Berlin, Berlin, Germany

**Background:** Biological disease-modifying anti-rheumatic drugs (bDMARDs) are effective but expensive treatment options in juvenile idiopathic arthritis (JIA). The extent to which the healthcare costs of JIA have changed as a result of their increasing use has hardly been investigated.

**Objectives:** The aim of this study was to analyse resource utilisation and direct healthcare costs in patients with JIA since the introduction of treatment with biologic agents.

**Methods:** Using health insurance claims data in Germany, resource utilisation and direct healthcare costs of children and adolescents with a diagnosis of JIA (International Classification of Diseases, Tenth Revision, [ICD-10] code M08, M09.0, L40.5) between January 1, 2007 and December 31, 2016 were assessed. Direct healthcare costs comprised costs for outpatient care (i.e., visits to physicians, laboratory tests, emergency department visits, and outpatient hospital services), costs for inpatient care (i.e., hospital admissions), costs for pharmacotherapy and other treatment costs (i.e., non-physician visits [e.g., visits to physical therapists] and aids/adaptations).

**Results:** Data from 12 652 children and adolescents with a diagnosis of JIA were included in the analyses. Mean direct healthcare costs per patient increased by 33% from € 4577 in 2007 to € 6109 in 2016. Pharmacological treatment was the cost domain with the highest increase (table 1). This increase was almost entirely caused by an increasing prescription of bDMARDs (from 8.6% to 15.7%). Costs for inpatient care also increased, whereas other treatment costs slightly decreased.

Total costs per patient were calculated as the sum of the domains outpatient care, hospital admissions, pharmacotherapy and other treatment costs. bDMARDs, biological Disease-Modifying Anti-Rheumatic Drugs; csDMARDs, conventional synthetic Disease-Modifying Anti-Rheumatic Drugs.

\* excluding costs for pharmacotherapy.

**Conclusions:** Direct healthcare costs in JIA considerably increased over the past 10 years, mainly caused by an expanding use of biologic agents. The results also showed that the rise in costs for treatment with biologic agents has been at a plateau since 2014. The healthcare costs incurred must, of course, always be placed in the context of indirect and intangible costs and the long-term prognosis of patients.

### EXPLORING PAIN AND THE IMPACT OF JIA ON ADOLESCENTS AND YOUNG ADULTS: A MIXED-METHODS STUDY

H.Chaplin<sup>1,2</sup>, Y. Ioannou<sup>2,3</sup>, D. Sen<sup>2</sup>, H. Lempp<sup>4</sup>, S. Norton<sup>1</sup>. <sup>1</sup>Health Psychology Section, Institute of Psychiatry, Psychology and Neuroscience, King's College London; <sup>2</sup>ARUK Centre for Adolescent Rheumatology, University College London; <sup>3</sup>UCB Pharmaceuticals; <sup>4</sup>Academic Rheumatology, King's College London, London, UK

**Background:** Young people with Juvenile Idiopathic Arthritis (JIA) have emphasised concerns about the extent to which factors beyond inflammation affect their daily lives, particularly with persistent pain, despite effective clinical management into adulthood. Pain experience and impact on daily life remains relatively unexplored in the adolescent and young adults (AYAs).

**Objectives:** This study aimed to: a) establish prevalence of current pain in AYAs with JIA, b) determine associations with pain intensity, and c) qualitatively explore perceived impact of JIA on daily life.

**Methods:** This cross-sectional mixed methods study recruited 85 JIA patients attending AYA Rheumatology clinics in London. It assessed pain intensity (APPT) as the primary outcome, with the following predictor variables: mood (HADS), illness perceptions (B-IPQ), fatigue (FACIT-F), functioning (WSAS), quality of life (MSK-HQ), demographics and disease activity. Analysis was conducted using Spearman's correlations and hierarchical multiple linear regression. Semi-structured interviews about the impact of JIA with a subset of 15 participants were conducted and analysed via inductive thematic analysis. Ethical/R and D approvals and informed consent were obtained.

**Results:** Participants completing the survey were predominantly female (68.2%), White British (65.9%), aged 16–25 (mean=19.63, SD=2.23), with Polyarticular (40%) the most common subtype, and 10.43 years mean disease duration (SD=5.16). Prevalence of current pain was 91.8%, with 37% reporting medium-to-severe pain. In interviews (66% female, 33% white British, mean age 19.92, mean disease duration 12 years), despite high prevalence, pain was only ranked fourth (6/15) as most impacting on daily life by those interviewed. The other top areas chosen were: fatigue (9/15), mood (8/15), social aspects (8/15), and impairments in functioning (5/15). Pain was reported in terms of impact on personal relationships (e.g. changes to mood linked to pain) and other restrictions preventing life as a 'normal' young person. In the survey, pain intensity was moderately associated with biological variables, e.g. active joints ( $r_s=0.27$ ), and strongly associated with psychological variables, e.g. depression and illness related distress ( $r_s=0.53$  and  $r_s=0.50$ ). Demographic and clinical variables (Step 1) explained 13.4% of variance in pain intensity. Adding distress, fatigue and functioning (Step 2) explained an additional 24.8%, and illness perceptions (Step 3) explained a further 30.4%. Identity and Consequences illness perceptions accounted for 70.5% of the association between active joints and pain.

**Conclusions:** Findings support an approach of the biopsychosocial model of pain in clinical practice. The impact of JIA occurs during active disease but also persist during remission, going beyond pain and inflammation. These impacts need to be monitored by healthcare

### PROLONGED IMAGE ACQUISITION TIME AFTER CONTRAST AGENT ADMINISTRATION RESULTS IN INCREASED SYNOVIAL THICKNESS ON POST-CONTRAST MRI OF JIA PATIENTS: STANDARDISATION IS KEY

A.M. Barendregt<sup>1</sup>, C. van Gulik<sup>2</sup>, P. Groot<sup>1</sup>, K. Dolman<sup>3</sup>, M. van den Berg<sup>4</sup>, A. Nassar Sheikh Rashid<sup>4</sup>, D. Schonenberg-Meinema<sup>4</sup>, C. Lavini<sup>1</sup>, K. Rosendahl<sup>5</sup>, R. Hemke<sup>1</sup>, T.W. Kuijpers<sup>4</sup>, M. Maas<sup>1</sup>, C.M. Nusman<sup>1</sup>. <sup>1</sup>Radiology and Nuclear Medicine, Academic Medical Center; <sup>2</sup>Radiology and Nuclear Medicine, University of Amsterdam; <sup>3</sup>Pediatrics, OLVG; <sup>4</sup>Department of Pediatric Hematology, Immunology, Rheumatology and Infectious Disease, Emma Children's Hospital, Amsterdam, Netherlands; <sup>5</sup>Section of Pediatric Radiology, Haukeland University Hospital, Bergen, Norway

**Background:** Timing of acquisition of post-contrast MR images for the assessment of the synovial membrane is important: delayed acquisition can result in

contrast washout into synovial fluid.<sup>1</sup> Several authors demonstrated the importance of this timing using qualitative data (membrane appearance on MRI).<sup>1–4</sup> Nonetheless, there is no international consensus on timing of post-contrast images in arthritis, leading to acquisitions at 1 to 10 min after contrast injection.<sup>1–5</sup> This could result in incorrect measurement of synovial thickness and thus imprecise assessment of disease activity and over or under treatment of patients.

**Objectives:** To quantitatively measure and compare thickness of the synovial membrane on early and late post-contrast knee MRI in patients with juvenile idiopathic arthritis (JIA).

**Methods:** Prospectively collected dynamic contrast-enhanced T1 MRIs of children with JIA were used to measure synovial thickness at time point 1 (TP1), 1 min and TP2, 5 min after contrast administration. Written and verbal informed consent for participation in our IRB-approved study was obtained. Two experienced readers, who were blinded for the time point, independently measured synovial thickness on a predefined, marked location in the patellofemoral compartment on randomised images. The Wilcoxon test was used to compare the mean synovial thickness measurements from TP1 and TP2. Moreover, we studied the number of patients judged to have active synovial inflammation (synovium >2 mm) on both time points.

**Results:** Measured synovial thickness in 53 patients with JIA (median age 13.5 years, 58.6% female) increased with prolonged time-after-contrast (TP1 1.4 mm and TP2 1.5 mm,  $p<0.001$ ). Moreover, we found a 25% relative increase of patients with active synovial inflammation (synovial membrane >2 mm) when comparing the measurements at TP2 versus TP1.

**Conclusions:** Our study is the first to add quantitative data to the literature showing that synovial thickness as measured on post-contrast MRI increases with a prolonged interval between contrast administration and acquisition of the post-contrast images. Our data, together with previous studies<sup>1–4</sup> indicate that it is questionable whether one can reliably measure synovial thickness without standardisation of the interval between contrast administration and acquisition of post-contrast sequences. This could not only influence clinical interpretation and quantitative scoring in JIA, but possibly also impacts other rheumatologic diseases in which synovial thickness is quantified in scoring systems, such as rheumatoid arthritis and osteoarthritis.<sup>6,7</sup>

De Benedetti<sup>9</sup>, on behalf of PRINTO and PRCSSG Investigators<sup>1</sup>.  
<sup>1</sup>Cincinnati Children's Hosp Med Ctr, Cincinnati, USA; <sup>2</sup>Istituto Giannina Gaslini, Pediatria II-Reumatologia, PRINTO, Genoa, Italy; <sup>3</sup>Hosp Universitario y Politécnico La Fe, Valencia, Spain; <sup>4</sup>Asklepios Clinic Sankt Augustin, Sankt Augustin, Germany; <sup>5</sup>Hosp Ramon y Cajal, Madrid, Spain; <sup>6</sup>Universitätsklinikum Freiburg, Freiburg, Germany; <sup>7</sup>Roche Innovation Ctr, New York, USA; <sup>8</sup>Roche Products Ltd, Welwyn Garden City, UK; <sup>9</sup>IRCCS Ospedale Pediatrico Bambino Gesù, Rome, Italy

**Background:** Efficacy and safety of intravenous (IV) tocilizumab (TCZ) were demonstrated in patients (pts) with systemic juvenile idiopathic arthritis (sJIA) in the phase 3 TENDER study<sup>1</sup> (WA18221). Study WA28118 (ClinicalTrials.gov, NCT01904292) investigated dosing regimens of subcutaneous (SC) TCZ in pts with sJIA by bridging to IV TCZ data to identify the optimal SC regimen.

**Objectives:** To characterise the pharmacokinetics (PK), pharmacodynamics (PD), and safety of TCZ SC in pts with sJIA; efficacy was an exploratory objective.

**Methods:** This phase 1b multicenter, open-label study evaluated PK, PD, and safety of TCZ SC in pts aged 1–17 years with sJIA and inadequate response to glucocorticoids and nonsteroidal anti-inflammatory drugs. Interim analysis (IA) was conducted after 24 pts had received TCZ SC for 14 weeks. Pts could be either TCZ-naive or switch from TCZ IV to SC at baseline. TCZ SC was administered for 52 weeks according to body weight: <30 kg, either 162 mg every 10 days (before IA) or 162 mg every 2 weeks (Q2W, after IA); ≥30 kg, 162 mg every week (QW).

**Results:** Among enrolled pts (n=51), 25 weighed <30 kg (8 before and 17 after IA) and 26 weighed ≥30 kg. Twenty-six pts (51%) were TCZ naive and 25 (49%) switched from TCZ IV. Median steady state C<sub>min</sub> was similar for pts <30 kg receiving TCZ 162 mg Q2W and those ≥30 kg receiving TCZ 162 mg QW, and the range largely overlapped (table 1). More than 95% (49/51) of pts treated with TCZ SC had model-computed steady state C<sub>min</sub> higher than the 5th percentile achieved with TCZ IV. Median and range of AUC<sub>2weeks</sub> were similar for both weight groups (table 1). Changes in interleukin-6, C-reactive protein, and erythrocyte sedimentation rate were similar for both weight groups. Most pts had ≥1 adverse event (AE; n=50; 98%). Injection site reactions (ISRs) occurred in 21 pts (41%); most were mild and none led to treatment interruption/withdrawal. AE rate was 1200.3/100 patient-years (PY) (909.3/100 PY excluding ISRs). The most common AEs were viral upper respiratory tract infection (13; 25.5%), neutropenia (13; 25.5%), and cough (12; 23.5%). Nine serious AEs occurred in 7 pts (13.7%; 19.3/100 PY); 5 were infections, all in the <30 kg group. Two deaths occurred, both in the <30 kg group. Median Juvenile Arthritis Disease Activity Score-71 improved (decreased) from baseline to week 52 for TCZ-naive pts (<30 kg, -13.9; ≥30 kg, -12.4) and was maintained or improved further for pts who switched from TCZ IV (<30 kg, -0.7; ≥30 kg -0.2).

Abstract OP0103 – Table 1

	TCZ SC (WA28118)		TCZ IV (WA18221)	
	<30 kg TCZ 162 mg Q2W n=25	≥30 kg TCZ 162 mg QW n=26	<30 kg TCZ 12 mg/kg Q2W n=46	≥30 kg TCZ 8 mg/kg Q2W n=43
Model-computed steady state PK parameters, median (range)				
C <sub>min</sub> µg/mL	64.2 (16.6-135.9)	72.4 (19.5-157.8)	65.9 (19.0-135.5)	70.7 (5.3-126.6)
C <sub>max</sub> µg/mL	126.6 (51.7-265.8)	89.8 (26.4-190.2)	274.4 (148.8-444.0)	253.0 (119.6-404.3)
AUC <sub>2weeks</sub> µg/mL·day	1298 (539-2792)	1154 (334-2370)	1734 (840-2712)	1631 (526-2779)

**Conclusions:** A PK-based strategy successfully bridged TCZ SC to TCZ IV in pts with sJIA. Dosing regimens of 162 mg Q2W in pts <30 kg and 162 mg QW in pts ≥30 kg provided adequate exposure to support efficacy comparable to that of TCZ IV. Except for ISRs, safety was consistent with the known safety profile of TCZ IV in sJIA.

OP0104

### ANTIBODIES AGAINST CARBAMYLATED PROTEINS ARE INVOLVED IN OSTEOCLASTOGENESIS BY INDUCING RANKL EXPRESSION IN OSTEOBLASTS IN VITRO

E.R. Spinelli<sup>1</sup>, R. Mancini<sup>1</sup>, M. Leopizzi<sup>2</sup>, T. Colasanti<sup>1</sup>, A. Pecani<sup>1</sup>, F. Ceccarelli<sup>1</sup>, F. Conti<sup>1</sup>, G. Valesini<sup>1</sup>, C. Alessandri<sup>1</sup>. <sup>1</sup>Medicina Interna e Specialità Mediche – Reumatologia; <sup>2</sup>Scienze Medico-Chirurgiche e Biotecnologie, Sapienza Università di Roma, Rome, Italy

**Background:** Citrullinated peptide are one of the main target of immune response in Rheumatoid Arthritis (RA) and antibodies to citrullinated peptides (ACPA) are involved in bone resorption. One of the target antigens – citrullinated vimentin – is expressed on the surface of osteoclast precursors where it can bind the antibodies starting the differentiation in mature osteoclast. Moreover, recent data demonstrated that serum levels of receptor activator of nuclear factor-κB ligand (RANKL) are higher in ACPA-positive RA patients. RANKL is the main osteoblast-derived cytokine inducing osteoclastogenesis. Antibodies directed against carbamylated proteins (Anti-CarP) have been recently described in RA patients with Rheumatoid Arthritis. The effect of anti-CarP on bone resorption has not been yet addressed.

**Objectives:** The aim of the study was to investigate *in vitro* the effect of anti-CarP on Osteoprotegerin (OPG) and RANK ligand (RANKL) production in osteoblast cultures.

**Methods:** Anti-CarP were investigated by ELISA in the sera of 88 RA patients using carbamylated fetal calf serum (CarFCS) and non-modified FCS as antigens. Anti-CarFCS were purified from the sera of 3 RA patients who tested highly positive for anti-CarP. Osteoblasts were isolated from the femoral head of 3 patients undergoing total hip arthroplasty and cultured in three different conditions – 1 ng/ml of anti-CarFCS, 10 ng/ml of anti-CarFCS or control medium for 4–6 days, until confluence. RNA was extracted from cell lysates and OPG and RANKL mRNA expression was analysed by Real-time PCR. Moreover, OPG and RANKL expression was investigated by immunofluorescence on treated and non-treated cells. Differences were determined either with two-way repeated measures analysis of variance (ANOVA) with Bonferroni's multiple comparison test, using Prism 5.0 software. A p value < 0.05 was considered significant.

**Results:** In osteoblast cultures, anti-CarFCS decreased the expression of OPG and increased the expression of RANKL in a dose-dependent manner, leading to an increase in RANKL/OPG ratio (figure 1A and 1B). The result was confirmed by the immunofluorescence analysis demonstrating the subcellular co-location of OPG and RANKL in osteoblast cultures (figure 1C).

Abstract OP0104 – Figure 1. Expression of mRNA for RANKL and OPG (A) and RANKL/OPG ratio (B) in osteoblast cultures treated with anti-CarFCS; sub-cellular location of RANKL and osteoprotegerin in osteoblasts' cultures (C).

**Conclusions:** The results of the study confirm that anti-CarFCS can be detected in nearly 40% of RA patients. The increase of RANKL/OPG ratio in the osteoblast cultures treated with anti-CarFCS suggests an effect of such autoantibodies on osteoclastogenesis and osteoclasts activity, supporting their possible involvement in the development of bone erosions.

OP0105

**ZCCHC6 DELETION DOWNREGULATES IL-6 AND REDUCES THE SEVERITY OF EXPERIMENTAL OSTEOARTHRITIS IN MICE**M.Y. Ansari, M.N. Khan, I. Ahmad, T.M. Haqqi. *Anatomy and Neurobiology, Northeast Ohio Medical University, Rootstown, USA*

**Background:** Osteoarthritis (OA) is the most common joint disease in elderly and is a major cause of disability. Currently no disease modifying agents exist to treat OA. ZCCHC6 (zinc-finger CCHC-domain containing protein 6) is a member of family of terminal uridylyltransferases (TUTs) and is known to carry out template independent addition of Uridine at the 3' ends of miRNAs. ZCCHC6 has been implicated in miRNA-mediated regulation of cytokine gene expression; however, the role of ZCCHC6 in the pathogenesis of OA is unknown.

**Objectives:** The aim of this study was to investigate the effect of ZCCHC6 deletion on proinflammatory cytokine, IL-6, expression in human and mouse chondrocytes and to study the role of ZCCHC6 in OA pathogenesis *in vivo* using Zcchc6<sup>-/-</sup> mice.

**Methods:** Human or mouse chondrocytes were prepared by sequential enzymatic digestion and treated with recombinant human or mouse IL-1 $\beta$  to mimic OA pathogenic conditions. Cytokine profiling was done using qPCR array and multiplex assay. IL-6 expression in chondrocytes was analysed by qPCR and immunoblotting/ELISA. IL-6 mRNA stability was determined by Actinomycin-D chase experiments. The 3'-uridylation of miRNAs was analysed by deep sequencing of small RNAs using Illumina MiSeq. ZCCHC6 and IL-6 expression in OA cartilage was analysed by immunohistochemistry. For *in vivo* studies, OA was induced by surgical destabilisation of medial meniscus (DMM) in the knee joints of mice. The severity of OA was assessed by safranin O/fast green staining followed by OARSI scoring.

**Results:** ZCCHC6 expression was upregulated in OA cartilage. Cytokine expression profiling in ZCCHC6 depleted human and Zcchc6<sup>-/-</sup> mouse chondrocytes revealed IL-6 as a major target of ZCCHC6. Depletion of ZCCHC6 expression in human chondrocytes resulted in decreased expression of IL-6 at mRNA and protein levels. ZCCHC6 depletion suppressed IL-1 $\beta$  induced expression of IL-6. Overexpression of ZCCHC6 in human chondrocytes resulted in increased expression of IL-6 in the presence or absence of IL-1 $\beta$ . Chondrocytes from Zcchc6<sup>-/-</sup> mice also showed decreased levels of IL-6 expression compared to Zcchc6<sup>+/+</sup>. Furthermore, overexpression of mouse Zcchc6 in Zcchc6<sup>-/-</sup> chondrocytes rescued IL-6 expression. IL-6 mRNA half-life was significantly reduced in Zcchc6<sup>-/-</sup> mouse chondrocytes and ZCCHC6 depleted human chondrocytes. Deep sequencing of small RNAs in ZCCHC6 depleted human chondrocytes showed reduced 3'-uridylation of IL-6 targeting miRNAs miR-26a/26b. Human chondrocytes transfected with miR-26a/26b mimic suppressed IL-6 expression, however, miR-26b mimic with additional 'UU' failed to suppress IL-6 expression. Zcchc6<sup>-/-</sup> mice expressed low levels of MMP13 and showed lesser matrix degradation in the joints with DMM surgery. Zcchc6<sup>-/-</sup> mice developed less severe OA as determined by safranin O/fast green staining followed by OARSI scoring. Synovitis was also decreased in the Zcchc6<sup>-/-</sup> mice DMM joints in comparison to Zcchc6<sup>+/+</sup> +DMM joints.

**Conclusions:** Our data demonstrate that ZCCHC6 is upregulated in OA cartilage and regulates IL-6 expression via miR-26b 3'-uridylation. These data identify a previously unknown function of ZCCHC6 in OA pathogenesis and identifies a potential therapeutic target for the management of OA.

Pope<sup>9</sup>, E.C. Keystone<sup>3,10</sup>, V.P. Bykerk<sup>3,11</sup>, on behalf of on behalf of CATCH (Canadian Early Arthritis Cohort) Investigators. <sup>1</sup>Medicine/ClinEpi and Rheumatology, McGill University, Montreal, QC, Canada; <sup>2</sup>Medicine/Rheumatology, Johns Hopkins, Baltimore, USA; <sup>3</sup>University of Toronto, Toronto, ON; <sup>4</sup>Clinical Epidemiology, McGill University, Montreal, QC; <sup>5</sup>Rheumatology, University of Manitoba, Winnipeg, MB; <sup>6</sup>Rheumatologie, Université de Sherbrooke, Sherbrooke, QC; <sup>7</sup>Institute de Rheumatologie, Montreal, QC; <sup>8</sup>Southlake Regional Health Centre, Newmarket, ON; <sup>9</sup>Western University, London, ON; <sup>10</sup>Sinai Health System, Toronto, ON, Canada; <sup>11</sup>Hospital for Special Surgery, New York, NY, USA

**Background:** Although early identification and aggressive treatment of RA improves outcomes, we have shown that 45% of early RA participants receiving guideline-based care do not achieve remission in the first year. Moreover, fewer women reached remission than men.

**Objectives:** To compare predictors of persistent disease activity (LDA/MDA/HAD) in the 1st year of RA treatment in men and women.

**Methods:** Sample included adults in CATCH (Canadian Early Arthritis Cohort) from 2007–2016 with active disease at baseline and  $\geq 12$  m F/U. Standardised visits included clinical assessments, questionnaires, and lab tests. Logistic regression with backward selection was used to identify predictors of failing to achieve remission (DAS28 <2.6) by 12 months among baseline sociodemographic and RA characteristics and patient reported outcomes.

**Results:** The sample included 1628 adults with classifiable RA, who were mostly female (72%) with a mean (SD) age of 55, (15) with 2 (2) comorbidities, and symptom duration of 6 (3) months. At enrollment, 95% had active disease (DAS28 MDA (42%); HDA (53%)), most were initially treated with csDMARDS (any 92%; MTX 75%). 46% of women and 38% of men did not reach remission by 12 months. Among women, multivariable results showed obesity more than doubled the likelihood of not achieving remission; other key predictors were minority status, lower education, and higher TJC and fatigue scores at baseline (table 1). In men, current smoking was associated with a 3.5 greater odds of not achieving remission in the first year; other predictors included older age, and higher pain. Not using MTX increased the likelihood of not achieving remission in women by 28% and men by 45%. Longer symptom duration and higher ESR were associated with not achieving remission in all. Factors not related to persistent disease activity included family history of RA, RF/ACPA status, erosions, SJC, HAQ and depressive symptoms at baseline.

**Conclusions:** In this large pan-Canadian cohort of early RA patients receiving guideline-based arthritis care, obesity in women and current smoking in men were the strongest predictors of not achieving remission in the first 12 months followed by non-use of MTX, higher baseline inflammation and longer symptom duration. Additional poor prognostic indicators in women included minority status, lower

education, and higher fatigue, whereas older age and greater pain were associated with persistent disease activity in men. Smoking cessation in men and weight reduction in women, and optimising MTX use may facilitate rapid reduction of inflammation, an essential goal of treatment in early RA.

### OP0107 ADIPOCYTOKINES IMBALANCE IS ASSOCIATED WITH VASCULAR DAMAGE IN SYSTEMIC SCLEROSIS

S. Bosello<sup>1</sup>, E. De Lorenzis<sup>1</sup>, G. Canestrari<sup>1</sup>, G. Natalello<sup>1</sup>, C. Di Mario<sup>1</sup>, L. Gigante<sup>1</sup>, A. Barini<sup>2</sup>, A. Barini<sup>2</sup>, L. Verardi<sup>1</sup>, B. Toluoso<sup>3</sup>, G. Ferraccioli<sup>1</sup>, E. Gremese<sup>1</sup>. <sup>1</sup>Rheumatology Unit, <sup>2</sup>Department of Laboratory Medicine, Fondazione Policlinico Universitario A. Gemelli – Catholic University of the Sacred Heart, Rome; <sup>3</sup>Institute of Rheumatology, Catholic University of the Sacred Heart – Fondazione Policlinico Universitario A. Gemelli, Roma, Italy

**Background:** Adipocytokines are implicated in the development of fibrosis, vasculopathy and immune abnormalities through a variety of biological effects, but their role in systemic sclerosis (SSc) is not fully investigated. Chemerin is implicated in chemotaxis of immune cells, in promoting angiogenesis and it is involved in inflammation. Adiponectin (APN) has metabolic actions and anti-inflammatory properties, while Leptin (LEP) mediates actions in endothelial cells, such as angiogenesis, vasodilation, NO production and upregulates various mediators of vascular inflammation.

**Objectives:** In this study we investigated Chemerin, LEP and APN levels in SSc patients according to disease subtypes and clinical characteristics.

**Methods:** Chemerin, LEP and APN levels were evaluated in 100 SSc patients and in sex, age and BMI matched healthy controls. Clinical and demographical characteristics were available for all patients.

**Results:** Chemerin, APN and LEP levels were lower in SSc patients compared to healthy controls (Chemerin: 58.7±27.6 ng/ml vs 74.0±29.0 ng/ml, p=0.004; LEP: 19.6±18.3 ng/ml vs 28.5±23.8 ng/ml, p=0.03, APN: 6.5±3.9 µg/ml vs 12.8±6.0 µg/ml, p<0.001)

Chemerin levels were lower in patients with anti-topoisomerase antibodies (50.2±22.7 ng/ml) respect to patients with other autoantibodies (64.6±29.7 ng/ml), p=0.018.

Regarding capillaroscopic damage, Chemerin levels were lower in patients with late pattern (44.8±18.9 ng/ml) compared to patients with early (64.3±28.5 ng/ml) and active pattern (71.7±29.9 ng/ml), p<0.001. APN levels inversely correlate with IL-6 levels (R=-0.4, p<0.001), while directly correlate with capillary density (R=0.3, p=0.03). Patients with avascular areas presented lower levels of APN (5.3±3.9 µg/ml) compared to patients without avascular areas (7.3±3.4 µg/ml), p=0.005. LEP levels directly correlate with vascular density on nailfold capillaroscopy (R=0.3, p=0.02), confirming the role of LEP in endothelial homeostasis. Furthermore, patients with avascular areas presented lower LEP levels (15.5±13.0 ng/ml) compared to patients without avascular areas (31.1±28.4 ng/ml), p=0.003. LEP levels were lower in patients with active digital ulcers (9.3±6.6 ng/ml), compared to patients without ulcers (9.3±6.6 ng/ml), p=0.01. The anti-inflammatory and endothelium protective role of APN emerged also when we considered the lung involvement: in fact patients with DLCO >50% presented higher levels of APN (7.0±3.9 µg/ml) compared to patients with DLCO <50% (5.8±3.8 µg/ml), p=0.05.

Considering the cardiopulmonary involvement, LEP levels inversely correlate with PAPs on echocardiography (R=-0.24, p=0.02). Finally LEP levels inversely correlate with skin score (R=-0.3, p=0.009) and patients with early disease presented lower LEP levels (15.1±13.2 ng/ml) compared to patients with long lasting disease (29.9±28.7 ng/ml), p=0.006.

**Conclusions:** Our data suggest an imbalance of the levels of adipocytokines in SSc, their down-regulation in patients with a more aggressive pattern on nailfold videocapillaroscopy and organ damage, suggesting a possible role of Chemerin, LEP and APN in the impaired angiogenesis and in the development of vasculopathy of SSc patients.

### OP0108 DIET INDUCED METABOLIC CHANGES IN AN OSTEOARTHRITIS MOUSE MODEL

M.-L. Hülsler<sup>1</sup>, C. Schreyiaeck<sup>1</sup>, Y. Luo<sup>2</sup>, A. Bozec<sup>2</sup>, G. Schett<sup>2</sup>, U. Müller-Ladner<sup>1</sup>, E. Neumann<sup>1</sup>. <sup>1</sup>Dept. of Rheumatology and Clinical Immunology, Campus Kerckhoff, Justus-Liebig-University Gießen, Bad Nauheim; <sup>2</sup>Department Clinic of Medicine 3 – Immunology and Rheumatology, University of Erlangen-Nürnberg, Erlangen, Germany

**Background:** Adipose tissue is not only an energy depot, but also secretes bioactive factors such as adipokines. Several of these factors are known to regulate immune responses. Osteoarthritis (OA) is one of the most common joint diseases with obesity being a well known risk factor. Therefore, an obesity model (High-fat diet, HFD) was combined with an established model for OA (DMM, destabilisation of the medial meniscus) to evaluate the role of adipokines in this setting.

**Objectives:** This work evaluates the influence of different adipokines on OA progression and obesity comparing systemic vs local effects at different time points.

**Methods:** The study was performed in C57Bl/6 mice fed with HFD or ND (normal diet) prior to OA induction. Mice were sacrificed and analysed 4, 6 and 8 weeks after surgery. For systemic analysis, sera were evaluated for adipokines such as adiponectin, leptin and visfatin and inflammatory markers. Diet induced systemic changes were also analysed using a fatty liver score and evaluation of crown-like structures (CLS) in adipose tissue. OA progression was scored and quantified based on histological stainings of the joints (H/E, safranin O). Immunohistochemical stainings of the joints were performed to evaluate local distribution of adipokine positive cells and the respective cell types. Metabolic parameters were correlated to the local progression of OA.

**Results:** The numbers of CLS were significantly lower comparing HFD (0.2±0.1553, n=7) with ND (5.219±0.9831, n=8) in mice. Fatty-liver score was significantly higher in HFD compared to ND. OA induction was significant at every time-point vs healthy control and higher in HFD (e.g.: OA score at 6 weeks HFD 3.7 vs ND 1.4). In the OA groups, there was a positive correlation between bodyweight and OA score (r<sup>2</sup>=0.33). Correlation level of OA score with liver score or serum leptin level was low, even though leptin was significantly induced by HFD. However, DMM decreased leptin levels at all time points, independent from diet (e.g. 4 weeks: HFD healthy 18.4 ng/ml vs HFD DMM 3.7 ng/ml). The different parameters for metabolic changes (fatty liver score and bodyweight) were positively correlated with serum leptin level. HFD, DMM or the combination of both did not show significant effects on serum levels of adiponectin, visfatin or IL-6. Local adipokine secretion in the joints was independent from systemic metabolism parameters.

**Conclusions:** Our data show that similar to observations in humans, OA is deteriorated by HFD which correlates mainly with the bodyweight and to a lower extend with metabolic changes induced by obesity. Local adipokine expression was especially detectable in the damaged meniscus showing increased amounts of adiponectin and leptin producing cells. Interestingly, local adipokine expression was independent from systemic adipokine levels.

## Biologics in RA. Improving and maintaining the response\_\_\_\_\_

### OP0109 IN RA PATIENTS WITH INITIAL RESPONSE TO RITUXIMAB, EARLY DEPTH OF B CELL DEPLETION IS ASSOCIATED WITH LONG TERM MAINTENANCE OF THERAPY

L. Garcia Montoya<sup>1,2</sup>, M.Y. Md Yusuf<sup>1,2</sup>, J.-B. Candelier<sup>1,2</sup>, P. Pentony<sup>1,2</sup>, L. Duquenne<sup>1,2</sup>, A.C. Rawstron<sup>1,2</sup>, E.M. Vital<sup>1,2</sup>, P. Emery<sup>1,2</sup>. <sup>1</sup>Leeds Institute for Rheumatic and Musculoskeletal Medicine, University of Leeds; <sup>2</sup>NIHR Leeds Biomedical Research Centre, Chapel Allerton Hospital, Leeds, UK

**Background:** B-cell depletion is a fundamental effect of rituximab (RTX). The speed/depth of initial B-cell depletion is associated with clinical response, and non-responders largely having incomplete depletion.<sup>1, 2</sup> However, some patients with incomplete depletion still show clinical improvement (ID-R). Little is known about factors associated with complete depletion; the long-term outcome of the two responder groups according to their level of depletion has not been studied yet.

**Objectives:** To assess factors that are associated with complete depletion and clinical response (CD-R) and compare the 3 year RTX retention between the two RTX responder groups (CD-R vs ID-R), with a view to inform practice on the optimal use of RTX in RA.

**Methods:** A prospective observational study was conducted in patients with RA who were treated with RTX in Leeds. Each initial cycle of RTX consisted of 2 × 1000 mg infusions, repeated either on clinical relapse or fixed 6 monthly

retreatment strategy. B-cells were measured at 0, 2 weeks and every 6 months using highly sensitive flow cytometry (as previously described). Complete depletion was defined as total B cell count  $<0.0001 \times 10^9/L$  at week 2. Patients were classified into 4 groups based on B-cell depletion (CD=complete,) and EULAR response (R=good/moderate, NR=no response). Multiple imputation was used for missing data. Factors for predicting CD-R in cycle 1 (C1) were tested using logistic regression analyses. In the survival analysis, an event was defined as RTX cessation either due to death, safety or switching to other biologics.

**Results:** A total of 693 patients were treated with RTX in Leeds. Of these, 624 had clinical data at 6 months and were included in the analysis. Total follow-up was 2826 patient-years. In cycle 1, 418/624 (67%) had EULAR response. Of these, 242/418 (58%) had CD-R. In univariable analysis, age, concomitant MTX/LEF, non-smoker, pre-RTX lower naïve, memory B-cell and plasmablasts were associated with CD-R in C1. However, in a multivariable analysis, only concomitant MTX/LEF (OR 2.1 95% CI: 1.3 to 3.5), non-smoker (1.6, 1–2.6) increased the odds while lower plasmablasts (0.89, 0.83–0.95) decreased the odds of CD-R. After adjusting for confounders including age, gender, concomitant MTX/LEF and previous exposure to TNF- $\alpha$ , there was a trend to longer maintenance on RTX (surrogate for response) in the CD-R vs ID-R groups; HR 0.70 (95% CI: 0.46 to 1.05);  $p=0.058$  (figure 1).

**Rituximab retention 3 years after the administration of the first cycle**

**Abstract OP0109** – Figure 1 Rituximab retention 3 years after the administration of the first cycle

**Conclusions:** Among patients with good initial clinical response to RTX, we observed differences in immunological response. This had important long term consequences: in patients with early complete B-cell depletion accompanied by good clinical response, RTX treatment was sustained over 3 years numerically, while responses of ID were less durable. Therefore, treatment with anti-CD20 mAb should aim to achieve CD for sustained maintenance on rituximab. CD-R can be predicted by concomitant use of MTX/LEF, non-smokers and those with low baseline plasmablasts.

OP0110

#### SERUM TOCILIZUMAB TROUGH CONCENTRATIONS ARE ASSOCIATED WITH CLINICAL DISEASE ACTIVITY INDEX SCORES IN ADULT RHEUMATOID ARTHRITIS PATIENTS

U Arad<sup>1,2</sup>, O. Elkayam<sup>1,2</sup>. <sup>1</sup>Rheumatology, Tel Aviv Sourasky Medical Center, <sup>2</sup>Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel

**Background:** Serum trough levels of TNF $\alpha$  inhibitor biologics have been found to be associated with clinical responses in rheumatoid arthritis (RA) patients. It is unknown whether serum trough levels of tocilizumab (TCZ) administered as a fixed dose subcutaneous injection, also associate with clinical disease activity responses.

**Objectives:** To ascertain whether serum TCZ trough levels at weeks 12 and 24 after beginning treatment with a 162 mg once weekly regimen of SC tocilizumab, were associated with clinical disease activity outcomes in RA patients.

**Methods:** We analysed data sets from the Israeli branch (TASC, NCT01988012) of the Roche multinational umbrella study TOZURA, which evaluated a SC TCZ treatment regimen of 162 mg once weekly as monotherapy or in combination with methotrexate or other csDMARDs in a real-life clinical setting. The study comprised of 100 patients. A paired-samples T test was used to compare mean serum TCZ levels at week 12 relative to week 24. Clinical disease activity index (CDAI) scores were natural log-transformed in order to achieve normal distribution. Generalised estimating equations were used to evaluate associations between the predictors (TCZ levels, soluble IL-6 receptor (sIL6R) levels) and the study outcomes (CDAI scores, HAQ scores, CDAI remission/low disease activity status, HAQ DI remission). Generalised estimating equations were also used to evaluate associations between age, sex, weight, BMI, baseline CRP levels, serum TCZ and sIL6R serum levels. P values below 0.05 were considered significant.

**Results:** Serum trough levels of TCZ at week 24 (mean 41.1, SD 23.2) were higher than at week 12 (mean 36.3, SD 18.1).

In a univariate analysis, for every increase of 1 microgram/ml in the serum concentration of TCZ there was a corresponding decrease of 1.3% (95% CI: 0.4% to 2.3%) in the CDAI score and for every increase of 100 ng/ml in the serum concentration of sIL6R there was a corresponding decrease of 12.6% (95% CI: 2% to 22%) in the CDAI score.

In a multivariate model which included age, sex, visit date and both sIL6R and TCZ levels, only the associated between TCZ levels and CDAI scores remained significant. Similarly, every increase of 10 microgram/ml in the serum concentration of TCZ was associated with an odds ratio of 1.35 (95% CI: 1.07 to 1.72) of being in a state of CDAI remission or low disease activity versus moderate/high disease activity state. TCZ and sIL6R serum levels were not associated with HAQ DI scores.

Female sex was associated with an increase of 12.9 microgram/ml in the serum TCZ concentrations (95% CI: 5.9 to 20.0). Also, every increase of 1 BMI unit was associated with a decrease of 1.5 microgram/ml in the serum TCZ concentrations (95% CI: 0.8 to 2.2) and every increase of 1 kg in weight was associated with a decrease of 0.6 microgram/ml in the serum TCZ concentrations (95% CI: 0.3 to 0.9).

**Conclusions:** In the first year of TCZ treatment with a fixed dose regimen of 162 mg SC injection once a week, serum trough concentrations of TCZ are associated with CDAI scores and a state of CDAI remission/low disease activity. Body weight and BMI are inversely associated with serum TCZ concentrations. These results suggest that personalising the dose of SC TCZ to body weight may improve clinical outcomes of RA disease activity.

Clinical Immunology, Saitama Medical Centre, Saitama Medical University, Kawagoe, <sup>7</sup>Department of Internal Medicine, Fukushima Red-Cross Hospital, Fukushima, <sup>8</sup>Department of Rheumatology, Shimane University Faculty of Medicine, Izumo, <sup>9</sup>Department of Clinical Immunology and Rheumatology, Hiroshima University Hospital, Hiroshima, <sup>10</sup>Institute of Rheumatology, Tokyo Womens Medical University, <sup>11</sup>Graduate School of Medical and Dental Sciences, Tokyo Medical and Dental University, <sup>12</sup>Institute of Rheumatology, Tokyo Women's Medical University, <sup>13</sup>Department of Allergy and Rheumatology, Graduate School of Medicine, The University of Tokyo, Tokyo, Japan

**Background:** Feasibility of discontinuation of biologic agents in patients with rheumatoid arthritis (RA) who have reached stable remission has been investigated. Although evidence has been accumulating regarding tumour necrosis factor inhibitors, the possibility of tocilizumab-free strategy is still unclear.

**Objectives:** To evaluate the sustained remission and low disease activity after discontinuation of tocilizumab in patients with RA who were treated with tocilizumab alone or in combination with methotrexate.

**Methods:** The SURPRISE study was a 2 year randomised, controlled study. Patients with active RA despite methotrexate were randomised to tocilizumab added to methotrexate (ADD-ON) or switch to tocilizumab alone (SWITCH). At week 52, tocilizumab was discontinued in patients who achieved remission based on disease activity score for 28 joints (DAS28-ESR<2.6). The endpoints of the second year included tocilizumab-free sustained remission rates at week 104, sustained low disease activity rates, radiological outcomes assessed with the modified total Sharp score (mTSS), and safety. The efficacy of re-instituted tocilizumab/methotrexate was also assessed.

**Results:** 105 patients who achieved remission at 52 week discontinued tocilizumab; 51 in the ADD-ON continued methotrexate and 54 in the SWITCH were observed without medication. Whereas sustained DAS28 remission rates at week 104 were 24% for the ADD-ON and 14% for the SWITCH (p=0.29), sustained low disease activity rate was significantly higher in the ADD-ON than in the SWITCH (55% vs 27%, p=0.005, figure 1). Radiographical progression was comparable in the 2 groups (mTSS; 0.37 vs 0.64, p=0.36). Re-start of tocilizumab induced remission in all patients except two irrespective of concurrent methotrexate after 36 weeks while re-start of methotrexate was effective only in a half of patients.

Abstract OP0111 – Figure 1 Tocilizumab-free low disease activity

**Conclusions:** Sustained low disease activity after tocilizumab discontinuation could be maintained with continued methotrexate in more than half of patients. Re-treatment with tocilizumab led remission in more than 90% patients.

#### OP0112 THERAPEUTIC DRUG MONITORING TO OPTIMISE SWITCHING BETWEEN BIOLOGIC AGENTS IN RHEUMATOID ARTHRITIS

M.J. l'Ami<sup>1</sup>, J. Ruwaard<sup>1</sup>, C.L. Krieckaert<sup>1</sup>, M.T. Nurmohamed<sup>1,2</sup>, T. Rispens<sup>3,4</sup>, G. Wolbink<sup>1,3</sup>. <sup>1</sup>Amsterdam Rheumatology and immunology Center, location Reade; <sup>2</sup>Amsterdam Rheumatology and immunology Center, location VU University Medical Center; <sup>3</sup>Landsteiner Laboratory, Academic Medical Center; <sup>4</sup>Immunopathology, Sanquin, Amsterdam, Netherlands

**Background:** Many patients with rheumatoid arthritis (RA) are treated with tumour necrosis factor inhibitors (TNFi). It is, however, unclear whether to switch to a second TNFi or to another mode of action drug in case of non-response. The detection of anti-drug antibodies (ADAs) have shown to be related to the response rate of a second TNFi.<sup>1</sup> The detection of ADAs is, however, to a large extent dependent of the type of assay used and, moreover, the efficacy of the drug is determined by the pharmacokinetics. Therefore, it more logical to use drug levels in daily clinical practice.

**Objectives:** To investigate whether serum drug concentration of patient's first TNFi, adalimumab, was related to the effectiveness of a second TNFi, etanercept.

**Methods:** Consecutive patients with RA treated with etanercept were followed in the Reade Rheumatology Registry, an observational cohort (NTR no.6868). Patients who were treated with adalimumab 40 mg every other week previously (switchers; n=69) were compared to patients starting etanercept without prior biologic agents (biologic-naïve; n=380). Patients received etanercept 50 mg weekly or 25 mg twice a week. Switchers were divided into three groups; respectively low- (<0.5 µg/mL), intermediate- (0.5 and 5.0 µg/mL) and high- (>5.0 µg/mL) adalimumab concentration. The last available serum sample before adalimumab discontinuation was assessed for adalimumab concentrations by enzyme linked immunosorbent assay (ELISA). ADAs were measured using the antigen binding test (ABT). Clinical endpoints were percentage of patients achieving European League Against Rheumatism (EULAR) good or moderate response and the Simplified Disease Activity Index remission criteria (SDAI <3.3) after 52 weeks.

**Results:** Median (IQR) adalimumab concentration of the switcher-groups with low (n=18), intermediate (n=18) and high concentrations (n=27) were, respectively 0.0 µg/mL (0.0–0.05), 2.5 µg/mL (1.5–4.3) and 7.4 µg/mL (6.0–11.8). ADAs were detected in, respectively 16 patients (89%), 6 patients (33%) and 3 patients (11%). Response rate of switchers with low adalimumab concentrations was

comparable to biological-naïve patients, whereas switchers with intermediate and high concentrations responded worse regarding EULAR response criteria (respectively 74%, 72%, 50% and 52%; figure 1A) and SDAI remission (respectively 27%, 27%, 6%, 11%; figure 1B).

**Conclusions:** For the first time, we showed that the response rate of switchers with low adalimumab concentrations was comparable to biological-naïve patients, whereas switchers with intermediate and high concentrations responded worse. Therefore, drug concentration assessment may optimise switching, as it helps to identify those patients that may benefit from a second TNFi.

OP0113

#### GRADUAL TAPERING TNF BLOCKERS VERSUS CONVENTIONAL SYNTHETIC DMARDS IN PATIENTS WITH RHEUMATOID ARTHRITIS IN SUSTAINED REMISSION: FIRST YEAR RESULTS OF THE RANDOMISED CONTROLLED TARA-STUDY

E. Van Mulligen<sup>1</sup>, A. E. A.M. Weel<sup>1,2</sup>, T.M. Kuijper<sup>2</sup>, J.J. Luime<sup>1</sup>, J.M.W. Hazes<sup>1</sup>, P.H.P. de Jong<sup>1,2</sup>. <sup>1</sup>Rheumatology, Erasmus MC; <sup>2</sup>Rheumatology, Maasstad hospital, Rotterdam, Netherlands

**Background:** Clinical and radiographic outcomes in rheumatoid arthritis (RA) have improved enormously in the last two decades, due to early detection of the disease, early initiation of 'intensive' therapy and a treat-to-target approach. As a result, 50%–60% of early RA patients will achieve sustained remission during the first year of follow-up. In aforementioned cases current guidelines recommend to consider tapering treatment, but an optimal approach to gradually de-escalate conventional synthetic or biologic DMARDs (respectively csDMARDs and bDMARDs) is currently lacking.

**Objectives:** The aim of this study is to evaluate the effectiveness of two tapering strategies, namely gradual tapering of csDMARDs and anti-TNF therapy during one year of follow-up.

**Abstract OP0113** – Figure 1 (A) Baseline characteristics and results after 12 months of follow-up of both tapering groups. (B) Cumulative flare over time, error bars indicate 95% confidence intervals. (C) Treatment at 12 months. Columns indicate the percentage of patients that tapered medication until the indicated amount of the original dose. (D) Mean DAS over time, error bars indicate 95% confidence intervals. (E) Mean HAQ over time, error bars indicate 95% confidence intervals. Abbreviations: ACPA; anti-citrullinated protein antibody, csDMARDs; conventional synthetic DMARDs, DAS; disease activity score, HAQ; health assessment questionnaire, RF; rheumatoid factor.

**Methods:** In this multicenter single-blinded randomised controlled trial RA patients in sustained remission for at least 3 consecutive months, defined as a DAS<sub>44</sub>≤2.4 and a swollen joint count (SJC)≤1, which was achieved with csDMARDs and a TNF blocker were included. Eligible patients were randomised into gradual tapering csDMARDs followed by the TNF blocker or vice versa. Medication was tapered in three steps over the course of 6 months. Gradual tapering was done by cutting the dosage into half, a quarter and thereafter it was stopped. The primary outcome for the clinical effectiveness was disease flare defined as DAS44 >2.4 and/or SJC >1. Secondary outcomes were quality of life and functional ability.

**Results:** A total of 187 patients were randomly assigned to tapering csDMARDs (n=93) or tapering anti-TNF (n=94). Patients had an average symptom duration of 6.7 years and were predominantly female (66%) with an average age of 56.4 years (figure 1A). The cumulative flare ratio in the csDMARD and anti-TNF tapering group was respectively 32% and 41% (figure 1B), which corresponds with a hazard ratio of 0.91 (95% CI: 0.68 to 1.22, p=0.55). In the last 3 months the increase in cumulative flare ratio differs the most between the two groups. On the other hand, in 48% and 51% of patients respectively tapering csDMARDs or anti-TNF the medication could be completely withdrawn (figure 1C). Percentages of patients which are not completely tapered are higher than the flare ratios, due to loss of remission without a disease flare. Furthermore, mean DAS and mean HAQ over time, and after 1 year, did not differ between both tapering groups (figure 1D and E).

**Conclusions:** There were no significant differences in flare ratios, disease activity and functional ability between both tapering strategies during the first year of follow-up. Therefore, in RA patients who are in sustained remission we advise to taper anti TNF first, but before tapering therapy rheumatologists should take the risk of a disease flare and patient's wishes into account.

#### ANA DEVELOPMENT IS ASSOCIATED WITH POOR RESPONSE TO BIOLOGICAL DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS IN PATIENTS WITH RHEUMATOID ARTHRITIS

Y. Ishikawa<sup>1</sup>, M. Hashimoto<sup>2</sup>, H. Ito<sup>2,3</sup>, M. Tanaka<sup>2</sup>, N. Yukawa<sup>4</sup>, T. Fujii<sup>4</sup>, T. Mimori<sup>5</sup>, C. Terao<sup>6</sup>. <sup>1</sup>Immunobiology Section, Joslin Diabetes Center/Harvard Medical School, Boston, USA; <sup>2</sup>Department of Advanced Medicine for Rheumatic Diseases; <sup>3</sup>Department of Orthopedic Surgery, Graduate School of Medicine, Kyoto University, Kyoto; <sup>4</sup>Department of Rheumatology and Clinical Immunology, Graduate School of Medicine, Wakayama University, Wakayama; <sup>5</sup>Department of Rheumatology and Clinical Immunology, Graduate School of Medicine, Kyoto University, Kyoto; <sup>6</sup>Center for Investigative Medical Sciences, RIKEN, Yokohama, Japan

**Background:** It has been well known that anti-TNF- $\alpha$  treatment for patients with rheumatoid arthritis (RA) is associated with anti-nuclear antibody (ANA)

development. Using data of 110 RA patients treated with infliximab (IFX), we previously reported that ANA development along with ANA levels at base line were associated with poor outcomes of IFX.<sup>1</sup> However, no replication studies have been reported. In addition, whether the findings are true to general biological disease-modifying anti-rheumatic drugs (bDMARDs) is uncertain.

**Objectives:** To replicate an association between poor response and development of ANA during IFX treatment in patients with RA. To analyse whether the association is found in other bDMARDs.

**Methods:** We analysed a data of Japanese RA patients treated with (n=721) or without (bDMARDs-naïve; n=1050) bDMARDs (IFX, etanercept ETN, adalimumab ADA, golimumab GLM, certolizumab pegol CZP, tocilizumab TCZ, abatacept ABT) as a first line bDMARD from a single comprehensive RA cohort. All of the participants were not included in our previous study. We conducted multiple logistic linear regression analysis to assess effects of ANA development on treatment outcomes. We further analysed correlates of ANA development. ANAs were determined by indirect immunofluorescence with HEp-2 cells, and ANA development was defined as more than two times increase from baseline values.

**Results:** We found that ANA development at 3 months after starting bDMARDs was significantly associated with cessation of bDMARDs due to insufficient response within a year (OR 3.70, p=0.037). We further found that RA patients who did not develop ANA at 3 months but developed ANA within a year showed a significant association with treatment failure between 12 and 24 months (OR 7.11, p=0.044). ANA levels at baseline showed significant association with or tendency of insufficient response in both situations (OR 1.21 and 1.69, respectively), independently on ANA development. We still found associations of ANA development after conditioning on IFX usage, indicating that the associations are not limited to IFX. Female was associated with ANA development (OR 1.85) and high levels of ANA at baseline (OR 2.41, p=0.006), which is consistent with previous data in healthy population.<sup>2</sup> bDMARDs use (OR 2.09, p=0.056) was also a risk for ANA development. Among bDMARDs, anti-TNF agents, especially IFX, were risk factors of ANA development (OR 6.34, p<0.0001).

**Conclusions:** ANA development during treatment is associated with poor response to bDMARDs, which is not limited to IFX. Female and IFX usage are risk factors for ANA development.

#### OP0115 IMPROVED RESPONSE TO ETANERCEPT IS ASSOCIATED WITH SERUM VITAMIN D LEVELS IN RHEUMATOID ARTHRITIS

W Dankers<sup>1,2</sup>, P.H. de Jong<sup>1,3</sup>, S.G. Heil<sup>4</sup>, S.A. van den Berg<sup>4</sup>, A.E. Weel<sup>1,3</sup>, J. M. Hazes<sup>1</sup>, E.M. Colin<sup>5</sup>, E. Lubbers<sup>1,2</sup>. <sup>1</sup>Rheumatology, <sup>2</sup>Immunology, ERASMUS MC, <sup>3</sup>Rheumatology, Maasstad Ziekenhuis; <sup>4</sup>Clinical Chemistry, ERASMUS MC, Rotterdam; <sup>5</sup>Rheumatology, Hospital Group Twente, Almelo, Netherlands

**Background:** Although treatment of rheumatoid arthritis (RA) has significantly improved during the past decades, many patients do not adequately respond or become resistant to current treatments. It is currently unknown why some patients respond well and others do not, and how the response rate could be improved.

Vitamin D has strong immunomodulatory properties and it has been shown RA patients have a lower serum 25(OH)D level than healthy individuals. Moreover, vitamin D levels are correlated with disease severity.<sup>1,2</sup> Interestingly, *in vitro* studies have shown that vitamin D augments the suppressive effects of etanercept in a simplified model for synovial inflammation.<sup>3</sup> This suggests that vitamin D could improve the therapeutic response to etanercept in RA patients.

**Objectives:** To investigate if etanercept response is related to serum vitamin D (25(OH)D) levels in RA patients.

**Methods:** For this study, data were used from the tREACH trial, a multicenter stratified single blinded randomised clinical trial. RA patients, according to the 2010 classification criteria, who started with etanercept within the first 12 months of the study were included in the analysis. Serum vitamin D (25(OH)D) levels were

determined at the start of treatment (Tstart) and 3 months later using the LIAISON 25 OH Vitamin D TOTAL assay. Correlation coefficients between vitamin D levels and the disease activity score (DAS) were calculated. Treatment response was determined with the EULAR response criteria, and difference in response rates was assessed using Chi-Square tests.

**Results:** 91 patients started etanercept in the first 12 months of the study, of which 24 did not have serum for 25(OH)D measurements at both start of treatment and three months later. Therefore, a total of 67 patients was included in this study, of which 82% was female. At baseline, 45 (67%) and 48 (73%) were positive for rheumatoid factor and anti-citrullinated protein antibodies, respectively. DAS after etanercept treatment was weakly inversely correlated with serum 25(OH)D after treatment (r=-0.29, p=0.02) and the change in 25(OH)D during treatment (r=-0.25, p=0.04). After correcting for DAS and serum 25(OH)D at the start of treatment the aforementioned correlations were still found. Importantly, EULAR response rate was significantly lower in patients who were vitamin d-deficient at the start of treatment (34.6% vs 59.4%) and in patients with decreasing 25(OH)D levels during treatment (39.2% vs 57.7%) (figure 1).

**Conclusions:** RA patients with a serum 25(OH)D level below 50 nmol/L at the start of etanercept treatment or a decreasing level during treatment have a lower EULAR response rate. Therefore, increasing serum 25(OH)D level in vitamin D deficient patients may be important to achieve optimal effects of TNF $\alpha$  blocking therapy.

#### OP0116 IMPACT OF TNF INHIBITORS ON NEED FOR JOINT REPLACEMENT IN PATIENTS WITH RHEUMATOID ARTHRITIS: A MATCHED COHORT ANALYSIS OF UK BIOLOGICS REGISTRY DATA

S. Hawley<sup>1</sup>, R. Cordtz<sup>2,3</sup>, L. Dreyer<sup>2,3</sup>, C.J. Edwards<sup>4</sup>, N.K. Arden<sup>1,5</sup>, C. Cooper<sup>1,5</sup>, A. Judge<sup>1,6</sup>, S. Ali<sup>7</sup>, K. Hyrich<sup>8,9</sup>, D. Prieto-Alhambra<sup>1</sup>. <sup>1</sup>INDORMS, University of Oxford, Oxford, UK; <sup>2</sup>The Parker Institute; <sup>3</sup>Center for Rheumatology and Spine Diseases, Gentofte, Rigshospitalet, Copenhagen, Denmark; <sup>4</sup>NIHR Clinical Research Facility, University Hospital Southampton; <sup>5</sup>MRC Lifecourse Epidemiology Unit, University of Southampton, Southampton; <sup>6</sup>Translational Health Sciences, University of Bristol, Bristol; <sup>7</sup>Epidemiology and Population Health, London School of Hygiene and Tropical Medicine, London; <sup>8</sup>Manchester University Foundation Trust, University of Manchester, Manchester, UK

**Background:** Previous ecological data from the UK and Denmark suggest a decline in the incidence of joint replacements for RA patients following the introduction of tumour necrosis factor inhibitors (TNFi). However, patient-level data on the comparative effectiveness of TNFi compared to conventional synthetic DMARD (csDMARD) use on the need for total hip (THR) or knee (TKR) replacement are lacking.

**Objectives:** To estimate the impact of TNFi use on subsequent need for THR or TKR (primary outcomes) or other joint replacement (OJR) (secondary outcome) in RA.

**Methods:** A propensity score (PS) matched cohort was analysed using the British Society for Rheumatology Biologics Registry (2001 – 2016) for Rheumatoid Arthritis (BSRBR/RA) data. Exclusion criteria were: previous THR or TKR (all analyses) or OJR (secondary analysis), less than 6 months follow-up, prevalent biological DMARD use, or first biological DMARD use that was not a TNFi. Patients were followed from date of registration up to the earliest of date of outcome, death, loss-to-follow-up or change of TNFi exposure status (stopping, switching or starting).

Multiple imputation was used to deal with missing data. The PS (i.e. the probability of receiving TNFi conditional on observed characteristics) was estimated using logistic regression. This included age, gender, ethnicity, index of multiple deprivation, BMI, smoking, year of registration, duration of RA, DAS-28, HAQ, SF36, ACR criteria, comorbidities, and comedications. A PS calliper of 0.2 was used to match all TNFi users to csDMARD users (with replacement) using a 1:1 ratio. Weighted Cox regression was used to estimate the impact of TNFi use on study outcomes, adjusted for any confounders that remained unbalanced.

**Results:** Our 1:1 matched cohort contained a total of 19 116 patient records. THR rate was 6.30/1,000 PYs [95% CI: 4.24 to 9.76] and 5.22/1,000 PYs [CI: 4.66 to 5.88] in the csDMARD and TNFi cohorts, respectively. TKR rate was 8.09/1,000 PYs [CI: 5.32 to 12.89] and 8.89/1,000 PYs [CI: 8.13 to 9.72], respectively. There was no significant association between TNFi use and THR or TKR (HRs=0.86 [CI: 0.60 to 1.22] and 1.11 [CI: 0.84 to 1.47], respectively), although when analyses were restricted to patients with DAS >5.1 (as per NICE guidance) these HRs were 0.74 [CI: 0.51–1.05] and 0.95 [CI: 0.71 to 1.26], respectively. Among those over 60 years old, TNFi was associated with a significant reduction in THR (HR=0.60 [CI: 0.41–0.87]) but not TKR (HR=1.31 [CI: 0.87–1.99]). THR but not TKR rates were also reduced among those with an above average HAQ score. Overall, no significant associations were found for OJR.

**Conclusions:** Our findings suggest TNFi use may reduce the need for THR in older and more severe RA patients, although no evidence was found for a reduction in younger or less severe patients or in rates of TKR or OJR. Further work is needed to confirm these results.

## SLE, Sjögren's and APS- new criteria, novel diagnostic tools and co-morbidities

OP0117

### SAFETY AND IMMUNE RESPONSE OF A LIVE ATTENUATED HERPES ZOSTER VACCINE IN PATIENTS WITH SYSTEMIC LUPUS ERYTHEMATOSUS: A RANDOMISED PLACEBO-CONTROLLED TRIAL

C.C. Mok<sup>1</sup>, K.H. Chan<sup>2</sup>, L.Y. Ho<sup>1</sup>, Y.F. Fung<sup>2</sup>, W.F. Fung<sup>2</sup>, P.C. Woo<sup>2</sup>. <sup>1</sup>Medicine, Tuen Mun Hospital; <sup>2</sup>Microbiology, University of Hong Kong, HK, Hong Kong

**Objectives:** To evaluate the safety and immune response of a live attenuated herpes zoster (HZ) vaccine in patients with systemic lupus erythematosus (SLE) in a randomised placebo-controlled trial.

**Methods:** Adult patients who fulfilled  $\geq 4$  ACR criteria for SLE and had a SLEDAI score  $< 6$  with stable immunosuppressive treatment for 6 m were recruited. Exclusion criteria were: active infection; lymphocyte  $< 500/\text{mm}^3$ ; reduced serum IgG/A/M level; serum creatinine  $> 200 \mu\text{mol/L}$ ; a history of cancer; and high-dose immunosuppressive treatment (prednisone  $> 15 \text{ mg/day}$ , azathioprine  $> 100 \text{ mg/day}$ , MMF  $> 500 \text{ mg/day}$ , cyclosporin  $> 100 \text{ mg/day}$ , tacrolimus  $> 3 \text{ mg/day}$ , CYC and biologics). Participants were randomly assigned to receive HZ vaccine (Zostavax) or placebo (same volume of normal saline) given subcutaneously. Anti-VZV IgG reactivity (baseline and 6 weeks post-vaccination) was measured by an ELISA coated with inactivated varicella-zoster viral antigen (Vidas VZV IgG, bioMerieux, Marcy l'Etoile, France). Cell-mediated response to HZ was assessed by a specific VZV-stimulated IFN $\gamma$  enzyme linked immunospot (ELISPOT) assay. Disease activity of SLE was assessed by the SLEDAI and PGA. Adverse events (AEs) and immune responses to HZ of the two groups were compared.

**Results:** 90 SLE patients were recruited (age  $45.6 \pm 14.1$  years; 93% women): 45 assigned to HZ vaccine and 45 to placebo. All participants had a history of HZ/

chickenpox infection. The baseline clinical profile of the two groups of patients was similar. Only 3 patients in the vaccine and 1 patient in the placebo group had mild SLE activity (all mild thrombocytopenia). Baseline SLEDAI and PGA scores of the two groups were not significantly different ( $1.58 \pm 1.8$  vs  $1.64 \pm 1.7$ ;  $p=0.86$  and  $0.21 \pm 0.18$  vs  $0.27 \pm 0.25$ ;  $p=0.18$ , respectively). The proportion of patients receiving various immunosuppressive agents, lymphocyte count, serum creatinine, IgG/A/M levels were also similar in the two groups. The mean baseline VZV IgG index value was  $3.28 \pm 1.19$  and  $3.45 \pm 1.07$  in the vaccine and control group of patients, respectively ( $p=0.48$ ). The paired VZV IgG titer at week 6 was significantly higher in the vaccine than control group, even after adjustment for baseline value ( $4.16 \pm 1.26$  vs  $3.32 \pm 1.01$ ;  $p<0.001$ ), lymphocyte count, Ig levels, SLEDAI, and other clinical variables. The% increase in VZV IgG antibody was significantly higher in the vaccinated than control patients ( $+59.8\%$  vs  $-2.1\%$ ;  $p=0.01$ ), indicating an effect of vaccine. 21 and 6 AEs were reported in the vaccinated and control patients, respectively, but none were serious. Significantly more vaccinated patients reported pain and erythema at the injection site than controls (31% vs 7%;  $p<0.01$ ) (mild in all and subsided in a few days). Other AEs more commonly reported with vaccination included dizziness (2%), arthralgia (2%) and subjective fever (4%). Two vaccinated patients (4.4%) had mild flare of skin/joint disease, and one control patients (2.2%) had mild increase in proteinuria between week 0 and 6. None of the patients had clinical HZ infection post-vaccination.

**Conclusions:** In patients with stable SLE who were not receiving intensive immunosuppression, the live attenuated HZ vaccine was well tolerated and provoked an expected antibody response. Study of the cell-mediated response to HZ post-vaccination is in progress.

**Disclosure of Interest:** None declared

OP0118

### DEVELOPMENT OF METABOLIC SYNDROME IN PATIENTS WITH SLE: RESULTS FROM AN INCEPTION COHORT

A. Mohammed<sup>1</sup>, M. Jefferies<sup>1</sup>, P. Pemberton<sup>2</sup>, M. Lunt<sup>2</sup>, B. Parker<sup>2</sup>, I.N. Bruce<sup>2</sup>, on behalf of Systemic Lupus International Collaborating Clinics. <sup>1</sup>University of Manchester; <sup>2</sup>NIHR Manchester Biomedical Research Centre, Manchester University NHS Foundation Trust, Manchester, UK

**Background:** Individuals with systemic lupus erythematosus (SLE) are at increased risk of cardiovascular disease, which is possibly related to metabolic syndrome (MetS). Previous studies suggest that inflammation may be an important underlying mechanism in MetS development, but include patients with prevalent MetS only. In order to assess whether the development of incident MetS could be predicted, we examined the association between the onset of MetS and disease activity, therapeutic exposure, and biomarkers of inflammation overtime in patients with SLE.

**Objectives:** 1) To identify the clinical characteristics of patients with recently diagnosed SLE who develop incident MetS during first two years of follow-up; 2) To determine whether metabolic and inflammatory biomarkers improve the ability to predict incident MetS during follow-up.

**Methods:** We studied 1687 recently diagnosed SLE patients ( $< 15$  months) enrolled into the SLICC Inception Cohort from 11 countries. Clinical, therapeutic and laboratory data were recorded at baseline and annually at follow-up visits. Serum concentrations of adiponectin, B-lymphocyte stimulator, high sensitivity C-reactive protein, interleukin (IL)-6, IL-18, IL-18 binding protein, insulin, leptin and tumour necrosis factor alpha were measured, if samples were available. A complete-case analysis was performed. Only patients with both MetS status available at baseline, year 1 and year 2 visits were analysed. Logistic regression was performed to analyse which factors were predictive of the development of incident MetS in the first 2 years of follow-up. Patients who developed incident MetS were compared with those who were free of MetS throughout follow-up.

**Results:** Overall, 436 (26%) patients were included in this complete-case analysis. Of these, 243 (56%) were free of MetS throughout the follow-up period, 87 (20%) had persistent MetS at each visit, and 106 (24%) developed incident MetS during follow-up. In a multivariable logistic regression model that excluded biomarkers, clinical factors associated with future onset of MetS included increased age, Hispanic ethnicity, active renal disease, higher disease activity and current corticosteroid use. This model performed 'fairly' when identifying patients likely to develop incident MetS (Area Under Receiver Operator Characteristics Curve (AUC ROC)=0.77). In a multivariable model that included the inflammatory and

metabolic biomarkers, increasing age, Korean ethnicity, higher disease activity and increased serum leptin performed similarly (AUC ROC=0.75).

**Conclusions:** SLE patients who develop incident MetS exhibit a more inflammatory disease phenotype, with higher corticosteroid exposure in the preceding visit. Increased serum leptin concentration is independently associated with future onset of MetS. These factors can help predict those at increased risk of developing future MetS and may help target patients for more focused cardiovascular disease prevention.

OP0119

#### PROGRESSION OF SUBCLINICAL ATHEROSCLEROSIS IN SYSTEMIC LUPUS ERYTHEMATOSUS OF LOW DISEASE ACTIVITY: THREE-YEAR FOLLOW-UP AND COMPARISON TO RHEUMATOID ARTHRITIS

E. Kravvariti, G. Konstantonis, P.P. Sfikakis, M.G. Tektonidou. *First Department of Propaedeutic and Internal Medicine/Joint Rheumatology Program, 'Laikon' Hospital, School of Medicine, National and Kapodistrian University of Athens, Athens, Greece*

**Background:** Both systemic lupus erythematosus (SLE) and rheumatoid arthritis (RA) are characterised by accelerated atherosclerosis compared to the general population. Prospective studies have shown that atherosclerosis progression is halted in patients with RA of low disease activity, but it is unclear if maintaining lupus low disease activity state mitigates accelerated atherosclerosis due to SLE.

**Objectives:** To prospectively assess the risk and determinants of atherosclerosis progression in SLE versus RA patients of low disease activity.

**Methods:** We performed carotid and femoral artery ultrasound to detect atherosclerotic plaques at baseline on 345 participants with SLE, RA, and healthy controls, individually matched for age and gender, after excluding patients with atherosclerotic cardiovascular disease, malignancy and diabetes. After 3 years of follow-up, patients with SLE (n=89) and RA (n=64) maintaining low disease activity<sup>1</sup> for >75% of the follow-up time, and their matched controls (n=72) underwent repeat ultrasound to identify those with atherosclerosis progression, as defined by the development of new plaques compared to baseline. We applied multiple logistic regression models to assess the odds of atherosclerosis progression between SLE, RA, and control participants, and used the stepwise backward elimination algorithm (p<0.1) to examine potential associations with SLE damage index, anti-phospholipid antibodies, corticosteroids, hydroxychloroquine, immunosuppressives, and disease duration in patients with SLE, adjusting for use of antiplatelet agents, statins, and traditional cardiovascular risk factors with the European Society of Cardiology's SCORE risk estimation of 10 year fatal cardiovascular disease.

**Results:** Atherosclerotic plaque progression was detected in 21% of SLE patients, 17% of RA patients, and 8% of controls (p=0.078). After controlling for SCORE, antiplatelet agent use and statins, the rate of atherosclerosis progression compared to healthy controls was significantly higher in SLE (OR=3.05, 95% Confidence Interval (CI) 1.06–8.79, p=0.039), but not in RA (OR=2.11, 95% CI: 0.72 to 6.23, p=0.176). In patients with SLE, longer disease duration at baseline (OR=1.11, 95% CI: 1.02 to 1.21, p=0.015), antiphospholipid antibody positivity (OR=7.04, 95% CI: 1.57 to 31.58, p=0.011 cumulative corticosteroid dose during follow-up (OR=1.16, 95% CI: 0.99 to 1.35, p=0.069), treatment with antiplatelet agents (OR=0.21, 95% CI: 0.05 to 0.99, p=0.049), and the SCORE prediction (OR=1.67, 95% CI: 0.91 to 3.08, p=0.099) were included in the multivariable model as determinants of atherosclerosis progression. No disease-related determinants were significantly associated with atherosclerosis progression in patients with RA.

**Conclusions:** Unlike RA, atherosclerosis progression is accelerated in SLE even in the setting of low disease activity. In addition to SCORE, longer disease duration at baseline, antiphospholipid antibody positivity, and higher cumulative corticosteroid dose during follow-up increase the odds of atherosclerosis progression in patients with SLE of low disease activity.

**Objectives:** To analyse the influence of epidemiology and ethnicity on the clinical systemic presentation at diagnosis of primary Sjögren syndrome (SjS).

**Methods:** The Big Data Sjögren Database included 10 475 worldwide patients from 22 countries fulfilling the 2002 criteria. Age at diagnosis, gender and ethnicity (77% White, 14% Asian, 6% Hispanic, 1% Black/African American, 2% others) were correlated with systemic involvement at diagnosis (retrospectively scored in 9974 patients using ESSDAI/clinESSDAI)

**Results:** Men had higher mean ESSDAI (8.0 vs 5.9, p<0.001) and clinESSDAI (8.4 vs 6.1, p<0.001) in comparison with women; the domains more active in men included lymphadenopathy (p<0.001), glandular (p<0.001), pulmonary (p=0.001), PNS (p<0.001) and CNS (p<0.001). Highest scores were also reported in patients with young-onset disease (<35 years) with respect to older onset (>65 years) for ESSDAI (6.5 vs 5.6, p=0.002) and clinESSDAI (6.4 vs 5.8, p=0.034). Highest ESSDAI scores were reported in Black/African American, followed by White, Asian and Hispanic patients (6.7 vs 6.3 vs 5.4 vs 4.9, respectively, p<0.001). BAA patients showed the highest frequency of activity in lymphadenopathy, articular, PNS, CNS and biological domains, Whites in glandular, cutaneous and muscular, Asians in pulmonary, renal and haematological and Hispanics in the constitutional domain.

**Conclusions:** This study provides the first evidence for a strong influence of epidemiology and ethnicity on the systemic phenotype at diagnosis of primary SjS

#### LUPUS ANTICOAGULANT IS ASSOCIATED WITH THROMBOTIC EVENTS IN HEALTHY CARRIERS: RESULTS FROM A PROSPECTIVE LONGITUDINAL STUDY

F. Ceccarelli<sup>1</sup>, A. Chistolini<sup>2</sup>, C. Perricone<sup>1</sup>, E. Rando<sup>1</sup>, C. Pirone<sup>1</sup>, E. Cipriano<sup>1</sup>, I. Leccese<sup>1</sup>, L. Massaro<sup>1</sup>, F. Morello<sup>1</sup>, F.R. Spinelli<sup>1</sup>, C. Alessandri<sup>1</sup>, G. Valesini<sup>1</sup>, F. Conti<sup>1</sup>. <sup>1</sup>Lupus Clinic, Reumatologia; <sup>2</sup>Dipartimento di Biotecnologie cellulari ed Ematologia, Sapienza Università di Roma, Sapienza University of Rome, Rome, Italy

**Background:** Antiphospholipid syndrome (APS) is an autoimmune disease characterised by thrombotic events and/or pregnancy morbidity in combination with persistent positivity for antiphospholipid antibodies (aPL) [lupus anticoagulant (LA), anticardiolipin (aCL), anti b2 glycoprotein I (anti-β2GPI) in medium/high titers]. These antibodies could be identified not only in other pathological

conditions (i.e. autoimmune diseases), but also in healthy subjects (aPL carriers). In this subset, the risk of developing thrombotic events or pregnancy morbidity ranges from 0% to 3.8%, and it is higher in subjects with LA positivity, triple positivity (LA+aCL+anti-β2GPI) and aCL positivity at high/medium titer. Nonetheless, 70% of aPL carriers described so far showed a concomitant autoimmune disease, being itself a risk factor for thrombotic events.

**Objectives:** We longitudinally followed up a cohort of healthy subjects persistently positive for aPL to evaluate the risk of developing thrombotic events.

**Methods:** Healthy subjects positive for aPL in at least 2 consecutive determinations (aPL carriers) were enrolled. Medical history was recorded and the following parameters were registered: presence of traditional risk factors (smoking, diabetes mellitus, hypertension, dyslipidemia, hormone therapy); obstetric history (infertility, miscarriages); family history of autoimmune and cardiovascular diseases with an early onset; recent infectious episodes. Laboratory evaluation was performed, including aCL IgG/IgM, anti-β2GPI IgG/IgM, LA, antinuclear antibody, C3/C4 serum levels, thrombophilia screening. All subjects were evaluated every 6 months.

Abstract OP0121 – Figure 1. Reports the Kaplan-Meier curve of aPL carriers free from thrombotic events.

**Results:** We enrolled 47 aPL carriers (M/F 9/38, median age at first visit 45.5 years, IQR 17). Thirty-six subjects (76.6%) were aCL+ (30.5% at medium/high titer), 30 (63.8%) anti-β2GPI+ (36.7% at medium/high titer), 24 (51.1%) LA+. Thirty-one subjects (65.9%) were positive for more than one aPL and 12 (25.5%) showed a triple positivity. The aPL carriers were longitudinally followed up for a median of 60 months (IQR 48). Twenty-four subjects were treated with low dose aspirin (LDA) and 3 with hydroxychloroquine. During this observational period, 5 subjects were lost to follow-up and 5 became persistently negative for aPL after a median of 54 months (IQR 39). Considering the remaining 37 aPL carriers, 3 (1F, 2M) experienced a thrombotic event (2 arterial and 1 venous). This patients were treated with LDA at the time of the event and were all LA+. In one case, the episode was preceded by a flu-like event. Interestingly, the LA prevalence resulted significantly higher in the subjects experiencing thrombotic events in comparison with those who did not (p=0.0001). We observed an absolute risk of thrombotic events of 0.08 (CI: 0.02 to 0.2) and an incidence rate of 1.1 (CI: 0.3 to 2.9).

**Conclusions:** In this prospective study, specifically designed to evaluate the incidence of APS related clinical manifestations in aPL positive healthy subjects, LA positivity resulted the most important risk factor of thrombotic events.

				(0.30,0.54)	

**Objectives:** We assessed whether two recently proposed disease activity outcomes were predictive of future damage.

**Methods:** For each month of follow-up in a large SLE cohort, we determined whether the patient was in Clinical Remission (as defined by the DORIS working group) or lupus low disease activity state (LLDAS) (as defined by Franklyn et al). Clinical Remission was defined as a PGA<0.5, clinical SLEDAI=0 and no prednisone or immunosuppressants. Clinical Remission on Treatment allowed for prednisone ≤5 mg/day and immunosuppressant use. LLDAS was defined as a SLEDAI ≤4, PGA≤1.0, no major organ activity, and no new activity. LLDAS on treatment allowed for prednisone use ≤7.5 mg/d and immunosuppressants. Damage was defined using the SLICC/ACR Damage index.

**Results:** There were 81 118 person-months observed among 2026 patients (92% female, 53% Caucasian, 39% African-American). table 1 shows the rates of damage, per person month, in subgroups defined by Remission or LLDAS. Damage rates were relatively low when LLDAS was achieved at least 50% of the time. These rates were similar to those experienced by patients who met a more stringent treatment restriction with Remission on Treatment at least 50% of the time.

**Conclusions:** Percent time in LLDAS had a clear dose response for rate ratios of organ damage. The equivalence of LLDAS and DORIS remission on treatment is welcome news, as LLDAS on treatment >50% of the time is an easier goal to achieve (3 times more person-months observed in our cohort) and more realistic as a clinical trial outcome.

### EVALUATION OF RETINAL MICROVASCULATURE BY OPTICAL COHERENCE TOMOGRAPHIC ANGIOGRAPHY IN SYSTEMIC LUPUS ERYTHEMATOSUS PATIENTS MIRRORS SYSTEMIC INVOLVEMENT

P. Conigliaro<sup>1</sup>, M. Cesaro<sup>2</sup>, C. Canofari<sup>1</sup>, G. Aloe<sup>2</sup>, G. Alvaro<sup>2</sup>, P. Triggianese<sup>1</sup>, A.G. Salandri<sup>2</sup>, M.S. Chimenti<sup>1</sup>, R. Perricone<sup>1</sup>. <sup>1</sup>Rheumatology, *Allergology and Clinical Immunology Clinic, Department of 'Medicina dei Sistemi'*; <sup>2</sup>Ophthalmology Unit, *Department of Experimental Medicine and Surgery, University of Rome Tor Vergata, Rome, Italy*

**Background:** Optical coherence tomographic angiography (OCTA) is a novel imaging modality that visualises retinal microvasculature in a noninvasive manner. It may have value in managing retinopathy, correlate with visual outcome and mirror systemic involvement in autoimmune diseases.

**Objectives:** Aim of this study was to evaluate retinal microvasculature in systemic lupus erythematosus (SLE) patients and correlate abnormal vascular maps with disease activity, damage accrual, treatment and visual outcome.

**Methods:** In a prospective cross-sectional study, OCTA was used to examine density maps, by means of a 6 mm scan, based on superficial retinal layer and deeper retinal layer images in patients and healthy controls (HC) (figure 1A-B) from November 2015 to December 2017. Vessel density, based on a map with vessels of 1-pixel width was measured.

**Results:** 52 eyes from 26 SLE patients and 40 healthy eyes from 20 HC were imaged (table 1). The eyes from SLE patients had a lower superficial whole en face density, superficial fovea density and superficial parafoveal density ( $p=0.02$  for all comparisons) compared with healthy eyes (figure 1C-E). A negative correlation was demonstrated in SLE patients between age and superficial whole en face density ( $p=0.0005$ ,  $r=-0.5$ ), superficial foveal density ( $p=0.006$ ,  $r=-0.4$ ), superficial parafoveal density ( $p=0.004$ ,  $r=-0.4$ ), deep whole en face density ( $p=0.003$ ,  $r=-0.4$ ) and deep parafoveal density ( $p=0.001$ ,  $r=-0.4$ ). SLEDAI correlated inversely with superficial en face density ( $p=0.002$ ,  $r=-0.4$ ), superficial parafoveal density ( $p=0.0003$ ,  $r=-0.5$  and  $p=0.002$ ,  $r=-0.5$ ), deep whole en face density ( $p=0.01$ ,  $r=-0.4$ ) and deep parafoveal density ( $p=0.002$ ,  $r=-0.4$ ). A negative correlation was found between SLICC and superficial whole en face density ( $p=0.0001$ ,  $r=-0.5$ ), superficial parafoveal density ( $p<0.0001$ ,  $r=-0.6$ ), deep whole en face density ( $p<0.0001$ ,  $r=-0.6$ ) and deep parafoveal density ( $p<0.0001$ ,  $r=-0.7$ ). Patients with nephritis displayed reduced parafoveal vessel density and parafoveal thickness compared to those of patients without nephritis ( $p=0.02$  and  $p=0.008$ , figure 1F-G). A positive correlation was found between hydroxychloroquine (HCQ) cumulative dose and both superficial and deep parafoveal density ( $p=0.009$ ,  $r=0.4$  and  $p=0.04$ ,  $r=0.3$ ). Best-corrected visual acuity in SLE positively correlated with superficial whole en face density, superficial parafoveal density, deep whole en

face density, and deep parafoveal density ( $p<0.0001$ ,  $r=0.7$  for all correlations). A negative correlation was found with fovea thickness ( $p=0.01$ ,  $r=-0.5$ ).

Abstract OP0123 – Table 1

	HC (n=20)	SLE (n=26)
Age (years)	46±8.9	49.6±13.6
Female n (%)	16 (80)	23 (88.5)
Disease duration (months)	-	181.5±93
SLEDAI	-	4.3±4.2
SLICC	-	1.9±1.5
HCQ cumulative dose (g)	-	738.8±486.8
Kidney involvement (n/%)	-	10/40
NPSLE (n/%)	-	8/32
aPL positive (n/%)	-	10/40

**Conclusions:** SLE patients, in particular those with kidney involvement, displayed a reduced retinal microvascular density compared with normal subjects. Vessel density provides a quantitative metric of capillary network that correlated with age, best-corrected visual acuity and clinical features as SLE disease activity and damage accrual. Hydroxychloroquine might have a protective role preserving the microvascular structures.

OP0124

### IN SLE PATIENTS IN SUSTAINED LOW DISEASE ACTIVITY, NOVEL INTERFERON ASSAYS PREDICT FLARES AND GLUCOCORTICOID REQUIREMENTS

K. Dutton, A. Psarras, Y. El-Sherbiny, M.Y. Md Yusof, P. Emery, E. Vital. *Leeds Institute of Rheumatic and Musculoskeletal Medicine, University of Leeds, Leeds, UK*

**Background:** Objectives of therapy in SLE are to maintain low disease activity and minimise glucocorticoid exposure. Disease activity is unpredictable with periods of low disease activity followed by flares. Once disease is controlled, there is an unmet need for predictors of sustained remission or flares to decide when glucocorticoids can be safely tapered. Type 1 interferon (IFN-I) activity is associated with disease activity in SLE. We recently validated two novel assays for IFN-I. First, a 2-score gene expression system that is continuous and accounts for molecularly of the IFN transcriptome. Second, the flow cytometric biomarker tetherin that allows measurement of IFN status in individual cell subsets, with memory B cell tetherin (tetherin) correlating best with disease activity.

**Objectives:** To determine whether IFN assays can predict flare and glucocorticoid requirements in patients with lupus

**Methods:** Retrospective notes review was done in 165 consecutive patients with SLE who submitted IFN biomarker samples between 2011–2015. The reviewer was blinded to biomarker status.

For the interferon scores, RNA was extracted from PBMCs and a custom Taqman array was used to measure expression of 30 interferon stimulated genes normalised to *PP1A* and then calculate IFN Score A (12 genes predominantly responsive to IFN-alpha) and IFN Score B (14 genes also responsive to other IFN subtypes and inflammatory mediators). For tetherin, PBMCs were analysed fresh with conventional surface staining. MFI of CD317 (tetherin) was measured on CD19+CD27+CD38 lymphocytes.

We performed two analyses:<sup>1</sup> In patients in sustained low disease activity (defined as no BILAG A or B in the six months prior to IFN biomarker sampling), prediction of new disease activity in the following six months (defined as new BILAG A or B).<sup>2</sup> The association between IFN biomarkers and change in mean monthly glucocorticoid dose following biomarker sampling (defined as same or increased vs decreased or no glucocorticoid prescription). Since tetherin is measured on B-cells we excluded patients who were B cell depleted after rituximab. IFN biomarkers were compared between groups using Mann-Whitney U Tests.

**Results:** Of 165 patients, 92 were in sustained low disease activity prior to biomarker sampling. Of these, new BILAG A/B activity occurred within 6 months of sampling in 16 (17%). New BILAG A/B activity was associated with higher levels of IFN Score A ( $p=0.027$ ,  $n=83$ ), IFN Score B ( $p=0.097$ ,  $n=83$ ) and tetherin ( $p=0.026$ ,  $n=92$ ).

Of 143 patients with complete data, glucocorticoid doses were increased or maintained after sampling in 45 and decreased or not prescribed in 98. Increased/maintained glucocorticoids were associated with higher IFN Score A ( $p=0.003$ ,  $n=113$ ), IFN Score B ( $p=0.013$ ,  $n=113$ ) and tetherin ( $p=0.043$ ,  $n=84$ ).

After adjustment for age, gender, pre and post-sampling glucocorticoid dose, substantive associations with flare remained for IFN Score A (OR=1.44/unit, 95% CI: 0.998 to 2.082,  $p=0.051$ ) and tetherin (OR=3.135/1000 units, 95% CI: 1.179 to 8.335,  $p=0.022$ ).

**Conclusions:** SLE patients in low disease activity with high IFN Score A, Score B and tetherin levels have an increased risk of disease activity and/or glucocorticoid exposure in the months that follow biomarker testing. There is a potential role for use of these IFN assays as predictive biomarkers in SLE in the future.

### The 'A-B-C' of PsA (Assessment, Biologicals, Co-morbidities)

#### OP0125 DAPSA AND ULTRASOUND SHOW DIFFERENT PERSPECTIVES OF PSORIATIC ARTHRITIS ACTIVITY: RESULTS FROM A LONGITUDINAL OBSERVATIONAL STUDY OF PATIENTS STARTING TREATMENT WITH BIOLOGIC DMARDS

S. Pukšić, J. Sexton, P. Bolton-King, B. Michelsen, T.K. Kvien, H.B. Hammer. *Dept. of Rheumatology, Diakonhjemmet Hospital, Oslo, Norway*

**Background:** Clinical disease activity in patients with psoriatic arthritis (PsA) may be assessed by DAPSA- a sum score of tender (of 68) and swollen (of 66) joints, CRP (mg/dl), patient's global assessment of disease activity (PGA) and patient's pain (0–10 VAS for both). Ultrasound (US) with grey scale (GS) and power Doppler (PD) is used to detect inflammation in joints as well as extra-articular structures. Discrepancies have previously been described between DAPSA and US.<sup>1</sup>

**Objectives:** To explore the associations between DAPSA and US assessments of disease activity during follow-up of patients with PsA starting bDMARD treatment.

**Methods:** Patients with PsA were included when initiating bDMARDs, and examined at 0, 3, 6, 9 and 12 months including 66 swollen/68 tender joint counts (SJC/TJC), examiner's global assessment VAS (EGA), patient reported outcome measures (PROMs; PGA, patient's pain, RAID, MHAQ), laboratory measures (CRP, ESR, calprotectin) and US (46 joints, 8 flexor tendons, 14 entheses and 4 bursae with calculated GS and PD sum scores). DAPSA was calculated. PD sum score zero was defined as US remission. Generalised Estimating Equations (GEE) was used for longitudinal analysis.

**Abstract OP0125 – Table 1** Median (IQR) of clinical, laboratory and US assessments during bDMARD treatment

	Baseline (n=47)	3 months (n=42)	6 months (n=36)	9 months (n=33)	12 months (n=31)
DAPSA	19.8 (13.9–30.9)	13.1 (4.9–20.9)	10.5 (2.6–18.7)	10.2 (3.5–20.5)	9.0 (2.4–20.6)
TJC (of 68)	7 (2–15)	2 (0–11)	1 (0–9)	2 (0–9)	2 (0–11)
SJC (of 66)	1 (0–3)	0 (0–1)	0 (0–1)	0 (0–0)	0 (0–0)
PGA (VAS 0–10)	5.2 (3.3–6.9)	2.8 (1.0–5.1)	2.0 (0.9–4.3)	3.3 (0.5–5.4)	2.7 (0.5–4.9)
PAIN (VAS 0–10)	5.4 (3.0–6.8)	3.1 (1.0–4.1)	2.8 (0.9–5.8)	2.6 (1.1–5.4)	2.2 (0.7–5.4)
MHAQ	0.50 (0.25–0.88)	0.25 (0.00–0.50)	0.13 (0.00–0.44)	0.25 (0.00–0.44)	0.13 (0.00–0.50)
RAID (0–10)	5.1 (4.0–6.0)	2.9 (0.9–5.1)	2.3 (1.3–4.7)	3.0 (0.9–5.2)	2.6 (1.1–4.9)
CRP mg/L	3 (1–7)	1 (1–3)	2 (1–4)	2 (1–3)	2 (1–3)
ESR mm/h	11 (6–17)	6 (3–12)	7 (3–11)	9 (3–13)	7 (4–14)
Calprotectin µg/L	826 (487–1202)	511 (307–741)	431 (305–669)	459 (267–1005)	432 (294–768)
EGA (VAS 0–10)	2.4 (2.0–2.8)	1.5 (1.0–2.2)	1.2 (0.8–1.6)	1.2 (0.8–1.6)	1.0 (0.5–1.2)
Sum score	4 (2–9)	2 (0–5)	2 (0–3)	3 (0–6)	4 (1–8)
GS					
Sum score	1 (0–4)	0 (0–2)	0 (0–2)	0 (0–2)	0 (0–2)
PD					

**Abstract OP0125 – Figure 1.** Baseline correlations with DAPSA

**Results:** 47 patients (mean (SD) age 48.4 (12.8) years, disease duration 12.7 (10.9) years, 60% women) were included (68% biologic-naïve). The figure depicts high correlation between DAPSA and subjective assessments at baseline, while PD sum score was more strongly associated with SJC ( $r=0.49$ ,  $p<0.001$ ), EGA ( $r=0.29$ ,  $p=0.05$ ) and DAS28 ( $r=0.35$ ,  $p=0.015$ ), but not with DAPSA ( $r=0.21$ ,  $p=0.16$ ) or PROMs. There was significant improvement at 3 months in all variables ( $p=0.046$ – $<0.001$ ) (table 1). Longitudinally, TJC and patient's pain had strongest association with DAPSA (standardised  $\beta$  0.86 vs 0.52, both  $p<0.001$ ). DAPSA remission was obtained in 27%–33% of the patients and PD remission in 60%–70%, but their association was weak and not statistically significant (OR 1.4, 95% CI: 0.69 to 2.95,  $p=0.33$ ).

**Conclusions:** In our observational PsA cohort DAPSA was mostly influenced by TJC and patient's pain and had no significant association with a comprehensive US examination. This finding indicates possible limitations of using DAPSA in T2T strategy in PsA.

#### OP0126 EVALUATING LOW DISEASE ACTIVITY DEFINITIONS IN PSORIATIC ARTHRITIS USING ULTRASOUND

P. Bosch<sup>1</sup>, R. Husic<sup>1</sup>, A. Ficjan<sup>1</sup>, J. Gretler<sup>1</sup>, A. Lackner<sup>1</sup>, W. Graninger<sup>1</sup>, C. Duftner<sup>2</sup>, J. Hermann<sup>1,3</sup>, C. Dejaco<sup>1,3</sup>. <sup>1</sup>Department of Rheumatology and Immunology, Medical University Graz, Graz; <sup>2</sup>Department of Internal Medicine VI, Medical University Innsbruck, Innsbruck, Austria; <sup>3</sup>Rheumatology Service, Hospital of Bruneck, Bruneck, Italy

**Background:** Cut offs for low disease activity (LDA) using psoriatic arthritis (PsA) specific composite scores have recently been proposed.<sup>1–3</sup> Whether these definitions adequately reflect the absence of inflammation is unknown.

**Objectives:** To evaluate these definitions against a low level of activity according to ultrasound examination.

**Methods:** We performed a prospective study on 83 PsA patients undergoing clinical and ultrasound examinations at two study visits scheduled 6 months apart. LDA was assessed using the Disease Activity index for Psoriatic Arthritis (DAPSA $\leq 14$ ), the Psoriatic Arthritis Disease Activity Score (PASDAS  $\leq 3.2$ ), the Composite Psoriatic Disease Activity Index (CPDAI $\leq 4$ ), the Disease Activity Score 28 CRP (DAS28-CRP $\leq 2.8$ ) and the Minimal Disease Activity criteria (MDA).

Ultrasound (US) evaluation was performed at 68 joints (evaluating synovia, peritendinous tissue, tendons and bony changes) and 14 entheses.

Minimal ultrasound disease activity (MUDA) was defined as a Power Doppler (PD) score  $\leq 1$ , respectively at joints, peritendinous tissue, tendons and entheses.

**Results:** LDA was present in 33.7%–65.0% of patients at baseline and in 44.3%–80.6% at follow-up examination, depending on the criteria used. MUDA was observed in 16.9% at baseline and in 30% at follow-up.

At baseline only the DAPSA-LDA definition was useful to identify MUDA patients (78.6% of patients identified correctly), whereas at follow up >80% of MUDA

patients were correctly classified as LDA according to DAPSA, PASDAS, CPDAI and DAS28-CRP.

Only DAPSA (Sensitivity (S)=88.2%, Specificity (Sp)=40.5,  $p=0.033$ ), PASDAS (S=88.2%, Sp=55.0%,  $p=0.002$ ) and the MDA criteria (S=71.4%, Sp=67.3%,  $p=0.003$ ) were able to discriminate patients with and without MUDA at follow-up. A global ultrasound inflammation subscore for joints and entheses (GUIS-j/e), containing the above mentioned US variables, was significantly higher in patients with active disease versus patients in LDA according to DAPSA ( $p=0.002$ ) and PASDAS ( $p=0.013$ ) at baseline and DAPSA ( $p=0.007$ ), PASDAS ( $p=0.001$ ), CPDAI ( $p=0.021$ ) and the MDA criteria ( $p<0.001$ ) at follow up.

**Conclusions:** Of all tested LDA definitions, DAPSA was overall the most efficacious in differentiating between high and low ultrasound scores and better identified patients with MUDA as compared to the other tested scores.

OP0127

#### CAN ACHIEVING MINIMAL DISEASE ACTIVITY (MDA) PREVENT PROGRESSION OF SUBCLINICAL ATHEROSCLEROSIS AND ARTERIAL STIFFNESS? A TWO-YEAR PROSPECTIVE COHORT STUDY IN PSORIATIC ARTHRITIS

T.H. Cheng<sup>1</sup>, Q. Shang<sup>1</sup>, E. K. M. Li<sup>1</sup>, P.C.H. Wong<sup>1</sup>, L.H.P. Tam<sup>1</sup>, T.Y. Zhu<sup>2</sup>, M. M. Chang<sup>1</sup>, J.J.W. Lee<sup>3</sup>, C.K. Wong<sup>4</sup>, A.P.W. Lee<sup>1</sup>, L.S. Tam<sup>1</sup>. <sup>1</sup>Department of Medicine and Therapeutics; <sup>2</sup>Department of Orthopaedics and Traumatology; <sup>3</sup>School of Public Health; <sup>4</sup>Department of Chemical Pathology, The Chinese University of Hong Kong, Hong Kong, Hong Kong

**Background:** PsA patients have higher CVD risk due to underlying inflammation. While achieving MDA was associated with articular benefits, its effect on CVD risk remained uncertain

**Objectives:** To investigate effect of achieving MDA on subclinical atherosclerosis and arterial stiffness

**Methods:** Subjects without CVD were recruited and received protocolised treatment aiming at MDA for 2 years. High-resolution ultrasound (for subclinical atherosclerosis) and arterial stiffness were assessed yearly. The primary objective was to investigate the effect of achieving MDA (MDA group) at 12 months on the progression of subclinical atherosclerosis (carotid intima-media thickness [IMT] and plaque) over 2 years. Secondary objectives were to compare 1) changes in arterial stiffness (branchial-ankle pulse wave velocity [PWV]) and augmentation index [AIX] over 2 years between MDA and non-MDA group; 2) changes in vascular outcomes in patients who could or could not achieve sustained MDA (sMDA, defined as achieving MDA from month 12 to 24). Carotid plaque progression was defined as an increase in number/region harbouring plaque compared with baseline

**Results:** 90 patients [male: 52 (58%); age: 50±11] were included. At 24 months, 62 (69%) were on csDMARDs, 20 (22%) were on anti-TNF- $\alpha$  and 8 (9%) were on Secukinumab. Proportion of patient achieved MDA increased significantly (baseline: 17%; 12 months: 64%; 24 months: 69%) after intensive treatment. Vascular outcomes were similar between MDA and non-MDA group (figure 1). 41 (46%) patients achieved sMDA. At baseline, a higher prevalence of subjects in the non-sMDA group were smokers, treated with NSAIDs and csDMARDs; fewer subjects were on bDMARDs, and they had higher disease activity compared with the sMDA group. 34 (38%) of them had plaque progression and prevalence was numerically higher in the non-sMDA group [22 (45%) vs 12 (29%),  $p=0.13$ ]. Using multivariate analysis, achieving sMDA had protective effect on plaque progression [OR=0.27, 95% CI: 0.09 to 0.84,  $p=0.03$ ] after adjustment of baseline difference (table 1). Achieving sMDA was also related to less progression of total plaque area (TPA), mean and maxIMT, PWV and AIX (table 1)

**Conclusions:** Effective suppression of inflammation by achieving sustained MDA may prevent subclinical atherosclerosis and arterial stiffness progression in PsA patients

#### THE PHENOTYPE OF AXIAL PSORIATIC ARTHRITIS: IS IT DEPENDENT ON HLA-B27 STATUS?

L. Coates<sup>1</sup>, E. Alonso<sup>2</sup>, X. Baraliakos<sup>3</sup>, F. Blanco Garcia<sup>4</sup>, J. Braun<sup>3</sup>, V. Chandran<sup>5</sup>, J.L. Fernandez-Sueiro<sup>6</sup>, O. FitzGerald<sup>6</sup>, P. Gallagher<sup>7</sup>, D. Gladman<sup>8</sup>, E. Gubar<sup>8</sup>, T. Korotaeva<sup>8</sup>, E. Loginova<sup>8</sup>, E. Lubrano<sup>9</sup>, J. Mulero<sup>10</sup>, J. Pinto-Tasende<sup>2</sup>, R. Queiro<sup>11</sup>, J. Sanz Sanz<sup>12</sup>, A. Szentpetery<sup>7</sup>, P. Helliwell<sup>13</sup>. <sup>1</sup>NDORMS, University of Oxford, Oxford, UK; <sup>2</sup>INIBIC, Complejo Hospitalario Universitario de A Coruña, A Coruña, Spain; <sup>3</sup>Ruhr-University Bochum, Bochum, Germany; <sup>4</sup>Department of Rheumatology, INIBIC, Complejo Hospitalario Universitario de A Coruña, A Coruña, Spain; <sup>5</sup>Toronto Western Hospital, Toronto, Canada; <sup>6</sup>Dept Rheumatology; <sup>7</sup>St Vincent's University Hospital, Dublin, Ireland; <sup>8</sup>Nasonova Research Institute of Rheumatology, Moscow, Russian Federation; <sup>9</sup>Università degli Studi del Molise, Campobasso, Italy; <sup>10</sup>Hospital Puerta de Hierro, Majadahonda, Madrid; <sup>11</sup>Hospital Universitario Central de Asturias, Oviedo; <sup>12</sup>Hospital Universitario Puerta de Hierro, Majadahonda, Madrid, Spain; <sup>13</sup>University of Leeds, Leeds, UK

**Background:** Up to 50% of patients with psoriatic arthritis (PsA) have associated spinal involvement similar to ankylosing spondylitis (AS). HLA-B27 positivity is lower in PsA compared to other SpA which may affect the disease phenotype.

**Objectives:** Our aim was to compare axial phenotype in PsA patients with and without HLA-B27 with AS patients.

**Methods:** A large international collaboration collected BASDAI, CRP, HLA-B27 status and sacroiliac joints (SIJ) and spine radiographs. These were read centrally by two blinded readers using consensus on the modified New York criteria, mSASSS and PASRI. AP spine radiographs were examined for symmetry (score difference  $\geq 2$  between sides) and morphology of syndesmophytes (typical marginal vs atypical chunky/non-marginal) were compared.

**Results:** Eight sites contributed 244 (25% HLA-B27+) PsA patients and 198 (75% HLA-B27+) AS patients. Mean BASDAI, mSASSS and PASRI were higher in AS. When categorised by diagnosis and HLA-B27 there were significant differences for age, sex, disease duration, mSASSS, PASRI and syndesmophyte symmetry. Regression analysis, with mSASSS and PASRI as dependent variables revealed significant associations with age, sex, duration of disease, and group (HLA-B27 and diagnosis).

Binary multivariate logistic regression was used to investigate associations of age, sex, HLA-B27 status, diagnosis (PsA v AS) and concomitant diabetes with radiographic features. Sacroiliac symmetry showed no significant associations, whilst syndesmophyte symmetry was associated with increasing age and HLA-B27 positivity. Typical marginal syndesmophytes were associated with age, HLA-B27 status and disease duration: in the cervical spine significant associations with age, sex and HLA-B27 status; in the lumbar spine with age, HLA-B27 and diagnosis. Atypical chunky syndesmophytes were associated only with increasing age and male sex.

Abstract OP0128 – Table 1

	Psoriatic arthritis		Ankylosing spondylitis		Statistic	p (2 way)
	B27- (n=184)	B27+ (n=60)	B27- (n=50)	B27+ (n=148)		
Age, y mean (sd)	55.3 (13.4)	50.5 (13.7)	48.5 (14.1)	48.5 (14.3)	7.7*	0.0001
Males n (%)	106 (58)	38 (63)	32 (64)	114 (77)	13.9+	0.003
Duration of disease, y mean (sd)	11.8 (10.3)	14.2 (11.0)	8.4 (9.5)	13.3 (12.3)	3.3*	0.02
Symmetry at SIJ n (%)	165 (90)	54 (90)	43 (86)	132 (89)	7.1+	Ns
Symmetry in spine n/N (%)	36/62 (58)	21/29 (72)	14/24 (58)	67/84 (80)	9.5+	0.02
Marginal syndesmophytes, n (%)	94 (51)	39 (65)	25 (50)	89 (60)	5.5+	Ns
Atypical syndesmophytes, n (%)	41 (22)	17 (28)	12 (24)	29 (20)	1.9+	Ns

\* F statistic from one way analysis of variance. +chi squared statistic

**Conclusions:** This analysis suggests less difference in radiographic phenotype between AS and axial PsA than previously thought. HLA-B27 negative PsA patients have less severe disease as measured by mSASSS and PASRI with less typical marginal syndesmophytes and symmetry, whilst HLA-B27 positive PsA appears similar to AS.

#### OP0129 DRUG SURVIVAL ON ANTI-TNF-ALPHA IN PSORIATIC ARTHRITIS PATIENTS WITH AXIAL INVOLVEMENT AND ANALYSIS OF PREDICTORS

S. Lopriore, F. Cacciapaglia, S. Perniola, M.G. Anelli, G. Lopalco, C. Scioscia, L. Coladonato, G. Laselva, G. Lapadula, F. Iannone. *Department of Emergency and Organ Transplantation (DETO), University of Bari, Rheumatology Unit, Bari, Italy*

**Background:** A few studies have focused on the clinical outcomes in predominant axial Psoriatic Arthritis (PsA) patients treated with anti-TNF- $\alpha$  agents<sup>1-3</sup> in real-life settings.

**Objectives:** Primary endpoint: to evaluate drug survival on anti-TNF- $\alpha$  agents in PsA patients with axial involvement or axial and either polyarticular or oligoarticular peripheral arthritis. Secondary endpoints: to evaluate the presence of any predictor of discontinuation of anti-TNF in PsA patients with axial involvement and to investigate whether peripheral arthritis may impact the discontinuation for ineffectiveness in patients with axial disease.

**Methods:** 415 biologic therapy-naive PsA patients (CASPAR criteria) starting a first TNF-inhibitor from January 2010 to December 2016 were screened. Among these, 87 had axial involvement (ASAS criteria) with imaging arm (X-ray or MRI) and were enrolled: 40 with axial and polyarticular peripheral PsA (Axe +Poly PsA), 38 with axial and oligoarticular peripheral PsA (Axe +Oligo PsA) and 9 with only axial disease (Ax-PsA). At baseline and at last available visit or drug discontinuation, we collected age, gender, disease duration, BMI, HLA-B27, nail psoriasis and/or dactylitis, TJC, SJC, ESR, CRP, enthesitis, LEI, DAPSA, BASDAI, ASDAS-CRP, PASI, HAQ, intake of glucocorticoids and DMARDs, anti-TNF therapy discontinuation and reasons of discontinuation. Drug

survival was evaluated by Kaplan-Meier life table method, comparison of survival curves with Log-rank test and baseline predictors of drug discontinuation with Cox regression analysis.

**Results:** At baseline, Axe +Poly PsA patients had significantly higher peripheral (DAPSA) and axial disease activity (BASDAI, ASDAS-CRP). Stratifying patients by subset of disease, the median of treatment was 51 months (95% IQR 24.87–77.13) for Ax-PsA group, 50 months (95% IQR 28.39–71.61) for Axe +Oligo PsA group, 30 months (95% IQR 11.84–48.15) for Axe +Poly PsA group (figure 1). Axe +Oligo PsA patients had significantly higher persistence on TNFi rather than Axe +Poly PsA patients (log rank test, p=0.03). Axe +Poly PsA patients had higher risk of stopping TNFi (Cox regression, HR 3.75) and significantly higher percentage of discontinuation for ineffectiveness rather than for an adverse event ( $\chi^2$  test, p=0.0009). At last observation, Axe +Poly PsA patients had higher DAPSA but no difference in axial disease activity (t-STUDENT test, Mann-Whitney test).

Abstract OP0129 – Figure 1. Drug survival on TNF-inhibitor in Ax-PsA, Axe+Oligo-PsA and Axe+Poly-PsA patients (Kaplan-Meier life table method, log rank test)

**Conclusions:** PsA subsets seems to have different features, behaviour, clinical response and drug survival on TNF-inhibitors. Axe +Poly PsA subset seems to be more aggressive and difficult to treat. Anti-TNF- $\alpha$  blockers may perform differently in PsA: a more accurate analysis of the clinical disease subsets may improve our knowledge and better management of PsA in daily practice.

#### OP0130 RISK OF CANCER IN PATIENTS WITH PSORIASIS/ PSORIATIC ARTHRITIS: A POPULATION-BASED STUDY IN THE PROVINCE OF BRITISH COLUMBIA

J.A Avina-Zubieta<sup>1,2</sup>, A. Dominique<sup>3</sup>, T.A. Simon<sup>3</sup>, H. Tavakoli<sup>1</sup>. <sup>1</sup> *Arthritis Research Canada, Richmond*; <sup>2</sup> *Faculty of Medicine, University of British Columbia, Vancouver, Canada*; <sup>3</sup> *Bristol-Myers Squibb, Princeton, USA*

**Background:** Psoriasis (PsO) is a relapsing chronic autoimmune disease of the skin. Up to one-third of patients (pts) also develop inflammatory arthritis, known as psoriatic arthritis (PsA). PsO/PsA, like other forms of chronic inflammatory arthritis, are often associated with complications such as cardiovascular disease and infections. However, data on the risk of cancer in pts with PsO/PsA at population level are limited.

**Objectives:** To assess the risk of cancer in pts with newly diagnosed PsO/PsA at the population level.

**Methods:** We created a population-based matched retrospective cohort of PsO/PsA pts diagnosed between 1 January 1997 and 31 December 2012 using administrative health data from British Columbia, Canada. We identified all incident cases of PsO/PsA and an equal number of controls matched on sex, age and calendar year. PsO/PsA cases met  $\geq 1$  of the following: 1 diagnostic code for PsO/PsA by a rheumatologist/dermatologist;  $\geq 2$  diagnostic codes for PsO/PsA,  $\geq 2$  months apart in a 2 year period by a non-rheumatologist/dermatologist; or  $\geq 1$  hospitalisation with diagnostic code for PsO/PsA. We evaluated incident cancers during follow-up from the Cancer Registry in both cohorts. Adjusted risk of cancers

was estimated using a generalised estimating equation extension of multivariate Poisson regression models.

**Results:** We identified 81 568 incident cases of PsO/PsA (mean age 48.5 years [SD 17.8], 51.5% female). Individuals with PsO/PsA were at significantly higher risk of being diagnosed with 8/41 types of cancer examined, including eye and orbit (4 fold), female genital (3 fold), non-melanoma skin (2 fold), prostate (males; 1.1 fold) (table 1). Incidence of rectal and colon cancer was lower among PsO/PsA pts relative to the non-PsO/PsA cohort (table 1).

**Abstract OP0130 – Table 1.** Incidence Rate (IR) and Incidence Rate Ratio (IRR) of Cancer Among PsO/PsA Pts Compared With the General Population

Outcome	PsO/ PsA events	Non- PsO/ PsA events	PsO/PsA follow-up (PY)	Non-PsO/ PsA follow-up (PY)	PsO/ PsA IR (per 100,000 PY)	Non- PsO/ PsA IR (per 100,000 PY)	IRR (95% CI)
Eye and orbit	13	<5	623,843.5	<5	2.08	-	4.25 (1.21–14.91)
Female genital other than cervix uteri, corpus uteri and ovary	55	21	623,625.8	611,542.1	8.81	3.43	2.57 (1.55–4.25)
Other urinary	31	16	623,818.6	611,585.4	4.97	2.62	1.90 (1.04–3.47)
Non-melanoma skin	401	217	621,233.8	610,223.9	64.54	35.56	1.82 (1.54–2.14)
Lung	705	589	622,877.2	610,834.8	113.18	96.42	1.17 (1.05–1.31)

PY=patient years

**Conclusions:** This general population-based study demonstrates that pts with PsO/PsA have an increased risk of several types of cancer, and a decreased risk of rectal and colon cancer. This association highlights the need to further explore potential risk factors and pathways that contribute to these complications.

**Acknowledgements:** This study received an unrestricted grant from Bristol-Myers Squibb for an investigator-initiated project in PsO/PsA.

#### OP0131 INNATE LYMPHOID CELLS CORRELATE WITH DISEASE ACTIVITY AND BONE REMODELLING IN PSORIATIC ARTHRITIS

A. Soare<sup>1</sup>, S. Weber<sup>1</sup>, L. Maul<sup>1</sup>, S. Rauber<sup>1</sup>, A.M. Gheorghiu<sup>2</sup>, I. Houssni<sup>1</sup>, A. Kleyer<sup>1</sup>, M. Luber<sup>1</sup>, J. Rech<sup>1</sup>, G. Schett<sup>1</sup>, J. Distler<sup>1</sup>, A. Rammig<sup>1</sup>. <sup>1</sup>Department of Internal Medicine 3, Rheumatology and Immunology, Friedrich-Alexander-University (FAU) Erlangen-Nürnberg, Erlangen, Germany; <sup>2</sup>Dr. I. Cantacuzino Clinical Hospital, Carol Davila University of Medicine and Pharmacy, Bucharest, Romania

**Background:** Evaluation of actual immunopathology in psoriatic arthritis (PsA) is challenging. Current composite measures approved for PsA are very useful tools to assess disease activity in clinical routine. Nonetheless, because of subjective patients' estimations that widely affect the scoring, in particular the distinction between remission and low disease activity is a common question of debate.

Innate lymphoid cells (ILC) subsets may couple different aspects of PsA disease activity.

**Objectives:** To address whether PsA is associated with an altered composition of innate lymphoid cells and whether such changes are associated with disease activity and structural damage in PsA.

**Methods:** 124 patients satisfying the Classification Criteria for Psoriatic Arthritis (CASPAR) and 26 healthy volunteers were enrolled in the study. Information regarding clinical features, laboratory parameters were collected and disease activity score 28 (DAS28), disease activity in psoriatic arthritis (DAPSA), minimal disease activity score (MDA) were calculated. MRI and high-resolution peripheral CT were taken and PsA MRI score (PsAMRIS) was assessed. Flow cytometric analysis was performed and IFNg-producing ILC1s, IL-4/IL-5-producing ILC2s and IL-17/IL-22-producing ILC3s were identified among ILCs. Multivariate linear regression and Receiver-Operating Characteristic (ROC) Curve analysis was performed using the IBM SPSS Statistics software.

**Results:** Total number of circulating ILCs were increased in PsA patients compared to healthy controls (p<0,001). Linear regression analyses of the relationship between disease activity and circulating ILC counts showed that ILC2 negatively and ILC1 and ILC3 positively correlated with DAPSA score. The strongest correlation was observed when the ratio of ILC2 to ILC3 was analysed (R=-0.5709; p<0.0001). ILC2/3 ratio was also reduced in patients with active psoriatic skin disease, presence of enthesitis or a history of concomitant uveitis. Extend of synovitis or tenosynovitis or presence of bone erosions or osteophytes on MRI was inversely correlated with the ILC2/3 ratio (R=-0.6753; p<0.0001, R=-0.5828; p=0.0011 and p<0.001 respectively). Consistently, presence of erosions and/or osteoproliferation assessed by HR-pQCT was correlated with a significant lower ILC2/3 ratio. Furthermore, ROC Curve was used to test the performance of the ILC2/3 ratio as marker in differentiating between remission and disease activity of PsA. Indeed, a cut-off 0.57 exhibited highest sensitivity (92.9%) and a 84.7% specificity in identifying remission.

**Conclusions:** The ILC2/3 ratio correlates with various facets of PsA manifestations and might be a useful tool to evaluate disease activity in PsA patients.

#### OP0132

#### STRUCTURAL AND MICROSTRUCTURAL INTRA-ARTICULAR BONE CHANGES AT THE METACARPAL HEADS IN PATIENTS WITH PSORIATIC ARTHRITIS COMPARED TO CONTROLS: A HR-PQCT STUDY

D. Wu<sup>1</sup>, J.F. Griffith<sup>2</sup>, S.H. Lam<sup>1</sup>, P. Wong<sup>1</sup>, J. Yue<sup>1</sup>, L. Shi<sup>3</sup>, E.K. Li<sup>1</sup>, I.T. Cheng<sup>1</sup>, T.K. Li<sup>1</sup>, T.Y. Zhu<sup>4</sup>, V.W. Hung<sup>4</sup>, L. Qin<sup>4</sup>, L.-S. Tam<sup>1</sup>. <sup>1</sup>Department of Medicine and Therapeutics; <sup>2</sup>Department of Imaging and Interventional Radiology; <sup>3</sup>Research Center for Medical Image Computing, Department of Imaging and Interventional Radiology; <sup>4</sup>Bone Quality and Health Center of the Department of Orthopedics and Traumatology, The Prince of Wales Hospital, The Chinese University of Hong Kong, Hong Kong, China

**Background:** Located inside the joint capsule,<sup>1</sup> the entire metacarpal head (MCH) is directly exposed to intra-articular inflammatory milieu in patients with psoriatic arthritis (PsA). We hypothesise that bone loss and new bone formation in the MCH will be more prominent in PsA compared to healthy controls.

**Objectives:** To investigate structural (bone erosion and enthesiophyte) and microstructural intra-articular bone changes in patients with PsA at the second and third MCH (MCH 2 and 3) compared with controls.

**Methods:** 139 subjects (77PsA, 62 control) underwent HR CT scanning at the MCH 2 and 3 and distal radius. 15 patients with joint destruction<sup>2</sup> were excluded from further analysis. An integrative CART-EBEE approach was developed to investigate the structural and microstructural bone changes. CART method (AB) was used to calculate volume of bone erosion and enthesiophyte [Crop of metacarpal bone(a,b); Automated segmentation of periosteal surface (c,e);Restoration of the missing cortical boundary based on anatomic curve(d,f);Three-dimensional calculation of volume(g)]; EBEE method was used to calculate volumetric bone mineral density (vBMD) and microstructure before and after exclusion of Bone Erosion (C) and Enthesiophyte (D).

**Results:** 62 patients with PsA and controls were comparable in age, gender and body mass index. PsA patients had a significantly increased number (mean  $\pm$ SD/patient 2.4 $\pm$ 1.4 vs 1.3 $\pm$ 1.1, p<0.001) and total volume of enthesiophytes (8.75  $\pm$ 6.92 vs 4.36 $\pm$ 4.90 mm<sup>3</sup>, p<0.001); but a similar number of bone erosion (mean  $\pm$ SD/patient 2.9 $\pm$ 1.2 vs 2.7 $\pm$ 1.4, p=0.408) and a trend suggestive of an increase in total volume of bone erosion (11.88 $\pm$ 7.82 vs 9.64 $\pm$ 5.96 mm<sup>3</sup>, p=0.076) per person compared with control. Depth of each individual bone erosion was greater in PsA than control; while no differences in the maximal height of each individual enthesiophyte was found between PsA and control. With regards to the microstructure, PsA showed a significantly decreased total vBMD, cortical vBMD (Ct.vBMD) and Ct. thickness at the distal radius; while a preferential bone loss at the trabecular (Tb.) compartment [Tb. vBMD; trabecular bone volume

fraction [BV/TV] and Tb. thickness] was observed at the MCH compared to control. After excluding of enthesiophyte, a further deterioration in the Ct. compartment (vBMD, perimeter, thickness) in PsA patients was observed. Regression model in PsA and controls indicated that PsA was independently associated with an increased total volume of enthesiophytes per person. Regression model in PsA showed that CRP, older age and higher BMI were independently associated with an increase in the total volume of bone erosion. On the other hand, older age was independently associated with an increase in total volume of enthesiophyte per person.

**Conclusions:** Intra-articular trabecular bone loss and enthesal new bone formation was more prevalent in the MCH of patients with PsA.

## RA: such a pain, and beyond

OP0133

### UNACCEPTABLE, REFRACTORY PAIN DESPITE INFLAMMATION CONTROL IN EARLY RHEUMATOID ARTHRITIS AND ITS RELATION TO TREATMENT STRATEGY: RESULTS FROM THE RANDOMISED CONTROLLED SWEFOT TRIAL

T. Olofsson<sup>1</sup>, J.K. Wallman<sup>1</sup>, A. Jöud<sup>2</sup>, M.E. Schelin<sup>3</sup>, S. Ernestam<sup>4,5</sup>, R. van Vollenhoven<sup>4</sup>, S. Saevarsdottir<sup>4</sup>, J. Lampa<sup>4</sup>. <sup>1</sup>Rheumatology, Department of Clinical Sciences Lund; <sup>2</sup>Occupational and Environmental Medicine; <sup>3</sup>Oncology, Department of Clinical Sciences Lund, Lund University, Lund; <sup>4</sup>Rheumatology Unit, Department of Medicine, Karolinska Institute; <sup>5</sup>Academic Specialist Centre, Stockholm Health Services, Stockholm, Sweden

**Background:** Pain is a major concern of RA patients and earlier work has defined the level considered not acceptable by patients (unacceptable pain according to the patient acceptable symptom state (PASS)<sup>1</sup>). While a lot of focus has been put on the occurrence and management of inflammatory pain, less is reported on refractory pain despite inflammation control, and its pattern in early RA.

**Objectives:** The aim of this study was to investigate the prevalence of unacceptable pain despite inflammation control during the first 2 years after treatment start in new-onset RA patient and to compare the impact of biological vs conventional combination therapy on the occurrence of this pain status.

**Methods:** The SWEFOT (SWedish FarmacoTherapy) trial was designed as a randomised, active-controlled, open-label study, enrolling early (<1 year) RA patients Oct 2002 to Dec 2005 After a 3 month run-in period on methotrexate (MTX), patients reaching DAS28  $\leq 3.2$  continued monotherapy (n=147), while the others were randomised to addition of infliximab (IFX; n=128) or sulfasalazine +hydroxychloroquine (SSZ+HCQ; n=130). Results for disease activity and radiographic data were published earlier. Here, we used a measure of unacceptable pain despite inflammation control as outcome (combining VAS pain  $>40$  mm<sup>100</sup> with CRP  $<10$  mg/L<sup>2</sup> and  $\leq 1$  swollen joint (of 28)). When comparing the randomised arms, last observation carried forward in case of protocol breach was used, while for analyses of the whole material we used all data irrespective of protocol breach. Differences in prevalence were analysed by Mc Nemar's test, while differences between patients randomised to IFX vs SSZ+HCQ as well as between EULAR response groups were estimated by logistic regression, adjusting for age, sex and VAS pain at baseline.

**Results:** In the whole material (including all 3 groups, n=405), the frequency of unacceptable pain despite inflammation control increased gradually from inclusion, reached 12% at 1 year (difference from inclusion;  $p<0.001$ ), and then remained stable until the 2 year follow-up; at that point accounting for more than half of all unacceptable pain (figure 1). The frequency was unrelated to EULAR response from inclusion to the 2 year follow-up (11.4% of good responders vs 10.4% of non-responders,  $p=0.95$ ). Furthermore, no difference in unacceptable pain despite inflammation control at 2 years was found between patients randomised to IFX vs SSZ+HCQ, (adjusted odds ratio 1.1 [95% CI: 0.5 to 2.4];  $p=0.75$ ).

**Conclusions:** After 2 years of early active treatment in new-onset RA patient, a substantial portion had unacceptable pain despite inflammation control. This pain status was as common in EULAR good responders as in non-responders and no difference was found between patients randomised to IFX compared to SSZ+HCQ. These data are in line with insufficient effects of current treatment strategies to prevent development of inflammation-independent pain in a subgroup of patients, strongly warranting alternative treatment strategies in these patients.

OP0134

### MULTIFACTORIAL EXPLANATORY MODEL OF FATIGUE IN PATIENTS WITH RHEUMATOID ARTHRITIS: A PATH ANALYSIS

C.R. Silva<sup>1</sup>, C. Duarte<sup>1,2</sup>, R. Ferreira<sup>1,2,3</sup>, E. Santos<sup>2,3,4</sup>, J.A. da Silva<sup>2,5</sup>. <sup>1</sup>Faculty of Medicine, University of Coimbra, Portugal; <sup>2</sup>Rheumatology Department, Centro Hospitalar e Universitário de Coimbra; <sup>3</sup>Health Sciences Research Unit: Nursing (UICISA-E), Escola Superior de Enfermagem de Coimbra, Coimbra; <sup>4</sup>Instituto de Ciências Biomédicas Abel Salazar, Porto; <sup>5</sup>Faculty of Medicine, University of Coimbra, Coimbra, Portugal

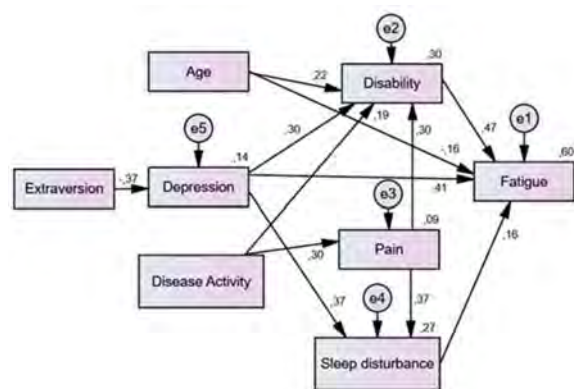

**Background:** Fatigue is one of the most prevalent and disabling symptoms among patients with Rheumatoid Arthritis (RA). However, it is also one of the most

neglected by health professionals. Much of this problem is due to health professionals' poor understanding of the etiology of fatigue and, also, the absence of effective strategies to prevent or treat it.

**Objectives:** This study aimed at developing a multidimensional explanatory model of fatigue in patients with RA as means to foster better understanding and care of this symptom.

**Methods:** This was an ancillary analysis of an observational, cross-sectional, single centre study. Patients completed a questionnaire that included demographic data and measures of sleep (0–10 Numeric Rating Scale (NRS)), pain (0–10 NRS), disability (HAQ), anxiety and depression (HADS), and personality (TIPI). Fatigue was assessed by the Functional Assessment of Chronic Illness Therapy – Fatigue (FACIT-F). Disease activity (DAS28-CRP3v) and haemoglobin levels were also assessed. Path analysis was performed to test and improve a hypothesised model for fatigue.

**Results:** In total, this analysis included 142 patients (83.1% females, mean (SD) age of 61.1 (11.7) years). The final path analysis model (figure 1) presented acceptable fit (Goodness of Fit Index, GFI=0.92; Comparative Fit Index, CFI=0.89; Root Mean Square Error of Approximation, RMSEA=0.10), and explained 60.0% of the variance of fatigue. Depression and disability had the greater direct influences upon fatigue ( $\beta=0.412$ ;  $p<0.001$  and  $\beta=0.465$ ;  $p<0.001$ , respectively). Sleep disturbance also influenced directly fatigue but at a lower intensity ( $\beta=0.157$ ;  $p=0.007$ ). Disease activity and pain had only an indirect influence on fatigue through disability and sleep disturbance ( $\beta=0.149$ ,  $p=0.005$ , and  $\beta=0.199$ ,  $p=0.005$ , respectively). Age was negatively associated with fatigue ( $\beta=-0.162$ ,  $p=0.003$ ). Extroverted patients presented less depressive symptoms and, consecutively, less fatigue ( $\beta=-0.224$ ,  $p=0.002$ ).

Abstract OP0134 – Figure 1 Final path analysis model with standardised direct coefficients.

Goodness of fit index=0.92; Comparative fit index=0.89; Root mean square error of approximation=0.10.

All coefficients in the model presented  $p<0.05$ .

**Conclusions:** Depression, disability and sleep disturbance appear to be the main factors explaining fatigue in patients with RA. Disease activity and pain seem to play only a secondary role. These findings foster a shift in the paradigm of patient care towards a more holistic management of fatigue, integrating adjunctive therapies in association with measures driven solely towards abrogation of the inflammatory process.

**OP0135 FOETAL-NEONATAL AND MATERNAL OUTCOMES IN WOMEN WITH RHEUMATOID ARTHRITIS**

Y.-C. Tsa<sup>1</sup>, S.-F. Luo<sup>1</sup>, M.-J. Chiou<sup>1</sup>, C.-F. Kuo<sup>1,2</sup>. <sup>1</sup>Rheumatology, Allergy and Immunology, Chang-Gung Memorial Hospital, Taoyuan, Taiwan, Province of China; <sup>2</sup>Rheumatology, Orthopedics and Dermatology, School of Medicine, University of Nottingham, Nottingham, UK

**Background:** Pregnancy involves adaptation to the immune system to prevent rejection of the foetus and this might have consequences on the activity of the rheumatoid arthritis (RA). Equally the aberrant immunity and disease activity of the RA might influence the pregnancy and foetal-neonatal outcomes.

**Objectives:** This study was designed to estimate the risk of adverse foetal-neonatal and maternal outcomes in pregnancies in women with RA.

**Methods:** We identified 2,350,339 singleton pregnancies using the Taiwan National Health Insurance database and birth registry between 2001 and 2012. Maternal history of RA, SLE, Sjögren's syndrome, systemic sclerosis, vasculitis and poly/dermatomyositis were ascertained; among them, 845 individuals had RA. Odds ratios (ORs) and 95% confidence intervals (CIs) for pregnancy outcomes were estimated using an adjusted generalised estimating equation model.

**Results:** Pregnancies in women with RA were associated with an OR (95% CI) of 1.65 (1.37–1.98) for low birthweight (<2500 g) (n=114), 1.41 (1.128–1.68) for prematurity (<37 week) (n=124), and 1.62 (1.36–1.92) for small for gestational age (n=132). Maternal outcomes in pregnancies of women with RA were just associated with an OR (95% CI) of 1.34 (1.06–1.68) for preterm labour (n=74). Women with RA did not have an increased risk of post-partum death, cardiovascular complications, surgical complications, and the other systemic organ dysfunction.

Abstract OP0135 – Table 1

Foetal-neonatal outcomes in pregnancies of women with RA, SLE, Sjögren's syndrome, systemic sclerosis, vasculitis and poly/dermatomyositis (different AIRDs).

	RA	SLE	Sjögren's syndrome	Systemic sclerosis	Vasculitis	Poly/dermatomyositis
Stillbirth	1.91 (0.99-2.98)	3.43 (2.71-4.33)*	1.29 (0.56-3.11)	1.58 (0.22-11.1)	N/A	1.21 (0.17-8.57)

Decreased fetal movements	0.59 (0.31-1.14)	0.46 (0.29-1.24)	0.41 (0.13-1.27)	0.92 (0.13-6.21)	0.98 (0.14-6.83)	0.59 (0.08-4.18)
Obstetrical abnormalities	1.51 (1.06-2.17)*	1.34 (1.06-1.70)*	2.41 (1.72-3.36)*	1.42 (0.35-5.87)	N/A	2.64 (1.19-6.33)*

\*Adjusted for age, sex, Charlson comorbidity index, urbanization, income, occupation, birth year, maternal nationality.  
 Abbreviation: AIRDs, autoimmune rheumatic diseases; RA, rheumatoid arthritis; N/A, not applicable; SLE, systemic lupus erythematosus.  
 \*p<0.05

**Conclusions:** Pregnancies in women with RA were at a higher risk for multiple adverse foetal-neonatal outcomes, especially low birthweight (<2500 g), prematurity (<37 week), and small for gestational age. Maternal outcomes showed that just preterm labour was more common in women with RA. Women with RA should not be discouraged to seek pregnancy based on the disease alone.

OP0136

### SIBLINGS OF PATIENTS WITH RHEUMATOID ARTHRITIS ARE AT INCREASED RISK OF ACUTE CORONARY SYNDROME

H. Westerlind<sup>1</sup>, M. Holmqvist<sup>1</sup>, L. Ljung<sup>1,2</sup>, T. Frisell<sup>1</sup>, J. Askling<sup>1</sup>. <sup>1</sup>Department of Medicine, Clinical Epidemiology Unit, Karolinska Institutet, Stockholm; <sup>2</sup>Department of Public Health and Clinical Medicine/Rheumatology, Umeå University, Umeå, Sweden

**Background:** Patients with rheumatoid arthritis (RA) are at increased risk of cardiovascular disease such as acute coronary syndromes (ACS), which cannot entirely be explained by traditional cardiovascular risk factors. Studies have shown an association between RA disease severity and risk of ACS, speaking for a contribution of the RA disease *per se* to the excess ACS risk. In a recent report, however, we demonstrated that despite more efficient control of inflammation in RA during the recent years, the excess risk for ACS among patients with RA compared to the general population remains<sup>1</sup>. This finding suggests that besides effects related to the RA disease *per se*, there may be a shared susceptibility. If the excess risk of ACS in patients with RA were increased due to this, an increased risk of ACS would be observed also in individuals with a similar genetic set-up and background as the patients with RA, such as their siblings.

**Objectives:** To investigate any potential shared susceptibility between RA and ACS by estimating the risk of ACS in full siblings of patients with (vs. without) RA.

**Methods:** We used the Swedish Rheumatology Quality register (SRQ) to identify an early RA cohort diagnosed between 1996–2015, which was linked to the Swedish Multigeneration Register, Patient Register, the Cause of Death register, and the Total Population Register. Through this, we sampled five general population comparator subjects to each patient with RA, matched by birth year and sex, and identified all full siblings to patients with RA and for their comparator subjects born within five years of their index case. The comparators, and all siblings, were required to be alive and living in Sweden at the time of the index patient's RA diagnosis (=start of follow-up). All unique individuals were then followed for ACS (defined as first ever hospitalisation for ACS (ICD10: I21 or I20.0) or MI listed as the cause of death), and censored at death, migration, RA diagnosis (for non-RA subjects) or the end of the study (Dec 31 st 2015). We calculated hazard ratios (HR) using a Cox proportional hazards model, adjusting for age, sex and calendar period of diagnosis. Confidence intervals (CI) were estimated using a robust sandwich estimator.

**Results:** We identified 7492 patients with RA who had 10 671 full siblings, and 35 120 population comparator subjects with 47 137 full siblings. The HR for ACS was 1.44 (95% CI: 1.25 to 1.66) and 1.23 (95% CI: 1.09 to 1.40) for patients with RA and their siblings, respectively, compared to the comparator subjects. A direct comparison between the RA patients and their RA-free siblings confirmed the familial association between RA and ACS, HR 1.19 (95% CI: 1.02 to 1.38).

**Conclusions:** The increased risk of ACS in siblings of patients with RA a) provide evidence of shared susceptibility between RA and ACS, the nature of which needs to be further investigated, and b) suggests that to bring down the CV risk in RA to that in the general population, cardiopreventive measures must go beyond optimised RA disease control.

OP0137

### ASSESSING THE RISK OF RA PATIENTS FOR COMORBID CONDITIONS THROUGH A STRUCTURED NURSE-LED INTERVIEW – THE ERIKO STUDY

K. Krueger<sup>1</sup>, R. Eder<sup>2</sup>, C. Mueller<sup>3</sup>, K. Rietzler<sup>3</sup>. <sup>1</sup>Rheumatologisches Praxiszentrum St. Bonifatius, München; <sup>2</sup>Rheumapraxis am Spitalort, Deggendorf; <sup>3</sup>Abbvie Deutschland GmbH and Co. KG, Wiesbaden, Germany

**Background:** Assessment of comorbidities in rheumatoid arthritis (RA) has proven to be difficult for the rheumatologist due to lack of time leading to considerable deficits. Nurse-led programs on RA comorbidity management might solve this problem and have been reported to be beneficial.<sup>1</sup>

**Methods:** The cluster randomised multicentre study ERIKO longitudinally assessed the general health status of patients with RA in Germany applying a

nurse-led scoring algorithm for individual risk profiles (ERIKO-Score). The ERIKO-Score is a composite score evaluating the following risk factors: cardiovascular (CV) risk (ESC-guideline), infection risk (RABBIT risk calculator), vaccination status (guideline), fracture risk (FRAX), tooth status (PSI), depression (PHQ-9) and health-related quality of life (hrQoL, RAID). The outcome was translated into a three-level ordinal score defined by the categories low, intermediate or high risk with 0, 1 and 2 points, respectively. Afterwards the treating rheumatologist discussed the outcomes with the patient. The primary endpoint, the change in ERIKO-Score between baseline and after one year of follow-up as a consequence of the structured assessment (active arm) was assessed using a mixed model in order to account for a random centre effect. Furthermore, comorbidity management in the active arm versus expert guided assessment following standard of care (SOC, control arm) was evaluated using Fisher's exact test and the Cochran-Armitage trend test.

**Results:** The analysis included 341 patients from 42 rheumatology centres with 210 patients in the active arm (mean disease duration 12.0 years (sd 8.8), mean DAS28 2.6 (sd 1.1)) and 131 patients in the control arm (mean disease duration 9.7 years (sd 7.4), mean DAS28 2.6 (sd 1.2)). After one year of follow-up the structured assessment led to a significant mean decrease in total ERIKO-Score by -0.45 (95% CI ranging from -0.67 to -0.23, p<0.001). This decrease was driven by an improvement in vaccination status, tooth status and depression risk. No difference in comorbidity management was detected between the structured assessment and SOC. At the end of follow-up, the mean ERIKO-Scores for both arms were 4.85 with 95% CIs ranging from 4.59 to 5.11 and 4.47 to 5.24 for the active arm and the control arm, respectively. A significant improvement in risk categorisation after one year of follow-up was observed for vaccination status and depression risk with better outcomes in the active arm as compared to the control arm.

**Conclusions:** A nurse-led comorbidity risk assessment in rheumatology practices resulted in a significant improvement after one year of follow-up. However, improvement was small and there was no benefit compared to expert-opinion based SOC. In clinical routine, applying the ERIKO-Score based on validated tools seems to be feasible. Nurse-led comorbidity assessment seems to be able to reduce existing deficits.

### INVESTIGATION OF BIOPSYCHOSOCIAL ASSESSMENTS IN PATIENTS WITH RHEUMATIC DISEASE

N.B. Karaca<sup>1</sup>, G. Arın<sup>1</sup>, A. Özçadırcı<sup>1</sup>, F.B. Oflaz<sup>1</sup>, S. Apraş Bilgen<sup>2</sup>, E. Ünal<sup>1</sup>. <sup>1</sup>Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences; <sup>2</sup>Department of Internal Medicine-Rheumatology, Hacettepe University Faculty of Medicine, Ankara, Turkey

**Background:** The daily living activities, functions, depression and anxiety of patients with rheumatic diseases can be affected at various levels.<sup>1</sup> This condition explains the biopsychosocial dimension of chronic pain, it also requires the multi-dimensional assessment of the disease.<sup>2</sup>

**Objectives:** The aim of this study was to investigate biopsychosocial assessments of patients with rheumatic diseases.

**Methods:** Patients with rheumatic diseases were included in this prospective study. Demographic informations of patients were recorded. Health Assessment Questionnaire (HAQ) was used to assess daily living activities, the Hospital Anxiety and Depression Scale (HADS) was used to assess the anxiety and depression levels and Cognitive Exercise Therapy Approach Scale (the authors request that the abbreviation stay as 'BETY' as the original in Turkish) was used to assess biopsychosocial status of the patients.<sup>3</sup> Data obtained from 352 patients were analysed by correlation analysis.

**Results:** 352 patients (82.4% women, 17.6% men, mean age: 46.01±11.6 years) were included in this study. Descriptives of the assessment results were given in table 1. There was a statistically significant correlation between the BETY and the

anxiety and depression subscales of HADS, respectively, strong and moderately strong, in the positive direction ( $r=0.618$   $p<0.001$  and  $r=0.572$   $p<0.001$ ). A statistically significant, strong correlation was found between the BETY and HAQ scores in the positive direction ( $r=0.650$   $p<0.001$ ) (table 2). It was observed that patients showed depression characteristics according to HADS cut-off values ( $>7$ ).

**Conclusions:** It was concluded that the cognitive functions of patients with rheumatic diseases were affected by anxiety-depression levels and daily living activities. Therefore, when the patient changes his/her cognition about his/her illness, it is thought that anxiety and depression levels may change positively. It was decided that the cognitive functions of the patients should be emphasised in the assessment of rheumatic patients.

## OP0139 CHARACTERISTICS OF DIFFICULT-TO-TREAT RHEUMATOID ARTHRITIS: RESULTS OF AN INTERNATIONAL SURVEY

N.M.T. Roodenrijs<sup>1</sup>, M.J.H. de Hair<sup>1</sup>, J.W.G. Jacobs<sup>1</sup>, P.M.J. Welsing<sup>1</sup>, D. M. F. M. van der Heijde<sup>2</sup>, J.M. van Laar<sup>1</sup>, G. Nagy<sup>3</sup>, on behalf of the Task Force Difficult-to-Treat RA. <sup>1</sup>Department of Rheumatology and Clinical Immunology, University Medical Center Utrecht, Utrecht; <sup>2</sup>Department of Rheumatology, Leiden University Medical Center, Leiden, Netherlands; <sup>3</sup>Department of Genetics, Cell- and Immunobiology and Department of Rheumatology, 3rd Department of Internal Medicine, Semmelweis University, Budapest, Hungary

**Background:** The EULAR and ACR recommendations regarding rheumatoid arthritis (RA) mainly focus on early phases of the disease and on pharmacological management. Nevertheless, some patients remain symptomatic despite treatment according to the current recommendations, which makes them difficult-to-treat.<sup>1</sup> The estimated prevalence of difficult-to-treat RA is around 5%–20%. A difficult-to-treat RA classification needs to be defined to enable creation of recommendations on its comprehensive management.

**Objectives:** To compose a definition of difficult-to-treat RA and to explore items on its comprehensive management not covered by the current EULAR RA management recommendations.

**Methods:** An online survey was distributed among rheumatologists (in training). It consisted of 9 questions regarding the background of the respondents, aspects to be included in the definition of difficult-to-treat RA and missing items on its comprehensive management in the current EULAR management recommendations. Multiple-choice questions were used to assess the necessity of incorporating the following items into the definition: the disease activity level, e.g. the disease activity score assessing 28 joints (DAS28-ESR), presence of fatigue, number of disease-modifying anti-rheumatic drugs (DMARDs) that failed and the inability to reduce oral glucocorticoid (GC) treatment. Optional open questions were used to identify additional features for the definition of difficult-to-treat RA and to collect items on its comprehensive management not covered by the current EULAR recommendations.

**Results:** 390 rheumatologists (a few of them in training) from 31 countries completed the survey between July and December 2017 (figure 1a). 50% of the respondents would include signs suggestive of active disease or a DAS28-ESR score  $>3.2$  in the definition (figure 1b) and 41% fatigue. The most selected option for the number and category of DMARDs that had to have been used to be included in the definition was 1) Failure to  $\geq 2$  conventional synthetic DMARDs and (Boolean) 2)  $\geq 2$  biological or targeted synthetic DMARDs with different mechanisms of action (figure 1c). 89% suggested including inability to taper oral GCs below 5 or 10 mg. Over 400 responses to open questions were submitted, of which a selection is listed in table 1.

Abstract OP0139 – Table 1 Most frequent answers to the open questions

Please define any additional features and suggested criteria for difficult-to-treat RA	Please mention any clinically relevant situations which are not covered by the current EULAR RA recommendations
Time span with active disease despite treatment	Treatment adherence
Rapidly progressive erosions despite treatment	Persistent chronic pain without objective inflammatory signs
Adverse events to multiple agents	Coping problems
Comorbidities, e.g. fibromyalgia	Extra-articular manifestations

**Abstract OP0139 – Figure 1 a)** origin and number of respondents, b) what should be the definition for not well-controlled disease in the definition of difficult-to-treat RA? c) which and how many anti-rheumatic drugs should at least be tried with insufficient effect (failed) for the definition of difficult-to-treat RA?

**Conclusions:** This survey shows that difficult-to-treat RA is seen as a heterogeneous condition; next to signs of active disease, failure to DMARDs and inability to taper GCs may be included in the definition. The large number of respondents and of responses with regard to items not covered by the current EULAR RA management recommendations underscore the need for recommendations on comprehensive management of difficult-to-treat RA.

**Background:** Treat-to-Target (T2T), achieving a DAS28 score lower than 2.6 (remission, Rem) or below 3.2 (low disease activity, LDA), is the main management strategy recommended by ACR and EULAR. The Smart System of Disease Management (SSDM) is an interactive mobile disease management tool, including the doctors' and patients' application system. The patients can perform self-evaluation, including DAS28, morning stiffness duration (MSD) and HAQ, and enter medical records (including medication and laboratory test results) through the mobile application. The data synchronises to the mobiles of authorised rheumatologists through cloud data base and advices could be delivered.

**Objectives:** The objective of this study is to evaluate the patterns of T2T and related influential factors among RA patients after applying SSDM in real world.

**Methods:** Patients were registered through downloading the SSDM application, then were trained to master SSDM by health professionals in clinics. The first assessment for DAS28 were performed as baseline. The patients were required to perform repeated assessments once a month after leaving clinics.

**Abstract OP0140** – Table 1 Results at baseline and in the final follow up from 2,264 patients with RA

	Baseline Total (2,264)	Achiever of T2T (908, 40%)		Failure of T2T (1,356, 60%)	
		Maintainer of T2T 643 (71%)	Relapser 265 (29%)	Maintaining failure of T2T 835 (62%)	Achiever of T2T 521 (38%)
Age (years): mean ± SD		49.21 ± 13.38	48.82 ± 13.70	50.99 ± 14.02	48.45 ± 13.82
Disease duration (months): mean ± SD		61.35 ± 86.11	63.98 ± 84.11	61.96 ± 72.49	65.67 ± 85.42
Times of patient self-evaluation and data entry: mean ± SD		5.29 ± 1.39	2.81 ± 1.20*	2.95 ± 1.44	5.38 ± 1.45*
DAS28: mean ± SD	Baseline	2.28 ± 0.61	2.48 ± 0.58	4.87 ± 1.16	4.33 ± 0.94
	Final follow up	2.15 ± 0.63	4.14 ± 0.84	4.51 ± 0.96	2.34 ± 0.60
MST median (IQR), mean ± SD	Baseline	0(0-0)	0(0-10)	29.16 ± 34.26	15.26 ± 20.25**
	Final follow up	0(0-2)	18.15 ± 22.14	13.93 ± 22.10***	0(0-5)
HAQ: median (IQR), mean ± SD	Baseline	0(0-0)	0(0-1)	4.68 ± 3.52	1.98 ± 2.15**
	Final follow up	0(0-0)	3.26 ± 2.47	2.18 ± 2.25***	0(0-0)

DAS28: disease activity score in 28 joints; HAQ: health assessment questionnaire; MST: morning stiffness duration.

\*: P<0.01; \*\*: P<0.001; One-way analysis of variance was used for comparisons in different groups.

†††: P<0.001; One-way analysis of variance was used for comparisons in the same group between baseline and final follow up.

**Results:** From Jun 2014 to Jan 2018 2,264 RA patients from 154 hospitals across China were followed up for more than 6 months through SSDM, and the results at baseline and in final follow up were shown in table 1. The rate of T2T achievers were 40% (908/2,264) at baseline, and improved significantly to 51% (1,164/2,264) after 6 month follow up, p<0.05. Among T2T achievers at baseline, 71% (643/908) maintained T2T, 29% (265/908) relapsed. Compared with relapsers, T2T maintainers performed more self-evaluation and data entry (5.29 vs 2.81, p<0.01). Among patients failed to achieve T2T at baseline, 38% (521/1,356) achieved T2T after 6 months. Comparing with 6 month failure (835/1,356), new T2T achievers got shorter MSD (15.26±20.25 vs 29.16±34.26 min, p<0.001), lower HAQ score (1.98±2.15 vs 4.68±3.52, p<0.001) at baseline, performed more times of self-evaluation and data entry (5.38 vs 2.95, p<0.01). However, even in

patients of 6 month failure, the MSD and HAQ score were improved significantly in final follow up comparing with those at baseline (13.93±22.16 vs 29.16±34.26, p<0.001; 2.18±2.25 vs 4.68±3.52, p<0.001, respectively).

**Conclusions:** After proactive disease management via SSDM for more than 6 months, the rate of T2T in RA patients increased significantly. The patients who perform more self-evaluations through SSDM had lower probability of relapse and higher T2T maintaining and achievement. SSDM is a valuable tool for long term RA follow-up through empowering patients. Future RCT of improving T2T outcome through intervention of above influential factors with SSDM is warranted.

### ULTRASOUND DIAGNOSTIC AND PREDICTIVE VALUE OF INTERSTITIAL LUNG DISEASE IN SYSTEMIC SCLEROSIS. DIAGNOSTIC AND PREDICTIVE VALUE OF ULTRASOUND IN THE ASSESSMENT OF INTERSTITIAL LUNG DISEASE

J. Gutiérrez<sup>1</sup>, M. Gutierrez<sup>1</sup>, K. Almaguer<sup>1</sup>, F. Gonzalez<sup>2</sup>, K. Camargo<sup>2</sup>, C. Soto<sup>1</sup>, A. Bernal-Gonzalez<sup>1</sup>, C. Bertolazzi<sup>1</sup>, D. Clavijo-Cornejo<sup>2</sup>, E. Cruz-Arenas<sup>3</sup>, C. Pineda<sup>2</sup>, M. Gutierrez<sup>2</sup>. <sup>1</sup>Division of Musculoskeletal and Rheumatic Disease; <sup>2</sup>Division of Musculoskeletal and Rheumatic Diseases; <sup>3</sup>Epidemiology Unit, Instituto Nacional de Rehabilitación, Mexico, Mexico

**Background:** Interstitial lung disease (ILD) is a common complication of Systemic Sclerosis (SSc) and frequently may be cause of death of patients. High resolution computed tomography (HRCT) is the reference imaging tool for the assessment of ILD; however, its use may be limited for both ionising radiation and costs. In this way, pulmonary ultrasound (US) is revealing interesting potential in the assessment of ILD.

**Objectives:** To determine the validity of pulmonary US in detecting subclinical ILD in SSc and to determine its predictive value for detecting disease progression.

**Methods:** We included 133 SSc patients ≥ 18 years-old without respiratory symptoms. Individuals with previous diagnosis of ILD or other pulmonary diseases were excluded. A rheumatologist performed the Borg scale dyspnea index, Rodnan skin score (RSS) and lung auscultation to confirm the subclinical respiratory status. Chest X-ray and respiratory function tests (RFT) were performed the same day in all patients. US was performed by a rheumatologist expert who was blinded to clinical assessment. To determine the concurrent validity HRCT was performed. Finally, serologic tests (anti-centromere, anti-Scl70) were obtained. HRCT findings were scored according to Warrick score, whereas US findings were classified according the previously proposed semiquantitative scale (0=normal, ≤5 B-lines; 1=slight, ≥6 and ≤15 B-lines; 2=moderate, ≤16 and ≥30 B-lines; 3=severe, ≥30 B-lines). In order to evaluate the inter-observer reliability, 50% of patients were assessed by 2 rheumatologists with different experience in US; both blinded to clinical data. A healthy control group matched for age and gender was included.

A follow-up including US, RFT and Borg scale was done every 3 months until 12 months.

**Results:** A total of 54 of 133 patients (40.6%) showed US signs of ILD in contrast to healthy controls (4.8%) (p=0.0001). The clinical and laboratory variables associated with ILD were: anti-centromere antibodies (p=0.005), Borg scale (p=0.004) and RSS (p=0.004). A positive correlation was demonstrated between the US and HRCT findings (p=0.001), confirmed also with the Chi square test (p=0.006). No association was shown with gender, age, disease duration, chest X-ray or RFT. Sensitivity and specificity of US in detecting ILD was 91.2% and 88.6% respectively. A Moderate inter-observer reliability of US findings was observed (kappa 0.50).

In follow-up, a total of 30 patients (22.6%) that demonstrated ILD during first evaluation, showed US worsening in their ILD status. Interestingly, 9 of those 30 patients (30%) became symptomatic by the Borg scale. The elapsed time in which progression of ILD or clinical conditions was documented was between 6 and 9 months of follow-up.

**Conclusions:** US showed a high prevalence of subclinical ILD in SSc patients. It demonstrated to be a valid, reliable and feasible tool to detect ILD in SSc and to follow-up its evolution. On the basis of our results we believe that US can be implemented as a screening tool for diagnosis of subclinical ILD in SSc.

**Background:** Few small-sized observational studies have suggested that rituximab might be a promising treatment in systemic sclerosis (SSc)

**Objectives:** To evaluate the outcomes of SSc-patients receiving in routine care Rituximab

**Methods:** Retrospective longitudinal multicenter observational study which included SSc-patients treated with rituximab upon the decision of their physician within the framework of EUSTAR. We interrogated the participating centres and EUSTAR database to determine epidemiological and clinical characteristics, the indication for initiating the treatment, and the following parameters at baseline and at the last visit under treatment: modified Rodnan Skin Score (mRSS), joint, lung and gastrointestinal involvements, treatment, laboratory tests and safety events.

**Results:** 248 patients were included: 70 (28%) men, mean age: 51±13 years, mean disease duration: 7±7 years; 150 (65%) had diffuse cutaneous-SSc, 54% were positive for anti-topoisomerase and 71% had lung fibrosis. Overlap disease was noticed in 62 patients (26%) including 23 with rheumatoid arthritis. The indication for the treatment was lung involvement (56%) followed by articular (42%) and skin involvements (30%). At baseline, 175 patients were treated with steroids and 132 with DMARDs. Mean follow-up was 2.4 (±1.9) years.

In the whole sample, mRSS decreased from 15±11 to 10±8 (p<0.01).

For SSc-patients treated for lung with baseline FVC <70%, FVC improved from 56 ±9% to 59±12%; p=0.02. In patients with articular involvement (n=83), tender joint and swollen joint counts decreased from 9±7 to 4±6 and from 3±5 to 1±3, respectively (p<0.01).

In the whole population, 45 patients could stop steroids and mean dose decreased from 10 mg to 7 mg in the other.

During the follow-up, 78 (31%) patients had side effects including 35 (14%) with severe side effects leading to discontinuation of the treatment in 10%. Six deaths were recorded (1 heart failure, 1 sepsis, 2 respiratory insufficiencies, 2 sudden deaths). 76 patients had infection, requiring hospitalisation in 20 patients.

**Conclusions:** In this study, skin, lung and joint involvement appeared to improve under rituximab. Infections and other severe adverse events were frequently

reported. A comparative study including control patients from EUSTAR centres is ongoing.

<sup>3</sup>Rheumatology Section, Villa San Giuseppe, Anzano del Parco (Como), Italy

**Background:** Adipose-derived stromal/stem cells (ADSCs) are believed to be pluripotent cells with characteristics similar to BMSCs. Preliminary attempts of cell therapy with ADSCs have been carried out with the purpose of inducing ulcer healing in peripheral vascular impairment that can be observed in animal models and human conditions. In a recent pilot open study from our group it has been demonstrated that lipofilling with autologous adipose tissue-derived cell fractions, which are known to contain both ADSCs and a stromal/vascular cell component, was effective in inducing a prompt healing of long lasting digital ulcers (DU) localised in the fingertips of a small number of patients with Systemic Sclerosis (SSc). The DU healing was accompanied by the rapid disappearance of local ischaemic pain and evidence of a partial restoration of capillary bed in the involved digits when assessed by nailfold videocapillaroscopy (NVC).

**Objectives:** A randomised controlled trial (RCT) was performed to confirm preliminary uncontrolled data indicating that regional adipose tissue (AT) grafting (G) is effective in inducing DU healing in patients with SSc.

**Methods:** Patients with SSc, fulfilling the 2013 ACR/EULAR classification criteria and suffering from a DUs lasting for at least 6 weeks prior to enrolment time and showing no tendency to heal, were randomised to be blindly treated with AT-G or a sham procedure (SP). AT-G consisted of injection at the base of the finger with DU of 0.5–1 ml of AT after centrifugation of fat aspirate from abdominal adipose tissue. SP consisted of a false liposuction followed by the injection of 0.5–1 ml of 0.9% saline solution at the base of the affected finger. Weekly iloprost infusion (0.5–2 ng/Kg/min), and calcium-channel blockers (oral nifedipine 20 mg daily) were administered during the entire observation time to all of the patients enrolled in both arms of the study.

The primary end-point was to compare the cumulative prevalence of healed DUs in the two groups within the following 8 weeks. Secondary end points to be assessed were: (i) pain intensity modification (measured by VAS), and (ii) variation of the number of capillaries in the affected digits (recorded by nailfold videocapillaroscopy) in patients receiving AT-G compared to those who underwent SP.

**Results:** AT-G and SP were performed in 25 and 13 patients, respectively. The two groups were comparable for age, gender, disease duration and SSc subtypes.

DU healing was observed in 23/25 and 1/13 patients treated with AT-G and SP, respectively (p<0.0001). The 12 patients who received the unsuccessful SP underwent a rescue AT-G. Also in all of them DU healing was observed after 8 weeks of observation. It was noticeable that only in the patients treated with AT-G either a significant reduction of pain intensity or an increase of capillary numbers in the affected finger were recorded after both 4 and 8 weeks (p<0.0001 in all the comparisons).

**Conclusions:** This RCT strongly confirm previous preliminary and uncontrolled data indicating that AT-G may be a successful option for inducing improvement and healing in ischaemic SS-related fingertip DUs that are resistant to more traditional therapeutic approaches.

### INTRAVENOUS VERSUS ORAL CYCLOPHOSPHAMIDE (CYC) FOR THE TREATMENT OF INTERSTITIAL LUNG INVOLVEMENT (ILD) AND SKIN INVOLVEMENT IN SYSTEMIC SCLEROSIS (SSC): SAFETY AND EFFICACY EVALUATION IN A LARGE MULTI-CENTRE SCLERODERMA COHORT

C. Brunj<sup>1</sup>, D.P. Tashkin<sup>2</sup>, V. Steen<sup>3</sup>, Y. Allamore<sup>4</sup>, O. Distler<sup>5</sup>, J. Grotts<sup>6</sup>, M. Matucci-Cerinic<sup>7</sup>, on behalf of EUSTAR centres, D.E. Furst<sup>8</sup>, on behalf of Scleroderma Lung Studies I and II centers on behalf of on behalf of EUSTAR, Scleroderma Lung Study I and II centres. <sup>1</sup>Department of Experimental and Clinical Medicine, Division of Rheumatology, University of Firenze, Firenze, Italy; <sup>2</sup>Department of Medicine, Division of Pulmonary Medicine and Critical Care, David Geffen School of Medicine at UCLA, Los Angeles; <sup>3</sup>Rheumatology Division, Department of Medicine, Georgetown University, Washington, USA; <sup>4</sup>Service de Rhumatologie A, Hôpital Cochin, Université Paris Descartes, Sorbonne Paris Cité, Paris, France; <sup>5</sup>Department of rheumatology, University Hospital Zurich, Zurich, Switzerland; <sup>6</sup>Department of Medicine Statistics Core, University of California at Los Angeles, Los Angeles, USA; <sup>7</sup>of Experimental and Clinical Medicine, Division of Rheumatology, University of Firenze, Firenze, Italy; <sup>8</sup>Department of Medicine, Division of Rheumatology, University of California Los Angeles, Los Angeles, USA

**Background:** In the last decade, oral CYC has shown modest but significant effect on SSc-ILD and skin thickness in two large randomised controlled trials, with superiority to placebo and similar efficacy to mycophenolate. However, many centres give priority to monthly IV CYC for expected milder toxicity.

**Objectives:** To compare efficacy and safety of oral versus iv CYC for treating ILD and/or skin involvement in SSc.

**Methods:** SSc patients treated with oral or iv CYC for at least 6 months were followed for 1 year from the last administration. Data were obtained from the EUSTAR database and the Scleroderma Lung Studies I and II regarding safety [both serious (SAEs) and non-serious adverse events (AEs)] and efficacy (%FVC, %DLCO, mRSS) at end of treatment and after one-year follow-up were analysed [mean ±SD or median(IQR) as appropriate].

**Results:** 322 patients were eligible: 149 patients received oral CYC with median daily dose 106(93–134) mg, treatment duration 365(364–366) days, while 153 patients received IV CYC median monthly dose 1000(700–1200) mg, treatment duration 335(291–374) days. Ethnicity, previous DMARD exposure, previous and concomitant steroid exposure and dosage, current/previous smoking exposure, prevalence of digital ulcers and arterial hypertension were different between the two groups (see table 1 for further details).

For efficacy: despite different baseline%FVC and%DLCO, adjusted changes in pulmonary measures from end of treatment (EOT) vs baseline and follow-up visit (FU) vs EOT were, respectively: %FVC [0(–5–5) vs 0(–7–7) and 1(–6–4) vs –2(–7–4), p=NS], %DLCO [–4(–9–3) vs –3(–9–6), 1(–6–5) vs –1(–9–6), p=NS] and mRSS [–3(–5–0) vs –1(–5–0), –1(–4–1) vs 0(–3–1), p=NS]. In a multivariate analysis, no independent variable significantly influenced%FVC change at any visit.%DLCO change was influenced by baseline%DLCO and history of SSc-related cardiomyopathy at EOT assessment and by history of SSc-muscle involvement at FU visit. Baseline mRSS was the only variable having a significant impact on mRSS change.

For safety: in the oral group, there were more leukopenia (WBC <2500 ×10<sup>9</sup>/mm<sup>3</sup> at least once – 21.6% vs 1.2%, p<0.001), haemorrhagic cystitis [5.5% (8 instances) vs 0%, p=0.011] at EOT visit. In contrast, there were more SAEs (9% vs 19%, p=0.025), need for oxygen supplementation (5% vs 14%, p=0.016) and SSc-related cardiomyopathy onset (2% vs 9%, p=0.024) during follow-up in the IV group.

**Abstract OP0144 – Table 1** Baseline significant differences between study population groups.

	Oral CYC (149 pts)	Intravenous CYC (153 pts)	P
Caucasian race, n(%)	104 (69.8)	146 (95.4)	<0.001
Afro-american race, n(%)	23 (15.4)	0 (0)	<0.001
Previous steroid exposure, n(%)	42 (28.4)	70 (46.7)	0.001
Previous DMARD exposure, n(%)	35 (23.5)	62 (41.3)	0.001
Steroid treatment at baseline, n(%)	51 (34.6)	111 (72.5)	<0.001
CYC treatment duration (days), mean	365 (365-366)	343 (194-514)	0.035
CYC daily dose (mg), mean (IQR)	106.6 (93.1-132.3)	33.3 (23.3-40)	0.001
Smoking history, n(%)	21 (14.6)	10 (6.6)	0.035
%FVC at baseline, mean (IQR)	69 (60-75)	83 (68-96)	<0.001
%DLco at baseline, mean (IQR)	51 (40-63)	56 (42-71)	0.022
History/presence of digital ulcers, n(%)	40 (26.8)	64 (42.1)	0.008
History/presence of arterial	40 (26.8)	25 (16.3)	0.035

CYC=cyclophosphamide, DMARD=disease modifying ant rheumatic drug, FVC=forced vital capacity, DLco=lung diffusion of carbon oxide.

**Conclusions:** In this hypothesis generating study, similar efficacy of one year of oral and iv CYC were seen. In contrast, a different safety profile for AE time courses and types of AEs were seen in the two groups. Although significantly higher dosage of steroids at all visits and prevalence of DMARDs use were

present in the IV CYC group (as a post-treatment maintenance), these did not have an impact on either safety or efficacy. Case-control or randomised studies are warranted to extend and confirm our data.

### SCLERODERMA RELATED INTERSTITIAL LUNG DISEASE AND MYCOPHENOLATE : LONG TERM OUTCOMES

R. Janardana<sup>1</sup>, A. Irodi<sup>2</sup>, P.P. Chebbi<sup>3</sup>, L. RV<sup>3</sup>, D. danda<sup>3</sup>, G. Mahasampath<sup>4</sup>. <sup>1</sup>Clinical Immunology and Rheumatology; <sup>2</sup>Radiology; <sup>3</sup>Christian Medical College, Vellore, Vellore, India; <sup>4</sup>Biostatistics, Christian Medical College, Vellore, Vellore, India

**Background:** Interstitial lung disease [ILD] is a leading cause of mortality in scleroderma. <sup>1</sup> Scleroderma lung study-II clearly illustrates the equivalent efficacy and a better side-effect profile of mycophenolate mofetil [MMF] as compared to cyclophosphamide.

**Objectives:** To study the long term outcomes of mycophenolate mofetil in scleroderma related interstitial lung disease (SSc-ILD) in terms of change in forced vital capacity (FVC)

To determine the effect of MMF on longitudinal high resolution computed tomography (HRCT) scores.

**Methods:** All patients of SSc-ILD from 2013 till date who had a baseline FVC and follow up FVC were taken for analysis. All patient received an average dose of 2 g/day of MMF for a median duration of 2 years and were tapered as per the standard protocol. FVC was measured using standard protocols. The FVC change was computed as percentage relative change from baseline FVC value. According to American Thoracic society recommendations, improvement is defined as an increase in FVC ≥10%, stabilisation by change in FVC <10% and worsening by a reduction in FVC ≥10%.

**Results:** We had 88 patients with a baseline and followup FVC data. Of these 66 patients had a 1 year follow up; 46 patients had a 2 year followup and 29 patients had a 3 year followup data. The absolute median (IQR) increase in the FVC value at the end of 1 year, 2 years, 3 years were 4.15 (-2.3 to 10.5), 2.85 (-3.4 to 7.2) and 3.8 (-0.6 to 10.4) respectively. At the end of 1 year, 2 years and 3 years 89.4%; 82.6% and 75.9% respectively had a stable or improved relative FVC change from baseline.

Of the 52 individuals who had a baseline as well as repeat HRCT, stable/improved scores in ground glass opacity, fibrosis and honey combing was seen in 80.8%, 86.5% and 86.5% respectively. There was no difference in the extent of FVC change between those with limited vs extensive disease.

**Abstract OP0145 – Table 1**

#### OP0146 IDIOPATHIC INFLAMMATORY MYOPATHIES & INTERSTITIAL LUNG DISEASE

N. Ciang, R. Ng, A. Leung, J. Chan, K. Kwok, G. Ho, R. Ho. *Division of Rheumatology, Queen Elizabeth Hospital, Hong Kong, Hong Kong*

**Background:** Idiopathic inflammatory myopathies (IIM) is associated with interstitial lung disease (ILD). IIM associated ILD ranges from subclinical disease, to rapidly progressive ILD (RPILD). Early recognition of these patients is essential for determining treatment.

**Objectives:** A retrospective case-control study in a tertiary referral centre to identify: a) Clinical features associated with ILD in IIM.

b) Whether antibodies e.g. anti-ENA and myositis specific antibodies (MSA), may aid recognition of ILD or RPILD.

c) Whether intensive immunosuppressants have implication on prognosis of ILD.

**Methods:** The clinical records of IIM patients who were followed up in rheumatology clinic or admitted into our hospital from Jan 2013 to Dec 2016 were reviewed. We analyse the clinical characteristics (*rash, arthritis, myositis, Raynaud's phenomenon, mechanic hands, and cutaneous ulcers with blood tests*), antibody profile (*anti ENA: anti-Jo1, Ro, La, Sm, RNP, Scl 70 and MSA: anti Oj, E, PL7, PL12, SRP, PM-Sci75, PM-Sci100, Ku, SAE1, NXP2, TIF1γ, MDA5, Mi2*), treatment and survival. We compare these parameters in IIM-ILD patients against those without ILD. Chi-squared and Mann-Whitney U tests were used to analyse categorical and continuous variables. Log rank test was used to compare survivals.

**Results:** Among the 101 IIM patients, the mean age was 62 years old with 71% female. 74 patients (73%) had dermatomyositis, 17 (17%) had polymyositis and 10 (10%) clinical amyopathic dermatomyositis. 53 patients (52%) had ILD; 48 (48%) had no ILD. In ILD group, 11/53 patients (21%) were RPILD.

All patients had anti-ENA checked. 59/101 patients (58%) had MSA profile.

Significantly more ILD patients had arthritis, mechanic hands, anti Jo1, anti Ro and anti MDA5 than those without ILD. 21/101 patients had cancers associated with IIM, but cancers were less common in ILD group. Subgroup analyses revealed arthritis, mechanic hands and anti MDA5 were again significantly more common in RPILD compared to other ILD patients (table 1). Anti MDA5 were more commonly found in deceased versus alive patients (40% vs 8.2%,  $p=0.02$ ; OR=7.5). Deceased patients also had significantly higher median peak ferritin (2475 vs 553 pmol/L,  $p=0.008$ ), so did the ILD group (2332 vs 484 pmol/L,  $p=0.02$ ).

ILD patients received more intensive immunosuppressants (high dose steroid, cyclophosphamide, MMF, tacrolimus, IVIg or even rituximab) than non ILD group. The survival was not significantly different between ILD and non ILD groups. However despite intensive immunosuppressants, RPILD patients' survival was still much worse than the other ILD patients (figure 1).

Abstract OP0146 – Table 1 Features with  $P<0.05$  and the odds ratios (OR)/relative risks (RR)

	ILD (%)	Non ILD (%)	P value	OR/ RR	RPILD (%)	Other ILD (%)	P value	OR/ RR
Arthritis	53	21	0.001	4.3	73	33	0.02	5.3
Mechanic hands	17	0	0.003	2.1	36	6	0.008	9.7
Carcinoma	8	35	0.001	0.2				
Anti Jo1	20	5	0.03	5				
Anti MDA5	24	0	0.02	2	50	8	0.008	11.8
Anti Ro	40	17	0.01	3.3				

Abstract OP0146 – Figure 1 Kaplan Meier curves of RPILD & ILD groups

**Conclusions:** Certain clinical features and MSA aid recognition of IIM-ILD. Anti MDA5 is related to ILD, RPILD and mortality. Ferritin may be a disease activity and prognostic marker for IIM-ILD. With immunosuppressants, survival of IIM patients with or without ILD is similar. For RPILD patients, the survival is significantly worse despite active treatment.

#### OP0147 ABERRANT ACTIVATION OF TYPE I INTERFERON SYSTEM IN ANTI-MDA5 DERMATOMYOSITIS PATIENTS

S. Zhang, B. Yan. *Rheumatology and Immunology, West China Hospital, Sichuan University, Chengdu, China*

**Background:** Anti-melanoma differentiation-associated gene 5 (MDA5) DM patients have an increased risk of interstitial lung disease (ILD), with a potentially fatal course.<sup>1</sup> Viral infection has been speculated to be the putative trigger for anti-MDA5 DM.<sup>2,3</sup> The molecular pathogenesis remains largely unknown.

**Objectives:** In this study, we aimed to explore the role of type I interferon (IFN) system in the pathogenesis of anti-MDA5 DM.

**Methods:** We studied 20 anti-MDA5 DM patients and compared them with anti-aminoacyl-tRNA synthetase (ARS) DM patients (n=10) and seronegative DM patients (n=30). The levels of IL-1b, IL-4, IL-6, IL-8, IL-10, IL-12, IL-18, TNF-a, IFN-a, IFN-b, IFN-g, B cell activating factor (BAFF), Krebs von den Lungen-6 (KL-6) in blood were tested by enzyme-linked immunosorbent assay and multiplex assay. Expressions of mRNA for sensor molecules (TLR3, TLR4, TLR7, TLR9, MDA5, RIG-1) and type I IFN inducible genes (IRF7, STAT1, MxA, ISG15) in peripheral blood mononuclear cell (PBMC) were detected by real-time polymerase chain reaction analysis. Expressions of STAT1, MxA, ISG15 proteins in skin lesions from anti-MDA5 DM were analysed by immunohistochemistry technique.

**Results:** Anti-MDA5 DM patients had higher levels of plasma type I IFN (IFN-a, IFN-b), IL-6, IL-10 and TNF-a than seronegative-DM patients. In comparison to anti-ARS DM patients, IFN-a alone displayed heightened level in anti-MDA5 DM patients. Among these 3 subsets of patients, PBMC from anti-MDA5 DM patients

have the significant upregulation of TLR3, TLR7, MDA5, RIG-1 sensors as well as IRF7, STAT1, MxA, ISG15 genes. And skin biopsies from anti-MDA5 DM patients were characterised by strong expression of STAT1, MxA, ISG15 proteins. Furthermore, overexpression of plasma BAFF was observed in anti-MDA5 DM patients. BAFF level was showed to be positively correlated with IFN- $\alpha$  level. Additionally, BAFF level, synergizing with IFN- $\alpha$ , was of great relevance to KL-6 in anti-MDA5 DM patients with higher plasma IFN $\alpha$  concentration.

**Conclusions:** Our data suggest that aberrant activation of the type I IFN system associated with BAFF may be implicated in the pathogenesis of ILD in anti-MDA5 DM. The discovery may drive the development of new therapeutic strategies for the type of DM patients.

#### A VALIDATION OF THE 2017 EULAR/ACR IDIOPATHIC INFLAMMATORY MYOPATHIES CLASSIFICATION CRITERIA IN AN EXPERT-DEFINED SINGLE-CENTRE TEN YEAR INCIDENT COHORT

M.J.S Parker<sup>1,2</sup>, A. Oldroyd<sup>3</sup>, M.E. Roberts<sup>4</sup>, R.G. Cooper<sup>5</sup>, J.B. Lilleker<sup>4</sup>, A. L. Herrick<sup>3</sup>, H. Chinoy<sup>3</sup>. <sup>1</sup>Rheumatology Department, Salford Royal NHS Foundation Trust, Salford, UK; <sup>2</sup>Rheumatology Department, Royal Prince Alfred Hospital, Sydney, Australia; <sup>3</sup>Centre for Musculoskeletal Research, University of Manchester, Manchester; <sup>4</sup>Greater Manchester Neurosciences Centre, Salford Royal NHS Foundation Trust, Salford; <sup>5</sup>MRC-ARUK Centre for Integrated Research into Musculoskeletal Ageing, University of Liverpool, Liverpool, UK

**Background:** The recently published 2017 European League Against Rheumatism (EULAR) and American College of Rheumatology (ACR) classification criteria for adult and juvenile idiopathic inflammatory myopathies (IIM) and their major subgroups reflect a long-appreciated need for more accurate case definition in

ongoing research in these complex and heterogenous diseases.<sup>1</sup> However a number of issues remain unresolved. There was a high frequency of missing data in both the derivation and validation samples, only one of the now numerous myositis specific autoantibodies is included, and certain well recognised IIM subtypes are not specifically classified despite their well phenotyped and differing natural histories, clinical features and treatment modalities.<sup>2,3</sup>

**Objectives:** To perform an external validation of the EULAR/ACR classification criteria in an incident IIM cohort and examine how classification criteria-assigned IIM subtype correlates with expert opinion.

**Methods:** Adults with newly diagnosed IIM attending Salford Royal NHS Foundation Trust Neuromuscular services were identified. A retrospective review of all putative cases was performed, and cases fulfilling a consensus expert-opinion diagnosis of definite IIM included. A broad range of clinical, serological and histological data were collected and each case assigned a single IIM subtype by expert opinion. The EULAR/ACR classification criteria were applied and sensitivity, specificity, positive and negative predictive value calculated, presented with 95% confidence intervals (CI).

**Results:** A total of 922 cases were screened with 255 expert opinion definite IIM identified. The sensitivity to diagnose an IIM was 99.6% (97.2–100) and 80.9% (76.0–85.8) for the classification criteria cut-points of 'probable' and 'definite' respectively. The sensitivity for 'definite' IIM improved to 90.2% (86.5–93.8) when biopsy data for 24/34 initially missed cases were excluded. In 94/255 cases the IIM subtype differed between expert opinion and classification criteria, most strikingly in the group subtitled 'polymyositis' using the EULAR/ACR criteria, where there was discrepancy in the majority (87/161).

**Abstract OP0148 – Table 1.** PM, polymyositis; DM, dermatomyositis; IBM, inclusion body myositis; ADM, amyopathic dermatomyositis; IMNM, immune-mediated necrotizing myopathy; ASS, anti-synthetase syndrome; OM, overlap myositis.

Classification Tree-assigned IIM Subtype

	PM	DM	IBM	ADM	Totals
PM	37	0	0	0	37
DM	3	54	0	0	57
IBM	0	0	56	0	56
Expert-assigned IIM Subtype					
ADM	0	0	0	14	14
ASS	29	5	0	0	34
IMNM	25	0	0	0	25
OM	30	2	0	0	32
Total	124	61	56	14	255

**Conclusions:** The criteria performed with high sensitivity in identifying IIM in an external cohort of IIM patients. However, substantial disagreement exists in subtype assignment, especially resulting in a larger proportion of cases of 'polymyositis' with heterogeneous features, important to consider in the application of these criteria to subsequent research.

## Can imaging improve diagnosis and outcome in rheumatic diseases

OP0149

### AN MRI GUIDED TREAT-TO-TARGET STRATEGY IN RHEUMATOID ARTHRITIS PATIENTS IN CLINICAL REMISSION IMPROVED MRI INFLAMMATION BUT NOT DAMAGE PROGRESSION – RESULTS FROM THE IMAGINE-RA RANDOMISED CONTROLLED TRIAL

S. Møller-Bisgaard, K. Hørslev-Pedersen, B. Ejbjerg, D. Glinatsi, M. Hetland, L. Ørnberg, J. Møller, M. Boesen, R. Christensen, K. Stengaard-Pedersen, O. R. Madsen, B. Jensen, J. Villadsen, E.-M. Hauge, P. Bennett, O. Hendricks, K. Asmussen, M. Kowalski, H. Lindegaard, S.M. Nielsen, H. Bliddal, N. Krogh, T. Ellingsen, A.H. Nielsen, L. Balding, A.G. Jurik, H. Thomsen, M. Østergaard. *Depts of Rheumatology and Radiology, Musculoskeletal Statistics Unit, Hospitals at Slagelse, Graasten, Gentofte, Aarhus, Frederiksberg, Silkeborg, Hjørring, Odense, Herlev, the Parker Institute and Rigshospitalet, Zealand, Funen and Jutland, Denmark*

**Background:** Magnetic Resonance Imaging (MRI) bone marrow oedema (BME)/osteitis and MRI synovitis have been identified as predictors of structural damage progression in rheumatoid arthritis RA.<sup>1,2</sup> Targeting MRI remission may reduce inflammation and halt damage progression.

**Objectives:** To investigate whether a 2 year treat-to-target (T2T) strategy targeting MRI remission (defined as absence of BME) suppresses MRI-determined measures of disease activity and structural joint damage in RA patients in clinical remission.

**Methods:** In the two year investigator initiated, randomised, open label multi-centre IMAGINE-RA study, 200 RA patients in clinical remission (defined as DAS28-CRP <3.2 and no swollen joints) receiving conventional synthetic disease-modifying antirheumatic drugs (csDMARDs) were randomised 1:1 to a conventional DAS28-CRP guided T2T treatment strategy targeting DAS28 <3.2 and no swollen joints or an MRI guided T2T treatment strategy applying the same clinical T2T strategy and in addition targeting absence of MRI BME. Patients were followed every 4 months over a 2 year follow-up period. In all patients contrast-enhanced MRIs of the 2nd–5th metacarpophalangeal (MCP) joints and wrist of the dominant hand were performed at baseline, 12 and 24 months. In the MRI T2T arm MRI was performed every 4 months ahead of the clinical visit and assessed for presence/absence of BME by one blinded evaluator so the result was available for the investigator at the visit. In the conventional T2T arm MRI findings were blinded to the investigator. If treatment target was not met treatment was escalated according to a predefined treatment algorithm starting with increment in csDMARD and then adding biologic DMARDs. MRIs (0, 12 and 24 months) were evaluated according to the RAMRIS scoring system, with known chronology by one blinded experienced reader. Pearson's chi-square statistics and repeated-measures logistic regression models were used to assess outcomes.

**Results:** MRI outcomes of inflammation and damage at 24 months are presented in the table 1. The MRI T2T arm showed statistically significant reductions at 24 months in all inflammatory endpoints (osteitis, tenosynovitis and total inflammation score,  $p < 0.018$ ), except synovitis, ( $p = 0.074$ ), compared to the conventional T2T arm. No differences between treatment strategies were seen in damage progression.

Abstract OP0149 – Table 1 MRI outcomes at 24 months

MRI outcomes at 24 months				
	MRI T2T	Conventional T2T	Difference between groups (95% CI)	P value*
<b>MRI</b>				
<b>Inflammation</b>				
Change in osteitis (RAMRIS) score	-1.8 (0.6)	-0.1 (0.5)	-1.8 (-3.2 to -0.3)	0.018
Change in synovitis (RAMRIS) score	-0.5(0.3)	0.3 (0.3)	-0.8 (-1.8 to 0.1)	0.074
Change in tenosynovitis (RAMRIS) score	-0.9 (0.3)	0.3 (0.3)	-1.2 (-2.1 to -0.3)	0.007
Change in total inflammation (RAMRIS) score	-2.9 (1.0)	0.7 (1.0)	-3.6 (-6.4 to -0.8)	0.013
<b>Damage</b>				
Change in erosion (RAMRIS) score	0.5 (0.2)	0.6 (0.2)	-0.1 (-0.6 to 0.4)	0.663
Change in JSN (RAMRIS) score	0.1 (0.2)	0.4 (0.1)	-0.3 (-0.7 to 0.2)	0.235
Change in total damage (RAMRIS) score	0.6 (0.3)	1.0 (0.3)	-0.3 (-1.2 to 0.5)	0.395
No progression in erosion (RAMRIS), n (%)	59 (79.7%)	70 (75.3%)	OR, 1.06 (0.02 to 66.59)	0.976

95% CI, 95% confidence interval; JSN=joint space narrowing; MRI=Magnetic Resonance Imaging; RAMRIS=RA magnetic resonance imaging scoring system; T2T=treat-to-target; total damage score=sum score of MRI erosion and JSN; total inflammation score=sum score of MRI synovitis, osteitis and tenosynovitis. Data are presented as least square means (SE) unless otherwise stated. Analyses are based on full analysis set (patients having a baseline visit and at least one follow-up visit) with no data imputation to replace missing data. \*P values are based on repeated-measures logistic regression models. For some of the variables, fewer patients were included in the analyses due to missing data, with the minimum being 85 (range 85-89) in the MRI T2T arm and 90 (range 90-95) in the conventional T2T arm.

**Conclusions:** An MRI T2T strategy, aiming to eliminate MRI BME, was more effective than a conventional T2T strategy in reducing MRI inflammation but not MRI damage progression. The reduced inflammatory load caused by the MRI T2T strategy may reduce long-term structural joint damage and improve patient-

reported outcomes, but more than two years follow-up data are needed to clarify this.

### ULTRASOUND POWER DOPPLER ACTIVITY PREDICTS CLINICAL JOINT SWELLING IN EARLY RHEUMATOID ARTHRITIS PATIENTS: SECONDARY ANALYSES FROM THE ARCTIC TRIAL

L.B Nordberg<sup>1,2</sup>, S. Lillegraven<sup>2</sup>, A.-B. Aga<sup>2</sup>, J. Sexton<sup>2</sup>, E. Lie<sup>2</sup>, H.B. Hammer<sup>2</sup>, I. C. Olsen<sup>2,3</sup>, T. Uhlig<sup>2</sup>, D. van der Heijde<sup>2,4</sup>, T.K. Kvien<sup>2</sup>, E.A. Haavardsholm<sup>1,2</sup>. <sup>1</sup>University of Oslo; <sup>2</sup>Departement of Rheumatology, Diakonhjemmet Hospital; <sup>3</sup>Research Support Services CTU, Oslo, Norway, Oslo University hospital, Oslo, Norway; <sup>4</sup>Leiden University Medical Center, Leiden, Netherlands

**Background:** Ultrasound is increasingly applied in the management of rheumatoid arthritis (RA). It is important to detect synovitis early to prevent future joint damage and disability. It is not known whether subclinical ultrasound inflammation in a joint precedes clinical joint swelling.

**Objectives:** We aimed to investigate whether ultrasound power Doppler (PD) activity in a joint is associated with subsequent clinical joint swelling in early RA patients.

**Methods:** In the treat-to-target ARCTIC trial, DMARD naïve early RA patients were randomised to follow-up with or without ultrasound, with the same treatment algorithm applied in both arms. Patients were assessed by 44 swollen joint count at all visits (13 visits over two years). Ultrasound examinations were performed using a validated 0–3 semi-quantitative scoring system.<sup>1</sup> with assessments at all visits in the ultrasound arm and at baseline, 12 and 24 months in the conventional arm. We calculated the risk of next-visit clinical joint swelling according to ultrasound inflammation status in clinically non-swollen joints at the preceding visit. We estimated the odds ratio of a joint being swollen at next visit in joints with different PD activity (PD score: 1, 2 or 3), compared to non-swollen joints with no PD activity (PD score=0). These calculations were performed in a logistic mixed-effects model with random intercepts for patient and joint in order to account for within-patient and -joint dependencies, and were adjusted for age, gender, ACPA status, DMARD treatment and strategy arm. Joints injected with corticosteroids were excluded. Data from the two strategy arms were pooled and analysed together, as clinical and radiographic outcomes were similar in the two arms after two years.<sup>2</sup>

**Results:** 230 patients were included (118 in the ultrasound strategy arm, 112 in the conventional strategy arm). Mean (SD) age was 51.4 (13.7) years, 61% were female and mean baseline DAS was 3.46 (1.17). The risk of clinical joint swelling at the next visit increased with grade of PD activity (table 1).

Abstract OP0150 – Table 1. Risk of swollen joint at the next visit in joints with subclinical synovitis

Ultrasound assessment	Joint swelling at the next visit n (%)	OR	p-value
PD 0	706/42819 (1.7%)	Reference:	
PD 1	37/469 (7.9%)	3.6 [2.3–5.5]	<0.001
PD 2	33/189 (17.5%)	11.8 [6.9–20.1]	<0.001
PD 3	7/45 (15.6%)	12.1 [4.1–35.7]	<0.001

PD=Power Doppler. Odds ratios are adjusted for within-patient and within-joint dependencies, gender, age, DMARD treatment, ACPA status and strategy arm.

**Conclusions:** We found PD activity in non-swollen joints to be strongly associated with development of clinical joint swelling at the next visit, and the risk increased with higher power Doppler activity. This study supports the use of ultrasound as a tool to detect joints at risk for developing clinical synovitis.

OP0151

### ROUTINELY RECORDED MUSCULOSKELETAL ULTRASOUND FINDINGS IMPACT CLINICIANS' DIAGNOSTIC BEHAVIOUR MAXIMALLY IN AUTOANTIBODY-SERONEGATIVE PATIENTS ATTENDING AN EARLY ARTHRITIS CLINIC

K. Iqbal<sup>1,2</sup>, D.W. Lendrem<sup>1,2</sup>, B. Hargreaves<sup>1,2</sup>, B. Thompson<sup>3</sup>, J.D. Isaacs<sup>1,2</sup>, A. G. Pratt<sup>1,2</sup>. <sup>1</sup>National Institute for Health Research Newcastle Biomedical Research Centre, Newcastle upon Tyne Hospitals NHS Foundation Trust and Newcastle University; <sup>2</sup>Institute of Cellular Medicine, Newcastle University; <sup>3</sup>Musculoskeletal Directorate, Newcastle upon Tyne Hospitals NHS Foundation Trust, Newcastle upon Tyne, UK

**Background:** Musculoskeletal ultrasound (MSUS) is a popular assessment tool, but its contribution to diagnostic practice over and above standard clinical and laboratory parameters has proved difficult to quantify.

**Objectives:** A published 7-joint ultrasound algorithm<sup>1</sup> has been adapted for pragmatic application during 15 min screening appointments forming part of initial patient assessments in the Newcastle Early Arthritis Clinic (NEAC). Its additive contribution to diagnostic classification in this routine setting was appraised.

**Methods:** Detailed baseline clinical and laboratory parameters were recorded. Semi-quantitative MSUS scoring (0–3, grey scale and power Doppler) of the most symptomatic wrist (midline and ulnar dorsal longitudinal views), 2nd/3rd MCPs and PIPs and 2nd/5th MTPs (all longitudinal views) was recorded by sonographers, along with the 'sonographer's scan impression' ('definitely inflammatory,' 'possibly inflammatory' or 'non-inflammatory'). All MSUS findings were available to rheumatologist diagnosticians during subsequent consultations, and persistent inflammatory arthritis (PIA) was classified only where patients were started on  $\geq 1$  disease modifying anti-rheumatic drug (DMARD). Stepwise multiple logistic regression was employed to identify clinical variables that independently predicted IA diagnosis; the additive contribution of MSUS parameters to resultant models was assessed by comparing areas under receiver operator characteristic curves (AU ROCs).

**Abstract OP0151** – Figure 1 ROC curves depicting additive discriminatory utility of MSUS 'scan impression' with clinical parameters alone (red), with respect to PIA diagnosis amongst seronegative early arthritis patients.  $\Delta$  AU AOC=0.08;  $p < 0.001$

**Results:** 847 patients were enrolled (17% seropositive for anti-citrullinated peptide autoantibody, ACPA); final outcomes of PIA were recorded in 29% and 18% of the overall and ACPA-seronegative cohorts, respectively. SJC, CRP, age and ACPA status were non-redundant clinical/laboratory predictors of a PIA diagnosis by consulting rheumatologists in the overall cohort (AU ROC 0.85; 95% CI: 0.81 to 0.88), their discriminatory utility being diminished in the seronegative sub-cohort (AU ROC 0.78; 95% CI: 0.72 to 0.82). Although the additive contribution of

summed parameters from the 7-joint MSUS algorithm to the model was statistically significant ( $p < 0.001$ ) it was numerically small ( $\Delta$  AU ROC 0.03 and 0.05 in the overall and seronegative cohorts, respectively). The 'sonographer's scan impression' was a potentially more useful diagnostic tool, its additive contribution to diagnostic outcome over clinical parameters alone being most evident in ACPA-negative patients where it increased the AU ROC by 10% ( $\Delta$  AU ROC 0.08;  $p < 0.001$ ; figure 1).

**Conclusions:** In this large, un-blinded observational study, the clinical utility of a 15 min MSUS screen for diagnosing PIA requiring DMARDs was particularly evident amongst ACPA negative patients attending an EA clinic.

### IS SONOGRAPHIC PHENOTYPE OF LATE-ONSET RHEUMATOID ARTHRITIS DIFFERENT FROM YOUNG-ONSET RHEUMATOID ARTHRITIS? RESULTS FROM THE BIRMINGHAM EARLY ARTHRITIS COHORT

R. Singh<sup>1,2</sup>, I. Sahbudin<sup>1,2</sup>, M. Maybury<sup>1</sup>, K. Raza<sup>1,3</sup>, A. Filer<sup>1,2</sup>. <sup>1</sup>Rheumatology Research Group, Institute of Inflammation and Ageing, University Hospitals of Birmingham; <sup>2</sup>Department of Rheumatology, University Hospitals Birmingham NHS Foundation Trust, Queen Elizabeth Hospital Birmingham; <sup>3</sup>Department of Rheumatology, Sandwell and West Birmingham Hospitals NHS Trust, Birmingham, UK

**Background:** The incidence of rheumatoid arthritis (RA) is generally seen as a bimodal age distribution, which consists of young-onset RA (YORA) and late-onset RA (LORA). Although a retrospective study has reported some differences in sonographic changes between LORA and YORA, little is known whether there are any differences in the clinical and sonographic phenotypes between these two groups during the early disease phases.

**Objectives:** To compare the clinical and sonographic characteristics between YORA and LORA during the early phases of disease.

**Methods:** DMARD-naïve patients with clinically apparent synovitis of at least one joint and symptom duration of three months or less were included in the analysis. Patients underwent clinical, ultrasonography and radiological assessments at baseline and final outcomes were determined at 18 months; patients were classified as having RA (according to either the 1987 ACR and/or 2010 ACR/EULAR criteria), a non-RA persistent arthritis or a resolving arthritis. Sonographic assessment included MCP, PIP, wrist, MTP, knee, ankle, elbow joints and wrist, hand flexor, bicep tendon, anteromedial-lateral tendon compartments. The presence and absence of joint synovitis and tenosynovitis were recorded according to the EULAR/OMERACT consensus definition.

	Young-onset RA (n=37)	Late-onset RA (n=36)	Non-RA persistent arthritis (n=27)	Resolving arthritis (n=50)	P (YORA vs LORA)
Age (years)	50 (45–56)	67 (63–73)	39 (31–60)	46 (35–59)	<0.001
EMS (mins)	75 (30–120)	120 (60–240)	60 (10–180)	30 (0–68)	0.808
DAS-28 CRP	5.02 (3.60–5.73)	5.11 (4.49–6.10)	3.77 (3.02–4.95)	3.35 (2.98–4.43)	1.00
RF%					
High Positive	15 (40.5)	10 (27.8)	1 (3.7)	2 (4)	0.568
Low Positive	5 (13.5)	7 (19.4)	4 (14.8)	1 (2)	
Negative	17 (45.9)	19 (52.8)	22 (81.5)	47 (94)	
ACPA %					
High positive	17 (45.9)	14 (38.9)	2 (7.4)	2 (4)	0.722
Low positive	1 (2.7)	2 (5.6)	0 (0.0)	0 (0.0)	
Negative	19 (51.4)	20 (55.6)	25 (92.6)	48 (96.0)	
Symptom duration (weeks)	8 (4–10)	8 (6–10)	6 (4–8)	5 (4–8)	1.00
Bilateral MTP squeeze, n (%)	22 (59.5)	10 (27.8)	4 (14.8)	10 (20.0)	0.09

**Results:** 150 patients were included in the analysis. At 18 months, 37 patients developed YORA, 36 developed LORA, 27 developed non-RA inflammatory arthritis and 50 patients had resolving arthritis. The clinical characteristics

between YORA and LORA were not significantly different at initial presentation (table 1). The ultrasound characteristics differed between these two groups. LORA patients were more likely to have shoulder biceps tendon tenosynovitis (GS;  $p=0.026$ , PD; 0.037), elbow joint synovitis (GS;  $p=0.010$ , PD;  $p=0.037$ ), MCP1 (PD;  $p=0.032$ ) and MCP5 (GS;  $p=0.035$ ) synovitis, compared to YORA patient. YORA patients were more likely to have MTP synovitis (GS;  $p=0.013$ ) compared to LORA patients.

**Conclusions:** This is the first study to describe the difference of both clinical and sonographic inflammation of YORA and LORA in recent-onset DMARD-naïve RA patients in a longitudinal study. There are differences in US-detected joint and tendon inflammation despite similarities in clinical characteristics. The prognostic value of the differences in US pathology between these two groups should be further explored.

**OP0153 RESOLUTION OF SYMPTOMS OF PATIENTS WITH CLINICALLY SUSPECT ARTHRALGIA IS PARALLELED BY DISAPPEARANCE OF MRI-DETECTED SUBCLINICAL INFLAMMATION; A LONGITUDINAL STUDY**

R.M. Ten Brinck, D.M. Boeters, H.W. van Steenberg, A.H. van der Helm-van Mil. *Rheumatology, LEIDEN UNIVERSITY MEDICAL CENTRE, Leiden, Netherlands*

**Background:** It is known that MRI-detected subclinical inflammation in patients with Clinically Suspect Arthralgia (CSA) precedes the development of clinically evident Inflammatory Arthritis (IA). However, there are no longitudinal studies in CSA patients that did not progress to IA. The course of joint symptoms in these patients is unknown. Furthermore, it is unknown if subclinical inflammation resolves spontaneously in parallel with disappearance of joint symptoms.

**Objectives:** To determine the course of joint symptoms and of MRI-detected subclinical joint inflammation, and mutual time relationships, in patients that presented with CSA but did not progress to IA during 2 year follow-up.

**Methods:** Between April 2012-April 2014, 149 patients were included in the CSA cohort. These patients had no clinically evident arthritis but recent-onset (<1 year) arthralgia of small joints that was clinically considered at risk for IA by the rheumatologist. None of the patients were treated with DMARDs. Patients underwent MRI at baseline and when arthritis developed or after 2 years (when follow-up ended). The patients that did not progress to IA within 2 years and had serial MRIs, as well as longitudinal clinical data and questionnaires (e.g. the HAQ), were studied ( $n=60$ ). 1.5T MRIs of wrist, MCP2-5, and MTP1-5 joints were scored for synovitis, tenosynovitis and bone marrow oedema (BME) (summed in the total MRI inflammation score) according to RAMRIS, blinded for order in time and clinical information. Paired t-tests were used.

**Results:** After 2 year follow-up, 20 patients (33%) had complete resolution of symptoms whereas 40 patients (66%) did not. The remaining symptoms in the latter group were diagnosed as: persistent inflammatory arthralgia ( $n=26$ ), osteoarthritis ( $n=6$ ) and tendinomyalgia ( $n=8$ ). In the total group, the mean total MRI-inflammation score decreased from 3.2 at baseline to 2.5 at 2 years ( $p=0.046$ ). When the patients with persistent symptoms were studied, there were no significant changes in MRI-inflammation scores. Analysing the patients with resolution of symptoms separately, the total MRI-inflammation score decreased significantly ( $3.3$  to  $2.3$ ;  $p=0.019$ ). Also the total synovitis and tenosynovitis scores decreased significantly ( $1.3$  to  $0.82$  and  $0.83$  to  $0.30$ , respectively;  $p=0.043$  and  $p=0.029$ ), whereas BME scores remained unchanged ( $1.2$  and  $1.2$ ;  $p=0.87$ ). After 2 year follow-up the absolute MR-scores of these patients were compared to data from age-matched symptom-free controls; no differences were found for synovitis, suggesting normalisation. Physical functioning, measured with HAQ, remained similar in patients with persistent symptoms ( $0.56$  to  $0.51$ ;  $p=0.61$ ), whereas HAQ normalised in patients with resolution of symptoms (mean score of  $0.15$  at 2 years,  $p=0.053$  compared to baseline).

**Conclusions:** Approximately one-third of the patients that presented with CSA and that did not convert to IA had resolution of symptoms, this was paralleled by normalisation of MRI-detected inflammation as well as physical functioning. This is the first study showing that subclinical inflammation in individuals at risk for developing RA can resolve spontaneously. The data suggest that subclinical inflammation was causally related to joint pain.

**OP0154 PROSPECTIVE OBSERVATIONAL STUDY TO EVALUATE THE USE OF MUSCULOSKELETAL ULTRASONOGRAPHY TO IMPROVE RHEUMATOID ARTHRITIS MANAGEMENT: INTERIM ANALYSIS OF THE ECHO STUDY**

M. Stein<sup>1,2</sup>, E. Rampakakis<sup>3</sup>, J.S. Sampalis<sup>2,3</sup>. <sup>1</sup>McGill University, <sup>2</sup>Canadian Rheumatology Ultrasonography Society (CRUS), Montreal; <sup>3</sup>JSS Medical Research, St. Laurent, Canada

**Background:** Musculoskeletal Ultrasound (MSUS) has been shown to be superior to clinical examination in the detection of synovitis in patients with Rheumatoid Arthritis (RA), and can be used to improve diagnostic accuracy and potentially monitor disease changes in order to make treatment decisions aimed at optimising patient care. Since the creation of the Canadian Rheumatology Ultrasonography Society (CRUS) in 2010, an increasing number of rheumatologists has been trained in the use of MSUS.

**Objectives:** The overall study objective is to compare the effectiveness of MSUS to Routine Care (RC) as a disease management tool in patients with moderate-to-severe RA for whom a change in treatment is indicated. In addition, the predictive power of MSUS assessments has been assessed here.

**Methods:** 'Echo' is a prospective two-cohort, quasi-experimental study of patients diagnosed with active moderate-to-severe RA managed either with MSUS (within CRUS) or as per RC. To be eligible for the study patients must require a change in treatment as per the judgment of the treating physician. Patients are followed for 1 year with assessments at baseline, 3, 6, 9, and 12 months. Key outcome measures of interest include CDAI LDA/Remission, DAS-28 LDA/Remission, patient satisfaction (TSQM) and patient perception of participation in disease management (PAM-13).

**Results:** A total of 383 patients (71.5% female) with a mean (SD) age of 58.7 (11.7) years and disease duration of 7.0 (10.0) years were enrolled, without any significant differences between treatment groups.

At baseline, a greater proportion of patients in the MSUS group were treated with a biologic DMARD (bDMARD; 50.3% vs 35.8%,  $p=0.004$ ); patients in the RC group were more likely to be treated with a non-biologic DMARD (nbDMARD; 84.2% vs 91.5%,  $p=0.027$ ). Over time, a comparable proportion of patients in the two groups started/switched a bDMARD (21.6% vs 15.6%,  $p=0.126$ ) or added/switched a nbDMARD (18.7% vs 23.6%,  $p=0.248$ ). The overall number of treatment modifications was also similar between groups (3.0 vs 2.7,  $p=0.236$ ).

Upon adjusting for age, gender, previous bDMARD treatment, and baseline parameter level, no differences between the two treatment groups with respect to CDAI LDA/Remission, DAS-28 LDA/Remission, and TSQM score were observed during follow-up. However, the PAM-13 score was significantly higher in the MSUS group (69.6 vs 64.2,  $p=0.02$ ).

In the MSUS group, higher total US erosion score at baseline was associated with a lower rate of CDAI LDA at 12 months (OR=0.86;  $p=0.047$ ); higher total PD synovitis score at baseline was associated with a lower rate of CDAI LDA at 6 months (OR=0.90;  $p=0.010$ ), and; higher total synovitis GREY scale at baseline was associated with lower rates of DAS28 LDA (OR=0.93;  $p=0.026$ ) and DAS28 remission (OR=0.94;  $p=0.061$ ) at 6 months.

**Conclusions:** MSUS assessments can be useful predictors of future disease remission in patients with RA. MSUS may be associated with increased patient perception of participation in disease management and patient activation.

**OP0155 ULTRASOUND AS AN OUTCOME MEASUREMENT TOOL FOR OPTIMISED MONITORING OF GOUT. VALIDATION OF THE OMERACT ULTRASONIC DEFINITIONS OF GOUT ELEMENTARY LESIONS**

S.N. Christiansen, M. Østergaard, O. Slot, L. Terslev. *Center for Rheumatology and Spine Diseases, Copenhagen Center for Arthritis Research, Rigshospitalet, Glostrup, Glostrup, Denmark*

**Objectives:** To evaluate ultrasound (US) as an outcome measurement instrument for monitoring gout patients during urate lowering therapy using the OMERACT US Working Group's 2015 definitions of US elementary lesions in gout.

**Methods:** US examination (28 joints, 26 tendons) were performed in patients with microscopically verified gout who either initiated or increased urate lowering therapy. Joints and tendons were evaluated for the four OMERACT elementary lesions of gout (Double contour, Tophus, Aggregates and Erosions). Furthermore, subcutaneous (SC) oedema was registered and synovitis was graded by grey scale (GS) and colour Doppler (CD) (both graded 0-3). A sum score was

calculated for each component for each patient (table 1). Patient Reported Outcomes (PROs) regarding pain (visual analogue scale), numbers of attacks within the last 3 months and physical function (Health Assessment Questionnaire) were obtained, as were C-reactive protein (CRP), p-urate and clinical joint examination. All examinations were repeated after 3 (n=29) and 6 months (n=15, follow-up still ongoing) and changes in scores were evaluated using Wilcoxon-Pratt signed-rank test.

**Results:** 29 patients (28 males, 1 female), mean age of 68 (39 – 89) years were included. US showed a numerical, but statistically non-significant (p=0.13), decline in DC count from baseline to 3 months' follow up, while at 6 months a statistically significant decline was observed (p=0.033). The tophus count decreased non-significantly at both 3 and 6 months' follow up, whereas the aggregate and erosion counts by large were unchanged. GS synovitis showed a statistically non-significant decrease at follow ups, whereas CD synovitis and SC oedema counts declined significantly at 3 months' follow up (p=0.033 and 0.044, respectively). P-urate levels decreased statistically significant from baseline to both 3 and 6 months' follow-up (both p-values<0.001), as did clinical markers such as CRP, joint evaluation, pain and attack frequency.

**Abstract OP0155** – Table 1 Course of US, biochemical and clinical variables during urate lowering therapy

HAQ (0-3)	0.150	0 (0-1.125)	0.150	0 (0-1.125)	0.70

\*p-values are calculated using Wilcoxon-Pratt signed rank test, two-sided p-values. Values in bold indicate p<0.05.  
 \*\* joints evaluated by US: Metatarsophalangeal, wrist, elbow, metatarsophalangeal, distal and proximal joints. Tendon compartment evaluated by US: Extensor tendons of the wrist (divided in compartments 1-6), biceps brachii and brachii radialis and ulnaris tendons were evaluated for tenosynovitis (TS) and CD; aggregates and tophi. Triceps, Achilles, quadriceps and patella tendons were only evaluated for aggregates and tophi.  
 \*\*\* Tender and swollen joint counts include proximal and distal interphalangeal joints of the hands and feet, metacarpal and metatarsophalangeal joints, wrist, elbow, knee/leg, ankle and knee.

**Conclusions:** Of the four OMERACT US elementary gout lesions only DC count showed a statistically significant decrease as a response to 6 months of urate lowering therapy. The number of tophi had decreased at both 3 and 6 months' follow up, but not statistically significant. Aggregates and erosions count did not markedly respond to the 6 month treatment.

The study indicates that US assessing the OMERACT elementary lesions, particularly DC, is a feasible tool for monitoring gout lesions. However, a follow-up of at least 6 months may be needed to detect change of crystal deposits, as reflected by DC, and presumably an even longer follow-up period is needed to evaluate more massive deposits as tophi.

**OP0156 SIMPLE ASSESSMENT OF CONVENTIONAL 18F-FDG PET/CT ACCURATELY DIAGNOSES CRANIAL ARTERITIS IN GLUCOCORTICOID-NAÏVE GCA PATIENTS: A CASE-CONTROL STUDY**

B.D.Nielsen<sup>1,2</sup>, I.T. Hansen<sup>3,4</sup>, A. Haraldsen<sup>5</sup>, S. Kramer<sup>5</sup>, K.K. Keller<sup>1</sup>, P. Therkildsen<sup>1</sup>, E.-M. Hauge<sup>1</sup>, L.C. Gormsen<sup>1</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>Clinical medicine; <sup>3</sup>Rheumatology, Aarhus University Hospital; <sup>4</sup>Clinical medicine, Aarhus University; <sup>5</sup>Nuclear Medicine and PET, Aarhus University Hospital, Aarhus, Denmark

**Background:** Although older studies argue that fluorine-18-fluorodeoxyglucose (FDG) positron emissions tomography (PET)/CT cannot demonstrate inflammation in cranial arteries the spatial resolution of modern PET systems have greatly

improved allowing for more precise diagnostics of small structures. FDG PET/CT is widely used to diagnose large-vessel (LV) giant cell arteritis (GCA). Recognising FDG uptake in cranial arteries potentially adds to FDG PET/CTs diagnostic accuracy for GCA.

**Objectives:** To evaluate the diagnostic accuracy of conventional FDG PET/CT of the cranial arteries in GCA.

**Methods:** In a cohort of consecutively included glucocorticoid-naïve patients suspected of new-onset GCA, patients full-filling 1990 ACR criteria for GCA were identified. Conventional FDG PET/CT and clinical assessment was performed before treatment. Controls were age- and sex-matched patients with malignant melanoma (MM) who had a metastatic-disease-free follow-up FDG PET/CT<sub>≥</sub>6 months after MM resection.

All PET images were evenly cropped to include only head and neck. Images were randomly assessed by 2 nuclear medicine physicians (10 years experience) blinded to clinical symptoms and findings. Training included review of 5 GCA-PET examinations (not part of cohort). Temporal (TA), maxillary (MA) and vertebral (VA) arteries were visually scored bilaterally. Arterial FDG uptake above surrounding tissue was considered indicative of inflammation and graded low or high. If disagreement between readers occurred, final score was settled by an expert nuclear medicine physician.

Student t test was used for quantitative data. Inter-reader agreement was evaluated by Cohens weighted kappa (disagreement on diagnosis weighted 0, disagreement on FDG uptake intensity weighted 0.2).

**Results:** A total of 44 patients and 44 controls were identified. In both case and control group, the mean age was 69 years (p=0.45) and 25/44 were women. Large-vessel involvement was seen in 39/42 patients, and 35/42 were temporal artery biopsy positive. GCA patients' median global assessment of disease activity was 8 (IQR: 5–10) and median CRP was 70 (95% CI: 58; 85) mg/L.

Considering only FDG uptake in TA and/or MA, diagnostic sensitivity and specificity was 66% (95% CI: 50%–80%) and 100% (95% CI: 92%–100%). Including VA, sensitivity increased to 86% (95% CI: 73%–95%) and specificity remained high, 98% (95% CI: 88% to 100%). Cohens weighted kappa was 0.82 (agreement 93%, p=0.000) in a per segment analysis and kappa was 0.84 (agreement 92%, p=0.000) in diagnosis.

**Abstract OP0156** – Figure 1 FDG PET/CT of cranial arteries in patients with giant cell arteritis

**Conclusions:** Inter-reader agreement on FDG uptake in cranial arteries is almost perfect, and cranial arteritis in glucocorticoid-naïve GCA patients can be readily and accurately diagnosed by conventional FDG PET/CT. The high diagnostic specificity suggests that TAB can be avoided in patients with FDG uptake in cranial arteries. Moreover, FDG PET/CT performed in patients with suspected vasculitis should always include head and neck.

THURSDAY, 14 JUNE 2018

**HPR Singing power to the people****OP0157-HPR AGREEMENT BETWEEN JIA PATIENTS AND PARENTS ON DISEASE PERCEPTION ANALYSED BY THE NORWEGIAN VERSION OF THE JAMAR QUESTIONNAIRE**

M. Bøisland<sup>1</sup>, M. Rygg<sup>2</sup>, E.B. Nordal<sup>3</sup>, A.M. Selvaag<sup>1</sup>. <sup>1</sup>Rheumatology, Oslo University Hospital, Oslo; <sup>2</sup>St. Olavs University Hospital, Trondheim; <sup>3</sup>University Hospital of North Norway, Tromsø, Norway

**Background:** Juvenile Idiopathic Arthritis (JIA) has a broad impact on the child and family life. There is an increasing interest in the importance and recognition of the value of parent/patient reported outcome (PRO). Juvenile Arthritis Multidimensional Assessment Report (JAMAR) assesses essential aspects of the child's disease perception and Health Related Quality of Life (HRQoL). The intention is to enhance adequate medical decisions and to improve patient care in routine clinical setting.

**Objectives:** To determine the level of agreement between patients with JIA and their parents on the quantitative items of the Norwegian version of JAMAR, the direction of potential differences and if sex, age, disease activity and duration influence the level of agreement.

**Methods:** 129 patient/parent dyads participated in the study. The patients, aged 12 to 18 years, were included consecutively at Oslo University Hospital, St. Olavs Hospital in Trondheim, and the University Hospital of Northern Norway in Tromsø during 2012–2013. Both patients and parents completed the JAMAR questionnaire. Demographic and disease specific data were recorded. The study examined the level of agreement for the seven quantitative items in JAMAR. Pain, disease activity (DA) and wellbeing (WB) were measured by a 21-numbered circle VAS, physical function with Juvenile Arthritis Functional Score (JAFS) and HRQoL with Paediatric Rheumatology Quality of Life Scale (JQL) total score including the sub- dimensions Physical Health (JQLPH) and Psychosocial Health (JQLPsH). Both the direction of the differences in scores and whether sex, age, disease activity (MDGlobal), and duration influenced the degree of agreement were investigated. Intraclass correlation coefficient ICC was used for analysis together with paired and independent t-test.

**Results:** Median age for patients were 15 years, 66% were girls, 37% had oligoarticular JIA, 25% had polyarticular RF negative JIA, 4% had systemic JIA, 34% belonged to other categories, and median MDGlobal was 1 (range 0–7). As a group, patients and parents median scores were similar, except for JQLPH, where patients scored better than parents (p=0.002). Correlations between answers from patients and parents were significant for all items (p<0.001), strength varying from ICC 0.70 for JQLPsH to strongest correlation for pain with ICC 0.93. Individual dyads agreement was low showing discordance ( $\geq 1$ ) in at least one item in up to 70% of the pairs.<sup>2</sup> Male patients scored better and female patients scored worse for WB than their parents (p=0.03). Patients with MDGlobal  $\leq 1$  scored less pain and patients with MDGlobal  $>1$  scored more pain than their parents (p=0.01).

**Conclusions:** The Norwegian version of JAMAR is a PRO- and HRQoL-tool suitable for standard clinical care. The study shows high level of agreement between patients and parents as groups, but the strength of the agreement varies between the items. Comparing dyads showed substantial differences on all items. Thus it is important that both adolescent patients and parents complete the questionnaire, and that both reports are used to support adequate clinical assessment and care.

**OP0158-HPR EFFECTIVENESS OF AN E-HEALTH TAILORED SELF-MANAGEMENT PROGRAM FOR PATIENTS WITH RHEUMATOID ARTHRITIS: AN EXPLORATIVE RCT**

R. Zuidema<sup>1</sup>, B. van Gaal<sup>1,2</sup>, I. Meek<sup>1</sup>, E. Van Den Ende<sup>3</sup>, S. Van Dulmen<sup>1,4,5</sup>, J. Fransen<sup>1</sup>, R. Nijhuis<sup>1</sup>. <sup>1</sup>Radboud university medical center; <sup>2</sup>HAN University of Applied Sciences; <sup>3</sup>Sint Maartenskliniek, Nijmegen; <sup>4</sup>NIVEL (Netherlands Institute for Health Services Research), Utrecht, Netherlands; <sup>5</sup>Buskerud and Vestfold University College, Drammen, Norway

**Background:** E-health programs have potential to support RA patients in self-management. However, many of these programs are developed without involving patients. As a consequence, patient preferences for program use are not well

known and these programs may not well suit patient's needs for self-management support. We developed a tailored e-health self-management program for patients with RA with the help of a patient panel. While self-management interventions are complex interventions, it is informative to perform an explorative RCT before embarking on a larger trial.

**Objectives:** 1) Evaluate the potential effectiveness in patients with RA of a 12 month tailored e-health self-management program, versus 'usual care', on self-management behaviour, self-efficacy, general health status, focus on fatigue and the level of pain and fatigue; 2) exploration of floor and ceiling effects of the potential outcome measures at baseline and effect sizes at 6 and 12 months after baseline were used to identify outcome measures most likely to capture potential benefits

**Methods:** The RCT was performed in out-patients from two hospitals in the Netherlands. Inclusion criteria were RA patients 18 years or older, being able to speak and read Dutch and having access to internet. Patients were randomised to 'e-health' in addition to 'usual care' or to 'usual care' alone. The 'e-health' group received 12 months access to the online self-management program. Assessment of outcomes occurred at baseline, 6 and 12 months. Outcome measures included self-management behaviour (PAM-13, SMAS-S), self-efficacy (RASE, PEPPI-5), general health status (RAND-36), focus on fatigue (MPCI-F), pain and fatigue (NRS scales). A linear mixed model for repeated measures, using the intention to treat principle was used to study differences between intervention and control groups. A sensitivity analysis was performed to study the influence of high and low compliance in the intervention group

**Results:** In total 157 patients (n=78 intervention group versus n=79 control group) were included in the study. A statistically significant (p<0.05) between-group difference was only shown for the RAND-36 vitality after 12 months, in favour of the 'e-health' group. Effect sizes were low. Compared with the patients with non or low compliance, patients with a high compliance to the intervention scored statistically significant better on RAND-36 perception after 12 months. Here also, effect sizes were low. Floor and ceiling effects were not apparent in the outcomes used.

**Conclusions:** Based on these results it is not possible to conclude on possible positive effects of the intervention: for all outcomes the effect sizes were low. Consequently, it is not possible to select outcome measures to be regarded as primary/main secondary outcomes for a larger trial. A process evaluation should be performed to give an explanation for the findings of this study.

**OP0159-HPR REUMANET BERNHOVEN: INTRODUCTION AND EVALUATION OF AN ONLINE SELF-MANAGEMENT TOOL AND PERSONAL HEALTH ENVIRONMENT FOR PATIENTS WITH RHEUMATOID ARTHRITIS(RA)**

S. Rongen-Van Dartel<sup>1</sup>, W. Müskens<sup>2</sup>, F. Lamers-Karnebeek<sup>1</sup>, B. Radovits-Persijn<sup>1</sup>, E. Denissen-Cranenburg<sup>1</sup>, C. Vogel<sup>1</sup>, F. Hoeks-van Dinther<sup>1</sup>, A. Wennemers<sup>1</sup>, P. van Riel<sup>1</sup>. <sup>1</sup>rheumatology, Bernhoven, Uden; <sup>2</sup>IQ Healthcare, radboud university medical center, Nijmegen, Netherlands

**Background:** Over the past 15 years, there has been a huge shift in the management of RA: the armamentarium has increased but also the way antirheumatic drug are being used has changed, e.g.treat to target. This has implications for how the communication between professional and patient needs to occur: hence shared decision making part of most guidelines. Therefore, healthcare must be organised in a different way: patients should be more involved in their treatment and patient's self-management should play a very important role. The use of a personal health environment can be an effective tool to involve patients in their disease management and helps to optimise the communication between the patient and health professionals.

**Objectives:** The aim of this project was to create an online personal health environment with self-management tools for patients with rheumatoid arthritis (RA) and determine the factors limiting patients to use this environment.

**Methods:** Since April 2017 a new online personal health environment was developed in the Netherlands especially for patients with RA, called Reumanet Bernhoven. It includes: 1. an overview of the medication and comorbidities, 2. a graphic of disease-related values (e.g.DAS28, anti-ccp, SR, BMI, 36-Item Short Form Health Survey (SF-36), Health Assessment Questionnaire (HAQ) and RA Impact of Disease (RAID)), 3. a diary, 4. questionnaires such as the different VAS scales (pain, fatigue, general health), Health Assessment Questionnaire HAQ, SF-36 and RAID questionnaire to prepare the outpatient visit. 5. an application to send messages to the health professional. 6. a library with useful disease-specific information. 7. a graphic overview of the DAS28 in combination with the RAID questionnaire to self monitor disease activity. After six months those patients who did not use Reumanet yet were contacted to reveal the cause.

**Results:** By November 2017, 997 RA-patients were included in Reumanet Bernhoven. 56% (n=557) used it at least once in this 6 month period. 13% (n=70) of them used the self monitoring tool. The remaining patients, 44% (n=440) were questioned for not using Reumanet at home. 55% (n=242) of these patients responded and 14% (n=62) do want to participate yet, 26% (n=114) did not have a computer or email address, 16% (n=71) did not want to using a digital environment at home.

**Conclusions:** Half of the RA-patients used Reumanet at home of which 13% performed self-monitoring of their disease activity in this online personal health environment. Reumanet will be seen as a promising tool to involve patients in their disease management and can be helpful for shared decision making between patient and health professional. In future, more research is needed to optimise patient self-management in a digital health environment in order to increase its usage.

#### OP0160-HPR DETERMINANTS OF HAPPINESS AND QUALITY OF LIFE IN PATIENTS WITH RHEUMATOID ARTHRITIS: A STRUCTURAL EQUATION MODELLING APPROACH

E. Santos<sup>1,2,3</sup>, C. Duarte<sup>1,4</sup>, R. Ferreira<sup>1,3</sup>, A.M. Pinto<sup>1,4</sup>, R. Geenen<sup>5</sup>, J.A.P. da Silva<sup>1,4</sup>, on behalf of 'Promoting happiness through excellence of care'.

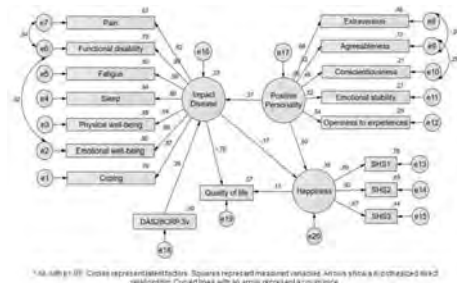

<sup>1</sup>Rheumatology department, Centro Hospitalar e Universitário de Coimbra, Coimbra; <sup>2</sup>Instituto de Ciências Biomédicas Abel Salazar, Porto; <sup>3</sup>Health Sciences Research Unit: Nursing; <sup>4</sup>Faculdade de Medicina da Universidade de Coimbra, Coimbra, Portugal; <sup>5</sup>Psychology, Utrecht University, Utrecht, Netherlands

**Background:** Remission is the core target of disease management in rheumatoid arthritis (RA), but the ultimate goal of medical care is to improve patients' enjoyment of life, a concept akin to happiness. What is the contribution of disease control towards happiness and what other means may the health professional consider towards that goal?

**Objectives:** To examine the determinants of happiness and quality of life (QoL) in patients with rheumatoid arthritis (RA), with emphasis on disease activity, disease impact and personality traits.

**Methods:** This is an ancillary analysis of an observational, cross-sectional study. Consecutive patients were assessed on disease activity, disease impact, personality, QoL and happiness. Structural equation modelling estimation was used to assess the associations between these dimensions, pursuing three hypotheses: H<sub>1</sub> – Disease activity and perceived impact of disease are negatively associated to overall QoL and happiness in patients with RA; H<sub>2</sub> – 'Positive' personality traits are related to happiness both directly and indirectly through perceived disease impact; H<sub>3</sub> – Happiness has a mediating effect in the relation between impact of disease and QoL.

**Results:** Data from 213 patients was analysed. Results obtained in the structural equation measurement model indicated a good fit [ $\chi^2/df=1.38$ ; CFI=0.98; GFI=0.92; TLI=0.97; RMSEA=0.04] and supported all three driving hypotheses (figure 1). Happiness was positively related to 'positive' personality (total effect of 0.56, with a direct effect of  $\beta=0.50$ ,  $p<0.001$  and an indirect effect of  $\beta=0.06$ ,  $p=0.03$ ) and, to a lesser extent, negatively related with perceived impact of disease ( $\beta=-0.17$ ;  $p=0.02$ ). This impact, in turn, was positively related to disease activity ( $\beta=0.36$ ;  $p<0.001$ ) and mitigated by 'positive' personality traits ( $\beta=-0.37$ ;  $p<0.001$ ). Impact of disease had a much stronger relation with QoL than with happiness (total effect of 0.72, of which  $\beta=-0.02$ ,  $p=0.04$  was an indirect effect vs  $\beta=0.17$ ;  $p=0.02$ , respectively). Happiness mitigated the negative effect of disease impact upon QoL ( $\beta=0.13$ ;  $p=0.01$ ). Moreover, disease activity had a negative indirect effect of  $-0.26$  ( $p=0.003$ ) on QoL and also a negative indirect effect of  $\beta=-0.06$  ( $p=0.04$ ) on happiness.

**Abstract OP0160-HPR – Figure 1.** Estimated standardised direct effect for the proposed model.

**Conclusions:** Optimisation of QoL and happiness of people with RA requires not only effective control of the disease process but also improvement of the disease impact domains. Personality, and its effects upon the patient's perception and experience of life, seems to play a pivotal mediating role in these relations and should deserve paramount attention if happiness and enjoyment of life is taken as the ultimate goal of health care.

#### OP0161-HPR THE DEVELOPMENT OF SELF-MANAGEMENT TRAINING FOR INNOVATIVE DEPARTMENTS (STRIDE): A SKILLS-TRAINING PROGRAMME FOR RHEUMATOLOGY TEAMS TO ENHANCE SUPPORT FOR SELF-MANAGEMENT

S. Halls<sup>1</sup>, E. Dures<sup>1</sup>, S. Hewlett<sup>1</sup>, S. Ryan<sup>2</sup>, R. Jenkins<sup>3</sup>, J. van Tonder<sup>3</sup>. <sup>1</sup>Nursing and Midwifery, The University of the West of England, Bristol; <sup>2</sup>Staffordshire and Stoke on Trent Partnership NHS Trust, Haywood Hospital, Stoke on Trent; <sup>3</sup>Rheumatology Department, Bristol Royal Infirmary, Bristol, UK

**Background:** Integrating self-management support into clinical practice is a key NHS, UK, EU and USA policy.<sup>1-3</sup> A survey with >1000 UK patients with inflammatory arthritis showed that many would like support to manage the impact of symptoms (82%), emotions (57%), and depression (34%).<sup>4</sup> However, rheumatology teams rated the support they offer as inadequate, and one of the main reasons is the lack of appropriate skills-training for healthcare professionals.<sup>5</sup> Evidence suggests that self-management support provision works best when it is condition-specific and has team and organisational support.<sup>6,7</sup>

**Objectives:** To develop a skills-training programme for rheumatology teams to enhance support for self-management provision through enhancing current skills and facilitating self-management strategy development.

**Methods:** The steering team comprised clinicians, academics with expertise in self-management and HP education, and two patient partners. To inform the practicalities and structure of the programme and optimise feasibility and acceptability, qualitative telephone interviews were performed with 11 rheumatology healthcare professionals, focusing on barriers and enablers of providing self-management support, and how to optimise buy-in.

**Results:** Interviews identified key considerations and practical recommendations for programme development including: the challenge vs value of involving the whole team; providing opportunities to practice skills; focusing on how to implement skills in clinical practice; and using peer support and prompts to develop and maintain skills. The Self-Management Training for Innovative Departments (STRIDE) programme was therefore formulated to comprise two 3 hour training sessions to whole teams at local departments, approximately 4-6 weeks apart (6 CPD hours). It contains modules on self-management, motivational interviewing, collaborative care and agenda setting, communication and acceptance, and signposting (eg for psychological or peer support) and the opportunity for teams to review their own practice and patient pathways. Delivery involves presentation of the evidence base, group discussion, 4 patient videos, skills demonstrations, and practice and feedback opportunities, facilitated by two expert trainers. Teams are provided with a localised support package after each session, which includes individual behavioural/attitudinal issues and team care provision points discussed during training and raised as potential areas to take forward.

**Conclusions:** Interviews highlighted the challenges in developing team training, and enabled the development of a practical, brief training programme. The STRIDE programme is currently being piloted and evaluated with five rheumatology teams across England. Evaluation involves assessment of healthcare professional skills, knowledge and confidence (pre and post training questionnaires); healthcare professional experiences of training (qualitative interviews); and a patient-based evaluation (pre and post training questionnaires).

**OP0162-HPR ESTIMATING HEALTH-RELATED QUALITY OF LIFE FOR GOUT PATIENTS: A POST-HOC ANALYSIS OF UTILITIES FROM THE CLEAR TRIALS**

F. Pérez-Ruiz<sup>1</sup>, A. So<sup>2</sup>, P. Kandaswamy<sup>3</sup>, R. Karra<sup>3</sup>, K. Kelton<sup>4</sup>, S. Perk<sup>4</sup>, T. Bardin<sup>5</sup>. <sup>1</sup>University of the Basque Country, Biscay, Spain; <sup>2</sup>Service de rhumatologie, Université de Lausanne, Lausanne, Switzerland; <sup>3</sup>Grünenthal GmbH, Aachen, Germany; <sup>4</sup>Medical Decision Modeling, Inc., Indianapolis, USA; <sup>5</sup>Rhumatologie, Lariboisière Hospital, and Université Paris Diderot Sorbonne Cité, Paris, France

**Background:** Prior studies of health-related quality of life (HRQoL) in gout patients have shown significant disutilities associated with flares and tophi or serum uric acid (sUA).<sup>1,2</sup> However, no prior study has explored the simultaneous impact of all three aspects of gout severity.

**Objectives:** Estimate the impact of gout flares, tophi, and sUA levels on HRQoL through post-hoc analysis of SF-36 data collected in two randomised, double-blind, placebo-controlled Phase 3 studies of urate lowering therapies in gout patients (CLEAR 1 and CLEAR 2).<sup>3,4</sup>

**Methods:** Linear regression analysis was used to estimate the effects of patient and disease characteristics on SF-6D scores at month 6 and month 12. Multiple regression methods and out-of-sample testing were used to select the final model from covariates representing tophus burden, the number of flares during each six-month period, serum urate levels, baseline characteristics, and comorbidities. Predicted mean utility scores were calculated by evaluating the model at the mean values of the covariates (excluding location-specific covariates) in the pooled CLEAR 1 and CLEAR 2 intent-to-treat population.<sup>3,4</sup>

**Results:** The final regression model (table 1) includes significant disutilities associated with the presence of tophi at screening (0.0418; SE: 0.0073; p<0.001), the number of gout flares (0.0036 per flare; SE: 0.0005; p<0.001), and median sUA on-treatment (0.0083 per mg/dL in excess of 6 mg/dL; SE: 0.0031; p=0.007). The predicted mean utility scores for patients with zero flares and no tophi are 0.7718 for sUA <6 mg/dL; 0.7552 for sUA 6 to <8 mg/dL; 0.7386 for sUA 8 to <10 mg/dL; and 0.7220 for sUA ≥10 mg/dL.

**Abstract OP0162HPR – Table 1.** Regression model of SF-6D utilities

	–	0.0005	<0.001
	0.0036	0.0073	<0.001
	0.0418	–	–
	–	0.0031	0.007
	0.0083	–	–

R<sup>2</sup>: 0.1788; Adjusted R<sup>2</sup>: 0.1730; Residual standard error: 0.1217 on 1857 degrees of freedom. <sup>†</sup>Baseline characteristics. <sup>‡</sup>Median sUA on-treatment. Abbreviations: SE, standard error; SF-6D, Short form 6D questionnaire; sUA, serum uric acid.

**Conclusions:** The present analysis is unique in that it explored the simultaneous effects of flares, tophi, and sUA on HRQoL. The results indicate that high sUA levels are associated with significant disutility when controlling for the effects of flares, tophi, and other patient covariates. The clinical rationale is that uncontrolled sUA creates a state of chronic inflammation, contributing to underlying ill health in addition to its effects on flares, tophi, and comorbidities.

**OP0163-HPR DEVELOPMENT OF AN ONLINE SELF-MANAGEMENT PLATFORM FOR PEOPLE WITH RHEUMATIC AND MUSCULOSKELETAL CONDITIONS (MSKHUB.COM)**

Y. Prior<sup>1,2</sup>, L. Sammut<sup>1,3</sup>, C. Vasilica<sup>1</sup>, on behalf of the MSKHUB Patient and Public Research Advisory Group (PRAG) and the MSKHUB Health Professionals Reference Group (HPRG). <sup>1</sup>Health Sciences, University of Salford, Salford; <sup>2</sup>Rheumatology, MidCheshire Hospitals NHS Trust, Leighton Hospital, Crewe; <sup>3</sup>Rheumatology, University Hospital Southampton NHS Foundation Trust, Southampton, UK

**Background:** Patient information and education have been shown to improve pain and self-efficacy and increase overall quality of life in people with chronic musculoskeletal conditions (MSCs). Informed patients are better able to distinguish and manage symptoms, use treatments effectively, access services needed, manage work and cope better with the psychological impact of their conditions. However, there is a need to improve the access to high quality specialist health information for people with rheumatic and MSCs.

**Objectives:** This study aimed to test the usability and acceptability of an online self-management platform developed for people with rheumatic and MSCs to facilitate access to (i) valid and reliable health information (ii) evidence-based Patient Reported Outcome Measures (PROMs) (iii) advice on self-help, assistive technologies and rehabilitation (iv) and peer support via an online community.

**Methods:** Phase 1 involved the MSKHUB community development through service-user and health professionals group formation. People with Rheumatic and MSCs (n=15) and their family/carers (n=5) were purposively identified via social media networks and brought in as collaborators to form the MSKHUB Patient and Public Research Advisory Group (PRAG). A multi-disciplinary group of health professionals (n=7) were also identified through the academic and clinical networks to form the MSKHUB Health Professionals Reference Group (HPRG). A digital-lead specialising in health technologies and social media networks also supported the development of the online content and social networks. The digital lead, PRAG and HPRG had face-to-face and online meetings throughout the Phase 1 to inform the development of the MSKHUB through an iterative process. Following the Phase 1, 25 participants with rheumatic and MSCs used the website on their own devices at home and provided feedback by completing a user-experience survey assessing ease of use, helpfulness, and satisfaction with the MSKHUB.

**Results:** Participants completed the registration process and all PROMs on the MSKHUB site in an average of 1.5 hours (SD 30 min); some PROMs required more to complete due to their size and complexity but all PROMs were deemed as relevant and important to include. Participants' comments were addressed to improve the user-friendliness and ease of use. Participants reported high levels of usefulness and satisfaction in the user-experience survey (80% rated the usefulness as 9/10% and 92% rated satisfaction as 7/10 [1=not useful/not satisfied at all to 10=extremely useful/satisfied]). All participants indicated they would continue using the MSKHUB and recommend it to their families and/or friends with rheumatic and MSCs.

**Conclusions:** MSKHUB Development (Phase 1) involved the creation and testing the usability and acceptability of an online self-management platform for people with rheumatic and MSCs, which is an important step in developing appropriate and user-friendly online health education platforms. Our study suggested that community dwelling people with rheumatic and MSCs demonstrated a high degree of acceptance of the MSKHUB and could use it easily. The Phase 2 will involve a wider testing of the MSKHUB for general site activity, use and evaluation through a variety of embedded appraisal methods within the site is currently underway.

**Background:** Nurses should promote self-assessment and self-management skills in order that patients might achieve a greater self efficacy and improvement in patients with axSpA.

**Objectives:** To evaluate the impact of a nurse-led program of self-management/assessment for disease activity program in axSpA.

**Methods:** Prospective, randomised, controlled, open, 12 month trial (NCT02374749). **Participants** 1/Patients: consecutive Axial SpA patients (according to rheumatologist) attending a clinic of the participating centres were invited 0.2/Nurses :all participated at a 1 day meeting prior the start of the study.

**Study treatment:** a program including: 1) Self-management=a) a video explaining the disease, the interest of smoking cessation in axial SpA, the role of NSAIDs as cornerstone treatment in axSpA in the absence of contra-indications, the interest of physical activity and exercise, followed by a discussion with the nurse; b) physical examination by the nurse to check for the presence of spinal deformities and depending on the absence/presence of such deformities projection of a specific video of home-based exercises. 2) Self-assessment: Video presentation of the rationale of the use of a composite index (ASDAS/BASDAI), followed by discussion with the nurse. Explanation by the nurse of the collection, calculation of BASDAI and ASDAS **Treatment allocation:** after written informed consent, the treatment was allocated randomly via an electronic system. **Outcome variables:** Primary: The level of coping (0–10, where 0=very well) after 12 months. Other variables: Successful smoking cessation, NSAID intake, Number of home-based or supervised exercise, international physical activity questionnaire (IPAQ).

**Results:** Baseline characteristics of the 502 recruited patients (250 and 252 in the active and control groups, respectively): Age: 46.7±12.2 years, male gender: 62.7%, disease duration: 13.7±11.0 y, Xray sacroiliitis 62.8%, MRI sacroiliitis 65.7%, current biologic treatment: 78.3%, ASDAS-CRP: 1.9±0.8, BASFI: 25.6±22.3. After 1 year, coping levels were lower in the active group, but not significant (2.8±2.0 vs 3.0±2.1, p=0.3). However, there was a significant decrease in the BASDAI in the active group (-1.2±15.8 vs +1.4±15.7, p=0.03), a significant increase in the number (6.1±28.8 vs -0.4±26.9, p=0.03) and duration (4.3±20.1 vs -1.7±20.7, p<0.01) of the home-exercises in the active group, and a greater IPAQ score in the active group at the end of follow-up (138.4±227 vs 95.6±173, p=0.02).

**Conclusions:** This study highly suggests a short-term benefit of a nurse led program on the self-management and self-assessment for disease activity in a young axSpA population in particular with regard to the frequency and the duration of home exercises.

**Fires and firefighters: switching the immune system on and off**

**OP0165** **JOINT-SPECIFIC DIFFERENCES IN THE ACTIVATION OF THE JAK-STAT PATHWAY IN RHEUMATOID ARTHRITIS**

T. Masterson, K. Klein, E. Karouzakis, O. Distler, C. Ospelt, M. Frank Bertoncelj. Center of Experimental Rheumatology Zurich, University Hospital Zurich, Schlieren, Switzerland

**Background:** Synovial fibroblasts (SF) promote chronic joint inflammation and joint destruction in rheumatoid arthritis (RA). We have shown recently that SF

from different joints exhibit profound differences in their transcriptomes, epigenomes and functions, which creates a unique microenvironment in each joint. This might influence the susceptibility of distinct joints to develop RA or lead to joint-specific differences in the disease severity or therapeutic response.

**Objectives:** To analyse differences in the JAK-STAT pathway in SF from different joints.

**Methods:** SF were isolated from knee, shoulder and hand joints of RA and osteoarthritis patients undergoing joint replacement surgery and from knee synovial biopsies of non-arthritic subjects with arthralgia. Transcriptomes and epigenomes of SF were determined by RNA-seq, Illumina HiSeq 2000 (n=21), ChIP-seq (Illumina HiSeq 2500, n=7) and Infinium HumanMethylation450 BeadChip (n=12). We used MetaCore (Thomson Reuters) for the pathway enrichment analysis of RNA-seq data. SF were stimulated with IL-6/soluble IL-6 receptor (IL-6/sIL-6R, 50 ng/ml each). The amount of STATs and phospho-STAT3 (p-STAT3) was measured by Western blot with normalisation to  $\alpha$ -tubulin.

**Results:** The JAK-STAT pathway was enriched in knee SF versus hand and shoulder SF (FDR<0.05). JAK1 (normalised reads – mean  $\pm$ SD: 10673 $\pm$ 2084) and STAT1 (15520 $\pm$ 2678) were the top expressed Janus kinase and STAT mRNAs in SF, respectively, whereas the expression of JAK3 (40 $\pm$ 26) and STAT4 (164 $\pm$ 91) mRNAs was low. Looking into joint-specific differences, STAT1 mRNA was higher in knee SF and shoulder SF compared with hand SF (p<0.05, FDR<0.15). Accordingly, STAT1 protein was increased in knee SF (STAT1/ $\alpha$ -tubulin ratio: 0.83 $\pm$ 0.02, p=0.02, n=4) and shoulder SF (1.02 $\pm$ 0.02, p=0.001, n=5) versus hand SF (0.57 $\pm$ 0.02, n=3). JAK1, STAT2 and STAT5B mRNAs were higher in knee compared with hand SF (p<0.05, FDR<0.05) and STAT2 and STAT6 mRNAs were higher in knee versus shoulder SF (p<0.05, FDR<0.05). TYK2 mRNA was high in hand SF compared with shoulder and knee SF (p<0.05, FDR<0.05). SF from different joints exhibited comparable DNA methylation at the promoters of these genes. Activating histone marks H3K4me3 and/or H3K27ac were enriched at the promoters of JAK1, STAT1, STAT2 and STAT5B in knee versus hand SF. This indicated that the abundance of activating histone marks at gene promoters might shape joint-specific expression of a subset of Janus kinase and STAT genes. Stimulation of SF with IL-6/sIL-6R increased the phosphorylation of STAT3 in knee (p-STAT3/ $\alpha$ -tubulin ratio 1.8 $\pm$ 1.0, p=0.03, n=5) and shoulder SF (1.8 $\pm$ 0.7, p=0.03, n=6) compared with hand SF (0.9 $\pm$ 0.5, n=6). The basal amount of STAT3 protein and the ratio pSTAT3/STAT3 was higher in knee SF (STAT3/ $\alpha$ -tubulin ratio: 0.8 $\pm$ 0.1; p-STAT3/STAT3: 2.2 $\pm$ 0.8, n=3) and shoulder SF (0.6 $\pm$ 0.4; 2.1 $\pm$ 1, n=4) versus hand SF (0.3 $\pm$ 0.02; 1.0 $\pm$ 0.4, n=2).

**Conclusions:** Here we show substantial quantitative and qualitative differences in the JAK-STAT signalling pathway in SF from different joints. Knee SF, in particular, exhibit increased expression of Janus kinase and STAT genes and enhanced JAK-STAT signalling upon stimulation with IL-6/sIL-6R. This suggests that RA in different joints might not be equally sensitive to Janus kinase inhibitors or blockade of IL-6. This has important implications in clinical practice and drug discovery in RA.

**OP0166** **COMPARATIVE EVALUATION OF CELLULAR AND MOLECULAR CHANGES ASSOCIATED WITH RESPONSE TO SELECTIVE IL-23 BLOCKADE VS DUAL IL-12/23 BLOCKADE IN PSORIASIS SKIN**

K. Li<sup>1</sup>, K. Campbell<sup>1</sup>, S. Garcel<sup>2</sup>, C. Brodmerkel<sup>1</sup>, J. Krueger<sup>2</sup>. <sup>1</sup>Janssen Research and Development, LLC, Spring House; <sup>2</sup>Laboratory for Investigative Dermatology, The Rockefeller University, New York, USA

**Background:** Emerging clinical data indicate that selective blockade of interleukin 23 (IL-23) can achieve greater efficacy compared to dual blockade of IL-12/23 in patients with moderate-to-severe psoriasis (PsO).<sup>1</sup> Ustekinumab (UST) targets the p40 subunit common to IL-12 and IL-23, whereas guselkumab (GUS) specifically targets the IL-23-specific p19 subunit. While differences in antibody potency may explain therapeutic differences between UST and GUS, we explored cellular and molecular changes in the skin of PsO patients treated with UST or GUS to understand the mechanism underlying selective IL-23p19 inhibition.

**Methods:** UST data were derived from the ACCEPT study (NCT00454584, n=85), in which PsO patients received either 45 mg or 90 mg of UST at weeks (wks) 0 and 4, and GUS data were from the first-in-human study (NCT00925574, n=24) that tested single subcutaneous doses of GUS. Skin biopsies were collected at baseline (BL), and wks 1 and 12 post-treatment from each study to evaluate 1) histologic improvement via epithelial thickness, T cells (CD3), and myeloid DCs (CD11c) counts and 2) molecular response to drug via microarray. Biopsies from healthy subjects served as controls. GUS 100 mg and 300 mg groups were combined to increase analytic power. The IC<sub>50</sub> of each drug was evaluated by cell-based bioassays.

**Results:** The two cohorts are comparable in BL demographics, disease characteristics, skin histopathology, PsO lesional molecular expression profiles, and significantly enriched canonical pathways. Blockade of IL-23 with GUS resulted in a significantly greater reduction in CD3 and CD11c counts in the skin at wk12 relative to BL when compared to UST blockade (>90% vs ~70%). In pts who achieved >50% improvement in PASI score, GUS (n=9) showed a larger impact on the PsO transcriptomic profile than UST 90 mg (n=12) by wk1 and greater enhancement was achieved by wk12. GUS neutralised 74% of the PsO disease profile by >80%, while UST resolved only 21% at wk12. Expression of PsO disease markers such as defensin Beta 4A and lipocalin 2 were fully resolved by GUS beyond the level observed in non-lesional skin of PsO pts, while UST only resolved these markers by 32% and 63%, respectively. *In vitro*, GUS showed higher potency (2–14 fold) than UST in inhibiting IL-23 activity, which may contribute to stronger neutralisation of PsO disease markers by GUS.

**Conclusions:** In conclusion, this comparative study demonstrates that GUS inhibits psoriasis-associated pathology and resolves the skin transcriptomic PsO disease profile more strongly than UST.

OP0167

#### A LOW MOLECULAR WEIGHT BAFF SIGNALLING INHIBITOR, BIK-13, AMELIORATES B CELL ACTIVATION *IN VITRO* AND *IN VIVO* AUTOIMMUNE MODELS AND CONSEQUENTLY SUPPRESSES PRODUCTION OF IGG AND CYTOKINES

K. Yoshimoto<sup>1</sup>, N. Seki<sup>2</sup>, K. Suzuki<sup>1</sup>, K. Sugahara<sup>2</sup>, K. Chiba<sup>2</sup>, T. Takeuchi<sup>1</sup>. <sup>1</sup>Keio University School of Medicine, Tokyo; <sup>2</sup>Research Unit/Immunology and Inflammation, Mitsubishi Tanabe Pharma Corporation, Yokohama, Japan

**Background:** We reported that BAFF robustly increases IL-6 production by peripheral monocytes of patients with primary Sjögren's syndrome (pSS) and that the BAFF-induced IL-6 production and serum IgG levels of the patients were positively correlated with the expression level of a BAFF receptor (BR3) in pSS monocytes. Moreover, we found that IgG production by pSS B cells *in vitro* was significantly enhanced by BAFF-stimulated monocytes. These results collectively suggest that BAFF signalling via BR3 is involved in IgG overproduction and that is a possible therapeutic target to treat autoimmune diseases, such as pSS. We successfully discovered a pyrrolopyrimidine derivative, BIK-13, which inhibits BAFF binding to BR3 by our original high throughput screening.

**Objectives:** To explore the possibility of BIK-13 as a drug to treat autoimmune diseases.

**Methods:** Human PBMC were stimulated *in vitro* with a mixture of soluble BAFF (sBAFF), recombinant human IL-21, and anti-IgM and anti-CD40 antibodies ('multiple stimulation') to differentiate B cells into plasma blasts and/or plasma cells. BIK-13 was added to the culture and the differentiation of B cells was monitored by the expression levels of CD19/CD38/IgD and Activation-induced cytidine deaminase (AID) analysed by FACS and quantitative RT-PCR, respectively. The amounts of IL-6, IL-10 and IgG in the culture supernatants were measured by ELISA. BIK-13 was administered intraperitoneally to MRL/lpr mice and serum levels of an anti-dsDNA antibody, IL-6 and IL-10 were measured by ELISA. The proportion of B cells among splenic lymphocytes of the mice was analysed by FACS. Production of cytokines *in vitro* by stimulated splenic lymphocytes was measured

by ELISA. Infiltration of lymphocytes into organs was analysed by immunohistochemistry.

**Results:** FACS analysis of multiple-stimulated human PBMC indicated that differentiation of B cells into plasma blasts and/or plasma cells was inhibited by BIK-13 in a dose dependent manner. Interestingly, increased IgG, IL-6 and IL-10 production by the stimulated PBMC were concomitantly and significantly suppressed by BIK-13. In addition, the expression level of AID in the cells was also suppressed by BIK-13, suggesting that an IgG class switching was impaired. Administration of BIK-13 to MRL/lpr mice for 16 weeks decreased the serum levels of an anti-dsDNA antibody, IL-6 and IL-10 as compared to the control. Notably, immunohistochemical analysis revealed that infiltration of B cells into salivary and lacrimal glands was remarkably suppressed in BIK-13-treated mice. Moreover, the proportion of B cells among splenic lymphocytes was also decreased in BIK-13-treated mice as compared to the control. In addition, production of IL-6 and IL-10 by activated splenic lymphocytes of the BIK-13-treated mice was also remarkably suppressed as compared to control mice.

**Conclusions:** Our data collectively suggest that BIK-13, a low molecular weight BAFF-signalling inhibitor, suppresses B cell activation/differentiation *in vitro* and consequently inhibits production of IgG and cytokines, such as IL-6 and IL-10, by the cells. The compound inhibited infiltration of B cells into organs of model mice of autoimmune diseases. These data suggest that the compound is a promising drug candidate to treat autoimmune diseases, such as pSS.

OP0168

#### NIK-IKK COMPLEX INTERACTION CONTROLS NF-KB DEPENDENT INFLAMMATORY ACTIVATION OF THE ENDOTHELIUM IN RESPONSE TO LTBR LIGATION

K. Jeucken<sup>1</sup>, P. Kucharzewska<sup>2</sup>, C.X. Maracle<sup>1</sup>, J.P. van Hamburg<sup>1</sup>, H.K. Olsson<sup>2</sup>, S.W. Tas<sup>1</sup>. <sup>1</sup>Experimental Immunology/Clinical Immunology and Rheumatology, AMC Amsterdam, Amsterdam, Netherlands; <sup>2</sup>Department of Bioscience, RIA IMed, AstraZeneca, Gothenburg, Sweden

**Background:** Sites of chronic inflammation, such as rheumatoid arthritis (RA) synovial tissue, are characterised by neovascularization and often contain tertiary lymphoid structures with characteristic features of lymphoid organs such as high endothelial venules (HEV), and sometimes even true germinal centres. Ligation of the lymphotoxin (LT)- $\beta$  receptor (LT $\beta$ R) results in activation of both canonical and NF- $\kappa$ B-Inducing Kinase (NIK)-dependent noncanonical NF- $\kappa$ B signalling in endothelial cells (EC) and plays a crucial role in lymphoid neogenesis. Noncanonical NF- $\kappa$ B signalling in EC promotes inflammation-induced angiogenesis and triggers the development of the cuboidal HEV appearance. However, the relative contribution of the individual pathways to the acquisition of leukocyte traffic-regulating properties by EC is less well understood.

**Objectives:** To identify the molecular pathways by which LT $\beta$ R drives inflammatory activation of EC to promote interactions with leukocytes.

**Methods:** Primary human EC were treated with LT $\beta$  or LIGHT to activate LT $\beta$ R, followed by analysis of downstream NF- $\kappa$ B signalling pathways and expression of inflammatory cytokines and adhesion molecules. To repress canonical NF- $\kappa$ B signalling pathway, a small molecule inhibitor of IKK $\beta$  was used, and noncanonical NF- $\kappa$ B signalling was repressed with siRNA targeting NF $\kappa$ B2. The role of NIK in LT $\beta$ R signalling was investigated using small molecule inhibitors and siRNA targeting NIK, as well as adenoviral overexpression of NIK. The role of NF- $\kappa$ B signalling in RA was measured by stimulating EC with RA synovial fluid (RASf) followed by analysis of inflammatory mediators.

**Results:** LT $\beta$ R triggering in EC resulted in activation of both canonical and non-canonical NF- $\kappa$ B signalling pathways and induced inflammatory cytokine expression and immune cell adhesion. IKK $\beta$  inhibition completely repressed LT $\beta$ R-induced inflammatory activation of EC, indicating that this process was mediated through canonical NF- $\kappa$ B signalling. Interestingly, inactivation of NIK with small molecule inhibitors and siRNAs significantly decreased LT $\beta$ R-induced expression of inflammatory cytokines and adhesion of immune cells to endothelium, whereas silencing of NF $\kappa$ B2 had no effect. This suggests that the noncanonical pathway is dispensable for NIK-dependent activation of EC through the canonical NF- $\kappa$ B pathway. Further analyses, including silencing of NIK and NIK overexpression, demonstrated a role for NIK in activation of the canonical NF- $\kappa$ B pathway by amplifying IKK complex activity. RASf stimulation of EC resulted in activation of canonical and noncanonical NF- $\kappa$ B signalling, and increased the expression of inflammatory cytokines and adhesion molecules, which could be blocked by targeting NIK.

**Conclusions:** These findings suggest that in addition to regulating noncanonical signalling, NIK can serve as an amplifier of canonical NF- $\kappa$ B signalling and associated inflammatory responses in EC, which may play a role in development and

maintenance of chronic inflammation. Consequently, NIK may be an attractive therapeutic target.

**OP0169 A COMBINATION OF PROTEINS AS MEASURED WITHIN THE MULTI-BIOMARKER DISEASE ACTIVITY SCORE AT PRESENTATION OF RA IDENTIFIES A GROUP OF ACPA-NEGATIVE RA PATIENTS WITH HIGH LIKELIHOOD OF DEVELOPING DMARD-FREE SUSTAINED REMISSION**

D.M. Boeters, L.E. Burgers, T.W. Huizinga, A.H. van der Helm-van Mil. *Rheumatology, Leiden University Medical Center, Leiden, Netherlands*

**Background:** Rheumatoid arthritis (RA) typically requires lifelong treatment. However, some RA patients achieve sustained disease-modifying antirheumatic drug (DMARD)-free remission, which is a proxy for cure of RA that has become increasingly achievable, as reported previously. DMARD-free sustained remission has been reported mostly in autoantibody-negative RA, yet the underlying mechanism is unknown. The multi-biomarker disease activity (MBDA) score combines 12 serum biomarkers and is developed to measure RA disease activity. We hypothesise that the subgroup of RA patients that is most likely to achieve DMARD-free sustained remission is identifiable at disease presentation by cytokines such as those combined in the MBDA score.

**Objectives:** To evaluate whether the MBDA score or its component cytokines at the presentation of RA are associated with ability to later achieve DMARD-free sustained remission.

**Methods:** 300 patients with RA (by the 1987 and/or 2010 criteria) who had been consecutively enrolled in the Leiden Early Arthritis Clinic between 2010 and 2015 were studied. At time of diagnosis, before DMARD treatment was started, the MBDA score, with a scale of 1–100, was determined from the serum concentrations of 12 biomarkers (VCAM-1, EGF, VEGF-A, IL-6, TNF-RI, MMP-1, MMP-3, YKL-40, Leptin, Resistin, CRP, SAA) with a pre-specified, validated algorithm. Patients were categorised as having a low (<30), moderate<sup>30–44</sup> or high (>44) MBDA score. DMARD-free sustained remission was defined as the absence of synovitis (by physical examination) that sustained after discontinuation of all DMARD therapy (including biologics and systemic and intra-articular corticosteroids) for the entire follow-up period, but had to extend to at least one year after DMARD withdrawal. Analyses were stratified for ACPA and restricted to 5 years follow-up as thereafter the number of patients became small. The median follow-up duration of all patients was 4.3 years.

**Results:** A total of 54 RA patients (18%) had achieved DMARD-free sustained remission. For the total group of RA patients, baseline MBDA category ( $p=0.03$ ) and ACPA-negativity ( $p<0.001$ ) were associated with achieving DMARD-free sustained remission. For ACPA-positive RA patients, the MBDA category at baseline was not associated with achieving DMARD-free sustained remission ( $p=0.89$ , figure 1). By contrast, among ACPA-negative RA patients, none of those with low MBDA score achieved DMARD-free sustained remission during 5 years follow-up, whereas the estimated rate of remission was 50% for those with moderate or high MBDA scores ( $p=0.009$ , figure 1). Of the 12 biomarkers in the MBDA test, only SAA showed a significant difference between ACPA-negative patients with and without DMARD-free sustained remission ( $p=0.01$ ).

**Conclusions:** ACPA-negative RA patients who achieved DMARD-free sustained remission were characterised by moderate to high MBDA scores at disease presentation. This is the first evidence that a cytokine profile at disease onset can identify a subgroup of ACPA-negative RA patients with a high likelihood of maintaining clinical remission after treatment withdrawal.

**OP0170 HUMAN IL-38 REDUCES JOINT INFLAMMATION IN A MOUSE MODEL OF GOUTY ARTHRITIS**

D.M. De Graaf<sup>1</sup>, F.L. Van de Veerdonk<sup>1</sup>, E.Z. Eisenmesser<sup>2</sup>, L.A.B. Joosten<sup>1</sup>, C. A. Dinarello<sup>1,3</sup>. <sup>1</sup>Experimental Internal Medicine, Radboud University Medical Center, Nijmegen, Netherlands; <sup>2</sup>Department of Biochemistry and Molecular Genetics; <sup>3</sup>Department of Medicine, University of Colorado Denver, Aurora, USA

**Background:** Interleukin-38 (IL-38) is the last member of the IL-1 family of cytokines to be fully investigated for its functions. IL-38 is proposed as an anti-inflammatory cytokine in various auto-inflammatory diseases, such as psoriasis and rheumatoid arthritis. For example, IL-38 knockout mice have exacerbated autoantibody-induced arthritis. Current understanding of the capacity of IL-38 in gout, a prototype IL-1 $\beta$  driven auto-inflammatory disease, is unknown.

**Objectives:** We hypothesised that *in vivo* treatment with human recombinant IL-38 results in a reduction in joint inflammation in a mouse model of gouty arthritis.

**Methods:** We treated C57/Bl6 mice with 1  $\mu$ g recombinant IL-38 (3–152 AA) intraperitoneally at 24, 12 and 2 hours before induction of gouty arthritis with intra-articular injection of albumin-opsonized monosodium urate crystals (300  $\mu$ g) and palmitic acid (200  $\mu$ M) in 10  $\mu$ L PBS. Joint inflammation was scored after 4 hours. The synovial lining was cultured in RPMI for 2 hours to allow cytokines to be secreted, and cytokines in the synovium were extracted with Triton-X 100 to obtain total cytokines (membrane and intracellular). In the synovial culture fluid and extract, IL-1 $\beta$ , IL-6 and KC were measured by ELISA. Data

**Results:** Mice treated with recombinant IL-38 exhibited significantly reduced joint swelling and redness on a three-point macroscopic inflammation scale: Vehicle-treated 1.5 $\pm$ 0.25 vs IL-38 Treated 0.75 $\pm$ 0.25 (n=10,  $p<0.0001$ , Mann Whitney-U test). The 2 hour synovial membrane culture fluid contained significantly lower levels of IL-1 $\beta$  (1207 $\pm$ 480 vs 379 $\pm$ 184 pg/mL,  $p<0.05$ ), IL-6 (10783 $\pm$ 2490 vs 5321 $\pm$ 2935 pg/mL,  $p<0.05$ ) and KC (4390 $\pm$ 931 vs 1081 $\pm$ 750 pg/mL,  $p<0.05$ ). In extract of the synovial membrane, there is a reduction in IL-1 $\beta$  (1505 $\pm$ 397 vs 624 $\pm$ 509 pg/mL,  $p<0.05$ ), IL-6 (11059 $\pm$ 2299 vs 3597 $\pm$ 2509 pg/mL,  $p<0.01$ ) and KC (1505 $\pm$ 397 vs 624 $\pm$ 509 pg/mL,  $p<0.05$ ).

**Conclusions:** Human recombinant IL-38 reduces swelling and redness of the joint, and pro-inflammatory cytokines secreted by and contained in the synovial membrane in a mouse model of gouty arthritis. These data reveal that recombinant IL-38 has therapeutic benefit in an IL-1 $\beta$  mediated model of inflammation.

**OP0171 LEPTIN LEVELS, OVERWEIGHT AND P GINGIVALIS PRESENCE CONTRIBUTE TO THE MECHANISM OF SYSTEMIC INFLAMMATION IN FIRST-DEGREE RELATIVES OF RHEUMATOID ARTHRITIS INDIVIDUALS**

C Romero-Sanchez<sup>1,2,3</sup>, J.A. Chaparro-Sanabria<sup>2,3</sup>, J.M. Bello-Gualtero<sup>2,3</sup>, R. Valle-Oñate<sup>3</sup>, L. Chila<sup>1</sup>, D.M. Castillo<sup>1</sup>, G. Lafaurie<sup>1</sup>, P. Chalem Ch<sup>4</sup>, W. Bautista-Molano<sup>1,2</sup>. <sup>1</sup>Unit of Oral Basic Investigation, Universidad El Bosque; <sup>2</sup>Clinical Immunology Group, Universidad Militar Nueva Granada; <sup>3</sup>Department of Rheumatology and Immunology, Hospital Militar Central; <sup>4</sup>Fundación Instituto de Reumatología Fernando Chalem, Bogotá D.C., Colombia

**Background:** Association studies in rheumatoid arthritis (RA) have been focused in the pre-clinical phases of the disease in first-degree relatives (FDR). Data has shown that obesity, ACPA and the periodontal condition may modulate the severity and the clinical presentation of RA

**Objectives:** To investigate the levels of adipokines in FDR and establish their association with the state of rheumatic and periodontal condition

**Methods:** 124 FDR individuals and 124 healthy controls matched by age and gender were included. Rheumatologic (clinical and serological markers) and periodontal assessment was performed. It was quantified the adiponectin, leptin, IL6 levels. HLA-DRB1 was determined. Serum markers of RA (rheumatoid factor, erythrocyte sedimentation rate, C reactive protein (CRP), and ACPA. *P gingivalis* and IgG1/IgG2 *P gingivalis* were measured. Radiographs of hands and feet were evaluated the Sharp-van der Heijde score. An association analysis was made to evaluate the relationship between adipokines and periodontal, rheumatologic conditions using X2 test, and logistic regression model was performed to confirm this associations

**Results:** In FDR group, 71.77% were women with a mean age of 39.24 $\pm$ 12.22 years. 37.09% had overweight and 4.83% had obesity. Among the controls, 70.97% were women, with an average age of 39.31 $\pm$ 12.30 years. 27.41% had overweight and 4.83% had obesity. Leptin levels were found in 37.66% vs 18.42% in controls ( $p=0.002$ ). In FDR, 60.48% had periodontal disease of which 62.66% moderate, *P gingivalis* in 62.10%. In controls, 55.64% had periodontal disease, of which 63.76% moderate with 42.74% *P gingivalis* positive ( $p=0.002$ ). In the FDR, radiography of hands and feet showed in 25.28% of them had some alteration, 68.18% had  $\geq 1$  erosion, 45.45% had  $\geq 1$  joint space narrowing and in 6.89% juxta-articular osteopenia. An association of leptin levels with the low economic level was found  $p=0.006$  and high levels of leptin in individuals with BMI  $\geq 30$   $p=0.031$ .

IL6 was found to be associated with severity of periodontal disease, with higher levels being found frequently in mild periodontal disease  $p=0.039$ . The condition of FDR was significantly associated with high leptin levels adjusted for presence of swollen joints, presence of *P. gingivalis* and low levels of IL6 OR=2.57, 95% CI: 1.14 to 5.95. In this group, the individual with leptin at moderate levels adjusted with BMI >25, has a lower probability of presenting CRP >3 mg/L OR=0.43 95% CI: 0.20 to 0.90.

**Conclusions:** High levels of leptin, the presence of *P. gingivalis* and swollen joints may be relevant conditions associated with the development of RA in FDR. Leptin levels and overweight can modulate the production of acute phase proteins in this group of individuals contributing to the mechanism of systemic inflammation. The clinical implications of our findings propose regulated exercise programs, oral hygiene, and weight control in FDR

#### OP0172 LPS-INDUCED PERIODONTITIS PROMOTES ARTHRITIS DEVELOPMENT IN MICE

A. Scanu<sup>1</sup>, C. Giraudo<sup>2</sup>, F. Galuppini<sup>3</sup>, V. Lazzarin<sup>3</sup>, G. Pennelli<sup>3</sup>, S. Sivoletta<sup>4</sup>, F. Oliviero<sup>1</sup>, P. Galozzi<sup>1</sup>, M. Rugge<sup>3</sup>, R. Stramare<sup>2</sup>, R. Luisetto<sup>5</sup>, L. Punzi<sup>1</sup>.  
<sup>1</sup>Rheumatology Unit; <sup>2</sup>Radiology Unit; <sup>3</sup>Surgical Pathology Unit; <sup>4</sup>Dentistry Section; <sup>5</sup>Dept. of Surgical Oncological and Gastroenterological Sciences, University of Padova, Padova, Italy

**Background:** Although *in vivo* studies have demonstrated that periodontitis aggravates experimental arthritis, there are no animal models that mimic the co-occurrence of these diseases.

**Objectives:** To investigate the arthritogenic effect of lipopolysaccharide (LPS) in a mouse model of periodontal disease.

**Methods:** Periodontitis was induced in CD1 mice by injection of 0.01 or 0.05 µg of LPS in 5 µl of PBS every 48 hour into the vestibular gingiva of the second molar on the left maxilla. Untreated mice or injected with LPS at the tail were used as controls. Mice (n=10 per condition) were monitored daily and arthritis was estimated by conventional visual scoring method (scale 0–5) and recording the paw swelling with a calliper. 2 weeks after the 9th injection mice were sacrificed to collect blood, maxilla and paw samples. The left maxilla was analysed by microCT and the alveolar bone loss was assessed measuring the distance between the cementum-enamel junction (CEJ) and the alveolar bone crest (ABC) of each molar. Ultrasound (US) was performed to measure the ankle joint space. Periodontal and paw tissues were processed for histological analysis. Inflammation, vascular proliferation and bone resorption were scored (0–3) in maxilla. Inflammation, pannus formation, cartilage and bone destruction were scored (0–5) in ankle joints. CXCL1, IL-1β, IL-6 and TNF serum levels were determined by ELISA.

**Results:** Ankle swelling and inflammation were noted after the 5th periodontal injection of 0.05 µg of LPS, picked at day 18 and continued for the next 15 days with paw swelling and score higher than those of untreated mice (at the sacrifice  $p<0.001$ ). 0.01 µg of LPS did not induce paw changes. Therefore, the subsequent assessments were conducted only in mice injected with 0.05 µg of LPS. The CEJ-ABC distance was greater in the inoculated (0.29±0.08 mm) than in the control (0.17±0.05 mm) mice ( $p<0.001$ ). Histological analysis showed that LPS induced a mild vascular proliferation (score 0.8±0.42) in periodontal tissue and a substantial alveolar bone resorption (score 1.8±0.42), but not inflammation. US revealed the presence of effusion and a 1.5-fold higher joint space in the ankle of mice with periodontitis than in controls ( $p<0.05$ ). Leukocyte infiltration (score 2.36±1.56) and synovial proliferation (score 2.09±1.54) were observed after histology in ankle joints of mice injected orally. The same sections had slight cartilage (score 1.32±1.21) and bone destruction (score 0.68±0.72). Animals that received LPS tail injection did not show any clinical and histological signs of arthritis. CXCL1 and TNF were higher in arthritic mice (CXCL1:2226.87±264.38 pg/ml; TNF:24.55±7.0 pg/ml), than in controls (CXCL1:445.97±92.09 pg/ml; TNF:3.22±1.04 pg/ml). Although there was no statistical difference, IL-1β and IL-6 were highest in LPS-mice (IL-1β:79.49±11.99 pg/ml; IL-6:196.02±40.62 pg/ml).

**Conclusions:** This study shows that experimental arthritis and periodontal disease can co-occur after LPS oral injection in mice. Our model may be useful to improve the understanding of the mechanisms underlying the link between periodontitis and arthritis.

#### Inclusive school environment for young people with RMDs

#### OP0173-PARE YOUTH-R-COACH, A PROGRAM FOR YOUTH WITH A CHRONIC DISEASE

L. van Nieuwkoop<sup>1,2</sup>, L. van Geene<sup>1</sup>, R. Janssen<sup>1</sup>. <sup>1</sup>Stichting Chronisch Ziek en Werk, Eindhoven; <sup>2</sup>Stichting Youth-R-Well.com, Lisse, Netherlands

**Background:** Youth-R-Coach is a project for youth (aged 15–25) with a chronic illness. It is a project set up by the Centre for Chronically Ill and Work (CCZW) in cooperation with Youth-R-Well.com, the Dutch organisation for youth with RMDs. Youth-R-Coach is based on CCZW's program for the certification of 'experience expertise'.

**Objectives:** Youth-R-Coach focusses on the development of experts-by-experience, and making those experiences available for others to learn from. A distinctive element is the creative aspect: the development of writing talent.

**Methods:** The participants reflect individually on personal experiences with their disease, as well as their personal competencies. This process is supported by a portfolio of assignments and a mentor who also has an RMD. The participants also incorporate their personal experience with the disease in a self-written book with support of a writing coach. Even though the process is an individual one, the program starts with a group of participants. There is a kick-off meeting, a weekend training and a final group meeting. In this way, the participants get to know each other and learn from each other's personal experiences with the disease. They stay in contact during the program and help each other with the portfolio and writing of their book. During the meetings, workshops are provided to teach them new skills, such as 'online coaching' and 'presenting'.

**Results:** Youth-R-Coach worked with a group of 7 participants who followed the program in 2016, and a group of 7 participants who started in 2017. Both groups are currently busy finalising their portfolios and books, which will be ready in May 2018.

The books are intended to make personal experiences in dealing with an RMD available for peers, for whom the books can be a source of support in dealing with the disease. The books are also interesting for a wider audience, because they provide insights into living with a chronic illness as a young person. The books are all very different. Some wrote short columns, while others wrote an entire novel. What all the books have in common is that they are all based on personal experiences of living with a chronic illness.

Developing expertise-by-experience and writing about their experiences has helped the participants to better cope with their disease, and has made them ambassadors. Some of them have been, or are still, involved in activities for patient organisations since the start of the program. For example, some have volunteered as a mentor for an RMD youth holiday camp, or given presentations based on personal experience with an RMD. Some participants will continue coaching their peers after finishing the program, and some continue writing about their personal experiences in a blog. How participants will continue to use their new-found skills is down to personal interests and competencies, but whatever they do, the program has given them useful tools for coping with and teaching others about the disease.

**Conclusions:** Fourteen participants (aged 18–27) developed their expertise-by-experience in dealing with an RMD and are now able to act as a coach for their peers. Their experiences in dealing with the disease will be published in self-written books and made available to a wide audience. All of the current participants had an RMD, but the project would also be useful for youths who have other chronic illnesses.

**Acknowledgements:** Youth-R-Coach was made possible with the financial support of the FNO Foundation.

#### The building blocks of systemic inflammation

#### OP0174 ALTERATION OF MEDIATORS OF VASCULAR INFLAMMATION BY ANIFROLUMAB IN THE PHASE IIB MOUSE STUDY IN SLE

W.I. White<sup>1</sup>, N.L. Seto<sup>2</sup>, M.P. Playford<sup>3</sup>, K.A. Casey<sup>1</sup>, M.A. Smith<sup>1</sup>, P. Carlucci<sup>2</sup>, B. Yu<sup>1</sup>, L. Wang<sup>1</sup>, G. Illei<sup>1</sup>, N. Mehta<sup>3</sup>, M.J. Kaplan<sup>2</sup>. <sup>1</sup>MedImmune, Gaithersburg; <sup>2</sup>National Institute of Arthritis and Musculoskeletal and Skin Diseases; <sup>3</sup>National Heart, Lung, and Blood Institute, Bethesda, USA

**Background:** Cardiovascular disease remains one of the leading causes of death for patients with systemic lupus erythematosus (SLE), and the disease is

widely known to feature premature atherosclerosis promoted by immune dysregulation. Neutrophil extracellular traps (NETs) can induce endothelial dysfunction and promote inflammatory events. Furthermore, sources of reactive oxygen species released during NET formation promote oxidised HDL, leading to deficient cholesterol efflux capacity (CEC). Type I interferons (IFNs) stimulate NET formation and inhibit vascular repair. Anifrolumab is a fully human, IgG1  $\kappa$  monoclonal antibody that binds to IFNAR1 and blocks signalling of all type I IFNs. Thus, anifrolumab may decrease mechanisms of vascular damage in SLE.

**Objectives:** We evaluated the ability of anifrolumab to reduce *in-vivo* NET formation and improve CEC relative to standard of care (SOC) in the MUSE study.<sup>1</sup>

**Methods:** Baseline IFN gene signature (IFNGS) test status (high or low) of MUSE patients was determined as described.<sup>1</sup> Plasma samples from fasting patients (n=190) were obtained at days 1 and 365 of the MUSE study. Plasma MPO-, HNE- and CitH3-DNA NET complexes were quantified by ELISAs in the MUSE and healthy donor (HD) samples (n=20) as described.<sup>2</sup> Wilcoxon rank-sum test was used to assess differences between groups. Post-treatment samples from the placebo (n=52) and 300 mg anifrolumab (n=73) groups were compared with baseline samples. Significance of change from baseline was determined using Wilcoxon signed-rank test. CEC was tested as described.<sup>3</sup> Reproducibility of the CEC assay was assessed using percent coefficient of variation (CV) from the analysis of variance (ANOVA). SLE patients with defective baseline CEC were identified as those with CEC <2 standard deviations from the HD mean value in the same testing run.

**Results:** All three neutrophil NET complexes (NNCs) were elevated in SLE patients (p<0.01) and were significantly enriched in IFN test-high patients (p<0.05). Anifrolumab significantly decreased all three NNCs at Day 365 vs Day 1 (p<0.05), whereas in the placebo group, complexes did not change or increased. The CEC assay was reproducible (16.4% CV) across 2 days of testing for a subset of 26 baseline samples, and longitudinal changes in steroid dosage for the placebo group did not affect CEC. Greater baseline NET complex levels significantly correlated with poor baseline CEC (p<0.05). Anifrolumab significantly increased CEC in IFNGS test-high patients with defective CEC at baseline (p<0.001), whereas no significant changes occurred in the placebo group.

**Conclusions:** Circulating NNCs were significantly elevated in patients with moderate to severe SLE as compared with HDs. Anifrolumab decreased circulating NNCs. Although changes in steroid dosages during MUSE did not affect CEC, anifrolumab significantly improved CEC over SOC. This work supports continued assessment of anifrolumab effects on vascular inflammation and endothelial damage in SLE.

OP0175

#### INTERFERON SIGNATURE MIGHT SERVE AS EARLY BIOMARKER FOR DEVELOPMENT OF LUPUS AND CORRELATES STRONGLY WITH MYXOVIRUS-RESISTANCE PROTEIN A

W. Lambers<sup>1</sup>, H. Westra<sup>1</sup>, B. Doombos-van der Meer<sup>1</sup>, M. Jonkman<sup>2</sup>, H. Bootsma<sup>1</sup>, K. de Leeuw<sup>1</sup>. <sup>1</sup>*Rheumatology and Clinical Immunology*; <sup>2</sup>*Dermatology, UMCG, Groningen, Netherlands*

**Background:** Incomplete systemic lupus erythematosus (iSLE) marks a group of patients with typical features of SLE, who do not meet classification criteria. Up to 55% progress to SLE, but there are no predictive markers available. Interferon (IFN) type-I is an important early mediator in SLE. The majority of SLE patients show upregulation of interferon-inducible genes. Levels of IFN-related soluble markers, which are more easily applicable, are also increased in SLE.

**Objectives:** To measure IFN signature and IFN-related soluble markers in iSLE patients to determine if these can serve as predictors of SLE.

**Methods:** Thirty iSLE patients (ANA titer  $\geq 1:80$ , disease duration <5 years,  $\geq 1$  ACR clinical feature), 39 SLE patients with quiescent disease (fulfilling ACR or SLICC criteria, SLEDAI  $\leq 4$ ) and 11 healthy controls (HC) were included. Clinical and serological data were retrieved from medical charts.

RNA was isolated from whole blood using PAXgene tubes, reversely transcribed to cDNA and quantitatively analysed by Real time PCR. IFN score was calculated based on cumulative expression of 12 IFN-related transcripts (IP-10, IFI44L, IFIT3, LY6E, MX1, SERPING1, IFITM1, IRF7, STAT1, C1QA, IFI16 and IRF9). A positive IFN-score was defined as >2 SD of the mean of the control group. Levels of IFN-related mediators, including IFN- $\gamma$  induced protein 10 (IP-10) and Myxovirus-resistance protein A (MxA) were measured using ELISA.

Statistical significance between groups was tested with Mann-Whitney U tests. Correlations of continuous data were calculated using Spearman's r test.

**Results:** Baseline characteristics are shown in table 1. An increased IFN score was present in 55% of iSLE patients (p=0.05) and 46% of SLE patients (p=0.07) (figure 1a). In iSLE, IFN score correlated positively with ESR (r=0.52, p=0.004), SSA titer (r=0.64, p=0.02) and cumulative number of ENA (r=0.57, p=0.001), and negatively with leukocyte count (r=-0.38, p=0.04), Hb (r=-0.39, p=0.04), and C4 (r=-0.47, p=0.01). SLEDAI, clinical symptoms, nor use of hydroxychloroquine were correlated with IFN score.

Abstract OP0175 – Table 1

	CTL (n=11)	iSLE (n=30)	SLE (n=39)
Female gender, n(%)	10 (91)	25 (79)	32 (82)
Age (median, range)	28 (25–65)	45 (20–83)	41 (19–76)
Disease duration, years median (range)		1.4 (0.1–4.6)	2.7 (0.5–6.8)
ACR criteria, median (range)		3 (1–3)	5 (2–9)
SLICC criteria, median (range)		3 (2–4)	5 (4–9)
SLEDAI median range)		0 (0–6)	2 (0–4)
Hydroxychloroquine use, n (%)		10 (33)	33 (85)
Immunologic features, n (%)			
ANA or SSA-pattern		30 (100)	39 (100)
Anti-dsDNA		9 (30)	33 (85)
Anti -SSA		14 (47)	12 (31)
Anti-Sm		3 (10)	6 (15)
Decreased complement		4 (13)	26 (67)

Levels of MxA correlated strongly with IFN score in both iSLE (r=0.78, p<0.0001) (figure 1b) and SLE (r=0.6, p<0.0001). IP-10 levels correlated with IFN score in iSLE (r=0.45, p=0.02), but not in SLE.

Abstract OP0175 – Figure 1 a) IFNscore in subject group, b) correlation between MxA and IFN score in iSLE

**Conclusions:** IFN-signature is present in 55% of patients with iSLE and correlates with ESR, autoantibody number, leukopenia, anaemia and hypocomplementemia. Interestingly, MxA levels correlated strongly with IFN-gene upregulation and thus might be a suitable and easily applicable surrogate marker for IFN type-I activity. iSLE patients with IFN upregulation might be those at most risk for disease progression; longitudinal data however should be awaited.

### RNA SEQUENCING DETECTION OF GENE DYSREGULATION IN B CELLS SORTED FROM SALIVARY GLAND TISSUE AND PERIPHERAL BLOOD REVEALS NEW PATHWAYS INVOLVED IN SJÖGREN'S SYNDROME PATHOPHYSIOLOGY

E. Rivière<sup>1</sup>, N. Tchitchek<sup>1</sup>, G. Nocturne<sup>1,2</sup>, J. Pascaud<sup>1</sup>, S. Boudaoud<sup>1</sup>, A. Thai<sup>3</sup>, N. Allaire<sup>3</sup>, B. Jagla<sup>4</sup>, M. Mingueneau<sup>3</sup>, X. Mariette<sup>1,2</sup>. <sup>1</sup>Immunology of viral Infections and Autoimmune Diseases, IDMIT, CEA – Université Paris Sud – INSERM U1184, Le Kremlin Bicêtre and Fontenay aux Roses; <sup>2</sup>Rheumatology, Université Paris Sud, Le Kremlin Bicêtre, France; <sup>3</sup>Immunology Research, Biogen, Cambridge, USA; <sup>4</sup>Biomarker Discovery Platform UtechS CB, Hub de Bioinformatique et biostatistique C3IB, Institut Pasteur, Paris, France

**Background:** Primary Sjögren's syndrome (pSS) is a chronic auto-immune disorder characterised by lymphocytic infiltrates and destruction of the salivary glands (SG). Chronic B cell activation, the secretion of autoantibodies and the critical role of BAFF have been demonstrated. However, mechanisms leading to B cells dysregulation remain partially understood.

**Objectives:** To establish transcriptomic maps of the B cells sorted from the SG and from blood using RNASeq analysis.

**Methods:** Patients had pSS according to 2016 EULAR/ACR criteria and controls had sicca symptoms without any antibodies and with normal SG biopsy. B cells were sorted from SG biopsies and from blood using a FACS ARIA. Total RNASeq profiling was performed using MiSeq (Illumina). Statistical analysis (DESeq2) identified differentially expressed genes between pSS and controls in B cells sorted from SG (9 pSS and 4 controls), from blood (16 pSS and 7 controls); and between B cells sorted from SG and blood in the same patients (4 pSS). Functional enrichment analysis was performed using Ingenuity Pathway Analysis.

**Results:** The pSS vs controls comparison in B cells sorted from SG identified up-regulated genes involved in activation of B cells including CD48, CD22 and CD40. TLR10, which is involved in innate immunity was also up-regulated in pSS. The analysis of the non-coding expressed RNAs showed an up-regulation of Mir155 which is essential for B cell differentiation and antibody production (table 1A).

In B cells sorted from blood, TLR7 and the downstream signalling molecule IRF7 were up-regulated in pSS. Additionally, IL-6 which is involved in B cells growth was up-regulated (table 1B). Enrichment analysis highlighted EIF2 signalling pathway, interferon (IFN) signalling pathway and role of JAK in IFN signalling.

The paired comparison between B cells from SG and from blood identified up-regulated genes including CD138, a plasma cell marker, IL-6, TLR5 and IFN induced genes (table 1C). Mir155HG was also up-regulated.

These results need to be confirmed by RT-qPCR and additional analysis of the non-coding expressed RNA is ongoing.

Table 1 Selection of genes differentially expressed between pSS and controls in B cells sorted from biopsy (1A), blood (1B) and between SG and blood B cells from the same pSS patients (1C)

	Gene Symbol	log2 fold-change	p-value
1A	<b>Salivary B cells (pSS vs controls)</b>		
	CD48	2.59	0.009
	CD22	2.29	0.048
	CD40	2.64	0.017
	TLR10	5.67	0.002
	Mir155HG	4.94	0.002
1B	<b>Blood B cells (pSS vs controls)</b>		
	TLR7	1.40	0.008
	IRF7	0.76	0.041
	IL-6	1.54	0.006
1C	<b>Salivary vs blood B cells in pSS</b>		
	CD138	6.92	9.63e-05
	IL-6	3.05	0.004
	TLR5	8.86	8.26e-06
	Mir155	3.10	0.011

**Conclusions:** This study allowed exploring the mechanisms that support B cell activation in pSS focusing on tissue resident and circulating cells. Our data confirmed the B cell activation and differentiation through several markers including CD40, CD22, CD48, CD138 and highlighted the role of innate immunity with the TLRs and key pathways including IFN and JAK signalling. Lastly, the role of an epigenetic regulation of Ig secretion is suggested in tissue infiltrating B cells through mir155 expression. Precise understanding of these dysregulation should offer development of new targeted therapeutic perspectives for patients.

OP0177

### BCL6 IDENTIFIES ECTOPIC GERMINAL CENTRES IN SALIVARY GLAND BIOPSIES IN PRIMARY SJÖGREN'S SYNDROME PATIENTS

U. Nakshbandi<sup>1</sup>, E.A. Haacke<sup>1,2</sup>, H. Bootsma<sup>1</sup>, F.K.L. Spijkervet<sup>3</sup>, A. Vissink<sup>3</sup>, B. van der Vegt<sup>2</sup>, F.G.M. Kroese<sup>1</sup>. <sup>1</sup>Department of Rheumatology and Clinical Immunology; <sup>2</sup>Department of Pathology and Medical Biology; <sup>3</sup>Department of Oral and Maxillofacial Surgery, University of Groningen, University Medical Center Groningen, Groningen, Netherlands

**Background:** Primary Sjögren's syndrome (pSS) patients who exhibit germinal centres (GCs) within salivary gland parenchyma have higher focus scores and present with more disease activity than GC negative pSS patients. Moreover, presence of GCs might be of clinical importance for stratification of treatment. However, there is considerable heterogeneity in reported findings concerning the presence of GCs. This can partially be explained by the difficulty in identifying GCs in diagnostic H and E sections and the lack of uniform histopathological criteria.

**Objectives:** The aim of this study was to assess the most appropriate way to identify unequivocally GCs in parotid and labial gland biopsies of pSS patients.

**Methods:** As part of routine diagnostic work-up for pSS, both parotid and labial salivary gland biopsies were taken from 100 consecutive patients suspected for pSS. Forty-two patients were classified as having pSS according to the ACR-EULAR criteria, the remaining 58 patients were classified as non-pSS sicca patients. Diagnostic salivary gland biopsies were formalin fixed, paraffin embedded and serially sectioned at 3–4 µm thickness. Sections were stained with H and E as well as immunohistochemically for CD3, CD20, CD21, CD45, Ki67 and Bcl6. Presence of GCs, the number of GCs/mm<sup>2</sup> salivary gland parenchyma and level of lymphoid organisation were determined in all sections.

**Results:** According to diagnostic H and E staining, in 15% and 2% of pSS patients GCs were present in parotid and labial salivary glands, respectively. Staining for the proliferation marker Ki67 and the GC-B cell associated transcription factor Bcl6, showed higher percentages: 23% and 25%. Much higher percentages of follicular dendritic cell (FDCs) networks were revealed by CD21L (45% and 55%, for parotid and labial glands, respectively) compared to the number of GCs seen in tissue sections stained for Bcl6. Similarly, the median number of CD21+ FDC networks/mm<sup>2</sup> was significantly higher than the number of GCs/mm<sup>2</sup> as revealed by H and E, Ki67 and Bcl6. Careful evaluation of the consecutive sections stained for CD21L and Bcl6, showed that only roughly half of the FDC networks, also harbour GCs. Finally, not all sections that showed clearly defined GCs by Bcl6 staining, also revealed GCs by Ki67 or H and E staining.

**Conclusions:** Due to the difficulty in GC recognition, use of diagnostic H and E leads to an underestimation and incorrect identification of GCs, while using anti-CD21L overestimates GC counts. This suggests that, although CD21+ FDC networks play an essential role in GC development and T/B cell compartmentalization, positivity for CD21+ FDC networks does not always imply presence of ectopic GCs. Furthermore, since Ki67 is an excellent marker for solely the dark zone of GCs, small GCs can be overlooked while other proliferative areas might be mistakenly identified as GCs. This study shows that staining for Bcl6 allows easy and unequivocal identification of GCs and should therefore be implemented in the histopathological evaluation of salivary gland biopsies of pSS patients.

OP0178

### ANALYSIS OF B-CELLS SUBSETS IN FIRST DEGREE RELATIVES OF PATIENTS WITH SYSTEMIC LUPUS ERYTHEMATOSUS

A. Ruiz Roman<sup>1</sup>, A. Muñoz Jimenez<sup>1</sup>, J.M. Lucena<sup>2</sup>, M.A. Montes Cano<sup>2</sup>, B. Sanchez Sanchez<sup>2</sup>, N. Garrido Puñal<sup>1</sup>, E. Blanco Alonso<sup>1</sup>, R. Gil<sup>1</sup>, J. Quijada Carrera<sup>1</sup>, E. Rubio Romero<sup>1</sup>, J. Povedano Gomez<sup>1</sup>. <sup>1</sup>Rheumatologia; <sup>2</sup>Inmunología, Hospital Universitario Virgen del Rocío, Sevilla, Spain

**Background:** Systemic lupus erythematosus (SLE) is an autoimmune, multi-organ disease characterised by periods of activity and remission. In lupus, one of the fields that has most helped his knowledge is the study of lymphocyte subpopulations through flow cytometry. Specifically, in the SLE some alterations have been detected at the level of B lymphocytes as the increase of B-cells subsets such as plasmablasts, plasma cells, transitional cells. There are no studies to date that have analysed the behaviour of B cells subsets in first -degree relatives of patients affected by lupus

**Objectives:** To analyse if there quantitative difference in the B-cells subsets of the first-degree relatives of SLE with respect to the control population (healthy) and the lupus population

**Methods:** Transversal descriptive study. We included 13 patients diagnosed with SLE according to the criteria of the American College of Rheumatology (ACR) with positivity for antinuclear antibodies (ANA) and anti-DNA, 34 first-degree relatives and 50 healthy controls between the months of May 2016 and March 2017. None of the subjects evaluated received treatment with rituximab or belimumab. We analysed B-cells subsets (negative double, naïve B-cells, unswitched memory B-cells, switched memory B-cells) in all the subjects included in our study. The 95% confidence intervals were obtained for both the means and the percentage difference. The level of statistical significance was established at  $p < 0.05$ . The data was analysed with IBM SPSS software Statistics 19 and EPIDAT 4.1.

**Results:** 47 subjects were analysed between relatives and patients, of which 33 (70.20%) were women. 13 subjects (27.70%) were diagnosed with lupus. 100% of those diagnosed with lupus were women. The mean (X) and confidence intervals (95% CI) for the different subgroups (healthy subjects, subjects diagnosed with SLE, relatives of the first degree) is shown in table 1. In none of the subpopulations analysed in patients diagnosed with SLE in front of relatives of 1 st grade it has reached statistical significance. When analysing B cells subsets of the three groups of subjects, we did find statistically significant differences between unswitched memory B cells of healthy subjects and 1 st degree relatives (being lower in the group of healthy subjects) This finding has not been described in any previous study, although it should be noted that the sample before us is small.

Abstract OP0178 – Table 1

B-CELLS SUBSETS		HEALTHY	SLE	RELATIVES
Naïve (%)	Mean	70,4 (95% CI:	69,3 (95% CI:	65,8 (95% CI:
	(CI95%)	68,2 to 72,7)	62,2 to 76,3)	60,4 to 71,2)
Doubles Negative (DN) (%)	Mean	4,1 (95% CI: 3,5	6,2 (95% CI: 4,8	2,9 (95% CI: 1,9
	(CI95%)	to 4,6)	to 7,6)	to 4,0)
Unswitched (%)	Mean	9,6 (95% CI: 8,2	13,0 (95% CI: 7,4	17,2 (95% CI:
	(CI95%)	to 11,1)	to 18,7)	13,4 to 21,1)
Switched (%)	Mean	11,4 (CI95%	11,5 (95% CI: 6,3	14,0 (95% CI:
	(CI95%)	=10,1–12,7)	to 16,7)	11,2 to 16,8)

**Conclusions:** There are quantitative differences between unswitched memory B-cells of healthy subjects and relatives of 1 st grade of SLE. More studies with a larger sample size are necessary to see the behaviour of the rest of B-type lymphocyte subpopulations

OP0179

#### MOLECULAR DOCUMENTATION OF THE CLONAL EVOLUTION OF A DIFFUSE LARGE B-CELL LYMPHOMA OUT OF CLONALLY EXPANDED RHEUMATOID FACTOR-EXPRESSING B CELLS IN A SJÖGREN'S SYNDROME PATIENT

R.J. Bende<sup>1</sup>, L.M. Slot<sup>1</sup>, T.A. Wormhoudt<sup>1</sup>, M.J. Kwakkenbos<sup>2</sup>, A.H. van Kampen<sup>3</sup>, A. Jongejan<sup>3</sup>, J.E. Guikema<sup>1</sup>, C.J. van Noesel<sup>1</sup>. <sup>1</sup>Pathology, Academic Medical Center, <sup>2</sup>AIMM Therapeutics, AIMM Therapeutics; <sup>3</sup>Clinical Epidemiology, Biostatistics and Bioinformatics, Academic Medical Center, Amsterdam, Netherlands

**Background:** Sjögren's syndrome (SS) is the autoimmune disease with the highest risk of lymphoma development. SS patients develop most frequently MALT lymphoma and to a lesser extent diffuse large B-cell lymphoma (DLBCL). Previously, we have shown that at least 40% of salivary gland MALT lymphomas express groups of near identical (also called stereotypic) B-cell receptors, which display *in vitro* mono-specific rheumatoid factor (RF) reactivity<sup>1</sup>. Recently, we have analysed the B-cell immunoglobulin heavy variable (IGHV) repertoire in 4 SS labial salivary glands. In 2 out of 4 salivary glands only one minor stereotypic RF B-cell clone was detected. Interestingly, in one salivary gland of patient SG22 a highly expanded stereotypic RF-expressing B-cell clone was present, which was also detected in peripheral blood. Twenty six months later, a clonally-related DLBCL was diagnosed<sup>2</sup>.

**Objectives:** To study the molecular alterations present in the RF-expressing B cell clones of salivary gland, peripheral blood and in the DLBCL of SS patient SG22.

**Methods:** From peripheral blood 4 RF-expressing immortalised B-cell clones with identical IGHV rearrangements were isolated. These 4 RF-clones were analysed by whole exome sequencing and the identified non-synonymous exome mutations were traced in the salivary gland and in the DLBCL, using targeted next generation sequencing.

**Results:** In total we identified 56 exome mutations in the 4 RF B-cell clones. Twelve non-synonymous mutations were shared between all 4 RF-clones, of which one was a missense mutation in *CARD11*, a well-known oncogenic mutation of DLBCL. In the salivary gland all shared 12 non-synonymous mutations were detected, whereas in the DLBCL only 4 of these mutations were detected.

Remarkably, the *CARD11* mutation was not detected in the DLBCL. The exome mutations were analysed for typical characteristics of induction by the B-cell specific mutator AID. This revealed that the large majority of mutations (80%) were (i) not located within 1,5 kB of the transcription initiation site of the genes, (ii) did not concern C/G nucleotides in AID hotspots (WRC/GYW) and (iii) were not in genes expressed by B cells. This lack of evidence for AID involvement, suggests that the exome mutations of the RF-clones were due to replication errors, obtained during their clonal expansion. Interestingly, as compared to the RF-clones of peripheral blood, the DLBCL accumulated 44 extra somatic mutations together in IGHV and IGKV. As expected, these new IGHV/IGKV mutations showed the characteristics of AID involvement, indicating that in an ancestor RF-clone, AID activity was induced.

**Conclusions:** We have documented the clonal outgrowth and diversification of a RF-specific B-cell clone in a SS patient and the evolution of this clone into a DLBCL. Our analysis are indicative for AID activity in the lymphoma cells, represented by accumulation of IGHV/IGKV mutations. However, we have no evidence that AID is instrumental in the accumulation of the non-IG mutations in the RF-clones from peripheral blood.

OP0180

#### TYPE I INTERFERON IS PRODUCED BY NON-HAEMATOPOIETIC TISSUE RESIDENT CELLS BUT NOT PDCs IN PRE-CLINICAL AUTOIMMUNITY AND SLE

A Psarras<sup>1,2</sup>, A. Alase<sup>1</sup>, A. Antanaviciute<sup>3</sup>, I. Carr<sup>3</sup>, M. Wittmann<sup>1</sup>, G. Tsokos<sup>2</sup>, P. Emery<sup>1</sup>, E.M. Vital<sup>1</sup>. <sup>1</sup>Leeds Institute of Rheumatic and Musculoskeletal Medicine, University of Leeds, Leeds, UK; <sup>2</sup>Beth Israel Deaconess Medical Center, Harvard Medical School, Boston, USA; <sup>3</sup>Leeds Institute for Data Analytics, University of Leeds, Leeds, UK

**Background:** Systemic Lupus Erythematosus (SLE) is characterised by persistently high type I interferon (IFN) activity. Plasmacytoid dendritic cells (pDCs) produce large amounts of IFNs in viral infection, although these immunogenic properties are usually strictly regulated. *In vitro*, pDCs are responsive to nucleic acids and they have therefore been postulated to be the main source of type I IFNs in SLE. However, their function is not fully established in human SLE.

**Objectives:** To investigate the dysregulated IFN axis in patients with pre-clinical autoimmunity and SLE.

**Methods:** Patients with SLE who met 2012 ACR/SLICC criteria were recruited. We also recruited healthy controls (HC) and therapy-naïve individuals presenting with ANA and 1–2 clinical symptoms, but not meeting ACR/SLICC criteria, of whom 17% progressed to SLE (At-Risk). IFN activity was evaluated by measuring a score of IFN-responsive genes in the PBMCs using TaqMan. pDCs were immunophenotyped as well as studied *in vitro* for production of proinflammatory cytokines and induction of T cell responses using flow cytometry. pDCs were sorted and sequenced using high-sensitive RNA sequencing. IFN expression was visualised in skin biopsies using *in situ* hybridisation. Keratinocytes were isolated from fresh skin biopsies and cultured *in vitro*; IFN production was measured by qPCR and ELISA.

**Results:** Most of the SLE and At-Risk patients had increased IFN activity, which correlated with disease activity and clinical features. In contrast, circulating pDCs were decreased in both SLE and At-Risk patients and their numbers did not correlate with any clinical features or IFN status. *In vitro* stimulation revealed that pDCs from SLE and At-Risk patients could not produce IFN- $\alpha$  and TNF- $\alpha$  upon stimulation with TLR9 or TLR7 agonists. In addition, they induced significantly less T cell activation and proliferation compared to HC pDCs. RNA-seq data analysis showed an upregulation of IFN-responsive genes in most of the SLE and At-Risk pDCs but not transcripts of any IFN subtypes. Other upregulated pathways were related to immune regulation and senescence. Phenotypically, SLE pDCs were characterised by upregulation of regulatory receptors and increased telomeric erosion. *In situ* hybridization revealed high IFN expression in the epidermis but not in lymphocyte-infiltrating areas of lesional biopsies from SLE patients. High expression of IFN was also observed in epidermis of At-Risk individuals without any signs of cutaneous inflammation. *In vitro* stimulation of freshly isolated keratinocytes also showed a notable increase in IFN production.

**Conclusions:** In SLE, non-haematopoietic tissue resident cells are a dominant source of IFN and this is present prior to clinically overt disease. Meanwhile, the professional IFN-producing pDCs have lost their immunogenic properties. These findings suggest an important role for tissue resident cells in autoimmunity and may facilitate novel therapeutic interventions.

**OP0181** **PATIENT PERSPECTIVES OF PEOPLE WITH PRIMARY SJÖGREN'S SYNDROME: A MULTICENTRE QUALITATIVE EUROPEAN STUDY**

J. Unger<sup>1</sup>, M. Mattsson<sup>2,3</sup>, R. Dragoi<sup>4</sup>, C. Boström<sup>3</sup>, F. Buttgerit<sup>5</sup>, A. Lackner<sup>6</sup>, T. Witte<sup>7</sup>, B. Raffener<sup>8</sup>, P. Peichl<sup>9</sup>, J. Hermann<sup>6</sup>, C. Dejaco<sup>6,10</sup>, T. Stamm<sup>11</sup>. <sup>1</sup>FH JOANNEUM, University of Applied Sciences, Bad Gleichenberg, Austria; <sup>2</sup>Sunderby Hospital, Department of Physiotherapy, Luleå; <sup>3</sup>Karolinska Institutet, Department of Neurobiology, Care Sciences and Society, Stockholm, Sweden; <sup>4</sup>Victor Babes University of Medicine and Pharmacy Timisoara, Timisoara, Romania; <sup>5</sup>Charité University Medicine, Berlin, Germany; <sup>6</sup>Medical University Graz, Graz, Austria; <sup>7</sup>Medical University of Hannover, Hannover, Germany; <sup>8</sup>Hospital of Bolzano, Bolzano, Italy; <sup>9</sup>Evangelic Hospital of Vienna, Vienna, Austria; <sup>10</sup>Hospital of Bruneck, Bruneck, Italy; <sup>11</sup>Medical University Vienna, Vienna, Austria

**Background:** Primary Sjögren's syndrome (pSS) is one of the most common systemic autoimmune disorders and leads to an impaired health related quality of life. However, treatment mainly focuses on the management of physical manifestations. Little is known about the lived experiences of people with pSS, including the impact on people's life, functioning and their social relationships.

**Objectives:** To explore the perspectives of people with pSS from different European countries with various cultural backgrounds in order to achieve a broad understanding of concepts that are important and meaningful to people with pSS. This study is a part of a project which aims to evaluate the coverage of the patient perspectives by patient reported outcome measures in pSS, which is funded by the Austrian Association of Rheumatology.

**Methods:** A multicentre focus group study was performed in five European countries, namely Austria, Germany, Italy, Romania and Sweden. Patients were recruited from the outpatient clinics of the local centres. Focus groups were chaired by a trained moderator and followed an interview guide which included questions about impairments and limitations in body structures, body functions, activities and participation as well as contextual factors and resources, such as coping strategies. Focus groups were audiotaped and transcribed. We conducted a content-analysis of each focus group and subsequently combined the extracted concepts from each country, using the International Classification of Functioning, Disability and Health as a frame of reference.

**Results:** A total of 12 focus groups was conducted in seven participating centres in five countries. Fifty people (48 women; 96%) with pSS participated in the focus groups (ranging from two to four groups per country). All focus groups had a total duration of 1030 min and resulted in 252 pages of transcript. From qualitative analysis we derived concepts meaningful to people with pSS from all countries, especially those concepts that were linked to a physical dimension. However, we identified differences in the description of these experiences in daily life, for example for pain-concerning sensations or for the impact on social relationships. Furthermore, the attitudes towards the treatment and towards the disease differed between the participants. People with pSS had various coping strategies, such as gaining more knowledge about the disease or utilising non-pharmacological treatment.

**Conclusions:** This is the first multicentre qualitative European study which investigated the patient perspectives in pSS with a cross-cultural understanding. Clinicians, health professionals and researchers need to know about the perspectives, experiences and needs of people with pSS in order to ensure a comprehensive treatment.

**The crystal maze – etiology and management**

**OP0182** **GOUT AND DEMENTIA IN THE ELDERLY: A MEDICARE CLAIMS STUDY**

J.A. Singh, J.D. Cleveland. University of Alabama at Birmingham, Birmingham, USA

**Background:** The pursuit of a link between gout/hyperuricemia and dementia has led to contradictory results. Most observational studies, including population-based studies, showed that hyperuricemia was associated with a higher risk of dementia and less cognitive dysfunction, while a few studies found hyperuricemia to be associated with a lower risk of dementia. Recently, a large French population-based study in the elderly (65 years or older) showed that hyperuricemia was associated with a higher risk of dementia and with MRI changes of ageing in the brain.

**Objectives:** To assess whether gout in the elderly is associated with a risk of incident dementia.

**Methods:** We used the 5% Medicare claims data for this observational cohort study. We used multivariable-adjusted Cox proportional hazard models to assess the association of gout with incident dementia, adjusting for potential confounders/covariates including demographics (age, race, gender), comorbidities (Charlson-Romano comorbidity index), and medications commonly used for cardiac diseases (statins, beta-blockers, diuretics, and angiotensin converting enzyme (ACE)-inhibitors) and gout (allopurinol and febuxostat).

**Results:** In our cohort of 1.23 million Medicare beneficiaries, 65 324 had incident dementia. The crude incidence rates in people without and with gout were 7.36 and 13.58 per 1000 person-years, respectively. In multivariable-adjusted analyses, gout was independently associated with a significantly higher hazard ratio of incident dementia, with a hazard ratio [HR] of 1.17 (95% CI, 1.13, 1.21); sensitivity analyses confirmed the main findings. Compared to age 65 to <75 years, older age groups were associated with 3.3 and 6.3-fold higher hazards of dementia; hazards were also higher for females, Black race or people with higher medical comorbidity.

Subgroup analyses indicated that gout was significantly associated with dementia in patients without key comorbidities (CAD, hyperlipidemia, CVD, diabetes, hypertension) with HR ranging 1.20–1.57, but not in patients with each of these comorbidities, except CAD, with HR 0.97–1.07 (table 1).

**Abstract OP0182 – Table 1.** Association of gout with incident dementia, in pre-defined subgroups of presence/absence of CAD, hyperlipidemia, CVD, diabetes or hypertension

	Multivariable-adjusted (Model 1)		Multivariable-adjusted (Model 1)	
	HR (95% CI)	P-value	HR (95% CI)	P-value
	<b>No CAD</b>		<b>CAD</b>	
Gout	1.20 (1.15–1.25)	<0.0001	1.07 (1.01–1.14)	0.032
	<b>No Hyperlipidemia</b>		<b>Hyperlipidemia</b>	
Gout	1.33 (1.27–1.40)	<0.0001	1.02 (0.97, 1.07)	0.56
	<b>No CVD</b>		<b>CVD</b>	
Gout	1.23 (1.18–1.28)	<0.0001	0.97 (0.90–1.05)	0.46
	<b>No Diabetes</b>		<b>Diabetes</b>	
Gout	1.24 (1.19–1.29)	<0.0001	1.04 (0.98–1.10)	0.23
	<b>No Hypertension</b>		<b>Hypertension</b>	
Gout	1.57 (1.46–1.68)	<0.0001	1.01 (0.97–1.05)	0.76

Gout\*CAD p-value<0.0001; Gout\*hyperlipidemia p-value<0.0001; Gout\*CVD p-value<0.0001;

Gout\*diabetes p-value<0.0001; Gout\*hypertension p-value<0.0001;

**Conclusions:** Gout was independently associated with 17%–20% higher risk of incident dementia in the elderly. Future studies need to understand the pathogenic pathways involved in this increased risk.

**OP0183** **ASSOCIATION BETWEEN HFE GENOTYPES AND CLINICAL SEVERITY CHARACTERISTICS OF CALCIUM PYROPHOSPHATE CRYSTAL ARTHRITIS**

F. Perez-Ruiz, S.P. Chinchilla, J. Atxotegi. Rheumatology Division of Cruces Hospital and University of the Basque Country, Baracaldo, Spain

**Background:** Several metabolic disturbances that reduce the activity of pyrophosphatases have been associated with development of calcium pyrophosphate crystal arthritis (CPPCA), but there is scarce data on their influence on clinical manifestations, as such disease-specific variables are not recorded in most available databases.

**Objectives:** To evaluate factors associated to severity of clinical joint involvement in patients with definite CPPCA.

**Methods:** Transversal study with prospective recruitment of cases (patients with CPPCA diagnosis confirmed by microscopy showing CPP crystals within

leucocytes in synovial fluid plus presence of X-ray chondrocalcinosis in at least one joint) and controls (patients with synovial effusion shown to have no CPP crystals and no chondrocalcinosis in hands and knee X-rays), paired by age and gender. Patients with hemochromatosis or primary hyperparathyroidism were not included. General variables were included along with plausible metabolic variables (Ca, P, Mg, iPTH, iron saturation [satFe%], ferritin, diuretics and type of diuretic, and HFE genotype), and distribution of joint involvement (mono-oligo-polyarticular) and clinical manifestations (acute [A-CPPCA] and chronic inflammatory [CI-CPPCA]), as in EULAR recommendations.

**Results:** 340 patients and 316 controls were recruited, 53% were men, age at inclusion was 67±10 year (IC range 62–75), time from onset of symptoms 5.2 ±5.3 year (IC range 1–8). Regarding cases, A-CPPCA was present in 147 (43.2%), CI-CPPCA in 193 (56.8%), with monoarticular involvement in 102 (30.0%), oligoarticular in 176 (51.8%), and polyarticular in 62 (18.2%). Patients showed higher serum ferritin levels and lower Mg levels than controls (253 and 2.00 vs 204 and 2.08, respectively), along with higher rate of HFE gene mutations (Odds ratio 2.30, 95% CI: 1.66 to 3.20). Genotypes including homozygous mutations of H63D allele, heterozygous mutations for C282Y allele, and double heterozygous mutations for C282Y and H63D were statistically associated with higher frequency of polyarticular involvement and with CI-PPA (figure 1). Clinical variables were also associated with higher SatFe% levels, but not Mg or ferritin levels. S65C gene mutations were not increased in patients compared to controls and did not show any association with clinical phenotype.

**Abstract OP0183** – Table 1 Rate (%) of polyarticular and chronic inflammatory clinical pattern impact of presence of any mutation and genotypes of FHE genes

**Conclusions:** Patients with definite CPPCA show differences in serum Mg and Ferritin levels compared to that of controls, and may contribute, along with other factors, to development of CPPCA. Nevertheless, only presence of some HFE genotypes involving C282Y and H63D genes were associated with more severe phenotype of clinical involvement.

#### OP0184 THE FREQUENCY OF FLARES IN SUBJECTS WITH CHRONIC REFRACTORY GOUT TREATED WITH PEGLOTICASE IS RELATED TO VARIATION IN THE LEVEL OF PLASMA URATE

L. Calabrese<sup>1</sup>, T. Fields<sup>2</sup>, A. Yeo<sup>3</sup>, P. Lipsky<sup>4</sup>. <sup>1</sup>Cleveland Clinic, Cleveland; <sup>2</sup>Weill Cornell Medical College, New York; <sup>3</sup>Horizon Pharma, Lake Forest; <sup>4</sup>AMPEL BioSolutions LLC, Charlottesville, USA

**Background:** Lowering plasma urate in subjects with gout is associated with an increase in flares because of an altered equilibrium between soluble urate and uric acid crystals.<sup>1</sup> Details of the relationship between plasma urate lowering and gout flares have not been fully delineated. Pegloticase is a mammalian recombinant uricase conjugated to polyethylene glycol approved for the treatment of chronic gout refractory to conventional oral urate lowering therapy.<sup>2–4</sup> Results from the two 6 month randomised clinical trials (RCTs) of pegloticase showed that during months 1–3, there was an increase in pegloticase-treated subjects experiencing gout flares vs those receiving placebo. However, the reported analysis did not separate results for subjects who did and did not respond to pegloticase with a sustained reduction in plasma urate levels or relate flares to plasma urate levels.

**Objectives:** To determine factors associated with the occurrence of flares in subjects who did and did not respond to pegloticase in the two RCTs for this therapy.

**Methods:** This analysis used results from 2 pivotal RCTs<sup>2</sup> of pegloticase (8 mg every 2 weeks [q2] or every 4 weeks [q4]) vs placebo in subjects with chronic refractory gout. A responder was defined as a subject with plasma urate <6.0 mg/dL ≥80% of the time from the week-9 infusion to just prior to the week-13 infusion and from the week-21 infusion to the week-25 final study visit. Gout flares were defined as acute joint pain and swelling requiring treatment. Gout flare prophylaxis

(colchicine, 0.6 mg once or twice daily, or a NSAID) was initiated 1 week before the first infusion and continued throughout the study.

**Results:** There were increases in the frequency of subjects experiencing flares and the mean flare frequency in the pegloticase group vs placebo during the first 3 months of the trial (figure 1A). In contrast, there were marked reductions in both outcomes during months 3–6 (figure 1B). The increase in flares in the first 3 months was most evident (p=0.0006) and the decrease during the second 3 months was least marked (p=0.0006) in subjects receiving q4 pegloticase. Previous analysis indicated that q2 pegloticase caused persistently lowered plasma urate in responders, whereas q4 administration resulted in a more saw tooth pattern.<sup>5</sup> Multivariate linear regression analysis indicated that the only variable associated with flares in the treated subjects was the absolute change in plasma urate prior to these events. Assessment of plasma urate at both 2 weeks and immediately before flares indicated that larger differences between these two values were associated with increased flare occurrence (p=0.002).

**Conclusions:** Flares associated with pegloticase treatment in subjects with chronic refractory gout were increased most markedly in responders to monthly administration and were significantly associated with fluctuations in plasma urate levels. Such fluctuations are much more common with monthly administration of pegloticase vs the recommended biweekly treatment regimen.

#### OP0185 EMERGENCY DEPARTMENT VISITS FOR GOUT: A DRAMATIC INCREASE IN THE PAST DECADE

A. Mithal<sup>1</sup>, G. Singh<sup>2</sup>. <sup>1</sup>ICORE; <sup>2</sup>Stanford University, Woodside, USA

**Background:** Several studies have suggested that the prevalence of gout has been increasing worldwide, perhaps related to lifestyle factors.<sup>1–3</sup> In the US, the NHANES study found a significantly higher age-adjusted prevalence (3.9%) in 2007–2008 than the estimate in 1988–1994 (2.9%). This trend paralleled an observed increase in hyperuricemia.<sup>1</sup>

**Objectives:** To study emergency department visits due to gout in the US over 9 years (2006 to 2014).

**Methods:** The Nationwide Emergency Department Sample (NEDS) is the largest all-payer emergency department (ED) database in the United States, yielding national estimates of hospital-based ED visits. It contains information from 31 million ED visits at 945 hospitals in 34 states that approximate a 20-percent stratified sample of U.S. hospital-owned EDs. Weighted, it estimates roughly 143 million ED visits. We studied all ED with primary diagnosis of Gout (ICD9 code 274.xx) from 2006–2014 and calculated prevalence in different age groups. Population data was obtained from US census bureau.

**Results:** Over last 9 years, 1.7 million people visited EDs with a primary diagnosis of acute gout. The total number of ED visits per year increased from 1 68 580 in 2006 to 2 13 780 in 2014, an increase of 26.8%. The prevalence of emergency room visits with primary diagnosis of gout increased from 56.5/100,000 population

in 2006 to 67/100,000 in 2014 ( $p < 0.001$ ). The largest increase in ED visits was a 28% increase in prevalence among the 45–64 years age group from 91/100,000 to 116/100,000 (27%,  $p < 0.001$ ). Men were responsible for 78% of the ED visits in both 2006 and 2014.

Age in years	Total number of ED visits in 2006	Prevalence of ED visits/100,000 population in 2006	Total number of ED visits in 2014	Prevalence of ED visits/100,000 population in 2014
18–44	49 265	44	55 216	48
45–64	68 544	91	97 081	116
65–84	44 358	137	53 206	133
85+	6242	128	8126	132
All ages	2 05 905	56.5	2 13 780	67

**Conclusions:** Emergency Department visits have increased dramatically in the US over the last 9 years, and this increase is mostly in the 45–64 years age group perhaps reflecting the undermanaged burden of uncontrolled gout. Education, improved recognition and long-term management as well as increased use of preventive strategies is needed.

OP0186

#### NEPHROLITHIASIS AS A COMPLICATION OF GOUT: A CROSS-SECTIONAL STUDY WITH HELICAL COMPUTED TOMOGRAPHY

E.P. Ramos, A.T. Barbosa, R.B. Souza, F. Seragioli, R.D.N. Giorgi, R.F. Rosa. *Rheumatology, IAMSPE, São Paulo, Brazil*

**Background:** Gout is the most prevalent inflammatory arthritis, secondary to persistent hyperuricemia. It has been associated with development and progression of cardiometabolic diseases and chronic kidney disease. Several studies have shown a relationship between hyperuricemia and history of nephrolithiasis, although cut-off levels for uric acid and other related risk factors are still not well established.

**Objectives:** To determine the frequency of nephrolithiasis (NL) detected by helical computed tomography (h-CT) and its associated risk factors in patients with gout in a tertiary hospital of São Paulo, Brazil.

**Methods:** This cross-sectional study, conducted from 2016 to 2017, included 80 patients with a diagnosis of gout, according to the criteria of the ACR/EULAR-2015. They were questioned about the previous history of NL and submitted to h-CT for NL. Two groups were established: with and without NL; and later, unilateral and bilateral lithiasis. Anthropometric data, disease duration, serum uric acid (UA), creatinine, urinary pH (pH) and urinary UA of groups were compared. Statistical analysis included: mean, standard deviation, relative percentages, t-student test, chi-square test and ROC curve. Comparison of time to event-rate was performed by Kaplan-Meier method with log rank test.  $p < 0.05$  was considered statistically significant.

**Results:** NL was confirmed by h-CT in 30% of patients. However, only 16% reported previous history of NL. Groups with NL and without NL were similar in mean age ( $65,96 \pm 5,54$  and  $68,89 \pm 9,58$  years,  $p = 0.147$ ), disease duration ( $16,63 \pm 11,49$  and  $11,77 \pm 9,74$  years,  $p = 0.056$ ) and BMI ( $29,72 \pm 5,09$  and  $28,82 \pm 5,08$ ,  $p = 0.470$ ). The NL group had higher pre-treatment UA compared with patients without NL ( $9,36 \pm 1,09$  and  $8,80 \pm 1,08$  mg/dL,  $p < 0.05$ ) and the most acidic pH ( $5,26 \pm 0,42$  and  $5,74 \pm 0,62$ ,  $p < 0.05$ ). In addition, patients with bilateral NL presented higher BMI than unilateral patients ( $p = 0.036$ ). According to ROC curve analysis, the best cutoff value for pre-treatment UA was 8.5 mg/dL, yielding sensitivity and specificity of 75% and 50%, respectively, for predicting NL events in this study. Kaplan-Meier analysis showed that after 20 years of disease, 55% of patients with pre-treatment AU  $\geq 8.5$  mg/dL had NL, while only 18% of patients with pre-treatment AU  $< 8.5$  mg/dL.

AU $\geq 8,5$ mg/dL		
Sensitivity	75%	95% IC: 53% - 90%
Specificity	50%	95% IC: 36% - 64%
		Without NL
AU $< 8,5$ mg/dL	27	6 (18%)
AU $\geq 8,5$ mg/dL	29	18 (38%)

**Conclusions:** Since prevalence of NL in gout patients cannot be determined reliably from the clinical history, an active screening test for NL should be performed in these patients. Our study suggests that urine acidification and UA  $\geq 8.5$  mg/dL are associated with an increased risk of NL during follow-up of gout patients and should be corrected in their treatment.

OP0187

#### FRUCTOSE-CONTAINING BEVERAGES IS AN INDEPENDENT RISK FACTOR FOR GOUT EARLY-ONSET IN SOUTH CHINA

Q. Li<sup>1</sup>, S.-H. Zeng<sup>2</sup>, X.-Y. Du<sup>1</sup>, Y.-H. Xu<sup>1</sup>, K.-M. Yang<sup>1</sup>, J.-J. Liang<sup>1</sup>, Y.-Q. Mo<sup>1</sup>, L. Dai<sup>1\*</sup>. <sup>1</sup>Department of Rheumatology, Sun Yat-Sen Memorial Hospital, Sun Yat-Sen University, <sup>2</sup>Zhongshan School of Medicine, Sun Yat-Sen University, Guangzhou, China

**Background:** A trend of earlier onset of gout has been reported even though its incidence increases in a linear fashion with age until 70 years. Dietary factors have been supposed to be contributed to the early onset of gout.

**Objectives:** To investigate diet characteristics of gout and their impact on the early onset of gout.

**Methods:** Consecutive gout patients who fulfilled the 2016 ACR/EULAR classification criteria were recruited between Dec 2016 and Dec 2017. A cross-section survey on dietary factors before gout onset was conducted with semi-quantitative diet questionnaire. The questionnaire included alcohol, fructose-containing beverages, soup, animal organs, sea-foods, hotpot, tea and coffee, which impact on

serum uric acid (sUA) and aren't major macronutrient provider in Chinese dietary patterns. The patients with gout onset before age 30 years were defined as early-onset group while the others were defined as control group.

**Results:** Among 180 gout patients recruited, there were 69 (38.3%) patients in early-onset group and 111 (61.7%) in control group. Compared with control group, gout patients in early-onset group presented significantly higher level of sUA, estimated glomerular filtration rate and proportion of obesity, but lower fraction excretion of uric acid and prevalence of hypertension (table 1, p<0.05). The results of diet questionnaire showed that more patients in early-onset group consumed fructose-containing beverages ≥3 times/week, but less alcohol, animal organs and tea (all p<0.05, figure 1). There were no significantly difference in the consumption of soup, seafood, hotpot and coffee. Consuming fructose-containing beverages ≥3 times/week [OR 8.3 (2.5, 27.1), p<0.001], alcohol ≥1 standard unit/d [OR 0.27 (0.10, 0.80), p=0.017] and tea ≥3 times/week [OR 0.33 (0.12, 0.92), p=0.033] were associated with early-onset gout after adjusted by variables which were significantly different between early-onset group and control group (table 1).

**Abstract OP0187 – Table 1.** Comparison of clinical characteristics between the early-onset group and control group

Characteristics	all patients (n=180)	early-onset group (n=69)	control group (n=111)	P
Male, n(%)	168 (93.3)	68 (98.6)	100 (90.1)	0.027
Age, years	42.5±15.5	28.3±7.2	51.4±12.4	<0.001
Age of onset, years	37.8±15.1	23.5±5.1	46.7±12.1	<0.001

**OP0188 EFFECTS OF ALLOPURINOL VERSUS FEBUXOSTAT ON CARDIOVASCULAR RISK IN KOREAN PATIENTS WITH GOUT: A NATION-WIDE COHORT STUDY**

A. Shin<sup>1</sup>, M.H. Kim<sup>1</sup>, Y.-J. Ha<sup>1</sup>, Y.J. Lee<sup>1</sup>, Y. Song<sup>2</sup>, S.C. Kim<sup>3</sup>, E.H. Kang<sup>1</sup>.  
<sup>1</sup>Division of Rheumatology, Department of Internal Medicine, Seoul National University Bundang Hospital, Sungnam; <sup>2</sup>Division of Rheumatology, Department of Internal Medicine, Seoul National University Hospital, Seoul, Korea, Republic Of; <sup>3</sup>Division of Pharmacoepidemiology and Pharmacoeconomics, Department of Internal Medicine, Brigham and Women's Hospital, Boston, MA, USA

**Background:** Gout is associated with an increased risk of cardiovascular (CV) disease.

**Objectives:** We aimed to investigate comparative CV risk among gout patients who initiated allopurinol versus febuxostat.

**Methods:** Using the 2002–2015 Korean National Health Insurance Service (KNHIS) data for the whole Korean population, we conducted a cohort study on patients aged ≥40 years who had ICD-10 diagnosis code for gout and initiated allopurinol or febuxostat without prior history of urate lowering therapy, excluding those with chronic kidney disease, cancer, or dialysis treatment. The primary outcome was a composite CV endpoint of hospitalisation for myocardial infarction, stroke/transient ischaemic attack, or coronary revascularisation. Secondary outcomes were individual components of the primary outcome, and hospitalisation for heart failure (HF). Follow-up time started from the day after the first date the study drug was initiated and continued through to the earliest date among the following censoring events: discontinuation of the study drugs, outcome occurrence, disenrollment, end of study dataset, or death. After propensity score (PS)-matching with a 4:1 ratio for allopurinol and febuxostat initiators to adjust for baseline confounding, we estimated hazard ratio (HR) and 95% confidence interval (CI) of CV risks in allopurinol initiators versus febuxostat.

**Results:** We included 39 636 allopurinol initiators PS-matched on 9909 febuxostat initiators with a mean age of 59 years and 78% male. Before PS matching, baseline CV risk factors including hypertension, dyslipidemia, diabetes, and previous ischaemic heart disease were more prevalent in febuxostat initiators. The incidence rate per 100 person-years for primary composite endpoint was 2.33 in allopurinol and 2.12 in febuxostat initiators in the primary as-treated analysis. The HR (95% CI) for the primary outcome associated with allopurinol was 1.18 (0.98–1.42) versus febuxostat. Secondary outcome analyses showed similar results (table 1).

**Abstract OP0188 – Table 1.** Risk of cardiovascular events in allopurinol versus febuxostat initiators

	Allopurinol (n=39,636)		Incidence rate per 100 person-year	Febuxostat (n=9,909)		Incidence rate per 100 person-year	HR (95% CI)
	Events (n)	person-years		Events (n)	person-years		
<b>AS-TREATED ANALYSIS</b>							
<b>Primary outcome</b>							
Composite CV end point	735	31 605	2.33	133	6272	2.12	1.18 (0.98–1.42)
<b>Secondary outcomes</b>							
MI	105	31 528	0.33	20	6269	0.32	1.03 (0.64–1.68)
Coronary revascularisation	215	31 546	0.68	31	6269	0.49	1.42 (0.97–2.08)
Stroke/TIA	498	31 572	1.58	94	6271	1.50	1.14 (0.91–1.43)
Heart failure	956	30 611	3.12	206	6108	3.37	1.15 (0.99–1.34)

Propensity-score matching was used to adjust more than 50 covariates including demographic characteristics, medical comorbidities such as CV risk factors, use of gout specific and non-specific medications, and health care utilisation pattern. CI=confidence interval; CV=cardiovascular; HR=hazard ratio; MI=myocardial infarction; TIA=transient ischaemic attack

**Conclusions:** In this large Korean population-based cohort study, CV risks appear to be numerically, but not statistically significantly, elevated among allopurinol initiators compared to febuxostat initiators.

**OP0189 IDENTIFICATION OF NEW AND RARE VARIANTS IN ABCG2, SLC22A1 AND ALDH16A1 GENES IN CRYSTAL-PROVEN EARLY-ONSET GOUT**

C. Collet<sup>1</sup>, H. Morel<sup>1</sup>, M. Ricquebourg<sup>1</sup>, M. Cohen-Solal<sup>2</sup>, J.-L. Laplanche<sup>1</sup>, T. Pascart<sup>3</sup>, T. Bardin<sup>4</sup>, F. Liote<sup>4</sup>, P. Richette<sup>4</sup>, H.K. Ea<sup>2,4</sup>. <sup>1</sup>Biochemistry, Hôpital Lariboisière; <sup>2</sup>Bioscar, Inserm UMR 1132, Paris; <sup>3</sup>rheumatology, Groupement des Hôpitaux de l'Institut Catholique de Lille, Lille; <sup>4</sup>rheumatology, Hôpital Lariboisière, Paris, France

**Background:** Early-onset or juvenile gout (EOG) without hypoxanthine-guanine phosphoribosyltransferase enzyme deficiency (*HPRT*, OMIM 300323) and not related to familial juvenile hyperuricemic nephropathy (*UMOD*, OMIM 300323) is a rare gout phenotype characterised by a first flare in adolescence or in young adulthood. While numerous genome wide association studies (GWAS) have been done in classical and late-onset gout, very few studies have been performed in EOG patients. Moreover, until now most genetic studies only assess association between pre-defined single nucleotide polymorphisms (SNP) and gout.

**Objectives:** Our aim was to identify the genetic variants of clinically confirmed EOG by screening all exons of gout-associated genes with targeted Next-Generation Sequencing (NGS) approach.

**Methods:** Twenty-six urate crystal-proven gout patients with first flare occurring before the age of 30 years were included. Gout history, comorbidities and patient characteristics were recorded. All participants provided written informed consent to genetic analysis. After DNA extraction from total blood samples, the NGS libraries were prepared with surselect QXT (Agilent) and sequencing was performed with miseq (Illumina).

The multigene panel included 80 genes described in GWAS and genes involved in rare diseases such as *HPRT* and *UMOD*.

**Results:** Twenty-six patients (24 men, 20 Caucasians, 5 Asians and 1 African) with crystal-proven gout had experienced their first flare at a mean age of 22.8 years [14–29]. Gout duration was 11.5 years [1–46] and clinical tophi observed in 9 patients. Mean age was 37.5 [24–69] years and mean body mass index 27.6 kg/m<sup>2</sup> [20.1–40.7]. Ten patients were overweight, 5 had obesity, 1 hypertension, 0 diabetes mellitus, 7 dyslipidemia and 10 chronic kidney disease stages 2–4. Mean serum urate level was 527 µmol/L [270–803]. Amongst 26 affected patients, 7 had a molecular anomaly (26.9%). Six patients harboured one rare or novel variant in *ABCG2* (three Caucasian patients), *ALDH16A1* (two Caucasian patients) and *SLC22A11* (one African patient). Two other patients (one Caucasian and one Asian) carried an association of variants in both *ABCG2* and *ALDH16A1*. All variants had a Minor Allele Frequency (MAF) below 0.3% or were never described in public databases. All variant were considered as probably pathogenic according to *in silico* predictive algorithms. Interestingly, the well-known p.Gln141Lys SNP of *ABCG2* was identified in 3 Asian patients (11.5%) at homozygous level.

**Conclusions:** Our finding of very rare and novel pathogenic variants in *ABCG2*, *ALDH16A1* and *SLC22A11* genes provides better insights of the molecular pathogenesis in early-onset juvenile gout. However, our results also highlight the involvement of yet undetermined genes in this population.

**Disclosure of Interest:** None declared

**Treatments: friend or foe?**

**OP0190 THE ROLE OF NSAIDS IN THE ASSOCIATION BETWEEN OSTEOARTHRITIS AND CARDIOVASCULAR DISEASES: A POPULATION-BASED COHORT STUDY**

M. Atiquzzaman<sup>1</sup>, J. Kopec<sup>2</sup>, M.E. Karim<sup>2</sup>, H. Wong<sup>2</sup>, A. Anis<sup>2</sup>. <sup>1</sup>Faculty of Pharmaceutical Sciences; <sup>2</sup>School of Population and Public Health, University of British Columbia, Vancouver, Canada

**Background:** Worldwide, osteoarthritis (OA) is a major musculoskeletal disorder. Recent research suggests that OA is an independent risk factor for cardiovascular disease (CVD).<sup>1</sup> The relationship is complicated because non-steroidal anti-inflammatory drugs (NSAIDs), a proven risk factor for CVD, are frequently used for the treatment of OA.<sup>2</sup> Researchers have hypothesised that NSAID use in the causal pathway between OA and CVD is what may ultimately impact these patients to develop CVD, this pathway has yet to be studied.<sup>3,4</sup>

**Objectives:** The objective of this study was to disentangle the role of NSAID in the increased risk of CVD among OA patients.

**Methods:** This longitudinal study was based on linked health administrative data from British Columbia, Canada. From a population-based cohort of 720,055 British Columbians, we matched on age and sex to assemble 7,743 OA patients and 23 229 non-OA controls (1:3 ratio). We used multivariable Cox proportional hazards models to estimate the risk of developing incident CVD (primary outcome) as well as ischaemic heart disease (IHD), congestive heart failure (CHF) and stroke

(secondary outcomes). To estimate the mediating effect of NSAIDs, defined as current use of NSAID using linked prescription dispensing records, in the OA-CVD relationship, we implemented a marginal structural model.

**Results:** People with OA had 23% higher risk of developing CVD compared to people without OA after adjusting for SES, BMI, hypertension, diabetes, hyperlipidemia, COPD, and Romano comorbidity score, adjusted HR (95% CI) was 1.23 (1.17, 1.29). Adjusted HR (95% CI) was 1.42 (1.33, 1.52), 1.17 (1.10, 1.27), 1.14 (1.08, 1.24) for CHF, IHD and stroke, respectively. Approximately 67.51% of the total effect of OA on the increased risk of CVD was mediated through current NSAID use. Among the secondary outcomes, approximately 44.77% of increased CHF risk was mediated through current NSAID use. More than 90% of the total effects on IHD and stroke was mediated through the current NSAID use.

**Conclusions:** Our study is the first to evaluate the mediating role of NSAID use in the OA-CVD relationship based on population-based health administrative data. The results of this study also indicate that OA is an independent risk factor for CVD. Our findings suggest that the mediating role of NSAID use substantially contributes to the OA-CVD association.

**OP0191 ALL-CAUSE MORTALITY AND CARDIOVASCULAR DEATH IN HYDROXYCHLOROQUINE USERS IN RHEUMATOID ARTHRITIS PATIENTS – A POPULATION BASED DANISH COHORT STUDY**

K. Soeltoft<sup>1</sup>, J. Hallas<sup>2</sup>, M.C.M. Wasko<sup>3</sup>, A.B. Pedersen<sup>4</sup>, S.P. Ulrichsen<sup>4</sup>, T. Ellingsen<sup>1</sup>. <sup>1</sup>Dept. of Rheumatology; <sup>2</sup>Dept. of Clinical Chemistry and Pharmacology, Odense University Hospital, Odense, Denmark; <sup>3</sup>West Penn Hospital, Pittsburgh, Pittsburgh, USA; <sup>4</sup>Dept. of Clinical Epidemiology, Aarhus University Hospital, Aarhus, Denmark

**Background:** Rheumatoid arthritis (RA) is associated with a marked increase in cardiovascular comorbidity and mortality.<sup>1</sup> The increased risk is present from the earliest stages of the disease and evidence suggests an overlap in the pathogenic features leading to RA and atherosclerosis.

Hydroxychloroquine (HCQ) is used to treat RA in combination with methotrexate and has been associated with decreased risk of type II diabetes and dyslipidaemia among RA patients. Also HCQ has improved survival rates when used to treat other inflammatory diseases, e.g. systemic lupus erythematosus.<sup>1</sup> The evidence regarding RA patients is scarce.

**Objectives:** We wish to examine whether HCQ would affect the incidence rates of cardiovascular diseases, type II diabetes, cardiac – and all-cause mortality among Danish RA patients in an observational cohort study.

**Methods:** We identified all incident RA patients during the period of 2004 through 2014 in Denmark. HCQ initiators were compared with non-users of HCQ, stratified on rheumatoid factor positivity. Each HCQ initiator was matched to a non-HCQ initiator by their propensity score (PS). In the PS all relevant available cardiovascular drugs and comorbidities were included. All together we had 3,742 RA patients in each group.

**Results:** We found a significant reduction in all-cause mortality and cardiovascular related death among HCQ initiators, with a hazard ratio of 0.83 (95% confidence interval [CI] 0.71–0.97) and 0.78 (95% CI: 0.61 to 0.99), respectively. We did not find any association between HCQ use and development of type II diabetes or specific ischaemic events (myocardial infarctions and ischaemic strokes).

**Conclusions:** The beneficial properties on survival seen with HCQ use in other inflammatory diseases seem also applicable to RA patients. These results need confirmation in a randomised setting but justifies the use of HCQ in combination with other conventional synthetic disease-modifying antirheumatic drugs even though the effect of HCQ, *per se*, on RA disease activity is limited.

#### OP0192 METHOTREXATE USE AND THE RISK FOR CARDIOVASCULAR DISEASE AMONG RHEUMATOID PATIENTS INITIATING BIOLOGIC DISEASE-MODIFYING ANTIRHEUMATIC DRUGS

F. Xie, L. Chen, H. Yun, E. Levitan, P. Muntner, J.R. Curtis. *University of Alabama at Birmingham, Birmingham, USA*

**Background:** Methotrexate (MTX) has been associated with reduced risk for CVD in several studies conducted among rheumatoid arthritis (RA) patients never exposed to biologic disease-modifying antirheumatic drugs (bDMARDs). Effect of concomitant MTX use on CVD risk among RA patients initiating bDMARDs remains unknown.

**Objectives:** The objective of this study was to assess the CVD risk associated with MTX use among RA patients initiate bDMARDs, overall, and by each bDMARDs initiated.

**Methods:** A retrospective cohort study was conducted using 2006–2015 Medicare claims data for RA patients. Follow up started at initiation (index date) and ended at earliest of 1) end of exposure of the specific bDMARDs agent (days of supply plus 90 days extension), 2) switched to other bDMARDs or tofacitinib, 3) CVD event, 4) death date, 5) loss of Medicare coverage, 6) end of study (September 30, 2015). MTX use was defined as 1) concomitant MTX use, with prescription for MTX within 120 days after index date and 2) time varying MTX, defined as prescription date to prescription date plus days of supply without extension. For sensitivity analysis, a 90 day extension was added to days of supply. The primary outcome was composite of incident MI, incident stroke and fatal CVD. Fatal CVD were identified by a claims based algorithm with PPV  $\geq 80\%$ .

Incidence rates (IR) and 95% confidence intervals (CI) were calculated using Poisson regression. Overall association between MTX use (versus no MTX) and risk of CVD were assessed using Cox regression. Given that the interactions between MTX and background bDMARDs was significant, we performed contrast (MTX Yes vs No) to examine the association between MTX and risk for CVD for each underlying bDMARDs in one model. A subgroup analysis limited the cohort to RA patients with previous exposure to MTX was conducted to ensure consistency of findings.

**Results:** A total of 88,255 DMARDs initiations (64 218 patients) were included in this study. The average age at initiation was 64.6 (12.3) years, 84.0% were female, 68.2% were non-Hispanic white. The crude IRs for CVD were 13.1 (95% CI: 12.2 to 14.0) and 18.7 (95% CI: 17.6 to 19.9) events per 1000 person years for RA patients with and without concomitant MTX respectively. The crude IRs for CVD were 12.1 (95% CI: 11.1 to 13.2) and 17.9 (95% CI: 16.9 to 18.8) events per 1000 person years for RA patients with and without time varying MTX respectively. IRs for individual bDMARDs are shown in figure. P-value for interaction

between concomitant MTX and background bDMARDs was 0.0189 and p-value for interaction between time varying MTX and background bDMARDs was 0.0030. The contrast HRs for concomitant MTX ranged from 0.61 (0.37, 1.01) for golimumab initiators to 0.97 (0.74, 1.26) for adalimumab initiators (figure 1). The contrast HRs for time varying MTX ranged from 0.58 (0.35, 0.96) for certolizumab initiators to 0.90 (0.68, 1.18) for adalimumab initiators.

Results were robust in sensitivity and subgroup analyses.

**Conclusions:** Our observational study suggests an overall 23% reduction of CVD risk associated with concomitant MTX use. The effect sizes vary among background bDMARDs.

#### OP0193 TOCILIZUMAB AND THE RISK FOR CARDIOVASCULAR DISEASE EVENTS AMONG RHEUMATOID ARTHRITIS PATIENTS: A DIRECT COMPARISON IN REAL WORLD SETTING

F. Xie, H. Yun, E. Levitan, P. Muntner, J.R. Curtis. *University of Alabama at Birmingham, Birmingham, USA*

**Background:** Multiple studies have observed unfavourable changes in lipid profile associated with tocilizumab (TCZ, anti-IL6 receptor antagonists) and some other rheumatoid arthritis (RA) therapies. The real-world cardiovascular disease (CVD) risk associated with the first anti-IL-6R medication for RA, TCZ, remains uncertain.

**Objectives:** The objective of this study was to assess the CVD risk associated with TCZ compared to individual tumour necrosis inhibitor (TNFi) therapies, as well as to other biologics used for RA (e.g. rituximab, abatacept).

**Methods:** Using 2006–2015 Medicare and MarketScan claims data, we conducted a retrospective cohort study among RA patients who initiated biologic disease-modifying antirheumatic drugs (bDMARDs) after January 1, 2010 and had at least 365 days medical and pharmacy coverage before initiation. The primary outcome was a composite of myocardial infarction (MI), stroke, and fatal CVD assessed using a validated method. Subgroups analyses were done for RA patients experienced to other bDMARDs before initiation and by stratifying patients with respect to key CVD risk factors to identify both higher and lower CVD risk patients. We provided descriptive statistical for each exposure group. Incidence rates and 95% confidence intervals were calculated using Poisson regression. COX regression was used to generate unadjusted and adjusted hazard ratio.

**Results:** We identified 3 54 486 (Medicare 206,275+MarketScan 148,211) RA patients and 4 63 446 (Medicare 271,832+MarketScan 191,614) initiations of bDMARDs. After applying inclusion and exclusion criteria, the final cohort contained 88 463 (Medicare 46,648+MarketScan 41,815) RA patients and 1 17 493 (Medicare 61,715+MarketScan 55,778) episodes. The mean (SD) age was 64.7 (12.1) in Medicare and 52.2 (12.3) in MarketScan. The majority of patients were female (83.9% in Medicare and 80.5% in MarketScan), and 68.6% were non-Hispanic White in Medicare. TCZ users were similar to abatacept and rituximab users except that TCZ users were less likely to be naïve to bDMARDs. Compared to TNFi users, TCZ users were more likely to be white, with history of CVD (other than MI or stroke), heart failure, atrial fibrillation, hospitalisation and had more

physician visits in baseline. TCZ users were less likely to be diabetic, use methotrexate in the baseline, and to be naïve to bDMARDs. The crude incidence rate (IR) per 1000 patient-years for composite CVD among Medicare patients ranged from 13.3 (95% CI: 11.1 to 16.0) for etanercept to 19.4 (95% CI: 16.3 to 20.9) for rituximab users. The crude incidence rate for pooled TNFi users was 16.4 (15.2–17.7). Compared to TCZ, the adjusted hazard ratios were 1.03 (0.82–1.29) for abatacept, 1.25 (0.96–1.61) for rituximab, 1.13 (0.84–1.52) for etanercept, 1.33 (0.99–1.80) for adalimumab, and 1.57 (1.21–2.05) for infliximab (figure 1). There were no significant differences in CVD risk between tocilizumab and any other biologic using MarketScan data. Results were robust in numerous subgroup analyses.

Abstract OP0193 – Figure 1. Incidence rates and adjusted hazard ratios of CVD events in RA patients

**Conclusions:** Consistent with findings of a recently completed safety trial in RA, tocilizumab was associated with a comparable CVD risk compared to etanercept, as well as a number of other RA biologics, in two large data sources.

**OP0194 THE ASSOCIATION BETWEEN SERUM URIC ACID AND ARTERIAL STIFFNESS IN A LOW-RISK, LARGE POPULATION OF MIDDLE-AGED KOREAN**

J. Hwang<sup>1</sup>, J.H. Hwang<sup>2</sup>, Y. Eun<sup>3</sup>, H. Kim<sup>3</sup>, J. Lee<sup>3</sup>, J.K. Ahn<sup>4</sup>. <sup>1</sup>Department of internal medicine, National Police Hospital; <sup>2</sup>Center for health promotion, Samsung Medical Center; <sup>3</sup>Department of medicine, Samsung Medical Center, Sungkyunkwan University School of Medicine; <sup>4</sup>Department of internal medicine, Kangbuk Samsung Hospital, Sungkyunkwan University School of Medicine, Seoul, Korea, Republic Of

**Background:** Arterial stiffness occurs because of biologic ageing and arteriosclerosis, and is most commonly measured by pulse-wave velocity. Several studies have reported that high serum uric acid may contribute to the development of a number of metabolic and haemodynamic abnormalities, and multivariate analyses in epidemiologic studies have suggested that hyperuricemia is an independent risk factor for arterial stiffness in those with comorbidities such as diabetes, hypertension, and chronic kidney disease. However, there are few reports about the association between SUA and arterial stiffness in apparently healthy populations. **Objectives:** We aimed to investigate the association between serum uric acid (SUA) and arterial stiffness as evaluated by brachial ankle pulse wave velocity (baPWV) in a low-risk, large, middle-aged Korean population.

**Methods:** We conducted a cross-sectional study of 66,917 Koreans (38 170 men, 28 747 women) who received yearly screening with available PWV and SUA results. None of the participants had coronary heart disease, diabetes, or hypertension. SUA was divided into quintiles for assessment of its association with baPWV by multiple linear regression analysis.

**Results:** The average SUA level was 5.23±1.4 mg/dl, and SUA values were higher in men than in women (6.1±1.2 mg/dl vs 4.1±0.8 mg/dl). In multiple regression analysis, PWV was significantly higher in SUA quintiles 2–5 compared to the lowest group (reference) (coefficient=11.52, 18.19, 24.73, and 31.02 cm/s, respectively). In female subjects, the average difference (cm/s) of PWV between quintiles 2–5 and quintile 1 of SUA was 13.1, 22.9, 34.6, and 32.1, respectively.

Fully adjusted linear coefficient  $\beta$  (S.E.) was 6.62 (0.70) and 12.43 (1.33) in all participants and female subjects, respectively ( $p<0.001$ ). In contrast, there was a J-shaped association between PWV and SUA quintile among males. When modelled continuously, each 1 mg/dl higher SUA level was associated with 0.27 higher baPWV ( $p<0.001$ ) in the adjusted analysis.

**Conclusions:** These findings indicate that higher SUA levels could have an unfavourable impact on arterial stiffness as measured by baPWV in a low-risk, large, middle-aged Korean population.

**Disclosure of Interest:** None declared

**OP0195 ROLE OF SEROPOSITIVITY ON MORTALITY IN RA AND THE IMPACT OF TREATMENT WITH DMARDS**

E. Alemaj<sup>1</sup>, Z. Guo<sup>1</sup>, M.E. Weinblatt<sup>2</sup>, N.A. Shadick<sup>2</sup>. <sup>1</sup>Bristol-Myers Squibb, Princeton; <sup>2</sup>Brigham and Women's Hospital, Boston, USA

**Background:** Previous studies showed that RF positivity (+) in RA was associated with increased overall mortality, and that cause-specific mortality rates differed by autoantibodies. Anti-citrullinated protein antibodies (ACPAs) have been associated with cardiovascular death, and RF with death due to neoplasm and respiratory disease.<sup>1</sup>

**Objectives:** To evaluate the association of serostatus (in particular, antibody [Ab] titres) with mortality and its modification by DMARDS.

**Methods:** Administrative claims data from Optum Clinformatics Data Mart and Humana databases (2006–2016) were used. Inclusion criteria: 2 diagnosis codes for RA plus 1 DMARD prescription; age  $\geq 18$  years (y);  $\geq 6$  months (M) baseline (BL); +/-3 M from index date. Index date was the first test date for ACPA or RF (main analysis) or the DMARD prescription date (DMARD effect on mortality analysis). Patients (pts) with ankylosing spondylitis, Crohn's disease, lupus, psoriatic arthritis or ulcerative colitis at/before index date were excluded. Based on BL Ab test, pts were categorised into Ab status of ACPA+/-, RF +/- and double +/-.

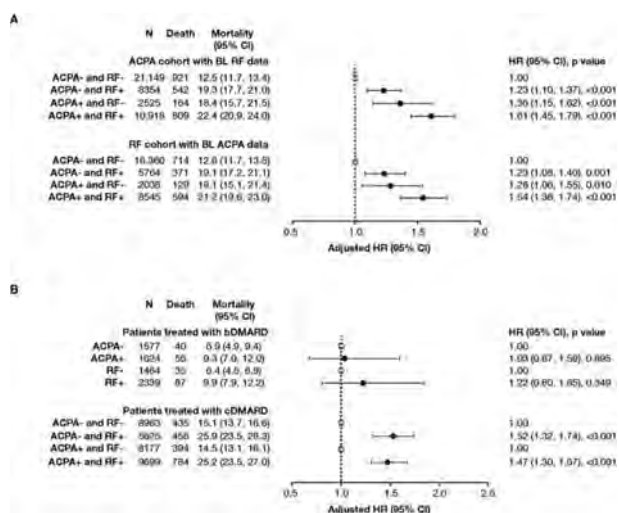

Ab +pts were then categorised into 2 groups based on Ab titres. DMARD-exposed pts were categorised into biologic (b)DMARD (use of any bDMARD) and conventional (c)DMARD (use of a cDMARD but never a bDMARD) cohorts. Crude mortality rates per 1000 pt-y, as well as adjusted analysis using traditional multivariate regression and disease risk score methods, were used. Covariates were age, sex, region, physician office visits in past 3 M, indicator variable for RA diagnosis before ACPA/RF testing, past hospitalisation, medication use (steroids, NSAIDs, salicylates), DMARD use and co-morbidities. **Results:** A total of 53 849 and 79 926 pts with RA had evaluable ACPA and RF status, respectively. The average (SD) age was 61.4 (15.2) and 61.8 (15.6) y in the ACPA and RF cohorts, respectively. For both ACPA and RF, mortality rates were significantly higher in Ab +vs Ab- pts, and were highest in pts with the highest Ab titres (table 1). The hazard ratios (HRs) for mortality were highest in pts with double positivity (figure 1A). HRs were higher in Ab +vs Ab- pts exposed to cDMARDs. There was no difference in mortality between Ab +vs Ab- pts in the bDMARD-exposed group (figure 1B).

Abstract OP0195 – Table 1 Crude mortality rates and HRs in patients categorised by serostatus

	Patients, n	Deaths, n	Pt-y	Crude mortality, incidence rate/1000 pt-y (95% CI)	Adjusted HR (95% CI)	P value
ACPA-	36 667	1798	1 26 451	14.2 (13.6–14.9)	1.00	
ACPA+	17 182	1276	57 719	22.1 (20.9–23.4)	1.48 (1.37–1.60)	<0.001
ACPA +Group	8321	606	29 518	20.5 (18.9–22.2)	1.38 (1.25–1.52)	<0.001
ACPA +Group 1*	8861	670	28 201	23.8 (22.0–25.6)	1.60 (1.45–1.76)	<0.001
RF-	46 376	2522	1 79 247	14.1 (13.5–14.6)	1.00	
RF+	33 550	2688	1 18 583	22.7 (21.8–23.5)	1.44 (1.36–1.53)	<0.001
RF +Group	16 758	1098	60 393	18.2 (17.1–19.3)	1.18 (1.09–1.27)	<0.001
RF +Group 1*	16 792	1590	58 190	27.3 (26.0–28.7)	1.79 (1.51–2.11)	<0.001

\*Based on antibody titre: Group 1=lower titre; Group 2=higher titre

**Abstract OP0195** – Figure 1 Mortality rates and HRs in patients categorised by (A) double ACPA and RF serostatus; (B) serostatus and DMARD exposure

**Conclusions:** Elevated ACPA and RF titres were independently associated with increased mortality among pts with RA. The associations between ACPA/RF and mortality persisted in those treated with cDMARDs but not with bDMARDs. Further studies are warranted to evaluate the effect of bDMARDs on mortality in seropositive pts.

#### SAFETY AND EFFICACY OF IMMUNE CHECKPOINT INHIBITORS IN PATIENTS WITH CANCER AND PREEXISTING AUTOIMMUNE DISEASES: A NATIONWIDE MULTICENTER RETROSPECTIVE STUDY

A. Tison<sup>1</sup>, G. Quere<sup>1</sup>, L. Misery<sup>1</sup>, E. Funck-Brentano<sup>2</sup>, F.-X. Danlos<sup>2</sup>, B. Bonniaud<sup>3</sup>, C. Scalbert<sup>4</sup>, T. Lesimple<sup>5</sup>, S. Martinez<sup>6</sup>, M. Marq<sup>7</sup>, C. Chouaid<sup>8</sup>, C. Dubos<sup>9</sup>, F. Brunet-Possenti<sup>2</sup>, C. Stavis<sup>10</sup>, L.Y. Chiche<sup>10</sup>, D. Cornec<sup>1</sup>, M. Kostine<sup>11</sup>, on behalf of Groupe de Cancérologie Cutanée (GCC), Groupe Français de Pneumo-Cancérologie (GFPC), Club Rhumatisme et Inflammation (CRI). <sup>1</sup>CHU, Brest; <sup>2</sup>AP-HP, Paris; <sup>3</sup>CHU, Dijon; <sup>4</sup>CHU, Lille; <sup>5</sup>Centre anti-cancer, Rennes; <sup>6</sup>CH, Aix; <sup>7</sup>CH Vendée, La Roche sur Yon; <sup>8</sup>CHU, Créteil; <sup>9</sup>Centre Baclesse, Caen; <sup>10</sup>Européen, Marseille; <sup>11</sup>CHU, Bordeaux, France

**Background:** Immune Checkpoint Inhibitors (ICI) have revolutionised the management of several cancers, enhancing the anti-tumoral immune response. However they are responsible for many Immune Related Adverse Effects (IRAE), and therefore most patients with Preexisting Autoimmune Diseases (PAD) have been excluded from clinical trials.

**Objectives:** The aim of this study was to evaluate the safety and efficacy of ICI in patients with PAD.

**Methods:** Three national expert networks, focusing respectively on skin cancers, thoracic cancers and inflammatory diseases participated in this study. All patients who received an ICI despite a PAD in clinical practice were included in this nationwide retrospective study.

**Results:** 112 patients were included: 64 men (57.1%), median age 66.5. Most patients received an anti-PD1 or anti-PD-L1 drug (84.8%). Main cancer types were melanoma (n=66, 58.9%) and Non-Small Cell Lung Carcinoma (NSCLC) (n=40; 35.7%). Median follow-up was 8 months [0–52].

Most frequent PAD were psoriasis and psoriatic arthritis (27.6%), rheumatoid arthritis (17.8%), inflammatory bowel disease (12.5%), spondyloarthritis (4.5%), lupus (6.3%), polymyalgia rheumatica and/or giant-cell arteritis (6.3%). 24 patients (21.6%) were receiving an immunosuppressive therapy (IS) at ICI initiation

(including steroids in 15, sDMARD in 10 and rituximab in 1). 37 patients (33%) had an active disease.

PAD flares were frequent (n=47; 42%) and 30.4% of them were severe (grade CTCAE 3–4). 26 patients (56.5%) received an IS treatment for a flare (22 received steroids and 7 a DMARD). Other IRAEs not related to the PAD occurred in 43 patients (38.4%), 41.5% were severe. 23 patients (56.1%) required an IS (including a DMARD in 4). 36 patients (32.1%) discontinued ICI temporarily or definitively because of a flare or an IRAE. One patient died due to an IRAE.

Concerning the anti-tumoral response, the Overall Response Rate (ORR) was 48.3% for melanoma and 53.8% for NSCLC. The median Progression Free Survival (PFS) was 12.4 months for melanoma and 9.7 for NSCLC. Median overall survival (OS) was not reached in any group. PFS and OS were shorter in patients receiving an IS treatment at ICI initiation (p=0.007, figure 1A, and p=0.003, respectively). PFS and OS were longer in patients who experienced a PAD flare or other IRAE, but this gain was lost when an IS was used to treat the flare/IRAE (p=0.008, figure 1B, and p=0.01, respectively). Conversely, this gain was not impacted with ICI discontinuation.

**Conclusions:** PAD flares and other IRAEs are frequent during ICI therapy and may be severe. The OS, ORR and PFS seem high in patients with PAD. The occurrence of a flare/IRAE is associated to a better outcome, gain lost when IS are used, while ICI discontinuation has no impact on PFS. Further prospective studies are needed to confirm our findings.

**Disclosure of Interest:** None declared

OP0197

#### RHEUMATIC AND MUSCULOSKELETAL ADVERSE EVENTS ASSOCIATED WITH IMMUNE CHECKPOINT INHIBITORS: DATA MINING OF THE US FOOD AND DRUG ADMINISTRATION ADVERSE EVENT REPORTING SYSTEM

X. Pundole<sup>1</sup>, M. Sarangdhar<sup>2</sup>, M.E. Suarez-Almazor<sup>3</sup>. <sup>1</sup>The University of Texas MD Anderson Cancer Center, Houston; <sup>2</sup>Division of Biomedical Informatics, Cincinnati Children's Hospital Medical Center, Cincinnati; <sup>3</sup>Department of General Internal Medicine, Section of Rheumatology and Clinical Immunology, The University of Texas MD Anderson Cancer Center, Houston, USA

**Background:** Immune-modulating monoclonal antibodies directed against immune checkpoints (cytotoxic T lymphocyte-associated antigen 4 (CTLA-4), programmed cell death-1 receptor (PD-1) and its ligand PD-L1), have demonstrated tremendous promise in the treatment of diverse solid tumour types, including melanoma, non-small cell lung cancer, among others and have improved survival rates of these cancer patients. However, these advances have created a new set of challenges in identifying and managing toxicities.

**Objectives:** To identify emerging trends of rheumatic and musculoskeletal adverse events by immune checkpoint inhibitor (ICI) treatment in the US Food and Drug Administration (FDA) Adverse Events Reporting System (FAERS).

**Methods:** We used AERSMine, an open-access web based application to mine the FAERS database from the first quarter (Q1) of 2011 to the third quarter (Q3) of 2017, approximately 7.1 million patients. Measures of disproportionality were calculated using well-established pharmacovigilance metrics, Relative Risks (RR) and safety signals (information component, (IC)), in a subset of patients with a cancer diagnosis. Terminology used for categorization of adverse events was as included in the FAERS. Fisher's exact test was used to determine significant adverse event differences by ICI treatment and age.

**Results:** We identified 30 939 unique patients with cancer and reports of immune checkpoint inhibitor associated toxicities. More than half of these reports were in relation with anti PD-1 inhibitors. Statistically significant adverse events associated with ICI therapy identified as toxicity signals with different agents included: NIVOLUMAB: myositis (n=102; RR, 1.35; p<0.01; IC, 0.43), rheumatoid arthritis (n=67; RR, 1.52; IC, 0.61), psoriatic arthropathy (n=20; RR, 1.93, IC, 0.95),

musculoskeletal pain (n=76; RR, 1.37; IC, 0.45) and myasthenia gravis (n=66; RR, 1.42; IC, 0.50);<sup>2</sup> PEMBROLIZUMAB: arthralgia (n=151; RR, 1.43; IC, 0.52) and pain in an extremity (n=58; RR, 1.35; IC, 0.43);<sup>3</sup> DURVALUMAB: polymyositis (n=2; RR, 4.41; IC, 2.15), rhabdomyolysis (n=4; RR, 2.68; IC, 1.42), and autoimmune arthritis (n=2; RR, 8.83; IC, 3.14);<sup>4</sup> IPILIMUMAB: muscular weakness (n=157; RR, 1.70; IC, 0.76) and back pain (n=105; RR, 1.27; IC, 0.34). In general, rates of rheumatic and musculoskeletal adverse events were higher in men and in the elderly population (>65 years).

**Conclusions:** A wide spectrum of rheumatic and musculoskeletal toxicity signals were detected with ICI's. Clinicians need to be vigilant about these rare but debilitating complications. Future studies to explore mechanisms and optimal management strategies of these toxicities are warranted.

## Can we halt progression of structural damage in axial SpA?

### OP0198 COMBINED EFFECTS OF TUMOUR NECROSIS FACTOR INHIBITORS AND NSAIDS ON RADIOGRAPHIC PROGRESSION IN ANKYLOSING SPONDYLITIS

L.S. Gensler<sup>1</sup>, M. Gianfrancesco<sup>1</sup>, M.H. Weisman<sup>2</sup>, M.A. Brown<sup>3</sup>, M. Lee<sup>4</sup>, T. Leach<sup>5</sup>, M. Rahbar<sup>4</sup>, J.D. Reveille<sup>6</sup>, M.M. Ward<sup>7</sup>. <sup>1</sup>Medicine, University of California, San Francisco, San Francisco; <sup>2</sup>Medicine, Cedars Sinai Medical Center, Los Angeles, USA; <sup>3</sup>Medicine, Queensland University of Technology, Brisbane, Australia; <sup>4</sup>Epidemiology/Biostatistics, The University of Texas Health Science Center at Houston, Houston; <sup>5</sup>Radiology, Cedars Sinai Medical Center, Los Angeles; <sup>6</sup>Medicine, The University of Texas Health Science Center at Houston, Houston; <sup>7</sup>NIH/NIAMS, Bethesda, USA

**Background:** The potential of TNFi or NSAIDs to reduce radiographic progression in AS is uncertain and causal effects of both exposures on radiographic progression have not been convincingly demonstrated. In addition, no study has evaluated whether effects are comparable among different NSAIDs in this setting.

**Objectives:** The objective of this study was to explore causal effects of NSAIDs and TNFi on radiographic progression in Ankylosing Spondylitis (AS) and to compare effects of celecoxib to other NSAIDs.

**Methods:** We included all patients meeting the modified New York criteria in a prospective cohort with at least 4 years of clinical and radiographic follow up. Clinical and medication data were collected every 6 months and radiographs were performed at baseline and every 2 years. We used longitudinal targeted maximum likelihood estimation to estimate the causal effect of TNFi and NSAIDs (using the NSAID index) on radiographic progression as measured by the modified Stoke Ankylosing Spondylitis Spine Score (mSASSS) at 2 and 4 years, accounting for time-varying covariates. We controlled for sex, race/ethnicity, education, symptom duration, enrollment year, number of years on TNFi, symptom duration at time of TNFi start, baseline mSASSS, ASDAS-CRP, current smoking, and missed visit status.

Abstract OP0198 – Table 1

	TNF use	No TNF use	Mean Difference	P-value
Comparing TNF use vs no TNF use, given no NSAID (=0) at time t:				
mSASSS @ 2 years	13.94	14.92	-0.98 (-2.77, 0.81)	0.28
mSASSS @ 4 years	16.12	15.62	0.50 (-0.63, 1.64)	0.38
Comparing TNF use vs no TNF use, given low NSAID (>0 and <50) at time t:				
mSASSS @ 2 years	15.43	15.49	-0.06 (-1.63, 1.51)	0.94
mSASSS @ 4 years	15.52	16.76	-1.24 (-1.80, -0.68)	<0.001
Comparing TNF use vs no TNF use, given high NSAID (>=50) at time t:				
mSASSS @ 2 years	14.79	15.13	-0.34 (-1.46, 0.78)	0.56
mSASSS @ 4 years	14.17	17.47	-3.31 (-4.02, -2.59)	<0.001
Comparing TNF use vs no TNF use, NSAID=celecoxib at time t:				
mSASSS @ 2 years	11.63	15.62	-3.98 (-4.51, -3.45)	<0.001
mSASSS @ 4 years	14.37	19.06	-4.69 (-5.08, -4.30)	<0.001

**Results:** Of the 519 patients, 75% were male with a baseline mean (SD) age and symptom duration of 41.4 (13.2) and 16.8 (12.5) years respectively. The baseline mean (SD) mSASSS was 14.2 (19.6). At baseline, NSAIDs were used in 66% of

patients, of which ½ used an index <50 and ½ an index ≥50). TNFi were used in 46% of patients at baseline. In the setting of TNFi use, the addition of NSAID therapy was associated with less radiographic progression in a dose-related manner at 4 years. When NSAID specific effects were examined, celecoxib in combination with TNFi use was associated with the greatest reduction in radiographic progression and this was significant at both 2 and 4 years (table 1).

**Conclusions:** Dose related use of NSAIDs together with TNFi in AS patients has a synergistic effect in slowing radiographic progression with the greatest effect in those using both high-dose NSAIDs and TNFi. Celecoxib appears to confer the greatest benefit in decreasing progression with effect at both 2 and 4 years.

### OP0199 SUSTAINED REMISSION OF INFLAMMATION IS ASSOCIATED WITH REDUCED STRUCTURAL DAMAGE ON SACROILIAC JOINT MAGNETIC RESONANCE IMAGING IN PATIENTS WITH EARLY AXIAL SPONDYLOARTHRITIS: EVIDENCE TO SUPPORT THE CONCEPT OF TREAT-TO-TARGET

W.P. Maksymowych<sup>1</sup>, P. Claudepierre<sup>2</sup>, M. de Hooze<sup>3</sup>, R.G. Lambert<sup>1</sup>, R. Landewé<sup>4</sup>, A. Molto<sup>5</sup>, D. van der Heijde<sup>3</sup>, J.F. Bukowski<sup>6</sup>, H. Jones<sup>6</sup>, I. Logeart<sup>7</sup>, L. Marshall<sup>6</sup>, R. Pedersen<sup>6</sup>, A. Szumski<sup>8</sup>, B. Vlahos<sup>6</sup>, M. Dougados<sup>5</sup>. <sup>1</sup>University of Alberta, Edmonton, Canada; <sup>2</sup>Universite Paris Est Creteil, Paris, France; <sup>3</sup>Leiden University Medical Center, Leiden; <sup>4</sup>Amsterdam Rheumatology and Immunology Center, Amsterdam, Netherlands; <sup>5</sup>Paris Descartes University, Hôpital Cochin, Paris, France; <sup>6</sup>Pfizer, Collegeville, USA; <sup>7</sup>Pfizer France, Paris, France; <sup>8</sup>inVentiv Health, Princeton, USA

**Background:** Treat-to-target is acceptable in RA; however, it is unknown whether it will reduce/prevent disability, impairment of mobility, and structural damage in early axial spondyloarthritis (axSpA) without radiographic sacroiliitis.

**Objectives:** To evaluate the impact of sustained clinical remission on MRI structural parameters. We hypothesised that patients with sustained inactive disease according to the ankylosing spondylitis disease activity score (ASDAS <1.3) are more likely to achieve reduction in erosion (structural damage) and increase in backfill (a reparative process) on MRI of the SI joints (SIJ).

**Methods:** EMBARK (NCT01258738) and DESIR (NCT01648907) enrolled patients with early axSpA. EMBARK included 12 weeks of double-blind placebo-control, then open-label etanercept for 92 weeks. Patients in the DESIR observational cohort had no history of biologics and received no biologics for 2 years. T1 weighted MRI images of SIJ at baseline and 104 weeks were combined and anonymized; readers were unaware of film chronology and original patient cohort. Three experienced readers evaluated MRI images using the SpondyloArthritis Research Consortium of Canada SIJ Structural Score. Lesion change was considered present if ≥2 of 3 readers measured change in same direction. ASDAS endpoints were assessed sequentially: sustained (≥2 visits 6 months apart) inactive disease (ASDAS <1.3) or moderate disease activity (≥1.3 to <2.1); or no sustained response (≥2.1). Net proportions of patients with decrease in erosion and increase in backfill were determined, unadjusted and adjusted for covariates that may affect development of lesions on MRI.

**Results:** From EMBARK and DESIR, 161 and 76 patients, respectively, were included. For patients in EMBARK with sustained ASDAS <1.3, a greater percentage had decrease in erosion (34/104, 32.7%) than increase (5/104, 4.8%); p<0.0001; without sustained response, 5/24 (20.8%) had decrease in erosion and 1/24 (4.2%) had increase. This trend was also present in DESIR. Patients with sustained ASDAS <1.3 in EMBARK: 22.1% had increase in backfill, 0% had decrease; p<0.0001; in DESIR, 21.7% had increase, 0% had decrease; p<0.05. For those without sustained response, difference between increase and decrease was smaller. Net percent of patients (adjusted) with sustained ASDAS <1.3 and erosion decrease: 22.6% and 9.3% for EMBARK and DESIR, respectively; without sustained response: 13.3% and -10.1%. Net percent of patients with sustained ASDAS <1.3 and backfill increase: 19.6% and 25.7% for EMBARK and DESIR, respectively; without sustained response: 8.7% and 6.0%.

**Conclusions:** These data demonstrate a link between sustained ASDAS inactive disease and MRI structural endpoints. Clinical relevance of change in MRI SIJ erosion and backfill and their relationship to ankylosis development requires study.

## Reproductive issues in rheumatology

OP0200

### CHARACTERISTICS AND OUTCOMES OF PROSPECTIVELY REPORTED PREGNANCIES EXPOSED TO CERTOLIZUMAB PEGOL FROM A SAFETY DATABASE

M.E.B. Clowse<sup>1</sup>, A.E. Scheuerle<sup>2</sup>, C. Chambers<sup>3</sup>, A. Afzali<sup>4</sup>, A. Kimball<sup>5</sup>, J. J. Cush<sup>6</sup>, M. Cooney<sup>7</sup>, L. Shaughnessy<sup>7</sup>, M. Vanderkelen<sup>8</sup>, F. Förger<sup>9</sup>. <sup>1</sup>Duke University Medical Center, Durham, NC; <sup>2</sup>UT Southwestern Medical Center, Dallas, TX; <sup>3</sup>UC San Diego School of Medicine, La Jolla, CA; <sup>4</sup>Ohio State University, Wexner Medical Center, Columbus, OH; <sup>5</sup>Beth Israel Deaconess Medical Center and Harvard Medical School, Boston, MA; <sup>6</sup>Baylor Scott and White Research Institute, Dallas, TX; <sup>7</sup>UCB Pharma, Raleigh, NC, USA; <sup>8</sup>UCB Pharma, Braine-l'Alleud, Belgium; <sup>9</sup>Inselspital, University of Bern, Bern, Switzerland

**Background:** Anti-tumour necrosis factor medications (anti-TNFs) are effective in controlling chronic inflammatory diseases, but information about their use and safety in pregnancy is limited. Consequently, anti-TNFs are often discontinued early in gestation. Certolizumab pegol (CZP), an Fc-free, PEGylated anti-TNF approved for treatment of rheumatic diseases and/or Crohn's disease, has no active placental transfer.

Abstract OP0200 – Figure 1 Overview of pregnancy reports

**Objectives:** This project provides information on pregnancy outcomes in women receiving CZP, especially those with early pregnancy exposure.

**Methods:** Prospective and retrospective data on maternal CZP exposure, including timing and duration, outcomes, comorbidities, and major malformations were extracted from the UCB Pharma safety database through 6 March 2017. This analysis was limited to prospective reports to avoid bias associated with retrospective submissions. Numbers of live births, miscarriages, elective abortions, stillbirths, and major congenital malformations were ascertained.

**Results:** From a total of 1541 maternal CZP-exposed pregnancies, 1137 were reported prospectively, of which 528 pregnancies (including 10 twin pregnancies) had 538 known outcomes: 459 live births (85%), 47 miscarriages (9%), 27 elective abortions (5%), and 5 stillbirths (1%) (figure 1). Of the 459 live births, 8 (2%) cases of major congenital malformations were reported (vesicoureteral reflux, club foot, congenital heart disease, cerebral ventricle dilatation, polydactyly, anal fistula, accessory auricle, and hydronephrosis). Of the 528 prospective pregnancies with known outcomes, 436 (83%) were exposed during the 1st trimester, when most organogenesis occurs; 201 pregnancies were exposed during the entire pregnancy.

**Conclusions:** This analysis represents the largest published cohort of pregnant women exposed to an anti-TNF for management of chronic inflammatory diseases. Analysis of pregnancy outcomes does not indicate a malformative effect of CZP compared to the EU general population (2%–3%), nor an increased risk of foetal death. These data are reassuring for women of childbearing age considering treatment with CZP; however, the ongoing collection of post-marketing surveillance data, including the ongoing MotherToBaby study from the Organisation of Teratology Information Specialists, will provide further important information.

**Acknowledgements:** This study was funded by UCB Pharma. The authors thank the patients and their caregivers in addition to the investigators and their teams who contributed to this study. ## Do we still need biopsies to diagnose Sjögren's and autoimmune myositis?

OP0201

### CLINICAL OUTCOMES AND RESPONSE TO ANTI-THROMBOTIC TREATMENT AMONG PATIENTS WITH CONCOMITANT LUPUS NEPHRITIS AND THROMBOTIC MICROANGIOPATHY: A MULTICENTER COHORT STUDY

S. Sciascia<sup>1</sup>, J. Yazdany<sup>2</sup>, M. Cuadrado<sup>3</sup>, M. Radin<sup>4</sup>, M. Dall'Era<sup>5</sup>, I. Aggarwal<sup>2</sup>, R. Fenoglio<sup>1</sup>, A. Barreca<sup>6</sup>, M. Papotti<sup>6</sup>, I. Cecchi<sup>1</sup>, E. Rubini<sup>1</sup>, K. Schreiber<sup>3</sup>, D. Roccatello<sup>1</sup>. <sup>1</sup>Center of Immunopathology and Rare Diseases, University of Torino, Torino, Italy; <sup>2</sup>UCSF, San Francisco, USA; <sup>3</sup>Lupus Unit, GSTT, London, UK; <sup>4</sup>University of Torino, Torino, Italy; <sup>5</sup>Center of Immunopathology and Rare Diseases, UCSF, San Francisco, USA; <sup>6</sup>Pathology, University of Torino, Torino, Italy

**Background:** In addition to glomerular lesions, renal vascular involvement is an important prognostic marker of lupus nephritis (LN). Among patients with various vascular changes, individuals with thrombotic microangiopathy (TMA) present with severe clinical manifestations and have a high mortality.

**Objectives:** We sought to assess renal outcomes and response to anti-thrombotic treatments in addition to conventional immunosuppression in patients with biopsy proven LN and TMA.

**Methods:** Clinical and renal histopathological data for 97 patients with biopsy-proven LN and TMA were retrospectively analysed. Antibody profiles, induction and maintenance therapies for LN, and anti-thrombotic treatments were collected. TMA lesions were classified into acute and chronic (table 1). A complete renal response (CR) was defined as proteinuria <0.5 g/24 hour and normal or near-

normal (within 10% of normal GFR if previously abnormal) GFR. Partial Response (PR) was defined as a  $\geq 50\%$  reduction in proteinuria to subnephrotic levels and normal or near-normal GFR. Renal outcomes were assessed at one year post biopsy. **Results:** The mean age of the patients was  $38.9 \pm 15.2$  years (range, 13–69 years). The study included 85 females (87.6%) and 12 males (12.4%). The clinical presentations were nephrotic syndrome, nephritic syndrome, and asymptomatic urinary abnormalities in 38 (39.2%), 20 (20.6%), 39 (40.2%) patients, respectively. Nine patients were classified Class III (9.3%, including 2 as Class III +V), 82 as Class IV (84.5%, 10 as Class IV-segmental (IV-S) (10.3%) and 72 as Class IV-global (IV-G) (74.2%), including 4 as Class IV-G+V and 6 as Class V (6.2%). Forty-two (43%) patients presented with acute and 55 (57%) with features of chronic TMA. All patients had received treatment with standard immunosuppressants (55% mycophenolate, 39% cyclophosphamide, 6% other regimen) and steroids.

Abstract OP0201 – Table 1

Acute TMA features	Chronic TMA features
• Endothelial swelling with partial or complete occlusion of lumina;	• Capillary wall thickening with double contours;
• Microthrombi, focal or global;	• Organizing capillary thrombi;
fragmented RBC on glomerular subendothelial space and/or mesangial areas;	• Glomerular ischemic collapse with afferent arteriolar occlusion;
• Mesangiolysis, focal, segmental/global;	• Segmental/global glomerulosclerosis
• Glomerular congestion with efferent arteriolar occlusion	

At 12 months, CR was observed in 37 patients (38.1%), PR in 22 (22.6%) and no response in 38 (39.1%). Sixty-one patients (62.9%) were antiphospholipid positive (aPL) and 37 (38.1%) received anticoagulation with vitamin-K antagonist (VKA) and/or heparins. Presence of aPLs (OR, 2.4; 95% confidence interval-CI, 1.2–7.3;  $p=0.03$ ), anti-DNA positivity (OR, 12.8; 95% CI: 3.0 to 71.3;  $p=0.002$ ), and chronic features of TMA (OR, 3.0; 95% CI: 1.2 to 17.5;  $p=0.04$ ) were all found to be associated with no response. When limiting the analysis to aPL positive patients, after adjusting for type of immunosuppressant therapy and LN class on biopsy, variables that were significantly associated with CR +PR were features of acute TMA rather than chronic (OR, 8.62; 95% CI: 1.4 to 97.1;  $p=0.03$ ) and the use of VKA/heparins (OR, 2.1; 95% CI, 1.02–16.2;  $p=0.046$ )

**Conclusions:** In patients with concomitant LN and TMA, the presence of aPL and chronic features of TMA were associated with poorer renal outcomes. In patients with aPL, the use of anticoagulation appeared protective and warrants further investigation as a therapeutic tool, especially in the setting of acute TMA.

#### OP0202 GENE EXPRESSION PROFILES IN PRIMARY SJÖGREN'S SYNDROME WITH AND WITHOUT SYSTEMIC MANIFESTATIONS

C. Vitali<sup>1</sup>, M. Dolcino<sup>2</sup>, R. Andracco<sup>3</sup>, A. Pelosi<sup>4</sup>, P. Fiore<sup>4</sup>, W. Maglione<sup>3</sup>, E. Zaccara<sup>3</sup>, N. Del Papa<sup>3</sup>, A. Puccetti<sup>4</sup>. <sup>1</sup>Dept. Rheumatology, San Giuseppe Institute, Como; <sup>2</sup>Dept. of Medicine, University of Verona, Verona; <sup>3</sup>Dept. Rheumatology, ASST G. Pini-CTO, Milano; <sup>4</sup>Immunology Area, Bambino Gesù Hospital, Rome, Italy

**Background:** Different phenotypes characterise the clinical spectrum of primary Sjögren's syndrome (SjS). Patients with a clinical expression limited to glandular features (GFs) are classically distinguished from patients with extra-glandular manifestations (EGMs). The former patients often complain higher level of fatigue and widespread pain (WP). (Segal et al. 2013) This suggests that gene expression pattern may be different in the two subgroups.

**Objectives:** To investigate the differences of gene expression in SjS patients with GFs and in those with EGMs.

**Methods:** Nineteen patients with SjS were selected for the study. Gene expression in peripheral blood mononuclear cells (PBMCs) was analysed in 4 patients with EGMs and 4 patients with GFs alone using Clariom D human Affymetrix gene chip (Affymetrix, Santa Clara, CA, USA), and compared to that found in healthy controls. Differences in gene expression were evaluated by analysis of variance (ANOVA) and Step-Up FDR-controlling procedure, being FDR corrected  $p$  value  $\leq 0.01$  and fold change  $> 2$  considered as statistically significant.

Validation of the gene overexpression was performed by quantitative Real Time (qRT)-PCR in PBMCs from all the selected SjS patients, using the  $\Delta\Delta Ct$  method for comparing relative fold expression differences.

**Results:** All the enrolled SjS patients (18 females and 1 male) had a positive lip biopsy, while anti-SSA/Ro antibodies were detected in 10/11 and 6/8 of the patients with EGMs and with GFs alone, respectively. ESSDAI value ranged from 7 to 55 in patients with EGMs (median 17), and from 0 to 2 in patients with GFs alone (median 1).

In both types of patients, the functional analysis of the two transcriptomes showed a large number ( $> 1000$ ) of modulated genes that are involved in the well-known pathological processes of SjS, i.e., apoptosis, inflammatory response, immune response, type I and type II interferons, and Toll-like receptors signalling.

Genes modulated only in patient with EGMs showed a significant enrichment of the biological processes associated with immune response (79% of all enriched processes) and, namely, of the molecular pathways related to B cell activation. The analysis of the transcripts expressed only in patients with GFs alone showed instead a preponderant enrichment in different metabolic processes (43%) and in processes associated with the central perception of the stimuli. Indeed, genes involved in sensory perception and in nociceptive signals (i.e., ANPEP, TNFRF1, P2RY1, IFNG) were modulated exclusively in patients with GFs alone. The significant differential expression of selected genes in the two SjS subgroups was confirmed by the qRT-PCR analysis.

**Conclusions:** These data indicate that in SjS patients with GFs alone a dysregulation of pain pathways (namely beta-adrenergic receptor and Notch signalling) may play a role in the development of WP that is common in this subset of patients. The biological mechanisms triggering the activation of these genes remain to be completely clarified.

## How monogenetic autoinflammatory diseases help to understand and treat rheumatic diseases

OP0203

### SAFETY AND EFFICACY OF INTRAVENOUS ADMINISTRATION OF BONE-MARROW DERIVED MESENCHYMAL STROMAL CELLS IN THERAPY REFRACTORY JUVENILE IDIOPATHIC ARTHRITIS PATIENTS, A PHASE IB/IIA PILOT-STUDY

J.F. Swart<sup>1</sup>, S. de Rook<sup>1</sup>, R.J. Nijelstein<sup>2</sup>, I. Slaper-Cortenbach<sup>3</sup>, J.J. Boelens<sup>4</sup>, N. Wulffraat<sup>1</sup>. <sup>1</sup>Pediatric Rheumatology; <sup>2</sup>Pediatric Radiology; <sup>3</sup>Cell Therapy Facility; <sup>4</sup>Pediatric Immunology, UMC UTRECHT, Utrecht, Netherlands

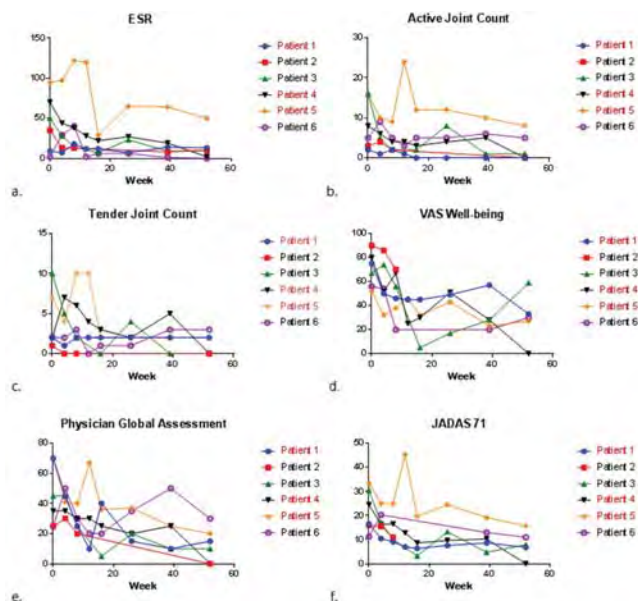

**Objectives:** To compare the total number of adverse events (AE's) before and after mesenchymal stromal cell (MSC) infusion in refractory JIA and to evaluate its effectiveness.

**Methods:** Single-centre Phase Ib/IIa, open label intervention study in JIA patients previously failing all biologicals registered for their diagnosis. Six patients will receive 2 million/kg intravenous infusions of allogeneic bone-marrow derived MSC. In case of ACR-Ped30-response but subsequent loss of response one and maximal two repeated infusions are allowed.

**Results:** Six JIA patients with 9.2 years median disease duration, still active arthritis and damage were included. All had failed methotrexate, corticosteroids and median 5 different biologicals. MSC were administered twice in 3 patients. No acute infusion reactions were observed and a lower post-treatment incidence in AE's was found. The one sJIA patient had again an evolving macrophage activation syndrome, 9 weeks after tocilizumab discontinuation and 7 weeks post- MSC infusion.

Eight weeks after one MSC infusion, 4 patients showed less active joints, 5 patients improved in many clinical parameters and inflammatory parameters decreased in 3/4. After 1 year, we found significantly lower active joint counts,

improved well-being scores, normalised median ESR- and CRP-levels. Inactive disease was reached by 3 patients at 1 year.

**Conclusions:** MSC infusions in refractory JIA patients are safe, although in sJIA stopping the 'failing' biologic treatment carries a risk of a MAS flare since the drug might still suppress the systemic features. Furthermore, intravenous administration of MSC might be efficacious even in multiple biological-failing JIA patients with damage.

### DOMINANT B CELL RECEPTOR CLONES IN PERIPHERAL BLOOD PREDICT ONSET OF ARTHRITIS IN INDIVIDUALS AT RISK FOR RHEUMATOID ARTHRITIS – A VALIDATION COHORT

A. Musters<sup>1</sup>, M.H. van Beers-Tas<sup>2</sup>, M.E. Doorenspleet<sup>1</sup>, P.L. Klarenbeek<sup>1</sup>, B.D. van Schaik<sup>3</sup>, A.H. van Kampen<sup>3</sup>, F. Baas<sup>4</sup>, D. van Schaardenburg<sup>2</sup>, N. de Vries<sup>1</sup>.

<sup>1</sup>Clinical Immunology and Rheumatology, Amsterdam Rheumatology and Immunology Center | AMC; <sup>2</sup>Rheumatology, Amsterdam Rheumatology and Immunology Center | Reade; <sup>3</sup>Clinical Epidemiology, Biostatistics and Bioinformatics; <sup>4</sup>Genome Analysis, Academic Medical Center, Amsterdam, Netherlands

**Background:** A phase characterised by the presence of specific autoantibodies and arthralgia's in the absence of clinically evident synovial inflammation often precedes the onset of rheumatoid arthritis (RA). However, only a subset of these *RA-risk* individuals will develop active disease in the short term<sup>1</sup>. Recent findings show that dominant B-cell receptor (BCR) clones in peripheral blood can accurately predict imminent onset of arthritis in these *RA-risk* individuals.<sup>2</sup>

**Objectives:** To validate the predictive role of BCR clones in peripheral blood in *RA-risk* individuals in a larger cohort.

**Methods:** The BCR repertoire in peripheral blood was analysed using next-generation BCR sequencing in a prospective cohort study of 129 *RA-risk* individuals from Reade. Like earlier, BCR clones expanded beyond 0.5% of the total repertoire were labelled highly expanded clones (HECs), shortly referred to as dominant BCR clones, and individuals were labelled BCR-positive if peripheral blood at study baseline showed  $\geq 5$  dominant BCR clones.

**Results:** We observed that the number of dominant BCR clones was increased in *RA-risk* individuals who developed arthritis within 3 years, compared to *RA-risk* individuals who did not  $10.6 \pm 5.3$  vs  $2.2 \pm 2.8$  (mean  $\pm$ SD;  $p < 0.0001$ ). When creating a ROC curve we could replicate that the most optimal cut-off for this test is at  $\geq 5$  dominant BCR clones in the peripheral blood (figure 1A), dividing the cohort

in 45 BCR-positive individuals and 84 BCR-negative individuals. None of the BCR-clone negative individuals developed arthritis within 36 months. Within the total follow-up of 104 months only 8% of the BCR-clone negative individuals developed arthritis compared to 76% of the BCR-clone positive individuals, resulting in a relative risk of 9.1 (95% CI: 4.4 to 18.8,  $p < 0.0001$ ).

To test whether a higher number of dominant BCR clones correlates with higher risk of arthritis BCR-clone positive individuals were subdivided into three groups: 5–9 HECs ( $n=27$ ), 10–14 HECs ( $n=13$ ) and  $\geq 15$  HECs ( $n=5$ ). The Kaplan-Meier curve for all groups is shown in figure 1B (logrank test between BCR-clone negative group and positive subgroups:  $p < 0.0001$ ). Having 10 or more HECs corresponded with a positive predictive value of 83% and a negative predictive value of 87% within 3 years. The BCR clonality test clearly added to existing indices of RA risk in *RA-risk* individuals (data not shown).

**Abstract OP0204** – Figure 1 Predictive value of dominant BCR clones (A) receiver operating characteristic (ROC) curves for the number of dominant clones, in at-risk individuals (dotted line at 36 months)

**Conclusions:** In this external validation cohort we could replicate the fact that dominant BCR clones in peripheral blood predict imminent onset of clinical symptoms of RA in seropositive arthralgia patients with high accuracy. Furthermore, a highly significant association correlating a higher number of dominant BCR clones with higher risk was shown. We hope these results will support evaluation of early interventions that prevent onset of arthritis.

### APRIL INDUCES A NOVEL SUBSET OF IGA-REGULATORY B CELLS THAT SUPPRESS INFLAMMATION THROUGH THE EXPRESSION OF IL-10 AND PD-L1

C. Fehres<sup>1</sup>, N. van Uden<sup>1</sup>, N. Yeremenko<sup>1</sup>, L. Fernandez<sup>2</sup>, G. Franco Salinas<sup>1</sup>, L. van Duivenvoorde<sup>1</sup>, B. Huard<sup>3</sup>, J. Morel<sup>4</sup>, H. Spits<sup>5,6</sup>, M. Hahne<sup>2</sup>, D. Baeten<sup>1</sup>.

**Background:** Regulatory B cells (Bregs) are immunosuppressive cells that modulate immune responses through multiple mechanisms, such as the production of IL-10 and the skewing of T cell differentiation in favour of a regulatory phenotype. However, the signals required for the differentiation and activation of these cells remain still poorly understood. We have already shown that overexpression of the TNF family member A Proliferation-Inducing Ligand (APRIL) reduces the incidence and severity of collagen-induced arthritis (CIA) in mice.

**Objectives:** As we have also found that APRIL promoted IL-10 production and regulatory functions in human B cells, we hypothesised that APRIL, but not BAFF, may be involved in the induction and/or activation of IL-10 producing Bregs that suppress inflammatory responses *in vitro* and *in vivo*.

**Methods:** Peripheral blood-derived naïve B cells were cultured in the presence of IL-21 +TGF- $\beta$ , IL-21 +APRIL or IL-21 +BAFF to induce class switch recombination to IgA. Regulatory B cell functions and phenotypes were assessed on the class switched IgA B cells.

**Results:** We describe that APRIL promotes the differentiation of naïve human B cells to IL-10-producing IgA<sup>+</sup> B cells. These APRIL-induced IgA<sup>+</sup> B cells display a regulatory B cell phenotype and inhibit T cell and macrophage responses *in vitro* through expression of IL-10 and PD-L1. Moreover, APRIL-induced IL-10 producing regulatory B cells suppress inflammation *in vivo* in experimental autoimmune encephalitis (EAE) and contact hypersensitivity (CHS) models. Finally, we showed a strong correlation between APRIL and IL-10 in the inflamed synovial tissue of inflammatory arthritis patients.

**Conclusions:** We identified a novel subset of regulatory B cells within the IgA switched B cell population that suppresses inflammation *in vitro* and *in vivo*, which indicate the potential relevance of this subset of B cells for immune homeostasis and immunopathology.

## Sustainable healthcare in rheumatology and the role of health professionals

### OP0206-HPR OUTPATIENT FOLLOW UP ON DEMAND FOR PATIENTS WITH RHEUMATOID ARTHRITIS – A TWO-YEAR RANDOMISED CONTROLLED TRIAL

A.-M.T. Sweeney, O.R. Madsen, L. Dreyer, A. Hansen. *Rheumatology, Gentofte Hospital, University Hospital of Copenhagen, Hellerup, Denmark*

**Background:** Medical treatment and care are often life-long in patients with rheumatoid arthritis (RA). During periods of stable illness, patients typically attend routine visits every 3–8 months at the rheumatology outpatient clinic. The arthritis may flare up between scheduled medical visits, but it may be difficult to get acute appointments with the rheumatologist. Scheduled routine visits may be in a stable and 'good' period without any symptoms and with no need for control and adjustment of treatment and care. Consequently, there is a demand for developing outpatient control procedures that cater to the needs of the individual patient and which support the patient's experience of active participation in the control and treatment of their own disease.

**Objectives:** To compare a new outpatient system based on patient self-controlled outpatient follow up (Open Outpatient Clinic System (OOCs)) with traditional scheduled routine visits at a rheumatology outpatient clinic.

**Methods:** A two-year RCT with RA patients aged 18 to 80 years with a disease duration of at least one year. Patients were recruited consecutively from the rheumatology outpatient clinic of a major university hospital in the Copenhagen area of (Denmark from Feb 2015 to Jan 2017) Patients were randomised electronically and stratified regarding bio-medicine. Joints were examined by a blinded rheumatologist. Patients in the intervention group received information about the disease, symptoms, treatment and use of the OOCs. Appointments for the control group were scheduled according to routine procedures. Outcome measures were collected at baseline, year 1 and year 2. Clinical parameters: Disease Activity Score 28 (DAS28), CRP, Visual Analogue Scale (VAS) pain and fatigue, number of tender and swollen joints (28 joints), X-ray of hands and feet. Psychological parameters: VAS patient satisfaction, VAS patient trust, VAS patient involvement and quality of life (EQ-5D).

**Results:** 289 patients were included, 253 completed the 1 st year, 158 the 2nd year. The OOCs at year one and two was comparable to traditional scheduled routine procedures regarding clinical and psychological outcome measures. No radiological progression was detected. Patients in the intervention group made more phone calls to the clinic (244 versus 55) and had fewer visits compared to the control group (424 versus 513). Main results are shown in the table 1.

Abstract OP0206HPR – Table 1. Preliminary results Jan 2018

RA patients Diagnosis codes:M059, M060, M069	Baseline OOCs	Baseline ctrl	1 year OOCs	1 year ctrl	2 years OOCs	2 years ctrl
Number of patients	144	145	125	128	75	83
Age (median)	62	64	-	-	-	-
Female, percent of patients	77	75	-	-	-	-
Male, percent of patients	23	25	-	-	-	-
Total number of visits, telephone visits excluded	-	-	424	513	211	354
Total visits per patient, telephone visits excluded (median)	-	-	3	4	2	4
Total number of telephone visits	-	-	244	55	72	13
Telephone visits per patient (median)	-	-	1	0	0	0
DAS28crp (median)	2.7	2.8	2.3	2.4	2.2	2.1
VAS patient satisfaction, 0 worst, 100 best (median)	96	95	94	93	93	93
VAS patient trust, 0 worst, 100 best (median)	97	96	94	95	94	97
VAS pt involvement, 0 worst, 100 best (median)	96	94	93	93	93	95

**Conclusions:** The OOCs met RA patient preferences for RA appointments and was comparable with traditional scheduled routine procedures regarding clinical and psychological outcomes after one year. Thus, the OOCs could provide a basis for a future organisation of outpatient care for patients with RA.

## SSc: From registries to trials – do we have sufficient data and the appropriate design?

### OP0207 THE OUTCOMES OF LIMITED CUTANEOUS SYSTEMIC SCLEROSIS PATIENTS: A EUSTAR DATABASE STUDY

C. Frantz<sup>1</sup>, D. Huscher<sup>2</sup>, E. Hachulla<sup>3</sup>, A. Balbir-Gurman<sup>4</sup>, G. Riemekasten<sup>5</sup>, E. Sieger<sup>6</sup>, P. Airo<sup>7</sup>, B. Joven<sup>8</sup>, S. Vettori<sup>9</sup>, F. Cozzi<sup>10</sup>, S. Ullman<sup>11</sup>, L. Czirkak<sup>12</sup>, Y. Allanore<sup>1</sup>, on behalf of EUSTAR group. <sup>1</sup>Rheumatology A, Cochin Hospital, Paris Descartes University, Paris, France; <sup>2</sup>Epidemiology unit, German Rheumatism Research Centre, Berlin, Germany; <sup>3</sup>Department of Internal Medicine, Hôpital Claude Huriez, Lille University, Lille, France; <sup>4</sup>B Shine Rheumatology Unit, Rambam Health Care Campus, Haifa, Israel; <sup>5</sup>Department of Rheumatology, University of Lübeck, Lübeck; <sup>6</sup>Department of Rheumatology and Clinical Immunology, Charité University Hospital, Berlin, Germany; <sup>7</sup>Rheumatology and Clinical Immunology, Spedali Civili of Brescia, Brescia, Italy; <sup>8</sup>Servicio de Rheumatología, Hospital Universitario 12 de Octubre, Madrid, Spain; <sup>9</sup>Department of Clinical and Experimental Medicine, F-Magrassi II, Napoli; <sup>10</sup>Rheumatology unit, University of Padova, Padova, Italy; <sup>11</sup>Department of Dermatology, University Hospital of Copenhagen, Hospital Bispebjerg, Copenhagen, Denmark; <sup>12</sup>Department of Immunology and Rheumatology, University of Pecs, Pecs, Hungary

**Background:** Several studies have consistently showed that the extent of skin involvement has a major impact on disease prognosis in the diffuse cutaneous subtype of systemic sclerosis. The large majority of the ongoing clinical trials aim at identifying efficient drug in this subset. By contrast, little is known about the limited cutaneous subset (LcSSc) and the translation of the data coming from DcSSc to LcSSc is uncertain.

**Objectives:** Therefore, our aim was to investigate skin and lung involvement trajectories of LcSSc patients using the large EUSTAR registry.

**Methods:** We analysed the longitudinal data extracted from the EUSTAR cohort collected before February 2017. Worsening of skin fibrosis was defined by an increase in modified Rodnan skin score (mRSS) >3.5 points from baseline to 2nd visit. Interstitial lung disease (ILD) was defined by any fibrosis on imaging (X-ray/computed tomography). Worsening of ILD was defined by a decrease of

FVC >10% from baseline to 2nd visit. For predicting models, predictors with  $p < 0.02$  in the univariate analysis were included in the logistic regression analysis.

**Results:** 8013 LcSSc were included with a mean follow-up of about  $3.3 \pm 3.7$  years. At baseline, mean  $\pm$ SD mRSS was  $6 \pm 5$  and ILD was present in 28.4% of all patients.

Worsening of skin fibrosis was observed in 6.4% (19/298), 7.8% (97/1248) and 9.8% (289/2957) of LcSSc patients at 6, 12 and 24 months follow-up respectively. In multivariate analysis, variables predicting skin fibrosis progression were elevated European Scleroderma Study Group activity index (ESeSG-AI) (OR [95 IC]: 1.22 [1.05–1.4],  $p = 0.007$ ) for 12 months progression and ESeSG-AI (1.24 [1.13–1.38],  $p < 0.001$ ) and mRSS (0.95 [0.93–0.98],  $p = 0.001$ ) for 24 months progression.

Worsening of ILD was observed in 11.7% (23/196) and 19.9% (65/326) of LcSSc patients with ILD at baseline, at 12 and 24 months follow-up respectively. In multivariate analysis, variables predicting ILD progression at 24 months were ESeSG-AI >3 (OR [95 IC]: 3.8 [1.51–9.56],  $p = 0.005$ ), FVC (1.03 [1.01–1.04],  $p < 0.001$ ) and LVEF (0.91 [0.85–0.97],  $p = 0.005$ ).

**Conclusions:** It appears that only few LcSSc patients progress for skin fibrosis; this limits the use of mRSS in this subset and the potential of anti-fibrotic drugs of skin disease. However, a substantial rate of ILD progression was identified as well as relevant predictors. These results support the inclusion of LcSSc patients in SSc-ILD trials evaluating anti-fibrotic drugs. Our predictive models will be helpful to define enriched population in future clinical trials.

OP0208

#### A PROOF-OF-CONCEPT DOUBLE-BLIND RANDOMISED PLACEBO-CONTROLLED TRIAL OF PROBIOTICS IN SYSTEMIC SCLEROSIS ASSOCIATED GASTROINTESTINAL DISEASE

A.H.L. Low<sup>1</sup>, G.G. Teng<sup>2</sup>, S. Pettersson<sup>3</sup>, P.F. De Sessions<sup>4</sup>, Q. Fan<sup>5</sup>, A. Law<sup>1</sup>, A. Santosa<sup>2</sup>, A. Lim<sup>2</sup>, J. Thumboo<sup>1</sup>. <sup>1</sup>Rheumatology and Immunology, Singapore General Hospital, Duke-National University Hospital; <sup>2</sup>Division of Rheumatology, National University Health System; <sup>3</sup>Lee Kong Chian School of Medicine, National Technological University; <sup>4</sup>Genome Institute of Singapore, Agency for Science, Technology and Research; <sup>5</sup>Centre for Quantitative Medicine, Duke-NUS Medical School, Singapore, Singapore

**Background:** Hypothesis: Gastrointestinal (GI) microbiota is a co-founding factor contributing to systemic sclerosis (SSc) and GI manifestations. Probiotics reduced GI symptoms by modulating microbiome composition in an open-label study.<sup>1</sup>

**Objectives:** To determine whether probiotics result in reduction of GI symptoms in SSc patients, assessed using the UCLA Gastrointestinal Tract questionnaire (GIT 2.0).

**Methods:** In this double-blind placebo-controlled trial, 40 subjects with SSc (total GIT0.1) were randomised to receive 60 days of probiotics (900 billion units/day, composite of lactobacilli, bifidobacteria and streptococcus) or placebo, followed by 60 days of probiotics in both groups. Subjects on probiotics or antibiotics 30 days prior were excluded. Enrolled subjects were required to have stable doses of prednisolone, immunosuppression and GI medications 30 days prior and during the trial. Between group differences in total GIT change was assessed after 60 days (primary endpoint) and 120 days (secondary endpoint). Stool microbiome composition was analysed using 16S next generation sequencing. We performed principle coordinate analysis, alpha diversity and taxonomic level analyses. Two-sample t-tests were used to evaluate between-group differences, reported as mean  $\pm$ SD. An intention-to-treat and last observer carried forward analysis was done.  $P$ -value < 0.05 was considered statistically significant.

**Results:** 40 subjects were randomised to placebo ( $n = 21$ ) or probiotics ( $n = 19$ ). Baseline characteristics are summarised in table 1. At the primary endpoint, change in total GIT was not statistically significant between placebo ( $-0.14 \pm 0.27$ ) and probiotic groups ( $-0.13 \pm 0.31$ ;  $p = 0.85$ ). At the secondary endpoint, there was greater reduction in total GIT in the probiotic ( $n = 13$ ;  $-0.18 \pm 0.26$ ) than the initial placebo group ( $n = 15$ ;  $-0.05 \pm 0.22$ ), though not reaching statistical significance ( $p = 0.14$ ). There was a statistically significant reduction in GIT-reflux subdomain in the probiotic group ( $-0.22 \pm 0.16$  vs initial placebo group  $0.05 \pm 0.27$ ;  $p = 0.0037$ ). Subjects on probiotics had greater abundance of lactobacillus, bifidobacterium and streptococcus, and exhibited high alpha diversity, whereas those on placebo had a decreasing trend of alpha diversity. Majority of adverse events were grades I and II.

**Abstract OP0208** – Table 1 Baseline characteristics of subjects

	Probiotic (n=19)	Placebo (n=21)
Fulfill EULAR/ACR 2013 criteria, n (%)	19 (100)	21 (100)
Mean $\pm$ SD Age, years	51.4 (13.7)	50.7 (7.9)
Females, n (%)	19 (100)	16 (76.2)
Disease duration from non-Raynaud's onset, years	44.5 (14.2)	41.3 (9.7)
Diffuse subtype, n (%)	3 (15.8)	6 (28.6)
Anti-Centromere positive, n (%)	7 (36.8)	2 (9.5)
Anti-Topo-I positive, n (%)	2 (10.5)	10 (47.6)
Mean $\pm$ SD total GIT	0.42 (0.29)	0.41 (0.27)
Mean $\pm$ SD GIT Reflux	0.45 (0.44)	0.39 (0.39)
Mean $\pm$ SD GIT Distension	1.13 (0.70)	0.93 (0.74)
Mean $\pm$ SD GIT Diarrhoea	0.26 (0.44)	0.36 (0.60)
Mean $\pm$ SD GIT Fecal soilage	0.26 (0.71)	0 (0)
Mean $\pm$ SD Body Mass Index	23.6 (2.8)	22.9 (3.0)
Hydrogen breath test positive, n (%)	2 (10.5)	3 (14.3)
Prednisolone, n (%)	6 (31.6)	8 (38.1)
GI medications	13 (68.4)	18 (85.7)
GI: Proton-pump inhibitor	11 (57.9)	17 (81.0)
GI: Pro-motility agent	7 (36.8)	7 (33.3)
Immunosuppressive medications	10 (52.6)	13 (61.9)

**Conclusions:** This trial demonstrated safety of probiotics in SSc. The primary outcome at 60 days was not achieved. A prolonged course of probiotics (120 days) resulted in greater improvement of GI reflux. There was a possible positive association between reduced GI stress (evidenced by greater alpha diversity of the GI microbiota) and lower GIT scores in the probiotic group. This study provides justification for a larger definitive trial of probiotics in SSc.

#### Patient involvement in research: The future of collaborative research. Lessons from the field of rheumatology and beyond

OP0209-PAR

#### THE PATIENT VOICE IN ARTHRITIS RESEARCH: A COLLABORATIVE APPROACH TO EMBEDDING PPI INTO RESEARCH STRATEGY

N. Nestor, on behalf of The Patient Voice in Arthritis Research Patient Insight Partners, A.G. Wilson, E.R. Dorris. Centre for Arthritis Research, University College Dublin, Dublin, Ireland

**Background:** Public and Patient Involvement (PPI) encompasses a variety of ways researchers engage with people for whom their research holds relevance. Active and formal PPI can result in increased patient support for research and improved likelihood of patient involvement in the case of clinical research, including improved relevance to patient quality of life. As a research centre, we decided to develop our own PPI initiative. In order to develop a meaningful and productive partnership, we have developed this initiative from conception with our patient insight partners.

**Objectives:** The overall objective is to improve our research quality, relevance and outcomes. We aim to ensure that the real-life experiences of people living with arthritis are considered in the decision making processes around arthritis research.

**Methods:** A community approach to recruitment of patient insight partners was used. Social media, advocacy charities, and local community events were the predominant source of recruitment. Three initiatives were proposed: steering committee, patient insight panels, and a patient educator programme. A discussion forum between patients and researchers was used to determine the feasibility, interest and accessibility of proposed initiatives. An independent facilitator was commissioned to prepare an unbiased report of the discussion forum, upon which the PPI strategy was developed.

**Results:** Patient support for the PPI initiative was overwhelmingly positive. A number of potential barriers to participation were identified.

1) Steering committee:

Risk of tokenism and the potential intimidation of a structure that was too formal. Mechanisms to overcome included multiple patient representatives, detailed terms of reference and a supportive environment with a rotating chair. Our patient insight partners proposed a three-tier structure: a patient focus group that

nominates the steering committee members and a plenary meeting to be kept informed about research they are involved in.

#### 2) Insight Panels:

Access to technology was viewed as the major barrier to remote involvement. Mechanisms to overcome included multiple modes of communication: online, telephone, postal communication. Providing the opportunity for face-to-face or speaking directly with a researcher in an informal setting was seen as crucial in building interpersonal relationships and sustaining involvement.

#### 3) Patient Educator:

Extremely well received. Barriers to participation revolved largely around travel and physical accessibility. This can be overcome with in-house resources.

Our research strategy is being revised with the PPI strategy as a central tenet. We are adopting the new steering committee under the three-tier format and yearly research meeting with plenary session. We have a PPI newsletter, the editorial board for which is made up of researchers and patient insight partners. A patient educator module is under review for incorporation into a new PhD programme. We have expanded our research into multidisciplinary areas, with new sociology researchers and psychology collaborators.

**Conclusions:** The development of a true patient partnership in our group has fundamentally changed the scope and remit of our research, allowing us to expand our biomedical and clinical research into a more holistic model.

### OP0210-PARE DUTCH JUVENILE IDIOPATHIC ARTHRITIS PATIENTS, CARERS AND CLINICIANS CREATING A RESEARCH AGENDA TOGETHER FOLLOWING THE JAMES LIND ALLIANCE METHOD

C.G.Schoemaker<sup>1,2</sup>, W. Armbrust<sup>3,4</sup>, J.F. Swart<sup>2,4</sup>, E. Versluis<sup>1</sup>, W. Olsder<sup>5</sup>, N. M. Wulffraat<sup>2</sup>. <sup>1</sup>Dutch JIA patient organisation, member of ENCA, Rijen; <sup>2</sup>Department of Pediatric Rheumatology, University Medical Center Utrecht, Utrecht; <sup>3</sup>Department of Pediatric Rheumatology, University Medical Center Groningen, Groningen; <sup>4</sup>Netherlands Association for Pediatric Rheumatology, Utrecht; <sup>5</sup>Youth-R-Well.com, Young Patient Organization, Lisse, Netherlands

**Background:** Biomedical research should support patients, carers and clinicians to take important decisions in the consulting room and eventually to improve the lives of patients.<sup>1</sup> Thus far the end-users of Juvenile Idiopathic Arthritis (JIA) research have not been involved in the prioritisation of future research. The JIA research community clearly sees the unmet need and has repeatedly expressed the wish to do something about this. As Parsons et al. have put it: 'Understanding young people's research priorities is important to develop research that is in tune with their needs.'<sup>2</sup> Putting this into practice starts with a search for relevant issues, working together with the end users of scientific knowledge on JIA – patients, carers and clinicians – and to prioritise research questions that can really make a difference.<sup>3</sup>

**Objectives:** In 2018 Dutch organisations of patients, carers and clinicians will collaboratively develop a research agenda for JIA, following the James Lind Alliance methodology.<sup>3,4</sup> An established research agenda, created by patients, carers and clinicians, will inform researchers and research funders about what the most important, relevant research questions for JIA are.

**Methods:** The James Lind Alliance (JLA) methodology enables us to do a systematic search for unanswered questions that are relevant to patients, carers and clinicians.<sup>4</sup> In a 'Priority Setting Partnership' (PSP), we will gradually establish a top 10 list of the most important unanswered research questions for JIA. In this process the input from patients and their carers will be given the same weight as that from clinicians.

The Dutch JIA PSP will be led by a steering group. This steering group coordinates the PSP and organises the activities. It will include representatives of patients (for JIA: young and adult JIA-patients), carers (for JIA: parents and spouses) and clinicians (for JIA: paediatric rheumatologists, physiotherapists, nurses, psychologists, social workers, ophthalmologist, etc.).

**Results:** The Dutch JIA organisations support the agenda; also financially. Following the JLA method it will take approximately twelve to eighteen months to formulate a research agenda, so the research agenda for JIA will be published in 2019.

**Conclusions:** A research agenda that will be jointly inspired by patients, carers and clinicians can really make a difference for decision-making in the consulting room and for the lives of JIA-patients.

### Can we improve the care of gout?\_\_\_\_\_

#### OP0211 ULTRASOUND SHOWS RAPID REDUCTION OF URIC ACID LOAD DURING A TREAT-TO-TARGET APPROACH IN GOUT PATIENTS: RESULTS FROM A LONGITUDINAL STUDY (NOR-GOUT)

H.B. Hammer<sup>1</sup>, L. Karoliussen<sup>1</sup>, L. Terslev<sup>2</sup>, E.A. Haavardsholm<sup>1,3</sup>, T.K. Kvien<sup>1</sup>, T. Uhlig<sup>1</sup>. <sup>1</sup>Dept Of Rheumatology, Diakonhjemmet hospital, Oslo, Norway; <sup>2</sup>Centre for Rheumatology and Spinal Diseases, Copenhagen University Hospital at Glostrup, Copenhagen, Denmark; <sup>3</sup>University of Oslo, Oslo, Norway

**Background:** Ultrasound (US) has received an increasing attention in detecting uric monosodium urate (MSU) deposits, and is included as a domain in the ACR/EULAR classification criteria for gout. The OMERACT US group has developed definitions for US elementary lesions in gout including the double contour sign (DC) (deposits of crystals on the surface of cartilage), tophus (larger hypo-echoic aggregation of crystals, usually well delineated), aggregates (small hyper-echoic deposits) and erosions. MSU deposits may be found in many different regions with some predilection sites, but only a few small studies have explored the decrease of deposits during treatment.

**Objectives:** To explore by US the longitudinal resolution of MSU deposits during a treat-to-target approach with urate lowering therapy (ULT) in patients with gout.

**Methods:** In a prospective observational study, patients with crystal-proven gout were included if they presented after a recent gout flare and had increased serum urate levels (>360 µmol/L/>6 mg/dl). In a treat-to-target approach using ULT and increasing drug doses with monthly follow-up until treatment target was met (<360 µmol/L, or <300 µmol/L if clinical tophi). An extensive US assessment was performed (GE E9 machine, grey scale 15MHz) at baseline and after 3, 6 and 12 months to detect MSU deposits, using the OMERACT definitions for DC, tophi and aggregates with bilateral assessment of radiocarpal joints, MCP 2, insertion of triceps and quadriceps, proximal and distal patellar tendon, the Achilles tendon and cartilage of distal femur (maximal flexed knee) and the talar cartilage of tibio-talar joint and MTP 1 joint. The degree of elementary lesions was semi-quantitatively scored 0–3 (0=none, 1=possible, 2=certain, 3=major deposits). Sum scores of DC, tophi and aggregates, as well as total sum score of all lesions, were calculated for each visit. Changes from baseline were explored by paired samples T-test and response by Standardised Response Mean (SRM).

**Results:** 161 patients were included at baseline (93.3% men, mean (SD) age 57.0 (14.1) years, disease duration 8.0 (7.7) years). The mean (SD) serum urate level decreased from 487 (82) µmol/L at baseline to 312 (52) µmol/L at 12 months, with 72% reaching the target at 3 months, and 84% at 12 months. Sum scores of deposits decreased over 12 months (table 1, with \*p<0.05, \*\*p<0.001), and the numeric decrease was largest for DC (figure 1). SRM from baseline to 3, 6 and 12 months was 0.73, 1.02 and 1.26 for DC, 0.06, 0.57 and 0.91 for tophi and 0.20, 0.51 and 0.66 for aggregates.

Abstract OP0211 – Table 1

	Baseline (n=161)	3 months (n=124)	6 months (n=115)	12 months (n=88)
Double Contour score	4.2 (3.4)	3.1 (2.8)**	2.3 (2.7)**	1.2 (1.9)**
Tophi score	6.5 (6.6)	6.3 (5.7)	5.4 (6.1)**	4.2 (5.3)**
Aggregates score	9.1 (5.3)	8.8 (4.9)*	7.9 (5.2)**	6.7 (4.9)**
Double Contour, tophi and aggregates sum score	19.8 (13.6)	18.1 (12.0)**	15.6 (12.8)**	12.1 (10.9)**

**Conclusions:** During a treat-to-target approach with ULT all deposits decreased, and most extensively for DC. This study shows that reduction of the uric acid load in gout during treat-to-target ULT can be visualised by US, and that DC may be the most sensitive to change.

#### OP0212 MOBILE PHONE TEXT MESSAGES FOR IMPROVING ALLOPURINOL ADHERENCE: A RANDOMISED CONTROLLED TRIAL OF TEXT MESSAGE REMINDERS

K. Bunphong, P. Narongroeknawin. *Internal Medicine, Phramongkutklao Hospital, Bangkok, Thailand*

**Background:** Medication adherence is important to treatment success, particularly in gout where the target level achievement is critical. However, there is no evidence that mobile phone text message reminder is effective in improving treatment adherence and clinical outcomes for gout.

**Objectives:** To evaluate the effect of mobile phone text messaging on the adherence to allopurinol treatment and serum uric acid (SUA) level of patient with gout in a randomized-controlled trial.

**Methods:** Adult patients who were diagnosed of gout by 1977 ARA classification criteria for gout, receiving at least 1 month of allopurinol, and had estimated glomerular filtration rate greater than 30 mL/min/1.73 m<sup>2</sup> were enrolled and randomly assigned to 2 groups by block randomization. Patients in the intervention group received a daily short message reminder to take allopurinol for 90 days. Patients in the control group received a weekly short message information about non-pharmacologic treatment for gout in plain language. The primary outcomes were allopurinol adherence, defined as the Medication Taking Behaviour for Thai patient (MTB-Thai) score >21, and SUA level at 12 weeks. The primary analysis was by intention-to-treat. This trial is registered with Thai Clinical Trials Registry, TCTR20171229004.

**Results:** Eighty-two patients were randomised, with 42 in the intervention group and 40 in the control group. No significant different of baseline characteristic, SUA (7.66±1.24 vs 7.78±1.17 mg/dL) and MTB-Thai score (18.38±0.73 vs 18.37±0.95) between two groups. At week 12, 37 patients (88.1%) in the intervention group achieved adherence compared with none of patient in the control group (RR for adherence 71.5, 95% CI: 4.54 to 1126.80; p=0.002). SUA level was decreased significantly from baseline in both study groups, however, the reduction in the intervention group was significantly greater than in the control group (-1.47±0.86 vs -0.28±0.39 mg/dL, p<0.001). Serum creatinine was significantly decreased in the intervention group (-0.03±0.09 mg/dL, p<0.031), while serum creatinine was unchanged in the control group (0.01±0.08 mg/dL, p=0.84).

**Conclusions:** Patients who received daily short message reminder had significantly improved adherence and reduction in SUA compared with the control

individuals. Mobile phones text reminders may be an important tool to enhance allopurinol adherence and help in controlling SUA level in gout patients.

**Disclosure of Interest:** None declared

#### 'Why does BMI matter?'

#### OP0213 WHAT IS THE IMPACT OF POOR PROGNOSTIC FACTORS ON THE ACHIEVEMENT OF LOW DISEASE ACTIVITY OR REMISSION IN PATIENTS WITH RHEUMATOID ARTHRITIS?

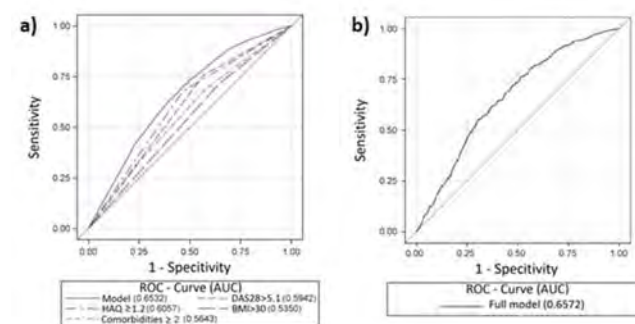

L. Baganz<sup>1</sup>, A. Richter<sup>1,2</sup>, K. Albrecht<sup>1</sup>, M. Schneider<sup>3</sup>, G.-R. Burmester<sup>4</sup>, A. Zink<sup>1,4</sup>, A. Strangfeld<sup>1</sup>. <sup>1</sup>German Rheumatism Research Center, Berlin; <sup>2</sup>Institute for Community Medicine, Greifswald; <sup>3</sup>Heinrich-Heine-University, Düsseldorf; <sup>4</sup>Charité University Medicine, Berlin, Germany

**Background:** Poor prognostic factors were initially developed using radiologic progression as outcome. In the 2016 update of the EULAR recommendations it is proposed to use these factors for decision whether or not a biologic should be started. However, the treatment target is not radiologic progression but low disease activity (LDA) or remission.

**Objectives:** To investigate the impact of indicators of unfavourable prognosis on the achievement of LDA and remission in patients with RA.

**Methods:** Patients from the German biologics register RABBIT switching from 1 st to 2nd csDMARD were studied. High disease activity (DAS28 >5.1), autoantibodies (RF/ACPA positive), prevalent erosions, functional limitation (HAQ ≥1.2), comorbidities (≥2), obesity (BMI >30kg/m<sup>2</sup>), and smoking were evaluated as prognostic factors. Generalised regression analyses were applied to investigate the role of prognostic factors regarding the achievement of LDA (DAS28 <3.2) or remission (DAS28 <2.6). Receiver operating characteristic (ROC) curves were calculated to compare the ability of the prognostic factors (baseline values) to discriminate patients achieving LDA from those maintaining moderate or high disease activity within six months. The prognostic value of all factors was determined by the area under the ROC curve (AUC).

**Results:** A total of 1613 patients were studied (mean age 58.9 years, mean disease duration 4.8 years). 35% had DAS28 >5.1, 60% were RF/ACPA positive, 27% had erosions, 44% functional limitation, 37% ≥2 comorbidities, 32% were obese, and 26% current smokers. LDA was achieved by 33% of patients with DAS28 >5.1, by 30% if also autoantibodies and erosions were present, and by 20% if DAS28 >5.1, HAQ ≥1.2, ≥2 comorbidities and obesity were present. DAS28 >5.1 (OR 0.41 [95% CI: 0.32 to 0.52]), HAQ ≥1.2 (0.58 [0.46;0.74]), ≥2 comorbidities (0.66 [0.47 to 0.90]) and obesity (0.72 [0.57;0.91]) independently decreased the probability of LDA within six months. Current smoking (0.67 [0.48;0.93]) was negatively associated with remission. RF/ACPA and erosions were not associated. The ROC curves for achieving LDA for the significant factors (DAS28 >5.1, HAQ ≥1.2, ≥2 comorbidities and obesity) and a model containing only these four factors are shown in figure 1(a). The AUC of the model is higher than the one of the single curves. The AUC for the full model (figure 1(b)) which was additionally adjusted for age, sex, autoantibodies, erosions, current smoking, therapy and time is similar to the one of the reduced model.

**Conclusions:** High disease activity, functional limitation, comorbidities and obesity had significant negative impact on LDA and remission. They should be considered as poor prognostic factors in csDMARD-treated patients. It appears that a combination of the factors is better than using single ones.

OP0214 **BASELINE COMORBIDITIES AND OVERWEIGHT PREDICT FUNCTIONAL STATUS AND HEALTH-RELATED QUALITY OF LIFE 9 YEARS LATER – A LONGITUDINAL COHORT STUDY OF 428 PATIENTS WITH RHEUMATOID ARTHRITIS RECEIVING STANDARD CARE**

L. Linde<sup>1</sup>, M.L. Hetland<sup>2</sup>. <sup>1</sup>Center for Rheumatology and Spine Diseases; <sup>2</sup>DANBIO, Center for Rheumatology and Spine Diseases, Rigshospitalet, Copenhagen, Denmark

**Background:** Health-related quality of life (HRQOL) and functional status are markedly reduced in patients with rheumatoid arthritis (RA) leading to a significant societal and individual burden. Comorbidities and sociodemographic factors are associated with reduced HRQOL and functional status in cross-sectional studies of RA,<sup>1</sup> but their predictive value is largely unknown as longitudinal studies are lacking.

**Objectives:** To investigate whether comorbidities and sociodemographic factors predict HRQOL and functional status 9 years later in real-world patients with RA.

**Methods:** Consecutive patients with RA were recruited from a university hospital outpatient clinic between July 2006 and July 2007. Data regarding sex, age, disease duration, disease activity score of 28 joints and CRP (DAS28), number of comorbid conditions, marital status (married/cohabiting vs living alone), smoking (ever, previously or currently), exercise ( $\geq$ once a week vs not regularly), body mass index (BMI), educational level (elementary, training or higher), functional status (the health assessment questionnaire (HAQ)) and HRQOL (Euroqol 5 dimensions (EQ-5D)) were registered in the clinical database DANBIO; patients then continued routine care.

EQ-5D includes 5 dimensions of health (mobility, self-care, usual activities, pain/discomfort, anxiety/depression), each divided into three levels of severity, yielding 243 possible health states. A validated algorithm converts each health state into an index score between 0 (death) and 1 (perfect health).<sup>2</sup>

HAQ and EQ-5D scores at the most recent follow-up visit were retrieved from DANBIO on Sept 30th 2017. Two linear regression models were built with scores for HAQ and EQ-5D at follow-up as outcomes, respectively, all baseline variables were entered as possible explanatory variables and stepwise backward selection was employed. Sex, age, disease duration and baseline HAQ/EQ-5D were forced into the models.

**Results:** 564 patients with RA were recruited (81% women, median (IQR) age: 60<sup>49–68</sup> years, disease duration: 7 (3–16) years, DAS28: 2.9 (2.1–3.7), HAQ: 0.63 (0.25–1.25), EQ-5D: 0.74 (0.66–0.82) and followed in routine care for a median of 9<sup>5–10</sup> years. 428 and 256 patients had complete HAQ and EQ-5D scores, respectively at follow-up (HAQ: 0.75 (0.25–1.4), EQ-5D: 0.78 (0.69–0.86)). Patients without complete HAQ and EQ-5D scores at follow-up were older at baseline (10 and 6 years, respectively,  $p < 0.0001$ ), while sex, disease duration, DAS28, HAQ and EQ-5D scores were similar.

High HAQ, BMI 26–30 kg/m<sup>2</sup>, and 3 or more comorbid conditions at inclusion were all independently associated with poorer functional status and low EQ-5D 9 years later (table 1). The models with HAQ or EQ-5D as outcome explained 51% and 31% of the variation (Adj R<sup>2</sup>), respectively.

**Abstract OP0214** – Table 1 Multivariable linear regression model with HAQ and EQ-5D at follow-up as outcomes.

Explanatory variables	HAQ at follow up			EQ-5D at follow up		
	Coefficient	95% CI		Coefficient	95% CI	
Women	0.19	0.06	0.33	-0.03	-0.08	0.02
Age (50–75 yrs)	0.06	-0.05	0.18	0.03	-0.01	0.07
Age (>75 yrs)	0.03	-0.22	0.28	0.01	-0.10	0.11
Disease duration (3–10 yrs)	0.10	-0.03	0.23	-0.01	-0.06	0.04
Disease duration (>10 yrs)	0.12	-0.02	0.25	-0.02	-0.07	0.03
Baseline HAQ (per unit increase)	0.72	0.63	0.81	-0.10	-0.14	-0.05
Baseline EQ-5D (per unit increase)	NS	-	-	0.13	-0.05	0.30
BMI (<18.5 kg/m <sup>2</sup> )	0.27	-0.08	0.62	-0.09	-0.23	0.04
BMI (26–30 kg/m <sup>2</sup> )	0.22	0.10	0.33	-0.09	-0.13	-0.04
BMI (>30 kg/m <sup>2</sup> )	0.16	0.01	0.32	-0.03	-0.08	0.03
One comorbid condition	0.13	0.01	0.26	-0.02	-0.07	0.02
Two comorbid conditions	-0.03	-0.18	0.12	0.03	-0.03	0.08
$\geq 3$ comorbid conditions	0.30	0.14	0.47	-0.14	-0.20	-0.08
Constant	0.39	0.07	0.72	0.79	0.64	0.94

Adjusted R<sup>2</sup>: HAQ: 0.51, EQ-5D: 0.31.

Reference groups: male, age: < 50 years, disease duration: 0–2 years, BMI: 18.5–25 kg/m<sup>2</sup>, comorbid conditions: none.

**Conclusions:** Potentially modifiable factors (overweight and comorbidities) were independently and consistently associated with worse functional status and HRQOL at follow-up 9 years later in patients with RA receiving standard care. The findings suggest that focus on lifestyle and comorbidities in patients with RA may improve important long-term outcomes.

**Musculoskeletal pain; feeding the opioid epidemic**

OP0215 **TIME-RELATED TRENDS IN OPIOID PURCHASES AMONG PATIENTS WITH EARLY INFLAMMATORY ARTHRITIDES**

P. Muilu<sup>1</sup>, V. Rantalaiho<sup>2,3</sup>, H. Kautiainen<sup>4</sup>, L.J. Virta<sup>5</sup>, K. Puolakka<sup>6</sup>. <sup>1</sup>Department of Medicine, Tampere University Hospital; <sup>2</sup>Centre for rheumatic diseases, Tampere University Hospital; <sup>3</sup>Faculty of Medicine and Life sciences, University of Tampere, Tampere; <sup>4</sup>Department of General Practice and Primary Health Care, University of Helsinki and Helsinki University Hospital, helsinki; <sup>5</sup>Research Department, Social Insurance Institution of Finland, Turku; <sup>6</sup>Department of Medicine, South Karelia Central Hospital, Lappeenranta, Finland

**Background:** Treatment outcomes in inflammatory arthritis (IA) have improved during the past decades; however, pain management remains a great challenge. There has been a concern of overprescription of opioids during recent years.

**Objectives:** The aim of this study was to explore the frequency of opioid users in patients with newly-onset IA in comparison with the general Finnish population and discover the proportion of long-term opioid users.

**Methods:** From the nationwide register maintained by the Social Insurance Institution of Finland we collected all incident adult patients with the five most common IAs between 2010–14. For each case, three eligible controls were randomly selected and individually matched according to age, sex, and place of residence. Opioid purchases between 2009–2015 were obtained from the drug prescription register and evaluated one year before and after the index date (decision of special reimbursement for antirheumatic drugs), further dividing the observation time into 3 month periods. Long-term use was defined as opioid purchases at least in three of these periods per year. All opioids from mild to strong were included.

**Results:** Data on different diagnosis groups are presented in table 1. The proportion of opioid purchasers among IA patients and their controls are shown in figure 1A-E. Also, odds ratio for long-term opioid use after the index date is shown in figure 1F.

**Abstract OP0215 – Table 1.** Number (N), proportion of females (%), and mean ages at baseline of incident patients with inflammatory arthritides between 2010 and 2014 in Finland.

	RA+ n=6186	RA- n=2970	UA n=2959	SpA n=3577	PsA n=2670
Age, mean (SD)	58 (15)	57 (17)	49 (17)	38 (12)	49 (13)
Proportion of females (%)	66.4	67.2	67.4	52.3	48.8

**Abstract OP0215 – Figure 1.** Proportion of opioid purchasers among patients with incident A) seropositive rheumatoid arthritis (RA+), B) seronegative rheumatoid arthritis (RA-), C) unspecified arthritis (UA), D) spondyloarthritis [(SpA), including ankylosing spondylitis and non-radiographic axial spondyloarthritis], and E) psoriatic arthritis (PsA) and their controls one year before and after the index date. F) Odds ratio for long-term opioid use among incident RA+, RA-, UA, SpA, and PsA patients versus controls after the index date.

**Conclusions:** IA patients are more likely to buy opioids one year before and one year after the diagnosis and prescription of antirheumatic medication than controls from the general population. The opioid purchases peak just before the index date in most IA patients. Long-term opioid use is also more common among patients with newly-onset IA, especially among those with SpA.

#### OP0216 EXAMINING MODIFIABLE PSYCHOLOGICAL & SOCIAL HEALTH FACTORS ASSOCIATED WITH USE OF OSTEOARTHRITIS ORAL ANALGESIC TREATMENT

E.R. Vina<sup>1</sup>, L. Hausmann<sup>2</sup>, D.S. Obrosky<sup>2</sup>, A. Youk<sup>2</sup>, D. Weiner<sup>3</sup>, S. Ibrahim<sup>4</sup>, C. K. Kwok<sup>1</sup>. <sup>1</sup>Medicine, University of Arizona, Tucson; <sup>2</sup>CHERP; <sup>3</sup>Geriatric, VAPHS, Pittsburgh; <sup>4</sup>CHERP, Philadelphia VAMC, Philadelphia, USA

**Background:** EULAR recommends the use of non-opioid oral medicines (acetaminophen, NSAIDs, or COX-2 inhibitors) for the management of knee osteoarthritis (OA). Opioids are also recommended when these other therapies fail. There are known demographic and clinical differences in OA treatment use. Patients' social and psychological health may also influence use of medications, yet their association with the utilisation of opioid or non-opioid oral OA treatments is unknown.

**Objectives:** Determine which modifiable social and psychological health factors are associated with use of oral opioid and non-opioid medications for OA.

**Methods:** Baseline data from a randomised controlled trial that examined the effects of a positive psychological intervention on pain in veterans with knee OA were used. For our study, patients were categorised based on self-reported use of the following oral medications for OA at baseline: opioids (with/without other oral analgesic treatments), non-opioid analgesics, and no oral analgesic treatment.

We used  $\chi^2$  or analysis of variance to compare sociodemographic, clinical, social, and psychological health variables by baseline OA treatment use. We used multinomial logistic regression models to estimate adjusted relative risk ratios (RRRs) of using an opioid or a non-opioid analgesic (vs. no oral analgesic treatment),

comparing patients by levels of social support (Medical Outcomes Study), health literacy ('How confident are you filling out medical forms by yourself'), and depressive symptoms (Patient Health Questionnaire-8). All models were adjusted for age, sex, race, income, OA symptom severity (WOMAC), self-reported Charlson comorbidity index, and body mass index.

**Results:** In this sample, 30.6% (n=110) reported taking opioid analgesics for OA, 54.2% (n=195) reported non-opioid use, and 15.3% (n=55) reported no oral analgesic use. Compared to the other groups, those taking opioids were younger (mean age 62.5 vs 64.3 vs 67.1, respectively, p=0.002) and had higher mean WOMAC scores (54.5 vs 45.7 vs 42.7, p<0.001). Opioid users also had lower mean social support scores (10.0 vs 10.5 vs 11.9, p=0.007) and were more likely to have moderate-severe depression (42.7% vs 24.1% vs 14.5%, p<0.001). Having adequate health literacy did not differ by treatment group type.

**Abstract OP0216 – Table 1** Social and psychological variables associated with oral analgesic treatment use\*

	Adjusted relative risk ratio	95%CI	p-value
<b>Non-Opioid Oral Analgesic Use †</b>			
Social support	0.94	(0.86,1.03)	0.188
Adequate health literacy	0.52	(0.21,1.30)	0.160
Depression, moderate to severe	1.93	(0.72,5.12)	0.189
<b>Opioid Use †</b>			
Social support	0.92	(0.83,1.02)	0.120
Adequate health literacy	0.53	(0.20,1.42)	0.207
Depression, moderate to severe	2.96	(1.08,8.07)	0.035
<b>Opioid Use ‡</b>			
Social support	0.98	(0.92,1.05)	0.601
Adequate health literacy	1.02	(0.55,1.89)	0.954
Depression, moderate to severe	1.53	(0.87,2.71)	0.140

\*Multinomial model adjusted for age, sex, race, income, WOMAC, comorbidity, BMI

†Reference: No oral medication use for OA

‡Reference: Non-opioid oral analgesic use

The table 1 shows the associations between the social and psychological health measures with oral analgesic use, adjusted for sociodemographic and clinical factors. Having moderate-severe depression was associated with higher risk of opioid analgesic use compared to no oral analgesic use (RRR 2.96, 95% CI: 1.08 to 8.07) when adjusted for sociodemographic and clinical factors. Depression level was not significantly associated with non-opioid oral medication use, compared to no oral analgesic medication use, in a similarly adjusted model. Neither social support nor health literacy was associated with opioid or non-opioid oral analgesic use in fully adjusted models.

**Conclusions:** Knee OA patients with more severe depression symptoms, compared to those without, were more likely to report using opioid (vs. non-opioid) analgesics for OA. Social support and health literacy were not significantly associated with oral analgesic use for OA when sociodemographic and clinical factors were accounted for.

#### What is lupus – syndrome or different entities?\_\_\_\_\_

#### OP0217 A PERMEABLE BLOOD-BRAIN BARRIER IS NOT REQUIRED FOR NEUROPSYCHIATRIC MANIFESTATIONS IN SLE AND PSS

M.B. Lauvsnes<sup>1</sup>, A.B. Tjensvoll<sup>2</sup>, S.S. Maroni<sup>3</sup>, I. Kvivik<sup>1</sup>, T.B. Grimstad<sup>1</sup>, O. J. Greve<sup>4</sup>, E. Harboe<sup>1</sup>, L.G. Gøransson<sup>1</sup>, C. Putterman<sup>5</sup>, R. Omdal<sup>1</sup>. <sup>1</sup>Medical Department, <sup>2</sup>Neurology, <sup>3</sup>Psychiatry, <sup>4</sup>Radiology, Stavanger University Hospital, Stavanger, Norway; <sup>5</sup>Division of Rheumatology, Albert Einstein College of Medicine, New York, USA

**Background:** A prevailing hypothesis for neuropsychiatric (NP) manifestations in systemic lupus erythematosus (SLE) and primary Sjögren's syndrome (pSS) is that brain reactive autoantibodies can enter the brain through an impaired blood-brain barrier (BBB) during inflammatory conditions. Based on murine models the cytokine TWEAK could contribute to NP phenomena by binding Fn14 on brain endothelial cells. This will open the BBB and allow brain-reactive autoantibodies produced in the periphery to reach their targets in the brain.

**Objectives:** The aim of this study was to investigate the role of the BBB's permeability for NP manifestations in human SLE and pSS. Also, we wished to investigate whether increased TWEAK concentrations could be attributed to brain

involvement as previously documented in the animal models of SLE. We compared TWEAK with markers of BBB permeability and astrocyte activation. Also, we estimated intrathecal B-cell activation, anti-NR2 abs, and explored whether these variables were associated with NP manifestations.

**Methods:** In a population-based cohort of 50 SLE (all fulfilling the ACR criteria) and 52 pSS patients (all fulfilling the AECG criteria) NP manifestations were classified according to the ACR recommendations for NP-SLE. TWEAK, anti-NR2 antibodies (abs) were measured in serum and cerebrospinal fluid (CSF), S100b in CSF, and IgG index and Q-albumin were calculated.

**Results:** TWEAK concentrations in serum/CSF, as well as S100B and anti-NR2 abs in CSF, Q-albumin and IgG indices are shown in table 1. Associations between intrathecal TWEAK and S100B, Q-albumin and IgG index are given in table 2. No associations were found between TWEAK in serum/CSF and NP manifestations in the SLE, nor in the pSS group. Further, no associations were revealed between NP manifestations and S100B, Q-albumin or IgG index. Anti-NR2 abs in CSF were associated with increased OR for dysfunction in the cognitive domains visuospatial processing (OR 4.9,  $p=0.03$ ) and motor functioning (OR 6.0,  $p=0.006$ ) when corrected for age, gender, disease duration and education.

**Abstract OP0217** – Table 1 Demographic and other selected data in 50 SLE- and 52 pSS patients

	SLE	pSS	<i>p</i> -value
Age, years, mean (SD)	43 (12)	57 (12)	<0.001
Females (%)	43 (86)	44 (85)	0.84
Disease duration, years, mean (SD)	12 (9)	7 (5)	<0.001
No with NP manifestations (%)	46 (92)	48 (92)	0.95
TWEAK, serum, pg/ml	655 (200-4644)	925 (451-1508)	<0.001
TWEAK, CSF, pg/ml	887 (369-2351)	1351 (481-5184)	<0.001
S100B in CSF, pg/ml	221 (110-420)	264 (138-544)	0.005
Q-albumin, ratio	4.71 (1.98-12.2)	4.24 (1.69-10.8)	0.99
IgG index, ratio	0.17 (0.10-0.39)	0.18 (0.09-1.12)	0.19
Anti-NR2 in CSF, ratio	0.37 (0.14-2.2)	0.41 (0.15-3.0)	0.20

Abbreviations: Abs, antibodies

Anti-NR2 ab values given as a ratio against an internal calibrator with defined signal intensity.

Laboratory data are presented as median and ranges.

**Abstract OP0217** – Table 2 Associations\* between TWEAK in CSF and selected laboratory variables in 50 SLE- and 52 pSS patients

Dependent variables	SLE			pSS		
	$\beta$	R <sup>2</sup>	<i>p</i> -value	$\beta$	R <sup>2</sup>	<i>p</i> -value
Q-albumin	0.11	0.01	0.45	0.11	0.01	0.44
S100B, pg/ml	0.50	0.25	<0.001	0.45	0.20	0.001
IgG index	-0.14	0.02	0.32	0.37	0.12	0.007

\* Univariable regression analyses

**Conclusions:** Although several studies show that TWEAK seems necessary for CNS involvement in murine SLE, no clinical NP manifestations could be attributed to TWEAK concentrations in CSF/serum in the SLE- or pSS patients. Further, no associations were found between NP manifestations and the integrity of the BBB (Q-albumin), nor astrocyte activation.

The TWEAK concentration was higher in CSF than blood in both the SLE- and pSS patients, indicating an intrathecal production.

TWEAK in CSF covaried with S100B in CSF possibly reflecting a common ongoing intracerebral process.

We hypothesise that TWEAK is neuroprotective in human SLE and pSS. Brain residing immune cells produce brain reactive abs, for example anti-NR2 abs. These abs bind to neurons, and the cellular stress induced in the neurons leads to production of TWEAK. Concurrently, the activated B cells secrete proinflammatory cytokines that among other actions activate astrocytes that in turn produce S100B, also a neuroprotective protein.

## Genetics, epigenetics and disease: is it all in the genes?

OP0218

### INVESTIGATING THE REGULATORY SNPs AT THE RUNX3 LOCUS ASSOCIATED WITH ANKYLOSING SPONDYLITIS

M.L. Vecellio<sup>1</sup>, A. Cortes<sup>2</sup>, C.J. Cohen<sup>1</sup>, R. Fischer<sup>3</sup>, B.P. Wordsworth<sup>1</sup>. <sup>1</sup>Nuffield Dept. of Orthopaedics, Rheumatology and Musculoskeletal Sciences; <sup>2</sup>Wellcome Trust Centre for Human Genetics; <sup>3</sup>Target Discovery Institute, University of Oxford, Oxford, UK

**Background:** Among the 100 genes associated with ankylosing spondylitis (AS), *RUNX3* a transcription factor (TF) involved in diverse immunological processes has a very robust ( $10^{-15}$ ) association.<sup>1</sup> The biggest challenge following association studies remain to understand the mechanism behind this association and get insights of the disease. We have recently demonstrated that the association between AS and the single nucleotide polymorphism (SNP) *rs4648889* located in a 2 kb regulatory locus upstream the promoter of *RUNX3* can be explained by allele-specific effects on TF recruitment that alter gene expression, specifically in CD8 +T cells.<sup>2</sup> In addition, another closely adjacent SNP, *rs4265380* shows functional effects (i.e. TF recruitment, histone marks enrichment and cell count) on CD14 +monocytes.<sup>3</sup>

**Objectives:** The main objectives of this work are: 1) to dissect the functional effects of the different SNPs at the *RUNX3* locus, acting in different cell types (especially CD8 +T cells and monocytes); 2) to identify the different interacting partners (i.e. TFs) binding at the *RUNX3* locus in the presence of the AS-associated alleles.

**Methods:** We used publicly available dataset to define the epigenetic landscape of the *RUNX3* locus. *In vitro* functional studies were performed to characterise the effects of these specific genetic variants, providing critical functional evidence for their role in AS.

**Results:** (1) Roadmap data revealed a robust peak for open chromatin and specific histone modifications associated with regulatory elements. Hi-C data showed the interaction of *RUNX3* with different genomic loci within chromosome 1, in GM12878 lymphoblastoid cell line, CD8 +T cells and monocytes; (2) ChIP-qPCR experiments on monocytes and CD8 +T cells from AS patients revealed the enrichment for several histone modifications (i.e. H3K79Me2 and H3K4Me1) at the *RUNX3* locus overlapping the SNPs of interest; (3) preliminary DNA pull-down experiments, followed by Mass Spectrometry, started to identify the whole range of proteins and TFs (DNA/protein 'interactome') that bind at the *RUNX3* locus in the presence of the AS-associated alleles, evaluated in both CD8 +T cells and monocytes; (4) initial pathway enrichment analysis highlighted the distinct contribution of proteins involved in the transcriptional machinery (AS-risk VS protective alleles).

**Conclusions:** We provide first evidence that the 2 kb region upstream the *RUNX3* gene has a plausible functional role in AS. These new observations are critically important not only in identifying specific cell types that play a pathogenic role in AS, but also in defining dysregulated pathways and potential therapeutic drug targets.

## It's your move: promoting physical activity in people with RMD's

### OP0219-HPR THE EFFICACY OF MOTIVATIONAL COUNSELLING AND SMS-REMINDERS ON DAILY SITTING TIME IN PATIENTS WITH RHEUMATOID ARTHRITIS: 22 MONTHS FOLLOW-UP OF A RANDOMISED, PARALLEL-GROUP TRIAL

T. Thomsen<sup>1</sup>, M. Aadahl<sup>2</sup>, N. Beyer<sup>3</sup>, M.L. Hetland<sup>1</sup>, K.B. Løppenthin<sup>1</sup>, J. Midtgaard<sup>4</sup>, R. Christensen<sup>5</sup>, S.M. Nielsen<sup>5</sup>, M. Østergaard<sup>1</sup>, P. Jennum<sup>6</sup>, B. A. Esbensen<sup>1</sup>. <sup>1</sup>Center for Rheumatology and Spine Diseases, Rigshospitalet, Denmark; <sup>2</sup>Centre for Clinical Research and Prevention, Bispebjerg and Frederiksberg Hospitals; <sup>3</sup>Department of Clinical Medicine, Faculty of Health and Medical Sciences, University of Copenhagen; <sup>4</sup>University Hospitals Centre for Health Research, Rigshospitalet, Denmark; <sup>5</sup>Musculoskeletal Statistics Unit, The Parker Institute, Bispebjerg and Frederiksberg Hospitals; <sup>6</sup>Danish Center for Sleep Medicine, Department of Neurophysiology, Rigshospitalet, Denmark, Copenhagen, Denmark

**Background:** Patients with rheumatoid arthritis (RA) have high amounts of daily sitting time and do not meet recommendations for moderate to vigorous physical activity (PA). Previously, we reported results from a randomised controlled trial (RCT) investigating the efficacy of a four-month individually tailored behavioural intervention, targeting reduction of sedentary behaviour (SB) in patients with RA.<sup>1</sup> The four-month post intervention results showed that patients in the intervention group reduced their daily sitting time; moreover patient-reported outcomes (PROs) and total cholesterol levels improved compared to the usual lifestyle control group.

**Objectives:** To investigate 18 month post-intervention efficacy of the four-month individually tailored, behavioural intervention on daily sitting time in patients with RA.

**Methods:** In the observer-blinded RCT, we included 150 RA patients from a rheumatology outpatient clinic. The intervention group (n=75) received three motivational counselling sessions and tailored text messages aimed at increasing light intensity PA through reduction of SB. The control group (n=75) maintained usual lifestyle. Primary outcome was change from baseline in objectively measured daily sitting time. Secondary outcomes included PROs and cardio-metabolic biomarkers (blood pressure, lipids and HbA1c). All outcome measures were analysed with a mixed effects repeated measures ANCOVA model on the intention-to-treat population.

**Results:** At 22 months follow-up from baseline, 12 participants were lost to follow-up (three and nine, respectively). Compared to baseline, daily sitting time in the intervention group decreased 1.10 h/day, and in the control group it increased 1.32 h/day; between-group difference of -2.43 h/day (95% CI: -2.99 to -1.86; p<0.0001) in favour of the intervention group. Likewise, for most secondary outcomes between-group results favoured intervention: VAS-pain: -15.51 mm (-23.42 to -7.60), VAS-fatigue: -12.30 mm (-20.71 to -3.88), physical function: -0.39 HAQ-units (-0.53 to -0.26), total cholesterol: -0.86 (-1.03 to -0.68), triglyceride: -0.26 (-0.43 to -0.09) and HbA1c: -1.15 (-1.39 to -0.91) mmol/l.

**Conclusions:** Even 18 months after completed intervention results showed an effect on daily sitting time and improvements in PROs, lipids and HbA1c in favour of the intervention group. Findings suggest that an individually tailored, behavioural approach may be beneficial in promoting health in addition to current clinical practise for patients with RA.

## Challenges of patient organisations' in the 21st century

### OP0220-PARE DEVELOPMENT OF THE SWISS NATIONAL STRATEGY 'MUSCULOSKELETAL DISEASES' 2017-2022 BY THE SWISS LEAGUE AGAINST RHEUMATISM

S.M. Engel, V. Krafft. *Swiss League against Rheumatism, Zürich, Switzerland*

**Background:** To support countries in their national efforts, the WHO developed a Global Action Plan for the Prevention and Control of Noncommunicable Diseases

2013-2020, which included cardiovascular diseases, cancers, chronic respiratory diseases and diabetes.<sup>1</sup> Although rheumatic or musculoskeletal diseases were not considered by the WHO, the Federal Office of Public Health (FOPH) of Switzerland included them within the National Strategy for the Prevention of Noncommunicable Diseases (NCD strategy).<sup>2</sup> This valuable national strategy and the corresponding action plan focus mainly on primary and secondary prevention with the aim to prevent diseases before their occurrence and to decrease associated risk factors. As a consequence, numerous organisations started to prepare disease-specific national strategies with focus on tertiary prevention and the main intention of supporting people with chronic illness.

**Objectives:** The objective of this project of the Swiss League against Rheumatism was to develop the Swiss National Strategy 'Musculoskeletal Diseases' 2017-2022. The strategy focused on patients affected by a rheumatic disease in order to complete the objectives that had already been undertaken by the Swiss government.

**Methods:** The structure of the Swiss League against Rheumatism (non-profit organisation) required a streamlined process. The theoretical framework, as part one in a two-part strategy, was developed from scientific literature. For the second part of the strategy, the identification of different measures in various fields of action, an expert group with advisory role was built in September 2015. This expert group was composed of different organisations: the Federal Office of Public Health, the Swiss Conference of the Regional Directors of Health Care, the Swiss Society of Rheumatologists, the Swiss Society of Orthopaedics and Traumatology, the Swiss Association of Physiotherapy, the Swiss Association of Occupational Therapy and the Swiss League against Rheumatism. Several interviews were conducted with experts from those and other organisations to determine the need for action in the field of musculoskeletal diseases for the upcoming six years. In summer 2016 the various recommendations of possible measures were prioritised.

**Results:** In summer 2017 as a result of this process, the Swiss League against Rheumatism was able to present the National Strategy 'Musculoskeletal Diseases' 2017-2022 with various measures grouped in the categories of 'prevention and early detection', 'care' and 'research and education'.<sup>3</sup>

**Conclusions:** Using this approach, a national strategy was developed with a reasonable amount of personal and financial resources. The current challenge of the implementation process is to motivate the involved organisations to realise specific measures on their own or in collaboration. These measures enable a better support of persons with musculoskeletal conditions during the full course of their disease.

### OP0221-PARE KNOW THEIR NUMBERS: WHAT DO RA PATIENTS KNOW ABOUT THEIR OWN BIOMEDICAL DATA?

T. Ngcozana<sup>1</sup>, A. Bhatia<sup>2</sup>. <sup>1</sup>Rheumatology, Royal Free Hospital; <sup>2</sup>Rheumatology, Hillingdon Hospital NHS Foundation Trust, London, UK

**Background:** Evidence shows that patients with a higher knowledge regarding their health, experience better health and have better outcomes, this leads to lower costs for the National Health Service. The Blood Pressure Association UK encourages the public to know their biomedical data. Similarly, there is a desire for patients with chronic diseases such as rheumatoid arthritis (RA) to know their biomedical data (blood pressure, lipid profile, DAS 28 score, BMI, blood sugar etc). It is well documented that patients with RA are at a high risk of developing cardiovascular disease.

**Objectives:** The aims of this study were to ascertain the existing knowledge that patients have on their biomedical data, understand the barriers of knowing these health indicators and enquire how their knowledge can be improved.

**Methods:** 50 consecutive patients with RA seen in a nurse-led clinic were asked to complete an anonymised questionnaire. The questionnaire consisted of 10 questions which assessed demographics, the patients' knowledge of their current biomedical data and the importance of knowing this information. It also enquired if patients knew what the term 'know your numbers' meant, reasons for not knowing and what could be done to increase their knowledge in knowing their numbers.

**Results:** 80% (n=40) questionnaires were returned. The estimated mean age (mean ±SD, years) was 58.1±13.4. A majority of the respondents were female

(87.5%). The highest category of disease duration for the cohort was between 2–5 years with 40% (n=16) patients. 30% (n=12) of the respondents were aware of the 'know your numbers' concept. 27.5% (n=11) knew their cholesterol while 80% did not know their last blood sugar. The majority 90% (n=36) did not know their BMI. Only 25% of the respondents knew their DAS score. 50% knew the significance of the numbers. 40% (n=16) reported that no one had informed them about the numbers. 95% (n=38) of the participants showed interest in knowing their numbers and 27.5% (n=11) suggested that a written record explained and regularly updated would be appropriate whilst 35% (n=14) proposed that a multidisciplinary input would be useful in regularly informing them of the numbers.

**Conclusions:** Although cardiovascular disease risk assessment and the management has improved in RA. There still remains a gap in patient engagement and activation in taking responsibility in knowing the risks and what they mean. It is well documented that patients with increased level of activation are more likely to engage in positive health behaviours resulting better outcomes. Our study has shown that although patients do not know much about their biomedical data they are interested in knowing about them. Knowing their biomedical may encourage them to take more ownership of their health even leading to more self-managing their RA.

## The EULAR exercise recommendations for physical activity in people with inflammatory arthritis and osteoarthritis

### OP0222-HPR PHYSICAL CAPACITY CONTRIBUTES marginally IN EXPLAINING VARIATIONS OF FATIGUE IN PERSONS MODERATELY AFFECTED BY RHEUMATOID ARTHRITIS

S. Pettersson<sup>1,2</sup>, I. Demmelmaier<sup>2</sup>, B. Nordgren<sup>2,3</sup>, A.B. Dufour<sup>4,5</sup>, C.H. Opava<sup>2,6</sup>.  
<sup>1</sup>Theme Inflammation and Infection, Karolinska University Hospital; <sup>2</sup>Division of Physiotherapy, Department of Neurobiology, Care Sciences and Society, Karolinska Institutet; <sup>3</sup>Functional Area Occupational Therapy and Physiotherapy, Allied Health Professionals Function, Karolinska University Hospital, Stockholm, Sweden; <sup>4</sup>Institute for Aging Research, Hebrew Senior Life, Harvard Medical School; <sup>5</sup>Beth Israel Deaconess Medical Center, Boston, USA; <sup>6</sup>Rheumatology clinic, Karolinska University Hospital, Stockholm, Sweden

**Background:** Fatigue is a prominent problem for persons with rheumatoid arthritis (RA). Physical activity, including planned and structured exercise, is an important non-pharmacological intervention that positively affects fatigue. Physical capacity including variables as aerobic capacity, muscle strength and lower limb capacity, are modifiable and their relative contributions to fatigue are thus of interest to better understand and address this detrimental consequence of RA.

**Objectives:** To explore the contributions of physical capacity in explaining variations in fatigue among people with rheumatoid arthritis (RA).

**Methods:** This cross-sectional study included 269 participants (82% women, mean age 60 years, mean DAS28 2.8, mean HAQ-DI 0.5) recruited for a physical activity intervention. Data were collected from the Swedish Rheumatology Quality Registers, from questionnaires on fatigue, activity limitation, perceived health, pain and anxiety/depression and from physical capacity tests (lower limb function, grip strength, aerobic capacity). We used logistic regression to estimate the association between severe fatigue ( $\geq 50$ , VAS 0–100) and A) independent variables related to disease and disease impact and B) model A plus physical capacity tests. Pooled odds ratio tests compared model fit.

**Results:** Severe fatigue was reported by 95 participants (35%). The three variables which were statistically significantly associated with severe fatigue ( $p < 0.05$ ) in both models were perceived health, pain and anxiety/depression. Anxiety/depression demonstrated the largest effect size with odds ratios of 2.43 (95% CI: 1.20 to 4.94) in model A and 2.58 (95% CI: 1.25 to 5.32) in model B. The likelihood ratio test indicated that model B was a better fit to the data than model A with  $\chi^2$  (df 3)=2.65,  $p=0.048$ .

**Conclusions:** We found that disease impact variables rather than physical capacity variables are predictors of severe fatigue in people with RA. Further studies are needed to assess correlations between physical capacity and fatigue using multidimensional assessments of fatigue to enable separate analyses of physical and mental fatigue respectively.

## Immune senescence and ageing

### OP0223 TARGETING CHONDROCYTE PLASTICITY VIA CONNEXIN43 MODULATION ATTENUATES CELLULAR SENESCENCE IN OSTEOARTHRITIS

M. Varela-Eirín<sup>1</sup>, A. Varela-Vázquez<sup>1</sup>, C. Paño<sup>2</sup>, A. Casado-Díaz<sup>3</sup>, J.M. Quesada-Gómez<sup>3</sup>, E. Fonseca<sup>1</sup>, T. Aasen<sup>4</sup>, A. Taberno<sup>5</sup>, J.R. Caeiro<sup>6</sup>, A. Blanco<sup>7</sup>, M. D. Mayán<sup>1</sup>. <sup>1</sup>CellCOM Research Group, Instituto de Investigación Biomédica de A Coruña (INIBIC), A Coruña; <sup>2</sup>Unit of Experimental Neurology-Neurobiology, Ramón y Cajal Hospital (IRYCIS), Madrid; <sup>3</sup>Clinical Management Unit of Endocrinology and Nutrition, Maimónides Biomedical Research Institute of Córdoba (IMBIC), Córdoba; <sup>4</sup>Translational Molecular Pathology Research Group, Vall d'Hebron Research Institute (VHIR), Barcelona; <sup>5</sup>Departamento de Bioquímica y Biología Molecular, Instituto de Neurociencias de Castilla y León (INCYL), Salamanca; <sup>6</sup>Department of Orthopaedic Surgery and Traumatology, Complejo Hospitalario Universitario de Santiago de Compostela (CHUS), Santiago de Compostela, Spain; <sup>7</sup>Flow Cytometry Core Technologies, UCD Conway Institute, Dublin, Ireland

**Background:** Chondrocytes in articular cartilage undergo phenotypic changes and senescence, restricting cartilage regeneration and favouring the osteoarthritis (OA) progression, a chronic disease characterised by degeneration of articular cartilage leading to physical disability and pain. Like other wound healing disorders, chondrocytes from OA patients show a chronic increase in the transmembrane channel protein connexin43 (Cx43), which through the exchange of factors or recruitment/release of signalling factors to the membrane regulates signal transduction. Immature or stem-like cells are found in cartilage isolated from OA patients, yet their origin and role in disease progression are unknown.

**Objectives:** Our objective was to investigate the role of Cx43 in chondrocyte plasticity during osteoarthritis.

**Methods:** Human mesenchymal stem cells and chondrocytes from osteoarthritic donors were used in this study. Protein levels were evaluated by western blot, immunofluorescence and flow cytometry. RNA expression was evaluated by RT-qPCR. Cell communication was studied by scrape loading assay and flow cytometry.

**Results:** Here we show that Cx43 acts as a positive regulator of the reversion of human chondrocytes to a less differentiated state. Overactivity of Cx43 in the membrane largely maintain this stem-like phenotype by increasing the basic helix-loop-helix transcription factor TWIST-1 and tissue remodelling and proinflammatory factors such as MMPs and IL-6, which in turn lead to cellular senescence by upregulation of p53 and p16INK4a, contributing to the senescence-associated secretory phenotype (SASP). Downregulation of Cx43 leads to redifferentiation of osteoarthritic chondrocytes (OAc) into more differentiated state decreasing MMPs, proinflammatory cytokines production and cellular senescence. Collectively, these results identify a causal Cx43-sensitive circuit in chondrocytes that regulates dedifferentiation and redifferentiation events involved in wound healing and tissue repair. In addition we show that chronic dedifferentiation drives catabolic processes and cellular senescence.

**Conclusions:** Targeting Cx43 allows dedifferentiated chondrocytes to revert to a chondrocyte-specific phenotype and its subsequent recovery in a predictable manner. These findings support the use of Cx43 as an appropriate therapeutic target to halt OA progression and to promote cartilage regeneration

## Special delivery: intercellular communication

### OP0224 ADAMTS-12 PROTECTS AGAINST INFLAMMATORY ARTHRITIS THROUGH INTERACTING WITH PROINFLAMMATORY CTGF

W. Fu, J. Wei, A. Hettinghouse, W. He, C. Liu. Department of Orthopaedic Surgery, New York University Medical Center, New York, USA

**Background:** It has been reported that a disintegrin and metalloproteinase with thrombospondin motifs-12 (ADAMTS-12) is a susceptibility gene for rheumatoid arthritis (RA) development, and its level was significantly increased in RA patients. In addition, ADAMTS-12 was also reported to be required for normal inflammation.

**Objectives:** This study aims to determine the role of ADAMTS-12 and the underlying mechanisms in the pathogenesis of inflammatory arthritis.

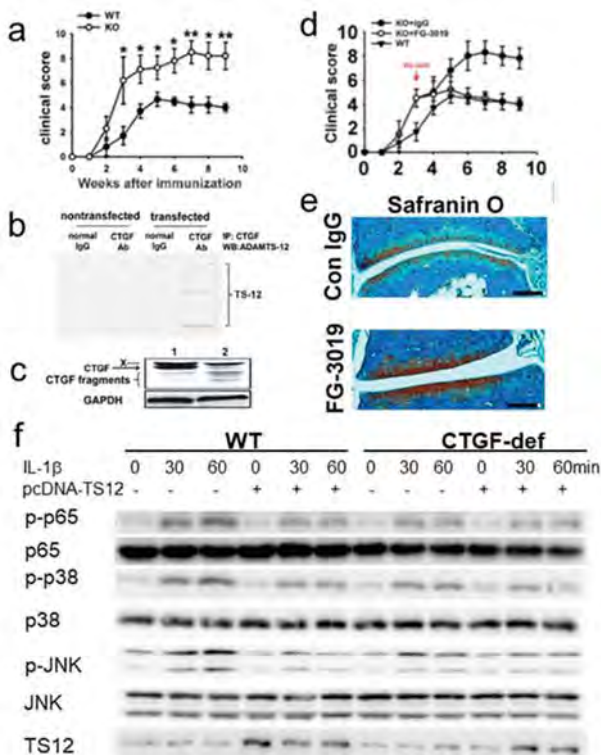

**Methods:** Collagen-induced arthritis (CIA) was established in ADAMTS-12<sup>-/-</sup> mice and their control littermates to determine the role of ADAMTS-12 *in vivo*. Connective tissue growth factor (CTGF) deficient Raw264.7 were used to

determine their functional interplays. Protein-protein interaction assays were performed to detect the interactions of ADAMTS-12 with CTGF

**Results: ADAMTS-12<sup>-/-</sup> mice are more susceptible to collagen-induced arthritis.** Accelerated disease onset, significant increase in the arthritis score and arthritis incidence, were observed in ADAMTS-12<sup>-/-</sup> mice (figure 1a). Histological analysis of whole ankle joints demonstrated a significant increase in synovitis, destruction of bone and cartilage loss in ADAMTS-12<sup>-/-</sup> mice. ELISA results indicated that ADAMTS-12<sup>-/-</sup> CIA mice exhibited enhanced release of pro-inflammatory and reduced secretion of anti-inflammatory cytokine. Collectively, these data demonstrate that ADAMTS-12<sup>-/-</sup> renders mice highly susceptible to CIA.

**ADAMTS-12 interacts with and cleaves CTGF, and ADAMTS-12-mediated signalling depends on CTGF during inflammation.** It is known that CTGF plays a pro-inflammatory role in the pathogenesis of inflammatory arthritis. We co-transfected CTGF and ADAMTS-12 into 293 T cells and found ADAMTS-12 bound to (figure 1b) and digested CTGF (figure 1c). *In vivo* studies also demonstrated that CTGF was accumulated in the synovium of ADAMTS-12<sup>-/-</sup> CIA mice. To further determine whether CTGF is a critical regulator of ADAMTS-12 mediated signalling, we generated CTGF deficient Raw264.7. Overexpression of ADAMTS-12 and CTGF deficiency could decrease the activation of inflammatory signalling markers such as NFκB, p38 and JNK in response to IL-1β at a comparable level. More importantly, overexpression of ADAMTS-12 in CTGF deficient Raw264.7 failed to further inhibit the activation of these signal molecules as compared to CTGF deficient Raw264.7 (figure 1f). Taken together, these results suggest that CTGF is a critical regulator of ADAMTS-12 mediated signalling during inflammation.

**Blocking CTGF attenuates inflammatory arthritis in ADAMTS12-deficient CIA mice model.** To determine whether the accelerated inflammation in ADAMTS-12<sup>-/-</sup> mice resulted from the accumulated CTGF, we administered CTGF antibody to ADAMTS-12<sup>-/-</sup> CIA model after disease onset. The arthritis score in ADAMTS-12 deficient mice was significantly reduced in presence of CTGF antibody (figure 1d). Moreover, histological analysis indicated CTGF abrogated further tissue destruction and inflammation (figure 1e).

**Abstract OP0224** – Figure 1 ADAMTS-12 protects against inflammatory arthritis through interacting with CTGF. (a) Clinical arthritis scores in WT and KO CIA mice. (b) Co-IP assays detect the associations of ADAMTS-12 with CTGF. (c) Western blotting of CTGF cleavage by ADAMTS-12. (d) Clinical arthritis scores in WT, control IgG-treated KO and CTGF antibody-treated KO mice with CIA. (e) Safranin O staining. (f) WT or CTGF-deficient (CTGF-def) Raw264.7 were transfected with pcDNA-ADAMTS 12 for 48hrs, then cells were treated with or without IL-1β for indicated time. Cell lysate were separated in SDS-page and probed with indicated antibodies.

**Conclusions:** ADAMTS-12-mediated regulation of inflammatory arthritis is probably through, at least in part, its interplay with CTGF and blockage of CTGF has been shown to be effective in treating inflammatory arthritis.

#### OP0225 S100A9 MEDIATES ACUTE NOCICEPTIVE PAIN IN EXPERIMENTAL SYNOVITIS

A.B. Blom, M.H. Van Den Bosch, E.J. Geven, E.N. Blaney Davidson, P.M. van der Kraan, P.L. van Lent. *Experimental Rheumatology, Radboud university medical center, Nijmegen, Netherlands*

**Background:** Synovitis-associated pain is an important aspect of arthritis pathology. Several inflammatory mediators released by the synovium have been implicated in the regulation of pain, including S100A8 and S100A9. These mediators may regulate pain either via direct stimulation of TLR4 on the nerve endings in the synovium or via stimulation at the site of the dorsal root ganglia (DRG), thereby enabling an increased phagocyte infiltration that may cause sensitisation.

**Objectives:** To elucidate the role of S100A9 in the pain response after induction of an acute synovitis using streptococcal cell walls (SCW) as a trigger, by comparing S100a9<sup>-/-</sup> mice and their wild type controls.

**Methods:** Acute synovitis was induced by a single intraarticular injection of SCW in the knee joint of C57Bl/6 (WT) mice and S100a9<sup>-/-</sup> mice (also functional knock-outs for S100A8). Control mice received a saline injection. Serum S100A8/A9 levels were investigated by ELISA. Joint swelling and cell influx was assessed by <sup>99m</sup>Tc accumulation and histology. Pain response were investigated using an Incapacitance Tester (weight bearing), Catwalk (gait analysis) and von Frey's filaments (mechanical allodynia). Gene expression of inflammatory mediators and neuron activation markers in DRG were determined by q-PCR. Monocyte influx and protein expression was monitored by immunohistochemistry (IHC).

**Results:** A single intraarticular injection of SCW resulted in acute synovitis, accompanied by a strongly increased synovial expression of S100A8 and S100A9 and increased serum S100A8/A9 levels at day 1, which returned to basal levels at day 7. However, joint swelling and cell influx were similar in WT and S100a9<sup>-/-</sup> mice at day 1, excluding a role for S100A8/9 on pain perception via increased synovitis. WT mice showed a marked and significant decrease in the percentage of weight bearing on the SCW injected hind paw (28%) compared to saline injection (47%, p<0.001) at day 1, whereas S100a9<sup>-/-</sup> mice did not. In addition, the stand-phase of the unaffected paws was significantly increased in WT mice 1 day after injection, while in S100a9<sup>-/-</sup> mice these parameters were not altered. Both mouse strains showed a similar reduction of paw withdrawal threshold, excluding a role for S100A8/9 in allodynia. Analysis of DRG showed no increased phagocyte infiltration after SCW injection and no change in gene expression of the chemokines MCP-1 and KC (for monocytes and neutrophils respectively), and pro-inflammatory cytokines IL-1β and TNF was measured. In addition, F4/80 staining was comparable between WT and S100a9<sup>-/-</sup> mice. However, expression of the neuron activation markers NAV1.7, ATF3 and GAP43 was significantly increased at 1 day after SCW injection in WT mice as compared to saline injected mice (p=0.022, 0.004 and 0.030 respectively) while no regulation of these factors was found in S100a9<sup>-/-</sup> mice, which is in line with the reduced pain response observed earlier in S100a9<sup>-/-</sup> mice. The difference in NAV1.7 expression in the DRG was further confirmed at protein level with IHC.

**Conclusions:** These findings show that S100A9 is an important mediator of inflammatory nociceptive pain response in the knee, rather than being involved in peripheral sensitisation. During the acute phase of inflammation S100A8/A9 is likely regulated via direct activation of TLR4 on nerve endings in the synovium and not via monocyte infiltration in the DRG.

#### Biologics in RA. More, more and more about safety.

#### OP0226 RISK OF HOSPITALISED INFECTION AND INITIATION OF ABATACEPT VERSUS TNF INHIBITORS AMONG PATIENTS WITH RHEUMATOID ARTHRITIS: A PROPENSITY SCORE-MATCHED COHORT STUDY

S.K. Chen<sup>1</sup>, K.P. Liao<sup>1</sup>, J. Liu<sup>2</sup>, S.C. Kim<sup>1</sup>. <sup>1</sup>Rheumatology, Immunology and Allergy; <sup>2</sup>Pharmacoepidemiology and Pharmacoeconomics, Brigham and Women's Hospital, Boston, USA

**Background:** Rheumatoid arthritis (RA) patients receiving biologic therapy are at an increased risk of infection. TNF inhibitors (TNFi) and abatacept are used similarly in RA as the first line biologic. Few studies conducted a head-to-head

**Abstract OP0226 – Table 1.** Risk of hospitalised infection in Abatacept versus TNFi initiators: PS-matched analysis

	Event	Abatacept (n=11,248)			TNF inhibitors (n=11,248)		
		Person-years	IR	HR (95% CI)	Person-years	IR	HR (95% CI)
Primary outcome	Hospitalised infection	1024	40.01	0.97 (0.89–1.06)	1031	41.21	1.0
Secondary outcomes	Bacterial infection	635	23.99	1.04 (0.93–1.16)	598	23.10	1.0
	Herpes zoster	402	15.06	1.01 (0.88–1.16)	391	14.94	1.0
	Bone/joint infection	53	1.93	1.33 (0.88–2.01)	39	1.45	1.0
	Cardiac infection	0	0	-	3	0.11	1.0
	Gastrointestinal infection	158	5.81	1.21 (0.96–1.52)	128	4.79	1.0
	Genitourinary infection	130	4.77	1.20 (0.93–1.55)	106	3.97	1.0
	Respiratory infection	351	13.11	0.91 (0.79–1.05)	378	14.45	1.0
	Skin/soft tissue infection	178	6.55	0.92 (0.75–1.13)	189	7.12	1.0
	Neurologic infection	2	0.07	0.20 (0.04–0.90)	10	0.37	1.0

comparison of infection risk specific to different types of biologics used in a real-world setting.

**Objectives:** To evaluate the risk of hospitalised infection among RA patients who initiate abatacept versus TNFi.

**Methods:** We identified RA patients aged  $\geq 18$  years with  $\geq 2$  RA diagnoses separated by 7–365 days using insurance claims data from Truven MarketScan database (2005–2015). New users of abatacept or TNFi (adalimumab, etanercept, certolizumab, golimumab, and infliximab) were included. To balance RA duration or severity between the groups, we excluded patients who previously used rituximab, tocilizumab or tofacitinib. We also excluded patients with malignancy, dialysis, HIV/AIDS, or organ transplantation. The primary outcome was a composite endpoint of hospitalised infection including bacterial, viral or opportunistic infection. Secondary outcomes were bacterial infection, herpes zoster, and infections affecting different organ systems. To control for over 50 baseline confounders, we performed 1:1 propensity score (PS) matching. We estimated incidence rate (IR) and hazard ratio (HR) with 95% confidence interval (CI) of risk of hospitalised infection.

**Results:** We included 11,248 PS-matched pairs of abatacept and TNFi initiators with median age of 56 years. 83% were female. In the 1 year baseline period, 68% had any use of oral steroids and 55% used methotrexate. 18% had diabetes and 3% had hospitalised infection. Over the mean 2.3 year of followup, 1024 abatacept and 1,031 TNFi initiators were hospitalised for infection (table 1). The risk of any hospitalised infection was similar (HR 0.97, 95% CI: 0.89 to 1.06) between the two groups with the IR per 1000 person-years of 40.01 in abatacept and 41.21 in TNFi initiators. We found consistent results in the analyses of secondary outcomes. IR=events per 1000 person-years

**Conclusions:** In this large cohort of RA patients who used abatacept or TNFi as a first or second-line biologic agent, we found no difference in the risk of hospitalised infection between the two groups.

#### OP0227 TIMING OF ABATACEPT BEFORE ELECTIVE ARTHROPLASTY AND POST-OPERATIVE OUTCOMES

M. George<sup>1</sup>, J. Baker<sup>1</sup>, K. Winthrop<sup>2</sup>, E. Alemao<sup>3</sup>, L. Chen<sup>4</sup>, S. Connolly<sup>3</sup>, T. Simon<sup>3</sup>, Q. Wu<sup>1</sup>, F. Xie<sup>4</sup>, S. Yang<sup>4</sup>, J. Curtis<sup>4</sup>. <sup>1</sup>University of Pennsylvania, Philadelphia; <sup>2</sup>Oregon Health and Science University, Portland; <sup>3</sup>Bristol Myers Squibb, New York; <sup>4</sup>University of Alabama at Birmingham, Birmingham, USA

**Background:** Guidelines recommend holding biologic DMARDs before major surgery, but few studies have examined perioperative timing of individual biologic therapies.<sup>1</sup>

**Objectives:** We aimed to determine whether holding abatacept infusions before elective hip or knee arthroplasty is associated with lower risk of adverse post-operative outcomes.

**Methods:** This retrospective cohort study using U.S. Medicare claims data from 2006-September 2015 evaluated adults with  $\geq 2$  ICD9 codes for RA who received abatacept by infusion within 6 months of inpatient primary or revision total hip or knee arthroplasty. Infusions were selected as these procedures can be precisely dated in claims data. Patients with hip fracture, malignancy, pre-existing infection, non-elective procedures, or surgery after hospital day 3 were excluded. Logistic and Cox regression were used to assess associations between abatacept stop timing (time between most recent infusion and surgery in 4 week intervals based on dosing interval) and adverse outcomes: 1) hospitalised infection within 30 days (from discharge diagnoses, PPV >80%), 2) rate of prosthetic joint infection (PJI, ICD9 996.66) within 1 year, and 3) 30 day readmission (among patients with discharge to home, rehabilitation facility, or skilled nursing facility). Propensity scores based on the probability of being in each abatacept stop timing group were used to balance confounders across exposure groups using inverse probability weighting. Risk of hospitalised infection associated with methotrexate or with average glucocorticoid dose in the 3 months prior to surgery was assessed in abatacept treated patients using a reduced multivariable logistic regression model.

**Results:** Among 1537 surgeries in 1410 patients, there were 158 (10.3%) hospitalised infections within 30 days (most commonly urinary, skin/soft tissue, and pneumonia), 34 (2.6/100 person-years) PJI within 1 year, and 108/1448 (7.5%) 30 day readmissions. There were no significant differences in the rates of hospitalised infection, prosthetic joint infection, or 30 day readmission in patients who received abatacept within 4 weeks of surgery vs patients with longer stop timing (table 1). Among abatacept treated patients, glucocorticoid use (vs. none) was associated with a dose-dependent increase in the risk of hospitalised infection:  $\leq 5$  mg [aOR 1.32 (0.88–1.98)], 5–10 mg [aOR 2.40 (1.54–3.73)], >10 mg [aOR 1.73 (0.74–4.06)]. Concomitant use of methotrexate was not associated with hospitalised infection risk [aOR 0.97 (0.68–1.38)] (table 2).

**Abstract OP0227 – Table 1** Association between abatacept stop timing and post-operative outcomes, from logistic and Cox regression with inverse probability weighting

Abatacept Stop Timing	30-day hospitalized infection		Prosthetic joint infection within 1 year		30-day readmission*	
	N (%)	aOR (95% CI)	N (inc/100py)	aHR (95% CI)	N (%)	aOR (95% CI)
< 4 weeks (n = 394)	61 (10.3)	Reference	11 (2.4)	Reference	44/572 (7.7)	Reference
4-8 weeks (n = 670)	80 (9.0)	0.98 (0.66-1.45)	15 (3.1)	1.22 (0.55-2.73)	45/627 (7.2)	0.97 (0.62-1.53)
≥ 8 weeks (n = 273)	37 (13.6)	1.11 (0.69-1.79)	6 (3.0)	0.71 (0.25-2.08)	19/249 (7.6)	0.94 (0.51-1.73)

\*Readmissions assessed among patients with discharge to home, rehabilitation facility, or skilled nursing facility. Adjusted odds ratios (aOR) and hazard ratios (aHR) from logistic and Cox regression with inverse probability treatment weights. inc/100py = incidence per 100 person years.

**Abstract OP0227** – Table 2 Association between glucocorticoids and methotrexate with post-operative hospitalised infection among abatacept treated patients, logistic regression model

Average glucocorticoid dose	Adjusted OR (95% CI)	p-value
None (n = 764)	Reference	–
≤5mg (n = 454)	1.32 (0.88-1.98)	0.18
5-10mg (n = 252)	2.40 (1.54-3.73)	<0.001
>10mg (n = 67)	1.73 (0.74-4.06)	0.21
Methotrexate use (n = 573)	0.97 (0.68-1.38)	0.86

Included in the reduced multivariable model but not shown: abatacept stop timing, age, disability, sex, race, median household income, surgery type, chronic kidney disease, surgeon volume. Tested but excluded (p > 0.2): osteonecrosis, diabetes, congestive heart failure, asthma/COPD, obesity, Charlson score, previous biologic, hospitalizations, hospitalized infections, number outpatient visits, hospital volume, skilled nursing facility residence, extra-articular RA, region, urban, antibiotics/NSAIDs/opioids past 90 days, year.

**Conclusions:** Holding intravenous abatacept for ≥4 weeks (one dosing interval) was not associated with a lower risk of hospitalised infection, prosthetic joint infection, or 30 day readmission. Glucocorticoid use even at 5–10 mg per day was associated with significantly greater risk of post-operative infection.

**OP0228** **COMPARATIVE RISK OF BIOLOGIC THERAPIES AND RISK OF GLUCOCORTICOIDS IN PATIENTS WITH RHEUMATOID ARTHRITIS UNDERGOING ELECTIVE ARTHROPLASTY**

M. George<sup>1</sup>, J. Baker<sup>1</sup>, K. Winthrop<sup>2</sup>, E. Alemao<sup>3</sup>, L. Chen<sup>4</sup>, S. Connolly<sup>3</sup>, T. Simon<sup>3</sup>, Q. Wu<sup>1</sup>, F. Xie<sup>4</sup>, S. Yang<sup>4</sup>, J. Curtis<sup>4</sup>. <sup>1</sup>University of Pennsylvania, Philadelphia; <sup>2</sup>Oklahoma Health and Science University, Portland; <sup>3</sup>Bristol Myers Squibb, New York; <sup>4</sup>University of Alabama at Birmingham, Birmingham, USA

**Background:** Patients with RA undergoing major surgery are at high risk for infection. Different biologic DMARDs may be associated with different infection risks.<sup>1</sup>

**Objectives:** Goals were 1) to compare post-operative infection risk after arthroplasty in patients with RA exposed to different biologics, and 2) examine associations between glucocorticoid use and post-operative infection.

**Methods:** A retrospective cohort study using U.S. Medicare data from 2006-September 2015 evaluated adults with ≥2 ICD9 codes for RA undergoing elective inpatient primary or revision total knee or hip arthroplasty. Eligible patients received an infusion or prescription for abatacept, adalimumab, etanercept, infliximab, or tocilizumab within 8 weeks or a rituximab infusion within 16 weeks of surgery. Patients with hip fracture, malignancy, pre-existing infection, or non-elective surgery were excluded. Average glucocorticoid dose in the 3 months before surgery was calculated from oral prescriptions. Logistic or Cox regression evaluated associations between biologic exposure and post-operative outcomes: 1) hospitalised infection within 30 days (from discharge diagnoses, PPV >80%), 2) rate of prosthetic joint infection (PJI, ICD9 996.66) within 1 year, and 3) 30 day readmission among patients with discharge to home, skilled nursing facility, or inpatient rehab. Propensity scores based on the probability of receiving a specific biologic treatment were used to balance confounders across treatment groups using inverse probability weighting. Similar analyses were used to evaluate associations between glucocorticoid dose and outcomes in the same cohort, using inverse probability weighted analyses based on the probability of being in each glucocorticoid treatment category.

**Results:** Among 7929 surgeries in 7138 patients, there were 717 (9.0%) hospitalised infections within 30 days of surgery (most commonly urinary, skin/soft tissue, and pneumonia), 192 (2.8/100 person-years) PJI within 1 year, and 465/7554 (6.2%) 30 day readmissions. There was no significant difference in the risk of

hospitalised infection, PJI, or 30 day readmission across biologic treatment groups (table 1). Glucocorticoid dose >10 mg/day (mean 13.5±3.5 mg/day) was associated with a significantly greater risk of hospitalised infection [aOR 2.37 (1.63–3.44)] and prosthetic joint infection [aHR 2.04 (1.09–3.84)] compared to no glucocorticoid use (table 1). Patients with glucocorticoid dose >10 mg also had a numerically greater risk of 30 day readmission that did not reach statistical significance [aOR 1.61 (0.99–2.61)] (table 1).

**OP0229** **THE ASSOCIATION OF BIOLOGIC DRUG-LEVELS WITH INFECTION RISK: RESULTS FROM THE BRITISH SOCIETY FOR RHEUMATOLOGY BIOLOGICS REGISTER FOR RHEUMATOID ARTHRITIS**

M. Jani<sup>1</sup>, W.G. Dixon<sup>1</sup>, M. Lunt<sup>1</sup>, D. De Cock<sup>1</sup>, J.D. Isaacs<sup>2</sup>, A.W. Morgan<sup>3</sup>, A. G. Wilson<sup>4</sup>, D. Plant<sup>5</sup>, K. Watson<sup>1</sup>, A. Barton<sup>5</sup>, K. Hyrich<sup>1,5</sup>, on behalf of BSRBR Control Centre Consortium. <sup>1</sup>ARUK Centre for Epidemiology, University of Manchester, Manchester; <sup>2</sup>University of Newcastle, Newcastle; <sup>3</sup>University of Leeds, Leeds; <sup>4</sup>University College of Dublin, Dublin; <sup>5</sup>BRC, Manchester Foundation Trust, Manchester, UK

**Background:** High dose tumour necrosis factor inhibitor (TNFi) drugs are associated with an increased serious infection (SI) risk. It is feasible that high biologic levels predict dose-dependent adverse events such as SI. No registries have systematically evaluated the effect of drug levels on infection risk.

**Objectives:** To assess the effect of biologic drug levels in rheumatoid arthritis (RA) patients on (i) all infections (AI) (ii) SI (infections requiring hospitalisation, IV antibiotics or lead to death)

**Methods:** Patients recruited to both the British Society for Rheumatology Biologics Register-RA (safety data) and the Biologics in RA Genetics and Genomics Syndicate (serological samples) were included. Both are large national prospective RA cohorts. Biologic drug levels were measured at 3/6/12 months after biologic initiation and stratified as low/normal or high drug levels (HL) as per thresholds defined using concentration-effect curves for each drug. The risk of first and total infections within the first year was analysed. Events occurring on drug or within 90 days of last dose were included. The risk of an event was compared between low/normal vs HL groups using Cox proportional-hazard models. Factors affecting both drug levels and infection risk were adjusted for in the models.

**Results:** 703 patients (286 etanercept, 179 adalimumab, 120 certolizumab, 104 tocilizumab and 14 infliximab) had clinical data and serological samples. 74% were women, mean (SD) age 58<sup>12</sup> years, on a first biologic (89%). The crude rate/1000 pyrs was 314 and 464 for AI; 54 and 76 for SI in the low/normal and HL groups respectively. The adjusted hazard ratio for AI within the first year differed significantly between the two groups with the HL group having 50 percent higher risk of AI (HR: 1.51; 95% CI: 1.14, 2.01) (table 1). The most common types of AI in the HL group were lower (34%) and upper (16%) respiratory tract infections, urinary tract infections (15%), skin infections including shingles (8%).

Abstract OP0229 – Figure 1 All infection Nelson-Aalen cumulative hazard estimates

**Conclusions:** RA patients with high biologic drug levels have a higher risk of infection. Monitoring drug levels may be helpful in prediction of infection. In disease remission patients with HL, biologic dose tapering may lower infection risk.

#### PREDICTORS OF HYPOGAMMAGLOBULINEMIA DURING RITUXIMAB MAINTENANCE THERAPY IN RHEUMATOID ARTHRITIS: A 12-YEAR LONGITUDINAL MULTI-CENTRE STUDY

G. Boletto<sup>1,2</sup>, J. Avouac<sup>1</sup>, J. Wipff<sup>1</sup>, M. Forien<sup>3</sup>, M. Dougados<sup>4</sup>, C. Roux<sup>4</sup>, A. Kahan<sup>1</sup>, P. Dieude<sup>3</sup>, Y. Allanore<sup>1</sup>. <sup>1</sup>Department of Rheumatology A, Cochin Hospital, Paris Descartes University, Paris; <sup>2</sup>Department of Rheumatology, Maison Blanche Hospital, Reims University Hospitals, Reims; <sup>3</sup>Department of Rheumatology Bichat Hospital, Paris Diderot University; <sup>4</sup>Department of Rheumatology B, Cochin Hospital, Paris Descartes University, Paris, France

**Background:** Rituximab (RTX) is an anti-CD20 monoclonal antibody that selectively depletes B-cell population. One of the drawbacks of a prolonged peripheral B-cell depletion is the suppression of protective antibodies and an increased risk for infectious events. However, few long-term data are available on predictors for the development of low levels of serum immunoglobulins in patients receiving repeated courses of RTX.

**Objectives:** We aimed at the identification of predictors for hypogammaglobulinemia occurrence in RA patients long-term treated with RTX in a 'real-life' setting.

**Methods:** Multicenter longitudinal observational usual care study including RA patients according to ACR<sup>1987</sup> and/or ACR/EULAR<sup>2010</sup> classification criteria followed and treated with RTX. A previous study assessing the safety profile of RTX in patients with RA reported a median follow-up of 30 months.<sup>1</sup> Therefore, we decided to include RA patients on RTX maintenance therapy, after a minimal exposition of 30 months. Serum protein electrophoresis was performed before each RTX infusion. Hypogammaglobulinemia and severe hypogammaglobulinemia were defined as total gammaglobulin <6 g/L and <4 g/L, respectively. Safety monitoring included the collection of all adverse events (AE) in particular severe infections.

**Results:** 134 patients met inclusion criteria: 113 female subjects (84.3%); mean age 52.1±11.4 years. Mean follow-up was 79.5±24.6 months and analysis was based on 854.9 patient-years (pt-yrs). Mean RTX cumulative dose was 12.0±4.9 g. Hypogammaglobulinemia (<6 g/L) occurred during the follow-up period in 23 patients (2.7 events per 100 pt-yrs), leading to an incidence of 17.1%. The mean time to development of hypogammaglobulinemia was 64±23 months. A total of 9.7% of patients had severe infections (1.5 events per 100 pt-yrs). Patients who developed hypogammaglobulinemia were more likely to experience severe infections (26.1% vs 6.3%, p=0.033). Univariate Cox analysis identified age over 65 years (HR 4.28 [95% CI: 0.92 to 19.97], p<0.001), low gammaglobulin levels prior the first RTX infusion (<8 g/L) (HR 7.35 [95% CI: 1.82 to 29.68], p<0.001) as predictors of protective factor (HR 0.26 [95% CI: 0.08 to 0.87], p=0.03).

**Conclusions:** Our results show that gammaglobulin levels of less than 8 g/L at baseline is a strong independent risk factor for developing subsequent hypogammaglobulinemia, whereas concomitant MTX therapy seems to be a protective factor in RA patients treated long-term with RTX. Identifying such predictors will raise clinicians' awareness and allow more tailored monitoring of RA patients long-term treated with RTX.

OP0231

#### GASTRO-INTESTINAL PERFORATIONS AMONG RHEUMATOID ARTHRITIS PATIENTS TREATED WITH BIOLOGIC DMARDS: A NATIONWIDE SWEDISH COHORT STUDY

A. Barbulescu, J. Askling, T. Frisell, on behalf of ARTIS. *Department of Medicine, Solna, Karolinska Institutet, Stockholm, Sweden*

**Background:** Use of glucocorticosteroids and NSAIDs for the treatment of RA has been associated with an increased risk of gastrointestinal (GI) perforations. The introduction of disease modifying agents, such as methotrexate or tumour necrosis factor inhibitors (TNFi) provided a seemingly safer treatment option, but the safety of other types of biologics relative to TNFi remains unclear.

**Objectives:** To estimate the incidence of gastro-intestinal perforations among Swedish RA patients treated with TNFi and non-TNFi biologics, and compare it with the incidence among bionative patients with RA and a matched general population comparator group.

**Methods:** We performed a register-based cohort study, including all Swedish RA patients, with follow-up between 2010 and 2015. For these, all treatment initiations with biologic disease modifying anti-rheumatic drugs were identified through the Swedish Rheumatology register (SRQ), and grouped by class into TNFi and non-TNFi drugs (10 857 and 5823 treatment starts). Biologics naïve patients with RA were identified by recorded diagnosis in the Swedish National Patient Register (NPR), since 2001 (n=54,732). Five general population controls were matched to

each biologic-treated patient with RA (n=53,214) by sex, age, and geographical region. A patient could participate to several of these exposure cohorts. For each patient, follow-up under a cohort ended either with an outcome event (GI perforation identified in the NPR as an ICD10 code from a predefined list) or with the first of any of the following censoring events: emigration from Sweden, death, transition to another cohort, discontinuation of treatment (+90/+180 days lag time) or end of study period. Crude incidence rates were tabulated for each cohort and adjusted hazard ratios (HR) and 95% confidence intervals were estimated in multivariable Cox regressions, controlling for baseline differences. The final adjusted model included the following covariates: sex, age, line of biologic treatment, disease characteristics, co-medication at treatment start, co-morbidities and a history of GI perforation.

**Results:** We found 31 GI perforations among 18 604 person-years (pyr) exposed to TNFi, and 31 GI perforations among 10 947 pyr exposed to non-TNFi, corresponding to crude incidence rates of 1.67 and 2.83 per 1000 pyr, respectively. The crude incidence rate among the biologics-naïve was 2.54 while among the general population comparators it was 0.94. The rate of GI perforations remained higher in patients with RA compared to the general population after adjustment for patient characteristics, HR of 1.78 (95% CI: 1.44 to 2.17), whereas the seemingly increased rate among bionative and non-TNFi users vs TNFi was largely explained by differences in age and disease history at start of follow-up, with adjusted HRs of 1.10 (0.68–1.78) for TNFi vs bionative and 1.10 (0.63–1.91) for TNFi vs non-TNFi, respectively.

**Conclusions:** Although patients with RA had a higher rate of GI perforations than matched general population comparators, no significant differences in risk remained between bionative, TNFi or non-TNFi treated RA patients after adjusting for baseline patient characteristics.

OP0232

#### FEMALE GENDER AND POSITIVE RHEUMATOID FACTOR PREDICT LOW SERUM INFlixIMAB LEVELS AND POSITIVE ANTI-DRUG ANTIBODIES, WHICH ASSOCIATE WITH TREATMENT FAILURE ON INFlixIMAB IN PATIENTS WITH EARLY RHEUMATOID ARTHRITIS. REPORT FROM THE SWEFOT TRIAL POPULATION

K. Hambarzumyan<sup>1</sup>, C. Hermanrud<sup>1</sup>, P. Marits<sup>1</sup>, N. Vivar<sup>1</sup>, S. Ernestam<sup>1</sup>, J. K. Wallman<sup>2</sup>, R.F. van Vollenhoven<sup>1,3</sup>, A. Fogdell-Hahn<sup>1</sup>, S. Saevarsdottir<sup>1</sup>, on behalf of SWEFOT trial group. <sup>1</sup>Karolinska Institutet, Stockholm; <sup>2</sup>Lund University, Lund, Sweden; <sup>3</sup>Amsterdam Rheumatology and Immunology Center, Amsterdam, Netherlands

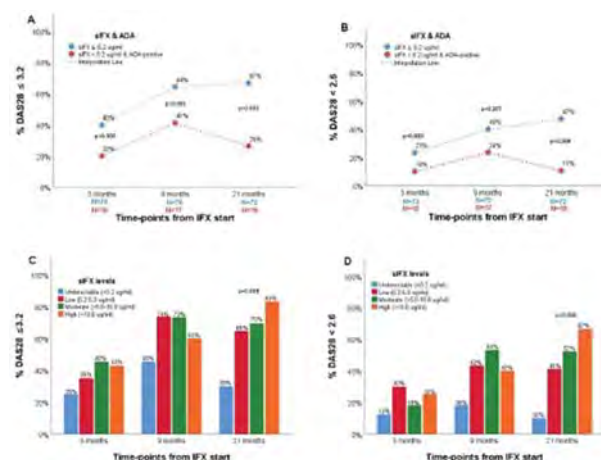

**Background:** Tumour necrosis factor (TNF) inhibitors, with infliximab (IFX) first on the market, have revolutionised treatment of patients with rheumatoid arthritis (RA). However, in a substantial proportion of patients, they lose efficiency, and up to 44% of patients have been found to develop anti-drug antibodies (ADA), leading to low serum IFX (sIFX) levels. Despite this, sIFX measurement is still rarely used for clinical decision making, and standardised clinical threshold titre levels have not been clearly defined.

**Objectives:** In an early RA trial adding IFX to methotrexate (MTX) in patients not achieving low disease activity (LDA=DAS28≤3.2) after 3 months monotherapy, we studied whether sIFX or ADA were associated with treatment outcome, and whether easily available baseline parameters predicted ADA development.

**Methods:** Of IFX-treated SWEFOT patients (n=128), 101 had available serum samples at follow-up, which were analysed for sIFX levels at 3, 9 and 21 months (routine ELISA). Samples with undetectable sIFX (<0.2 µg/ml) were analysed further for ADA using direct ELISA with plate-bound TNF. Primary and secondary outcome measures were LDA and remission (DAS28 <2.6) at 21 months. Clinical and demographic characteristics of patients at start of IFX therapy (baseline) were tested as potential predictors of ADA development, using uni- and multivariate logistic regression.

**Results:** At 3, 9 and 21 months from IFX add-on to MTX, 15%, 23% and 28% of patients, respectively, had undetectable sIFX, and 34% were ever ADA-positive. Significantly higher proportion of patients achieved LDA among those with detectable sIFX, versus undetectable sIFX and positive ADA (67% vs 26%, p=0.002, figure 1A), with similar difference for remission (47% vs 11%, p=0.004, figure 1B). When sIFX levels were further stratified into <0.2, 0.2–5.0, 5.0–10.0 and >10 µg/ml, there was a significant trend across the groups in achievement of LDA (30%, 65%, 70% and 83% respectively, p=0.008, figure 1C) or remission (10%; 41%, 52% and 67%, respectively, p=0.004, figure 1D). Women had undetectable sIFX at 21 months more often than men (35% vs 7%, p=0.006). In multivariate logistic regression analysis, the following baseline characteristics were significant

predictors of ever ADA-positivity: female gender, RF-positivity, higher tender joint count, erythrocyte sedimentation rate and lower health assessment questionnaire score (data not shown).

**Abstract OP0232** – Figure 1 Clinical outcome of patients at 3, 9 and 21 months stratified for sIFX and ADA status at the same time points. Proportion of patients in LDA (A) and remission (B) among patient with detectable sIFX level (blue dots) and ADA positive patients with undetectable sIFX levels (red dots). Proportion of patients in LDA (C) and remission (D) among four strata of patients according to sIFX levels undetectable (<0.2 µg/ml) – blue bars, low (0.2–5.0 µg/ml) – red bars, moderate (>5.0–10.0 µg/ml) – green bars, and high (>10.0 µg/ml) – orange bars.

**Conclusions:** In early RA patients receiving add-on IFX therapy, ADA-positivity or lower serum IFX levels were associated with a higher risk of not reaching treatment targets, that is LDA or remission. RF positivity and female gender, factors known to be associated with worse clinical outcomes, predicted development of ADA.

OP0233

#### LONG-TERM SAFETY OF ADALIMUMAB IN ADULT PATIENTS FROM GLOBAL CLINICAL TRIALS ACROSS MULTIPLE INDICATIONS: AN UPDATED ANALYSIS IN 29,987 PATIENTS REPRESENTING 56,951 PATIENT-YEARS

G. Burmester<sup>1</sup>, R. Panacchione<sup>2</sup>, K. Gordon<sup>3</sup>, J. Rosenbaum<sup>4</sup>, D. Arian<sup>5</sup>, W. Lau<sup>5</sup>, R. Tarzynski-Potempa<sup>5</sup>. <sup>1</sup>Charité – University Medicine Berlin, Berlin, Germany; <sup>2</sup>University of Calgary, Calgary, Canada; <sup>3</sup>Medical College of Wisconsin, Milwaukee; <sup>4</sup>Oregon Health and Science University and Legacy Devers Eye Institute, Portland; <sup>5</sup>AbbVie Inc., North Chicago, USA

**Background:** Adalimumab is an anti-tumour necrosis factor- $\alpha$  (TNF- $\alpha$ ) agent indicated for the treatment of immune-mediated diseases. The long-term safety of adalimumab was previously reported in 23 458 patients representing up to 12 years of clinical trial exposure in rheumatoid arthritis (RA), juvenile idiopathic arthritis, ankylosing spondylitis (AS), psoriatic arthritis (PsA), plaque psoriasis (Ps), and Crohn's disease (CD).

**Objectives:** Here we report an updated analysis examining the long-term safety of adalimumab in adult patients with RA, AS, non-radiographic axial spondyloarthritis (nr-axSpA), peripheral SpA (pSpA), PsA, Ps, hidradenitis suppurativa (HS), CD, ulcerative colitis (UC), and non-infectious uveitis (UV).

**Methods:** Here we report an updated analysis examining the long-term safety of adalimumab in adult patients with RA, AS, non-radiographic axial spondyloarthritis (nr-axSpA), peripheral SpA (pSpA), PsA, Ps, hidradenitis suppurativa (HS), CD, ulcerative colitis (UC), and non-infectious uveitis (UV).

**Results:** This analysis included 29 987 patients, representing 56 951 patient-years of exposure (table 2). The majority of adalimumab exposure was in RA studies. The most frequently reported SAE of interest was infection (highest incidences in CD, RA, UV, and UC). Overall and for most of the adalimumab populations (AS, PsA, Ps, UC, CD, and RA), the observed number of deaths was below what would be expected in an age- and sex-adjusted population (table 1). For HS, nr-axSpA, pSpA, and UV studies, the small size of these trials precluded accurate assessment of the standardised mortality ratio, and the 95% CIs all included 1.0.

**Abstract OP0233** – Table 1 Standardised mortality ratios across indications

Indication	SMR	95% CI
RA (n=15,511)	0.74	0.63–0.87
AS (n=2026)	0.14	0.00–0.77
nr-axSpA (n=863)	1.22	0.14–4.40
pSpA (n=165)	1.84	0.21–6.65
PsA (n=837)	0.34	0.04–1.24
Ps (n=3732)	0.34	0.15–0.64
HS (n=733)	1.50	0.40–3.84
CD (n=3896)	0.44	0.14–1.02
UC (n=1739)	0.37	0.12–0.87
UV (n=464)	1.23	0.45–2.68
Total (n=29,986)	0.65	0.57–0.74

\*Rates in events/100 PYs.  
†Total includes the 10 populations shown plus 20 patients with Behçet's disease (35.5 PY).  
‡Excludes oral candidiasis and tuberculosis.  
§Excludes lymphoma, hepatosplenic T-cell lymphoma, leukemia, NMSC, and melanoma.

**Conclusions:** This analysis of data from clinical trials of adalimumab demonstrated an overall safety profile consistent with previous findings and with the TNF inhibitor class. No new safety signals or tolerability issues with adalimumab treatment were identified and, for most indications, the mortality rate was below what would be expected in an age- and sex-adjusted population. Efficacy and safety data continue to support the well-established benefits of adalimumab for the approved indications.

**Clinical and therapeutic aspects of vasculitis**

**OP0234 INFLIXIMAB THERAPY IN PATIENTS WITH TAKAYASU ARTERITIS**

E.H. Park<sup>1</sup>, E.Y. Lee<sup>1</sup>, Y.J. Lee<sup>2</sup>, Y.J. Ha<sup>2</sup>, B.Y. Choi<sup>3</sup>, W.-H. Yoo<sup>4</sup>, J.C. Paeng<sup>5</sup>, H. Y. Suh<sup>5</sup>, J.S. Park<sup>6</sup>, S. Shon<sup>6</sup>, Y.W. Song<sup>1</sup>. <sup>1</sup>Department of Internal Medicine (Division of Rheumatology), Seoul National University Hospital, Seoul; <sup>2</sup>Department of Internal Medicine (Division of Rheumatology), Seoul National University Bundang Hospital, Seongnam; <sup>3</sup>Department of Internal Medicine (Division of Rheumatology), Seoul Medical Center, Seoul; <sup>4</sup>Department of Internal Medicine (Division of Rheumatology), Chonbuk National University, Jeonju; <sup>5</sup>Department of Nuclear Medicine, Seoul National University Hospital; <sup>6</sup>Department of Molecular Medicine and Biopharmaceutical Sciences, Graduate School of Convergence Science and Technology, and College of Medicine, Seoul National University, Seoul, Korea, Republic Of

**Background:** Takayasu arteritis (TAK) is a chronic inflammatory disease that predominantly affects the aorta and its main branches. Glucocorticoids (GCs) are the cornerstones of the initial treatment of TAK. However, most patients relapse with steroid withdrawal.

**Objectives:** To evaluate the efficacy and safety of infliximab (IFX) in Korean patients with active TAK.

**Methods:** Patients with active TAK were enrolled in a single-centre prospective open label trial. Active disease was defined according to the National Institutes of Health (NIH) criteria. Concomitant GCs were tapered to prednisone ≤10 mg/day or equivalent at 2 weeks prior to the initiation of IFX. Patients received intravenous infusions of IFX, at a starting dose of 5 mg/kg at weeks 0, 2, 6, and then every 8 weeks, up to week 46, and were followed up to week 54. At week 30, patients with partial remission received increased dose of IFX by 1.5 mg/kg, and patients who failed with IFX terminated the study. At week 38 and 46, patients with symptom of active disease or high serum level of erythrocyte sedimentation rate (ESR) or C-reactive protein (CRP), were instructed to increase the IFX dose by 1.5 mg/kg, up to 9.5 mg/kg, at each point. All the patients underwent Positron Emission Tomography-Computed Tomography (PET-CT) at baseline and week 30. The primary efficacy end point was the achievement of partial or complete remission at week 30.

**Results:** Twelve patients with TAK were enrolled and treated with IFX; 1 patient with study violation was excluded from analysis. At week 30, 3 patients (27.3%) achieved complete remission and 6 patients (54.5%) achieved partial remission. Statistically significant improvements were seen at week 30 for all of major secondary measures, including change from baseline in Indian Takayasu Clinical Activity Score 2010 ITAS 2010 (median 11.0, interquartile range [IQR] 10.0–11.8; 6.0, IQR 5.0–9.0, p=0.004), ITAS.A (14.0, IQR 12.0–14.0; 7.0, IQR 6.0–10.5, p=0.003) and serum levels of ESR (56.0, IQR 44.0–82.5; 26.0, IQR 20.0–56.5, p=0.031) and CRP (1.3, IQR 0.7–2.6; 0.2, IQR 0.1–2.1, p=0.019). PET parameters were significantly reduced, including maximum standardised uptake value (3.50, IQR 3.10–3.84; 3.10, IQR 2.49–3.27, p=0.023), target-to-vein ratio (1.34, IQR 1.13–1.95; 1.31, IQR 1.05–1.45, p=0.032), and target-to-liver ratio (2.38, IQR 1.47–3.05; 1.92, IQR 1.51–2.18, p=0.014) from baseline to week 30. Serum levels of pentraxin-3, soluble human leukocyte antigen-E (sHLA-E), interleukin-6 tended to decrease, while tumour necrosis factor-α level increased after IFX therapy. There were no serious adverse events (SAEs) or AEs necessitating discontinuation of IFX.

**Conclusions:** Treatment with IFX may lead to remission or improvement with lower glucocorticoid requirement in TAK (clinicaltrials.gov NCT02457585).

OP0235

### INTERFERON-FREE ANTIVIRALS FOR HEPATITIS C VIRUS-ASSOCIATED CRYOGLOBULINEMIA VASCULITIS: A LONG-TERM FOLLOW-UP STUDY

P. Cacoub<sup>1</sup>, S.N. Si Ahmed<sup>2</sup>, Y. ferfar<sup>1</sup>, S. Pol<sup>3</sup>, D. Thabut<sup>1</sup>, C. Hezode<sup>4</sup>, L. Alric<sup>5</sup>, C. Comarmond<sup>1</sup>, G. Ragab<sup>6</sup>, L. Quattuocio<sup>7</sup>, M. Hegazy<sup>6</sup>, T. Poynard<sup>1</sup>, M. Resche Rigon<sup>8</sup>, D. Saadoun<sup>1</sup>. <sup>1</sup>Hôpital Pitié Salpêtrière, Paris; <sup>2</sup>CH Orleans, Orleans; <sup>3</sup>Hôpital Cochin, PARIS; <sup>4</sup>Hôpital H Mondor, Creteil; <sup>5</sup>CH Purpan, Toulouse, France; <sup>6</sup>Cairo university, Cairo, Egypt; <sup>7</sup>University Hospital Udine, Udine, Italy; <sup>8</sup>Hôpital Saint Louis, Paris, France

**Background:** In small-size and short term studies of hepatitis C virus (HCV)-cryoglobulinemia vasculitis (CryoVas), direct antiviral agents (DAAs) showed a better response rate and tolerance than interferon containing regimens.

**Objectives:** To evaluate the effectiveness and tolerance of all oral interferon-free DAA in a large CryoVas cohort with long-term follow-up.

**Methods:** This prospective international multicenter cohort study included 148 symptomatic HCV-CryoVas patients (53.7% with cirrhosis and 49.3% antiviral-naïve). They all received DAA, i.e. sofosbuvir (SOF) plus daclatasvir (n=53), SOF plus ribavirin (n=51), SOF plus ledipasvir (n=23), or SOF plus simeprevir (n=18), for 12 or 24 weeks. The primary endpoint was the clinical response of CryoVas symptoms at week 12 after stopping DAAs.

**Results:** 106 (72.6%) patients showed a complete response, 33 (22.6%) a partial response and 7 (4.8%) no response of CryoVas symptoms. Cryoglobulinemia was no longer found in 53.1%. A sustained virological response was obtained in 97.2%. Premature DAA withdrawal was noted in 4.1%. Two factors were associated with a poor response: a severe form of CryoVas [OR 0.33, 95% CI: 0.12 to 0.91; p=0.03] and peripheral neuropathy [OR 0.31, 95% CI: 0.11 to 0.84; p=0.02]. After a median follow-up of 15.3 months, 4 (2.8%) patients died. The final clearance rates of CryoVas manifestations were as follows: purpura (97.2%), renal involvement (91.5%), arthralgia (85.7%), neuropathy (77.1%) and cryoglobulinemia (53.8%). Only SOF plus ledipasvir regimen showed significant superiority [OR 4.09, 95% CI: 1.19 to 19.00; p=0.04].

**Conclusions:** The different DAA combinations showed high response rates of HCV-CryoVas symptoms. The tolerance was good, and the mortality rate was very low. We identified prognosis factors of response to DAA.

OP0236

### RISK OF CARDIOVASCULAR DISEASE AND VENOUS THROMBOEMBOLISM AMONG PATIENTS WITH INCIDENT ANCA-ASSOCIATED VASCULITIS: A 20 YEAR POPULATION-BASED COHORT STUDY

A. Berti<sup>1,2</sup>, E. Matteson<sup>3</sup>, C.S. Crowson<sup>3</sup>, U. Specks<sup>4</sup>, D. Corne<sup>5</sup>. <sup>1</sup>Unit of Immunology, Rheumatology, Allergy and Rare Diseases, IRCCS San Raffaele Scientific Institute, Milan; <sup>2</sup>Rheumatology Clinic, Santa Chiara Hospital, Trento, Italy; <sup>3</sup>Division of Rheumatology; <sup>4</sup>Division of Pulmonary and Critical Care Medicine, Mayo Clinic, Rochester, USA; <sup>5</sup>Lymphocytes B et Autoimmunité, Université de Bretagne Occidentale, Brest, France

**Background:** Although modern treatments have greatly improved survival in ANCA-associated vasculitis (AAV), many patients suffer cardiovascular and thrombotic complications during long-term follow up.

**Objectives:** We aimed to assess the cardiovascular disease (CVD) and venous thromboembolism (VTE) risks among patients with newly diagnosed AAV.

**Methods:** A population-based incident AAV cohort of 58 patients diagnosed between 1996 and 2015 in Olmsted County (Minnesota, USA) was identified by medical record review. For each patient, 3 age- and sex-matched non-AAV comparators were randomly selected from the same population and assigned an index date corresponding to the AAV incidence date. Medical records of cases and comparators were reviewed for CVD events, which included cardiac events (coronary artery disease, heart failure and atrial fibrillation), cerebrovascular accidents (CVA), peripheral vascular disease (PVD) and VTE, which included deep vein thrombosis (DVT) and pulmonary embolism (PE).

**Results:** Baseline total cholesterol, high-density lipoprotein and current smoking rate were lower in AAV than comparators (p=0.03, p=0.01 and p=0.04, respectively), while other CVD risk factors and Framingham risk score were not significantly different between the 2 groups. CVD events developed in 13 patients and

17 comparators, corresponding to a >3 fold increased risk (hazard ratio [HR] 3.15; 95% confidence interval [CI]: 1.51–6.57) (figure 1). By subtypes, risks were increased for cardiac events (HR 2.96, 95% CI: 1.42 to 6.15) and CVA (HR 8.16, 95% CI: 2.45 to 27.15), but not for PVD. The HR for VTE was 3.26 (95% CI: 0.84 to 12.60), significantly increased for DVT (HR 6.25, 95% CI: 1.16 to 33.60), but not for PE (HR 1.33, 95% CI: 0.23 to 7.54).

**Conclusions:** Despite a similar prevalence of CVD risk factors at baseline, the risk of CVD is >3 fold higher and for CVA 8-fold higher in patients with incident AAV than matched comparator subjects.

OP0237

### A COMPARISON OF PK AND PD OUTCOMES OF TOCILIZUMAB IN GIANT CELL ARTERITIS AFTER SC AND IV DOSING

N.L. Mallatieu<sup>1</sup>, J.H. Stone<sup>2</sup>, P. Villiger<sup>3</sup>, M. Klearman<sup>4</sup>, L. Brockwell<sup>5</sup>, S. Dimonaco<sup>5</sup>, J.E. Charion<sup>6</sup>. <sup>1</sup>Roche Innovation Ctr, New York; <sup>2</sup>Massachusetts Gen Hosp Rheumatol Unit, Harvard Med School, Boston, USA; <sup>3</sup>Dept Rheumatology, Immunology and Allergy, U Bern, Bern, Switzerland; <sup>4</sup>Genentech, South San Francisco, USA; <sup>5</sup>Roche Products Ltd, Welwyn Garden City, UK; <sup>6</sup>Roche Innovation Ctr, Basel, Switzerland

**Background:** Tocilizumab (TCZ), a humanised anti-interleukin-6 (IL-6) receptor monoclonal antibody, was recently approved for the treatment of patients with giant cell arteritis (GCA). Evidence was based on results of a double-blind randomised controlled trial (RCT) in GCA patients given 162 mg TCZ either weekly (QW) or every other week (Q2W) via subcutaneous (SC) route (GiACTA trial<sup>1</sup>). A second RCT conducted using 8 mg/kg TCZ given intravenously (IV) every 4 weeks (Q4W) also showed positive outcomes in GCA patients.<sup>2</sup> The double-blind dosing portion of each study lasted approximately 1 year. All three regimens (SC 162 mg QW, SC 162 mg Q2W, IV 8 mg/kg Q4W) resulted in positive outcomes for sustained remission of GCA. However, a higher benefit was noted in some key secondary efficacy outcomes with the QW vs the Q2W SC regimen.<sup>1</sup>

**Objectives:** To characterise the pharmacokinetics (PK) of TCZ in the GCA population and to assess the impact of the exposure differential from the three regimens on pharmacodynamic (PD) markers.

**Methods:** TCZ levels and PD biomarkers (soluble IL-6 receptor [sIL-6R], IL-6, erythrocyte sedimentation rate [ESR], and C-reactive protein [CRP]) were measured using validated assays at regular intervals throughout the dosing period from all patients in each trial. A comparison of PK and PD outcomes was conducted to understand the dose exposure–response relationships.

**Results:** At week 52, mean trough steady state exposure (C<sub>trough</sub>), a primary PK driver of TCZ efficacy, was highest from SC 162 mg QW, followed by IV 8 mg/kg Q4W, and finally SC Q2W (figure 1). Of the PD end points, at week 52, sIL-6R levels were similar for the SC QW and IV regimens but lower for the SC Q2W regimen

(figure 1), possibly demonstrating a higher level of target engagement from the SC QW and IV regimens compared with the Q2W regimen. IL-6 levels increased vs baseline after TCZ administration for all three regimens, reflecting displacement of bound, endogenous IL-6 from its receptor, consistent with the mechanism of action of TCZ. ESR levels decreased to a similar extent in response to TCZ administration with all three regimens. Change from baseline in CRP was comparable between the two SC regimens (~79%–93% reduction from baseline from the QW and Q2W regimens, respectively). Quantitative changes in CRP values are not available for the IV study.

**Abstract OP0237** – Figure 1 Mean (SD) baseline and week 52 PK/PD markers after chronic dosing with TCZ after IV and SC regimens in GCA patients.

**Conclusions:** Comparison of  $C_{trough}$  after 52 weeks of dosing with TCZ from the 8 mg/kg IV regimen with that obtained from two SC regimens showed that exposures from the IV regimen were within the range of exposures of the QW and Q2W regimens. Comparison of PD outcomes showed that all three regimens had comparable results, with the possible exception of lower levels of sIL-6R (a mechanistic marker reflecting serum concentration and target engagement) from the SC Q2W regimen. Comparability of PD results is consistent with the similar efficacy outcomes seen in the SC and IV trials.

#### OP0238

### ASSOCIATION BETWEEN AGE AT DIAGNOSIS AND CLINICAL PRESENTATION AND OUTCOMES OF ANCA-ASSOCIATED VASCULITIS. ANALYSIS FROM THE DCVAS STUDY

S.Monti<sup>1,2</sup>, A. Craven<sup>3</sup>, C. Klersy<sup>4</sup>, C. Montecucco<sup>2</sup>, R. Caporali<sup>2</sup>, R. Watts<sup>5</sup>, P. A. Merkel<sup>6</sup>, R. Luqmani<sup>3</sup>. <sup>1</sup>University of Pavia, PhD in Experimental Medicine; <sup>2</sup>Rheumatology, IRCCS Policlinico S. Matteo Foundation, Pavia, Italy; <sup>3</sup>Rheumatology, NDORMS, University of Oxford, Oxford, UK; <sup>4</sup>Biometry and Clinical Epidemiology, IRCCS Policlinico S. Matteo Foundation, Pavia, Italy; <sup>5</sup>Norwich Medical School, University of East Anglia, Norwich, UK; <sup>6</sup>Rheumatology and Department of Biostatistics, Epidemiology, and Informatics, University of Pennsylvania, Philadelphia, PA, USA

**Background:** ANCA-associated vasculitis (AAV) can affect all age groups. Nevertheless, the differences in disease presentation and outcome between younger and elderly-onset patients are still incompletely understood.<sup>2</sup>

**Objectives:** To identify distinguishing characteristics of clinical presentations, short-term outcomes and accumulated damage for AAV, based on age of disease onset.

**Methods:** We included patients with a final diagnosis of AAV: granulomatosis with polyangiitis (GPA), microscopic polyangiitis (MPA), eosinophilic granulomatosis with polyangiitis (EGPA) enrolled in The Diagnostic and Classification Criteria for Primary Systemic Vasculitis (DCVAS) study through May 2017. We divided the population according to age at diagnosis: <65 years old (group A) or ≥65 (group B).

**Results:** We included 1338 patients. 66% had a disease onset <65 years of age (male:50%; mean age 48.4±12.6 years); 34% had an elderly-onset (male: 46%; mean age 73.6±6). The diagnoses of GPA and EGPA were more frequent in group A (73% and 74% of patients, respectively) compared to MPA (56%),  $p<0.001$  for comparisons within each diagnostic group. P-ANCA/anti-MPO positivity was more frequent in group B (48% vs 27%,  $p=0.001$ ); c-ANCA/PR3

predominated in group A (48% vs 35%;  $p<0.001$ ). The clinical presentation at onset significantly differed between the two groups. Patients from group A had higher rates of ocular, cutaneous, and musculoskeletal involvement compared to patients in group B who experienced more systemic, renal, cardiovascular, and neurological manifestations (figure 1). Pulmonary and gastrointestinal manifestations were equally distributed between the two age groups. Vasculitis Damage Index (VDI) was significantly higher in patients from group B, with 12% of patients with a 6 months VDI score ≥5, compared to 7% in group A;  $p=0.01$ . There were 13 (1.5%) deaths amongst patients belonging to group A compared to 22 (4.8%) in group B, HR 3.44 (1.65–7.18);  $p=0.001$ .

**Abstract OP0238** – Table 1. Clinical characteristics and outcome according to age groups

	Group A (<65 years) n=878	Group B (≥65 years) n=460	p
Mean Age	48.4±12.6	73.6±6	<0.001
Diagnostic delay	14.6±34.4	11.8±32.2	0.036
Symptoms duration	19.9±35.1	18.1±33.1	0.145
<b>Type of AAV:</b>			
GPA	536 (61%)	199 (43%)	<0.001
EGPA	148 (17%)	186 (40%)	<0.001
MPA	189 (22%)	66 (14%)	0.004
p-ANCA/anti-MPO	240 (27%)	222 (48%)	0.001
c-ANCA/anti-PR3	421 (48%)	161 (35%)	<0.001
<b>VDI at 6 months follow-up</b>			
=0	236 (28%)	90 (22%)	base
=1/2	378 (44%)	184 (41%)	0.186
=3/4	187 (22%)	116 (26%)	0.010
≥5	57 (7%)	55 (12%)	0.001

**Conclusions:** Patients with AAV with elderly-onset disease display a different pattern of organ-involvement and an increased risk of significant damage and mortality compared to younger patients. A better understanding of the influence of age of onset on the clinical course of AAV could improve diagnostic and classification criteria and has implications on their pattern of presentation and subsequent clinical course.

#### OP0239

### PREGNANCY OUTCOMES IN PATIENTS WITH IGA VASCULITIS

J.Nossen<sup>1,2</sup>, W. Raymond<sup>2</sup>, H. Keen<sup>2,3</sup>, C. Inderjeeth<sup>1,2</sup>, D. Preen<sup>4</sup>. <sup>1</sup>Rheumatology, Sir Charles Gairdner Hospital, Nedlands; <sup>2</sup>Rheumatology, School of Medicine, University of Western Australia, Crawley; <sup>3</sup>Rheumatology, Fiona Stanley Hospital, Murdoch; <sup>4</sup>School of Population and Global Health, University of Western Australia, Crawley, Australia

**Background:** IgA vasculitis (IgAV) is usually a self-limiting condition, but women with a history of IgAV are reported to have an increased risk of complications during pregnancy. There is however little international data regarding obstetric outcomes and risk factors for IgAV patients<sup>1</sup>.

**Objectives:** To compare pregnancy outcomes between matched controls and patients hospitalised for IgA vasculitis in Western Australia (WA), where birth centres attached to public hospitals are the principal source for delivery of free midwifery-led care.

**Methods:** Cohort study of IgAV patients (ICD-9-CM 287.0/ICD-10-AM D69.0) using non-exposed age-matched controls (1:3), where pregnancy-related events and outcomes (see table 1 for ICD codes) were extracted from state-wide hospital morbidity data for period 1980 to 2015. Results are presented as odds ratios (95% CI) versus controls.

**Results:** Pregnancy-related contacts (n=1,440) occurred in 49.5% of all female IgAV patients (n=347) and in 37% of all female controls (n=914). IgAV patients were younger at first pregnancy (23.7 vs 26.4 years, p<0.01) and had a higher overall mean number of hospital pregnancy contacts than controls (5.4 vs 3.1, p<0.001). IgAV patients experienced 168 uncomplicated live births, 93 complicated (including preterm) deliveries and 32 abortive pregnancies. The risk for abortion (OR 1.3, CI: 0.7 to 2.3), complicated delivery (OR 0.9, CI: 0.7 to 1.3) or classification as high-risk pregnancy (OR 0.94, CI: 0.74 to 1.24) was similar for IgAV patients compared to controls, despite a higher risk of hypertensive disorders (OR 4.4 CI:1–9.1).

**Abstract OP0239 – Table 1.** Diagnostic codes used for data extraction from health registries

Definition	ICD9 codes	ICD10 codes
Any pregnancy event	630–80, V22–V24, V27, V30–V40	O00–O85, Z33–Z35, Z37–Z39
Normal delivery healthy child	650.1–9	O80.1–9
Complicated delivery	652–670	O81–O85
Abortive outcome	630–640, 656.4	O00–O08.9, Z33.2
High risk pregnancy	V23–V24	O09–O09.9
Hypertension in pregnancy	642–643	O10–O15.9

**Conclusions:** In this large population-based longitudinal study, the risk for abortion or complicated pregnancies/deliveries was not increased for IgAV patients. The more frequent hospital contacts and increased risk of hypertension during pregnancy in IgAV patients had little impact on pregnancy outcome.

#### OP0240 FAVOURABLE LONGTERM OUTCOME IN PATIENTS WITH GIANT CELL ARTERITIS TREATED WITH TOCILIZUMAB. REAL LIFE DATA FROM A SWISS CENTRE

A. Rubbert-Roth, T. Neumann, P. Rein, H. Prillwitz, J. von Kempis. *Klinik für Rheumatologie, Kantonsspital St Gallen, St Gallen, Switzerland*

**Background:** Tocilizumab (TCZ) has been shown to be effective for achieving sustained glucocorticoid (GC)-free remission in patients with giant cell arteritis (GCA) <sup>1,2</sup>. However, data on real life patients and longterm follow up is still limited.

**Methods:** We included all patients with GCA or polymyalgia treated with TCZ iv (8 mg/kg/month) in our division from 1/2013 to 1/2018. Safety and efficacy were analysed retrospectively.

**Results:** 42 patients were analysed (69% female). Patients with involvement of cranial vessels (n=20) were older than patients without cranial involvement (n=16) (72.8±6.4 vs 63.2±10.3 years, p=0.05). Initially, 9 patients had AION, vascular stenosis was detected in 10 and aneurysms in 9 patients.

Initial vascular imaging included MR/CT angiography in 36 and 14 patients, ultrasound in 23 patients and PET CT in 8 patients.

Mean duration of TCZ therapy was 18.2±9.6 months with treatment ongoing in 33 patients. Since 2013, the time between diagnosis and initiation of TCZ as well as the number of immunosuppressants before TCZ decreased. All patients initially received iv methylprednisolone followed by standard oral tapering of prednisone starting with 1 mg/kg/d. PMR patients were started on oral GC. Low dose ASS or oral anticoagulants were used in 83% and statins in 55% of GCA patients.

Before the first RCT of TCZ in GCA was reported<sup>3</sup>, TCZ was initiated in 25 patients after failure of conventional immunosuppressives after a mean disease duration of 12.7±11.2 months. TCZ was started after failure of one immunosuppressant in 19/25 patients, 6/25 patients failed to at least 2 immunosuppressants. Since 12/2015, 17 patients were started on TCZ with a significantly shorter disease duration

(mean 4.1±5.4 months) (p=0.0047). 14/17 patients received TCZ after GC alone, in only 3 patients MTX was used before TCZ.

GC free remission was achieved in 24/33 patients (73%) with ongoing TCZ treatment. GC free and TCZ free remission was achieved in 6 patients only (4/6 PMR, 2/36 patients with GCA). Therefore, a favourable outcome was noted in 30/42 patients (76.2%). In 12 patients, TCZ was stopped in patients with GC free remission. 3/11 patients relapsed after 11, 11 and 3 months and responded to reinitiation of TCZ and GC, all achieving GC free remission again. 3 GCA patients stopped TCZ in GC free remission, but died of vascular complications during follow-up.

Infections during TCZ treatment included 2 patients who developed herpes zoster, one patient with RSV pneumonia and one patient with bronchitis, all occurring within the first 6 months of TCZ treatment and during concomitant GC therapy (9.5%). TCZ was reinitiated in all of these patients without subsequent complications. 3 patients developed ischaemic vascular complications (7.1%) during treatment with TCZ: 1 patient with cerebral infarction and 2 patients developed progressive vascular stenosis.

**Conclusions:** TCZ resulted in GC free remission in 76% of patients. Unfavourable events were limited to infections and vascular complications. However, sustained remission without TCZ was observed infrequently and was mainly limited to patients with PMR. Our data suggest that patients with GCA benefit from continuous treatment with TCZ.

#### Background:

**Objectives:** We report the long term outcome of 46 TA patients treated with tocilizumab, describe the factors of response and compare the vascular event free survival to DMARDS.

**Methods:** retrospective nationwide french study

**Results:** We observed a decrease in the NIH scale; in C-reactive protein levels and in daily prednisone dose at 3 and 6 months, respectively; p<0.0001) under tocilizumab. The overall tocilizumab failure free survival was 81% [95% CI: 0.7 to 0.95], 72% [95% CI: 0.55 to 0.95] and 48% [95% CI: 0.2 to 0.1] at 12, 24 and at 48 months, respectively. The presence of constitutional symptoms at the time of tocilizumab initiation (hazard ratio 5.6 [95% CI: 1.08 to 29], p=0.041), C-reactive protein level (hazard ratio 1.16 [95% CI: 1.01 to 1.31] for every 10 mg/L, p=0.003) were significantly associated with tocilizumab-failure-free survival. The incidence of vascular complications of TA decreased significantly under tocilizumab compared to DMARDS therapy.

**Conclusions:** This nationwide study shows that tocilizumab may reduce the incidence of vascular complications in TA.

FRIDAY, 15 JUNE 2018

## Axial spondyloarthritis: on the interface between healthy and diseased

OP0242 **FATTY LESIONS DETECTED ON MRI SCANS IN PATIENTS WITH ANKYLOSING SPONDYLITIS ARE BASED ON THE DEPOSITION OF FAT IN THE VERTEBRAL BONE MARROW**

X. Baraliakos<sup>1</sup>, H. Boehm<sup>2</sup>, A. Samir Barakat<sup>3</sup>, G. Schett<sup>4</sup>, J. Braun<sup>1</sup>.  
<sup>1</sup>Rheumazentrum Ruhrgebiet, Herne; <sup>2</sup>Clinic for spinal surgery, Zentralklinik, Bad Berka, Germany; <sup>3</sup>Orthopedic and Traumatology Department, Cairo University, Cairo, Egypt; <sup>4</sup>Med. Klinik 3, Friedrich Alexander University Erlangen-Nuremberg, Erlangen, Germany

**Background:** Fatty lesions (FL), similar to bone marrow oedema (BME) and sclerosis (SCL), are characteristic findings in MRI examinations of patients with ankylosing spondylitis (AS) and degenerative disc disease (DDD). It has recently been shown that FL are associated with syndesmophyte formation in AS. The anatomic correlate of FL has not been studied to date. Current assumptions are solely based on non-invasive data.

**Objectives:** To examine the cellular composition of FL in the edges of vertebral bodies of patients with AS or DDD by histology.

**Methods:** Patients with AS or DDD undergoing planned kyphosis correction surgery by spinal osteotomy (in AS) or surgery to correct spinal stenosis (in DDD) were included into this biopsy study. The spinal surgeon (HB) took all biopsies mainly in the area close to the vertebral edge in many of which FL had been seen by MRI (figure 1a for AS and 1b for DDD). Biopsies were decalcified, embedded in paraffin, cut and stained by hematoxylin and eosin. The marrow composition was analysed and the cellularity graded (% surface area) by two different investigators blinded to patients' diagnosis. Four different marrow compositions could be differentiated: (i) fat, (ii) fibrosis, (iii) inflammation and (iv) hematopoiesis (normal).

**Results:** A total of 60 biopsies mostly obtained from the lower thoracic spine and the lumbar spine of 21 AS patients (mean age 51.7 years, mean disease duration 24.6 years) and of the lumbar spine in 18 DDD patients (mean age 60.1 years) were available. On the patient level, the histological appearance of MRI-FL was different between the groups: fat marrow was present in biopsies of 19 AS (90%) but in only 5 DDD (28%) patients. Inflammatory marrow changes, resembling mononuclear infiltrates, were found in 8 AS (38.1%) and 14 DDD (77.8%) patients at areas with concomitant FL and BME on MRI, while marrow fibrosis was seen in 6 AS (28.6%) and 4 DDD (22.2%) patients at areas with concomitant FL and SCL on MRI. In the semiquantitative histopathological analysis, the mean distribution ( $\pm$ standard deviation) of the various bone marrow tissue types in the biopsies differed between the AS vs DD in a similar way, with 43% ( $\pm$ 26.3%) vs 16% ( $\pm$ 30.3%) for fatty marrow, 11% ( $\pm$ 15.5%) vs 55% ( $\pm$ 42%) for inflammatory marrow and 9% ( $\pm$ 16.1%) vs 13% ( $\pm$ 27.8%) for fibrotic marrow, respectively.

**Conclusions:** The presence of FL on MRI corresponds to fat deposition in the bone marrow of patients with advanced AS. These data show that the MRI change termed 'fatty lesion' is indeed based on the deposition of fat in the vertebral bone marrow in AS. Since vertebral bone marrow is physiologically harbouring hematopoiesis, AS seems to lead to a change in the bone marrow microenvironment with local disruption of hematopoiesis and replacement by fat. The link between fat and new bone formation should be studied in earlier disease stages.

**DOI:** 10.1136/annrheumdis-2018-eular.7152

OP0243 **PREVALENCE OF INFLAMMATORY AND CHRONIC CHANGES SUGGESTIVE OF AXIAL SPONDYLOARTHRITIS IN MAGNETIC RESONANCE IMAGES OF THE AXIAL SKELETON IN INDIVIDUALS <45 YEARS IN THE GENERAL POPULATION AS PART OF A LARGE COMMUNITY STUDY (SHIP)**

X. Baraliakos<sup>1</sup>, D. Feldmann<sup>1</sup>, A. Ott<sup>1</sup>, C.O. Schmidt<sup>2</sup>, M. Albers<sup>2</sup>, A. Richter<sup>2</sup>, J. Braun<sup>1</sup>. <sup>1</sup>Rheumazentrum Ruhrgebiet, Herne; <sup>2</sup>Institute for Community Medicine, University of Greifswald, Greifswald, Germany

**Background:** Magnetic resonance imaging (MRI) is crucial for classification and diagnosis of axial spondyloarthritis (axSpA). Characteristic MRI lesions of axSpA are bone marrow oedema (BME) or structural fatty lesions (FL) of the sacroiliac joints (SIJ) and spine. However, the specificity of these lesions has been questioned, since patients with chronic back pain but no axSpA may also have a positive MRI, as shown in recent cohort studies.

**Objectives:** To investigate the prevalence of BME and FL on MRI of the spine and the SIJ in the general population.

**Methods:** Volunteers <45 years of the population based Study of Health in Pomerania (SHIP)<sup>1,2</sup> underwent MRI examinations of the spine (sagittal orientation, T1 and T2 MRI sequences) and the SIJ (coronal orientation, STIR sequences), independently of clinical symptoms. Two trained readers blinded for age and gender of the examined persons evaluated the prevalence of BME (SIJ and spine) and FL (spine) suggestive of axSpA using the ASAS definitions: a lesion in the SIJ was considered positive if located periarticularly and in the middle part of the joint and a lesion in the spine was considered positive if detected at the edge of the vertebral body). Clearly degenerative lesions involving the vertebral endplate or being accompanied by abnormalities of the intervertebral disc (protrusion or prolapse) were not counted.

**Results:** A total of 802 complete MRI sets (spine and SIJ) of 394 male (49.1%) and 408 female volunteers (50.9%) was evaluated. The mean age of all patients was 37.5 $\pm$ 6.2 years. BME in the SIJ suggestive of axSpA were found in 144 individuals (18%), with an equal distribution between males (n=74, 18.8%) and females (n=70, 17.2%). A similar pattern of BME was found in the spine, again with no differences between males and females. However, the location of the lesions was different: 9.5% had  $\geq$ 1 lesion in the cervical, 18.6% in the thoracic and 7.4% in the lumbar spine. Overall, 88.6% male and 84.6% female volunteers were found to have  $\geq$ 1% and 54.6% male and 46.1% female volunteers were found to have at  $\geq$ 3 positive spinal lesions in any spinal region. In comparison, the prevalence of FL was higher (36.7% volunteers in the cervical, 72.4% in the thoracic and 52.7% in the lumbar spine). Overall, 86.5% volunteers were found to have  $\geq$ 1% and 50.2% volunteers were found to have  $\geq$ 3 positive spinal lesions in any spinal segment.

Logistic regression analysis showed that age was the only demographic characteristic that independently contributed to the occurrence of both BME (RR=1.22, 95% CI: 1.03 to 1.46, p<0.025) or FL (RR=1.12, 95% CI: 1.07 to 1.19, p<0.001).

**Conclusions:** In this large population-based study with healthy volunteers a relatively high prevalence of inflammatory and structural MRI lesions was found. Whether these lesions are to be explained by mechanical stress needs to be further studied. The high prevalence of BME and FL in the axial skeleton in the general population indicates a limited diagnostic value of these MRI findings. Thus, those should be interpreted with caution in relation to diagnosis, classification and assessment of disease activity.

Ramonda<sup>6</sup>, D. Baeten<sup>7</sup>, D. van der Heijde<sup>3</sup>, A. Weel<sup>4</sup>, R. Landewé<sup>7,8</sup>. <sup>1</sup>Department of Clinical Immunology and Rheumatology, Amsterdam Rheumatology and Immunology Center, Academic Medical Center/ University of Amsterdam, Amsterdam, Netherlands; <sup>2</sup>Department of Rheumatology, VIB Inflammation Research Center, Ghent University, Ghent, Belgium; <sup>3</sup>Department of Rheumatology, Leiden University Medical Center, Leiden; <sup>4</sup>Department of Rheumatology, Maasstad Ziekenhuis, Rotterdam, Netherlands; <sup>5</sup>Department of Rheumatology, Diakonhjemmet Hospital, Oslo, Norway; <sup>6</sup>Department of Rheumatology, University of Padua, Padua, Italy; <sup>7</sup>Department of Clinical Immunology and Rheumatology, AMC, Amsterdam; <sup>8</sup>Department of Rheumatology, Zuyderland Medical Center, Heerlen, Netherlands

**Background:** Inflammation shown on MRI of the sacroiliac joint (MRI-SI) is prevalent in axSpA (±30%) but the specificity is not well known.  
**Objectives:** To compare MRI of the sacroiliac joints (MRI-SI) of healthy, symptomless individuals and those with known mechanical strain acting upon SI joints to axial spondyloarthritis (axSpA) and chronic back pain (CBP) patients.  
**Methods:** Three trained, calibrated and blinded readers randomly scored MRI-SI of 172 subjects: 47 healthy individuals without current/past back pain; 47 axSpA patients from the SPondyloArthritis Caught Early (SPACE) cohort (with a previously confirmed positive MRI-SI); 47 CBP controls (irrespective of MRI-SI results) from the SPACE cohort; 7 women with postpartum back pain; and 24 frequent runners. Readers scored according to the ASAS definition and SPARCC score.  
**Results:** Of the 47 healthy volunteers, 11 (23.4%) had a positive MRI-SI, compared to 43 of 47 (91.5%) positive axSpA patients and 3 of 47 (6.4%) CBP patients. Of the runners, 3 of 24 (12.5%) and of the women with postpartum back pain 4 of 7 (57.1%) had a positive MRI-SI. Using a SPARCC cut-off of ≥2 for positivity, 12/47 and healthy volunteers (25.5%), 46/47 positive axSpA patients (97.9%), 5/47 CBP controls (10.6%), 4/24 runners (16.7%) and 4/7 women with postpartum back pain (57.1%) were positive. 'Deep' BME-lesions were not found in healthy volunteers, CBP patients and runners, but in 38 of 47 positive axSpA patients (80.9%) and in 1 of 7 women with postpartum back pain (14.3%).

**Conclusions:** A substantial proportion of healthy individuals without current/past back pain has a positive MRI-SI according to the ASAS definition. Deep (extensive) BME lesions are exclusively found in axSpA patients.

**OP0245 ABILITY OF MRI OF THE SACROILIAC JOINTS TO DIFFERENTIATE PATIENTS WITH AXIAL SPONDYLOARTHRITIS FROM WOMEN, WHO HAVE GIVEN BIRTH, PATIENTS WITH DISC HERNIATION, PERSONS WITH HARD PHYSICAL WORK, LONG-DISTANCE RUNNERS AND HEALTHY MALES**

S. Seven<sup>1</sup>, P. Hededal<sup>1</sup>, M. Østergaard<sup>1</sup>, L. Morsel-Carlsen<sup>1</sup>, I.J. Sørensen<sup>1</sup>, B. Bonde<sup>2</sup>, G. Thamsborg<sup>1</sup>, O. Hendricks<sup>3</sup>, N.R. Jørgensen<sup>1</sup>, S.J. Pedersen<sup>1</sup>. <sup>1</sup>Depts. of Rheumatology (COPECARE), Radiology and Biochemistry, Rigshospitalet, Glostrup; <sup>2</sup>The Birthe Bonde Clinic of Physiotherapy, Copenhagen; <sup>3</sup>Kong Christians X's Gighospital, Gråsten, Denmark

**Background:** Sacroiliitis detected by MRI plays a central role in the ASAS (Assessment of Spondyloarthritis International Society) classification criteria for axial spondyloarthritis (axSpA)<sup>1</sup>. However, both false positives and false negatives have been reported. We have little knowledge of the best MRI approach to separate AxSpA from other conditions that may appear like sacroiliitis.

**Objectives:** To assess the value of different types of MRI SIJ lesions to differentiate axSpA from other conditions.

**Methods:** In this prospective cross-sectional study, the MASH study, 204 participants, age ≤45 years were enrolled. All participants with pain should have VAS pain >2 (on a scale 0–10) for ≥2 months. Women with and without pain after pregnancy, patients with disc herniation and all participants without pain were not allowed to have any clinical SpA features or rheumatologic conditions. Information on HLA-B27 and CRP were not available until after the study. The study included 41 patients with axSpA, 46 women with and 14 without pain respectively related to pregnancy/labour; 12 months, 25 patients with lumbar disc herniation, 26 persons with hard physical jobs (cleaning assistants), 23 long-distance runners (≥30 km/week) and 29 healthy men. All participants underwent clinical, laboratory and MRI examination including STIR and T1-weighted sequences of the SIJs. MRIs were evaluated in random order according to the Spondyloarthritis Research Consortium of Canada SIJ MRI scores for inflammation<sup>2</sup> and structural lesions<sup>3</sup> by two experienced readers blinded to all clinical data.

**Results:** The 204 participants comprised 41.2% males, had a mean (min-max) age of 33.2 (19; 45) years, and 22% were HLA-B27 positive. The table 1 below shows the clinical characteristics within each participant group, and the preliminary MRI results based on one reader. MRI bone marrow oedema, fat metaplasia and erosions were frequently present in patients with axSpA, but were also seen in the other groups of study participants with and without pain, particularly in women with postpartum pain. MRI backfill and ankylosis were only seen in patients with axSpA.

**Abstract OP0245 – Table 1.** Clinical characteristics, SPARCC scores and distribution of SPARCC scores

Clinical characteristics, SPARCC scores and distribution of SPARCC scores

SPARCC Ankylosis	≥1	17 (42)	0 (0)	0 (0)	0 (0)	0 (0)	0 (0)

In cells with 1 row, values are N (%). In cells with 2 rows, values are mean (upper row) and median (lower row).  
 \*MRI SIJ scores were for SPARCC. Spondyloarthritis Research Consortium of Canada SIJ MRI scores for inflammation and structural lesions.  
 †Without scores for depth and ankylosis.  
 ‡CRP: C-Reactive Protein, HLA-B27: Human Leucocyte Antigen B27

**Conclusions:** Inflammatory lesions, fat metaplasia and erosions were most frequently occurring in patients with axSpA, but also in women with postpartum pain. The SPARCC-scores cannot separate the different groups entirely. Further detailed analysis of lesions may help differentiate axSpA from other conditions.

#### OP0246 INFLAMMATION ON MRI OF SPINE AND SACROILIAC JOINTS IS HIGHLY PREDICTIVE OF STRUCTURAL DAMAGE IN AXIAL SPONDYLOARTHRITIS: THE 5 YEARS DATA OF THE DESIR COHORT

A. Sepriano<sup>1</sup>, S. Ramiro<sup>1</sup>, R. Landewé<sup>2</sup>, M. Dougados<sup>3</sup>, D. van der Heijde<sup>1</sup>.  
<sup>1</sup>Rheumatology, Leiden University Medical Centre, Leiden; <sup>2</sup>Rheumatology, Amsterdam Rheumatology and Clinical Immunology Center (ARC), Amsterdam, Netherlands; <sup>3</sup>Rheumatology, Hôpital Cochin, Hôpitaux de Paris, Paris, France

**Background:** The effect of local inflammation on structural damage in patients (pts) with axial spondyloarthritis is not well known.

**Objectives:** We aimed to test the possible effect of inflammation on structural damage both assessed by MRI and at the level of the spine and the SIJ.

**Methods:** Pts with recent onset ( $\leq 3$  years) axSpA (according to the treating rheumatologist) from the DESIR cohort were included. MRI of the SIJ (MRI-SIJ) and spine (MRI-spine) were obtained at baseline (BL), 2 and 5 years and scored by 3 trained central readers unaware of the chronology. Bone Marrow Oedema (BME) at MRI-SIJ was assessed according to ASAS definition and at the MRI-spine by the presence of  $\geq 3$  lesions. Structural damage in the SIJ (MRI-SIJ-STR) and in the spine (MRI-spine-STR) was defined by  $\geq 3$  fatty lesions. The% of structural net progression (number of 'progressors' minus the number of 'regressors' divided by the total number of pts) was assessed in subgroups according to CRP and BME status at BL. The effect of BME on MRI-SIJ on MRI-SIJ-STR and of BME on MRI-spine on MRI-spine-STR was evaluated using two types of binomial generalised estimating equations (GEE) models: i. effect at BL on 5 years incorporating measurements from all readers (GEE adjusted for reader); ii. effect of BME over 5 years (longitudinal time-lagged models with auto-regression). The final models were adjusted for variables proved to confound the association of interest (variables tested: age, gender, HLA-B27, smoking status, CRP, BASDAI, ASDAS, treatment with NSAIDs and TNFi).

**Abstract OP0246** – Figure 1 Net progression from MRI-SIJ-STR negative to MRI-SIJ-STR positive ( $\geq 3$  fatty lesions) according to baseline objective inflammatory markers:

**Results:** In total, 151 and 145 pts had complete 5 year MRI-SIJ and MRI-spine data available from 3 readers, respectively. Of the 151 pts with complete MRI-SIJ data, the net% pts who switched from MRI-SIJ-STR negative to positive ranged from 3.8% to 24% according to the presence of objective signs of inflammation at BL (figure 1). Low number of pts did not allow for similar analysis in the spine. In the multivariable analysis, both the presence of BME at MRI-SIJ (OR=4.2 [95% CI: 2.4 to 7.3]), and BME at MRI-spine (OR=8.9 [95% CI: 2.1–38.7]) at baseline were highly predictive of MRI-SIJ and MRI-spine structural progression respectively 5 years later, adjusting for CRP (only factor found to confound the association of interest). Similar positive associations were found in the longitudinal models testing the effect of BME on MRI-SIJ-STR and MRI-spine-STR over 5 years (table 1).

**Abstract OP0246** – Table 1 Effect of inflammation on MRI (ASAS definition of sacroiliitis and BME in the spine) on binary MRI structural outcomes

	$\geq 3$ fatty lesions on MRI-SIJ	$\geq 3$ fatty lesions on MRI-Spine
<b>Effect of BMI on:</b>	OR (95% CI) (n=144–197)	OR (95% CI) (n=145–197)
By GEE adjusted for reader	<b>4.2 (2.4; 7.3)*</b>	<b>8.9 (2.1; 38.7)*</b>
By longitudinal GEE adjusted for reader and repeated measurements	<b>5.1 (2.7; 9.6)£</b>	<b>15.6 (4.8; 50.3)£</b>

\* Adjusted for CRP at baseline; £ adjusted for time-varying lagged ASDAS-CRP.

**Conclusions:** Our results show that local inflammation is strongly associated with the development of structural damage over 5 years both in the SIJ and spine in early axSpA and that this effect is independent of systemic inflammation.

#### OP0247 PERFORMANCE OF REFERRAL STRATEGIES FOR SPONDYLOARTHRITIS: A POPULATION-BASED NATIONWIDE STUDY

A. Sepriano<sup>1,2</sup>, S. Ramiro<sup>1,2</sup>, F. Araújo<sup>1,3</sup>, P. Machado<sup>4</sup>, A. Rodrigues<sup>1,5</sup>, N. Gouveia<sup>1,5</sup>, M. Eusébio<sup>5</sup>, H. Canhão<sup>5,6</sup>, J. Branco<sup>1,5</sup>, on behalf of EpiReumaPt Team. <sup>1</sup>CEDOC, NMS, Lisbon, Portugal; <sup>2</sup>Rheumatology, Leiden University Medical Centre, Leiden, Netherlands; <sup>3</sup>Rheumatology, Hospital Ortopédico de Sant'Ana, Cascais, Portugal; <sup>4</sup>Rheumatology, University College London, London, UK; <sup>5</sup>EpiReumaPt Investigation Team; <sup>6</sup>CEDOC, EpiDoC Unit, NOVA Medical School and National School of Public Health, Universidade Nova de Lisboa, Lisbon, Portugal

**Background:** Several strategies have been proposed to promote early referral of patients with axial spondyloarthritis (axSpA), but consensus on the 'best' strategy is yet to be achieved. Moreover, few studies compared referral strategies (RS) head-to-head and, up to now, none has neither evaluated these in a 'nationwide' setting (external validity) nor assessed the entire spectrum of SpA (i.e. axSpA and peripheral SpA).

**Objectives:** To evaluate the performance of the screening strategy for SpA of a nationwide epidemiological study (EpiReumaPt), as compared to previously proposed RS.

**Methods:** EpiReumaPt was a three-stage national health survey (2011–2013) where, in the first phase, 10 661 adult participants were randomly selected and interviewed using a structured face-to-face questionnaire that included screening for rheumatic diseases (RD), such as SpA. In the second phase, positive screenings for  $\geq 1$  rheumatic complaint plus 20% negative screenings were invited for an assessment by the rheumatologist. Finally, 3 rheumatologists revised all the information and defined the final diagnosis by consensus. All participants of the second phase were included (n=3,877). Each RS (table 1) was tested against the SpA revised diagnosis using the following metrics: sensitivity, specificity, positive predictive value (PPV), and post-test probability of disease given a negative test (1-negative predictive value). RS with an imaging (e.g. MRI) or laboratory component (e.g. CRP, HLA-B27) were modified (by excluding these components) given limited data obtained in the survey (table 1). A weighting factor was used to take the survey design into account.

**Results:** From the total 3877 participants, 92 received a SpA diagnosis [weighted prevalence: 1.6% (95% CI: 1.2 to 2.1)], 3107 other RD diagnosis [e.g. knee osteoarthritis (31%)] and 678 no RD diagnosis. The ASAS RS was the most sensitive (85%) followed by the EpiReumaPt strategy (72%) (table 1). The ASAS and EpiReumaPt RS had the lowest post-test probabilities of SpA in the presence of negative screening (0.6% and 0.7% respectively), thus, yielding a marked decrease in the probability of disease if negative [(1.6–0.6)/1.6\*100=63%; (1.6–0.7)/1.6\*100=56% respectively]. On the other hand, the likelihood of SpA increased by 38% (2.2–1.6)/1.6\*100 and 119% (3.5–1.6)/1.6\*100 in case of a positive ASAS and EpiReumaPt RS, respectively. Brandt III was the least sensitive strategy in this study and not contributive to excluding SpA (1-NPV: 1.5%; pre-test probability: 1.6%), but expectedly increased the likelihood of SpA by 3.8 times if positive. The performance of the remaining RS is described in the table 1.

**Abstract OP0247** – Table 1 Performance of the referral strategies against the rheumatologist clinical diagnosis (N=3,877; pre-test probability: 1.6% – weighted national SpA prevalence)

	Sensitivity (%)	Specificity (%)	PPV (%)	1-NPV (%)
ASAS	85.4	38.8	2.2	0.6
EpiReumaPt	72.1	67.6	3.5	0.7
CafaSpA one	56.3	69.7	2.9	1.0
Brandt I	49.2	79.3	3.7	1.0
Braun IBP	47.5	78.7	3.5	1.1
MASTER	36.7	87.7	4.6	1.2
Brandt II	27.7	92.4	5.6	1.3
Hermann	22.4	93.2	5.1	1.3
CafaSpA two	15.2	95.2	4.9	1.4
Braun 2 step	15.1	95.7	5.3	1.4
Brandt III	7.9	98.4	7.6	1.5

ASAS (≥1/5+): IBP (ASAS definition), good response to NSAIDs, family history of SpA, peripheral manifestations (arthritis, enthesitis and/or dactylitis), extra-articular manifestations (uveitis, psoriasis and/or IBD); EpiReumaPt (≥1/5+): previous SpA/PsA diagnosis, IBP (≥ 3/8 features), CBP (≥ 3 months) starting <45 years and ≥ 1/6 SpA features, dactylitis, enthesitis; CafaSpA one (≥1/3+): IBP (ASAS definition), good response to NSAIDs, family history of SpA; CafaSpA two (≥2/3+): see CafaSpA one; Brandt I (≥ 1/1+): IBP (morning stiffness>30 min, pain at night/early morning, improvement by exercise; ≥1/3); Brandt II (≥ 1/1+): ≥2/3 IBP features (see Brandt I); Brandt III (≥ 1/1+): ≥3/3 IBP features (see Brandt I); Braun IBP (≥ 2/5+): start BP≤35 years, waking second half of the night, alternating buttock pain, improvement by movement, not rest; MASTER (≥ 2/3+): IBP (morning stiffness>30 min, improvement exercise, not rest, awakening in the night because of BP), good response to NSAIDs, family history of AS; Hermann (≥1/1): IBP (Callin's criteria); Braun 2 step (≥ 2/3): psoriasis, alternating buttock pain, improvement BP by exercise. HLA-B27 excluded from ASAS, Brandt I-III and Braun 2 step; elevated CRP/ESR excluded from ASAS.

**Conclusions:** For the first time, a wide range of SpA RS were tested head-to-head in a population-based setting where the ASAS and EpiReumaPt RS were shown to be the most sensitive. Our data suggest that these strategies can be effectively used as screening tools for SpA especially when laboratory and imaging data are not available.

OP0248

#### POTENTIAL DIFFERENCES IN AXIAL SPONDYLOARTHRITIS DISEASE ACTIVITY CATEGORIZATION USING DIFFERENT MINIMUM VALUES FOR HIGH-SENSITIVITY CRP IN ANKYLOSING SPONDYLITIS DISEASE ACTIVITY SCORE CALCULATION AND DIFFERENT DEFINITIONS OF DISEASE FLARE

R. Landewé<sup>1</sup>, J. Sieper<sup>2</sup>, U. Kiltz<sup>3</sup>, X. Wang<sup>4</sup>, M. Li<sup>4</sup>, J. Anderson<sup>4</sup>. <sup>1</sup>University of Amsterdam, Amsterdam, Netherlands; <sup>2</sup>Charité Universitätsmedizin Berlin, Berlin; <sup>3</sup>Rheumazentrum Ruhrgebiet, Herne, Germany; <sup>4</sup>AbbVie Inc., North Chicago, USA

**Background:** It has been recommended that the lower limit of high-sensitivity CRP (hsCRP) be restricted to 2 in the Ankylosing Spondylitis Disease Activity Score (ASDAS) calculation. Also, a definition of flare of ASDAS increase ≥0.9 was recently proposed.

**Objectives:** Using non-radiographic axial SpA (nr-axSpA) trial data, this analysis evaluated potential differences in patient (pt) categorization using different minimum values for hsCRP in the ASDAS calculation and different definitions of disease flare.

**Methods:** ABILITY-3 (NCT01808118) assessed the impact of continuation versus withdrawal of adalimumab (ADA) in nr-axSpA pts who achieved sustained remission with open-label ADA. All pts received open-label ADA 40 mg every other wk during a 28-wk lead-in period. Pts who achieved remission, defined as ASDAS inactive disease (ID, ASDAS <1.3) at wks 16, 20, 24, and 28 were randomised to 40-wk, double-blind ADA (continuation) or PBO (withdrawal). ASDAS was calculated with the full range of hsCRP (protocol-defined) and limiting hsCRP to the lowest possible value of 2 mg/L (rederived). Flare was calculated as 2 consecutive study visits with ASDAS >2.1 (protocol definition) or with ASDAS increase ≥0.9 (modified definition). Data are reported as observed (open label) and by nonresponder imputation (double blind).

**Results:** 673 pts were enrolled. At open-label baseline, mean ASDAS using the protocol-defined ASDAS calculation was 3.6 vs 3.7 when rederived. At wk 28, 295 (43.8%) pts achieved protocol-defined ASDAS ID vs 272 (40.4%) pts using the rederived ASDAS; mean ASDAS at double-blind baseline was 0.7 vs 0.9, respectively. At wk 68, significantly more pts treated with ADA vs PBO had no flare per protocol definition (69.7% vs 47.1%; p<0.001; table 1). Similar results were observed with modified definitions (table 1). At wk 68, significantly greater proportions of ADA vs PBO pts achieved ASDAS endpoints (all p<0.001), with similar results for protocol-defined and rederived ASDAS calculations, respectively: ID (57.2% vs 33.3% and 52.0% vs 29.4%), major improvement (58.6% vs 32.0% and 50.0% vs 30.7%), and clinically important improvement (67.1% vs 45.1% and 67.1% vs 44.4%).

**Abstract OP0248** – Table 1 Percentage of patients not experiencing disease flare at week 68 using protocol-defined or rederived ASDAS and/or modified flare definitions

Variable, n (%)	Adalimumab (40 mg EO/W) n=152*	Placebo n=153*	Difference, %	P value
Protocol-defined ASDAS and flare	106 (69.7)	72 (47.1)	22.7	<0.001
Rederived ASDAS, protocol-defined flare	100 (65.8)	69 (45.1)	20.7	<0.001
Protocol-defined ASDAS, modified flare definition	97 (63.8)	56 (36.8)	27.2	<0.001
Rederived ASDAS and modified flare definition	99 (65.1)	65 (42.5)	22.6	<0.001

ASDAS, Ankylosing Spondylitis Disease Activity Score; EO/W, every other week; ID, Nonresponder imputation; P value using 2-sided Pearson chi-square test. \*Efficacy outcomes were calculated based on the number of patients randomized, rather than those who would have qualified for randomization based on rederived ASDAS calculations.

**Conclusions:** At both open-label and double-blind baseline, mean ASDAS was similar, regardless of the hsCRP value cut-off used. Fewer pts in both treatment groups were categorised as not experiencing a flare when limiting the lowest possible hsCRP value to 2 mg/L in the ASDAS calculation and/or using a modified flare definition. However, treatment differences remained similar compared with the protocol-defined methodology. Results suggest infrequent clinically relevant differences in ASDAS values with use of either definition for minimum hsCRP and that the use of ASDAS >2.1 or ASDAS increase ≥0.9 as the definition of flare is reasonable.

OP0249

#### THE CONTRIBUTION OF STRUCTURAL MRI LESIONS TO DETECTION OF SACROILIITIS IN PATIENTS IN THE ASSESSMENTS IN SPONDYLOARTHRITIS INTERNATIONAL SOCIETY (ASAS) CLASSIFICATION COHORT

W.P. Maksymowych<sup>1</sup>, M. Østergaard<sup>2</sup>, R.G. Lambert<sup>3</sup>, U. Weber<sup>4</sup>, S.J. Pedersen<sup>5</sup>, J. Sieper<sup>6</sup>, D. Poddubnyy<sup>6</sup>, S. Wichuk<sup>1</sup>, P. Machado<sup>7</sup>, X. Baraliakos<sup>8</sup>. <sup>1</sup>Medicine, University of Alberta, Edmonton, Canada; <sup>2</sup>Rheumatology, Copenhagen Center for Arthritis Research, Copenhagen, Denmark; <sup>3</sup>Radiology, University of Alberta, Edmonton, Canada; <sup>4</sup>Rheumatology, King Christian 10th Hospital for Rheumatic Diseases, Graasten; <sup>5</sup>Rheumatology, Gentofte Hospital, Copenhagen, Denmark; <sup>6</sup>Rheumatology, Charité Universitätsmedizin Berlin, Berlin, Germany; <sup>7</sup>Rheumatology, University College London, London, UK; <sup>8</sup>Rheumatology, Rheumazentrum Ruhrgebiet, Herne, Germany

**Background:** Active lesions typical of axial spondyloarthritis (axSpA) in the sacroiliac joint (SIJ) were reported by local site readers in about 40% of patients in the ASAS classification cohort (ASAS-CC) when this study was conducted over 10 years ago<sup>1</sup>. There has been no data reported on the occurrence of structural lesions in this cohort. Since this study was conducted, there has been considerable progress in our understanding of SIJ lesions observed on MRI, which raises the possibility that MRI scans of patients in the ASAS-CC could now be interpreted substantially differently.

**Objectives:** To determine the added contribution of structural lesions in the SIJ to the evaluation of sacroiliitis in an inception cohort of patients with axSpA.

**Methods:** Recently updated MRI lesion definitions for axSpA (ASAS\_MRI\_def<sup>m</sup>) were recorded in an eCRF that comprises global assessment (lesion present/absent) and detailed scoring (SPARCC SIJ inflammation, SPARCC SIJ structural). MRI scans were available in a variety of formats (DICOM (n=175), JPEG (n=71), DICOM film(n=32)) and sequences, axial and semicoronal orientations, from 278 of the 495 cases who had MRI performed in the ASAS-CC. Image quality

was considered sufficient to record global data by 6 central readers in all cases. An additional reader assessed only images in DICOM format (n=175). Comparison of active and structural lesion frequencies typical of axSpA was assessed descriptively according to individual and majority of central readers data.

**Results:** Active lesions typical of axSpA were recorded in about 30% of cases in the cohort. Active or structural lesions typical of axSpA were recorded in about 40% of patients (table 1). Similar data was observed when active sacroiliitis was defined using the ASAS definition of a positive MRI. Structural lesions alone, without any active lesions typical of axSpA, were recorded in 6.6% of cases. Active lesions alone, without any structural lesions typical of axSpA, were recorded in 7.8% of cases. Both active and structural lesions typical of axSpA were recorded in 23.1% of cases. The frequencies of these categories were only slightly lower when majority reader data was analysed.

**Abstract OP0249** – Table 1 Contribution of structural MRI lesions to detection of sacroiliitis in the ASAS-CC. (\*Individual data from Reader; \*majority reader ( $\geq 4$ ) data)

Variable	Mean% (Range)*	Number (% of Cases)*
Active lesions typical of axSpA	31.5 (24.5-38.5)	79 (28.4%)
Active lesions typical of axSpA but not structural lesions typical of axSpA	7.8 (4.6-11.8)	7 (2.9%)
Structural lesions typical of axSpA	31.4 (23.5-39.9)	68 (28.6%)
Structural lesions typical of axSpA but not active lesions typical of axSpA	6.6 (4.2-12.7)	7 (2.9%)
Active and structural lesions typical of axSpA	23.1 (16.0-29.0)	51 (21.4%)
Active or structural lesions typical of axSpA	39.2 (28.2-48.7)	99 (41.6%)
Active lesions typical of axSpA and meets ASAS definition for positive MRI	30.0 (22.6-37.4)	79 (28.4%)
ASAS positive MRI but not structural lesions typical of axSpA	7.2 (3.4-11.3)	7 (2.9%)
Structural lesions typical of axSpA but not ASAS positive MRI	8.8 (5.0-13.0)	7 (2.9%)
ASAS positive MRI and structural lesions typical of axSpA	22.6 (15.6-28.6)	51 (21.4%)
ASAS positive MRI or structural lesions typical of axSpA	38.4 (27.7-47.9)	99 (41.6%)

**Conclusions:** Structural lesions typical of axSpA may be observed without any active lesions typical of axSpA in 5%–10% of cases presenting with undiagnosed back pain in the ASAS-CC. This is the same proportion of the cohort for which active lesions typical of axSpA are seen without any structural lesions typical of axSpA. In view of the concomitant presence of both lesions, contextual interpretation seems optimal.

## Present and future treatments for SLE, Sjögren's and APS

OP0250

### A RANDOMISED, DOUBLE-BLIND STUDY TO ASSESS THE SAFETY, TOLERABILITY AND PRELIMINARY EFFICACY OF LENIOLISIB (CDZ173) IN PATIENTS WITH PRIMARY SJÖGREN'S SYNDROME

T. Dörner<sup>1</sup>, M. Zeher<sup>2</sup>, U. Laessing<sup>3</sup>, F. Chaperon<sup>3</sup>, S. De Buck<sup>3</sup>, A. Hasselberg<sup>3</sup>, M.-A. Valentin<sup>4</sup>, S. Ma<sup>5</sup>, M. Cabanski<sup>3</sup>, C. Kalis<sup>3</sup>, C. Burkhart<sup>3</sup>, P. Gergely<sup>3</sup>.

<sup>1</sup>Department Medicine/Rheumatology and Clinical Immunology Charité Universitätsmedizin, Charité Research Organisation GmbH, Berlin, Germany;

<sup>2</sup>Medical University of Debrecen, Ungarn, Hungary; <sup>3</sup>Novartis Institutes for Biomedical Research; <sup>4</sup>NOVARTIS, BASEL, Switzerland; <sup>5</sup>Novartis Institutes for Biomedical Research, Cambridge, USA

**Background:** Primary Sjögren's syndrome (pSS) is a systemic and progressive autoimmune disease characterised by lymphoid infiltration and progressive alteration of exocrine glands secretory function. Ectopic germinal center-like structures harbour plasma cells that generate autoantibodies leading to immune complex formation. Leniolisib (CDZ173) is an oral low molecular weight compound that selectively inhibits the lipid kinase PI3K $\delta$ . In animals, leniolisib blocks PI3K $\delta$ -dependent B cell functions, disrupts germinal centre formation and immune cell trafficking, supporting the rationale for a PI3K $\delta$ -targeted therapy in pSS

**Objectives:** To evaluate the safety, tolerability, pharmacokinetics (PK) and preliminary clinical efficacy of multiple oral doses of leniolisib, after 12 weeks of treatment, in pSS patients

**Methods:** Double-blind, randomised, placebo-controlled, parallel-design study recruited 30 seropositive pSS patients with moderate to severe disease activity as determined by EULAR Sjögren's Syndrome Disease Activity Index (ESSDAI) $\geq 6$ , EULAR Sjögren's Syndrome Patient Reported Index (ESSPRI) $\geq 5$  and stimulated

whole salivary flow rate  $>0$  mL/min. Patients were randomised in a 2:1 ratio to receive leniolisib (70 mg b.i.d) or placebo. The primary outcome was change in ESSPRI at week 12. Secondary outcomes included PK, changes in ESSDAI, the Short Form-36 (SF-36), Multidimensional Fatigue Inventory (MFI) and global Visual Analogue Scales (VAS) completed by patients and physicians. Additional assessments included lacrimal gland function and biomarkers relevant to pathway and disease

**Results:** Overall safety and tolerability profile of leniolisib was acceptable, but appeared less favourable than placebo. In particular, rash occurred more frequently in the leniolisib group (11/20 patients) compared to placebo (1/10 patients). There was a slight improvement (not statistically significant) in ESSPRI scores (dryness, pain and fatigue) favouring leniolisib. Similar trends were observed in secondary endpoints (SF-36/mental and physical, MFI, VAS completed by patients and physicians). After 12 weeks of treatment, there was a slight improvement (not statistically significant) in the lacrimal gland function in the leniolisib group compared to placebo. The observed PK profile was as expected based on healthy volunteer data. Biomarker results suggest a strong and sustained target and pathway engagement, as evidenced by inhibition of phosphorylated Akt in *ex-vivo* stimulated B cells, significant decrease in serum CXCL13 and reduced frequency of circulating Follicular T helper-like cells. There was a trend of decreasing autoantibody levels in leniolisib-treated patients

**Conclusions:** Leniolisib had an acceptable safety and tolerability profile, but caused rashes a known class effect of PI3K inhibitors. Target and pathway engagement were confirmed, however no clear efficacy signal for leniolisib was seen based on ESSPRI and ESSDAI in this Proof-of-Concept study at the studied dose.

OP0251

### ATTAINMENT OF LOW DISEASE ACTIVITY AND REMISSION IN SYSTEMIC LUPUS ERYTHEMATOSUS PATIENTS WITH HIGH DISEASE ACTIVITY IN THE ATACEPT PHASE IIB ADDRESS II STUDY AND ITS LONG-TERM EXTENSION

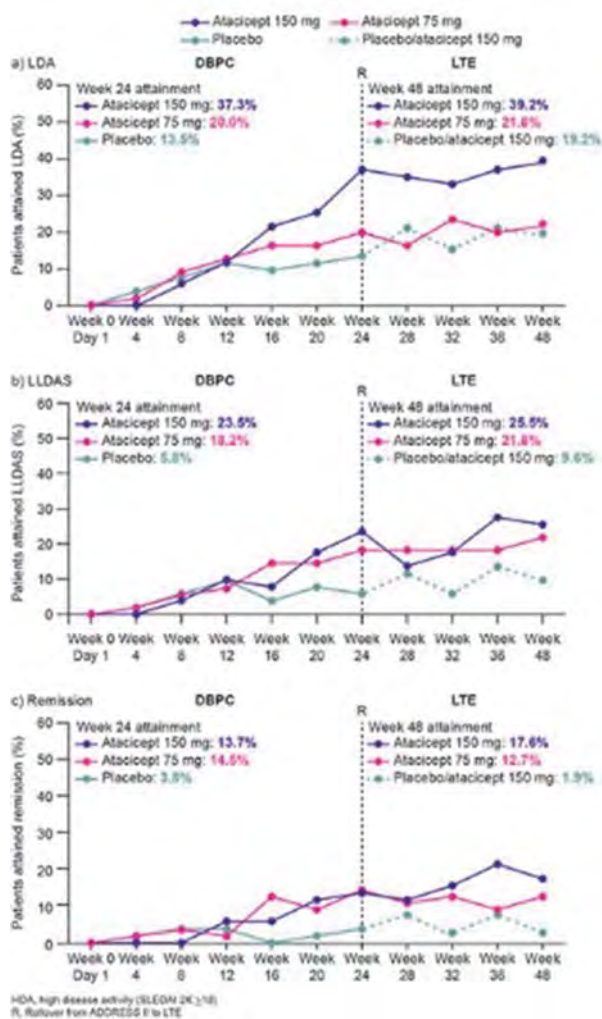

E. Morand<sup>1</sup>, J.T. Merrill<sup>2</sup>, D.A. Isenberg<sup>3</sup>, A.H. Kao<sup>4</sup>, C. Vazquez-Mateo<sup>4</sup>, S. Wax<sup>4</sup>, P. Chang<sup>4</sup>, K. Pudota<sup>4</sup>, C. Aranow<sup>5</sup>, D. Wallace<sup>6</sup>. <sup>1</sup>Monash University, Melbourne, Australia; <sup>2</sup>Oklahoma Medical Research Foundation, Oklahoma, USA; <sup>3</sup>University College London, London, UK; <sup>4</sup>EMD Serono Research and Development Institute, Inc. (a business of Merck KGaA, Darmstadt, Germany), Billerica; <sup>5</sup>Feinstein Institute for Medical Research, Manhasset; <sup>6</sup>Cedars-Sinai Medical Center, David Geffen School of Medicine, UCLA, Los Angeles, USA

**Background:** Low disease activity (LDA) and remission are consummate goals of SLE treatment.<sup>1</sup> Lupus Low Disease Activity State (LLDAS) is associated with reduced damage accrual,<sup>2</sup> and has been shown to be a feasible clinical trial endpoint.<sup>3</sup> In the Phase IIb ADDRESS II study,<sup>4</sup> atacept improved SRI-6 response rates and flare prevention at Week (Wk) 24 vs placebo (PBO), in patients with High Disease Activity (HDA; SLEDAI-2K $\geq 10$ ) at Screening, with an acceptable safety profile.

**Objectives:** Post-hoc analysis of ADDRESS II and its long-term extension to describe 48-wk rates of LDA and remission in patients with HDA at Screening.

**Methods:** Pts were randomised 1:1:1 to weekly subcutaneous PBO or atacept 75 or 150 mg for 24 wks in ADDRESS II. Completers entered the extension study at the same dose, except PBO patients who switched to atacept 150 mg (PBO/atacept 150 mg). This analysis includes: LDA (SLEDAI-2K $\leq 2$ ); LLDAS (SLEDAI-2K $\leq 4$  without major organ activity, no new disease activity vs previous visit, Physician's Global Assessment [PGA] $\leq 1$ , prednisone-equivalent  $\leq 7.5$  mg/day, and stable immunosuppressants); and remission (clinical SLEDAI-2K=0, PGA  $< 0.5$ , prednisone  $\leq 5$  mg/day) per definitions proposed by DORIS.<sup>1</sup>

**Results:** Of 306 ADDRESS II pts, 158 (52%) had HDA at entry; 42.4% achieved SRI-6, 23.4% LDA, 15.8% LLDAS and 10.8% remission at Wk 24. At Wk 48, 52.5% achieved SRI-6, 26.6% LDA, 19.0% LLDAS and 10.8% remission. Among the 83 HDA patients with an SRI-6 response at Wk 48, LDA, LLDAS, and remission represented increasingly stringent subsets (49.4% [n=41] attaining LDA, 34.9% [n=29] LLDAS, and 20.5% [n=17] remission). LDA, LLDAS and remission rates were higher in patients treated with atacept 150 mg vs 75 mg and PBO/atacept 150 mg (table 1; figure 1).

Abstract OP0251 – Figure 1. LDA, LLDAS and remission in patients with HDA at screening (a. LDA; b. LLDAS; c. remission)

Abstract OP0251 – Table 1 LDA, LLDAS and remission at Wk 48 of patients with HDA at screening

Endpoint	Statistics	PBO/Atacicept 150 mg* (n=52)	Atacicept 75 mg (n=55)	Atacicept 150 mg (n=51)
LDA	Attainment, n (%)	10 (19.2)	12 (21.8)	20 (39.2)
	OR [95% CI]		1.17 [0.46–3.00]	2.71 [1.11, 6.60]**
LLDAS	Attainment, n (%)	5 (9.6)	12 (21.8)	13 (25.5)
	OR [95% CI]		2.62 [0.85–8.06]	3.22 [1.05, 9.82]**
Remission	Attainment, n (%)	1 (1.9)	7 (12.7)	9 (17.6)
	OR [95% CI]		7.44 [0.88–62.71]	10.93 [1.33, 89.78]**

\*PBO pts who switched to atacicept 150 mg after Week 24; \*\*p<0.05; CI, confidence interval; OR, odds ratio

**Conclusions:** At 48 wks, patients entering the ADDRESS II study with HDA who received atacicept 150 mg were more likely to attain LDA, LLDAS and remission than those treated with 75 mg or PBO/atacicept 150 mg. These endpoints were more stringent and discriminatory than SRI-6, confirming LLDAS, LDA, and remission to be robust and meaningful endpoints for SLE trials, and adding further support for future studies of atacicept in SLE.

**OP0252 ORGAN DAMAGE PROGRESSION AND LONG-TERM SAFETY OF BELIMUMAB (BEL) IN PATIENTS WITH SYSTEMIC LUPUS ERYTHEMATOSUS (SLE): AN EXTENSION OF PIVOTAL PHASE 3 BLISS STUDIES**

B.F. Van Vollenhoven<sup>1</sup>, S.V. Navarra<sup>2</sup>, R.A. Levy<sup>3</sup>, M. Thomas<sup>4</sup>, A. Heath<sup>3</sup>, T. Lustine<sup>3</sup>, A. Adamkovic<sup>3</sup>, J. Fettiplace<sup>5</sup>, M.L. Wang<sup>3</sup>, B. Ji<sup>5</sup>, D. Roth<sup>3</sup>.  
<sup>1</sup>Amsterdam Rheumatology and Immunology Center ARC, Amsterdam, Netherlands; <sup>2</sup>University of Santo Tomas Hospital, Manila, Philippines; <sup>3</sup>GSK, Collegeville, PA, USA; <sup>4</sup>Kerala Institute of Medical Sciences, Trivandrum, Kerala, India; <sup>5</sup>GSK, Stockley Park, UK

**Background:** Non-United States completers of the Phase 3 BLISS-52 (BEL110752) and BLISS-76 (BEL110751) studies could continue treatment with BEL.

**Objectives:** To evaluate long-term safety, tolerability and organ damage progression in patients with SLE treated with BEL.

**Methods:** In this multicentre, open-label long-term study (BEL112234/NCT00712933), patients received intravenous BEL every 4 weeks, plus standard SLE therapy. Safety was assessed at each visit. Organ damage (Systemic Lupus International Collaborative Clinics/American College of Rheumatology Damage Index [SDI]) was assessed as a safety endpoint every 48 weeks. The study continued until BEL was commercially available in each patient's country and included an 8 week follow-up period.

**Results:** In total, 738 patients entered the long-term study and were treated for up to 9 years (3352 patient-years). Of these, 735 (99.6%) received ≥1 dose of BEL; the mean (SD) number of infusions was 56.4 (27.02). The incidence of adverse events (AEs) remained stable or declined over time (table 1). The most common AEs were headache (n=205, 27.9%), nasopharyngitis (n=155, 21.1%), diarrhoea (n=143, 19.5%), arthralgia (n=136, 18.5%) and influenza (n=134, 18.2%). Sixty-nine patients (9.4%) experienced an AE resulting in discontinuation of BEL or study withdrawal. Eleven deaths occurred, one of which (cardiogenic shock) was possibly related to BEL. Three serious AEs of suicide attempt/ideation (0.4%) occurred. The mean (SD) SDI score was 0.6 (1.02) at baseline (prior to the first dose of BEL). At Year 8 87.7% of patients had no change in SDI score from baseline, indicating low organ damage accrual (figure 1).

<sup>a</sup>Number of patients; <sup>b</sup>included opportunistic infections, tuberculosis, herpes zoster (recurrent and disseminated) and sepsis; <sup>c</sup>two deaths during post-treatment follow-up.

**Conclusions:** BEL displayed a stable safety profile with no new safety signals. There was minimal organ damage progression.

OP0253

**A PHASE III RANDOMISED, DOUBLE-BLIND, PLACEBO-CONTROLLED STUDY TO EVALUATE THE EFFICACY AND SAFETY OF ABATACEPT OR PLACEBO ON STANDARD OF CARE IN PATIENTS WITH ACTIVE CLASS III OR IV LUPUS NEPHRITIS**

R. Furie<sup>1</sup>, M.A. Dooley<sup>2</sup>, D. Wofsy<sup>3</sup>, T. Takeuchi<sup>4</sup>, A. Malvar<sup>5</sup>, A. Doria<sup>6</sup>, J. Romero-Diaz<sup>7</sup>, T.M. Chan<sup>8</sup>, A. Elegbe<sup>9</sup>, G.B. Appel<sup>10</sup>, D. Jayne<sup>11</sup>, M.A. Maldonado<sup>9</sup>.

<sup>1</sup>Northwell Health, New York; <sup>2</sup>University of North Carolina at Chapel Hill, Chapel Hill; <sup>3</sup>University of California San Francisco, San Francisco, USA; <sup>4</sup>Keio University, Tokyo, Japan; <sup>5</sup>Hospital Fernández, Buenos Aires, Argentina; <sup>6</sup>University of Padua, Padua, Italy; <sup>7</sup>Instituto Nacional de Ciencias Médicas y Nutrición, Mexico City, Mexico; <sup>8</sup>University of Hong Kong, Hong Kong, Hong Kong; <sup>9</sup>Bristol-Myers Squibb, Princeton; <sup>10</sup>Columbia University Medical Center, New York, USA; <sup>11</sup>University of Cambridge, Cambridge, UK

**Background:** The tenets of novel treatment strategies for active class III or IV lupus nephritis (LN) aim to improve renal response rates as well as the speed, robustness and durability of responses; decrease extra-renal SLE disease activity; reduce glucocorticoid exposure; ensure tolerability and provide acceptable treatment-related safety profile.

**Objectives:** Compare efficacy and safety of IV abatacept (ABA), a selective T cell co-stimulation modulator, vs placebo (pbo), on background therapy for active proliferative LN.

**Methods:** This was a 24-mth, randomised, Phase III, multicentre, double-blind study with an open-ended, blinded long-term extension. Patients (pts) were randomised to pbo or ABA IV 30 mg/kg for 3 mths, followed by ABA~10 mg/kg every 4 wks on a background of mycophenolate and glucocorticoids. The primary endpoint, complete response (CR) at 1 year, was a composite measure that required maintenance of glomerular filtration rate, urine protein-to-creatinine ratio

(UPCR) ≤0.5, absence of urinary cellular casts and prednisone ≤10 mg/day. We report Yr 1 data and available post-Yr 1 data for all pts, all double-blind.

**Results:** 405 pts were randomised (ABA n=202; pbo n=203). At baseline, mean age was 33 years, mean UPCR=3.78, mean serum creatinine=0.93 mg/dL and mean GFR=95 mL/min. Yr 1 study completion rates were ABA 77%, pbo 79%; fewer ABA pts discontinued during Yr 2 (ABA 14%, pbo 22%) and beyond. There were no significant differences between treatment arms in the proportion of pts with CR after 52 wks of treatment (ABA 35.1%, pbo 33.5%, p=0.73; primary endpoint). Achievement of sustained CR (2 successive visits) occurred earlier and more frequently in ABA-treated pts (figure 1). These benefits were driven by improvement in proteinuria which was seen as early as Day 85 (adjusted mean change in UPCR ABA -2.50, pbo -2.00; adjusted difference from pbo [95% CI] -0.50 [-0.84,-0.16]) and was sustained beyond Yr 2 (Yr 2: ABA -3.13, pbo -2.72; adjusted difference from pbo [95% CI] -0.41 [-0.79,-0.03]). There was no negative impact of ABA on renal function (eGFR). Few non-renal adjudicated BILAG A or B events occurred in Yr 1 (ABA=13 [BILAG A=0], pbo=12 [BILAG A=2]). Safety in Yr 1 was consistent with the known profile of ABA (serious adverse event [SAE] rate ABA 24%, pbo 19%). SAE rates after Yr 1 improved (ABA 6%, pbo 13%). The death rate was similar at Yr 2 (ABA 7, pbo 6). Improvements in SLE-related pharmacodynamic markers (C3, C4 and anti-dsDNA autoAb) were more sustained in ABA-treated pts.

**Abstract OP0253** – Figure 1 Kaplan-meier plot of time to first sustained complete renal response during year 1 of double-blind period: all randomised and treated patients

**Conclusions:** The study failed to meet its primary endpoint of higher CR rate in pts with active class III or IV LN after 1 year of abatacept treatment. Abatacept-treated pts had more rapid improvement in proteinuria, which led to earlier, sustained CR. There was a favourable safety profile extending beyond 2 years of treatment.

OP0254

#### A PROPENSITY SCORE-MATCHED (PSM) ANALYSIS OF ORGAN DAMAGE IN PATIENTS WITH SYSTEMIC LUPUS ERYTHEMATOSUS (SLE) FROM THE POOLED BLISS LONG-TERM EXTENSION (LTE) TRIALS VERSUS THE TORONTO LUPUS COHORT (TLC)

M. Urowitz<sup>1</sup>, R.L. Ohsfeldt<sup>2</sup>, R.C. Wielage<sup>2</sup>, J.J. Dever<sup>2</sup>, M. Zakerifar<sup>2</sup>, Y. Asukai<sup>3</sup>, S. Ramachandran<sup>4</sup>, A.V. Joshi<sup>4</sup>. <sup>1</sup>Centre for Prognosis Studies in Rheumatic Diseases, Toronto Western Hospital, Toronto, ON, Canada; <sup>2</sup>Medical Decision Modeling Inc., Indianapolis, IN, USA; <sup>3</sup>Value Evidence and Outcomes, GSK, Brentford, UK; <sup>4</sup>Value Evidence and Outcomes, GSK, Philadelphia, PA, USA

**Background:** A pooled analysis of the open-label BLISS LTE studies (BEL112233/BEL112234) reported low levels of organ damage accrual (measured by Systemic Lupus International Collaborating Clinics [SLICC]/American College of Rheumatology Damage Index [SDI]) in patients who received belimumab (BEL) plus standard therapy (SoC) over a 5 year period. However, the LTE studies had no SoC arm. This post-hoc study (206347) used PSM to match BLISS LTE patients to TLC patients to define a SoC treatment comparison cohort.

**Objectives:** To assess damage accrual in patients with SLE treated with BEL plus SoC compared with PSM patients from the TLC treated with SoC alone.

**Methods:** This analysis compared the mean SDI change from baseline (over 5 years), time to SDI event (on all patients with  $\geq 1$  year follow-up), and magnitude of year-to-year SDI change (over 5 years), from baseline to Year 5 in patients treated with BEL plus SoC (pooled United States [US] and non-US data from the BLISS LTE studies), and SoC alone. Patients in the LTE and TLC were 1:1 PSM based on 16 clinical variables with a propensity score calliper  $\pm 20\%$ . Regression augmented inverse propensity score weighting (IPSW) tested the robustness of the PSM results.

**Results:** For the 5 year analysis, 181 LTE patients were matched to 181 TLC patients (mean bias 3.8%) from a larger pool of 973 patients (BLISS LTE n=592; TLC n=381). Time-to-event PSM resulted in 323 LTE and 323 TLC patients (mean bias 3.7%) from a larger pool of 1541 patients (BLISS LTE n=949; TLC n=592). The mean SDI score change from baseline in the BEL group was 0.265 (95% confidence interval [CI]: 0.180, 0.350) compared with 0.718 (95% CI: 0.547, 0.889) in the SoC group, resulting in a BEL treatment effect of  $-0.453$  fewer SDI units (95% CI:  $-0.646, -0.260$ ;  $p < 0.001$ ) over 5 years compared with SoC alone. The IPSW model produced similar results ( $-0.374$ , 95% CI:  $-0.512, -0.236$ ;  $p < 0.001$ ). Patients treated with BEL were 60% less likely to progress to a higher SDI score over any given year of follow-up compared with SoC patients (hazard ratio 0.397, 95% CI: 0.275, 0.572;  $p < 0.001$ ). A patient receiving BEL has a 3.1% annual probability of organ damage progression compared with a 7.5% annual probability with SoC. Among the 646 time-to-event matched patients, there were 49 increases in SDI over the first 5 years in the BEL group and 102 in the SoC group. Of these, 4.1% (n=2/49) of the BEL group had an SDI increase  $\geq 2$  compared with 25.5% (n=26/102) of the SoC group. Therefore, for patients who experienced any increase, the likelihood of experiencing a  $\geq 2$  point SDI increase was 6-times greater in the SoC group (25.5/4.1=6.22;  $p=0.002$ ).

**Conclusions:** This PSM analysis demonstrates that BEL plus SoC reduces, and slows the rate of organ damage progression and reduces the magnitude of progression compared with SoC alone.

OP0255

#### IDENTIFICATION OF CLINICAL AND SEROLOGICAL PREDICTIVE FACTORS OF RESPONSE TO RITUXIMAB TREATMENT IN SYSTEMIC LUPUS ERYTHEMATOSUS (SLE) PATIENTS

H. Sánchez Pérez<sup>1</sup>, D. Isenberg<sup>2</sup>. <sup>1</sup>Rheumatology, Hospital Universitario De Canarias, La Laguna, Spain; <sup>2</sup>Centre for Rheumatology Division of Medicine, University College London, London, UK

**Background:** Response to Rituximab (RTX) varies significantly between SLE patients. Ethnicity may play a role in these differences, and a possible relationship has been suggested between the clinical response to RTX and the presence of certain auto-antibodies (ab) (anti-ENA and anti-dsDNA ab) and C3 levels at baseline.

**Objectives:** The aim of this study was to identify biomarkers that could predict the response to RTX treatment in SLE patients.

**Methods:** This was a cross-sectional study of 121 SLE patients treated with RTX in UCLH between 2000 and 2016. Demographic, clinical and serological data were analysed. Disease activity was evaluated using the BILAG index. Patients were categorised as 'Responders' if all or some of the As and Bs from the BILAG score at the time the RTX was given were lost at 6 and at 12 months, and as 'Non-Responders' if none of the As and Bs were lost. Relapse after RTX treatment was defined as development of a new BILAG Grade A or B in any system. A uni and multivariate regression analysis were performed to identify predictive factors of response to RTX utilising a combination of clinical and biological markers.

**Results:** At 6 and at 12 months, 85% and 70% respectively of our patients had responded clinically to the RTX treatment. 24% of patients relapsed during the year after RTX. In the univariate analysis, constitutional symptoms at diagnosis (crude OR (95% CI): 5.66 (1.53–20.88),  $p=0.009$ ) and the absence of musculoskeletal disease at the time of RTX (0.27, (0.09–0.81),  $p=0.019$ ) were related to response at 6 months. In the multivariate analysis, both remained significant, (adjusted OR (95% CI)): 5.33 (1.39–20.41),  $p=0.014$  and 0.26 (0.08–0.81),  $p=0.021$  respectively. With respect to the response at 12 months, in the univariate analysis the presence of arthritis as the main indication for RTX (3.16 (1.31–7.58),  $p=0.010$ ), the absence of renal disease at diagnosis (0.36 (0.15–0.86),  $p=0.022$ ) and of cardiorespiratory disease at the time of RTX (0.29 (0.09–0.89),  $p=0.031$ ), less than one anti-ENA ab (0.28 (0.12–0.66),  $p=0.003$ ), low levels of C3 at diagnosis (0.29 (0.09–0.89),  $p=0.031$ ), increased anti-dsDNA ab levels (0.38 (0.17–0.89),  $p=0.025$ ) and decreased C3 levels (0.27 (0.11–0.63),  $p=0.002$ ) before RTX were related to the response. In the multivariate analysis, only the absence of more than one anti-ENA showed significance (0.30 (0.11–0.82),  $p=0.020$ ). Having more than one anti-ENA was related to relapse (3.30 (1.36–8.05),  $p=0.009$ ), while having arthritis as the main indication for RTX therapy was associated with a lower risk of flare (0.26 (0.10–0.64),  $p=0.004$ ). On the multivariate analysis, having arthritis remained significant (0.29 (0.11–0.75),  $p=0.010$ ).

**Conclusions:** There is a relation between the presence of more than one anti-ENA ab and a worse response to treatment at 12 months and a higher risk of flaring. Having arthritis at the time of RTX leads to a negative response at 6 months but a lower risk of flare before 1 year.

OP0256

#### HYDROXYCHLOROQUINE REDUCES RISK OF INCIDENT DIABETES MELLITUS IN PRIMARY SJÖGREN SYNDROME PATIENTS: A PROPENSITY SCORE MATCHED POPULATION-BASED COHORT STUDY

W.-S. Chen<sup>1</sup>, C.-Y. Tsai<sup>1</sup>, C.-C. Chang<sup>2</sup>. <sup>1</sup>Rheumatology, Taipei Veterans General Hospital; <sup>2</sup>Rheumatology, Taipei Medical Hospital, Taipei, Taiwan, Province of China

**Background:** HCQ is an antimalarial drug that is widely prescribed for the treatment of Sjögren syndrome. Glucocorticoids may alter glucose metabolism and contribute to diabetes mellitus. Treatment for primary Sjögren syndrome (SS) sometimes requires glucocorticoids that may worsen glucose homeostasis. HCQ can reduce diabetes risk in SLE and RA.

**Objectives:** This study aimed to investigate the association of HCQ use and diabetes mellitus risk in primary SS patients.

**Methods:** This nationwide, population-based cohort study was conducted using the Taiwan National Health Insurance Research Database. In the period 2002–13, 7311 newly diagnosed primary SS patients were identified after excluding those with a previous diagnosis of RA, SLE or diabetes mellitus. The propensity score matched 4874 patients with at least 6 month hydroxychloroquine exposure after diagnosis and 2437 patients without. Incidence of diabetes mellitus was identified as a new diagnostic code using a diabetes mellitus-specific medication.

**Results:** Four hundred and ninety-seven newly diagnosed diabetes mellitus patients were identified among primary SS patients (4874 had taken HCQ and 2437 had never taken HCQ), with an average follow-up period of 4.9 years. Compared with patients without HCQ treatment, the hazard ratio (HR) of diabetes

mellitus in patients taking HCQ at a cumulative dose  $\geq 175$  g was reduced [HR 0.60 (95% CI: 0.45 to 0.80),  $p < 0.001$ ]. Higher prednisolone-equivalent dose ( $\geq 88$  defined daily dose) was associated with increased risk of developing diabetes mellitus [HR 1.50 (95% CI: 1.11 to 2.03),  $p = 0.001$ ], which was reduced by concomitant HCQ use at a cumulative dose  $\geq 374$  g [HR 0.34 (95% CI: 0.22 to 0.56),  $p = 0.001$ ].

**Conclusions:** This propensity score matched analysis of Taiwanese patients with primary SS found that use of HCQ is associated with reduced risk of incident diabetes mellitus in a dose-dependent manner. High-dose glucocorticoids increase the risk of diabetes, which can be decreased by concomitant HCQ use.

**Disclosure of Interest:** None declared

**OP0257 DECREASE OF AUTOPHAGY IN PERIPHERAL BLOOD MONONUCLEAR CELLS FROM SYSTEMIC LUPUS ERYTHEMATOSUS PATIENTS TREATED WITH BELIMUMAB**

T. Colasanti, F.R. Spinelli, C. Barbati, L. Massaro, F. Ceccarelli, M. Vomero, F. Morello, V. Orefice, F. Conti, G. Valesini, C. Alessandri. *Lupus Clinic, Sapienza University of Rome, Rome, Italy*

**Background:** Autophagy is a conserved catabolic process that degrades cytoplasmic constituents and organelles in the lysosome, promoting the recycling of cellular nutrients, and is also a key mechanism for protein homeostasis and quality control<sup>1</sup>.

T lymphocytes from patients with systemic lupus erythematosus (SLE) are resistant to induction of autophagy<sup>2</sup>.

Belimumab (BLM), a human monoclonal antibody that inhibits B lymphocyte stimulator (BLYS), is the first biological drug to be approved for the treatment of SLE. BLM seems to play a role in modulating the signalling cascade involved in the regulation of autophagy, blocking the binding of soluble BLYS to its receptors (B cell activating factor receptor, BAFF-R; B cell maturation antigen, BCMA; transmembrane activator and calcium modulator and cytoplasmic ligand interactor, TACI), mainly expressed on B cells and plasmacells<sup>3</sup>.

**Objectives:** The aim of this study was to evaluate the autophagy process by means the expression of LC3-II and p62 markers in lysates of peripheral blood mononuclear cells (PBMCs) from SLE patients at baseline (t0) and after 2 weeks (t2weeks), 1 month (t1month), and 3 months (t3months) of treatment with BLM. We also investigated the presence of BLYS receptors on T cell subsets.

**Methods:** We enrolled 15 consecutive patients who started treatment with BLM (M/F, 0/15; mean age, 44.3 years, range 30–54 years; mean disease duration, 242.6 months, range 48–432 months). All patients fulfilled the American College of Rheumatology revised classification criteria<sup>4</sup>. PBMCs from SLE patients were lysed in lysis buffer and analysed to evaluate autophagy, monitoring LC3-II and p62 levels by Western blot. Flow cytometry was performed for surface phenotyping of freshly isolated PBMCs, using conjugated monoclonal antibodies against human CD4 and CD8; anti-human BAFF-R, BCMA, and TACI polyclonal antibodies were used to detect BLYS receptors on T cells subsets.

**Results:** LC3-II expression levels in PBMCs from SLE patients decreased after 3 months of BLM therapy and, in the same lapse, p62 levels increased (figure 1;  $p < 0.05$  for all the experimental conditions). BAFF-R and BCMA were expressed on CD4<sup>+</sup> (Mean Fluorescence Intensity -fold increase-, MFI=1.6 and 1.2, respectively;  $p < 0.05$ ) and CD8<sup>+</sup> (MFI=1.6 and 2.5;  $p < 0.05$ ) T cells, while TACI was expressed only on CD8<sup>+</sup> T cells (MFI=1.2;  $p < 0.05$ ).

**Conclusions:** In the present study we demonstrated, for the first time, the expression of BAFF-R, TACI and BCMA in CD4<sup>+</sup> and CD8<sup>+</sup> T cells from SLE patients, and that BLM treatment was able to decrease the levels of autophagy in PBMCs. We can speculate that BLM could mediate this effect by blocking the binding of BLYS with its receptors.

**From cartilage to bone**

**OP0258 EFFICACY OF THE HIGHLY SELECTIVE ADAMTS-5 INHIBITOR GLPG1972 IN THE RAT MENISCECTOMY MODEL**

L. Lapescheux<sup>1</sup>, P. Clement-Lacroix<sup>1</sup>, D. Merciris<sup>1</sup>, S. Meurisse<sup>1</sup>, M. Borgonovi<sup>1</sup>, C. Cottreaux<sup>1</sup>, P. Mollat<sup>1</sup>, F. Brebion<sup>1</sup>, R. Gosmini<sup>1</sup>, F. De Ceuninck<sup>2</sup>, I. Botez<sup>2</sup>, E. van der Aar<sup>3</sup>, T. Christophe<sup>3</sup>, N. Vandervoort<sup>3</sup>, R. Blanqué<sup>1</sup>, D. Comas<sup>1</sup>, P. Deprez<sup>1</sup>, D. Amantini<sup>1</sup>. <sup>1</sup>Galapagos Sasu, Romainville; <sup>2</sup>Institut de Recherches Servier, Suresnes, France; <sup>3</sup>Galapagos NV, Mechelen, Belgium

**Background:** Aggrecan cleavage is an early process in cartilage degradation observed in OA. As a result, aggrecanase inhibition is an attractive therapeutic strategy for the treatment of OA.<sup>1,2</sup> A disintegrin and metalloproteinase with thrombospondin motifs-5 (ADAMTS-5) is an aggrecanase playing a key role in the catabolic events leading to OA.<sup>3</sup> We previously described the pharmacological characterisation of GLPG1972, a potent, selective and orally bioavailable ADAMTS-5 inhibitor showing anti-catabolic activity in cartilage explants and displaying disease-modifying OA drug (DMOAD) potential in the destabilisation of the medial meniscus (DMM) model in mice.<sup>4,5</sup>

**Objectives:** In this communication we report the activity of GLPG1972 in a second model of surgery-induced OA, the rat meniscectomy (MNX) model.<sup>6</sup>

**Methods:** OA pathology was induced by meniscectomy in the right hind leg of each rat. On day 1 post surgery, rats were randomly assigned to a treatment group (n=20 per group) according to their body weight. GLPG1972 was administered orally over 3 weeks at dose levels of 10, 25 and 50 mg/kg b.i.d. At sacrifice, the right tibias were collected and processed for histological analysis. OA development in the tibial plateau was evaluated using the OARSI score. The following structural parameters were measured by imaging histomorphometry analysis: subchondral bone plate thickness, proteoglycan content and fibrillation index. Blood samples were collected at steady state at predose, 1, 3 and 6 hour post-dose for the determination of GLPG1972 plasma concentrations.

**Results:** Three weeks post-surgery, a significant reduction in OARSI score compared to vehicle-treated rats was observed with GLPG1972 at 25 and 50 mg/kg b.i.d. (–24% and –23%, respectively). Treatment with GLPG1972 also resulted in a significant reduction in cartilage fibrillation as of 25 mg/kg b.i.d. and prevented proteoglycan loss and subchondral bone plate thickening at all doses. At 25 mg/kg b.i.d. GLPG1972 average plasma concentration over 24 hour was found to be in line with the value observed in other rat MNX experiments (385 ng/mL). GLPG1972 bio-distribution in the target tissue was also determined: the average condyle to plasma ratio was found to be 0.14.

**Conclusions:** Oral dosing with GLPG1972 in rat MNX model resulted in significant chondroprotection confirming the DMOAD potential of GLPG1972. A Phase 1 first-in-human study was successfully completed with GLPG1972 (NCT02612246), and a dose-escalation Phase 1b study in OA patients is ongoing (NCT03311009). GLPG1972 is a promising OA drug candidate and a Phase 2 program is currently under preparation.

OP0259

### ZCCHC5, A LTR RETROTRANSPONON-DERIVED NEOFUNCTIONALIZED GENE, IS ESSENTIAL FOR THE TRANSCRIPTIONAL ACTIVITY OF SOX9 AND THE EXPRESSION OF COL2A1 IN CHONDROCYTES AND IS DOWNREGULATED IN OA CARTILAGE

T.M. Haqqi, N.M. Khan. *Anatomy and Neurobiology, North East Ohio Medical University, Rootstown, USA*

**Background:** Retrotransposon-derived DNA sequences occupy approximately 40% of the mammalian genome, compared with only 1.5% of protein coding genes, and are a source of variation in the genome. LTR-derived gene *ZCCHC5* (*Mart3*) is a member of *gag*-related retrotransposon family that has lost the ability to retrotranspose. *ZCCHC5* gene encode a protein of approximately 53 Kd and contains a nucleic acid binding domain (CX<sub>2</sub>CX<sub>4</sub>HX<sub>4</sub>C), a *gag*-like region within the intact ORF and a homeobox associated leucine zipper motif indicating that this gene may have acquired new function(s) in the cell. Expression and function of *ZCCHC5* in degenerative joint diseases such as OA or other diseases has not been explored.

**Objectives:** The aim of this study was to investigate whether *ZCCHC5* is expressed in OA cartilage and chondrocytes and whether it is involved in the regulation of catabolic and/or anabolic factors in chondrocytes and its modulation under pathological conditions.

**Methods:** Chondrocytes were derived by the enzymatic digestion of human OA and normal C57BL6 mouse cartilage. Total RNA was prepared using Trizol and was made DNA-free using on-column digestion. mRNA expression was quantified using TaqMan assays. Protein expression was determined by immunohistochemistry (IHC) and Western blotting (WB) with validated antibodies. siRNA mediated depletion or plasmid mediated overexpression of *ZCCHC5* gene was used to study its role in chondrocyte function under pathological conditions. Luciferase reporter vectors were used to study promoter activity in human chondrocytes.

**Results:** TaqMan, WB and IHC analyses revealed that the expression of *ZCCHC5* was very low in the damaged OA cartilage compared to the levels detected in normal cartilage and the unaffected cartilage of the same patient. Stimulation of human and mouse chondrocytes with IL-1 $\beta$  significantly decreased the expression of *ZCCHC5* ( $p < 0.05$ ) which correlated with the inhibition of COL2A1 expression and upregulation of MMP-13. Overexpression of *ZCCHC5* upregulated the COL2A1 mRNA and protein levels which were not suppressed by stimulation with IL-1 $\beta$ . Importantly, in these cells expression of MMP-13 was low and remained suppressed under pathological conditions. In contrast siRNA mediated depletion of *ZCCHC5* expression in chondrocytes abrogated the protective effect on COL2A1 expression and increased the level of MMP-13 mRNA and protein upon treatment with IL-1 $\beta$ . Additionally, depletion of *ZCCHC5* eliminated the SOX9 activity and COL2A1 promoter activation in human chondrocytes but this was reversed by reintroduction of *ZCCHC5* expression indicating that *ZCCHC5* plays an important role in SOX9 activity and COL2A1 transcription.

**Conclusions:** Our data for the first time demonstrate that a LTR retrotransposon-derived neogene *ZCCHC5* plays a key role in maintaining the differentiated functions of adult articular chondrocytes. Its repression in OA may contribute to cartilage deterioration by blocking chondrocyte anabolic functions and by enhancing expression of catabolic factors. Taken together, our data revealed a previously unidentified role of *ZCCHC5* in a disease pathogenesis and uncovered a potential therapeutic approach to limit/reverse cartilage damage in OA.

OP0260

### TARGETING NEUTROPHIL MICROVESICLES TO DAMAGED CARTILAGE USING ANTIBODIES TO POST-TRANSLATIONALLY MODIFIED COLLAGEN II

L.M. Topping, C. Vinci, H. Rhys, L. Norling, A. Nissim. *WHRI, Queen Mary University of London, London, UK*

**Background:** Microvesicles (MV) are extracellular vesicles released from the plasma membrane of cells. MV derived from neutrophils (PMN) have been shown to penetrate cartilage and exert chondro-protective effects in inflammatory arthritis 1-2.

Collagen type II (CII) is the most abundant protein found in cartilage. Inflammation in the joint results in post-translational modification of collagen II (CII) by reactive oxygen species (ROS). We have produced a single chain variable fragment (scFv) antibody specific to CII modified by ROS, namely anti-ROS-CII<sup>3</sup>. We hypothesise that loading anti-ROS-CII upon MV will localise them to the arthritic cartilage.

**Objectives:** The main objectives of this study were: i) Load anti-ROS-CII upon MV using aqueous energy dissemination; ii) Assess incorporation of anti-ROS-CII upon MV *in vitro* and iii) Validate the localisation and therapeutic potential of the enriched microvesicles in an *in vivo* model of arthritis.

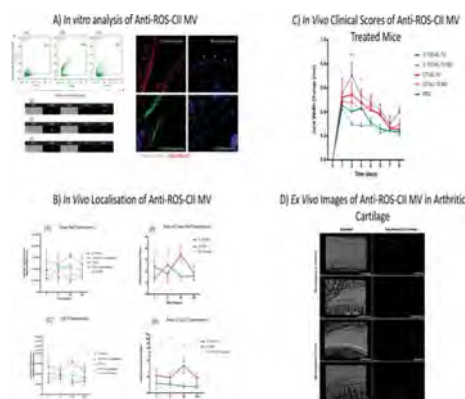

**Methods:** Anti-ROS-CII were produced in house. Human PMN MV from healthy donors were isolated as previously described<sup>4</sup>. Anti-ROS-CII were intercalated upon MV using 100 ug 1,2-dioleoyl-*sn*-glycero-3-phospho-L-serine by aqueous energy dissemination, as previously described<sup>4-5</sup>. Incorporation was assessed by ImageStream<sup>X</sup> (IS<sup>X</sup>), ELISA, NanoSight and immunofluorescence.

*In vivo* experiments were performed in an Antigen Induced Arthritis (AIA) mouse model. Localisation was assessed by IVIS Imaging following intravenous treatment of enriched MV. *Ex vivo* IVIS imaging was performed to confirm *in vivo* data. *In vivo* experiments were also conducted using MV enriched with anti-ROS-CII fused to vIL-10 and anti-mTNF therapies. Clinical scores were assessed throughout. Knee joints were harvested and snap frozen to detect the presence of enriched MV in the arthritic cartilage by confocal microscopy, and for qPCR analysis.

**Results:** Incorporation of anti-ROS-CII upon MV was observed by ImageStream. Antibodies present on the MV retained their binding capabilities, as shown by ELISA. Strong microvesicle fluorescence was detected in the arthritic cartilage of mouse tissue sections when using anti-ROS-CII enriched MV as a primary incubation.

*In vivo* studies exhibited the ability of the enriched MV to localise specifically in the arthritic joint. *Ex vivo* IVIS knee imaging confirmed *in vivo* results. *Ex vivo* knee cryosections showed the presence of enriched MV specifically within the arthritic cartilage.

*In vivo* treatment studies using anti-ROS-CII fused to anti-inflammatory therapeutics led to a significant reduction in knee swelling.

**Conclusions:** In this study we have demonstrated the ability to use aqueous energy dissemination to successfully enrich MV with antibodies. These enriched MV are able to localise in the arthritic joint and deliver anti-inflammatory therapeutics.

Overall, this study demonstrates the attainability of targeting a biological scaffold to the arthritic joint. The potential of co-delivering MV alongside anti-inflammatory therapeutics is paramount to simultaneously protect cartilage and reduce inflammation.

### RETINOIC ACID IS REGULATED BY CARTILAGE INJURY AND IS ANTI-INFLAMMATORY IN HAND OSTEOARTHRITIS

L. Zhu, H. Ismail, A. Chanalaris, M. Gardiner, T.L. Vincent, on behalf of ECHO. *Kennedy Institute of Rheumatology, Oxford, UK*

**Background:** A Genome-Wide Association Study (GWAS) in hand OA has identified the association of hypomorphic variants within *ALDH1A2* and severe hand OA (Styrkarsdottir U, et al. 2014). This gene encodes the enzyme catalysing the production of all-trans retinoic acid (atRA). atRA has an essential role in embryonic limb development, but its role in adult cartilage and in OA remains unclear. Previous work from our lab has shown that cartilage injury activates inflammatory signalling and regulates the expression of inflammatory genes.

Trapeziectomy is a surgical treatment for patients with intractable base of thumb OA and is a good source of hand OA cartilage.

**Objectives:** The aim of this study was to investigate the expression of atRA-dependent and inflammatory genes in the cartilage of patients and to examine these with respect to the presence/absence of polymorphic ALDH1A2 variants. We also investigate the regulation of atRA upon cartilage injury and its effect on injury-induced inflammatory gene regulation.

**Methods:** We collected 26 trapeziectomy samples, and dissected the cartilage within one hour of collection. Genomic DNA was extracted for the identification of the two common variants (SNP rs4238326 and SNP rs3204689). Expression levels of atRA-dependent and inflammatory genes were tested by RT-PCR.

Healthy cartilage was obtained from femoral heads of 5-week-old mice and porcine metacarpophalangeal joints of 3–6 months old pigs. Gene regulation upon cartilage injury was tested. To examine the role of specific injury-induced pathways, porcine joints were pre-injected with selective inhibitors to: TGF $\beta$ R, FGF2R, TAK1 and CYP26, 1 hour prior to injury.

**Results:** Polymorphic variants in ALDH1A2 were common in this patient population and we identified 8 patients homozygous for both variants, and 5 patients who were wild type for both variants. mRNA levels of ALDH1A2 and atRA-dependent gene CYP19A were significantly lower in the homozygous group compared to wild type (figure 1). There were also trends in the regulation of several other atRA-dependent genes. Conversely, inflammatory genes such as HAS1, TSG6 and ADAMTS5 showed a general increase in homozygous patients.

Cartilage injury in both porcine and murine tissue led to a rapid down-regulation of atRA-dependent genes (CYP26s and RARs). Injecting joints with a potent TAK1 inhibitor prevented the drop of atRA-dependent genes. Prior injection of the joint with a CYP26 (enzymes that normally break down atRA) inhibitor, restored levels of atRA-dependent genes after injury and suppressed injury-induced inflammation genes.

**Conclusions:** Polymorphic variants in ALDH1A2 are associated with significantly lower levels of ALDH1A2 and CYP19A1 mRNA in hand OA cartilage. Adult articular cartilage constitutively produces atRA, and this is strongly suppressed by mechanical injury through TAK1 activation. Preventing the drop in cellular atRA upon injury, by pre-incubating the joint with a CYP26 inhibitor, restores atRA levels and leads to a reduction in inflammatory gene regulation. These results indicate that atRA plays an important anti-inflammatory role in cartilage and provides a potential novel therapeutic strategy to treat hand OA.

#### OP0262 DISEASE MODIFYING EFFECTS OF THE CANINE IL4-10 FUSION PROTEIN IN THE CANINE GROOVE MODEL OF OSTEOARTHRITIS

E.M. Van Helvoort<sup>1</sup>, J. Popov-Celeketi<sup>1</sup>, K. Coelvelde<sup>1</sup>, A. Doornenbal<sup>2</sup>, M. Tryfonidou<sup>2</sup>, C. Wijne<sup>1</sup>, F. Lafeber<sup>1</sup>, S. Mastbergen<sup>1</sup>. <sup>1</sup>Rheumatology and Clinical Immunology, University Medical Centre Utrecht, Utrecht University; <sup>2</sup>Department of Clinical Sciences of Companion Animals, Faculty of Veterinary Medicine, Utrecht University, Utrecht, Netherlands

**Background:** An ideal disease modifying osteoarthritis (OA) drug should have analgesic, chondroprotective and anti-inflammatory effects. A fusion protein of Interleukin 4 and 10 (IL4-10FP) might have these effects.

**Objectives:** This study evaluates the effects of canine IL4-10FP (cIL4-10FP) in the canine Groove model of OA.

**Methods:** In 8 skeletally mature dogs, knee OA in the right leg was induced according to the Groove model. After 6 weeks of OA development, intra-articular injections in the affected knee with either PBS (500  $\mu$ l; n=4) or cIL4-10FP (10  $\mu$ g/500  $\mu$ l; n=4) were given weekly for 10 weeks. The contra-lateral joints served as a healthy control.

Force plate analysis (FPA) was used to determine joint loading as a surrogate marker of pain. The ratio of the affected over the contra-lateral control joint was calculated for each dog for each time point. FPA was performed before OA

induction to determine baseline values, and before and 24 hours after the 1<sup>st</sup>, 6<sup>th</sup> and 9<sup>th</sup> intra-articular injection. A linear mixed model was used to evaluate effects of injections. After 10 weeks of treatment dogs were euthanized and tissue samples were harvested. Serum Immunoglobulin G (IgG) titers against cIL4-10FP were evaluated to check for potential antibody formation.

Cartilage proteoglycan content and release of proteoglycans were determined *ex vivo* by Alcian Blue assay. Synovial inflammation was evaluated by HE-staining using OARSI grading. Changes in outcomes in the affected/treated joints compared to contra-lateral control joints were calculated.

**Results:** After OA induction a clear reduction in joint loading (increase in pain) was found (standing force and braking force). After cIL4-10FP injections these forces increased toward normalisation (cIL4-10FP vs PBS group, p=0.002 and p=0.01, respectively). No IgG elevation was detected after 10 injections. Compared to contra-lateral controls, proteoglycan content of OA PBS injected knees suggested tissue degeneration (27 vs 34 mg/g). In the cIL4-10FP treated group proteoglycan content in right knees was not different from the contralateral controls (33 vs 31 mg/g). The mean change in proteoglycan content compared to contra-lateral controls was different with a p value of 0.057 (figure 1). A similar pattern was found for the change in release of proteoglycans from the cartilage, which was less increased in the cIL4-10FP group compared to the PBS group (0.4% vs 3.0%; p=0.029, figure 1).

Synovial inflammation was mild (characteristic of this model) and did not change after intra-articular injections (0.4 and -1.3 points out of 18 for cIL4-10FP and PBS respectively).

**Abstract OP0262** – Figure 1 Chondroprotective effects of cIL4-10 fusion protein. (A) change in proteoglycan content between left (control) and right (injected) knees. Values are expressed per animal, representing a mean of 8 samples, and as median  $\pm$  IQR. (B) change in release of proteoglycans between left (control) and right (injected) knees. Values are expressed per animal, representing a mean of 8 samples, and as median  $\pm$  IQR.

**Conclusions:** Repetitive intra-articular injection with canine IL4-10FP in dogs did not lead to antibody formation. Dogs treated with cIL4-10FP showed improved joint loading compared to PBS treated dogs, reflecting an analgesic effect. Recovery of proteoglycan content and normalisation of release in cIL4-10FP treated dogs indicate a chondroprotective effect. Synovial inflammation in the Groove model was too mild to be changed significantly. These results clearly warrant further research to develop IL4-10FP as a DMOAD.

#### OP0263 CLAUDIN-11 REGULATES BONE HOMEOSTASIS VIA BIDIRECTIONAL EPHB4-EPHRIN2 SIGNALING

C.-H. Lee<sup>1\*</sup>, J.M. Baek<sup>2</sup>, Y.J. Choi<sup>3</sup>, W.-H. Yoo<sup>3</sup>, M.S. Lee<sup>4</sup>, J.-Y. Kim<sup>2</sup>. <sup>1</sup>Wonkwang University Hospital; <sup>2</sup>Anatomy, Wonkwang University, Iksan; <sup>3</sup>Internal Medicine, Chonbuk National University Hospital, Jeonju; <sup>4</sup>Internal Medicine, Wonkwang University Hospital, Iksan, Korea, Republic Of

**Background:** Claudins (Cldns) are well-established components of tight junctions (TJs) that play a pivotal role in the modulation of paracellular permeability. Several studies have explored the physiologic aspects of Cldn family members in bone metabolism. However, the effect of Cldn11, a major component of central nervous system myelin, on bone homeostasis has not been reported.

**Objectives:** This study was performed to identify the effects of Cldn on bone metabolism via regulation of osteoclast and osteoblast differentiation and their function

**Methods:** We performed various *in vitro* and *in vivo* studies using gain- and loss-of function of Cldn11 that is belong to the Cldn group. Osteoclast formation from bone marrow cells (BMC) and Osteoblast formation was evaluated in specific condition with over-expression or down-regulation of Cldn11. The expression of osteoclast associated gene and osteoblast related gene mRNA were assessed

by RT-PCR. The levels of c-fos and NFATc1 protein were assessed by western blot. Also the mitogen-activated protein (MAPK)s and important signal pathways were measured using Western blot analysis. Osteoclast function was evaluated with resorption pit assay and osteoblastic effects of Cldn11 was evaluated with new bone formation of mouse calvaria. With LPS and co-treated Recombinant protein of Cldn11 on mouse calvaria, we evaluated the effects of Cldn11 on LPS induced bone loss by using histologic analysis.

**Results:** We found that Cldn11 played a negative role in receptor activator of nuclear factor kappa B ligand dependent osteoclast (OC) differentiation by down-regulating the phosphorylated form of extracellular signal-regulated kinase (ERK), Bruton's tyrosine kinase, and phospholipase C gamma 2, in turn impeding c-Fos and nuclear factor of activated T cells c1 expression. Osteoblast (OB) differentiation by positive feedback of Cldn11 was achieved through the phosphorylation of Smad1/5/8, ERK, and c-Jun amino-terminal kinase. Importantly, this Cldn11-dependent dual event arose from targeting EphrinB2 ligand reverse signalling into OC and EphB4 receptor forward signalling into OB. In agreement with these *in vitro* effects, subcutaneous injection of Cldn11 recombinant protein exerted similar effects on local calvarial regions in mice.

**Conclusions:** These findings suggest that Cldn11 is a novel regulator in bone homeostasis.

## OP0264 GLUCOSEPANE : A NEW BIOMARKER OF THE SEVERITY OF OSTEOARTHRITIS

N. Rabbani<sup>1</sup>, U. Ahmed<sup>1</sup>, C. Lambert<sup>2</sup>, C. Legrand<sup>2</sup>, A. Anwar<sup>1</sup>, K. Rajpoot<sup>3</sup>, S. Pasha<sup>1</sup>, R.K. Davidson<sup>4</sup>, I.M. Clark<sup>4</sup>, P.J. Thormalley<sup>1</sup>, Y. Henrotin<sup>2</sup>. <sup>1</sup>Warwick Systems Biology, Clinical Sciences Research Laboratories, University of Warwick, Coventry, UK; <sup>2</sup>Bone and cartilage research unit, University of Liège, Liège, Belgium; <sup>3</sup>School of Computer Science, University of Birmingham, Birmingham; <sup>4</sup>School of biological Sciences, University of East Anglia, Norwich, UK

**Background:** Glycation, oxidation and nitration of proteins are reactions involved in accelerated ageing of tissues. The products of these reactions are used as biomarkers of chronic pathologies such as diabetes or chronic inflammatory states.

**Objectives:** In this work, we studied by mass spectrometry the levels of amino acids and glycated, oxidised or nitrated proteins in culture media of chondrocytes cultivated in multi-layers and in the blood of guinea pigs or osteoarthritis patients.

**Methods:** Sixty male, 3-week-old Dunkin-Hartley guinea pigs were used in this work. At 4-weeks-old and 8 week intervals until week 36, twelve animals were sacrificed and histological severity of knee osteoarthritis evaluated and cartilage rheological properties. Human patients with early and advanced osteoarthritis and healthy subjects were recruited. Human chondrocytes cultured in multilayers were treated for 10 days with interleukin (IL) -1 $\beta$ . Amino acids and glycated, oxidised and nitrated proteins were analysed in the serum of guinea pigs, osteoarthritis patients and in the culture medium conditioned by chondrocytes by stable isotopic dilution analysis liquid chromatography-tandem mass spectrometry using the Acquity UPLC system.

**Results:** Severity of osteoarthritis increased progressively in guinea pigs with age. Glycated, oxidised and nitrated amino acids were increased markedly at week 36. Glucosepane and dityrosine increased progressively from weeks 20

and 28, respectively. Glucosepane was positively correlated with the OA histological severity ( $r=0.58$ ,  $p<0.0001$ ) and the Young's modulus ( $r=0.52-0.56$ ,  $p<0.0001$ ). Oxidation free adducts were positively correlated with OA severity ( $p<0.0009-0.0029$ ) and hydroxyproline with cartilage thickness ( $p<0.0003-0.003$ ). In the clinical study, plasma glucosepane was increased 38% in patients with early osteoarthritis ( $p<0.05$ ) and 6-fold in patients with advanced osteoarthritis ( $p<0.001$ ) compared to healthy subjects. IL-1 $\beta$  increased the release of glycated, oxidised and nitrated products from chondrocytes *in vitro*.

**Conclusions:** The glycation, oxidation and nitration of proteins are reactions related to the severity of osteoarthritis. The products of these reactions are measurable in blood by mass spectrometry and could be biomarkers of osteoarthritis. More specifically, glucosepane is an advanced glycation product very strongly increased in the severe form of the disease. In conclusion, serum glucosepane is a potential biomarker for diagnosis and progression of osteoarthritis.

## OP0265 LOCAL REACTIVATION OF GLUCOCORTICOIDS BY 11 $\beta$ -HYDROXYSTEROID DEHYDROGENASE TYPE 1 MEDIATES THE DEVELOPMENT OF GLUCOCORTICOID-INDUCED BONE LOSS

C. Fenton<sup>1,2</sup>, C. Doig<sup>1</sup>, S. Fareed<sup>1</sup>, A. Naylor<sup>2</sup>, C. Wehmeyer<sup>2</sup>, C. Buckley<sup>2</sup>, G. Lavery<sup>1</sup>, M. Cooper<sup>3</sup>, K. Raza<sup>2</sup>, R. Hardy<sup>1,2</sup>. <sup>1</sup>Institute of Metabolism and Systems Research; <sup>2</sup>Institute of Inflammation and Ageing, University of Birmingham, Birmingham, UK; <sup>3</sup>ANZAC Research Institute, University of Sydney, Sydney, Australia

**Background:** Due to the potent immunomodulatory and anti-inflammatory nature of glucocorticoids (GCs) they are routinely used in the treatment of inflammatory diseases such as rheumatoid arthritis. However their therapeutic potential is limited due to the prevalence of adverse side effects associated with long term GC exposure such as osteoporosis, insulin resistance and obesity. 11 $\beta$ -hydroxysteroid dehydrogenase type 1 (11 $\beta$ -HSD1) is a bi-directional enzyme that primarily converts inactive GCs to their active counterparts. Previously, local reactivation of GCs by 11 $\beta$ -HSD1 has been shown to play a major role in the metabolic side effects associated with GC excess.

**Objectives:** We aim to assess whether local reactivation of GCs by 11 $\beta$ -HSD1 mediates the adverse effects of therapeutic GCs on bone.

**Methods:** Wild-type (WT) mice and transgenic mice with a global 11 $\beta$ -HSD1 knockout (11 $\beta$ KO) were treated with the active murine GC corticosterone (CORT) (100 mg/ml) for 4 weeks. Tibia and humerus bones were excised post-mortem for micro-CT analysis, gene expression analysis and three point flexure strength (TFS) tests. Serum was collected from mice for ELISA analysis of TRAcP-5b and P1NP.

**Results:** Micro-CT analysis of bone volume to tissue volume (BV/TV), trabecular thickness (TT) and trabecular number (TN) found no significant differences between untreated WT and 11 $\beta$ KO mice (BV/TV: WT 8.5% $\pm$ 0.66 vs 11 $\beta$ KO 7.5% $\pm$ 0.76, NS; TT: WT 96.5  $\mu$ m $\pm$ 3.8 vs 11 $\beta$ KO 95.8  $\mu$ m $\pm$ 6.4, NS; TN: WT 0.0009 1/ $\mu$ m $\pm$ 0.00004 vs 11 $\beta$ KO 0.0008 1/ $\mu$ m $\pm$ 0.00004, NS). Humerus TFS tests of WT and 11 $\beta$ KO animals also showed no significant differences (WT 51.2 MPa $\pm$ 15.1 vs 11 $\beta$ KO 49.2 MPa $\pm$ 4.9, NS). All bone parameters were decreased in CORT fed WT mice indicating the development of osteoporosis, whilst 11 $\beta$ KO mice were protected against many of the detrimental effects of CORT (BV/TV: WT 4.2% $\pm$ 0.38 vs 11 $\beta$ KO 7.2% $\pm$ 0.71,  $p\leq 0.05$ ; TN: WT 0.0006 1/ $\mu$ m $\pm$ 0.00004 vs 11 $\beta$ KO 0.0009 1/ $\mu$ m $\pm$ 0.00008,  $p\leq 0.001$ ; HBS: WT 27.1 MPa $\pm$ 5.6 vs 11 $\beta$ KO $\pm$ 5.0 MPa $\pm$ 5.1,  $p\leq 0.05$ ). ELISA analysis of mouse serum showed no significant differences in the bone resorbing osteoclast marker TRAcP-5b amongst the groups, whereas analysis of the bone forming osteoblast marker P1NP revealed a significant increase in CORT fed 11 $\beta$ KO mice compared with CORT fed WT mice (11 $\beta$ KO 158.6 ng/ml $\pm$ 53.1 vs WT 31.4 ng/ml $\pm$ 7.4,  $p\leq 0.05$ ). Gene expression of the mature osteoblast markers ALP (alkaline phosphatase) and BGLAP (osteocalcin) showed significant increases in CORT fed 11 $\beta$ KO animals compared to CORT fed WT animals (ALP: 11 $\beta$ KO 0.0074 AU  $\pm$ 0.0012 vs WT 0.0022 AU  $\pm$ 0.0007,  $p\leq 0.01$ ; BGLAP: 11 $\beta$ KO 0.27 AU  $\pm$ 0.04 vs WT 0.02 AU  $\pm$ 0.01,  $p\leq 0.001$ ). No significant differences were observed between untreated WT and 11 $\beta$ KO animals.

**Conclusions:** These data suggest that local reactivation of GCs by 11 $\beta$ -HSD1 mediates the development of glucocorticoid-induced osteoporosis by inhibiting osteoblastic bone formation.

## Seeking the pathophysiology of rheumatoid arthritis and spondylarthritis

### OP0266 SYNOVIAL TISSUE PROFILING IN AUTOANTIBODY POSITIVE AT RISK INDIVIDUALS REVEALS GENE SIGNATURES ASSOCIATED WITH LATER DEVELOPMENT OF RHEUMATOID ARTHRITIS

L.G. Van Baarsen<sup>1,2</sup>, M.J. de Hair<sup>1</sup>, J.F. Semmelink<sup>1,2</sup>, I.Y. Choi<sup>1</sup>, D.M. Gerlag<sup>3,4</sup>, P. Tak<sup>3,5,6,7</sup>, <sup>1</sup>Amsterdam Rheumatology and immunology, department of Clinical Immunology and Rheumatology; <sup>2</sup>Experimental Immunology; <sup>3</sup>Clinical Immunology and Rheumatology, Academic Medical Center/University of Amsterdam, Amsterdam, Netherlands; <sup>4</sup>Current: Clinical Unit Cambridge, GlaxoSmithKline, Cambridge; <sup>5</sup>GlaxoSmithKline, Stevenage; <sup>6</sup>University of Cambridge, Cambridge, UK; <sup>7</sup>Ghent University, Ghent, Belgium

**Background:** Previous work has suggested subtle infiltration of synovial T cells<sup>1</sup> in the absence of overt synovial inflammation<sup>2</sup> in individuals at risk of developing rheumatoid arthritis (RA).

**Objectives:** To study the molecular changes in synovium preceding arthritis development in preclinical RA.

**Methods:** We included sixty-seven individuals who were IgM rheumatoid factor (RF) and/or anti-citrullinated protein antibody (ACPA) positive and without any evidence of arthritis. All individuals underwent mini-arthroscopic synovial biopsy sampling of a knee joint at inclusion and were prospectively followed. First, an explorative genome-wide transcriptional profiling study was performed on synovial biopsies obtained from 13 individuals using Agilent arrays (test cohort). Survival analysis was used to identify transcripts with a significant association with arthritis development. The expression level of differentially expressed genes was validated using quantitative real-time PCR in the total cohort. Immunohistochemistry was used to study gene candidates at protein level *in situ*.

**Results:** Six of the 13 individuals in the explorative study developed RA after a median follow up time of 20 months (IQR 2–44). The 7 individuals who did not develop RA had a median follow up time of 85 months (IQR 69–86). Using a False Discovery Rate of <5% we found that increased expression of 3151 transcripts correlated with a higher risk of arthritis development, and increased expression of 2437 transcripts correlated with a lower risk. Gene Set Enrichment Analysis revealed that synovial biopsies of individuals who developed RA after follow up display higher expression of genes involved in several immune response-related pathways (e.g. T cell and B cell receptor pathways, cytokine and chemokine signalling and antigen processing and presentation) compared with biopsies of individuals who did not develop RA. In contrast, lower expression was observed for genes involved in e.g. extracellular matrix receptor interaction, Wnt-mediated signal transduction and lipid metabolism. Subsequently, the expression level of a selection of 27 differentially expressed genes was validated by quantitative real-time PCR in 61 RA-risk individuals. Two-way hierarchical cluster analysis classified the individuals into two groups, where those individuals who developed RA (n=16) showed a preference to cluster together in the left arm of the dendrogram (Chi2 p=0.03).

Immunohistochemistry analyses (n=54) showed an abundant expression of CXCL12 and CXCR4 already in most RA-risk individuals. Synovial biopsies from RA-risk individuals who developed arthritis were more likely to show a positive gp38 staining and lower lipid staining.

**Conclusions:** This study clearly shows molecular changes appearing in synovial tissue before onset of arthritis in the absence of overt synovitis. Preclinical synovial alterations in immune response genes and lipid metabolism were associated with development of arthritis.

OP0267

### THE PADI4 GENE PROMOTER METHYLATION LEVEL IS ASSOCIATED WITH ANTI-PADI4 ANTIBODIES LEVEL AND RA ACTIVITY

B. Kolarz<sup>1</sup>, M. Dryglewska<sup>2</sup>, M. Ciesla<sup>1</sup>, A. Selwa<sup>3</sup>, M. Majdan<sup>2</sup>. <sup>1</sup>Faculty of Medicine, University of Rzeszow, Rzeszow; <sup>2</sup>Department of Rheumatology and Connective Tissue Diseases, Medical University of Lublin; <sup>3</sup>Department of Rheumatology and Connective Tissue Diseases, Independent Public Teaching Hospital No 4 in Lublin, Lublin, Poland

**Background:** Rheumatoid arthritis (RA) is a chronic, autoimmune, inflammatory disease that predominantly affects the synovial membrane leading to joint destruction. Anti-citrullinated protein antibodies (ACPA) are important markers of RA. They recognise post-translationally modified auto-antigens generated by enzymes peptidylarginine deiminases (PADIs) mostly type 4 (PADI4), which transform arginine to new amino acid citrulline in various proteins. There were also identified anti-PADI4 antibodies (anti-PADI4) which are a specific marker of RA. DNA methylation plays a key role in the control of gene expression. The process concerns CpG islands in promoter regions of about 75% of genes and leads to gene silencing when over-expressed. It is possible that PADI4 production is also regulated via methylation.

**Objectives:** We aimed to identify if there is an association between PADI4 gene promoter methylation degree, anti-PADI4 antibodies level and RA activity.

**Methods:** A total of 155 unrelated patients, 125 with RA, 83.2% female, aged 52.2±12.3 years (mean ±SD) and 30 healthy controls (HC), 76.7% female, aged 53.2±8.1 years, were enrolled. RA patients were divided according DAS28 score into 4 groups as shown in table 1. Whole blood and serum samples were collected and stored at -80°C until analysis. DNA was extracted from whole blood and stored at -80°C until analysis. Two single-nucleotide polymorphisms (SNPs) of the PADI4 gene (PADI-94, rs2240340 and PADI-104, rs1748033) were determined by TaqMan genotyping. Quantitative real-time methylation-specific PCR (qMSP) was used to analyse the methylation status of promoter region in PADI4 gene. Anti-PADI4 antibodies were evaluated in serum by ELISA.

**Results:** We found the differences in anti-PADI4 level between RA severe and HC group (p<10<sup>-5</sup>), RA moderate and HC (p<10<sup>-5</sup>), RA low activity and HC (p<0.05) and in PADI4 methylation group between RA severe and RA remission (p<0.05), RA moderate and RA remission (p<10<sup>-3</sup>) and RA moderate and HC (p<10<sup>-2</sup>). What is interesting is that methylation level in the RA remission group is higher than in the HC. The intensity of PADI4 methylation correlates with anti-PADI4 antibodies level and DAS28 score with r<sub>s</sub>=-0.2 and -0.36 respectively (both p-values<0,05) and anti-PADI4 level is associated with DAS28 score (r<sub>s</sub>=0.38).

Abstract OP0267 – Table 1

	RA Severe DAS28>5.1; 27.2%	RA Moderate DAS28>3.2– 5.1; 36.8%	RA Low (DAS28>2.6– 3.2; 15.2%)	RA Remission (DAS28≤2.6; 20.8%).	Healthy Control (HC)
PADI4	1.32	1.14	1.98	2.12	1.86
Metylation	[0.79–2.27]	[0.69–1.82]	[1.37–2.48]	[1.73–2.94]	[1.62–3.49]
Anti-PADI4	731.03	716.11	589.57	455.54	293.25
[U/ml]	[477.98– 1288.1]	[400.85– 1250.8]	[306.08– 2380.2]	[271.26– 1104.9]	[234.39– 389.12]

Data are given by median [interquartile range]

**Conclusions:** We demonstrate the novel finding that elevated methylation of PADI4 gene promoter is associated with lower RA activity and lower level of anti-PADI4 antibodies and might play a role in pathophysiology of RA or be used as future therapeutic target. The data suggest that PADI4 enzyme synthesis is epigenetically regulated by its gene promoter methylation.

OP0268

### APOPTOSIS OF SYNOVIAL FIBROBLASTS INDUCED BY P53-DERIVED HYBRID PEPTIDES THROUGH DISSOCIATING THE BINDING OF P73 WITH IASPP TO INCREASE PUMA AND BAX EXPRESSION

C.-R. Wang<sup>1</sup>, S.-Y. Chen<sup>1</sup>, A.-L. Shiau<sup>2</sup>, C.-L. Wu<sup>3</sup>. <sup>1</sup>Internal Medicine, National Cheng Kung University Hospital; <sup>2</sup>Microbiology and Immunology; <sup>3</sup>Biochemistry and Molecular Biology, National Cheng Kung University Medical College, Tainan, Taiwan, -

**Background:** In rheumatoid arthritis (RA) synovial fibroblasts (SFs), mutant p53 can lead to transformation-like features resistant to the apoptosis induction.<sup>1</sup> Deficiency in p53-mediated suppression by its dominant-negative counterpart is observed in human cancers with activating p73 as a therapeutic strategy in such patients.<sup>2</sup> A p53-derived hybrid peptide 37 amino acid (37AA) can inhibit the p73 binding with inhibitory apoptosis stimulating protein of p53 (IASPP), thus activating the downstream apoptosis signalling pathway in tumour cells.<sup>3</sup>

**Objectives:** We hypothesised that p73 is involved in the RA pathogenesis, and examined whether p53-derived hybrid peptides can activate p73 to induce apoptosis of SFs by using adenoviral vectors encoding 37AA (Ad37AA) to transduce SFs *in vitro* and inject collagen-induced arthritis (CIA) joints *in vivo*.

**Methods:** Mononuclear cells (MNCs) from RA patients before and after receiving the adalimumab therapy were examined for iASPP expression by real-time RT-PCR. Synovial tissues and SFs from RA patients and CIA rats were subjected to immunohistochemical and immunofluorescent staining and real-time RT-PCR for the p73 and iASPP expression. SFs transduced with Ad37AA, were subjected to TUNEL assay for apoptotic status and real-time RT-PCR for the expression of downstream apoptosis signalling molecule PUMA and Bax. SFs were transduced with lentiviral vectors-encoding short hairpin p73 RNA to produce p73-silenced SF transfectants. Therapeutic effects of Ad37AA injection were evaluated on CIA joints. Immunohistochemical staining and TUNEL assay were used to analyse synovial cadherin-11/PUMA/IL-6 expression and apoptotic cells, respectively.

**Results:** There were reduced iASPP levels by targeting TNF in RA MNCs, and increased p73 with co-localised iASPP expression in synovial lining layers and SFs from RA patients and CIA rats. Enhanced cell apoptosis, increased PUMA and Bax expression and lower iASPP-associated p73 levels were identified in Ad37AA-transduced SFs, and silencing p73 abrogated the increased PUMA and Bax expression. Articular indexes and histologic scores were reduced in Ad37AA-injected joints with decreased SF densities, increased apoptotic cells, higher PUMA expression and lower IL-6 levels.

**Conclusions:** These results demonstrate that injecting p53-derived hybrid peptides can induce apoptosis of SFs through the activation of p73 in the rheumatoid joint, suggesting that strengthening the p73-dependent apoptotic mechanism is a potential therapeutic strategy in RA patients.

### ACTIVATION OF MERTK+CD206+ SUBPOPULATION OF HUMAN SYNOVIAL TISSUE-RESIDENT MACROPHAGES LIMITS INFLAMMATORY RESPONSE

S.R. Finlay<sup>1</sup>, S. Alivernini<sup>2</sup>, A. Elmesari<sup>1</sup>, B. Toluoso<sup>3</sup>, L. Perticca<sup>3</sup>, C. Di Mario<sup>3</sup>, A. Capacci<sup>3</sup>, A. Filer<sup>4</sup>, G. Ferraccioli<sup>3</sup>, I. McInnes<sup>1</sup>, E. Gremese<sup>3</sup>, M. Kurowska-Stolarska<sup>1</sup>. <sup>1</sup>Institute of Infection, Immunity and Inflammation, Glasgow, UK; <sup>2</sup>Institute of Rheumatology, Fondazione Policlinico Universitario A. Gemelli; <sup>3</sup>Institute of Rheumatology, Fondazione Policlinico Universitario A. Gemelli, Rome, Italy; <sup>4</sup>Institute of Infection, Inflammation and Ageing, Birmingham, UK

**Background:** Current therapies have transformed the management of rheumatoid arthritis. However, there are still a substantial proportion of patients who do not respond to treatments, and among those who respond, only small proportion achieve disease remission. We showed previously that human synovial tissue macrophages (STMs) are a heterogeneous population; and a sub-population of CD206<sup>+</sup>MertK<sup>+</sup> positive STMs predominates in RA patients in sustained remission, in contrast to patients with active RA. Their surface receptors, e.g. MerTK, and distinct transcriptomes suggest that they may play a pivotal role in re-enforcing joint homeostasis during remission.<sup>1</sup> Thus, we hypothesise that activation of

CD206<sup>+</sup>MerTK<sup>+</sup> human synovial tissue macrophages contribute to the resolution of inflammation.

**Objectives:** We aimed to investigate whether activation of MerTK in STM sub-population promotes an anti-inflammatory environment in the synovium.

**Methods:** Using flow cytometric techniques and with a specific antibody panel design,<sup>1</sup> STMs from digested RA synovial biopsies (n=36) were phenotyped and/or harvested. Patients' group included 28 patients with active disease and 8 patients in remission (DAS28 ESR <2.6 and power doppler negative). After excluding all other cell types, macrophages were gated based on the expression of CD64 and CD11b (CD45<sup>pos</sup>CD64<sup>pos</sup>CD11b<sup>pos</sup>HLA-DR<sup>pos</sup>).<sup>1</sup> Two distinct sub-populations: CD206<sup>+</sup>MerTK<sup>+</sup> and CD206<sup>-</sup>MerTK<sup>-</sup> were sorted and cultured on a collagen coated 96-well plate at 1000 cells per well in the presence of with LPS (10 ng/ml)±Gas6, a MerTK ligand (200 ng/ml), for 24 hour. TNF production was measured with a high sensitivity ELISA.

**Results:** As previously shown,<sup>1</sup> RA patients in sustained remission have a majority of CD206<sup>+</sup>MerTK<sup>+</sup> STMs whilst patients with active RA show an increased number of CD206<sup>-</sup>MerTK<sup>-</sup> macrophages. The percentage of CD206<sup>+</sup>MerTK<sup>+</sup> macrophages negatively correlated with the disease activity score. Stimulation of FACS-Aria sorted CD206<sup>+</sup>MerTK<sup>+</sup> and CD206<sup>-</sup>MerTK<sup>-</sup> macrophages with TLR4 ligand induced TNF production. However, activation of MerTK pathway by Gas6 inhibited LPS-induced TNF production by CD206<sup>+</sup>MerTK<sup>+</sup> subpopulation.

**Conclusions:** CD206<sup>+</sup>MERTK<sup>+</sup> macrophages, which predominate in RA patients in remission, have Gas6-mediated negative feedback mechanism limiting TNF production. Thus, Gas6/MerTK pathway in synovial tissue macrophages could drive the resolution of inflammation and synovial tissue homeostasis. Further functional and transcriptomics studies will reveal the therapeutic potential of CD206<sup>+</sup>MERTK<sup>+</sup> macrophages.

OP0270

### IGA ANTI-CCP ANTIBODIES ARE DETECTABLE IN THE SALIVA BUT NOT SPUTUM OF INDIVIDUALS AT-RISK OF DEVELOPING RHEUMATOID ARTHRITIS

K. Mankia<sup>1</sup>, P. Pentony<sup>1</sup>, L. Hunt<sup>1</sup>, Y. El-Sherbiny<sup>2</sup>, L. Duquenne<sup>1</sup>, D. Corscadden<sup>2</sup>, T. Do<sup>3</sup>, J. Meade<sup>3</sup>, D. Devine<sup>3</sup>, P. Emery<sup>1</sup>. <sup>1</sup>Rheumatology, Leeds Institute of Rheumatic and Musculoskeletal Medicine and NIHR Leeds Biomedical Research Centre; <sup>2</sup>Rheumatology, Leeds Institute of Rheumatic and Musculoskeletal Medicine; <sup>3</sup>Oral Microbiology, University of Leeds, Leeds, UK

**Background:** Recent evidence suggests the initiation of rheumatoid arthritis (RA) – related autoimmunity may occur by local citrullination at the oral mucosa and lungs. IgA antibodies are the hallmark of mucosal immunity; the majority of saliva IgA antibodies are locally produced whereas IgG antibodies are largely serum derived.<sup>1</sup> Furthermore, IgA anti-CCP antibodies have recently been described in the sputum of at-risk individuals.<sup>2</sup> The relative importance of the oral and lung mucosa in disease initiation is, however, unclear and the prevalence of saliva and sputum anti-CCP antibodies in the same at-risk individuals has not been reported.

**Objectives:** To investigate the prevalence of IgA anti-CCP antibodies in the saliva and sputum of seropositive individuals at risk of developing RA.

**Methods:** Anti-CCP positive individuals with no evidence of clinical synovitis (CCP+), anti-CCP positive RA patients (RA) and healthy controls (HC) matched for age and smoking status were recruited. Unstimulated saliva and serum samples were collected. Induced sputum samples were obtained using 7% saline via ultrasonic nebuliser (UltraNeb 3000 DA, Devilbiss, Germany). Sputum was mixed with phosphate buffered saline, mechanically disrupted and centrifuged to obtain supernatant. IgA and IgG anti-CCP antibodies (anti-CCP2, immunocap assay, Phadia) were measured in all saliva, sputum and serum samples. IgA and saliva/sputum IgG anti-CCP titres exceeding the 95th centile in HC were considered positive.

**Results:** 55 CCP+, 40 RA and 32 HC were recruited and had saliva and serum collected. 24 CCP+, 14 RA and 22 HC had sputum and serum collected. Of these, 23 CCP +and 7 RA patients provided simultaneous saliva, sputum and serum samples. 8/55 (15%) CCP +and 10/40 (25%) RA patients had positive saliva IgA anti-CCP levels compared with 1/31 (3%) HC. 23/54 (43%) CCP +and 21/48 (44%) RA patients had positive serum IgA anti-CCP levels compared with 1/32 (3%) HC (table 1). Of note, 7/18 (39%) patients with a positive saliva IgA anti-CCP test had a negative serum IgA anti-CCP test, suggesting localised production and accumulation of IgA anti-CCP antibodies rather than transfer from the serum. Only 1/24 CCP+ (4%) and 1/14 (7%) RA patients had positive sputum IgA anti-

CCP levels. No patients had IgA anti-CCP detectable in both saliva and sputum samples.

#### Abstract OP0270 – Table 1

	Anti-CCP positive results (%)					
	Saliva IgA	Sputum IgA	Serum IgA	Saliva IgG	Sputum IgG	Serum IgG
HC	1/31 <sup>(1)</sup>	1/22 <sup>(1)</sup>	1/32 <sup>(1)</sup>	1/31 <sup>(1)</sup>	0/22 (0)	0/32 (0)
CCP+at-risk	8/55 <sup>(15)</sup>	1/24 <sup>(1)</sup>	23/54 <sup>(43)</sup>	23/54 <sup>(43)</sup>	10/24 <sup>(42)</sup>	50/54(93)
RA	10/40 <sup>(25)</sup>	1/14 <sup>(7)</sup>	21/48 <sup>(44)</sup>	23/42(55)	9/14(64)	47/48(98)

**Conclusions:** We found an increased prevalence of saliva but not sputum IgA anti-CCP antibodies in seropositive at-risk individuals. These findings support the concept that localised RA-related autoimmunity in at risk individuals can be site specific. IgA anti-CCP antibodies at the oral mucosa precede arthritis and may represent an important step in the initiation and propagation of disease.

#### OP0271 GASTROINTESTINAL DAMAGE AND MICROBIAL TRANSLOCATION ARE INVOLVED IN THE DEVELOPMENT OF IMMUNE SYSTEM ACTIVATION IN INFLAMMATORY BOWEL DISEASE-ASSOCIATED SPONDYLOARTHRITIS

D. Benfaremo<sup>1</sup>, M.M. Luchetti<sup>1</sup>, F. Ciccio<sup>2</sup>, C. Avellini<sup>1</sup>, T. Spadoni<sup>1</sup>, S. Svegliati<sup>1</sup>, M. Ciferri<sup>1</sup>, A. Gabrielli<sup>1</sup>. <sup>1</sup>Dipartimento di Scienze Cliniche e Molecolari, Università Politecnica delle Marche, Ancona; <sup>2</sup>Dipartimento Biomedico di Medicina Interna e Specialistica, U.O. di Reumatologia, Palermo, Italy

**Background:** The altered composition of the gastrointestinal (GI) microbiota, known as dysbiosis, can induce and modulate the systemic inflammation, through microbial translocation and T-cell activation, in several immuno-mediated diseases, such as inflammatory bowel disease (IBD), HIV infection, and ankylosing spondylitis.

**Objectives:** In a cohort of 85 patients with inflammatory bowel disease-associated spondyloarthritis (SpA/IBD), we assessed gut bacterial infiltration and intestinal damage. In systemic circulation, GI epithelial damage, microbial translocation and immune system activation were assessed with intestinal-fatty acid binding protein (I-FABP), lipopolysaccharide (LPS), soluble CD14 (sCD14), respectively. Moreover, the *in vitro* activity of the latter two was evaluated on osteoblast cells.

**Methods:** I-FABP, LPS, sCD14, sclerostin (SOST) and anti-SOST antibodies (anti-SOST-IgG) were assayed with ELISAs. LPS and sCD14 were used *in vitro* to stimulate the MG63 human osteoblast-like cell line. Occludin, claudin-1, claudin-4, and the presence of bacteria were assessed, respectively, by real-time-PCR analysis and immunohistochemical staining of the ileum.

**Results:** Bacteria were detectable in the ileal epithelium of IBD patients, but only in SpA/IBD they were associated with epithelial damage and downregulation of occludin, claudin-1 and claudin-4 (figure 1A-B).

The serum levels of I-FABP, LPS and sCD14 resulted significantly higher in axial (187.9, 14.03, and 26.97, respectively) and peripheral SpA/IBD (130.3, 11.55, and 18, respectively) than in IBD patients (IFABP 43.65,  $p < 0.0001$  for both patients' groups; LPS 9.625,  $p < 0.0001$  vs Ax-SpA/IBD and =0.007 vs Per-SpA/IBD; sCD14 12.34,  $p < 0.0001$  for both patients' groups) (figure 1C).

In the SpA/IBD cohort, SOST was weakly correlated with I-FABP ( $r = -0.2683$ ), LPS ( $r = -0.3063$ ) and sCD14 ( $r = -0.3075$ ), and anti-SOST-IgG with LPS ( $r = 0.3959$ ) and sCD14 ( $r = -0.3414$ ). Moreover, sCD14 showed significant correlation with I-FABP ( $r = 0.3316$ ) and LPS ( $r = 0.5649$ ).

*In vitro*, LPS, but not sCD14, significantly induced SOST expression through the upregulation of both Wnt3a and Wnt5a and the downregulation of the b-catenin proteins (figure 1D). On the opposite, the combination of LPS and sCD14 downregulated SOST expression through the upregulation of ERK1/2 and b-catenin protein (figure 1D).

**Abstract OP0271 – Figure 1** A. immunohistochemical staining of ileal bacteria. Ten ileal samples of patients affected by SpA/IBD or IBD were stained for bacteria infiltration (upper panel). Lower (from left to right): Gram and LPS staining of the same samples. B. Analysis of ileal tight-junctions proteins expression. From the left to the right: Ten ileal samples of patients affected by SpA/IBD or IBD were stained for occludin (and claudin-1 and -4, data not shown); count of occludin positive cells and quantitative real-time-PCR of occludin (and claudin-1 and -4, data not shown) expression in the same ileal samples. C. analysis of I-FABP, LPS and sCD14 serum levels in SpA/IBD and IBD patients. ELISAs assays were carried out in 45 patients with axial and 40 patients with peripheral SpA/IBD, and compared with IBD or HC. D. Western-blot analysis of MG-63 osteoblast-cells. The MG-63 osteoblast-like cell line was stimulated with LPS ± sCD14 *in vitro* and then cells were harvested for western blot analysis. Semi-quantitative densitometric analysis of the protein bands was carried out on the blot (data not shown). Statistical analysis: Kruskal-Wallis analysis. \*\* $p < 0.01$ ; \*\*\*\* $p < 0.0001$ ; if not reported:  $p$  non significant. Abbreviations. SpA/IBD: inflammatory bowel disease-associated spondyloarthritis; ax-SpA/IBD: axial SpA/IBD; peripheral SpA/IBD; IBD: Inflammatory bowel disease; HC: healthy controls; I-FABP: intestinal fatty acid binding protein; LPS: bacterial lipopolysaccharide; sCD14: soluble CD14; ERK 1/2: extracellular Signal-regulated Kinase-1/2. Wnt: wingless protein family; SOST: sclerostin.

**Conclusions:** The role of gut inflammation and microbial translocation in the onset of arthritis in IBD patients are still under investigation. We have demonstrated that in SpA/IBD there is a significant bacterial infiltration of the ileal tract, associated with the downregulation of tight-junctions' proteins (occludin, claudin-1 and claudin-4) and epithelial damage, that cause microbial translocation and higher plasma levels of I-FABP, LPS, and sCD14. LPS and sCD14, thus, could trigger a complex systemic inflammatory response acting on several biochemical pathways, linking the immune system (anti-SOST-IgG) and the bone (SOST).

#### OP0272 INFLAMMATION AT BARRIER TISSUES SUCH AS SKIN AND GUT TRIGGERS MILD JOINT INFLAMMATION AND IS INFLUENCED BY BIOMECHANICAL STRESS INDUCED BY FORCED-RUNNING

G.R. Gulino<sup>1</sup>, M. Van Mechelen<sup>1,2</sup>, R. Lories<sup>1,2</sup>. <sup>1</sup>Skeletal Biology and Engineering, KU Leuven; <sup>2</sup>Division of Rheumatology, UZ Leuven, Leuven, Belgium

**Background:** The factors triggering the onset of psoriatic arthritis (PsA) and other forms of spondyloarthritis (SpA) are mostly unknown. These joint diseases are clinically associated with psoriasis (PsO) and inflammatory bowel disease (IBD). The three pathologies share the common leitmotiv of chronic inflammation and all of them have an at least partially shared genetic susceptibility. Enteses, the attachment sites of tendons and ligaments into the bones, are considered as a primary disease localization and a site of biomechanical stress. Increasing evidence supports the hypothesis that biomechanical stress, together with inflammatory triggers such as antigens and changes in the microbiome, can contribute to the onset of PsA and SpA by inducing local microdamage in the enteses.

**Objectives:** Here, we aim to understand early events leading to PsA and SpA by combining a protocol of forced exercise in mice with simultaneous locally-induced cutaneous or intestinal inflammation.

**Methods:** Forty 8 weeks old C57/Bl6 male mice were used to induce the PsO- or IBD-like disease, respectively by serial applications of imiquimod cream (IMQ) on a shaved area of the back skin, and administration to the intestine of dextran sodium sulphate (DSS) dissolved in drinking water. Forty control mice were left

untreated. After induction of inflammation, we applied a protocol of forced treadmill running to increase biomechanical stress in half of the mice. Control mice with or without IMQ or DSS treatment did not run. We evaluated skin and gut disease severity clinically and by histology, and performed microCT scans, histological and immunohistochemical analyses of the knees and the paws, to investigate eventual changes occurring in the joints.

**Results:** Clinical and histological assessment of the skin or gut confirmed successful induction of cutaneous and intestinal inflammation. The exercise protocol slightly affected the severity of the PsO- but not of the IBD-like disease in mice. In both models, disease was not confined to the target organs as systemic inflammation was demonstrated by trabecular bone loss, as indicated by microCT analyses, and by changes in spleen size. The exercise protocol did not appear to have an additional effect on these systemic disease manifestations, but it is associated with increased articular cartilage thickness and cellularity. Signs of mild joint inflammation were seen for both the IMQ and DSS models. Mild synovitis was triggered by skin and gut disease. At the entheseal level, immunohistochemical detection for CD45<sup>+</sup> cells showed that forced exercise boosts inflammation in the presence of inflammation triggered at a distant site.

**Conclusions:** Induction of PsO- or IBD-like inflammation by local treatments of immune-privileged barrier tissues, such as skin and gut, also triggers a systemic response with inflammation-associated bone loss and discrete signs of joint disease. Forced running exercise increased the degree of enthesitis in this setting, providing new support for the hypothesis that biomechanical stress contributes to disease manifestations in PsA and other forms of spondyloarthritis.

#### OP0273 TRANSMEMBRANE TNF SIGNALLING THROUGH TNF-RI INDUCES SPA-LIKE INFLAMMATION, WHEREAS SIGNALLING THROUGH TNF-RII IS CRUCIAL FOR NEW BONE FORMATION

M. van Tok<sup>1</sup>, D. Pots<sup>1</sup>, I. Blijdorp<sup>1</sup>, M. Armaka<sup>2</sup>, G. Kollias<sup>2</sup>, M. van de Sande<sup>1</sup>, D. Baeten<sup>1</sup>, L. Van Duivenvoorde<sup>1</sup>. <sup>1</sup>*Clinical Immunology And Rheumatology, Amsterdam Medical Center, Amsterdam, Netherlands;* <sup>2</sup>*Division of Immunology, Biomedical Sciences Research Center 'Alexander Fleming', Vari, Greece*

**Background:** TNF can drive strictly distinct inflammatory pathologies depending on its expression form. Previously, we have shown that transmembrane (tm) TNF rather than soluble TNF contributes to key pathological features of spondyloarthritis (SpA), including new bone formation.<sup>1</sup>

**Objectives:** Delineate the cellular and molecular mechanisms by which selective tmTNF overexpression leads to SpA-like pathology.

**Methods:** tmTNF tg mice (TgA86)<sup>2</sup> were crossed with TNF-RI or TNF-RII knock out mice. Animals were followed for 100 days for clinical symptoms of arthritis and spondylitis development. Histology was performed at the end of the study on both peripheral and axial joints. Calvarial mouse fibroblasts were cultured in osteogenic conditions. Differentiation towards osteoblasts was analysed by alizarin red staining, alkaline phosphatase (ALP) staining as well as by qPCR for collagen type I, II, and X, ALP and RUNX2.

**Results:** Clinical arthritis, visualised by swelling and deformation of front- and hind paws, was observed in 100% of the tmTNF<sup>+/WT</sup> (>20) as well as in all tmTNF<sup>+/WT</sup>xTNF-RII<sup>-/-</sup> mice (7/7) but not in tmTNF<sup>+/WT</sup>xTNF-RI<sup>-/-</sup> mice (0/9). Histologically, peripheral synovitis, osteitis and enthesitis were observed in all tmTNF<sup>+/WT</sup> and tmTNF<sup>+/WT</sup>xTNF-RII<sup>-/-</sup> mice, confirming previous findings that tmTNF-mediated synovitis requires the presence of the TNF-RI receptor.<sup>2</sup> Similarly, hunch back formation and crinkled tails were observed in the tmTNF<sup>+/WT</sup> and the tmTNF<sup>+/WT</sup>xTNF-RII<sup>-/-</sup> mice but not in tmTNF<sup>+/WT</sup>xTNF-RI<sup>-/-</sup> mice. Histology confirmed the presence of inflammatory cellular infiltrates at the edge of the intervertebral units in all tmTNF<sup>+/WT</sup> tg mice and all tmTNF<sup>+/WT</sup>xTNF-RII<sup>-/-</sup> mice, but not in tmTNF<sup>+/WT</sup>xTNF-RI<sup>-/-</sup> mice. Whereas these data indicate that TNF-RI is required for tmTNF-induced inflammation, it was striking that 50% (10/20) of the tmTNF<sup>+/WT</sup> versus none (0/7) of the tmTNF<sup>+/WT</sup>xTNF-RII<sup>-/-</sup> mice depicted clear histological signs of endochondral new bone formation. To test whether TNF-RII is involved in pathological new bone formation in this model, calvarial fibroblasts skulls from tmTNF<sup>+/WT</sup>, tmTNF<sup>+/WT</sup>xTNF-RI<sup>-/-</sup>, tmTNF<sup>+/WT</sup>xTNF-RII<sup>-/-</sup> or WT were differentiated with osteogenic medium with or without IL-17A. tmTNF overexpressing fibroblasts enhanced the osteogenic differentiation as observed by ALP and alizarin red staining and increased mRNA levels of Collagen type I and ALP compared to WT. This enhancement in osteogenesis was maintained in tmTNF<sup>+/WT</sup>xTNF-RI<sup>-/-</sup>-derived fibroblasts but abolished in tmTNF<sup>+/WT</sup>xTNF-RII<sup>-/-</sup>-derived fibroblasts.

**Conclusions:** The SpA-like phenotype in tmTNF tg mice is crucially dependent on TNF-RI to drive peripheral and axial inflammation, but TNF-RII signalling is required to drive the pathological new bone formation under inflammatory conditions.

#### HPR Supporting self-management

##### OP0274-HPR A FUNCTIONAL EXERCISE PROGRAM IMPROVES PAIN AND HEALTH RELATED QUALITY OF LIFE IN PATIENTS WITH FIBROMYALGIA: A RANDOMISED CONTROLLED TRIAL

G. Fernandes, F. Jennings, M. Cabral, R. Santos, J. Natour. *Rheumatology Division, Universidade Federal de São Paulo, São Paulo, Brazil*

**Background:** Fibromyalgia (FM) is a syndrome characterised mainly by chronic generalised pain that affects the physical fitness and functional capacity of patients. There is increasing evidence of the benefits of physical exercise in improving FM symptoms, making these interventions part of therapeutic arsenal.

**Objectives:** To evaluate the effectiveness of a program of functional exercises in reducing pain, improving functional capacity, increasing muscle strength, improving flexibility, balance and quality of life of patients with FM.

**Methods:** It is a controlled and randomised study, with blind evaluator. A total of 82 female patients with FM were included, with age between 18 and 65 years, randomised into two groups, intervention and control. The intervention group (FEG) performed functional exercise training for 45 min twice a week for 14 weeks. The control group (SEG) performed stretching exercises with the same duration and frequency. Evaluation instruments were: VAS – Visual Analogue Scale for pain assessment; FIQ- Fibromyalgia Impact Questionnaire, for assessing health-related quality of life; Time-up and go test for functional performance evaluation; 1RM, for evaluation of muscle strength; Bank of Welss, for the assessment of flexibility; Berg Balance Scale, to evaluate balance; and SF-36 to evaluate general quality of life. Also, the amount of analgesics used during the intervention period was assessed.

**Results:** 41 patients were randomised to the FEG and 41 patients to the SEG. After intervention, the FEG presented a reduction in pain and an improvement in the quality of life related to the disease, which was statistically significant compared to SEG. Regarding general quality of life, functional capacity, muscle strength, flexibility and balance, there was no difference between the groups.

**Conclusions:** Functional exercise training proved to be effective in reducing pain and improving the health-related quality of life of patients with FM when compared to stretching exercises.

**OP0275-HPR** THE EFFECTS OF EXERCISE ON DEPRESSIVE AND ANXIETY SYMPTOMS IN RHEUMATOID ARTHRITIS: A SYSTEMATIC REVIEW AND META-ANALYSIS

S.G. McKenna<sup>1</sup>, M.P. Herring<sup>2</sup>, A. Donnelly<sup>2</sup>, A. Fraser<sup>3</sup>, L. Comber<sup>1</sup>, N. Kennedy<sup>1</sup>.

<sup>1</sup>Discipline of Physiotherapy, School of Allied Health; <sup>2</sup>Department of Physical Education and Sport Sciences, University of Limerick; <sup>3</sup>Department of Rheumatology, University Hospitals Limerick, Limerick, Ireland

**Background:** Exercise reduces depressive and anxiety symptoms among the general population, and those with a chronic illness. Elevated depressive and anxiety symptoms are prevalent co-morbidities in Rheumatoid Arthritis (RA) therefore, addressing same through exercise may have an important impact on their health related quality of life (HQoL). Evidence does support the effect of exercise on these outcomes however, quantitative synthesis of evidence from randomised controlled trials (RCTs) of exercise effects, on these critically important symptoms in RA, has yet to be conducted.

**Objectives:** To quantify the overall population effect of exercise on depressive and anxiety symptoms, fatigue, and pain, derived from available RCTs, and to explore the extent to which participant and trial characteristics moderated the mean effect.

**Methods:** Articles published before September 2017 were located by two independent reviewers using Google Scholar, PsycINFO, PubMed, and Web of Science. Trials included both randomization to exercise and non-exercise control using validated measures of depression and anxiety, assessed at baseline and post-intervention. Hedges' *d* effect sizes (95% CI) were computed and random effects models were used for all analyses. Sources of bias were also assessed independently by two reviewers using the Cochrane bias assessment tool for RCTs and Newcastle–Ottawa Quality Assessment Scale for non-RCTs.

**Results:** Seventeen studies were included, with 1214 participants, of which 12 RCTs contributed to the meta-regression analysis. Participants were aged 49±9 years and 83%±14% female. Exercise training consisted on average of 3±1 weekly sessions, 60±17 min per session, and 11±5 weeks in duration. Interventions were diverse with a mix of aerobic and/or resistance training including, 4 different types of Yoga, 2 dance based and 1 Tai-chi. Mean reported adherence was 87%±11%. For depression, 18 of 20 effects (90%) were >0. The mean effect size  $\Delta$  was 0.20 (0.10–0.31;  $p<0.001$ ). For anxiety, seven of seven effects (100%) were >0. The mean effect size  $\Delta$  was 0.50 (0.27–0.74;  $p<0.001$ ). Seven of 16 effects reduced pain by a mean effect delta of 0.04 (95% CI: –0.14 to 0.21;  $z=0.41$ ;  $p>0.69$ ). Six of 11 effects (54.5%) did not reduce fatigue with the mean effect delta being –0.01 (95% CI: –0.20 to 0.19;  $z=-0.09$ ;  $p>0.93$ ). Depressive or anxiety symptoms were not the primary outcome in any of the included trials.

**Conclusions:** Pharmacologic interventions have improved the management of RA however, research indicates that exercise remains an important part of the overall treatment. This quantitative synthesis of evidence from RCTs of the effects of exercise shows significant small-to-moderate reductions in depressive and anxiety symptoms. It has been reported that the degree of depression and anxiety in people with RA is a preceding sign of physical disability that may appear later in life therefore, aiming to target both through exercise may help to improve HQoL. Future trials should focus on depression and/or anxiety as the primary outcome. Exercise prescription is a core skill for physiotherapists therefore, they should be confident in prescribing exercise to people with RA, who have depression and anxiety, as it significantly reduces their symptoms.

**OP0276-HPR** OCCUPATIONAL BALANCE AND ITS RELATION TO PERFORMANCE OF VALUED LIFE ACTIVITIES IN PERSONS WITH RHEUMATOID ARTHRITIS IN WORKING AGE

I. Ahlstrand<sup>1</sup>, P. Wagman<sup>1</sup>, C. Håkansson<sup>2</sup>, M. Björk<sup>3</sup>. <sup>1</sup>School of Health and Welfare, Dep. of Rehabilitation and ADULT, Jönköping University, Jönköping; <sup>2</sup>Division of Occupational and Environmental Medicine, Lund University, Lund; <sup>3</sup>Department of Rheumatology and Department of Social and Welfare Studies, Linköping University, Linköping, Sweden

**Background:** Experience of balance in everyday activities where work is an essential part is important to health and well-being,<sup>1</sup> as has also been observed in previous studies in people with rheumatoid arthritis (RA).<sup>2</sup> The Valued life activity scale (VLA-swe) is a questionnaire in which patient's first report if the separate activities are valued or not to perform and secondly difficulties to perform these activities.<sup>3</sup> Occupational Balance Questionnaire (OBQ) focuses on satisfaction with the amount and variation of occupations.<sup>4</sup>

**Objectives:** The objectives were to 1) describe the relationship between performance of valued activities and experienced occupational balance, and to 2) identify aspects associated with low occupational balance in persons with RA.

**Methods:** 368 persons (age 18–65 years, 77% women) with RA responded to a questionnaire measuring occupational balance (OBQ)<sup>4</sup> and performance of

valued life activities (VLA-swe).<sup>3</sup> Other aspects of interest were activity limitations measured by Health Assessment Questionnaire (HAQ), pain (measured by VAS), continuous stress (stressed continuously for more than a month during the last 12 months), children at home, education, and living situation. The relation between OBQ and performance in VLA across genders and Workers/Non-workers were analysed using non-parametric correlation analyses. To identify the impact of different aspects on the likelihood that participants would report lower occupational balance, OBQ was analysed using workers/nonworkers, stress, gender, age, pain and difficulties performing valued activities as independent variables in logistic regressions models. The study was approved by the Regional Ethics Committee (Dnr2011/452–31).

**Results:** The OBQ was significantly related to difficulties to perform valued activities reported by VLA ( $r=-0.41$ ,  $p<0.001$ ). Having more difficulties performing valued activities was the strongest predictor of lower occupation balance and increased the risk of reporting lower occupation balance with nearly five times (OR=4.54,  $p<0.001$ ). Continuous stress increased the risk of having lower occupation balance more than three times (OR=3.27,  $p<0.0001$ ) than those who not reported being stressed. The other variables show no significant impact on the likelihood that the participants would report lower occupational balance.

**Conclusions:** The results showed support for the relationship between occupation balance and performance of valued life activities and highlights to identify what's important for the individual and to assume that in the rehabilitation. The results also show the importance of ability to manage stress, in order to enable for retaining ability to work and achieve high occupational balance.

**OP0277-HPR** EVALUATION OF THE EFFECTIVENESS OF A PROGRESSIVE RESISTANCE TRAINING PROGRAM FOR PATIENTS WITH FIBROMYALGIA: A RANDOMISED CONTROLLED TRIAL

M.C. Vassalli, A. Jones, J. Natour, R. Silva. *Rheumatology, Federal University of São Paulo – UNIFESP, São Paulo, Brazil*

**Background:** Fibromyalgia (FM) is a chronic pain syndrome, not inflammatory, characterised by the presence of diffuse pain and painful points. Commonly, it is linked to other symptoms such as fatigue, sleep disorders, morning stiffness; and psychological disorders such as anxiety and depression. The medical treatment of FM brings benefits in the short term. For long-term benefits it is usually associated with non-medicated treatment, such as patient education, physical conditioning, rehabilitation and psychological therapy. In this study, we used the progressive resistance training, which is muscle strengthening performed through the gradual increase of load during the training period.

**Objectives:** To evaluate the impact of a global progressive resistance training program on pain, quality of life, functional capacity and muscular strength in patients with fibromyalgia

**Methods:** Sixty patients were randomised into 2 groups: experimental group and control group. Patients in the experimental group underwent a progressive resistance training program, performed twice a week for 12 weeks. The charge intensity was progressively increased from 40% to 80% of 1RM. The following muscle groups were worked: trunk flexors and extensors, elbow flexors and extensors, knee flexors and extensors, hip abductors and adductors and shoulder abductors. In addition to strength training, the experimental group also received a structured education program in one hour class once a week for five weeks. Patients in the control group received the same education program.

**Results:** After the intervention, significant improvements were observed in the experimental group in comparison with control group over time for the following parameters: pain ( $p=0.004$ ), FIQ ( $p=0.021$ ), quality of life (with statistically significant improvement for all the SF-36 domains), functional capacity, assessed by the 6 min walk test ( $p=0.045$ ), and muscle strength (with statistically significant improvement for all muscle groups trained). The intergroup and intragroup comparisons were showed in table 1.

Abstract OP0277-HPR – Table 1 Intergroup and intragroup comparisons

Filer<sup>8</sup>. <sup>1</sup>Rheumatology, Odense University Hospital, Odense, Denmark; <sup>2</sup>Experimental Medicine and Rheumatology, Queen Mary University London, London, UK; <sup>3</sup>Rheumatology, Saint-Pierre University Hospital; <sup>4</sup>Rhumatologie, Cliniques Universitaires Saint-Luc, Brussels, Belgium; <sup>5</sup>Rheumatology and Bone Metabolic Diseases, Hospital de Santa Maria, Lisbon, Portugal; <sup>6</sup>Orthopedics, Odense University Hospital; <sup>7</sup>Epidemiology and Biostatistics, University of Southern Denmark, Odense, Denmark; <sup>8</sup>Institute of Inflammation and Ageing, University of Birmingham, Edgbaston, UK

**Background:** Synovial tissue analysis could provide a step towards personalised medicine in daily clinical practice for patients with inflammatory arthritis. However systematic reports comparing the patient's perspective when undergoing synovial biopsy according to different synovial sampling techniques is currently missing from the literature. We here present a multicenter study across Europe, comparing patient reported outcomes (PRO) and safety data from patients undergoing synovial biopsy procedures using either ultrasound guided needle biopsy (US-NB), ultrasound guided portal and forceps (US-PF) or conventional arthroscopy.

**Objectives:** 1. Describe PRO data on joint indices of pain, stiffness and swelling, procedural discomfort and willingness to undergo a second biopsy for each biopsy technique. 2. Describe and compare safety data. 3. Evaluate the impact of intramuscular (IM) or intra-articular (IA) corticosteroid as part of the biopsy procedure, on PRO data and safety. 4. Evaluate how sequential biopsy procedures impacted on PRO and safety data.

**Methods:** Information on PROs, safety, diagnosis, disease activity and treatment were collected from five European biopsy centres. Joint pain, swelling and stiffness indices were recorded as 0–100 mm VAS; qualitative variables on balanced 5-point Likert scales. PRO data delta values between post and pre-values were calculated. Between group comparisons with unadjusted and adjusted robust linear regression, adjusting for disease activity, corticosteroid use during biopsy procedure and when relevant pre-biopsy value.

**Results:** 524 synovial biopsy procedures were included; 329 (78%) had Rheumatoid Arthritis and biopsies were primarily from wrist (n=296, 57%). PRO and safety data are presented in table 1. None of the biopsy techniques caused increase in pain, swelling or stiffness, and there were no differences in post biopsy and delta PROs between biopsy procedures. There was 9 adverse events (1.7%) with no difference between biopsy methods(p=0.85). 71.7% reported none or mild

discomfort during biopsy and 86.5% were positive or neutral to rebiopsy. Corticosteroid use, IM (n=62) or IA (n=38), did not result in more adverse events (p=0.81). However, it was associated with a reduction in post-swelling (p=0.005), but not pain or stiffness. Sequential biopsy procedures (n=103 patients), did not result in more adverse events (p=0.61) or worsening in PRO data between baseline and second biopsy procedure.

Abstract OP0278-HPR – Table 1 Patient reported outcomes and safety

	Needle	Portal & Forceps	Arthroscopic	Total	p-value	Adjusted p-value*

Pre stiffness, mean (SD)	51.48 (30.33)	47.28 (31.89)	48.79 (30.13)	50.62 (30.77)	0.56	0.03
Post stiffness, mean (SD)	37.72 (30.45)	33.75 (28.01)	36.14 (24.91)	37.61 (29.57)	0.56	0.18
Delta pain, mean (SD)	-12.90 (27.74)	-13.14 (30.36)	-20.94 (28.91)	-13.76 (28.27)	0.17	0.19
Delta swelling, mean (SD)	-14.67 (29.57)	-8.83 (27.74)	-18.68 (35.03)	-14.43 (29.96)	0.28	0.17
Delta stiffness, mean (SD)	-13.70 (28.62)	-13.52 (32.25)	-14.18 (37.49)	-13.72 (30.32)	0.99	0.18
<b>Safety</b>						
Syncope or presyncope, n (%)	2 (0.8)	0 (0.0)	0 (0.0)	2 (0.4)		
Tamponovitis	1 (0.3)	0 (0.0)	0 (0.0)	1 (0.2)		
Neurological affection, n (%)	4 (1.0)	1 (1.5)	0 (0.0)	5 (1.0)		
Tendon damage, n (%)	0 (0.0)	0 (0.0)	0 (0.0)	0 (0.0)		
Haemarthrosis, n (%)	1 (0.3)	0 (0.0)	0 (0.0)	1 (0.2)		
Deep vein thrombosis	0 (0.0)	0 (0.0)	0 (0.0)	0 (0.0)		
Joint infection	0 (0.0)	0 (0.0)	0 (0.0)	0 (0.0)	0.85*	

\* adjusted for biopsy method, disease activity, intra-articular or intramuscular corticosteroid injection during biopsy; used in Post and delta values also pre-values.

† Test for difference in total number of adverse events between groups, by Fisher's exact test.

**Conclusions:** Overall, our results do not suggest a significant difference in tolerability or safety between US-NB, US-PF or arthroscopic synovial sampling. Further, data suggests that use of IM or IA corticosteroid, as part of the biopsy procedure, is safe and improves tolerability. Finally, sequential synovial biopsies were well tolerated and safe when performed using all biopsy techniques.

**OP0279-HPR A NATIONAL SURVEY OF THE UTILISATION AND EXPERIENCE OF HYDROTHERAPY IN THE MANAGEMENT OF AXIAL SPONDYLOARTHRITIS: THE PATIENTS' PERSPECTIVE**

M Martin<sup>1,2</sup>, A. Gilbert<sup>3</sup>, C. Jeffries<sup>2,4</sup>. <sup>1</sup>Rheumatology/Physiotherapy, Guy's and St Thomas' NHS Foundation Trust; <sup>2</sup>AStretch, London; <sup>3</sup>AKGilbert Ltd, Brighton; <sup>4</sup>Physiotherapy/Hydrotherapy, Solent NHS Trust, Portsmouth, UK

**Background:** Hydrotherapy is recommended in the United Kingdom (UK) by the National Institute for Health and Care Excellence (NICE) as an adjunctive therapy in the management of Axial Spondyloarthritis (AS). Despite these guidelines, NHS hospital hydrotherapy services are in decline. The impact on utilisation and patient experience are poorly understood.

**Objectives:** To identify the utilisation of hospital hydrotherapy services for AS in the UK and capture the patients' experience to inform future services and research.

**Methods:** An online survey was distributed to the National Ankylosing Spondylitis Society (NASS) patient membership between September and November 2017, with social media updates. The survey design included open and closed questions. Thematic analysis of the qualitative responses was conducted.

**Results:** 250 members completed the survey (40.4% male; average age 50.4 years; average delay to diagnosis 11.4 years). **Utilisation:** 157 (65.7%) accessed a hospital hydrotherapy service. 102 (63.0%) were referred by rheumatology, 26 (16.0%) via a specialist AS Physiotherapist and 3 (1.9%) self-referring via a telephone helpline. The most frequent service offered was six weekly sessions. 85 (62.5%) reported no access to hospital hydrotherapy when in flare. Barriers to access in a flare included long waiting times, a limit on the sessions offered and pool closures. 'Pay as you Go' hospital hydrotherapy sessions were accessed by 35 (16.1%) with 119 (77.3%) interested in doing so. 59 (26.9%) received written hydrotherapy resources for continuation in a non-hospital pool following discharge. 77 (50.7%) were advised to continue with hydrotherapy for self-management. Barriers to utilising a non-hospital pool were high cost, lower pool temperature, pool crowding and a lack of knowledge of exercises. 28 (18.5%) reported a current threat of closure of their hospital hydrotherapy pool. **Experience:** Five themes emerged from the qualitative data. 1) *Emotional well-being:* Patients described greater control over their condition when exercising in water. 2) *Exercise Behaviour:* Patients performed a wider variety of exercise, often challenging themselves, and not attempted on land. 3) *Group Effect:* Patients described a sense of motivational support when exercising with others. 4) *Professional Support:* Patients cited the benefit of hydrotherapy sessions led by a physiotherapist who shared their expertise and discussed problems. 5) *Pool Environment:* Patients described gains from non-impact exercise and

weightlessness in the water. The warmer pool temperature was stated as a reason for the benefits obtained.

Reported benefits of hydrotherapy are illustrated in graph 1:

**Conclusions:** This survey suggests variability in utilisation of hospital hydrotherapy services by a national AS patient group in the UK, with barriers to access, lack of promotion and pool closures. Similar benefits of hydrotherapy to those stated in the NICE guidance were experienced.<sup>1</sup> Future service recommendations which focus on flexible access for flare management, 'Pay as you Go' schemes, group exercise and self-management may increase utilisation, optimise experience and reverse decline. Research to assess the benefits of these service recommendations in a clinical population is needed.

#### OP0280-HPR PHYSICAL ACTIVITY IN ESTABLISHED RA AND VARIABLES ASSOCIATED WITH PHYSICAL ACTIVITY MAINTENANCE OVER A SEVEN YEAR PERIOD

A Bremander<sup>1,2</sup>, K. Malm<sup>2</sup>, M.L. Andersson<sup>1,2</sup>, on behalf of The BARFOT study group. <sup>1</sup>Department of Clinical Sciences, Lund, Section of Rheumatology, Lund; <sup>2</sup>RandD Centre, Spenshult, Halmstad, Sweden

**Background:** Interventions to promote a healthy lifestyle also in patients with rheumatoid arthritis (RA) have been in focus over the last years. Physical activity (PA) defined as moderate-to-vigorous physical activity (MVPA) has the possibility to reduce disease burden in RA and may contribute to improved quality of life (QoL). It is well known that a large number of patients with RA have a sedentary life style and are less active than their healthy peers. However, less information is known about the long term change of MVPA and possible associated variables.

**Objectives:** To study self-reported change of MVPA over seven years in a well-defined RA cohort.

**Methods:** A lifestyle questionnaire was sent twice to patients in the BARFOT cohort, in 2010 (n 1525) and in 2017 (n 1046) with a response rate of 73% and 68% respectively and 950 patients responded to both questionnaires. All patients fulfilled the ACR criteria for classification of RA and had a disease duration at inclusion (1992 to 2006) of  $\leq 12$  months. Patients were dichotomized as being active on recommended levels of MVPA (MVPA<sub>rec</sub>; physically active on a moderate level  $\geq 150$  min/week (MPA) or on an intense level  $\geq 75$  min/week (VPA)) or not (sedentary). The patients reported body mass index, smoking habits, tender (TJC) and swollen joint count (SJC, 28-joints), patient global assessment (PatGA), pain intensity (NRS) and distribution (pain mannequin), fatigue (NRS), physical function (HAQ), health related QoL (EQ5D), comorbidities and medical treatment. Possible associated variables with meeting MVPA<sub>rec</sub> at both time points or not (dependent variable) was studied by using a logistic regression analysis. All variables were adjusted for age, gender and smoking habits.

**Results:** Forty-one percent (n 389) of the patients met MVPA<sub>rec</sub> at both occasions, and they reported better EQ5D scores compared with the sedentary group (mean 0.77 (SD 0.18) vs 0.68 (0.27)). The patients who met MVPA<sub>rec</sub> were younger, (mean age (SD) 59<sup>13</sup> years vs 62<sup>13</sup> years, p<0.001) and were to higher extent never smokers 46% vs 38%, p=0.021. There was a negative association

with meeting MVPA<sub>rec</sub> and being overweight (OR 0.58, 95% CI: 0.43 to 0.96) or obese (OR 0.38, 95% CI: 0.25 to 0.59), the presence of cardiovascular (OR 0.56, 95% CI: 0.41 to 0.75) and pulmonary diseases (OR 0.51, 95% CI: 0.31 to 0.85), TJC (OR 0.98, 95% CI: 0.95 to 0.995), high pain intensity (OR 0.99, 95% CI: 0.987 to 0.998), and pain distribution (OR 0.93, 95% CI: 0.90 to 0.96), worse fatigue (OR 0.99, 95% CI: 0.998 to 0.997) and a worse physical function (HAQ, OR 0.58, 95% CI: 0.45 to 0.76). Patients with higher values in QoL (EQ5D, OR 3.1, 95% CI: 1.52 to 6.2) were positively associated with meeting MVPA<sub>rec</sub>. In 2010 there were no differences in medical treatment between the groups, p=0.377. In 2017 the group meeting MVPA<sub>rec</sub> included a lower number of untreated patients compared to 2010 (25% vs 34%, p=0.017).

**Conclusions:** Only four out of ten patients with established RA reported to maintain recommended levels of PA over a seven year period. Experiencing high quality of life seems to be important for PA maintenance together with lower levels of pain, fatigue and better physical function. Health care professionals need to take the patient perspective into account and support maintenance of physical activities accordingly.

#### OP0281-HPR PREFERENCES OF PATIENTS WITH RHEUMATOID ARTHRITIS REGARDING DISEASE MODIFYING ANTI-RHEUMATIC DRUGS: A DISCRETE CHOICE EXPERIMENT

M. Van Heuckelum<sup>1</sup>, E. Mathijssen<sup>2</sup>, M. Vervloet<sup>3</sup>, A. Boonen<sup>4</sup>, A. Pasma<sup>5</sup>, R. Hebing<sup>6</sup>, H. Vonkeman<sup>7</sup>, M. Wenink<sup>2</sup>, B. van den Bemt<sup>1</sup>, L. van Dijk<sup>3</sup>. <sup>1</sup>Rheumatology and Pharmacy; <sup>2</sup>Rheumatology, Sint Maartenskliniek, Nijmegen; <sup>3</sup>NIVEL, Utrecht; <sup>4</sup>Rheumatology, MUMC+, Maastricht; <sup>5</sup>Rheumatology, ErasmusMC, Rotterdam; <sup>6</sup>Rheumatology, Reade, Amsterdam; <sup>7</sup>Rheumatology, MST, Enschede, Netherlands

**Background:** Adherence to disease modifying anti-rheumatic drugs (DMARDs) is suboptimal in rheumatoid arthritis (RA) patients. Adherence rates vary from 30% to 90%, which may be partly due to patients' preferences regarding treatment benefits and drawbacks of DMARD therapy. Tailoring treatment options to these preferences might motivate patients to adhere to their drugs and eventually improve adherence.

**Objectives:** The primary objective is to identify subgroups in RA patients based on their preferences towards DMARD characteristics. The secondary objective is to identify characteristics associated with subgroup membership.

**Methods:** A discrete choice experiment (DCE) based on a literature review, expert recommendations and focus groups was used to elicit preferences in RA patients. Patients were asked to state their choice over two different hypothetical treatment options, which were described by seven DMARD characteristics and three levels within each characteristic (e.g. route of administration with the levels: oral, subcutaneous and intravenous). Patients were eligible to participate if they were diagnosed with RA according to the ACR/EULAR 2010 criteria, current user of at least one DMARD, and aged  $\geq 18$  years. Latent class analysis was used to identify subgroups based on stated preferences towards DMARD characteristics and multinomial logistic regression was used to identify characteristics (i.e. beliefs about medicines, patient- and disease-related variables) associated with subgroup membership.

**Results:** A total of 1317 RA patients were invited to participate in this study with an overall response rate of 24.8% (n=326). Three subgroups with segment sizes of 46.5% (SG1), 24.6% (SG2) and 28.9% (SG3) were found. SG1 was most strongly influenced by chance of efficacy, which contributed for 43.6% in their choice for a DMARD. In contrast with SG1, route of administration, risk of cancer and frequency of administration contributed most in SG2 (relative importance (RI) of 22.3%, 17.0% and 16.2% respectively). In SG3, route of administration (RI:38.2%) contributed most in their choice for a DMARD with a strong preference for tablets/capsules. Current and previous use of other cDMARDs (i.e. leflunomide, azathioprine, ciclosporin or gold therapy) and indifferent (low necessity, low concerns) beliefs were significantly associated with assignment to SG2 (Relative Risk Ratio (RRR) 6.03, p=0.0012, RRR=3.64, p=0.013 and RRR:14.91, p=0.003 respectively). Current and previous use of sulfasalazine, other cDMARDs, medium educational level and (early) retirement were significantly associated with assignment to SG3 (RRR:3.91, p=0.009; RRR:0.34, p=0.010, RRR:3.38, p=0.020, RRR:3.12, p=0.005 and RRR:0.358, p=0.034).

Abstract OP0281-HPR – Figure 1 Relative importance of attributes for each subgroup

**Conclusions:** DCE data revealed that RA patients had different preferences for DMARD characteristics, which resulted in the identification of three subgroups. Integrating preferences of these subgroups in patient-tailored treatment decisions and the effect on medication adherence should be part of future research.

**Background:** In systemic sclerosis (SSc), previous GWASs have identified several loci associated with the disease, but their rate of discovery has been limited due to modest sample sizes. Extensive collaborative efforts have enabled us to gather the largest cohort of SSc patients. In the present study, we have performed a large meta-GWAS taking advantage of our well-powered cohort.

**Objectives:** To continue unravelling the complex genetic component of SSc.

**Methods:** The complete set of individuals enrolled for this study comprised a total of 26 679 genome-wide genotyped individuals of European ancestry. PLINK and EIGENSTRAT were used for quality control and population stratification adjustments. Genotype imputation was performed with IMPUTE2 and the 1000 Genome Project Phase 3 as reference panel.

**Results:** Twenty-three loci reached the genome-wide significance level ( $p$ -value  $< 5 \times 10^{-8}$ ) in our large-scale meta-analysis. Twelve out of the total significant signals represented new associations and involved novel pathways in the pathophysiology of the disease. Significant enrichment was observed for epigenetic marks of active promoters and active enhancers in critical cell types for the disease. In addition many of the interrogated variants correlated with eQTLs thus altering gene expression.

**Conclusions:** Using a large meta-GWAS, we have identified twelve novel associations for SSc susceptibility and confirmed several previously reported risk loci. These results considerably increase our understanding of the genetic basis of SSc and shed light on the pathogenesis of the disease providing important information to discover new therapeutic targets genetically validated.

Alarcon-Riquelme<sup>7</sup>, M.D. Mayes<sup>8</sup>, J. Martin<sup>1</sup>, on behalf of The Myositis Genetics Consortium, Scleroderma Genetics Consortium. <sup>1</sup>Institute of Parasitology and Biomedicine Lopez-Neyra, Granada, Spain; <sup>2</sup>Department of Genetics, University Medical Centre Groningen, University of Groningen, Groningen, Netherlands; <sup>3</sup>Institute of Clinical Molecular Biology, Christian-Albrechts-University of Kiel, Kiel, Germany; <sup>4</sup>Rheumatology Unit, Department of Medicine, Karolinska Institutet, Stockholm, Sweden; <sup>5</sup>Division of Immunology, Infection and Inflammatory Disease; <sup>6</sup>Division of Genetics and Molecular Medicine, King's College London, London, UK; <sup>7</sup>Centro de Genómica e Investigación Oncológica (GENYO), Pfizer-Universidad de Granada-Junta de Andalucía, Granada, Spain; <sup>8</sup>The University of Texas Health Science Center–Houston, Houston, USA

**Background:** Cross-disease genome-wide association studies (GWAS) in autoimmune diseases (AIDs) has become a powerful tool to expose new genetic variants associated with disease susceptibility and to reveal shared biological mechanisms in the pathophysiology of these conditions.

**Objectives:** The goal of our study was to identify shared genetic etiologies by performing a large-scale meta-analysis of four systemic AIDs in individuals from European-descent populations, including rheumatoid arthritis [4595 cases and 3372 controls], systemic lupus erythematosus [3154 cases and 8775 controls], systemic sclerosis [2255 cases and 4407 controls] and myositis [1674 cases and 3150 controls]

**Methods:** PLINK and EIGENSTRAT were utilised for quality control and population stratification adjustments. Genotype imputation was performed using Minimac in the Michigan Imputation Server and the Haplotype Reference Consortium as reference panel.

**Results:** We meta-analysed ~6.5 million single nucleotide polymorphisms (SNPs) (MAF >1%, R<sub>sq</sub> >0.3) across the four diseases and were able to identify 27 genome-wide significant independent loci with at least two diseases leading the association. Our new findings include five unreported shared risk loci: *NAB1*, *KPNA4-ARL14*, *DGQK*, *LIMK1*, and *PRR12*. The results from the meta-analysis were functionally enriched in transcription factor binding sites, promoter and enhancer histone marks and DNase cleavage hotspots in immune cell lines, as well as in epithelial and epidermal cell lines. This is consistent with the clinical manifestations across diseases related to the immune system and the connective tissue. Interestingly, several associated variants were able to modify the expression of the nearest genes and constitute shared expression quantitative trait loci across diseases.

**Conclusions:** These studies offer the opportunity to uncover new biological pathways, address patient classification based on their molecular taxonomy and provide an opportunity for drug repositioning by targeting shared mechanisms across diseases.

**Background:** Rheumatoid arthritis-associated interstitial lung disease (RA-ILD) and idiopathic pulmonary fibrosis (IPF) share phenotypic similarities. The gain-of-function *MUC5B* promoter variant rs35705950 is the strongest risk factor for development of IPF

**Objectives:** We hypothesised that rs35705950 would also contribute to the risk of ILD in RA patients.

**Methods:** Using a French discovery population and multi-ethnic validation populations from 6 different countries, we tested the association of the *MUC5B* promoter variant in RA-ILD (n=620), RA without ILD (n=614), and unaffected controls (n=5448).

**Results:** The discovery population revealed an association of the *MUC5B* promoter variant with RA-ILD when compared to unaffected controls ( $OR_{adj}=3.8$  95% CI: 2.8 to 5.2;  $p=9.7 \times 10^{-17}$ ) (figure 1A). Similar to the discovery cohort, the *MUC5B* promoter variant was significantly over-represented among the cases of RA-ILD in the multi-ethnic study cohorts when compared to unaffected controls ( $OR_{adj}=5.5$  95% CI: 4.2 to 7.2;  $p=4.7 \times 10^{-35}$ ) (figure 1A), and when the discovery population and the multi-ethnic cohorts were combined ( $OR_{combined}=4.7$  95% CI: 3.9 to 5.8;  $p=1.3 \times 10^{-49}$ ) (figure 1A). Additionally, the *MUC5B* promoter variant was found to increase the risk of ILD among patients with RA ( $OR_{combined}=3.1$  95% CI: 1.8 to 5.4;  $p=7.4 \times 10^{-5}$ ), however, no statistical association with the *MUC5B* promoter variant was observed for RA without ILD (figure 1B). The association of the *MUC5B* promoter variant with RA-ILD increased significantly when

restricted to the usual interstitial pneumonia (UIP) by high-resolution computed tomography ( $OR_{combined}=6.1$  95% CI: 2.9 to 13.1;  $p=2.5 \times 10^{-6}$ ) (figure 1C). Immunohistochemical and *in-situ* hybridization analysis of RA-ILD lung tissue demonstrated expression of *MUC5B* by type 2 alveolar epithelial cells undergoing endoplasmic reticulum stress.

**Conclusions:** Our findings demonstrate that *MUC5B* promoter variant rs35705950 is a risk factor for RA-ILD specifically associated with radiologic evidence of UIP.

**OP0285 IDENTIFICATION OF RARE CODING VARIANTS IN IL-1-RELATED PATHWAYS IN PATIENTS WITH ADULT-ONSET STILL'S DISEASE**

G.Cavalli<sup>1,2</sup>, R. van Deuren<sup>2</sup>, P. Arts<sup>2</sup>, M. Steehouwer<sup>2</sup>, C. Gilissen<sup>2</sup>, P. Sfriso<sup>3</sup>, P. Galozzi<sup>3</sup>, S. Colafrancesco<sup>4</sup>, R. Priori<sup>4</sup>, L. Cantarini<sup>5</sup>, O.M. Lucherini<sup>5</sup>, S. Rodolfi<sup>1</sup>, G. De Luca<sup>1</sup>, E. Baldissera<sup>1</sup>, F. van de Veerdonk<sup>2</sup>, L. Dagna<sup>1</sup>, A. Hoischen<sup>2</sup>, C.A. Dinarello<sup>2,6</sup>. <sup>1</sup>Vita-Salute San Raffaele University, Milan, Italy; <sup>2</sup>Radboud University Medical Center, Nijmegen, Netherlands; <sup>3</sup>University of Padua, Padua; <sup>4</sup>Sapienza University of Rome, Rome; <sup>5</sup>University of Siena, Siena, Italy; <sup>6</sup>University of Colorado Denver, Aurora, CO, USA

**Background:** Adult-onset Still's disease (AOSD) is a rare autoinflammatory disease characterised by fever, arthritis, and multi-organ involvement. Inflammation in AOSD is mediated by interleukin (IL)–1 $\beta$ , as confirmed by the dramatic clinical efficacy of selective blockers of this cytokine. The genetic predisposition to this rampant IL-1-driven inflammation remains nevertheless elusive. Previous studies failed to identify associations between polymorphisms in the genes encoding IL-1 and AOSD, thus pointing at more complex genetic mechanisms. This 'missing heritability' cannot be adequately investigated with traditional techniques for genetic partitioning, such as GWAS, which only assess common variants and polymorphisms. Studies focusing on highly penetrant rare variants or different types of mutations (i.e. small copy-number variations; insertions/deletions) are warranted.

**Objectives:** We hypothesised that genetically determined changes in IL-1-related pathways resulting in excessive IL-1 $\beta$  activity lead to the development of autoinflammation in AOSD. Scope of this study was to unravel the combined mutational variation of a network of IL-1-related receptors, pathways, counter-regulators, and cellular processes possibly involved in the pathogenesis of AOSD and IL-1-mediated inflammation in general.

**Methods:** We collected clinical, demographic, and genetic data from a large cohort of 76 AOSD patients and developed an innovative platform based on molecular inversion probes (MIP) technology for performing highly multiplexed targeted-resequencing. This allows efficient sequencing of the coding sequence of 48 genes related to the IL-1-pathway, and allows studying rare and common variants in one assay. We have also screened 500 healthy controls, and 1000s of samples with other disorders using the same assay.

**Results:** We identified rare and unique (i.e. private variants) in the IL1 pathway in several individuals with AOSD. Whether any these are involved in a strong predisposition to AOSD is currently followed-up. Rare genetic variants have been identified in six IL-1-pathway 'clusters':

1. Deregulated activation of the inflammasome and release of IL–1 $\beta$  and IL–18.
2. IL–1 family receptors and intracellular signalling mediators.
3. Other pro-inflammatory cytokines and receptors.
4. Regulatory molecules, including IL–1Ra or IL–37.
5. Cellular processes regulating production of IL–1 and IL–18 (i.e. autophagy).
6. Production of ROS, which function as markers of cellular damage and trigger inflammation.

**Conclusions:** Unravelling the genetic bases of inflammation in AOSD deepens our understanding of the human innate immunome. Of note, this study platform may serve for the genetic analysis of other IL-1-mediated conditions, including gout and other autoinflammatory diseases, whose genetic predisposition remains elusive. Equally important, the identification of pathways amenable to targeting with small molecules or biologics may translate into remarkable clinical implications.

OP0286

### GENOTYPIC EFFECTS OF ANKYLOSING SPONDYLITIS ASSOCIATED IL7R POLYMORPHISMS ARE MEDIATED THROUGH MONOCYTES IN INFLAMMATION

M.H. Al-Mossawi<sup>1</sup>, E. Lau<sup>2</sup>, S. Danielli<sup>2</sup>, N. Yager<sup>1</sup>, J. de Wit<sup>1</sup>, E. Mahe<sup>3</sup>, L. Rizvi<sup>1</sup>, J. Knight<sup>2</sup>, B. Fairfax<sup>3,4</sup>, P. Bowness<sup>1</sup>. <sup>1</sup>Nuffield Department of Orthopaedics, Rheumatology and Musculoskeletal Sciences; <sup>2</sup>Wellcome Trust Centre for Human Genetics; <sup>3</sup>Weatherall Institute of Molecular Medicine; <sup>4</sup>Department of Oncology, University of Oxford, Oxford, UK

**Background:** Interleukin 7 (IL-7) plays a key role in T cell survival and proliferation. Both cell-surface expressed and soluble forms of the IL-7 receptor (sIL7R) are recognised. sIL7R has been shown to prolong IL-7 activity in inflammation.<sup>1</sup> IL7R polymorphisms are associated with multiple inflammatory diseases including ankylosing spondylitis (AS). Higher levels of circulating sIL7R are present in those carrying the risk variant but the cellular sources of soluble IL7R are unclear. Expression quantitative trait loci (eQTL) studies have shown genetically regulated IL7R gene upregulation in monocytes after innate immune stimuli.<sup>2</sup>

**Objectives:** This study aims to characterise the genotypic effects of IL7R polymorphism on monocyte protein surface expression and sIL7R release.

**Methods:** Monocyte cell surface IL7R expression was measured by flow cytometry in the presence or absence of LPS or TNF in a cohort of volunteers recruited from the Oxford biobank. Soluble IL7R was quantified by ELISA in purified monocyte cultures stimulated with LPS. RNA sequencing was performed for 8 paired samples of control and recombinant IL-7 exposed stimulated monocytes.

**Results:** Surface IL7R expression was induced after 24 hours of LPS stimulation both in isolated monocytes (n=84, p<8.9e-19) and CD14 +cells in whole PBMC cultures (n=103, p<3.9e-31). We find the key genotypic regulator of this response to be rs6897932, previously associated with AS predisposition, both in isolated monocytes (n=85, p=9e-7) and CD14 +cells in whole PBMC cultures (n=103, p=9.4e-5). There was no genotypic effect seen in unstimulated monocytes. Notably IL7R positivity of CD4+, CD8 +and CD56+cells measured within the PBMC culture both before or after LPS stimulation showed no association with rs6897932. The addition of anti-TNF (Infliximab) abrogated the genotypic effect. In a second independent cohort, genotype-specific surface IL7R induction was also observed after stimulation with recombinant human TNF (n=62, p=0.0007). In a third cohort, release of soluble IL7R was observed to be under genetic control after stimulation with LPS (n=99, p<3.1e-11). RNA sequencing of isolated monocytes stimulated with LPS and recombinant IL-7 showed differential expression of 3240 transcripts (FDR<0.05) compared with LPS alone (n=8). Direct *ex-vivo* staining of monocytes from inflamed synovial fluid of SpA showed significant upregulation of IL7R compared to paired PBMC monocytes (n=4, p<0.015).

**Conclusions:** Monocytes upregulate IL7R expression and soluble IL7R secretion after LPS treatment in a functional, genotype- and TNF $\alpha$ -dependent manner. SpA synovial monocytes express IL7R suggesting preactivation. These data draw attention to an unappreciated key myeloid role for AS risk variants at IL7R.

### GENE ENHANCERS ASSOCIATED WITH AN INCREASED RISK OF DEVELOPING JIA FAIL TO DOWN REGULATE RUNX1 AFTER CELL STIMULATION

A. Yarwood, C. Taylor, A. Hinks, S. Smith, K. Duffus, A. McGovern, W. Thomson, S. Eyre. *Arthritis Research UK Centre for Genetics and Genomics, Centre for Musculoskeletal Research, Manchester Academic Health Science Centre, University of Manchester, Manchester, UK*

**Background:** In recent years there have been tremendous strides in determining the genetic component of complex diseases, not least in Juvenile Idiopathic Arthritis (JIA). We now have 17 genetic loci robustly associated with an increased risk of developing JIA.<sup>1</sup> In JIA, like all complex diseases, the regions of the genome harbouring genetic changes are found outside protein coding DNA, in regions of the genome shown to control gene expression, often sited some distance from the closest gene. One of these JIA associated regions, on chromosome 21q22, is labelled with the *RUNX1* gene, although the associated variants are situated over 450 kb from the gene. We have previously demonstrated, through Capture HiC analysis, that the genomic region containing the JIA associated variants makes a physical contact with the *RUNX1* promoter. The next challenge in this region, therefore, is to determine how a risk genetic background effects the expression of the gene, contributing to the susceptibility to JIA.

**Objectives:** Determine the function and mechanism of how the gene enhancer region, situated over 450 kb upstream of the *RUNX1* gene, works to increase the risk of developing JIA.

**Methods:** B-lymphocyte cell lines, containing either a risk or protective JIA genetic background at the 'RUNX1' loci were interrogated for potential causative functional mechanism. Allele specific interactions were investigated using chromosome conformation capture (3C), enhancer activity (H3K4me1) with chromatin immunoprecipitation (ChIP), and the resultant expression of the *RUNX1* gene analysed by qPCR in both stimulated (IL4/anti CD40) and unstimulated cell lines.

**Results:** The enhancer region associated with JIA interacts with the *RUNX1* promoter in B-cell lines. A stimulation specific effect is observed in B-cell lines harbouring the protective alleles. In this protective context, prior to stimulation *RUNX1* expression is higher than in the risk genotype with enhancer enrichment detected near the proximal promoter. After stimulation the interaction between the enhancer and *RUNX1* promoter is much stronger, and whilst no enhancer enrichment was detected, this increased interaction frequency after stimulation corresponds to a sharp downregulation of *RUNX1* expression. In contrast, the risk genotype showed no stimulation dependant change, maintaining both interaction and expression levels.

**Conclusions:** 3C and ChIP experiments were performed to investigate genotype and stimulation specific DNA-DNA and DNA-protein interactions and identify correlation with gene expression. These results suggest that the ability for B-cells to switch from relatively high expression of the *RUNX1* transcript to low expression upon stimulation is crucial to an appropriate immune response.

OP0288

### TRANSCRIPTIONAL PERTURBATION OF RA-RISK ENHANCER BY CRISPR-DEADCA9 REGULATES LONG RANGE GENE TARGETS

K. Duffus<sup>1</sup>, M. Imran<sup>2,3</sup>, T. Katopodi<sup>1</sup>, H. Ray-Jones<sup>2</sup>, G. Orozco<sup>1</sup>, A. Adamson<sup>2</sup>, S. Eyre<sup>1</sup>. <sup>1</sup>Arthritis Research UK Centre for Genetics and Genomics, Centre for Musculoskeletal Research, Manchester Academic Health Science Centre; <sup>2</sup>University of Manchester, Manchester; <sup>3</sup>Wellcome Trust Sanger Institute, Cambridge, UK

**Background:** Findings from genome wide association studies in complex diseases indicate over 90% of genetic variants associated with risk of developing disease are found outside protein coding regions, suggesting regulation of gene expression is key to disease susceptibility. For rheumatoid arthritis (RA) it has been demonstrated that risk variants are found in gene regulation regions, and are significantly enriched in T-cell specific enhancers. In addition, a significant proportion of associated variants lay some distance from the nearest gene and enhancers may not necessarily regulate the closest gene, effectively 'skipping' genes. Using chromatin conformation technology (HiC) we have demonstrated that an enhancer region intronic of the *COG6* gene, containing variants associated with RA, make robust physical contact with the promoter of *FOXO1*, almost 1 Mb away on the linear chromosome. *COG6* is not an obvious candidate risk gene for RA, whilst *FOXO1* is involved in T-cell development and shown to be over expressed in RA synovium. The challenge now is to provide empirical evidence that the enhancer found within *COG6* does regulate *FOXO1* expression, and how an RA risk genetic background affects this regulation.

**Objectives:** Use CRISPR-Cas9, to perturb the COG6 intronic enhancer region and measure the downstream effect on the expression of FOXO1.

**Methods:** We utilised a modified form of the Cas9 enzyme, dead Cas9 (dCas9), that can precisely target DNA, but will not induce a cut. Using the dCas9 attached to either enhancers (p300) or repressors (KRAB) of expression we investigated how perturbation of the enhancer intronic of COG6 changed the expression of FOXO1.

We designed 3 guides across the COG6 enhancer, and transduced a cell line (HEK293) using a lentiviral dCas9 CRISPR system, with either dCas9-KRAB or dCas9-p300 and each of the three guides. We cultured the cells until 70%–80% confluent, GFP sorted the cells and then extracted RNA. A quantitative PCR was performed (QuantStudio) for both COG6 and FOXO1 gene transcript expression and normalised to housekeeping genes.

**Results:** Up to 90% of HEK cells were transduced with the dCas9 enzyme and guide, and these were sorted by FACS using GFP to sort the top 60%. The 3 guides gave consistently increased levels of FOXO1 expression with the dCas9-p300, compared to both control and dCas9-KRAB ( $p=0.02$ ). This was particular evident for guide 3, with a 40% increase (p300) and 10% decrease (KRAB) of FOXO1 expression observed. Expression of COG6 was also perturbed, but in a less consistent manner, with both increase and decrease expression for KRAB and p300.

**Conclusions:** Over 90% of HEK cells were transduced with the dCas9 enzyme and guide, and these were sorted by FACS using GFP to sort the top 60%. The 3 guides gave consistently increased levels of FOXO1 expression with the dCas9-p300, compared to both control and dCas9-KRAB ( $p=0.02$ ). This was particular evident for guide 3, with a 40% increase (p300) and 10% decrease (KRAB) of FOXO1 expression observed. Expression of COG6 was also perturbed, but in a less consistent manner, with both increase and decrease expression for KRAB and p300.

#### INTEGRATION OF CHROMATIN CONFORMATION, TRANSCRIPTOME AND GENOME-WIDE LANDSCAPE OF BRD2 AND BRD4 BINDING MOTIFS IDENTIFIES MECHANISMS OF BET INHIBITOR ACTION IN RHEUMATOID ARTHRITIS SYNOVIAL FIBROBLASTS

S. Nagpal<sup>1</sup>, V. Krishna<sup>2</sup>, X. Yin<sup>1</sup>, D. Pocalyko<sup>2</sup>, A. Walsh<sup>1</sup>, K. Bachman<sup>2</sup>, I. Anderson<sup>1</sup>, L. Madakamutil<sup>1</sup>. <sup>1</sup>*Immunology, <sup>2</sup>Discovery Sciences, Janssen Research, Spring House, USA*

**Background:** Rheumatoid arthritis (RA) is a chronic autoimmune disease characterised by infiltration of immune cells into the synovium and hyperplasia of the synovial lining, resulting in the formation of pannus that degrades cartilage and bone. Fibroblast-like synoviocytes (FLS) are the main cell types of the rheumatoid synovium and possess phenotypic and molecular characteristics of transformed cells. JQ1, an inhibitor of the bromodomain and extra terminal domain (BET) family that includes BRD2, BRD3, BRD4 and BRDT has shown efficacy *in vitro* on RA-FLS proliferation and *in vivo* in a murine model of arthritis.

**Objectives:** We sought to elucidate the mechanism of action of BET proteins in FLS biology and determine the potential therapeutic utility of targeting BRD2/BRD4 for RA disease treatment and interception.

**Methods:** To understand the mechanism of JQ1 action, we subjected JQ1-treated RA-FLS to transcriptional profiling by RNA-Seq and determined BRD2 and BRD4 cistromes by identifying global BRD2/BRD4 chromatin binding sites by ChIP-Seq. In addition, Assay for Transposable Accessible Chromatin by high throughput Sequencing (ATAC-Seq) was employed to identify open and closed regions of chromatin in JQ1-treated RA-FLS.

**Results:** We demonstrate that the active isomer of JQ1 but not its inactive isomer inhibits IL-1b-induced RA-FLS activation and proliferation. Through an integrated analysis of RNA-Seq, ATAC-Seq to profile changes in chromatin accessibility and ChIP-Seq of BRD2/4 and Pol2 proteins, we found that JQ1 inhibited multiple key inflammatory pathways, and altered the genome wide occupancy of crucial transcription factors involved in inflammatory signalling. Specifically, JQ1 treatment resulted in reduced occupancy of both BRD2 and BRD4 in approximately 2000 regions genome-wide, and a loss of Pol2 occupancy in approximately 600 genomic regions. Collectively we found that 105 genes had altered occupancy in all three proteins (BRD2, BRD4 and Pol2) and were also differentially expressed. Most prominently, JQ1 resulted in down regulation of IL6, IL8, p38 MAP kinase and HMGB1/TLR4 signalling pathways. In addition, we have identified BRD2/BRD4 super-enhancer genes and demonstrate that JQ1 altered BRD2/BRD4 occupancy in the IL6 and IL8 super-enhancer regions, and significantly down-regulated IL6, IL8, TLR4 and IL1b expression.

**Conclusions:** Our results suggest pleiotropic effects of JQ1 on pathways that have been individually targeted and shown to be efficacious for the treatment of RA. These studies provide a strong rationale for targeting of BRD2/BRD4 in RA.

#### OP0290-PARE KEEP AN EYE OUT FOR INVISIBLE PAINS – A DANISH CAMPAIGN

C.R. Ziegler. *Gigtforeningen, Gentofte, Denmark*

**Background:** How does it feel to live with a RMD and have chronic pain? How do you explain pain caused by RMD to your friends and family? How do you make others understand how pain affects your daily life? The communication department of the Danish Rheumatism Association needed to convey living with invisible pains, because it is of such importance to people with RMDs. Based on interviews with the users (people with RMDs) we found the best way of making others understand was to create a film, which illustrated living with invisible pain.

**Objectives:** We wanted to increase the general understanding of RMDs and living with invisible pain in society. The secondary objective was to brand awareness of the Danish Rheumatism Association and to generate leads for further processing, e.g. signing up for membership.

**Methods:** Based on a few interviews with users and several posts from Social Media we focused on making invisible pain visible. By choosing the media of a film we could show what the users found difficult putting into words. The film had to be short to make it possible to share, e.g. on Facebook, and by choosing a film without speak we avoided language barriers. Through adverts we retargeted visitors to our website and generated more members of the association.

**Results:** We launched the film on World Arthritis Day 2017 In 3½ weeks the film reached 1 million users and more than 1000 comments on Facebook, and the number of followers went up by 2000. The total impact of the film will be presented in June 2018.

**Conclusions:** In the presentation we will show how and why the campaign could be such a success. We will focus on how to follow-up the positive results of generating leads and making invisible pain visible.

**OP0291-PARE RUNNING WITH RHEUMATISM: A 7-WEEK TRAINING PROGRAMME FOR NOVICE RUNNERS WITH INFLAMMATORY RHEUMATIC DISEASE**

J.F.M.Holla<sup>1,2</sup>, J. Brontsema<sup>1</sup>, N. Schenk<sup>3</sup>, R. Jansen<sup>4</sup>, R. Vreenegeoor<sup>5</sup>, M. Fluit<sup>1</sup>, W.F. Peter<sup>1</sup>, I.E. Bultink<sup>6</sup>. <sup>1</sup>Reade, Center for Rehabilitation and Rheumatology, Amsterdam; <sup>2</sup>Faculty of Health, Sports and Social Work, Inholland University of Applied Sciences, Haarlem; <sup>3</sup>Runner with inflammatory rheumatic disease, Weesp; <sup>4</sup>Club manager, Athletics Club Phanos, Amsterdam; <sup>5</sup>Running trainer, Run2Day, Haarlem; <sup>6</sup>Amsterdam Rheumatology and immunology Center, VU University Medical Center, Amsterdam, Netherlands

**Background:** In the Netherlands, running is the second most practised sport. Running is also becoming increasingly popular among people with inflammatory rheumatic diseases, according to the growing number of running-related questions to the Dutch Arthritis Foundation and rheumatologists. Frequently asked questions are: 'Am I allowed to run?' and 'How can I start in a safe way?'.

**Objectives:** Given the increasing demand from the target group, and the potential positive health consequences of high-intensity exercise,<sup>1</sup> we developed a 7 week running programme for novice runners with inflammatory rheumatic disease, and explored its feasibility and safety.

**Methods:** First we performed a needs assessment among 228 participants with different inflammatory rheumatic diseases. In all, 200 (88%) participants were interested in practicing the sport of running. Then, a rheumatologist, specialised physical therapist, patient representatives and experienced running trainers developed the running programme, based on the proven effective 'Start to Run' programme of the Dutch Athletics Federation. The programme aims to prepare participants in 7 weeks for a 20 min run without breaks, and consists of one supervised group training session and one or two non-supervised training sessions per week. In addition to gradual progression of joint load (by starting with running on soft even surfaces) and running volume, special attention is paid to development of muscle strength and coordination, optimal movement pattern and running at an own comfortable pace. During the programme, the running trainer is in close contact with a rheumatologist and/or specialised physical therapist who can be consulted for advice.

**Results:** Of the first 24 participants of 'Running with Rheumatism', 12 participants completed the programme successfully, 4 participants developed a running related injury, 1 participant dropped out due to rheumatic symptoms, and 7 participants dropped out due to other reasons (e.g. surgery, infectious mononucleosis, burn-out). Participants indicated that they felt safe and comfortable during the group training sessions, and were surprised to be able to achieve so much progress in a short time period. They felt that they had become stronger and got to know their body and physical capabilities better.

**Conclusions:** The first running groups were successful. The incidence of running related injuries did not significantly differ from incidence rates reported from

comparable programmes for regular novice runners in the Netherlands. Therefore, we aim for nationwide implementation.

**OP0292-PARE THE CREATION OF THE 'AQUA RE-ACTION'. A METHODOLOGICALLY BASED AQUATIC PHYSICAL INTERVENTION/REHABILITATION PROGRAM FOR PEOPLE WITH RMD'S**

A. Iacovou. Cyprus League Against Rheumatism, Limassol, Cyprus

**Background:** As an Aquatic Instructor and an OA patient myself, I faced with other RMD patients the demand for an aquatic physical conditioning program that can meet our needs. After contacting with Patient Leagues and Aquatic Fitness Training Organisations, I found out that there was no such a specific program and it was essential to create one.

**Objectives:** My first objective was to get trained and create an aquatic program that could improve the quality of life through improving the ROM, muscular strength, flexibility, balance and aerobic capacity. My next objective was to accommodate people with variables like having or not fear of water, with minimum or increased joint mobility, with different affected joints and connective tissues. Hence to that I had to approach and convince Rheumatologists, Orthopaedics, Physiotherapists and patients for the benefits of this specific Aquatic program and have it as an option to their rehabilitation. Moreover, I had to use water as my basic instrument and use it's principles (Laws of physics) to estimate the programs intensity. Finally I decided to offer that knowledge through an Instructor course.

**Methods:** In order to get trained, I followed specific training in Aquatic fitness and Rehabilitation by International Aquatic Organisations like the Aquatic Exercise Association, International Aquatic Therapy Faculty and BECO Academy and spending hours in the pool testing exercises and designing the program. Methodologically, I implemented the Principles of Aquatic Environment like buoyancy, hydrostatic pressure, inertia, and biomechanics like, hydrodynamics, movement speed, levers, to estimate the exercise in low to medium intensity and I emphasised on the the quality and the execution of the movement. The program was focused on no pain moves in the biggest possible ROM, using all joints and muscle groups, working on muscle flexibility strength and aerobic capacity. I created a shallow and a deep water program in order to classify participants based on certain criteria.

I contacted meetings with Physicians, and the Cyprus League Against Rheumatism. Published article about Aquatic workout benefits to RMD's at the Cyprus League Against Rheumatism (Cyplar) Journal, I gave lectures and special offer to Cyplar members.

The creation of the Instructors course, needed to start from registering a name, logo and manual. It was also essential to build a business structure to obtain financial and human resources.

**Results:** Based on the participants testimonies there was an improvement on quality of life, their joints range of motion, muscle strength, flexibility and aerobic capacity. Hence to that they mention less pain, move quality night sleep and generally better social life with out depression. All the above was mentioned also from their Physicians and therapists that lead to increasing their trust towards the program benefits. Hence to that our collaboration with CYPLAR continued by organising a joined annual Swimming charity event.

AQUA Re-Action is the registered name of the program, and Logo and Manual are in an ongoing process of final registrations.

**Conclusions:** Having an active lifestyle through an aquatic physical conditioning program, which is under the guidance of a specialised Aquatic Instructor, for at least 3 times per week, can lead to a significant improvement on patients Quality of life within few weeks.

**OP0293-PARE** **PROBLEMS, GOALS AND URGENT WISHES OF YOUNG AUSTRIANS DIAGNOSED WITH RHEUMATIC DISORDERS: A REPORT**

P. Wegscheider, G. Schaffer. *Austrian Rheumatism League, Maria Alm, Austria*

**Background:** The Austrian Rheumatism League provides information about rheumatic disorders in order to improve the quality of life. It helps to get in contact with professional health caregivers and supports the sharing of personal experience. Because we suspected that young patients often have very different problems, goals and urgent wishes than their older counterparts, we conducted a survey addressing these questions.

**Objectives:** We sent a questionnaire to young people between 15 and 35 years old diagnosed with 'rheumatism' and in order to get information about their diagnosis, their daily lives, their problems, goals and urgent wishes.

**Methods:** 52 persons between 15 and 35 years old and diagnosed with juvenile idiopathic arthritis, rheumatoid arthritis, psoriatic arthritis, Mb. Bechterew, systemic lupus erythematoses, Sjögren-Syndrome, Sharp-Syndrome or fibromyalgia filled out a questionnaire. The subjects were divided into two groups (15–25, 25–35 years). The questions covered gender, province of residence, education, job, retirement, pregnancies/family as well as the problems and goals of the subjects. We also asked where they obtain necessary information about their condition (doctor, web).

**Results:** 55% of the participants were 15–25 years old and 45% were between the age of 25–35 years. 72% were female. Of these, 15 live in the province of Salzburg, 15 in Upper Austria and 15 in Vorarlberg. There were 5 participants each from other provinces (Vienna, Lower Austria, Styria, Carinthia, Tyrol and Burgenland). Most young adults got their information from their doctors (50%) or from the internet (39%). 39% graduated with A-level, 27% graduated at university and 34% completed specialised job training. 78% of these young Austrians were able to earn their living; 22% were not able to work. 29% never got the chance to start working. 35% had enough support to get pregnant and to manage a family. There was a strong desire (81%) for a meeting (which was never held before in Austria). 50% expressed willingness to help us or to run their own group. The most urgent wish of young people diagnosed with a rheumatic disorder is to be healed or to receive the ideal therapy in order to go into remission. The participants felt that there is a lack of understanding and appreciation of young people with painful chronic diseases. Some participants would like to be treated by younger rheumatologists. They feel that this would facilitate 'eye level' consultations. There is also a lack of understanding and support in schools, in civil service settings and in government agencies. A big issue mentioned was inflexible thinking, especially in job settings. Applicants with rheumatic disorders must compete with healthy individuals for forty-hour jobs. For people with a rheumatic disorder a forty-hour job is often too much, but they can do good work in a job with shorter working hours. Young people feel it is necessary to force our society and our doctors to feel responsible for the concerns of young people with rheumatism.

**Conclusions:** Following the positive feedback the Austrian Rheumatism League organised a first meeting for those young people with rheumatism. A program of sports and relaxation in a beautiful natural setting was planned with the aim of enhancing positive, constructive thinking and well-being. We must encourage young people with rheumatic disorders to participate in the activities of the Austrian Rheumatism League, and encourage our society to give up black and white thinking. Everyone should be educated to accept and appreciate handicapped colleagues in their work setting, and to treat them as equals. Furthermore, our government should make it possible for persons with rheumatic disorders to stay at work and with their families even if they are not able to work forty hours a week. All doctors working with rheumatic patients should be familiar with their thoughts, beliefs, aims and problems in order to support them not only with drug prescriptions but also with understanding.

**OP0294-PARE** **ADDRESSING KEY CHALLENGES OF LAY INVOLVEMENT IN MUSCULOSKELETAL RESEARCH: CO-APPLICANTS AND TRIAL STEERING COMMITTEES**

A. Higginbottom, S. Blackburn, R. Taylor, C. Rhodes, L. Campbell, K. Dziedzic. *Research Institute for Primary Care and Health Sciences, Keele University, Keele, UK*

**Background:** Patient and Public Involvement (PPI) in research is a requirement of funding in the UK. It has shown to improve the relevance and quality of research. For over 10 years, a Research User Group (RUG) of over 100 patients with musculoskeletal and other long term conditions who actively work with a Research Institute.<sup>1</sup> Researcher and anecdotal feedback from RUG members and researchers have highlighted two challenging PPI roles: lay co-applicants on research grants and lay membership of trial study steering committees (TSCs).

For some RUG members, this has resulted in a less positive experience and a disinterest in having these important roles in the future

**Objectives:** To address the challenges of involving RUG members as co-applicants and as members of TSCs, and to describe ways of supporting RUG members in these roles.

**Methods:** Information to improve understanding of the challenges of these roles were gathered during group meetings and informal conversations with 13 RUG members, and a workshop with 35 researchers. PPI and researcher perspectives were captured on flipcharts, notes and meeting minutes. This information shaped the development of resources and approaches to support RUG members as lay co-applicants and TSC members.

**Results:**

**Abstract OP0294PARE – Table 1.** Challenges and support of lay co-applicants and TSC lay members

	Challenges	Support provided
Lay co-applicant	Understanding the role and time commitment Managing expectations Difficulties with online grant submission process Research jargon	Guidance and advice provided for RUG members and research teams Early meetings encouraged between research teams and RUG members to discuss and agree roles Personal and technical support provided for lay members during the grant submission process Glossary
Lay members of TSCs	Understanding the role and process of TSCs Understanding study background, aim and design Sustaining interest during extended periods between meetings Uncertainty about what, how and when to contribute in meetings Awareness of role by other TSC members Lack of training Teleconference meetings Volume of emails and paperwork to review Research jargon	Training module for RUG members Guides for Chairs, RUG members and researchers Pre-meetings with Chair and post meeting support (debrief) Two RUG members to attend for mutual support PPI as a set agenda item and lay contribution encouraged throughout meetings PPI Support Worker attend meetings to support RUG member Hard copies of paperwork sent, sections relevant to lay input highlighted Glossary

**Conclusions:** Providing support to RUG members and researchers can sustain active and long-term lay involvement in these challenging yet important research roles.

**OP0295-PARE** **'KWEK BEGRIP': THE LAUNCH OF OUR CREATIVE CAMPAIGN ACROSS THE NETHERLANDS ON WORLD ARTHRITIS DAY AIMS TO INCREASE AWARENESS ABOUT RMDs IN GENERAL AND PEOPLE LIVING WITH RMDs IN PARTICULAR**

S. De Jong. *Patient advocacy, Dutch Arthritis Foundation, Amsterdam, Netherlands*

**Background:** With two million patients, RMDs are one of the most common chronic diseases in the Netherlands. A 2016 Nivel survey showed that 50% of all RMD patients deal with people who know too little about RMDs in order to understand their situation. RMDs are not always visible, and symptoms may vary from day to day. This often leads to friends, colleagues, neighbours and even relatives showing incomprehension. For RMD patients this can lead to loneliness, insecurity and a sense of not being accepted. Understanding RMDs and being able to show compassion starts with knowing about RMDs.

**Objectives:** By launching a national creative campaign about incomprehension, the Dutch Arthritis Foundation aims to raise general awareness of RMDs to promote understanding of people with a RMD and to reduce their sense of loneliness.

**Methods:** The Dutch Arthritis Foundation started its campaign on World Arthritis Day: 'Grow awareness, plant a bulb!'. To 'grow understanding', we created two special tulip bulb fields, one online and one offline, for participants to plant the special 'Anita Witzier' tulip bulb. Anita Witzier is a well-known Dutch television host who suffers from rheumatoid arthritis. She has been ambassador for the Dutch Arthritis Foundation since 2001.

With the help from 70% of all local RMD patient organisations and a number of garden centres, we handed out a total of 15 000 bags of tulip bulbs across the Netherlands. The campaign kick-off was on World Arthritis Day. The event, held on a tulip breeder's field, hosted presentations about incomprehension, and served to share real-life stories.

We also developed a website where people could plant bulbs digitally. Every week, participants receive a video, cartoon, update or article with information about RMDs. The campaign will run until 21 May 2018 when the (real-life) tulips will bloom in our RMD field. All participants can then visit the field to pick a bunch of flowers.

**Results:** The campaign received a great deal of national media attention on WorldArthritisDay, and featured on television programmes, in newspapers and on online platforms. 8000 people have since signed up for the online tulip field, sharing the information with others in their network. The campaign site drew 68 000 visitors between 12 Oct and 31 Oct. The campaign also resonated with people on Facebook. In October, our campaign posts reached 1,869,000 visitors, with more than 65 000 interactions (respond, share, like, watch video, conversion to campaign site).

**Conclusions:** Raising awareness for incomprehension can be difficult. A creative approach can help to kickstart a public debate. Responses generally show that people with RMDs appreciate this complicated subject being put on the map.

OP0296

#### THE RISK OF DELIBERATE SELF-HARM IN RHEUMATOID ARTHRITIS AND ANKYLOSING SPONDYLITIS: A POPULATION-BASED COHORT STUDY

B Kuriya<sup>1,2</sup>, J. Widdifield<sup>3,4</sup>, J. Luo<sup>4</sup>, S. Vigod<sup>4,5</sup>, N. Haroon<sup>1,6</sup>. <sup>1</sup>Medicine, University of Toronto; <sup>2</sup>Rheumatology, Sinai Health System; <sup>3</sup>Holland Musculoskeletal Research Program, Sunnybrook Research Institute, University of Toronto; <sup>4</sup>Institute of Clinical Evaluative Sciences; <sup>5</sup>Psychiatry, University of Toronto; <sup>6</sup>Rheumatology, University Health Network, Toronto, Canada

**Background:** Inflammatory arthritis is associated with the development of mental health disorders. However, there is limited data on the risk of serious mental health outcomes following a rheumatoid arthritis (RA) or ankylosing spondylitis (AS) diagnosis.

**Objectives:** To estimate the risk of deliberate self-harm in patients with ankylosing spondylitis or rheumatoid arthritis compared with the general population.

**Methods:** We evaluated population-based cohorts of RA (n=53,240) and AS (n=13,964), each matched 1:4 by age, sex, and calendar year (at diagnosis) with non-IA comparator cohorts in Ontario, Canada. Individuals with a history of mental illness or prior episode of deliberate self-harm were excluded. The outcome was a first emergency room presentation for deliberate self-harm, subsequent to RA or AS diagnosis, between April 1, 2002 and March 31, 2016. We estimated hazard ratios (HR) and 95% confidence intervals (95% CI) for RA and AS, separately, versus the comparator groups, adjusting for demographic, clinical and health service utilisation variables.

**Results:** Individuals with AS were more likely to deliberately self-harm (incidence rate [IR] of 6.79/10,000 person years [PY] compared to 3.19/10,000 PY in comparators, with an adjusted HR 1.82 (95% CI: 1.26 to 2.62). Deliberate self-harm was also increased for individuals with RA (IR 3.51/10,000 PY) compared to comparators (IR 2.45/10,000 PY) only before (HR 1.43, 95% CI: 1.16 to 1.75), but not after covariate adjustment (HR 1.09, 95% CI: 0.88 to 1.36). The most frequent method of self-harm was poisoning (64% of attempts in AS, 81% in RA) or self-mutilation (36% in AS, 18% in RA).

**Conclusions:** There is a significantly increased rate of self-harm attempt in inflammatory arthritis and the risk is particularly elevated following a diagnosis of AS. These findings highlight the need for routine evaluation of self-harm behaviour as part of the management of chronic inflammatory arthritis. Understanding the mechanisms contributing to deliberate self-harm attempts will help tailor preventive strategies to reduce morbidity associated with this serious mental health outcome.

#### DISEASE ACTIVITY IN RHEUMATOID ARTHRITIS PATIENTS IS INFLUENCED BY COUNTRIES' SOCIOECONOMICS: RESULTS FROM THE METEOR REGISTRY

S.A. Bergstra<sup>1</sup>, J. Tavares-Costa<sup>2</sup>, M. Garzo-Elizondo<sup>3</sup>, K. Salomon-Escoto<sup>4</sup>, N. Govind<sup>5</sup>, C. Allaart<sup>1</sup>, R. Landewe<sup>6</sup>. <sup>1</sup>Rheumatology, LUMC, Leiden, Netherlands; <sup>2</sup>Unidade Local de Saúde do Alto Minho, Ponte de Lima, Portugal; <sup>3</sup>Hospital Universitario Dr José Eleuterio González, Monterrey, Mexico; <sup>4</sup>UMass Memorial Medical Center, Worcester, USA; <sup>5</sup>University of the Witwatersrand, Johannesburg, South Africa; <sup>6</sup>ARIC, Amsterdam, Netherlands

**Background:** The treatment and prognosis of rheumatoid arthritis (RA) patients have improved tremendously, but patients across the world may not benefit similarly. One of the potentially critical factors may be poorer access to expensive biological (b)DMARDs.

**Objectives:** To investigate daily practice data regarding bDMARD-use in different countries worldwide and assess if a lower country's socioeconomic status (SES) is associated with worse clinical outcomes and lower usage of bDMARDs.

**Methods:** Data on disease activity and drug use from countries that contributed  $\geq 100$  RA patients after 1–2000 were extracted from the daily practice, observational METEOR database. Missing data were imputed using multi-variate normal imputation (30 cycles). Gross domestic product (GDP) per capita in international dollar (Int\$) was used as indicator of SES. Per country average DAS28 and the proportion of patients in DAS28-remission (DAS28 <2.6) were calculated by taking the average of all patients at the last available visit. Univariable logistic regression analyses were performed to assess associations between GDP, bDMARD use and disease outcomes at a country level.

**Results:** In total, 20,379 patients were included from 12 countries: United States, Mexico, South-Africa, Japan, Brazil, United Kingdom, Spain, Ireland, Portugal, France, India and the Netherlands. The number of patients ever using a bDMARD varied between 0.9% (South-Africa) and 75% (Ireland). The proportion of patients in remission at the final visit varied between 2% (India) and 39% (Netherlands).

Patients in countries with a higher GDP per capita had a lower average DAS28 and consequently, a higher proportion of them were in DAS28-remission:  $\beta$  (95% CI)  $-0.32$  ( $-0.41$ ;  $-0.021$ ) lower DAS28 and an additional 4.2% (0.14; 8.26) of patients in DAS28-remission for every 10,000 Int\$ additional GDP.

To underscore the assumption that the association between SES and DAS28 is mediated by bDMARD use, we assessed whether SES was associated with bDMARD use per country. Indeed, a higher GDP per capita was associated with a higher proportion of patients using a bDMARD:  $\beta$  (95% CI) 11.2 (4.82; 17.5), indicating an additional 11% of patients using a bDMARD per 10,000 Int\$ increase in GDP per capita. Furthermore, DAS28 was  $\beta$  (95% CI)  $-0.14$  ( $-0.28$ ;  $-0.0054$ ) lower and 2.8% ( $-0.13$ ; 5.8) more patients achieved DAS28-remission per 10% increase in proportion of patients using a bDMARD, figure 1.

**Abstract OP0297** – Table 1 Associated between 'GDP per capita (Int\$)', '% bDMARD use' and 'disease activity'.

**Conclusions:** RA patients in countries with a lower SES had worse disease activity. Although patients in countries with a lower SES less often used bDMARDs, the effect of bDMARD use on disease activity was smaller than expected, indicating that other factors than access to bDMARDs may contribute to the effectiveness of RA treatment.

**DOI:** 10.1136/annrheumdis-2018-eular.5456

OP0298

### THE COMPARATIVE EFFECTIVENESS OF CYCLING TUMOURNECROSIS FACTOR INHIBITOR (TNFI) VERSUS SWAPPING TO A NONTNFI ON PATIENT-REPORTED FUNCTIONAL ABILITY OF PATIENTS WITH RHEUMATOID ARTHRITIS

M.A. Lopez-Olivo<sup>1</sup>, A. Matusевич<sup>1</sup>, S.B. Cantor<sup>2</sup>, G. Pratt<sup>3</sup>, M.E. Suarez-Almazor<sup>1</sup>.  
<sup>1</sup>General Internal Medicine; <sup>2</sup>Health Services Research; <sup>3</sup>Research Medical Library, The University of Texas, MD Anderson Cancer Center, Houston, USA

**Background:** Data on patient-reported functional ability to evaluate the optimal strategy for patients who have failed to first TNFi is scarce. Patient-reported outcomes are a critical component of assessing whether clinicians are improving the wellbeing of patients.

**Objectives:** We conducted a systematic review and meta-analysis to evaluate the comparative effectiveness of two strategies, cycling versus swapping, on patient-reported functional ability and other patient-reported outcomes.

**Methods:** Four electronic databases were searched (MEDLINE, EMBASE, Cochrane Library, and Web of Sciences). Sources of grey literature (unpublished records) were searched through clinicaltrials.gov and other websites. The selection process, risk of bias assessment, and data extraction were performed by two independent reviewers. We included controlled trials evaluating patient-reported outcomes in patients either cycling to a second TNFi or swapping to a targeted drug with an alternative mechanism of action. Other outcomes reported included pain, patient global assessment, fatigue, and quality of life.

**Results:** We included 13 studies reporting data on 4394 patients. The reported cycling strategies were adalimumab, certolizumab, etanercept, golimumab, or infliximab; swapping strategies were abatacept, rituximab, tocilizumab, or tofacitinib. For the individual comparisons, TNFi versus disease modifying antirheumatic drug (DMARD), there was a statistically significant increase in functional ability from baseline to 14 weeks, favouring those patients receiving the cycling strategy (Mean Difference (MD) -0.20, 95% CI: -0.34 to -0.06; scores ranging from 0 to 3). Differences favouring cycling when compared to a DMARD were also observed for pain, fatigue, and patient global assessment. Similarly, when comparing nonTNFi versus DMARD, there was a statistically significant increase in functional ability from baseline to 24 weeks, favouring those patients receiving the swapping strategy (MD -0.31, 95% CI: -0.35 to -0.27; scores ranging from 0 to 3). Differences favouring cycling when compared to a DMARD were also observed for pain, sleep, fatigue, patient global, and quality of life (SF-36 physical and mental components). Three RCTs directly compared the two strategies. There was no statistically significant differences in the functional disability reported between those patients assigned to the cycling strategy compared with those assigned to the swapping strategy at 12, 24, 36 or 52 weeks (MD at 52 weeks -0.05, 95% CI: -0.18 to 0.09; score ranging from 0-3).

**Conclusions:** Although evidence from previous reports suggest that swapping may be more effective than cycling when evaluating some clinical outcomes our results suggest that with the current evidence both strategies are equally effective in improving functional disability and other patient-reported outcomes.

OP0299

### COST-EFFECTIVENESS OF TAPERING TNF BLOCKERS VERSUS CONVENTIONAL SYNTHETIC DMARDS IN RHEUMATOID ARTHRITIS: FIRST YEAR RESULTS OF THE RANDOMISED CONTROLLED TARA-STUDY

E. van Mulligen<sup>1</sup>, A. E. A. M. Weel<sup>1,2</sup>, T.M. Kuijper<sup>2</sup>, J.J. Luime<sup>1</sup>, J.M.W. Hazes<sup>1</sup>, P. H.P. de Jong<sup>1,2</sup>. <sup>1</sup>Rheumatology, Erasmus MC; <sup>2</sup>Rheumatology, Maastricht hospital, Rotterdam, Netherlands

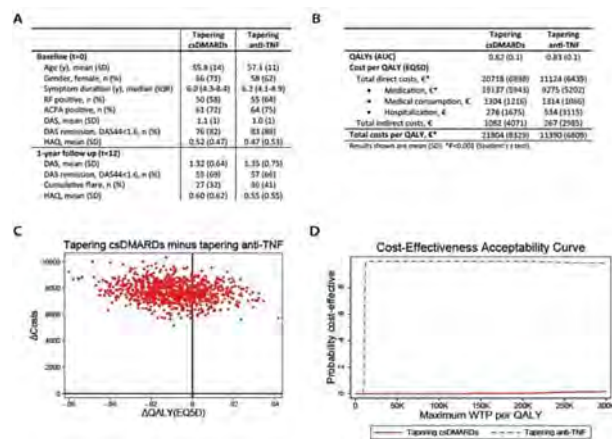

**Background:** Current guidelines recommend to consider tapering treatment in rheumatoid arthritis (RA) patients who are in sustained remission, but the optimal approach to de-escalate conventional synthetic and biological DMARDs (respectively csDMARDs and bDMARDs) remains unknown. The benefits of tapering are a decreased risk of long-term adverse events and a reduction of health care costs, especially when bDMARDs are tapered. However, tapering treatment may lead to more transient or persistent disease flares, which have a direct impact on patients' lives and societal costs.

**Objectives:** The aim of this study is to evaluate the difference in cost-effectiveness of tapering csDMARD or anti-TNF therapy during one year of follow-up.

**Methods:** The TARA trial is a multicenter single-blinded randomised controlled trial. Included were RA patients that used a combination of csDMARDs and anti-TNF and who were at least for 3 months in sustained remission, defined as a DAS<sub>2.4</sub> and a swollen joint count (SJC) ≤1. Patients were randomised into

gradual tapering csDMARDs followed by the TNF blocker or vice versa. Medication was tapered in three steps over the course of 6 months. Gradual tapering was done by cutting the dosage into half, a quarter and thereafter it was stopped. Data on QALYs (measured with the Dutch EuroQol [EQ5D]), direct, and indirect costs were used to calculate the Incremental Cost Effectiveness Ratio (ICER). Direct costs comprises costs for treatment and medical consumption, while indirect costs comprises costs due to loss of productivity (i.e. sick leave and unemployment).

**Results:** A total of 187 patients were randomly assigned to tapering csDMARDs (n=93) or tapering anti-TNF (n=94). Patients had an average symptom duration of 6.7 years and were predominantly female (66%) with an average age of 56.4 years (figure 1A). Average QALYs (SD), over 1 year, for tapering csDMARDs or anti-TNF were, respectively, 0.82 (0.1) and 0.83 (0.1) (figure 1B). One year after inclusion a none significant difference in cumulative flare ratio of 9% was observed (overall flare ratio 36%). Patients in the anti-TNF tapering group had lower costs per QALY (SD) (€11 390 (6809)) compared to patients in the csDMARD tapering group (€21 804 (8329)). The difference in costs per QALY were mainly determined by the medication costs (figure 1B). The Incremental Cost Effectiveness Ratio (ICER, 95% CI) between tapering csDMARDs and anti-TNF was €31 922 (-€920572, €984416) (figure 1C). Tapering anti-TNF was >95% cost-effective across all willingness-to-pay thresholds compared to tapering csDMARDs (figure 1D).

**Abstract OP0299** – Figure 1 Summary of economic evaluation. (A) baseline characteristics and results after 12 months of follow-up of both tapering groups. (B) total costs per QALY after 1 year of follow-up. (C) cost effectiveness and plane of costs of tapering csDMARDs minus costs for tapering anti-TNF. (D) acceptability curves for tapering csDMARDs and tapering anti-TNF. Abbreviations: AUC; area under the curve, csDMARDs; conventional synthetic DMARDs, EQ-5D; Dutch EuroQol, QALY; quality adjusted life year, WTP; willingness to pay.

**Conclusions:** Tapering anti-TNF is more cost-effective compared to tapering csDMARDs. Therefore, in RA patients who are in sustained remission we advise to taper anti-TNF first, but before tapering therapy rheumatologist should take the risk of a disease flare and patient's wishes into account.

**Disclosure of Interest:** None declared

OP0300

### REDUCING AVOIDABLE BIOLOGIC DRUG WASTAGE THROUGH COLLABORATION BETWEEN PATIENTS AND CARE PROVIDERS: THE LEEDS SPONDYLOARTHRITIS SERVICE EXPERIENCE

A. Barr, D. Pickles, N. Fadl, J. Dou, C. Vandeveld, S. Dubash, J.E. Freeston, H. Marzo-Ortega. NIHR Leeds Biomedical Research Centre, University of Leeds, UK., Leeds Teaching Hospitals Trust and Leeds Institute of Rheumatic and Musculoskeletal Medicine, Leeds, UK

**Background:** The Leeds rheumatology department manages a cohort of approximately 4,000 patients with inflammatory arthritis receiving biologic therapies with an estimated annual cost of £15,000,000. Of these, approximately 1,000 have axial Spondyloarthritis or Psoriatic arthritis (SpA). Biologic drug wastage with self-injectable drugs can occur when patients have no further use for their existing stockpile of drug (typically occurring when receiving further stock around the time of stopping, pausing or switching drugs). Wastage is recorded by home-delivery companies on receiving returned 'unusable' stock. With intravenous drugs, wastage occurs when patients don't attend infusions. Reducing risk of self-injectable wastage has been achieved (1) but reducing self-injectable and intravenous biologic wastage has not.

**Objectives:** To establish whether a patient information letter could be used to reduce measured biologic drug wastage.

**Methods:** All SpA patients receiving biologic therapies (infusion or self-injectable) were identified by prescription records. Wastage (recorded by the infusions ward & home-delivery companies) was reviewed from January 2016 until May 2017. A patient information leaflet (PIL) was developed and sent simultaneously to all patients advising how to minimise wastage (ie: call the infusions ward or delivery companies early when unable to attend and pausing, stopping or switching biologics respectively). The same wastage was measured for 4 months afterwards.

**Results:**

Time.frame	16 .months Jan.2016 to.May.2017	4 .months May.to. Sep.2017	12 .month.projection
Biologic Drug wasted	Pre.intervention.wastage (negative.value)	Post. intervention. wastage	Projected.annual. savings.(positive.value)
Adalimumab	-£12,598.33	£0.00	+£9,448.75
Certolizumab	£0.00	£0.00	£0.00
Golimumab	£0.00	£0.00	£0.00
Tocilizumab	-£1,612.80	£0.00	+£1,209.60
Ustekinumab	-£2,147.00	£0.00	+£1,610.25
Secukinumab	£0.00	£0.00	£0.00
Infusions(infliximab and biosimilar)	-£64,680.00	£0.00	+£48,510.00
Total financial value	-£81,038.13	£0.00	+£60,778.60

In the 16 months prior to the PIL intervention an estimated £81,000 of wastage was measured. Of this, 80% was due to infusion ward wastage (n=45 infliximab infusions) and 20% was due to self-injectable biologics. Following the PIL intervention, no wastage was measured either on the infusion ward or for self-injectable biologics. This resulted in a projected annual saving of £61,000 (80% of which was related to avoidable infliximab wastage). During the observation period the total number of patients taking biologics did not change significantly. No adverse events have been associated with this PIL. Limitations include; a standardised infliximab dose banding was introduced during the final month which may have reduced wastage; Etanercept/etanercept biosimilar data are incomplete as the project is ongoing and are therefore excluded from the analysis.

**Conclusions:** This is the first intervention demonstrating a reduction in measured biologic drug wastage. It represents a simple, reproducible and sustainable intervention through a collaborative effort between patients and health care providers and offers potential significant savings in a time of austerity.

**OP0301 TWO YEAR COST-EFFECTIVENESS ANALYSIS OF THE CARERA TRIAL IN EARLY RA: A PIGGY BACK STUDY**

S.S. Pazmino<sup>1</sup>, R. Westhovens<sup>1,2</sup>, J. Joly<sup>2</sup>, V. Stouten<sup>1</sup>, D. De Cock<sup>1</sup>, K. Van der Elst<sup>1,2</sup>, P. Verschueren<sup>1,2</sup>, on behalf of the CareRA study group. <sup>1</sup>Rheumatology, KU Leuven- Skeletal Biology and Engineering Research Department; <sup>2</sup>Rheumatology, University Hospitals, Leuven, Belgium

**Background:** Rheumatoid arthritis (RA) causes high individual, medical and societal costs. EULAR guidelines suggest treating early, intensively and to target using disease modifying anti-rheumatic drugs (DMARDs), preferably with initial glucocorticoid (GC) bridging. COBRA slim, a combination of methotrexate (MTX) with a moderate dose prednisone step down bridge scheme showed a positive efficacy/tolerability balance in the Care in early RA (CareRA) trial. COBRA Slim in comparison to DMARD combination therapy with GC bridging, has the necessary intensity to induce remission, but with a lower risk of severe discomfort or adverse events, decreasing the early need for biologic (b)DMARDs.

**Objectives:** Perform an economic evaluation on the 2 year pragmatic randomised CareRA trial.

**Methods:** Patients with early RA (≤1 year) naïve to DMARDs were randomised to monotherapy or synthetic (cs)DMARD combination with or without GC bridging, after risk stratification based on classical prognostic markers. Clinical and patient-reported data were collected at each visit (≥ 10 times in 2 years).

Direct costs of visits and RA medication (systemic GCs, cs and bDMARDs) over 2 years were calculated for each patient from each of the 5 treatment arms (table 1).

For cost-effectiveness analysis, benefits were expressed as the proportion of patients with DAS28CRP<2.6 at year 2. Missing data was imputed per item with expectation maximisation.

For cost-utility analysis, utilities were calculated using a validated mapping algorithm reconstructing EQ-5D scores based on age, sex, HAQ and pain scores at relevant study visits. Quality-adjusted life years (QALYs) encapsulating the impact of treatment on a patient's length of life and health-related quality of life, were calculated as the time-weighted average of all available EQ-5D scores (area under the curve).

Incremental cost-effectiveness ratios (ICERs) from each strategy were calculated. ICERs compare the additional costs a strategy imposes over another with the additional benefits it delivers. Means and medians based methods were calculated with confidence intervals via bootstrapping.

**Results:** From the initial CareRA cohort (n=379), cost/benefit data of 326 patients was used for a 2 year economic analysis. The mayor driver of direct costs was bDMARDs (57%>87% of total costs). Number of consultations were comparable (±11) across all treatment strategies.

The cost-effectiveness analysis in the high risk population showed a higher ICER for COBRA Avant Garde (mean € 198.65/1%, median € 78.41/1%) and a dominated ICER for COBRA Classic (mean € -181.40/1%, median € -35.01/1%) compared to the Slim. In the low risk arm, ICERs for COBRA Slim compared to Tight Step Up (TSU) were € 46.75/1% (mean) and € 43.64/1% (median).

Cost-utility analysis in the high risk arm showed an incremental cost of € 1 469.36 for an increased utility of 0.012555 QALYs for COBRA Classic compared to COBRA Slim, resulting in an ICER of € 117 033.85/QALY.

The ICER of COBRA Avant Garde vs COBRA Slim was € 69 329.19/QALY. In the low risk arm, the comparison of COBRA Slim to TSU yields an ICER of € 1 342.78 per QALY.

**Abstract OP0301 – Table 1**

Treatment strategy	Direct costs		Effectiveness		Utility			QALYs of 2 years	
	Mean (95% CI)	Median (IQR)	Mean ± SD	% <2.6 at Y2	Y1	Y2	Mean ± SD		
HIGH RISK	COBRA Slim n=67	€ 238.62 (€1 713.15, €2 896.13)	€ 1 145.37 (1034.96-1588.07) BS-CI €3 192.64, €1 267.93	2.20 ± 0.87	75.9 % BS-CI 67.8%, 83.9%	0.57	0.82	0.82	1.64 ± 0.31 BS-CI 1.57, 1.69
	COBRA Classic n=67	€ 707.98 (€2 942.15, €4 923.24)	€ 1 428.92 (1 342.46, 1 878.27) BS-CI €1 378.84, €1 481.98	2.30 ± 0.88	87.3 % BS-CI 58.6%, 75.9%	0.53	0.82	0.81	1.65 ± 0.32 BS-CI 1.58, 1.72
	COBRA Avant Garde n=77	€ 410.83 (€2 287.62, €5 933.28)	€ 1 608.01 (1305.72-1763.05) BS-CI €1 591.61, €1 929.40	2.03 ± 0.83	81.3 % BS-CI 74.6%, 93.6%	0.56	0.82	0.86	1.65 ± 0.34 BS-CI 1.58, 1.72
LOW RISK	COBRA Slim n=34	€ 3055.64 (€1 596.07, €5 383.40)	€ 1 124.04 (1029.76-1825.78) BS-CI €1 040.66, €1 286.20	1.95 ± 0.86	79.4 % BS-CI 67.6%, 88.2%	0.60	0.87	0.87	1.72 ± 0.31 BS-CI 1.67, 1.83
	Tight Step up n=41	€ 877.99 (€ 1 262.42, €4 740.37)	€ 968.19 (809.85-1555.25) BS-CI € 897.13, €1 186.03	2.23 ± 1.03	75.6 % BS-CI 63.4%, 85.4%	0.66	0.84	0.82	1.59 ± 0.35 BS-CI 1.49, 1.68

BS-CI: 95% confidence intervals resulting from 1000 bias-corrected and accelerated bootstrapped replications; QoL: quality of life; QALYs: quality-adjusted life years; SD: standard deviation; IQR: interquartile range; BS: baseline; Y1: year 1; Y2: year 2

**Conclusions:** COBRA Slim which consists of an initial combination of MTX and a moderate dosed GC remission induction scheme has a favourable cost-effective and cost-utility profile for patients with early RA independent of their prognostic factors.

**OP0302 AN EVALUATION OF UTILISATION PATTERNS AND APPROPRIATENESS OF LABORATORY TESTS AMONG NEW REFERRALS TO RHEUMATOLOGISTS: CHOOSING UNWISELY!**

A. Ahrari<sup>1</sup>, S.S. Barrett<sup>2</sup>, S. Rohekar<sup>3</sup>, P. Basharat<sup>3</sup>, G. Rohekar<sup>3</sup>, S. Haig<sup>3</sup>, J. Pope<sup>3</sup>. <sup>1</sup>Internal Medicine; <sup>2</sup>Medicine, Schulich School of Medicine; <sup>3</sup>Rheumatology, Western University, London, Canada

**Background:** Laboratory testing including autoantibodies are common investigations ordered by physicians in diagnosing rheumatic diseases. Tests such as rheumatoid factor (RF) and antinuclear antibody (ANA) have been shown to have low positive predictive value and questionable clinical utility in general practice. <sup>1-3</sup>Optimizing value in medical care is a worldwide concern. In addition, overuse of diagnostic tests can increase health resource use, lead to unnecessary referrals, and cause anxiety associated with positive results. To that end, the Canadian Rheumatology Association (CRA) joined the national Choosing Wisely Canada Campaign and developed a list of 5 tests with evidence indicating they may not be adding value and in fact be harmful. Among these, ANA testing was identified as one of the tests often inappropriately ordered. <sup>3</sup> When combined with extractable nuclear antibodies (ENA) and anti-dsDNA, these tests impose a significant cost.

**Objectives:** To evaluate the utilisation patterns, appropriateness, and associated cost of tests (ANA, ENA, anti-dsDNA, RF, and complement levels) in patients referred to rheumatologists 2 years after release of CRA choosing wisely guidelines.

**Methods:** A chart audit reviewing the records of all referred patients to five rheumatologists at an academic university out-patient rheumatology clinic over one year (including referrals that were rejected) was conducted. Specific tests requested prior to referral and their indication based on clinical presentation were extracted. Other data included reason for referral and the final diagnosis. The number of unnecessary laboratory tests and associated costs were calculated.

**Results:** Over 500 patients were reviewed. Most common referrals were for possible diagnosis of rheumatoid arthritis, lupus, and seronegative spondyloarthropathies. Prior to referral: 77% had undergone ANA testing at least once, in one-third of cases, ANA was repeated; 25% had ENA testing and 30% had anti-dsDNA. Among all ANA tests, 25% were requested when there was no clinical suspicion for connective tissue diseases based on American College of Rheumatology criteria. Half of ENA and anti-dsDNA testing was requested in the context of negative ANA. RF was requested in 65% of the referrals and in one third, there was no clinical suspicion of inflammatory arthritis.

**Abstract OP0302 – Figure 1.** Utilisation patterns and associated costs of laboratory investigations among referrals to rheumatologists

**Conclusions:** RF, ANA, ENA, and anti-dsDNA are among commonly ordered investigations prior to referral to rheumatology. Despite the recommendations by choosing wisely campaigns, up to 50% of investigations are inappropriately ordered. Based on our cost estimation, more selective ordering of the above tests, and minimising inappropriate investigations would lead to 45% cost reduction.

#### OP0303

### SYSTEMATIC SCREENING OF COMORBIDITIES IMPROVES VACCINATION RATES, SKIN CANCER SCREENING AND VITAMIN D SUPPLEMENTATION IN PATIENTS WITH AXIAL SPONDYLOARTHRITIS: RESULTS OF THE COMEDSPA PROSPECTIVE, CONTROLLED, ONE YEAR RANDOMISED TRIAL

A. Moltó, A. Etcheto, S. Poiraudeau, L. Gossec, P. Claudepierre, M. Soubrier, F. Fayet, D. Wendling, P. Gaudin, E. Demis, S. Guis, S. Poupin, A. Ruyssen-Witrand, M. Dougados. *COMEDSPA study group, Paris, France*

**Background:** Specific recommendations for the detection/prevention of comorbidities have been proposed for patients with SpA. However, we know that often a gap exists between recommendation and their implementation in daily practice

**Objectives:** To evaluate the impact of a program of systematic screening of comorbidities and its management (detection/prevention).

**Methods:** Prospective, randomised controlled open, 12 month trial (NCT02374749). Patients: Axial SpA (according to rheumatologist). Study treatment: Collection of data by the nurse during a specific out-patient visit for the 5

studied SpA comorbidities (i.e. cardiovascular disease (CVD), osteoporosis, cancer, infection and peptic ulcer) according to the recommendations of the French Society of Rheumatology. In the event of non-agreement with the recommendation the patient was informed. A report summarising the results of this program prepared by the nurse was sent to the patient's attending physician and rheumatologist. Treatment allocation: After written informed consent, the study treatment was allocated randomly. Outcome variables: the main outcome was the change after one year of a comorbidity score. This weighted composite comorbidity score ranged from 0 to 100, where 0=optimal management of the 5 studied comorbidities and its weights were derived from the percentage of attributed mortality in SpA to each comorbidity in the literature, i.e. 40 points for CV disease, 20 points for cancer and infection, 10 points for osteoporosis and 10 points for peptic ulcer. The number of patients with actions undertaken against comorbidities according to the recommendations during the 12 months following this program were defined as secondary variables

**Results:** There were no differences in the baseline characteristics of the 502 recruited patients (252 and 250 in the active and control groups, respectively): Age: 46.7±12.2 years, male gender: 62.7%, disease duration: 13.7±11.0 y, Xray sacroiliitis 62.8%, MRI sacroiliitis 65.7%, current biologic treatment: 78.3%, ASDAS-CRP: 1.9±0.8, BASFI: 25.6±22.3. During the 1 year follow-up period, the comorbidity score decreased more in the active group, but this difference was not significant (−3.20 vs −1.85).

The number of actions per patient was statistically higher in the group comorbidities : 4.54±2.08 vs 2.65±1.57 (p<0.001); the number of patients with actions performed to be in agreement with recommendations during the 12 months follow-up was higher in the active group for infections (flu vaccination : 28.6% vs 9.9%, p<0.01; pneumococcal vaccination:40.0% vs 21.1%,p=0.04), skin cancer screening (36.3% vs 17.2%; p=0.04), and osteoporosis (BMD performed: 22.6% vs 8.7%, p<0.01; Vitamin D supplementation initiation: 51.9% vs 9.4%, p<0.01).

**Conclusions:** This study highly suggests the short-term benefit of program on the systematic screening of comorbidities for its management in agreement with recommendations, even if this young age population of axSpA patients.

**Acknowledgements:** This study was conducted thanks to a grant from the French National Research Program (PHRC) thanks to an unrestricted grant from ABBVIE.

### MULTIDISCIPLINARY COLLABORATION AMONG YOUNG SPECIALISTS: RESULTS OF AN ONGOING INTERNATIONAL SURVEY BY YOUNG ORGANISATIONS

M. Kostine<sup>1</sup>, A. Najm<sup>2</sup>, J. Pauling<sup>3</sup>, A.C. Ferreira<sup>4</sup>, K. Stevens<sup>5</sup>, E. Smith<sup>6</sup>, I. Eguiluz Gracia<sup>7</sup>, S. Ramiro<sup>8</sup>, E. Nikiphorou<sup>9</sup>, A. Molto<sup>10</sup>, A. Alunno<sup>11</sup>, P. Studenic<sup>12</sup>, A. Sepriano<sup>9</sup>, J. Rodríguez Carrio<sup>13</sup>, C. Richez<sup>1</sup>, on behalf of EMEUNET, YNP, PReS EMERGE and EAACI JM. <sup>1</sup>Bordeaux University Hospital, Bordeaux; <sup>2</sup>Nantes University Hospital, Nantes, France; <sup>3</sup>Royal National Hospital for Rheumatic Diseases, Bath, UK; <sup>4</sup>Central Hospital of Lisbon, Lisbon, Portugal; <sup>5</sup>The Queen Elizabeth University Hospital, Glasgow; <sup>6</sup>Alder Hey Children's Hospital, Liverpool, UK; <sup>7</sup>Hospital Regional of Malaga, Malaga, Spain; <sup>8</sup>Leiden University Medical Center, Leiden, Netherlands; <sup>9</sup>King's College London, London, UK; <sup>10</sup>Cochin Hospital, Paris, France; <sup>11</sup>University of Perugia, Perugia, Italy; <sup>12</sup>Medical University Vienna, Vienna, Austria; <sup>13</sup>University of Oviedo, Oviedo, Spain

**Background:** Young clinicians and researchers frequently work alongside other medical specialists in order to share expertise, knowledge and skills. Multidisciplinary work is worthwhile but may be sometimes challenging.

**Objectives:** To describe current clinical and research collaboration among young specialists and to identify some perspectives to develop such collaborations.

**Methods:** An online survey was disseminated by email and social media (facebook and twitter) to members of the Emerging European League Against Rheumatism Network (EMEUNET), the Young Nephrologists' Platform (YNP), the Paediatric Rheumatology European Society Emerging Rheumatologists and Researchers (PReS EMERGE), and the European Academy of Allergy and Clinical Immunology Junior Members (EAACI JM).

**Results:** Of 354 respondents from 40 countries, 60% were female, 23% were aged below 30 years and 67% 31–40 years. Young rheumatologists were the most represented (36%), followed by young nephrologists (24%), young paediatricians (18%), young allergologists (11%) then young internists (3%) and several other specialties (as clinical immunology, dermatology, pulmonology, orthopaedics). 60% were certified specialists, 34% in training and 6% were researchers without clinical work. Overall, the top 3 specialties for clinical collaboration in daily practice were radiology, cardiology and dermatology. Collaborations were reported frequently by phone and email, also by various combined clinics while common local multidisciplinary meetings were uncommon. Of note, 71% of respondents found collaboration with young colleagues easier than with senior specialists. Research collaboration usually started by knowing other specialists (73%) and/or by attending common meetings (39%). 96% would like to develop

clinical research collaborations and 69% basic research collaborations. The majority of young specialists would be interested in online (84%) and/or 1–2 days (86%) common courses including cases discussion (80%) and training workshops (84%), as well as webinars recorded with several specialists on a specific disease (96%). Respondents were a bit less enthusiastic with developing collaboration through social media (facebook 61%, twitter 58%) but interested in common apps (71%).

**Conclusions:** This collaborative initiative highlighted wishes from young specialists for developing 1) regular local multidisciplinary meetings to discuss complex patients 2) clinical research collaboration with combined grants and 3) multidisciplinary online projects such as common courses, webinars and apps.

**Acknowledgements:** We thank all members of young organisations for their active participation.

## The changing therapeutic landscape of PsA

### OP0305 DISEASE INTERCEPTION IN PSORIASIS PATIENTS WITH SUBCLINICAL JOINT INFLAMMATION BY INTERLEUKIN 17 INHIBITION WITH SECUKINUMAB – DATA FROM A PROSPECTIVE OPEN LABEL STUDY

E. Kampylafka<sup>1</sup>, I. d Oliveira<sup>1</sup>, C. Linz<sup>1</sup>, V. Lerchen<sup>1</sup>, M. Engbrecht<sup>1</sup>, D. Simon<sup>1</sup>, M. Sticherling<sup>2</sup>, J. Rech<sup>1</sup>, A. Kleyer<sup>1</sup>, G. Schett<sup>1</sup>, A.J. Hueber<sup>1</sup>. <sup>1</sup>Department of Internal Medicine 3 – Rheumatology and Immunology; <sup>2</sup>Department of Dermatology, Friedrich-Alexander-University Erlangen-Nürnberg (FAU) And Universität Tsklinikum Erlangen, Ulmenweg 18, 91054 Erlangen, Germany, Erlangen, Germany

**Background:** Musculoskeletal changes precede the onset of psoriatic arthritis (PsA). A subset of psoriasis patients is characterised by arthralgia as well as inflammatory changes in the joints visible by MRI assessment. These patients have a high risk to progress into PsA.

**Objectives:** To test the concept of a very early intervention in PsA we exposed psoriasis patients with subclinical joint inflammation to the anti-interleukin (IL)–17A antibody secukinumab. We hypothesised that IL-17A inhibition disrupted the early link between skin and joint disease in psoriasis.

**Methods:** Psoriasis (but not PsA) patients were included in the open prospective 24 weeks 'Interception in Very Early PsA' (IVEPSA) study. To fulfil the inclusion criteria patients had to have a PASI score greater than 6 or nail or scalp involvement as well as inflammatory or erosive changes in MRI or high-resolution peripheral quantitative computed tomography (HRpQCT) at baseline. Patients received treatment with secukinumab 300 mg sc. for 24 weeks. MRI scans and HRpQCT of the dominant hand were performed at baseline and at 24 weeks. MRI was scored according to PsAMRIS. HRpQCT evaluated for erosions and enthesiophytes.

**Results:** 20 patients (median age 49.5 years (IQR 42.8, 59), 70% males) with a median disease duration of 14 years (IQR 5, 20), were included into the study. At baseline, 85% reported arthralgia assessed by a Visual Analogue Scale (VAS) and 40% had tender joints on examination (TJC78). 83.3% had at least one inflammatory lesion in the MRI, 66.7% synovitis, 55.6% tendinitis/enthesitis, 27.8% osteitis and 16.7% periarticular inflammation. Erosions were present in 72.2% and 58.8% in the MRI and HRpQCT, respectively, while enthesiophytes were found in 33.3% and 41.2%. One patient was discontinued early due to lack of improvement (wk12) and one patient was unable to perform the follow-up MRI. Psoriatic skin disease (total PASI and BSA) significantly improved (both  $p < 0.05$ ) and also arthralgia (VAS pain, tender joint count) significantly declined after secukinumab treatment (both  $p < 0.05$ ). Total PsAMRIS score and synovitis subscore significantly improved at week 24 ( $p = 0.005$  and  $p = 0.008$ , respectively). Importantly, improvement in total PsAMRIS score significantly correlated with the improvement in arthralgia ( $p < 0.05$ ). Finally, neither erosions nor enthesiophytes in MRI and HRpQCT progressed during the 24 weeks of treatment. There was no new safety signal in the study.

**Conclusions:** IL-17 inhibition by secukinumab over 24 weeks led to resolution of inflammation and no progression of bone changes in the joints in psoriasis patients with subclinical peripheral joint involvement. These data suggest that very early disease interception in PsA is a feasible approach. IVEPSA also provides the guide for further very early interventions in PsA providing concepts for imaging-based identification and the sensitivity to change subclinical inflammation through biological disease modifying anti-rheumatic drug therapy.

OP0306

### SUBCUTANEOUS SECUKINUMAB INHIBITS RADIOGRAPHIC PROGRESSION IN PSORIATIC ARTHRITIS: ANALYSIS BY PRIOR ANTI-TNF THERAPY AND CONCOMITANT METHOTREXATE USE

D. van der Heijde<sup>1</sup>, P. Mease<sup>2</sup>, R. Landewé<sup>3</sup>, S. Mpofo<sup>4</sup>, P. Rahman<sup>5</sup>, H. Tahir<sup>6</sup>, A. Singhal<sup>7</sup>, E. Boettcher<sup>8</sup>, S. Navarra<sup>9</sup>, X. Zhu<sup>10</sup>, A. Reade<sup>10</sup>, L. Pricop<sup>10</sup>, K. Abrams<sup>10</sup>. <sup>1</sup>Leiden University Medical Centre, Leiden, Netherlands; <sup>2</sup>Swedish Medical Centre and University of Washington, Seattle, WA, USA; <sup>3</sup>University of Amsterdam and Atrium Medical Centre, Amsterdam, Netherlands; <sup>4</sup>Novartis Pharma AG, Basel, Switzerland; <sup>5</sup>Memorial University, Newfoundland and Labrador, Canada; <sup>6</sup>Whipps Cross Hospital, London, UK; <sup>7</sup>Southwest Rheumatology, Dallas, TX, USA; <sup>8</sup>Rheumazentrum Favoriten, Vienna, Vienna, Austria; <sup>9</sup>University of Santo Tomas Hospital, Manila, Philippines; <sup>10</sup>Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA

**Background:** Psoriatic arthritis (PsA) is associated with joint inflammation, characterised by synovitis, presence of erosions, joint space narrowing (JSN) and new bone formation leading to structural damage, increased disability and reduced quality of life. Secukinumab (SEC) provided significant and rapid clinical efficacy, and inhibition of radiographic progression in PsA patients (pts) in the FUTURE 5 study.<sup>1</sup>

**Objectives:** To assess the effect of subcutaneous (sc) SEC on radiographic progression by prior anti-TNF therapy or concomitant methotrexate (MTX) use in the FUTURE 5 study.

**Methods:** Adults (n=996) with active PsA, stratified by prior anti-TNF therapy (naïve and inadequate response/intolerance [IR]), were randomised 2:2:2:3 to sc SEC 300 mg with loading dose (LD), 150 mg LD, 150 mg no LD, or placebo (PBO) at baseline (BL), Wks 1, 2, 3, 4, and every 4 wks thereafter. At Wk 16, PBO non-responders were switched to SEC 300 or 150 mg. Concomitant MTX ( $\leq 25$  mg/week) was allowed. Radiographic progression (mean change in van der Heijde-modified total Sharp score for PsA [vdH-mTSS] and its components: erosion and joint space narrowing [JSN] scores from BL to Wk 24) was based on hand/wrist/foot X-rays obtained at BL, Wks 16 (non-responders) assessed by two blinded readers (plus an adjudicator if required). Average scores were used. Statistical analyses used linear extrapolation at Wk 24 for all PBO non-responders and for all other pts with missing Wk 24 X-rays.

**Results:** At BL, 30% pts were anti-TNF-IR and 50% were on concomitant MTX. Radiographic progression was significantly inhibited at Wk 24 in the overall population with SEC vs PBO; mean change from BL in vdH-mTSS was 0.08 (300mg;  $p < 0.01$ ), 0.17 (150mg;  $p < 0.05$ ), -0.09 (150mg no LD;  $P < 0.01$ ) vs 0.50 (PBO). Lower radiographic progression (vdH-mTSS, erosion and JSN scores) was observed with SEC vs PBO regardless of prior anti-TNF therapy or concomitant MTX use (table 1).

**Abstract OP0306 – Table 1.** Radiographic findings (mean change in scores from BL to Wk 24)

Radiographic findings (mean change in scores from BL to Wk 24)	SEC 300mg		SEC 150mg		PBO

### EFFICACY AND SAFETY OF RISANKIZUMAB, A SELECTIVE IL-23P19 INHIBITOR, IN PATIENTS WITH ACTIVE PSORIATIC ARTHRITIS OVER 24 WEEKS: RESULTS FROM A PHASE 2 TRIAL

P.J. Mease<sup>1\*</sup>, H. Kellner<sup>2</sup>, A. Morita<sup>3</sup>, A.J. Kivitz<sup>4</sup>, K.A. Papp<sup>5</sup>, S. Aslanyan<sup>6</sup>, B. Berner<sup>7</sup>, S. Chen<sup>8</sup>, A. Eldred<sup>9</sup>, F. Behrens<sup>9</sup>. <sup>1</sup>Swedish Med. Ctr. and Univ. of Washington, Seattle, USA; <sup>2</sup>Private Practice and Div. of Rheumatology KHI Neuwittelsbach, München, Germany; <sup>3</sup>Dept. of Geriatric and Environmental Dermatology Nagoya City Univ. Graduate Sch. of Med Sci., Nagoya, Japan; <sup>4</sup>Altoona Ctr. for Clin. Res., Duncansville, USA; <sup>5</sup>K Papp Clin. Res. and Probiol Med. Res., Waterloo, Canada; <sup>6</sup>Boehringer Ingelheim Pharma. Inc., Ridgefield, USA; <sup>7</sup>Boehringer Ingelheim Pharma GmbH and Co. KG, Biberach, Germany; <sup>8</sup>AbbVie Inc., N. Chicago, USA; <sup>9</sup>CIRI/Rheumatology and Fraunhofer Institute IME, Translational Med. and Pharmacology, Goethe Univ., Frankfurt, Germany

**Background:** Interleukin-23 (IL-23), a key regulator of multiple effector cytokines, has been implicated in the pathogenesis of psoriatic arthritis, synovitis, enthesitis, and bone erosion. Risankizumab (RZB) is a humanised IgG1 monoclonal antibody that binds to p19 subunit of IL-23, selectively inhibiting this critical cytokine.

**Objectives:** To report the efficacy and safety of different doses of RZB in patients (pts) with active psoriatic arthritis (PsA) over 24 weeks.

**Methods:** In this double-blind, parallel-design, dose-ranging Phase 2 study, pts with active PsA (stratified by prior TNFi use and concurrent MTX use) were randomised in a 2:2:2:1:2 ratio to receive RZB (150 mg at weeks [Wks] 0, 4, 8, 12, and 16 [Arm 1], 150 mg at Wks 0, 4, and 16 [Arm 2], 150 mg at Wks 0 and 12 [Arm 3], 75 mg single dose at Wk 0 [Arm 4]) or matching placebo (PBO, Arm 5). Pts completing Wk 24 visit had an option to enter a separate open-label extension (OLE) study; pts not entering the OLE were followed until Wk 32. Efficacy assessments included ACR20/50/70, PASI, minimal disease activity (MDA), DAS28(CRP), dactylitis count, SPARCC enthesitis index, pain-VAS, HAQ-DI, and mTSS scores.

**Results:** Of the 185 pts who received the study drug, 173 (93.5%) completed 16 Wks of treatment and 145 (78.4%) entered OLE at Wk 24. The primary endpoint of ACR20 response at Wk 16 was achieved by pts in each of the RZB arms.<sup>†</sup> At Wk 24, ACR20/50/70 responses were significantly higher in pts receiving RZB (pooled across all RZB arms) compared with PBO (table 1). PASI75/90/100 responses at Wk 24 were significantly higher in RZB-treated pts compared with PBO. At Wk 24, RZB-treated pts achieved significantly higher MDA responses as well as greater improvements in DAS28(CRP) and Pain-VAS. Improvements in HAQ-DI and enthesitis from BL were numerically greater in RZB arms. At Wk 24, RZB-treated pts (pooled across all RZB arms) showed significant improvement from BL in mTSS compared with PBO. Treatment-emergent adverse events (TEAEs), collected up to Wk 32, were comparable across treatment arms (table 2); the most common TEAE was infection. There were no deaths or cases of tuberculosis in RZB-treated pts; 2 adjudicated major adverse cardiovascular events (TEAEs) were reported in RZB arms.

Abstract OP0307 – Table 2. Overview of treatment-emergent adverse events (TEAEs) over 32 weeks

TEAEs, n (%)	Risankizumab (RZB)				Placebo
	Arm 1 N=42	Arm 2 N=42	Arm 3 N=39	Arm 4 N=20	Arm 5 N=42
Any AE	27 (64.3)	22 (52.4)	27 (69.2)	13 (65.0)	31 (73.8)
Drug related AEs <sup>a</sup>	8 (19.0)	7 (16.7)	8 (20.5)	4 (20.0)	8 (19.0)
Serious AE <sup>b</sup>	3 (7.1)	0	2 (5.1)	3 (15.0)	2 (4.8)
Drug related serious AE <sup>b</sup>	1 (2.4)	0	2 (5.1)	1 (5.0)	0
Severe AE	3 (7.1)	0	2 (5.1)	1 (5.0)	4 (9.5)
AE leading to drug discontinuation	3 (7.1)	0	0	1 (5.0)	2 (4.8)
Infection <sup>c</sup>	16 (38.1)	13 (31.0)	16 (41.0)	6 (30.0)	12 (28.6)
Serious infection	0	0	0	2 (10.0) <sup>d</sup>	0
Serious hypersensitivity	1 (2.4) <sup>e</sup>	0	0	0	0
Adjudicated MACE	1 (2.4) <sup>f</sup>	0	0	1 (5.0) <sup>g</sup>	0
Malignancy	0	0	0	1 (5.0) <sup>h</sup>	0
Depression	0	0	2 (5.1)	0	0

Arm 1: 150 mg RZB at weeks 0, 4, 8, 12, and 16; Arm 2: 150 RZB at weeks 0, 4, and 16 (PBO at weeks 8 and 12); Arm 3: 150 mg RZB at weeks 0 and 12 (PBO at weeks 4, 8, and 12); Arm 4: 75 mg RZB at week 0 (PBO at weeks 4, 8, 12, and 16); Arm 5: PBO at weeks 0, 4, 8, 12, and 16.

<sup>a</sup>Investigator assessed AE as possibly related to study drug. <sup>b</sup>No serious adverse event type was reported in more than one patient. <sup>c</sup>The most frequently reported AE was upper respiratory tract infection. <sup>d</sup>1 patient with urinary tract infection, influenza, and sepsis. <sup>e</sup>1 patient with gastroenteritis and pyelonephritis. <sup>f</sup>An event of investigator reported anaphylactic reaction occurred after the 1<sup>st</sup> injection of risankizumab. The sponsor assessed the event details as not consistent with IgE-mediated anaphylaxis. <sup>g</sup>1 patient with ischemic stroke. <sup>h</sup>1 patient with type 1 myocardial infarction. <sup>i</sup>1 patient with ovarian cancer.

AE = adverse event; IgE = immunoglobulin E; MACE = major adverse cardiovascular event; PBO = placebo; RZB = risankizumab; TEAE = treatment-emergent adverse event.

**Conclusions:** Pts with active PsA treated with RZB maintained improvement in joint and skin symptoms through 24 wks. RZB-treated pts (pooled across all RZB arms) showed evidence for inhibition of radiographic progression. RZB was well-tolerated with no new or unexpected safety findings.

**OP0308 EFFICACY AND SAFETY RESULTS OF GUSELKUMAB IN PATIENTS WITH ACTIVE PSORIATIC ARTHRITIS OVER 56 WEEKS FROM A PHASE 2A, RANDOMISED, DOUBLE-BLIND, PLACEBO-CONTROLLED STUDY**

A. Deodhar<sup>1</sup>, A.B. Gottlieb<sup>2</sup>, W.-H. Boehncke<sup>3</sup>, B. Dong<sup>4</sup>, Y. Wang<sup>4</sup>, Y. Zhuang<sup>4</sup>, W. Barchuk<sup>5</sup>, X.L. Xu<sup>5</sup>, E. Hsia<sup>4</sup>. <sup>1</sup>Oregon Health and Science University, Portland; <sup>2</sup>Department of Dermatology, New York Medical College, Valhalla, USA; <sup>3</sup>Hôpital Universitaire de Genève, Genève, Switzerland; <sup>4</sup>Janssen Research and Development, LLC, Spring House; <sup>5</sup>Janssen Research and Development, LLC, San Diego, USA

**Objectives:** Evaluate efficacy and safety of guselkumab (GUS) in patients (pts) with active psoriatic arthritis (PsA) over 56 weeks (wks).

**Methods:** Pts w/active PsA (defined as  $\geq 3$  tender and  $\geq 3$  swollen joints, C-reactive protein  $\geq 3$  mg/L) and  $\geq 3\%$  body surface area (BSA) of plaque psoriasis despite current or previous treatment w/standard-of-care therapies, including previous TNF inhibitor therapy, were eligible to participate and were randomised 2:1 to receive GUS 100 mg subcutaneously or placebo (PBO) at wk 0, 4, and every 8 wks thereafter through wk44. At wk16, pts from either group with  $<5\%$  improvement from baseline in both swollen and tender joint counts were eligible for early escape (EE) to open-label ustekinumab. All remaining PBO pts crossed-over to receive GUS 100 mg at wks24, 28, 36, and 44. At wk56, a post-treatment follow-up visit was conducted. Efficacy post wk24 through wk44 and wk56 was evaluated in pts who did not EE and continued treatment at wk24 (post wk24 efficacy analysis set) based on observed data. The wk24 data in this population were included as a reference.

**Results:** 149 pts were randomised to receive study agent (PBO: 49, GUS: 100). The study met its primary and all secondary endpoints through wk24. At wk24, 29 pts in the PBO group crossed over to receive GUS, of which 28 completed treatment through wk44. 86 pts in the GUS group continued treatment at wk24 and 84 pts completed treatment through wk44. Post wk24, ACR 20/50/70 and PASI 75/90/100 responses improved in PBO to GUS crossover pts and were well-maintained in GUS pts through wk44 (last efficacy assessments while on drug) and wk56 (final follow-up visit) (table 1). The efficacy results from wk24 through wk44 and wk56 are summarised in table 1.

Through wk56, 17.2% of PBO—GUS, 46.0% of GUS, and 39.5% of the combined GUS pts had  $\geq 1$  AEs, of which infections and infestations were the most commonly reported (3.4%, 27.0%, and 21.7%, respectively). Post wk24, there was no disproportional increase in overall AE frequency, or infections and infestations among GUS pts with longer exposure. Through wk56, among 129 pts who received GUS, there was 1 pt with malignancy (basal cell carcinoma), 1 pt with 2 serious infections (both pneumonia), 6 pts reported  $\geq 1$  SAEs (myocardial infarction, osteoarthritis, pupils unequal, radius fracture, pneumonia, ulcerative keratitis), 2 pts discontinued treatment due to AEs, 1 pt had neutropenia meeting NCI-

CTCAE toxicity grade 3, and 6 pts were positive for antibodies to GUS. No deaths occurred through wk56.

**Abstract OP0308** – Table 1 Efficacy results from Wk24 through Wk44 and Wk56 in post Wk24 efficacy analysis set based on the observed data

Efficacy Endpoints	PBO→GUS			GUS		
	Week 24*	Week 44	Week 56	Week 24	Week 44	Week 56

\*Among the patients with arthritis at baseline

\*Among the patients with dactylitis at baseline

\*Measured prior to receiving guselkumab

**Conclusions:** In pts with active PsA and  $\geq 3\%$  BSA of psoriasis, GUS demonstrated substantial benefits on joint symptoms, physical function, psoriasis, enthesitis, dactylitis, and quality of life, and efficacy was well-maintained through wk56. GUS was well-tolerated with no unexpected safety findings in this population after ~1 year of exposure.

**OP0309 CHARACTERISATION OF CLINICAL BENEFITS IN SUBJECTS CLASSIFIED AS ACR20 NON-RESPONDERS AT WEEK 104 OF APREMLAST TREATMENT: SUBANALYSIS OF 3 LONG-TERM, PHASE III TRIALS**

P. Mease<sup>1</sup>, D. Gladman<sup>2</sup>, A. Kavanaugh<sup>3</sup>, P. Nakasato<sup>4</sup>, B. Guertel<sup>4</sup>, L. Teng<sup>4</sup>, P. Nash<sup>5</sup>. <sup>1</sup>Swedish Medical Center and University of Washington School of Medicine, Seattle, USA; <sup>2</sup>Krembil Research Institute, Toronto Western Hospital, Toronto, Canada; <sup>3</sup>University of California, San Diego; <sup>4</sup>Celgene Corporation, Summit, USA; <sup>5</sup>University of Queensland, Brisbane, Australia

**Background:** The PALACE 1, 2, and 3 trials evaluated the efficacy and safety of apremilast (APR) in subjects with active psoriatic arthritis (PsA) despite prior conventional disease-modifying anti-rheumatic drugs and/or biologics.

**Objectives:** The aim of this analysis is to further characterise the clinical benefits associated with long-term APR exposure in subjects who failed to achieve an ACR20 response at Week 104.

**Methods:** Subjects were randomised (1:1:1) to receive placebo (PBO), APR 30 mg BID (APR30), or APR 20 mg BID at baseline. Subjects who were randomised to APR30 at baseline and classified as ACR20 non-responders (ACR20NRs) at Week 104 were considered for this analysis. At Weeks 24, 52, and 104, ACR core components were examined as well as the proportions of

subjects achieving PASI-75/PASI-50 among those with psoriasis involvement  $\geq 3\%$  of the body surface area at baseline, and dactylitis count and MASES of 0 among those with dactylitis or enthesitis at baseline. Safety is described for the overall PALACE 1–3 population.

**Results:** A total of 109 subjects randomised to APR30 treatment at baseline were ACR20NRs at Week 104. Baseline ACR core components were similar for ACR20NRs and ACR20 responders at Week 104. Among these ACR20NRs, several core components of ACR response, including swollen/tender joint counts and Physician's Global Assessment of Disease Activity (visual analogue scale) scores, showed sustained improvements from baseline through Week 104 (table 1). Importantly, of the 109 ACR20NRs at Week 104, 50.0% achieved a PASI-50 response after continued treatment with APR30 through Week 104 (table 1). Among ACR20NRs with baseline dactylitis (n=44) or enthesitis (n=74), 68.2% achieved a dactylitis count of 0 and 33.8% achieved a MASES of 0 at Week 104. More limited improvements in Subject's Global Assessment of Disease Activity, Subject's Assessment of Pain, Health Assessment Questionnaire-Disability Index, and C-reactive protein outcomes most commonly had an impact on subjects' ability to achieve an ACR20 response. In the overall subject population, no new safety concerns were identified through 104 weeks.

Abstract OP0309 – Table 1

	ACR20NRs at Week 104 With APR30 From Baseline (n=109)		
	Week 24	Week 52	Week 104
Swollen joint count (0-76), mean and median % change	-52.2, -71.4	-62.8, -73.3	-58.0, -75.0
Tender joint count (0-78), mean and median % change	-32.5, -47.4	-45.8, -53.5	-41.7, -51.7
PhGA (VAS 0-100 mm), mean and median % change	-37.9, -43.6	-49.8, -54.2	-44.3, -48.7
Dactylitis=0, n/m (%) <sup>a</sup>	23/44 (52.3)	29/44 (65.9)	30/44 (68.2)
MASES=0, n/m (%) <sup>b</sup>	20/74 (27.0)	27/74 (36.5)	25/74 (33.8)
PASI-75, n/m (%) <sup>c</sup>	17/50 (34.0)	22/50 (44.0)	18/50 (36.0)
PASI-50, n/m (%) <sup>d</sup>	31/50 (62.0)	33/50 (66.0)	25/50 (50.0)

Data are as observed at Week 24, Week 52, and Week 104 for all subjects who were randomized to APR30 at baseline and were ACR20NRs at Week 104 and with a value at the time point indicated.  
<sup>a</sup>Examined among subjects with dactylitis at baseline. <sup>b</sup>Examined among subjects with enthesitis at baseline. <sup>c</sup>Examined among subjects with  $\geq 3\%$  psoriasis involvement of the body surface area at baseline. PhGA=Physician's Global Assessment of Disease Activity; VAS=visual analog scale; n/m=number of subjects achieving response/number of subjects with evaluable data at the time point; MASES=Maastricht Ankylosing Spondylitis Enthesitis Score; PASI-75/50= $\geq 75\%/\geq 50\%$  reduction from baseline Psoriasis Area and Severity Index score.

**Conclusions:** ACR20NRs receiving APR30 demonstrated significant improvements in core PsA domains. The data may explain why subjects who failed to achieve an ACR20 response remained on long-term APR treatment. These findings suggest that some subjects with PsA may experience meaningful clinical improvement that is not completely captured by the assessment of ACR20 response criteria. Outcome measures specifically designed for PsA subjects, may be more suitable to evaluate treatment response in PsA subjects.

Coruña, Spain

**Background:** Psoriasis and psoriatic arthritis (PsA) are described as associated with more frequency of risk factors and cardiovascular events.

**Objectives:** To determine the prevalence of risk factors and cardiovascular events in a cohort of patients with PsA treated with biological therapy and its correlation with gender.

**Methods:** We included all PsA patients (met CASPAR criteria) following treatment with bDMARDs (reference population 2.055.000). We obtained data of high

blood pressure, hyperlipidemia, hyperuricemia, type 2 diabetes mellitus, obesity (BMI  $\geq 30$ ), non-infectious liver disease, ischaemic cardiopathy, myocardial infarction, ischaemic stroke or transient ischaemic attack. For this analysis included gender, age, disease duration, current bDMARDs with or without current co-medication with csDMARDs and HLA-B27 status. Continuous variables were reported as mean  $\pm$  standard deviation. Categorical variables were reported as percentages and frequencies. All analyses were performed using SPSS software. Differences were considered statistically significant if  $p < 0.05$  (two-tailed).

**Results:** Data were obtained from 598 PsA patients who have been treated with bDMARDs. Three-hundred and twenty-five (54.3%) patients were men, mean age was 53.3 $\pm$ 12.6 years (men 53.3 $\pm$ 12.9 and women 53.2 $\pm$ 12.3,  $p=0.943$ ) and disease duration of PsA was 12.4 $\pm$ 8.7 years. No differences were seen for disease duration of PsA, nail disease, dactylitis, uveitis or HLA-B27. The prevalence of high blood pressure, hyperlipidemia, hyperuricemia, type 2 diabetes mellitus, obesity, non-infectious liver disease, ischaemic cardiopathy, myocardial infarction (MI) and ischaemic stroke/transient ischaemic attack (IS) was 36.0%, 43.6%, 16.0%, 12.5%, 26.3%, 12.5%, 5.5%, 3.8% and 1.3%, respectively. Men had most prevalence of type 2 diabetes mellitus, hyperuricemia, non-infectious liver disease, ischaemic cardiopathy, myocardial infarction and brain stroke event (see table 1). Patients with MI or IS had more prevalence of CV risk factors.

Abstract OP0310 – Table 1

	Female (273)	Male (325)	P
High blood pressure, n(%)	98 (35.9)	117 (36.0)	0.979
Hyperlipidemia, n(%)	111 (40.7)	150 (46.2)	0.177
Hyperuricemia, n(%)	13 (4.8)	82 (25.3)	<0.001
Diabetes mellitus, n(%)	21 (7.7)	54 (16.6)	0.001
Liver disease, n(%)	19 (7.6)	49 (16.7)	0.002
Ischaemic cardiopathy, n (%)	8 (2.9)	25 (7.7)	0.011
Myocardial infarction, n (%)	5 (1.8)	18 (5.5)	0.019
Brain stroke event, n (%)	1 (0.2)	7 (2.2)	0.058

**Conclusions:** Type 2 diabetes mellitus, hyperuricemia, non-infectious liver disease, ischaemic cardiopathy, myocardial infarction and brain stroke event were more prevalent in men than in women with PsA. Male gender had correlation with the prevalence of cardiovascular events or their risk factors.

#### OP0311 NOTABLE EVOLUTIONS IN THE CHARACTERISTICS OF PSORIATIC ARTHRITIS CLINICAL TRIALS POPULATIONS IN THE ERA OF BIOLOGICAL TREATMENTS

A.-S. Vandendorpe, K. De Vlam, R. Lories. *Skeletal Biology and Engineering Research Center – Dept. Development and Regeneration, KU Leuven, Leuven, Belgium*

**Background:** Psoriatic arthritis is a chronic inflammatory disease that affects the musculoskeletal system. It can include arthritis, spondylitis, dactylitis and enthesitis, and is strongly associated with the presence of psoriasis. The introduction of biological therapies as a treatment option has brought a significant improvement in disease control for these patients.

**Objectives:** In this study, we wanted to detect emerging differences in demographic and clinical characteristics of the PsA-patient study population since the introduction of biologicals.

**Methods:** We selected 12 phase II- and phase III-trials and divided them into 3 treatment periods based on different time windows and working mechanisms of the particular biologicals or targeted DMARDs. Published tables with the baseline demographic and clinical characteristics of study population from the individual studies were used. For inclusion of a specific parameter, it had to be present in at least one study of each period. An exception to this rule was made for the 'number of patients with prior anti-TNF therapy', only present in studies from the second and third period. Parameters were defined in different categories: patient characteristics (gender, age, race, weight), disease characteristics (duration of PsA, presence of dactylitis, presence of enthesitis, psoriasis body surface area), disease activity parameters (swollen joint count, tender joint count, C-reactive protein

(CRP)-level, visual analogue scale of disease activity and pain, disease activity score, psoriasis area severity index (PASI)-score, disease effects (total Sharp score, health assessment questionnaire disability index (HAQ-DI)-score) and prior treatments. For the continuous data, we calculated a weighted mean and standard deviation (SD) per period. Data not available in the form of mean  $\pm$ SD in the original studies were therefore not included. For the discrete data, we summed up the patients meeting the criterion from all the studies in a given period and calculated a percentage. We used the RStudio software. For the normally divided data, we used ANOVA-test for a group analysis to find significant differences between the time periods. For the discrete data, we used Chi-square test.

**Results:** Detailed analysis of the baseline characteristics showed some remarkable differences between the three different treatment periods with most data indicating that these shifts have occurred between the first and the second period. In comparison to the initial trials with etanercept, infliximab and adalimumab, gender and race show more diversity, patients are older but have a shorter disease duration, show lower swollen and tender joint counts, but more enthesitis, and have lower CRP-levels. Although several of these parameters suggest an overall lower disease activity in the second and third period of trials, this is not reflected in the physician's and patient's perspective of disease activity and the HAQ-DI score.

**Conclusions:** Our analysis found significant differences in patient characteristics, disease characteristics, disease activity, disease effects and use of prior treatments between the 3 periods of treatment drugs since the introduction of biologicals. Patients appear to be considered earlier and with less severe disease albeit that the subjective evaluation of disease activity goes in the opposite direction.

OP0312

#### INTERNATIONAL LEAGUE OF ASSOCIATIONS FOR RHEUMATOLOGY (ILAR) TREATMENT RECOMMENDATIONS FOR PSORIATIC ARTHRITIS IN RESOURCE-POOR COUNTRIES

M. Elmamoun<sup>1</sup>, M. Eraso<sup>2</sup>, A. Maharaj<sup>3</sup>, V. Chandran<sup>4</sup>, L. Coates<sup>5</sup>, on behalf of ILAR-PsA recommendations group, A Adebajo, A Sharma, S Toloza, L Vega-E, O Vega-H, A Abogamal, A Ajibade, O Ayanlowo, V Azevedo, W Bautista-M, S Carneiro, C Goldenstein-S, F Hernandez-V, U Ima-E, A Lima, J Medina-R, G Mody, T Narang, A Ortega-L, R Ranza. <sup>1</sup>Rheumatology, University of Toronto; <sup>2</sup>Toronto Western Hospital, Toronto, Canada; <sup>3</sup>Prince Mshiyeni Memorial Hospital, Durban, South Africa; <sup>4</sup>University of Toronto, Toronto, Canada; <sup>5</sup>University of Oxford, Oxford, UK

**Background:** The European League Against Rheumatism (EULAR) and the Group for Research and Assessment of Psoriasis and PsA (GRAPPA) updated their respective recommendations for the management of PsA in 2015. However, these guidelines are primarily based on studies conducted in resource replete countries; hence they may not be applicable to countries in Central and South America, and Africa. Therefore, new ILAR recommendations have been developed for these regions adapted from existing recommendations.

**Objectives:** To establish ILAR recommendations for the management of PsA in resource poor settings, particularly Central/South America and Africa, using an expert local panel, adaptation of existing EULAR and GRAPPA treatment recommendations and a new systematic literature review (SLR) for specific issues in resource-poor countries.

**Methods:** The ADAPTE Collaboration process<sup>1</sup> for guideline adaptation was followed to assess and adapt the EULAR and GRAPPA treatment recommendations for PsA covering the Americas and Africa. The process was conducted according to its three phases: set-up phase (identifying and seeing agreement from a panel of participants from the relevant countries), adaptation phase (defining health questions using the PIPOH tool, assessing the two source recommendations, conducting an SLR to answer health questions not addressed in the two source recommendations, assessing quality of source recommendations, assessing applicability of principles contained in the source recommendations, and drafting adapted recommendations), and finalisation phase (external review, aftercare planning and final production).

**Results:** Five principles for the management of PsA were developed addressing 1. Goals of therapy, 2. Assessment of domains, 3. Assessment of relevant comorbidities, 4. Safety of pharmacotherapy and shared decision making, and 5. Frequency of follow up. Six recommendations for the management of PsA were also developed addressing 1. Goals of therapy, 2. Screening and management of

tuberculosis, HIV, HBV, HCV, Chagas' disease, leishmaniasis, leprosy, and other concomitant comorbidities, 3. Frequency of monitoring in resource poor countries, 4. Safety and efficacy of pharmacotherapy in all domains, 5. Efficacy and safety of combination therapy, and 6. Safety and efficacy of biosimilars and intended copies.

**Conclusions:** ILAR recommendations for the management of PsA in resource-poor countries are now available, developed by adapting principally the GRAPPA recommendations, but also the EULAR recommendations, supplemented by expert opinion from these regions.

#### T/B be or not T/B: adaptive or innate immunity – that is the question

OP0313

#### MOLECULAR ANALYSIS OF ANTI-CITRULLINATED PROTEIN ANTIBODY VARIABLE REGIONS INDICATES ABERRANT SELECTION PROCESSES DURING ACPA B-CELL DEVELOPMENT

R.D. Vergroesen<sup>1</sup>, L.M. Slot<sup>1</sup>, F.S. van de Bovenkamp<sup>2</sup>, M.T. Koning<sup>3</sup>, T.W. J. Huizinga<sup>1</sup>, T. Rispens<sup>2</sup>, R.E.M. Toes<sup>1</sup>, H.U. Scherer<sup>1</sup>. <sup>1</sup>Rheumatology, Leiden University Medical Center, Leiden; <sup>2</sup>Sanquin Research and Landsteiner Laboratory, Academic Medical Center, Amsterdam; <sup>3</sup>Hematology, Leiden University Medical Center, Leiden, Netherlands

**Background:** Anti-citrullinated protein antibodies (ACPA) represent the most specific biomarker in Rheumatoid Arthritis (RA) and have been associated with RA pathogenesis. ACPA-IgG are heavily N-glycosylated in the variable domain. Recently, we showed that >80% of ACPA-IgG clones harbour N-glycosylation sites in their variable regions that result from somatic hypermutation (SHM). The reason for this remarkable phenomenon is incompletely understood. Elucidation of its molecular basis might provide insights into mechanisms by which ACPA-expressing B cells breach tolerance.

**Objectives:** To understand the molecular origin of ACPA variable domain N-glycosylation based on B-cell receptor (BCR) sequence analyses.

**Methods:** ACPA-expressing B cells were isolated from peripheral blood of 12 ACPA-positive RA patients using CCP2-streptavidin tetramers and fluorescence activated cell sorting. Full-length immunoglobulin (Ig) transcripts of heavy chains (HC) and light chains (LC) were obtained using anchoring reverse transcription of Ig sequences and amplification by nested PCR. Sequences were analysed for the degree of SHM and the presence of N-glycosylation sites (defined as sequences encoding N-X-S/T (X  $\neq$  Proline) in the protein backbone). Sites that required a single nucleotide mutation to be generated were defined as s-SHM sites, whereas sites requiring multiple mutations were defined as m-SHM sites. IgG sequences of 12 healthy donors were used as control.

**Results:** 67% of ACPA-Ig $\kappa$  LC and 47% of ACPA-Ig $\lambda$  LC contained  $\geq$ 1 n-glycosylation sites compared to 82% of ACPA-IgG HC. Nucleotide mutation rates were similar for ACPA-Ig $\kappa$  LC and ACPA-Ig $\lambda$  LC (88.2% $\pm$ 5.7% and 87.3% $\pm$ 5.3% similar to germline, respectively) and lower compared to the mutation rate of ACPA-IgG HC (82.4% $\pm$ 5.8% similar to germline). The distribution of sites in ACPA-Ig $\kappa$  LC and ACPA-IgG HC was similar, with most sites located in framework region (FR) 3 (42% and 49%, respectively). In contrast, 65% of all N-glycosylation sites in ACPA-Ig $\lambda$  LC clones were located in FR1 and only 7% were located in FR3. Furthermore, 26% of all N-glycosylation sites in ACPA-IgG HC were m-SHM sites compared to 15% in IGHV-matched IgG clones derived from healthy donors. 28% and 44% of all N-glycosylation sites were m-SHM sites in ACPA-Ig $\kappa$  LC and ACPA-Ig $\lambda$  LC, respectively. No correlation was observed between the number of nucleotide mutations and the number of total N-glycosylation or m-SHM sites in ACPA clones.

**Conclusions:** Our analyses revealed an abundance of N-glycosylation sites in ACPA-IgG HC, ACPA-Ig $\kappa$  LC and ACPA-Ig $\lambda$  LC. N-glycosylation sites in ACPA are frequently m-SHM sites. Intriguingly, the generation of such sites requires multiple somatic mutations suggesting that m-SHM sites in specific positions in ACPA variable regions could be advantageous for the survival of ACPA-expressing B cells. This indicates that the introduction of N-glycosylation sites might be a selective process that could allow these B cells to escape from putative tolerance checkpoints.

OP0314

**B CELL PHENOTYPE AND FUNCTION IN THE SYNOVIUM OF ACPA+ AND ACPA- RHEUMATOID ARTHRITIS PATIENTS**

A. Floudas<sup>1</sup>, M. Bielecka<sup>2</sup>, C. Low<sup>2</sup>, D.J. Veale<sup>2</sup>, U. Fearon<sup>1</sup>. <sup>1</sup>Trinity College Dublin; <sup>2</sup>UCD, Dublin, Ireland

**Background:** Rheumatoid arthritis (RA) is a chronic inflammatory autoimmune disease of unknown and complex etiology with severe detrimental effects for the patient's quality of life. While rheumatoid factors (RF) and anti-citrullinated protein antibodies (ACPA) have been used extensively for the diagnosis of RA, no clear mechanism of action towards disease pathogenesis and progression has been identified. Importantly, both seropositive and seronegative RA patients experience significant improvement in disease severity following B cell depletion. Therefore, we hypothesised that B cells have a central role in ACPA<sup>+</sup> and ACPA<sup>-</sup> RA irrespective of their capacity to produce auto-antibodies.

**Objectives:** The characterisation of B and T cell populations in the peripheral blood and synovium of ACPA<sup>+</sup>, ACPA<sup>-</sup> and arthralgia patients.

The identification of non-antibody mediated B cell function under the hypoxic conditions of the inflamed joint.

**Methods:** Peripheral blood, synovial fluid and tissue was obtained from ACPA<sup>+</sup>, ACPA<sup>-</sup> and arthralgia patients. Following enzyme digestion of the tissue, several 15-colour panels were used for the flow cytometric analysis of T and B cell populations of ACPA<sup>+</sup>, ACPA<sup>-</sup> and arthralgia patients compared to healthy subjects. Activation and function of healthy, sorted B cells, cultured *in vitro* and stimulated by CD40 and BCR mediated signals under normoxic (21% O<sub>2</sub>) and hypoxic (1% O<sub>2</sub>) conditions was examined.

**Results:** Pro-inflammatory cytokine production by peripheral blood CD4<sup>+</sup> T cells is not significantly different between ACPA<sup>+</sup>, ACPA<sup>-</sup> and arthralgia patients when compared to healthy controls. However, a significant reduction in CD27<sup>+</sup> switched memory B cells was observed between healthy subjects and ACPA<sup>+</sup> RA patients. The aforementioned decrease in memory B cells is potentially a result of increased susceptibility to FAS induced apoptosis since healthy B cells cultured with RA patient plasma showed increased activation, CD80/CD86 and FAS expression.

In the synovial fluid and synovial tissue, CD4 T cell pro-inflammatory cytokine production was increased when compared to peripheral blood CD4 T cells. Interestingly, ACPA<sup>-</sup> RA patient CD4<sup>+</sup> T cells produced reduced amounts of pro-inflammatory cytokines when compared to ACPA<sup>+</sup> RA patient CD4<sup>+</sup> T cells. Despite accumulation of switched and double negative (DN) memory B cells in the synovial fluid and tissue, compared to peripheral blood, no differences in synovial B cell subpopulation composition between ACPA<sup>+</sup> and ACPA<sup>-</sup> RA patients was observed. Interestingly, sorted B cells from healthy subjects showed increased sensitivity to *in vitro* stimulation with increased expression of CD80 and CD86 when cultured under hypoxic conditions, while co-culture with RA patient synovial fibroblasts did not enhance this effect.

**Conclusions:** The increased capacity of ACPA<sup>+</sup> compared to ACPA<sup>-</sup> RA patient synovial CD4<sup>+</sup> T cells to produce pro-inflammatory cytokines, could be responsible for the more severe disease progression of ACPA<sup>+</sup> compared to ACPA<sup>-</sup> RA. The accumulation of memory B cells in both ACPA<sup>+</sup> and ACPA<sup>-</sup> RA, underlines a common, antibody independent, contribution of B cells in synovial inflammation. While B cell activation under hypoxic conditions and increased CD80/CD86 expression is potentially an important mediator for the emergence of auto-reactive T cells and disease progression in RA.

Bathi<sup>1</sup>, T. Arkachairi<sup>1,2</sup>, D.J. Lovell<sup>3,4</sup>, S. Albani<sup>5</sup>. <sup>1</sup>Translational Immunology Institute, Singapore Health Services Pte Ltd, Singhealth/Duke-NUS Academic Medical Centre; <sup>2</sup>KK Women's and Children's Hospital, Singapore Health Services Pte Ltd, Singapore, Singapore; <sup>3</sup>Division of Rheumatology, Cincinnati Children's Hospital Medical Center; <sup>4</sup>Department of Paediatrics, University of Cincinnati College of Medicine, Cincinnati, USA; <sup>5</sup>Translational Immunology Institute, Singapore Health Services Pte Ltd, Singhealth/Duke-NUS Academic Medical, Singapore, Singapore

**Background:** JIA patients respond well to anti-TNFA biologics, with up to 80% of patients achieving clinical remission. In spite of this success, 50%–80% will relapse upon therapy withdrawal, indicating a large proportion of patients had yet to fully resolve their disease. Compounded by concerns with drug toxicities and financial burden, there is a genuine interest to find predictors for successful drug cessation and devise new avenues of therapy.

**Objectives:** To determine how subclinical persistence of disease occurs despite therapy, we compare JIA individuals destined to flare or remain inactive, prior to (To) and after therapy withdrawal (Tend). Previous publications have reveal that CD4 T cells play a vital role in disease pathogenesis in JIA patients. We aim to dissect the CD4 landscape (a) through CyToF, to decipher the CD4 subsets responsible for disease persistence, (b) to unravel the pathways involved through mRNA analysis with Nanostring.

**Methods:** Patients treated with anti-TNF-alpha biologics were recruited with clinically inactive disease on treatment and initiated with therapy discontinuation. The patients designated as flare (n=24) and inactive (n=24) based on 6 JIA core set parameters. Healthy paediatric controls (n=17) with no inflammatory disease were recruited pre-operatively during day surgeries. A separate study with active JIA patients recruited pre/post treatment (n=4 paired) with anti-TNFA biologics and achieving recent clinical remission.

**Results:** Interrogation of PBMCs with CyToF reveal the persistence of a subset of CD3 +CD4+inflammatory memory CD45RA- TNFA +PD1- CTLA4- T cells (p<0.05) in flare (To) versus inactive (To) individuals. Intriguingly an additional subclinical subset, TNFA +IL-6+, was detected (p<0.05) in flare (To) versus healthy individuals. Upon therapy withdrawal, this subclinical subset expands (p<0.05) in flare (Tend) individuals versus inactive (Tend). Notably we also observe a distinct early increase in CD3 +CD4+CD45 RA- CXCR5 +T cells in flare versus inactive (To) individuals which subsides after therapy withdrawal, indicating early T-B interaction. We noted strong but likely inadequate compensatory enrichment of CD45RA- subset of Tregs in flare versus inactive (To/Tend) individuals. To decipher the mechanism that leads to incomplete disease resolution, we sorted CD3 +CD4+CD45 RA- CD45RO+T cells from flare and inactive (To/Tend) patients, and observed striking dysregulation in several major pathways, (a) TCR activation, (b) TNFA signalling, (c) Apoptosis, (d) NF-kB signalling, (e) MAPK signalling. This dysregulation also extends to a separate cohort of active JIA patients naive to anti-TNFA biologics therapy and persisting till recent onset clinical remission.

**Conclusions:** These results highlight a strong immunological memory dysregulation in a subset of CD4 T cells in JIA patients that is predictive of clinical fate and providing new therapeutic insights.

OP0316

**INCREASED EXPRESSION OF MICRORNA-142-3P IS ASSOCIATED WITH THE FUNCTIONAL DEFECT OF REGULATORY T CELLS IN ANTI-NEUTROPHIL CYTOPLASMIC ANTIBODY ASSOCIATED VASCULITIS**

G. Dekkema<sup>1</sup>, T. Bijma<sup>1,2</sup>, W. Abdulhad<sup>3</sup>, P. Jellema<sup>1</sup>, A. Van Den Berg<sup>1</sup>, B. J. Kroesen<sup>4</sup>, C. Stegeman<sup>2</sup>, P. Heeringa<sup>1</sup>, J.-S. Sanders<sup>2</sup>. <sup>1</sup>Pathology and Medical Biology; <sup>2</sup>Department of Internal Medicine, division of Nephrology; <sup>3</sup>Department of Rheumatology and Clinical Immunology; <sup>4</sup>Department of Clinical Immunology, University Medical Center Groningen, Groningen, Netherlands

**Background:** Circulating regulatory T cells (Tregs) in anti-neutrophil cytoplasmic antibody associated vasculitis (AAV) are frequently functionally deficient. The mechanism behind their impaired function is however unknown. Small non-coding microRNA (miR) are post-transcriptional regulators of protein synthesis and previous studies have shown that differently expressed miRs in T cells are associated with auto immunity.

**Objectives:** To investigate whether the dysfunctionality of Tregs in AAV is due to altered microRNA (miR) expression.

**Methods:** Tregs (CD4<sup>+</sup>CD45RO<sup>+</sup>CD25<sup>+</sup>CD127<sup>-</sup>) of healthy controls (HC) and AAV patients in remission without treatment (AAV-REM) were FACS-sorted, and total RNA was isolated. Samples from 8 HCs and 8 AAV-REMs were subjected to miRNA microarray analysis. Based on relative expression and fold change, 5 differentially expressed miRs were validated in an independent cohort using qRT-PCR and a database and literature search was performed to identify potential targets.

**Results:** Nineteen miRs differentially expressed were detected by microarray analysis, of which Let-7g, miR-20a-5p, miR-26a-5p, miR-142-3 p, miR-146a-5p were validated in an independent cohort. Of these, miR-142-3 p was confirmed to be significantly upregulated (2-fold, p=0.03) in Tregs from AAV-REM patients compared to HC Tregs (n=23, n=22). To study the functional impact of miR-142-3 p overexpression, HC Tregs were transfected using either a mimic-miR-142-3 p or a scrambled (SCR)-control. After transfection, live Tregs were co-cultured with T effectors (CD4<sup>+</sup>CD25<sup>+</sup>) in a suppression assay to test their suppressive capacity. Transfection with mimic-miR-142-3 p significantly increased the miR-142-3 p levels (2.4 fold, p=0.03) and reduced the suppressive capacity compared to SCR-transduced Tregs (1.9 fold reduction, p=0.02). Moreover, miR-142-3 p levels tended to correlate to the suppressive function of Tregs (p=0.06, rho=-0.591). A database and literature search identified adenyl cyclase 9 (AC9) as a promising target of miR-142-3 p. mRNA levels of AC9 tended to be lower in AAV-REM patients compared to HC (3.8 fold, p=0.07). In addition, cAMP

levels, which are partly produced by AC9, were significantly lower in Tregs from AAV-REM patients after 48 hour of stimulation with anti-CD3 and anti-CD28 (1.7 fold,  $p=0.003$ ).

**Conclusions:** Increased expression of miR-142-3p in Tregs of AAV-REM patients is associated with their functional impairment, potentially by targeting the AC9/cAMP mediated suppression.

### OP0317 SCREENING OF AN AUTOANTIBODY SIGNATURE OF EARLY KNEE OSTEOARTHRITIS: DATA FROM THE OSTEOARTHRITIS INITIATIVE

M. Camacho Encina<sup>1</sup>, V. Calamia<sup>1</sup>, F. Picchi<sup>1</sup>, J. VanDuijn<sup>2</sup>, J. Qiu<sup>2</sup>, C. Ruiz Romero<sup>1</sup>, J. LaBaer<sup>2</sup>, F.J. Blanco<sup>1</sup>. <sup>1</sup>Rheumatology Research Group, *ProteuRed, PRB2-ISCIII, INIBIC-Complejo Hospitalario Universitario A Coruña, A Coruña, Spain*; <sup>2</sup>Virginia G. Piper Center for Personalized Diagnostics, *Biodesign Institute, Arizona State University, Tempe, Arizona, USA*

**Background:** The immune system can detect the changes involved in the osteoarthritic (OA) joint, triggering the production of immunoglobulins against self-proteins (Autoantibodies or AABs). As AABs might be generated in a stage prior to the disease, they can be potentially used to identify an increased risk for the disorder, allowing the diagnosis of asymptomatic OA.

**Objectives:** The discovery of an AAb signature useful for the early diagnosis of knee OA.

**Methods:** Nucleic Acid-Programmable Protein Arrays (NAPPA) were used to screen the presence of AABs against 2200 human proteins in sera belonging to two different subcohorts from the Osteoarthritis Initiative (OAI): Incidence and Non-exposed subcohorts. Participants in the incidence subcohort had not developed any symptomatic knee OA at baseline, but they did present an increased risk of developing the disease. Non-exposed subcohort incorporate participants which have no radiographic findings or symptoms of knee OA, nor any reported risk factors. A hundred sera from both subcohorts at baseline were used. In order to know if the profile of AABs was specific of asymptomatic OA, samples belonging to the same patients selected from the incidence subcohort were analysed after 72 months of follow up, when all of them have developed OA. Data were normalised following the Biodesign Institute criteria. A 1.1 cutoff was used to determine reactivity and all proteins over the cutoff were analysed by Wilcoxon test. The Partial Area Under the Curve (pAUC) at 95% specificity was analysed with a  $p$  value < 0.05.

**Results:** We detect AABs against six proteins showing different reactivity (see table 1) in a stage prior to the disease –samples from the incidence subcohort at baseline compared with the non-exposed subcohort–. These proteins were implicated in the cholesterol biosynthesis (Diphosphomevalonate decarboxylase, MVD), and the elimination of potentially toxic xenobiotic or endogenous compounds (ASB7 and UGT1A7, respectively). We also found a GTPase from the Rho family (RAC3), the Vacuolar protein sorting-associated protein 4B (VPS4B), which has been recently reported to facilitate chondrocyte apoptosis in a OA rat model, and Methionine adenosyltransferase 2 subunit beta (MAT2B). The latter is the regulatory subunit of the enzyme responsible of the catalysis of S-adenosylmethionine, a dietary supplement widely used in the management of OA symptoms. None of the six AABs were found after the disease has been established (samples from the incidence subcohort at 72 months).

Abstract OP0317 – Table 1

Acc number	Symbol	Wilcoxon test (pvalue)	Specificity at 95%	AUC	AUC (p value)
O75351	VPS4B	0.005	80.80%	0.855	0.4732
Q9NZL9	MAT2B	0.005	80.80%	0.86	0.0497
P53602	MVD	0.002	75.60%	0.9	0.0426
P60763	RAC3	0.003	76.30%	0.88	0.0496
Q9HAW7	UGT1A7	0.015	79.59%	0.82	0.0481
Q9H672	ASB7	0.002	76.90%	0.885	0.0499

**Conclusions:** This work is the first to screen a large number of human proteins for the discovery of OA-associated AABs. We define a panel of six AABs, which are increased prior to the development of symptomatic knee OA. These results suggest that a serum AABs signature can facilitate the discovery of early OA biomarkers useful for clinical diagnosis.

### OP0318 NETOSIS-INHIBITING T-ACPA THERAPY FOR USE IN DIFFERENT NET-DRIVEN HUMAN AUTOIMMUNE DISEASES

R.G. Chirivi<sup>1</sup>, J.W. van Rosmalen<sup>2</sup>, K. Kambas<sup>3</sup>, G. Schmets<sup>2</sup>, H. Kalisvaart<sup>2</sup>, G. Bogatkevich<sup>4</sup>, T. Shaw<sup>5</sup>, H. van Es<sup>5</sup>, J.M. Raats<sup>1</sup>. <sup>1</sup>Citryll and ModiQuest BV; <sup>2</sup>ModiQuest BV, Oss, Netherlands; <sup>3</sup>Laboratory of Molecular Hematology, Democritus University of Thrace, Alexandroupolis, Greece; <sup>4</sup>Department of Medicine, Medical University of South Carolina, Charleston, USA; <sup>5</sup>Citryll BV, Oss, Netherlands

**Background:** Aberrant Neutrophil Extracellular Trap (NET) formation contributes to the induction and propagation of inflammation and plays a key role in causing tissue damage in conditions like sepsis, SLE, RA and vasculitis. Citrullination of proteins is involved in the formation of NETs, autoimmunity, and the breaking of tolerance in NET-driven autoimmune diseases. In SLE and RA, neutrophils undergo enhanced NETosis, and NET components are observed in blood, inflamed tissues and joints.

**Objectives:** Our objective is to develop a novel first in class NET-inhibiting therapeutic anti-citrullinated protein antibody (tACPA) targeting citrullinated histones 2A and 4, for the treatment of human diseases in which aberrant NET formation add to the severity of the pathology with an initial focus on autoimmune diseases. Here, we demonstrate the utility of tACPA for different NET-based diseases beyond RA, including SLE, vasculitis, gout and idiopathic pulmonary fibrosis (IPF).

**Methods:** Previously, using two RA animal models, the therapeutic properties of tACPA have been demonstrated.<sup>Chirivi et al., 2013</sup> In the current studies, neutrophils from RA and SLE donors, as well as biological NET-inducing stimuli, such as RA synovial fluid (SF), gout SF and activated platelets, have been used to demonstrate the NETosis-inhibiting properties of tACPA in different human disease contexts. We have further expanded tACPA's therapeutic utility by testing it in a surrogate model for NET-mediated organ damage (sepsis) and IPF.

**Results:** NETosis in human RA and SLE neutrophils have been induced with a calcium ionophore and could be inhibited by tACPA treatment (40%–100% reduction). Similar results were obtained using RA and gout SF or activated platelets as NETosis inducers in combination with neutrophils from healthy donors. These observations have been confirmed with multiple NET readouts such as MPO activity, MPO/DNA ELISA, DNA quantification as well as imaging readouts. In addition, we demonstrated that in an LPS-induced sepsis model 30% of tACPA-treated mice survived (compared to 0% in placebo controls), showing protection against organ failure. In a bleomycin-induced IPF mouse model, tACPA protected mice from the development of lung fibrosis (compared to placebo controls). When determining neutrophil counts in bronchoalveolar lavage samples, we found that in tACPA-treated mice, neutrophil levels were normal, while levels in placebo-treated mice were elevated.

**Conclusions:** In a sepsis and IPF mouse model, tACPA prevented NET-mediated organ damage, providing evidence that tACPA could be a promising therapeutic strategy for diseases where NET-mediated endothelial toxicity causes organ damage like SLE, vasculitis and IPF. Central to our strategy for generating a preclinical data package supporting clinical testing, is to demonstrate that patient NETosis can be significantly inhibited *ex vivo*. We will present data that confirm that tACPA can block human SLE NETosis as well as human NETosis induced by activated platelets or gout SF.

OP0319

### LOW AND MODERATE PHYSICAL ACTIVITY REDUCES LOCALISED IL-1B IN AN ACUTE MOUSE MODEL OF GOUT BY DOWN-REGULATING TLR2 EXPRESSION ON CIRCULATING NEUTROPHILS

K. Jablonski<sup>1</sup>, B. Sandoval<sup>1</sup>, P. Harb<sup>1</sup>, A. Kalyanasundaram<sup>2</sup>, J.M. Hampton<sup>1</sup>, W. N. Jarjour<sup>1</sup>, N. Schlesinger<sup>3</sup>, N.A. Young<sup>1</sup>. <sup>1</sup>Rheumatology and Immunology; <sup>2</sup>Physiology and Cell Biology, The Ohio State University Wexner Medical Center, Columbus; <sup>3</sup>Rheumatology, Rutgers Robert Wood Johnson Medical School, New Brunswick, USA

**Background:** While physical activity was originally believed to exacerbate inflammation in rheumatic disease, recent studies have shown significant reductions in inflammation with regular exercise. It has been previously shown that down-regulation of toll-like receptor (TLR)2 and TLR4 expression correlates with increased physical activity in humans. Furthermore, both TLR2 and TLR4 knockout mice are resistant to monosodium urate (MSU) crystal-induced gout. Additionally, mesenchymal stem cells (MSCs) can be immunosuppressive by secreting IL-1 receptor antagonist (IL-1RA) and have also been shown to be up-regulated with exercise.

**Objectives:** The aim of this study was to investigate the mechanism by which exercise suppresses gouty inflammation and to define the potential roles of TLR2, TLR4, and MSCs in the process.

**Methods:** NFκB reporter mice [BALB/C-Tg(NFκB-RE-luc)-Xen] were exercised daily by treadmill walking (45 min/day for 2 weeks) at low intensity (35% VO<sub>2</sub>max; 8 m/min), moderate intensity (55% VO<sub>2</sub>max; 11 m/min), and high intensity (75% VO<sub>2</sub>max; 15 m/min). Mice were then injected with MSU crystals (0.5 mg) into the tibio-tarsal joint (ankle). Localised NFκB activity was measured 16 hours later in the injected ankle by bioluminescent imaging. Tissue was collected and processed for immunohistochemical (IHC) analysis and whole blood was collected for both flow cytometry and serum analysis.

**Results:** Mice in the low/moderate intensity exercise groups had decreased inflammation, F4/80<sup>+</sup> macrophages, and MPO<sup>+</sup> neutrophils at the site of MSU injection compared to high intensity and non-exercised controls. Similarly, bioluminescent imaging of NFκB activity was significantly reduced locally in both low/moderate intensity groups compared to high-intensity and non-exercised controls. Surface expression of TLR4 on peripheral monocytes or neutrophils showed little difference by flow cytometry, while TLR2 expression on peripheral neutrophils was significantly reduced. In concordance, localised IL-1β expression via IHC was reduced in low/moderate intensity exercise conditions. IL-1RA expression correlated with IL-1β induction locally by IHC and was elevated in serum. Also, bone marrow-derived MSCs were significantly reduced in low/moderate intensity exercise compared to high-intensity or non-exercised controls.

**Conclusions:** These data show that while low/moderate intensity exercise regimens can reduce the localised MSU crystal-induced inflammation, high intensity training negates this response. Moreover, the exercise-mediated suppression of NFκB activity and IL-1β expression locally can be partially explained by a reduction in peripheral neutrophil recruitment via downregulation of TLR2 expression in the peripheral blood. Although not clearly defined mechanistically in this study, our results also suggest that MSCs may contribute to this immunosuppressive response and are mobilised out of the bone marrow with low/moderate intensity exercise.

### S100A9 HAMPERS OSTEOCLAST DIFFERENTIATION FROM CIRCULATING PRECURSORS BY REDUCING THE EXPRESSION OF RANK

M.H. Van Den Bosch<sup>1</sup>, I. Di Ceglie<sup>1</sup>, T. Vogl<sup>2</sup>, J. Roth<sup>2</sup>, C.S. Goodyear<sup>3</sup>, P.M. van der Kraan<sup>1</sup>, A.B. Blom<sup>1</sup>, P.L. van Lent<sup>1</sup>. <sup>1</sup>Experimental Rheumatology, Radboud university medical center, Nijmegen, Netherlands; <sup>2</sup>Institut für Immunologie, Münster, Germany; <sup>3</sup>Institute of Infection, Immunity and Inflammation, Glasgow, UK

**Background:** High levels of the damage-associated molecular patterns (DAMPs) S100A8 and S100A9 are produced in the synovium during both experimental and human rheumatoid arthritis (RA). These alarmins have been implicated in inflammation-induced bone resorption. We and others have previously shown that stimulation of mature osteoclasts with S100A8/A9 results in increased numbers and bone resorptive activity. In agreement, reduced bone destruction was observed after induction of experimental RA models in S100a9<sup>-/-</sup> mice. However, the effects of S100A8/A9 on monocyte-to-osteoclast differentiation remain elusive.

**Objectives:** Here, we investigated the effects of S100A9 on CD14<sup>+</sup> monocytes and their potential to differentiate into osteoclasts.

**Methods:** CD14<sup>+</sup> monocytes were isolated from buffy coats of healthy donors using density gradient centrifugation and magnetic cell sorting. Cells were differentiated into osteoclasts with macrophage colony-stimulating factor (M-CSF) and Receptor activator of nuclear factor kappa-B (RANK) ligand (RANKL) in the presence or absence of S100A9. mRNA expression was determined by RT-qPCR and protein expression was determined using Luminex analysis. Moreover, osteoclast differentiation was assessed using Tartrate-resistant acid phosphatase (TRAP) staining and the resorptive capacity was determined using mineral-coated plates. RANK protein expression was assessed using FACS.

**Results:** We observed that S100A9 stimulation of monocytes resulted in a strong induction of various pro-inflammatory factors, such as interleukin (IL)1β, IL6, IL8, and tumour necrosis factor (TNF)α after 24 hours, both on the mRNA and protein level. Interestingly, we observed a strong decrease in the number of multinucleated osteoclasts as determined by TRAP staining, at day 6 and 8 after start of the cultures. In agreement with this, the cells showed a strongly reduced resorptive capacity after 10 days of culture. We demonstrated that already a 24 hour stimulation with S100A9 strongly reduced the osteoclastogenic potential of the CD14<sup>+</sup> monocytes. Finally, to determine the mechanism of how this short S100A9 stimulation might reduce the osteoclast development, we determined the protein expression of the RANK receptor, which is crucial for osteoclast differentiation. We observed that S100A9 stimulation hampered the M-CSF-induced upregulation of RANK after 24 hours, suggesting that this underlies the hampered osteoclast differentiation. Interestingly, this S100A9-induced decreased RANK expression could be reversed by addition of the TNFα-inhibitor etanercept, but not by addition of IL1 receptor antagonist.

**Conclusions:** Whereas S100A8/A9 have been previously shown to stimulate the numbers and resorptive capacity of mature osteoclasts, we here show that stimulation of monocytes with S100A9 strongly inhibits their osteoclastogenic potential, possibly via TNFα-induced reduction of RANK expression. This suggests that S100A8/A9 does not solely stimulate osteoclast formation and function but rather that the timing of exposure to S100A8/A9 is an important determinant for monocyte-to-osteoclast differentiation.

### Pathophysiology and biomarkers in PsA: what impact?

OP0321

### PRECISION MEDICINE USING DIFFERENT BIOLOGICAL DMARDS BASED ON CHARACTERISTIC PHENOTYPES OF PERIPHERAL T HELPER CELLS IN PSORIATIC ARTHRITIS

I. Miyagawa, S. Nakayama, K. Nakano, S. Kubo, S. Iwata, Y. Miyazaki, M. Yoshikawa, H. Yoshinari, Y. Tanaka. The First Department of Internal Medicine, University of Occupational and Environmental Health, Japan, Kitakyusyu, Japan

**Background:** Biological DMARDs targeting TNF-α, IL-17, and IL-12/23 (p40) are available. The high efficacy of these drugs has been proven in numerous clinical trials. However, there are some cases in which a change from one bDMARDs to another one is necessary because of the refractory nature of the disease, and there is no established method to select the optimal bDMARDs according to the individual case, despite the fact that various drugs are available.

**Objectives:** We sought to investigate the selection of specific biological DMARDs based on characteristic lymphocyte phenotypes for treating PsA.

**Methods:** we performed this study to evaluate the efficacy of biologics therapy in 64 patients with PsA after 6 months of therapy, and to compare the results of

peripheral lymphocyte phenotyping using 8-colour flow cytometry, with specific focus on helper T cell subsets, between 26 patients with PsA and healthy donors. In addition, the therapeutic response of 26 patients in whom the optimal bDMARDs was strategically chosen based on the results of peripheral lymphocyte analysis was evaluated at 6 months of treatment intervention in comparison with 38 patients in whom the standard biological product was used based on the 2011 and 2015 EULAR recommendations. Thus, the possibility of the optimisation of drug selection for bDMARDs therapy based on peripheral blood lymphocyte phenotyping was investigated.

**Results:** The 26 patients with PsA in the strategic treatment group were classified into the following 4 types based on the peripheral blood analysis: a CXCR3<sup>+</sup>CCR6<sup>+</sup>CD38<sup>+</sup>HLA-DR<sup>+</sup> activated Th1 cell-predominant type, CXCR3<sup>+</sup>CCR6<sup>+</sup>CD38<sup>+</sup>HLA-DR<sup>+</sup> activated Th17 cell-predominant type, Th1/Th17-high type, and Th1/Th17-low type. Accordingly, ustekinumab was administered to the activated Th1 cell-predominant patients, secukinumab to the activated Th17 cell-predominant patients, secukinumab or TNF inhibitor to the Th1/Th17-high patients, and TNF inhibitor to the Th1/Th17-low patients. At 6 months of strategic treatment, there was a significant decrease in SDAI (from 16.2 to 3.52), DAS28 (ESR) (from 4.13 to 2.27), and PASI (from 8.36 to 2.40). There were no statistically significant differences in background factors at baseline between these 2 groups. Moreover, the proportion of patients with the combined use of MTX was significantly lower in the strategic bDMARDs treatment group. There were significant decreases in TJC, SJC, PGA, CRP, ESR, DAS28 (ESR), SDAI, and PASI in both groups at 6 months of therapy. There were no significant differences in the amounts of these decreases between the two groups. However, at 6 months of therapy, the rate of low disease activity achievement according to SDAI, DAS28 (ESR), and ACR20 response rate was significantly higher in the strategic bDMARDs treatment group.

**Conclusions:** Strategic treatment in which different bDMARDs were selected according to phenotypic differences in helper T cells showed significantly higher efficacy than standard bDMARD therapy. The results of this study provide an important guide to the implementation of more effective therapeutic intervention.

FRIDAY, 15 JUNE 2018

## The art of diagnosis of axial SpA

OP0322

### ARE WE TREATING WITH BIOLOGICAL THERAPIES WOMEN PATIENTS WITH REAL NON-RADIOGRAPHIC AXIAL SPONDYLOARTHRITIS?

R.E. Nieto<sup>1</sup>, C. Plasencia<sup>2</sup>, D. Peiteado<sup>2</sup>, A. Villalba<sup>2</sup>, A. Balsa<sup>2</sup>, V. Navarro-Compán<sup>2</sup>. <sup>1</sup>Hospital Provincial de Rosario, Rosario, Argentina; <sup>2</sup>University Hospital La Paz, IdiPaz, Madrid, Spain

**Background:** As a result of the development of the ASAS criteria for axial spondyloarthritis (axSpA), a new entity (non-radiographic axSpA –nr-axSpA) was created. In some countries major concerns have been raised with regard to this entity because this could imply administrating TNF inhibitors (TNFi) to non-SpA patients. Especially the possibility of treating women with fibromyalgia has been mentioned.

**Objectives:** To evaluate if the gender distribution and the pattern of patients have changed in clinical practice since TNFi were approved for nr-axSpA.

**Methods:** Dataset from a prospective cohort including all patients with axSpA treated with biological therapy (BT) since 2000 till August-2017 in a tertiary hospital was analysed. Patients' and disease' characteristics and disease activity parameters were collected at baseline. Based on the starting date for the first BT, patients were classified in two groups: i) before 2013 and ii) during or after 2013, since the nr-axSpA approval-date for TNFi in the country was July 2012. Gender distribution and other characteristics were compared between both groups using Chi-square and Student-t tests.

**Results:** In total, 385 axSpA patients initiated BT. Out of these, 266 initiated BT in period i) and 119 in period ii). The characteristics of patients in both groups are depicted in table 1. Importantly, no differences between period i) and ii) were observed regarding gender distribution (38% and 39% of women; p=0.8, respectively). Additionally, during period ii), the percentage of patients with nr-axSpA was similar for both genders and out of all patients with nr-axSpA, the majority (60%) were men. Overall, disease duration was shorter in period ii) for both genders. Women in period ii) had significantly higher ASDAS, BASMI and CRP than women in period i) and higher ASDAS, BASDAI and BASFI than men in period ii).

**Abstract OP0322** – Table 1 Patients characteristics stratified for starting first TNFi period and gender

**Conclusions:** In clinical practice, the frequency of women initiating BT have not increased since its approval for nr-axSpA. Additionally, women treated nowadays with BT have more objective parameters of disease activity than they used to do. This supports that when treating axSpA women (including nr-axSpA) with BT, we are currently treating axSpA -and not fibromyalgia- patients.

OP0323

### ARE GENDER-SPECIFIC APPROACHES NEEDED IN DIAGNOSING EARLY AXIAL SPONDYLOARTHRITIS? DATA FROM THE SPONDYLOARTHRITIS CAUGHT EARLY COHORT

A. Ortolan<sup>1</sup>, M. van Lunteren<sup>2</sup>, S. Ramiro<sup>2</sup>, R. Ramonda<sup>1</sup>, R. Landewé<sup>3</sup>, H. Dagfinrud<sup>4</sup>, L. Jacobsson<sup>5</sup>, D. van der Heijde<sup>2</sup>, F.A. van Gaalen<sup>2</sup>. <sup>1</sup>Rheumatology Unit, Department of Medicine DIMED, University of Padova, Padova, Italy; <sup>2</sup>Department of Rheumatology, Leiden University Medical Center, Leiden; <sup>3</sup>Department of Rheumatology, Amsterdam Rheumatology and Immunology Center, Amsterdam, Netherlands; <sup>4</sup>Department of Rheumatology, Diakonhjemmet Hospital, Oslo, Norway; <sup>5</sup>Department of Rheumatology, University of Gothenburg, Gothenburg, Sweden

**Background:** Although gender differences have been observed in the severity of axial spondyloarthritis (axSpA), gender differences in disease presentation of early axSpA have not been thoroughly investigated.

**Objectives:** Our aim was to assess if the disease presents differently in males and females, and to evaluate if this has an impact on the diagnostic process.

**Methods:** Baseline data from the SpondyloArthritis Caught Early cohort, which includes patients with chronic back pain (CBP; ≥3 months, ≤2 years, onset <45 years), were analysed. Patients underwent a full diagnostic workup, including MRI and radiograph of the sacroiliac joints (MRI-SIJ and X-SIJ), to establish a diagnosis of axSpA. Characteristics of male and female patients with a definite diagnosis of axSpA (based on a level of confidence about the diagnosis ≥7, as expressed by the physician on a 0–10 rating scale) were compared. Regression models were built for 1) the whole CBP cohort stratified by gender to study which SpA features were associated most with diagnosis in each gender, and 2) for axSpA patients to test if gender was associated with imaging positivity (MRI SIJ+and/or X-SIJ+).

**Results:** Of the 719 CBP patients, 275 were male. With 146/275 (53.1%) males and 155/444 (34.9%) females diagnosed as axSpA, males were more likely to be diagnosed with axSpA (OR 2.1, 95% CI: 1.5 to 2.9). Despite similar symptom duration, male axSpA patients were younger at diagnosis (27.4±7.5 vs 29.5±7.8 years; p=0.021). Presence of SpA features was similar in male and female axSpA patients (table 1) except for HLA-B27 and imaging positivity, which were more common in male axSpA patients (HLA-B27 +80% vs 60%; p<0.0001 and positive imaging 78% vs 64%; p=0.007). Nevertheless, both these SpA features were still more prevalent in female axSpA patients than in non-axSpA patients, either females (HLA-B27 +23% and imaging 7%) or males (HLA-B27 +34% and positive imaging 11%) (all p<0.001). Moreover, in multivariable models with diagnosis as

outcome, HLA-B27 and imaging positivity were associated with a diagnosis of axSpA in both sexes (male patients: HLA-B27+: OR 3.8, 95% CI: 1.7 to 8.8; MRI-SIJ+: OR 24.3, 95% CI: 9.7 to 60.6; X-SIJ+: OR 2.7, 95% CI: 0.7 to 9.4 and female patients: HLA-B27+: OR 6.7 95% CI: 3.2 to 14.0; MRI-SIJ+: OR 32.6 95% CI: 14.2 to 75.0; X-SIJ+: OR 6.9 95% CI: 1.4 to 32.7). In models with imaging positivity as the outcome, male gender and HLA-B27 positivity were both independently associated with MRI+and/or X-SI+ (OR 1.8, 95% CI: 1.0 to 3.1 and OR 1.8 (1.0–3.3).

<b>Any positive imaging</b>	<b>114 (78)</b>	<b>99 (64)</b>	<b>0.007</b>

Results are presented as n (%) unless otherwise indicated. AxSpA= axial spondyloarthritis; CBP=chronic back pain; HLA=human leukocyte antigen; IBP=inflammatory back pain; IBD=inflammatory bowel disease; NSAIDs=non-steroidal anti-inflammatory drugs; CRP= C reactive protein; ESR=erythrocyte sedimentation rate; MRI=magnetic resonance imaging; SIJ= sacroiliac joints; X=X rays; any positive imaging= MRI-SIJ+ and/or X-SIJ+. All features were complete in at least 95% of patients unless specified otherwise. Bold indicates significant results.

**Conclusions:** Although our data show clear gender differences in early axSpA, they highlight that in both genders HLA-B27 and imaging are key elements for a diagnosis of axSpA. Therefore, our study does not suggest that separate diagnostic strategies are required for men and women.

## Understanding the language of basic research, epidemiology and health services articles

### OP0324 RISK OF SERIOUS INFECTIONS IN RHEUMATOID ARTHRITIS PATIENTS TREATED WITH ABATACEPT, RITUXIMAB AND TOCILIZUMAB IN DENMARK AND SWEDEN

K.L. Grøn<sup>1</sup>, E. Arkema<sup>2</sup>, B. Glinthberg<sup>1</sup>, F. Mehnert<sup>1</sup>, M. Østergaard<sup>1</sup>, L. Dreyer<sup>1</sup>, M. Nørgaard<sup>1</sup>, N.S. Krogh<sup>1</sup>, J. Askling<sup>2</sup>, M. Heltand<sup>1</sup>, on behalf of all departments that have contributed with data and the ARTIS Study Group. <sup>1</sup>The DANBIO registry and the Danish Departments of Rheumatology, Copenhagen, Denmark; <sup>2</sup>Department of Medicine Solna, Karolinska Institutet, Stockholm, Sweden

**Background:** Safety concerns have been raised regarding the risk of serious infections (SI) with the different available biologic disease-modifying anti-rheumatic drugs (bDMARDs). Little is known about the risk of SI in patients with rheumatoid arthritis (RA) treated with non-tumor-necrosis-factor-inhibitors (non-TNFi) bDMARDs.

**Objectives:** In RA patients treated in routine care with the three non-TNFi, abatacept, rituximab and tocilizumab 1) to compare crude as well as adjusted incidence

rates (IR) of SI after the first year of treatment, and 2) to estimate the relative risk (RR) of SI across these drugs after 1 year of treatment.

**Methods:** Collaborative observational cohort study conducted in Denmark (DK) and Sweden (SE) in parallel. RA patients in DANBIO (DK) and ARTIS/SRQ (SE) who started a non-TNFi treatment<sup>Jan 2010-Dec 2015</sup> were included and their clinical characteristics at baseline were identified. Baseline comorbidities, reimbursed antibiotic prescriptions and incident SI (hospitalisation listing infection as major cause of admission) were identified through linkage to National Patient Registries and Prescription Drug Registries. IR of SI per 100 patient years (adjusted for age and sex) and rate ratios (as estimates of RR, adjusted for additional covariates) during 1 year treatment were assessed via Poisson regression.

**Results:** 8987 treatment episodes were identified (abatacept 2,725/rituximab 3,363/tocilizumab 2,899). Differences in baseline characteristics between the three drugs were observed (table 1). During the first year of treatment, 456 SI were identified. Across all three non-TNFi there was a non-significant tendency towards higher IRs in DK than in SE. Age/sex-adjusted IRs for SI were similar across treatments in each country (abatacept/rituximab/tocilizumab for SE 6.0/6.4/4.7 and for DK 7.1/8.1/6.1, respectively). The 1 year adjusted between-drug comparisons (=RR) were formally non-significant (table 1).

**Abstract OP0324** – Table 1 Baseline characteristics, IR and RR of RA patients starting non-TNFi stratified by drug and country

	ABA vs TCZ (ref)		ABA vs RTX (ref)		TCZ vs RTX (ref)	
Adjusted RR (95%CI)	1.15 (0.69, 1.90)	1.13 (0.83, 1.54)	0.84 (0.55, 1.60)	0.86 (0.66, 1.13)	0.92 (0.50, 1.36)	0.77 (0.57, 1.03)

DK=Denmark, SE=Sweden

\*adjusted for age and gender. \*\* Adjusted for age, sex, DAS28, smoking, disease duration, HAQ, previous serious infection, previous cancer, previous chronic obstructive pulmonary disease and terility of antibiotic prescriptions. Numbers are medians (IQR) unless otherwise stated. End of follow-up was July 2015 in DK and December 2015 in SE

**Conclusions:** The risk of SI across treatment with non-TNFi ranged between 4.7 and 8.1/100 patient years after 1 year, but no significant differences were observed between specific drugs. The numerical between-drug differences may partly be explained by differences in baseline characteristics.

**Acknowledgements:** Partly funded by Foreum and Nordforsk. The Swedish part of the study forms part of the ARTIS safety monitoring programme. For this, ARTIS has or has had agreement with Abbvie, BMS, MSD, Pfizer, Roche, Astra-Zeneca, Eli Lilly, Samsung Bioepis, and UCB. The Danish part of the study forms part of a post-marketing safety surveillance agreement with BMS.

### OP0325 EFFECT OF THREE HEALTH IT INTERVENTIONS ON RA DISEASE ACTIVITY SCORE DOCUMENTATION IN AN ACADEMIC RHEUMATOLOGY CLINIC

J. Gandrup<sup>1</sup>, J. Li<sup>1</sup>, Z. Izadi<sup>1</sup>, T. Ellingsen<sup>2</sup>, J. Yazdany<sup>1</sup>, G. Schmajuk<sup>1,3</sup>. <sup>1</sup>University of California, San Francisco, San Francisco, USA; <sup>2</sup>Odense University Hospital, Odense, Denmark; <sup>3</sup>San Francisco VA Medical Center, San Francisco, USA

**Background:** Routine assessments of disease activity are a key part of high quality rheumatoid arthritis (RA) care. Recommendations published in 2012 detailed the preferred disease activity measures, but little has been published about how to best implement these measures to guide routine clinical practice.

Customization of the electronic health record (EHRs) provides an opportunity to systematically collect disease activity scores in order to adequately implement treat-to-target approaches to RA treatment.

**Objectives:** To evaluate the overall impact of three health information technology (IT) initiatives at the point of care on the proportion of RA patient visits with disease activity scores recorded in an academic outpatient clinic.

**Methods:** We studied three initiatives designed to facilitate disease activity score documentation: 1. An EHR flowsheet, 2. Public reporting of physicians' performance, 3. An EHR SmartForm to facilitate the calculation and documentation of a validated RA measure, the Clinical disease activity index (CDAI). The initiatives were implemented at different time points over the study period. The study cohort included all adult RA patients with at least 2 face-to-face encounters in the outpatient rheumatology clinic at University of California, San Francisco between June 2012 – June 2017. Clinical data and covariates were retrieved from the EHR data warehouse.

To examine trends in CDAI documentation over time, we created a quality control chart (p-chart) (figure 1, where vertical lines indicate onset of each of the initiatives). For each initiative, we analysed our data using a two-pronged pre-post approach. First, we developed multiple logistic regression models in which the outcome was documentation of CDAI, controlling for patient age, sex, race/ethnicity, language and insurance category as well as physician sex and years in practice. Second, logistic mixed effect models were used to account for repeated visits by patients to the clinic and clustering by physicians.

**Results:** We included data from 7406 encounters from 978 unique patients. Mean (SD) age was 58.9 (16) years, 82% were female, 44% were racial/ethnic minorities, and 59% had public insurance. Over a 60 month period, overall documentation of CDAI scores per month in the clinic increased from 0% to 64% (figure 1). Results from mixed effect logistic modelling showed that Initiative 1 significantly increased CDAI recordings (OR=40.14 p<0.001); Initiative 2 further increased recordings (OR=2.86, p<0.001); Initiative 3 decreased the probability of CDAI being recorded (OR=0.61, p<0.001). No systematic differences were found across patient demographics or provider sex and years in practice.

**Abstract OP0325** – Figure 1 proportion of visits per month with CDAI documentation during implementation of quality improvement initiatives

**Conclusions:** Introduction of a flowsheet and public reporting of physician performance within the practice significantly improved performance, but institution of the SmartForm did not further improve on these gains. However, gains were maintained through the end of the five-year study period. Future work should focus on whether improved CDAI documentation is associated with improved patient outcomes, such as lower disease activity and improved physical function.

## The stromal link to inflammation

OP0326

### MODELLING THE INTERACTION BETWEEN DISEASE MICROENVIRONMENT AND MESENCHYMAL STEM CELLS IN SCLERODERMA

Z. Taki<sup>1</sup>, B. Abdi Ahmed<sup>1</sup>, E. Gostjeva<sup>2</sup>, C. Venturini<sup>3</sup>, C. Denton<sup>1</sup>, A. Salama<sup>4</sup>, H. Lopez<sup>1,5</sup>, B. Stratton<sup>1</sup>. <sup>1</sup>Centre for Rheumatology and Connective Tissue Diseases, UCL, London, UK; <sup>2</sup>Biological Engineering, MIT, Cambridge MA, USA; <sup>3</sup>Pathogen Genomics Unit, <sup>4</sup>Renal Medicine, UCL, London, UK; <sup>5</sup>Murigenics Inc, Vallejo CA, USA

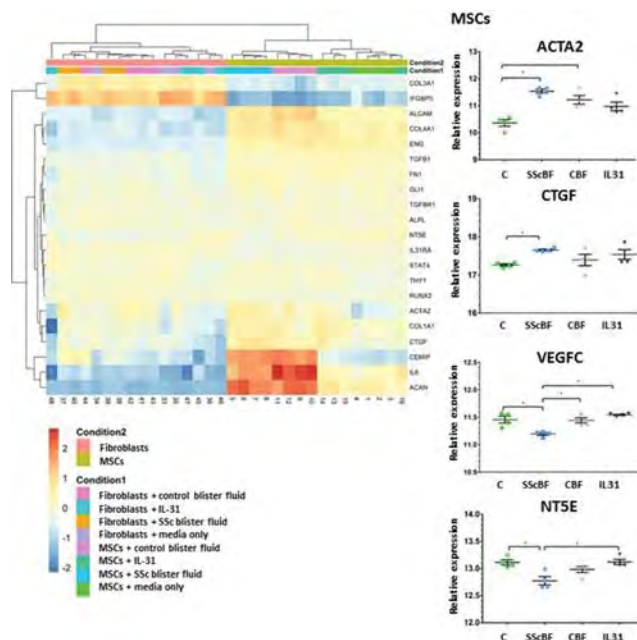

**Background:** Mesenchymal stem cells (MSCs) are pleuripotent bone marrow and tissue resident cells implicated in homeostasis and tissue repair. Systemic

sclerosis (scleroderma, SSc) is a severe connective tissue disease characterised by progressive fibrotic thickening of the dermis, accompanied by loss of subcutaneous fat and microvasculature. Aberrant activation of MSCs within the disease microenvironment may underly the persistent fibrotic repair process, or account for the failure of adipogenesis and dysregulated vascular repair.

**Objectives:** We sought to: 1) determine whether activated MSCs are present within the SSc involved skin lesions, 2) test whether SSc suction blister fluid (BF) derived from involved forearm skin can induce phenotype changes in MSCs, 3) fully profile the altered gene expression in MSCs exposed to SSc BF, 4) investigate the role of key factors present at increased level in SSc BF (IL-31, lactate).

**Methods:** Novel post-fixation collagenase tissue dissociation techniques applied to 1 mm tissue sections, combined with Feulgen staining of DNA, were used to identify MSCs undergoing metakaryotic division within the involved skin of SSc patients. Fat derived MSCs from healthy controls were treated in tissue culture with blister fluid derived from the fibrotic skin lesions or from matched sites in healthy individuals, or exposed to key constituent factors, including cytokines (IL-31, 50 ng/ml), metabolites (lactate, 25 mM), and enhanced stiffness matrix (50 kPa gels). The responses of MSCs were studied by analysis of next generation sequencing (NGS) and phenotype changes.

**Results:** MSCs undergoing metakaryotic division were identified in SSc skin biopsy material but not in healthy control (HC) tissue (SSc vs HC, superficial dermis 0 vs 0, mid dermis 1.1 vs 0 p<0.0001, deep dermis 1.4 vs 0 p<0.0001 metakaryotic cells per x20 field). SSc BF (diluted 1:125 in media) induced disease-relevant phenotype changes in MSCs, such as  $\alpha$ SMA expression (p<0.05), collagen gel contraction (p<0.002) and scratch wound repair (p<0.016), as well as loss of adipogenic potential, more than control BF or media alone, due in part to elevated IL-31 and lactate. NGS indicated that SSc blister fluid induced treatment-specific gene expression in MSCs (figure 1), more differentially than in normal dermal fibroblasts, consistent with activation of fibrosis, wound repair, migration, osteogenesis, connective tissue formation and loss of angiogenesis/vascular repair. Induction of  $\alpha$ SMA in MSCs was dependent on the matrix stiffness in medium.

**Conclusions:** Factors present at elevated levels in the disease microenvironment, including cytokines and metabolites, as well as the stiffened ECM, are capable of promoting the migration and differentiation of fat derived MSCs, towards tissue reparative cells implicated in the fibrotic process. Conversely, the adipogenic and vascular regenerative potential of these cells may be reduced by exposure to the SSc microenvironment.

OP0327 **CXCL4 DRIVES FIBROSIS BY PROMOTING SEVERAL KEY CELLULAR AND MOLECULAR PROCESSES**

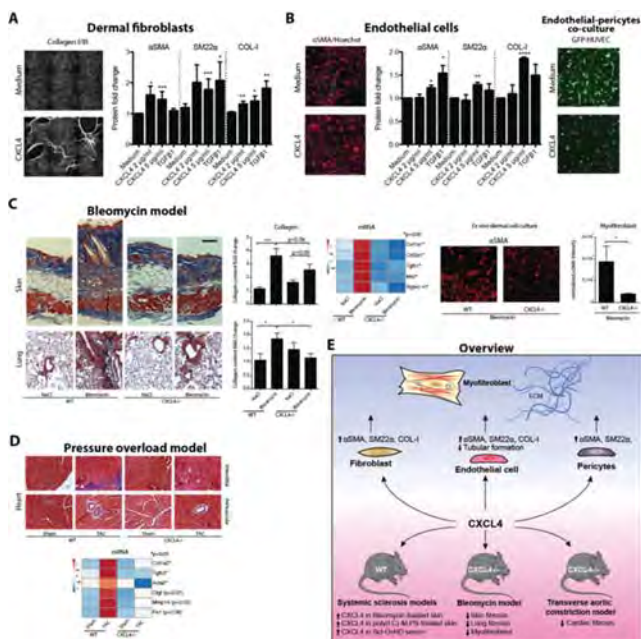

W. Marut<sup>1</sup>, A. Affandi<sup>2</sup>, T. Carvalho<sup>1</sup>, A. Ottria<sup>1</sup>, J. Haan<sup>3</sup>, M. Brandt<sup>3</sup>, R. Tieland<sup>1</sup>, M. Brans<sup>3</sup>, B. Malvar-Fernandez<sup>1</sup>, C. Bekker<sup>1</sup>, M. van der Linden<sup>1</sup>, B. Giovannone<sup>1</sup>, D.-J. Heijnen<sup>4</sup>, A. Kowalska<sup>5</sup>, R. Lafyatis<sup>6</sup>, C. Cheng<sup>3</sup>, S. de Jager<sup>3</sup>, J. van Roon<sup>1</sup>, T. Radstake<sup>1</sup>. <sup>1</sup>Laboratory for translational immunology, University Medical Center Utrecht; <sup>2</sup>Lundlaan, UMCU; <sup>3</sup>Department of Experimental Cardiology; <sup>4</sup>Department of Dermatology, University Medical Center Utrecht, Utrecht, Netherlands; <sup>5</sup>Department of Hematology, Children's Hospital of Philadelphia, Philadelphia, USA; <sup>6</sup>Rheumatology section, Boston University School of Medicine, Boston, Netherlands

**Background:** Fibrosis, characterised by excessive accumulation of extracellular matrix (ECM) through myofibroblasts, is a leading cause of mortality worldwide<sup>1,2</sup>. Understanding the pathways involved in myofibroblasts activation is crucial to develop novel treatment strategies. Systemic sclerosis (SSc) is a prototypic fibrotic disease in which we previously identified CXCL4 to be strongly correlated with skin and lung fibrosis<sup>3</sup>.

**Objectives:** We aimed to elucidate the role of CXCL4 in fibrosis development using *in vitro* and *in vivo* assays.

**Methods:** Human primary dermal fibroblasts, endothelial cells, and pericytes, were (co-) cultured in the presence or absence of recombinant human CXCL4. CXCL4<sup>-/-</sup> mice were used in bleomycin-induced skin and lung fibrosis model, and pressure-overload cardiac fibrosis model. Gene expression was assessed by qPCR, protein expression was determined by western blot or immunofluorescence, and collagen content was measured by trichrome staining or hydroxyproline assay.

**Results:** We found that CXCL4 induced the expression of myofibroblast markers  $\alpha$ SMA and SM22 $\alpha$ , and collagen synthesis in human dermal fibroblasts, endothelial cells, and pericytes. CXCL4 also suppressed endothelial cell tubular formation in a co-culture with pericytes. In mice, CXCL4 expression was increased in a variety of mouse inflammatory and fibrotic models. Using CXCL4<sup>-/-</sup> mice, we confirmed the essential role of CXCL4 in promoting fibrotic events in the skin, lung, and heart using two independent fibrosis models.

**Conclusions:** CXCL4 drives myofibroblast transformation from different precursors and it is required for fibrosis development across organs. Our findings implicate a pivotal role of CXCL4 in fibrosis further substantiating the potential role for neutralising CXCL4 as a novel therapeutic strategy.

OP0328-HPR **PATIENTS' VIEWS ON ROUTINE COLLECTION OF PATIENT-REPORTED OUTCOMES IN RHEUMATOLOGY CARE – A DANBIO FOCUS GROUP STUDY**

J. Primdahl<sup>1</sup>, D.V. Jensen<sup>2</sup>, R.H. Meincke<sup>2</sup>, K.V. Jensen<sup>3</sup>, C. Ziegler<sup>3</sup>, S. W. Nielsen<sup>3</sup>, L. Dalsgaard<sup>3</sup>, M. Kildemand<sup>4</sup>, M.L. Hetland<sup>5</sup>, B.A. Esbensen<sup>6</sup>. <sup>1</sup>King Christian X's Hospital for Rheumatic Diseases, University of Southern Denmark, Graasten; <sup>2</sup>The Danbio registry, Rigshospitalet; <sup>3</sup>Patient research partner, Copenhagen; <sup>4</sup>Odense University hospital, Odense; <sup>5</sup>The Danbio registry, Rigshospitalet, University of Copenhagen; <sup>6</sup>Rigshospitalet, University of Copenhagen, Copenhagen, Denmark

**Background:** Patient Reported Outcomes (PROs) are important for shared decision-making regarding treatment. The DANBIO registry, which has included >60 000 patients (>5 00 000 visits), routinely collects PROs (health assessment questionnaire (HAQ), visual analogue scales for pain, fatigue and global health, patient acceptable symptom state (PASS) and an anchor) on touch-screens in the waiting room, as part of rheumatology standard care.<sup>1</sup> The aims of DANBIO are to 1) monitor the disease in individual patients, 2) improve treatment quality, 3) conduct research. Patients' experience with the collection of PROs in DANBIO has not been explored.

**Objectives:** To explore patients' views on the collection of PROs in rheumatoid arthritis (RA), psoriatic arthritis (PsA) and ankylosing spondylitis (AS)

**Methods:** We conducted a qualitative study based on one semi-structured focus group interview in each of the five geographical regions in Denmark. The analysis of the transcribed interviews was based on content analysis.<sup>2</sup> Four patient research partners were involved in all phases of the study

**Results:** In total, 32 adult patients with RA (n=21), PsA (n=6) or AS (n=5) participated. 21 (66%) were female, mean age 60 years (range 32–80).

The analysis identified an overarching theme **Potential for improvement of communication** referring to patients' perception that PROs have the potential to inspire both patients and clinicians to prepare for and improve dialogue in the consultation. In addition, four subthemes emerged.<sup>1</sup> **Lack of information about why the data is collected** referring to patients' uncertainty as to whether the PROs aimed primarily at monitoring their own disease, to save money or for research purposes. Questions regarding who gets access to data (in addition to the rheumatologist or nurse), and if data were sold to external parties, were also expressed.<sup>2</sup> **Validity of the data** referring to patients' concerns about how to reply 'correctly'. The fluctuations in disease activity and timing in relation to pharmacological treatment affected the patients' answers. They were uncertain whether answers should reflect their present state or an average of disease manifestations since their last visit. Patients were also uncertain regarding the reference; should they compare to healthy individuals or to when the arthritis is as good as it can be. Some chose to answer as if they were doing worse or better than they actually felt, in order to enter into dialogue with the clinician or because they were worried that medical treatment would be withdrawn.<sup>3</sup> **Inclusion of the PROs in the consultation** referring to patients' experiences varying from no use of the PROs at all to detailed review with the rheumatologist or nurse

**Conclusions:** Systematic information and continuous dialogue regarding the purpose of the collection of PROs, how to answer the PROs and active use of the answers in the consultations are important for patients with arthritis

**OP0329-HPR** **OUTCOMES THAT MATTER TO PEOPLE LIVING WITH INFLAMMATORY ARTHRITIS; A GLOBAL STANDARD SET, DEVELOPED BY THE INTERNATIONAL CONSORTIUM FOR HEALTH OUTCOME MEASUREMENT (ICHOM) WORKING GROUP FOR INFLAMMATORY ARTHRITIS**

M. Oude Voshaar<sup>1</sup>, Z. Das Gupta<sup>2</sup>, M.A. Van de Laar<sup>1,3</sup>, H.E. Vonkeman<sup>1,3</sup>, on behalf of International Consortium for Health Outcome Measurement (ICHOM) Working Group for Inflammatory Arthritis. <sup>1</sup>*Psychology, Health and Technology and Arthritis center Twente, University of Twente, Enschede, Netherlands;* <sup>2</sup>*International Consortium for Health Outcomes Measurement, London, UK;* <sup>3</sup>*Department of Rheumatology and Clinical Immunology, Medisch Spectrum Twente, Enschede, Netherlands*

**Background:** Value-based health care (VBHC) is a framework for improving efficiency of healthcare in which competition on value for patients is the central concept. Public reporting of patient outcomes by healthcare providers is proposed as a mechanism that will accelerate identification and adoption of innovations that increase value, through shared learning and sparking competition on outcomes that matter to patients. A key barrier to the implementation of VBHC in inflammatory arthritis (IA) is the absence of a universally accepted set of patient outcomes and risk adjustment variables that are appropriate and feasible to implement in different healthcare systems worldwide.

**Methods:** The International Consortium for Health Outcomes Measurement (ICHOM) assembled a multidisciplinary international working group (WG), consisting of 24 experts, including six patient representatives, to develop a standard set of patient-centred outcomes for IA. The process followed a structured approach using a modified Delphi process to reach consensus on 1) medical conditions to be covered by the set, 2) outcome domains, 3) outcome measures, 4) case mix variables and – definitions. Each step was supported by systematic literature reviews and consultation of (external) experts on the topic under consideration.

**Results:** The WG decided to include rheumatoid arthritis, ankylosing spondylitis, psoriatic arthritis and juvenile idiopathic arthritis in the IA Standard Set. Twenty-four outcome domains were initially identified in the 130 randomised trial reports and 28 qualitative studies that were found in the systematic literature reviews. Ultimately, pain, fatigue, activity limitations, overall physical and mental wellbeing, work/school/housework ability and productivity, inflammatory disease activity including therapeutic response (i.e. has the patient achieved the treatment target?), and serious adverse events were included. The measurement properties of 21 patient-reported outcome measures were assessed for all of the included domains. 20 of these were linked to an item response theory-based common reporting metric. This allows users of the ICHOM IA set to choose their preferred instrument while allowing comparison of outcomes. A number of risk adjustment variables and time points for collection were recommended to allow global benchmarking.

**Conclusions:** We present the ICHOM standard set of outcomes for Inflammatory Arthritis, that we encourage providers of care to implement to facilitate global comparison of outcome data and stimulate shared learning.

**Innovative treatments for a better quality of life**

**OP0330-PARE** **LOVE YOUR HEART, AN ONLINE, INTERACTIVE CARDIOVASCULAR RISK ASSESSMENT PROGRAMME FOR PEOPLE WITH RA/IA**

A.M. Bosworth, S. Arora. *n/a, National Rheumatoid Arthritis Society, Maidenhead, UK*

**Background:** Having RA doubles the risk of most heart problems, including heart attack, stroke and atherosclerosis — the build-up of fat, cholesterol and cellular debris (plaque) on blood vessel walls. Studies show that approx. 50% of people with RA die prematurely due to cardiovascular disease (CVD) one of the most common co-morbid risks. Many patients and even health professionals are unaware of this leading potentially to poorer long-term outcomes. UK Rheumatologist, Dr. Holly John originally developed and piloted this programme in group face to face format in Dudley which achieved very good results, but the format limited the number of people who could access it and benefit from it. NRAS, with Dr. John's permission, wanted to make it as widely available as possible to all with RA. Being unaware of these risks means that people with RA can be less likely to address factors, firmly within their own control, such as smoking, exercise, weight and diet.

**Objectives:** In order to make this programme freely available to all, we had to convert a face to face paper-based programme into an on-line, interactive video which would not only educate but enable people to assess their own personal CVD risks and set goals to mitigate such risks. We have also included within the programme baseline and 6 month follow up assessments to measure intended and actual behaviour change. The overall purpose of the programme is to achieve a healthier heart lifestyle thereby reducing premature mortality due to CVD.

**Methods:** Using the paper participant manual created for the group programme and working closely with Dr. John and other health professional specialists (exercise, smoking cessation, nutrition) at Dudley as well as patients who had attended the programme, we reviewed with our creative film production team the best way to adapt this to create a really engaging, interactive on-line educational experience which would allow participants to undertake the programme over time whilst working through the goal-setting and evaluation process. 2 days of filming were done in Dudley and Maidenhead at the end of 2016 followed by 12 months' period of editing, review, some re-filming and software development. The programme piloted with 20 people with RA at the end of 2017 and their feedback has been incorporated. The programme launches in the UK on 14th February, St. Valentine's Day. Heart-shaped business cards and A4 posters describing the programme with links to register, will be sent to all rheumatology units across the UK in February/March encouraging HCPs to refer their patients to Love your Heart.

**Results:** Many people have registered interest in this programme and we anticipate a high take up immediately post launch. Numbers who have participated by early June, together with anonymised baseline assessment details including intention to change behaviour will be available by June/EULAR should we be successful in having this abstract accepted.

**Conclusions:** It is too early to make any conclusions but we hope that by <sup>EULAR 2019</sup> we will have some interesting conclusions to report on. We anticipate that this programme is more likely to encourage patients to make heart healthy lifestyle choices than being advised to 'exercise, eat healthily, lose weight, stop smoking' by health professionals during routine clinic appointments.

**OP0331-PARE** **BEHAVIOUR CHANGE EXPERIENCES AND NEEDS OF PERSONS WITH RHEUMATIC DISEASE**

L. Alemo Munters<sup>1</sup>, A. Beerman<sup>2</sup>. <sup>1</sup>*and the Swedish Rheumatism Association, and the Swedish Rheumatism Association;* <sup>2</sup>*Karolinska Institutet, Karolinska Institutet, Stockholm, Sweden*

**Background:** Persons with rheumatic diseases have a higher rate of surgery as well as a need of beneficial lifestyle behaviours, in order to control risk factors associated with surgery and disease co-morbidities.

**Objectives:** The objective was to explore behaviour change experiences and needs of individuals similar to patients undergoing knee and hip surgery.

**Methods:** A survey was designed with focus on current lifestyle behaviours; experience of behaviour changes; desire to change behaviours; and attitudes and willingness to adopt digital tools in the behaviour change process. The survey was distributed via a web system to 13864 Swedish Rheumatism Association (SRA) members with a rheumatic disease.

**Results:** 1660 consented to participate of whom a majority were women, 1/2 between 45 and 64 years of age and 1/3 older than 65, where 2/3 had experienced at least 1 surgery and 2/3 of these 2–3 surgeries, with 1/4 concerning knee or hip surgery. 20% had experienced complications. Almost all respondents had access to a smartphone, computer and the internet. The most problematic current behaviour was insufficient physical activity, with less than 1/5 engaging in recommended levels of physical activity/week. Less than 1/10 smoked and about 1/20 gave indications of risky alcohol consumption. Regarding healthy eating, a large majority ate breakfast daily, 3/4 ate fruits and vegetables daily, and slightly under 1/2 ate fish 2–3 times a week. However, about 2/3 consumed unhealthy foods several times/week, with 1/5 indicating consumption 1–2 times/day. Accordingly, 2/3 indicated they would like to increase physical activity level and over 1/2 wanted to improve eating habits. 20% wanted to change other behaviours such as weight loss, consumption of sugary foods, and stress management. Fewer than 10% wanted to change their smoking habits and less than 1/20 wanted to change their alcohol habits. A majority had attempted prior behaviour change, 3/4 focused on physical activity, 2/3 on healthy eating, 1/5 on smoking and 1/20 on alcohol. Regarding the duration of the change, it was permanent for 2/5. Among those who succeeded in maintaining the change during a shorter period, 44% succeeded for 3–6 months, 1/20 for 6–12 months and about 1/10 for periods of 1–2 years. Regarding types of support used for implementing behaviour change, 1/3 had no support but only 1/10 found this helpful. Almost half used self-help, 1/5 used social support, 1/6 used professional support, and 1/10 used digital support. Most helpful were self-help, followed by social, professional and digital support, respectively.

Respondents were asked about use of a digital tool to support lifestyle behaviour change. Over 3/4 were open to using digital tools. Regarding the respondents' preferences: the top three preferences were for reminders, contact with peers and information on the importance of changing the behaviour in question.

**Conclusions:** The survey suggests that SRA members have digital access despite 1/3 being older than 65. The focus for current and future behaviour change is physical activity and to a lesser extent, healthy eating. Smoking and risky alcohol use behaviours are low in this group. Willingness to engage in a digital tool is high, and preferences are clear, with interest in human contact with professionals and peers through the digital tool, as well as automated functions.

## Advances in biologic therapy of small vessel vasculitis

### OP0332 PAEDIATRIC OPEN-LABEL CLINICAL STUDY OF RITUXIMAB FOR THE TREATMENT OF GRANULOMATOSIS WITH POLYANGIITIS (GPA) AND MICROSCOPIC POLYANGIITIS (MPA)

P. Brogan<sup>1</sup>, G. Cleary<sup>2</sup>, O. Kasapcopur<sup>3</sup>, S. Rangaraj<sup>4</sup>, R. Yeung<sup>5</sup>, P. Brunetta<sup>6</sup>, J. Cooper<sup>6</sup>, P. Pordeli<sup>7</sup>, P.B. Lehane<sup>8</sup>. <sup>1</sup>UCL Institute of Child Health and Great Ormond Street Hospital NHS Foundation Trust, London; <sup>2</sup>Alder Hey Children's Hospital, Liverpool, UK; <sup>3</sup>Cerrahpasa Medical School, Istanbul, Turkey; <sup>4</sup>Nottingham University Hospitals NHS Trust, Nottingham, UK; <sup>5</sup>Hospital for Sick Children and University of Toronto, Toronto, Canada; <sup>6</sup>Genentech, Inc., South San Francisco, USA; <sup>7</sup>F. Hoffmann-La Roche, Mississauga, Canada; <sup>8</sup>Roche Products Ltd, Welwyn Garden City, UK

**Background:** Rituximab in combination with glucocorticoids (GC) is approved to treat adult patients (pts) with GPA or MPA; however, limited data exist on the safety and efficacy of rituximab in paediatric pts with these potentially life- and organ-threatening diseases.

**Objectives:** To report the interim safety, pharmacokinetics (PK) and exploratory efficacy data from the 6 month remission induction phase of a Phase IIa international, open-label, 18 month clinical study of rituximab in paediatric pts with GPA or MPA.

**Methods:** Pts aged  $\geq 2$  to  $\leq 18$  years with newly diagnosed or relapsing GPA/MPA received 4 intravenous (IV) rituximab infusions of 375 mg/m<sup>2</sup> body surface area (BSA) on Days 1, 8, 15 and 22 with concomitant GC 1 mg/kg/day (max 60 mg/day) tapered to 0.2 mg/kg/day minimum (max 10 mg/day) by Month 6. All pts received 3 doses of pulse IV methylprednisolone (30 mg/kg/day, max 1 g/day) prior to first rituximab infusion and mandatory prophylaxis for *Pneumocystis jirovecii* infection. Pts were also pre-medicated with acetaminophen and an antihistamine, 1 hour before each rituximab infusion. Adverse events (AEs) and laboratory data were measured at each study visit (1, 2, 4 and 6 months). Plasma samples for PK analysis were collected throughout the study; clearance and area under the curve (AUC) were calculated using population PK modelling from the RAVE study of rituximab in adult pts with GPA/MPA.<sup>1</sup> For exploratory efficacy assessment, the Paediatric Vasculitis Activity Score (PVAS) was measured at each study visit.

**Results:** Of the 25 pts enrolled, 19 (76%) had GPA and 6 (25%) had MPA (median [range] age 14<sup>6-17</sup> years; 80% female). Median (range) disease duration was 0.5 (0.2-0.72) months; 2 pts had received prior cyclophosphamide therapy. All received 4/4 rituximab infusions and completed the 6 month induction phase. By Month 6, all pts had experienced  $\geq 1$  AE. The most common AEs by system organ class were infections and infestations in 16 pts (64%). AE terms reported in  $\geq 3$  pts are listed in the table 1. Eleven serious AEs occurred in 7 pts (28%), including 3 serious infections (viral gastroenteritis, one lower and one upper respiratory tract infection). 32% of pts had  $\geq 1$  infusion related reaction (IRR). No serious IRRs or deaths were reported. The relationship between AUC and BSA was flat and comparable to adult pts. A total of 13 pts (52%) achieved remission by 6 months, defined as PVAS of 0 and GC dose 0.2 mg/kg/day (max 10 mg/day) or PVAS of 0 on 2 consecutive readings  $\geq 4$  weeks apart irrespective of GC dose.

Abstract OP0332 – Table 1 Adverse events reported in  $\geq 3$  patients

Adverse event	Number of events (% of pts with $\geq 1$ AE)
Headache	6 (24%)
Upper respiratory tract infection	5 (20%)
Abdominal pain (upper)	3 (12%)
Back pain	3 (12%)
Blood IgG decreased	3 (12%)
Chest pain	3 (12%)
Cough	3 (12%)
Epistaxis	3 (12%)
Hypertension	3 (12%)
Nausea	3 (12%)
Pyrexia	3 (12%)
Vomiting	3 (12%)

AE, adverse event; IgG, immunoglobulin G.

**Conclusions:** In the initial 6 months of this first global clinical trial of rituximab in paediatric pts with GPA/MPA, rituximab was generally safe and well tolerated. The overall safety profile and PK parameters were comparable to adults with GPA/MPA. No new safety signals were observed. However, the study size and interim nature of the analysis limit firm conclusions. The clinical trial and additional efficacy, PK and safety analyses are ongoing.

### OP0333 SURVIVAL IN ANCA ASSOCIATED VASCULITIDES: A RETROSPECTIVE MULTICENTRIC ANALYSIS IN NORTHERN ITALY

M. Felicetti<sup>1</sup>, S. Monti<sup>2,3</sup>, M. Bond<sup>4</sup>, A. Berti<sup>5</sup>, R. Padoan<sup>1</sup>, G. Paolazzi<sup>5</sup>, G. Brunoni<sup>6</sup>, L. Quartuccio<sup>4</sup>, R. Caporali<sup>2</sup>, F. Schiavon<sup>1</sup>. <sup>1</sup>Department of Medicine DIMED, Operative Unit of Rheumatology, University of Padova, Padova; <sup>2</sup>Department of Rheumatology, IRCCS Policlinico S. Matteo Foundation; <sup>3</sup>University of Pavia, PhD in Experimental Medicine, Pavia; <sup>4</sup>Department of Biological and Medical Sciences, Rheumatology Clinic, University Hospital of Udine, Udine; <sup>5</sup>Rheumatology Unit; <sup>6</sup>Nephrology Unit, Santa Chiara Hospital, Trento, Italy

**Background:** Patients affected by ANCA associated vasculitides (AAV) show lower survival than general population, even if the mortality decreased significantly in the last decade.

**Objectives:** Aim of our study is to analyse the early mortality (within 6 months) and the long-term survival in a multicentric Italian cohort of AAV patients.

**Methods:** we identified all patients affected by AAV, diagnosed from 1995 until 2017, followed routinely in four vasculitis referral centres in Northern Italy. We enrolled patients with diagnosis of granulomatosis with polyangiitis (GPA) and micro polyangiitis (MPA), fulfilling EMA algorithm or <sup>CHCC 2012</sup> definitions, with complete survival data at last follow up. The analysis focused on early mortality, long-term survival and their predictors.

**Results:** We enrolled 200 AAV patients (F/M 110/90, Caucasian 98%) with a median age at diagnosis of 54.6 $\pm$ 15.2 years. 157 (78.5%) were affected by GPA and 43 (21.5%) by MPA. Data about ANCA antibodies were available in 181 patients and 157 (87%) resulted ANCA positive: 100 c-ANCA/PR3, 56 p-ANCA/MPO and one with double specificity PR3-MPO-ANCA.

During the follow up period [53<sup>26-100</sup> months], we registered 21 (10.5%) deaths, 6 (28.5% of all mortality) within 6 months after diagnosis: 9 patients died due to infectious complications, 1 due to hepatic cancer, 1 due to end stage heart failure, 1 due to massive cholestasis and 9 due to unknown causes.

Early mortality was significantly associated with a higher frequency of alveolar haemorrhage (p=0.01; OR 11.1 IC95% 2.1-60.1) and respiratory failure (p<0.001, OR 28.3 95% CI: 4.7 to 170.6).

The long-term survival, analysed with Kaplan-Maier method, did not show significant differences between GPA and MPA patients, while a significant poorer

survival was observed in p-ANCA/MPO patients than c-ANCA-PR3 and ANCA negative patients (Log rank test: p=0.04).

At univariate analysis of baseline data, deceased patients resulted older at disease onset (p=0.001) with more comorbidities (p<0.001) and presented at diagnosis a higher frequency of respiratory failure (p=0.002, OR 7.1 IC95% 2.2–22.2) and renal insufficiency (p=0.003, OR 4.7 95% CI: 1.6 to 13.7). No significant differences were noted in term of infections/year, relapses/year and cancer development.

**Conclusions:** In this large cohort of Italian patients we confirm a higher short and long-term survival in AAV patient than reported in literature. Nevertheless, up to one third of deaths occurred within 6 months after diagnosis and infection diseases resulted the most frequent cause of death. Moreover, our data confirm the prognostic importance of ANCA pattern and the poor outcome of patient with severe lung and renal involvement.

**FRIDAY, 15 JUNE 2018:** Tapering and flaring in PsA and SpA

**Abstract OP0334 – Figure 1** Time to flare by week 68

**OP0334 EFFICACY AND SAFETY OF CONTINUING VERSUS WITHDRAWING ADALIMUMAB (ADA) IN MAINTAINING REMISSION IN PATIENTS WITH NON-RADIOGRAPHIC AXIAL SPONDYLOARTHRITIS (NR-AXSPA)**

R. Landewé<sup>1</sup>, J. Sieper<sup>2</sup>, P. Mease<sup>3</sup>, R. Inman<sup>4</sup>, X. Wang<sup>5</sup>, M. Li<sup>5</sup>, A. Pangan<sup>5</sup>, J. Anderson<sup>5</sup>. <sup>1</sup>University of Amsterdam, Amsterdam, Netherlands; <sup>2</sup>Charité Universitätsmedizin Berlin, Berlin, Germany; <sup>3</sup>Swedish Medical Center and University of Washington, Seattle, USA; <sup>4</sup>University of Toronto, Toronto, Canada; <sup>5</sup>AbbVie Inc., North Chicago, USA

**Background:** It is not known whether TNF blockers can be stopped in nr-axSpA patients (pts) who are in remission.

**Objectives:** ABILITY-3, reported here, assessed if ADA can be discontinued or should be continued in nr-axSpA pts in sustained remission after a 28-wk open-label period.

**Methods:** ABILITY-3 enrolled adult pts diagnosed with nr-axSpA, fulfilling ASAS criteria but NOT modified New York criteria who had objective evidence of active MRI inflammation in the SI joints or spine or elevated high-sensitivity CRP at screening, active disease at baseline (ASDAS ≥2.1, BASDAI ≥4, total back pain ≥4), and inadequate response to ≥2 NSAIDs. Pts who achieved ASDAS inactive disease (ASDAS <1.3) with open-label ADA 40 mg every other wk at wk 16, 20, 24, and 28 were randomised to 40-wk, double-blind PBO (withdrawal) or ADA (continuation) in period 2. Primary efficacy endpoint was proportion of pts who did not experience a flare (ASDAS ≥2.1 at 2 consecutive study visits) during period 2. Secondary endpoints were also assessed up to wk 68 (nonresponder imputation).

**Results:** Of 673 enrolled pts, 305 (45%) were randomised to double-blind treatment. A significantly greater proportion of pts treated with ADA vs PBO had no flares (70% vs 47%; p<0.001) at wk 68; relative risk of flare with treatment withdrawal was 1.77. Time to flare analysis showed significantly lower risk of flare for ADA vs PBO (figure 1). At wk 68, significantly greater proportions of ADA vs PBO pts achieved secondary endpoints, except for HAQ-S (table 1). Among pts who received ADA at any time, 77% reported adverse events (AEs) and 4% reported a serious AE; nasopharyngitis (17%), upper respiratory tract infection (12%), worsening of axSpA (9%), headache (8%), and diarrhoea (6%) were the most common. During period 2, incidence of AEs was similar for ADA and PBO (65% vs 69%), incidence of serious AEs was higher for PBO vs ADA (7% vs 1%), and the most common AEs in both the ADA and PBO groups were nasopharyngitis (16% vs 13%), upper respiratory tract infection (13% vs 8%), and worsening of axSpA (6% vs 14%; none serious).

**Abstract OP0334 – Table 1** Efficacy outcomes at week 68

Wk 68, n (%)	ADA (40 mg EOW) n=152	PBO n=153	P Value
No flare	106 (70)	72 (47)	<0.001
ASDAS ID	87 (57)	51 (33)	<0.001
ASDAS MI	89 (59)	49 (32)	<0.001
ASDAS CII	102 (67)	69 (45)	<0.001
ASAS20	107 (70)	72 (47)	<0.001
ASAS40	100 (66)	70 (46)	<0.001
ASAS 5/6	87 (57)	49 (32)	<0.001
ASAS PR	64 (42)	41 (27)	0.005
BASDAI50	103 (68)	72 (47)	<0.001
Change from baseline in BASFI, LSmean±SE	-3.97±0.11 n=111	-3.51±0.13 n=77	0.007
Change from baseline in HAQ-S, LSmean ±SE	-0.68±0.04 n=112	-0.58±0.04 n=79	0.088

**Conclusions:** In pts with nr-axSpA who achieved sustained remission with ADA, continued therapy was associated with significantly more pts maintaining remission and lower disease activity than treatment withdrawal. These results support the continuation of ADA therapy after achievement of sustained remission. Safety findings were consistent with established safety profile of ADA.

**OP0335 HIGH NEED FOR ANTI-TNF THERAPY AFTER WITHDRAWAL STRATEGY IN EARLY PERIPHERAL SPONDYLOARTHRITIS**

P. Carron<sup>1,2</sup>, G. Varkas<sup>1,2</sup>, T. Renson<sup>1,2</sup>, A.-S. De Craemer<sup>1</sup>, D. Elewaut<sup>1,2</sup>, F. Van den Bosch<sup>1,2</sup>. <sup>1</sup>Rheumatology; <sup>2</sup>VIB Inflammation Research Center, University of Ghent, Ghent, Belgium

**Background:** Treatment with TNFi in early stages of peripheral Spondyloarthritis (pSpA) results in higher rates of clinical remission, compared to treatment in more longstanding disease.<sup>1</sup> When remission is reached, the recently updated T2T-recommendations suggest tapering of treatment. In the CRESPA-trial pSpA patients were treated with golimumab monotherapy; we demonstrated that – after reaching sustained remission – discontinuation of golimumab led to biological-free remission in 53% of patients; conversely 47% experienced a disease flare. It is currently unknown if concomitant administration of DMARDs could lead to higher rates of biological-free remission.

**Objectives:** To explore – in pSpA patients in clinical remission – the possibility that co-medication with methotrexate would allow discontinuation of the TNFi.

**Methods:** The CRESPA-trial included patients with active pSpA and symptom duration <12 weeks; the primary study results have been reported previously (reference). In the CRESPA-Extension protocol, patients were included that either did not reach remission (but had substantial improvement with golimumab treatment), or that experienced recurrence of arthritis, enthesitis or dactylitis within 1 year after discontinuation of golimumab. These patients received additional open-label golimumab 50 mg SC every 4 weeks for 2 years. At week 104, patients were offered an additional 12 weeks of golimumab treatment, but now in combination with methotrexate 15 mg weekly. At week 116, patients in clinical remission continued methotrexate, but discontinued golimumab. Patients were prospectively followed to assess the rate of sustained biological-free clinical remission. In

case of relapse of arthritis, enthesitis or dactylitis under methotrexate monotherapy, golimumab was restarted.

**Results:** Currently, twenty three of the original 60 pSpA patients included in the CRESPA-trial, completed the 2 year CRESPA-Extension protocol; of these, 21 (91%) were in clinical remission at week 104 when methotrexate was added. The mean follow-up period after completion of the extension part, was 80±28 w. 5 patients (24%) are still in sustained remission (n=5) under methotrexate monotherapy whereas in 16 patients (76%), golimumab needed to be re-installed because of relapse of disease activity (n=14) or development of adverse events related to methotrexate (n=2). Recurrence of disease was characterised by development of arthritis in all patients with a median of 4 tender and 3 swollen joints. In 50% (n=7) of the cases, concomitant dactylitis was present. 64% (9/14) were having concomitant psoriasis which was mild since all had a BSA <5%. The mean time for recurrence was 28.6 weeks. Restarting golimumab treatment promptly restored clinical remission in all patients within 12 weeks.

**Conclusions:** In patients with pSpA in clinical remission after 2 years of golimumab monotherapy, concomitant administration of methotrexate before discontinuation of the TNFi, did not significantly raise the percentage of patients in biological-free remission. In 76% of patients, golimumab had to be restarted, underscoring the overall weak efficacy of methotrexate in pSpA.

#### OP0336 THE EFFECT OF TIMING AND DURATION OF STATIN EXPOSURE ON THE RISK OF REVISION FOLLOWING TOTAL HIP OR KNEE ARTHROPLASTY: A POPULATION-BASED COHORT STUDY

M. Cook<sup>1</sup>, A.K. Sorial<sup>2</sup>, M. Lunt<sup>1</sup>, T. Board<sup>3</sup>, T. O'Neill<sup>1</sup>. <sup>1</sup>Arthritis Research UK Centre for Epidemiology, THE UNIVERSITY OF MANCHESTER, Manchester; <sup>2</sup>Institute of Genetic Medicine, Newcastle University, Newcastle; <sup>3</sup>The Centre for Hip Surgery, Wriglington Wigan and Leigh NHS Foundation Trust, Wigan, UK

**Background:** Total hip/knee replacement (THR/TKR) are safe and effective interventions for the treatment of osteoarthritis. However, around 2.5% of patients who undergo a THR/TKR in the UK require revision surgery within 5 years. Experimental studies have suggested that statins may have a beneficial effect on bone by promoting osteoblast formation and reducing osteoclastic bone resorption. Statins have been linked to improved strength of the bone-implant interface and may also attenuate the inflammatory response to particulate wear debris and subsequent periprosthetic osteolysis. Observational data suggest that postoperative exposure to statins may reduce the risk of revision arthroplasty. However, the influence of timing of statin exposure on revision risk has not previously been investigated. This may be significant since statins may affect biological processes occurring at different postoperative periods.

**Objectives:** To determine whether the timing of statin exposure relative to the primary arthroplasty influences the risk of revision arthroplasty. Also to determine whether the duration of exposure is associated with the risk of revision arthroplasty.

**Methods:** Subjects from the Clinical Practice Research Datalink, a population-based clinical database, who had THA/TKA from 1988–2016 were included. Cox regression models were used to determine the association between statin exposure and the risk of revision THA/TKA, i) at any time and ii) if first exposed 0–1, 1–5, or >5 years following THA/TKA. Cox regression was also used to determine the association between total duration of statin exposure (<1, 1–2, 2–3, 3–4, 4–5, >5 years) and revision risk. The Cox regression models were adjusted for the propensity score for statin exposure in each period, which was calculated using a logistic regression model including demographic factors, selected comorbidities and selected medication. Missing data for covariates were imputed using multiple imputation by chained equations with 10 iterations.

**Results:** 1 51 305 participants were included. 57 003 (37.7%) were exposed to statins during follow up and 3500 (2.3%) had revision arthroplasty. In a propensity score adjusted model, exposure to statins was associated with a reduced risk of revision arthroplasty (HR (95% CI) 0.82 (0.75, 0.90)). Participants first exposed within 1 year and between 1 and 5 years following THA/TKA (vs unexposed) had a reduced risk of revision arthroplasty (HR (95% CI) 0.82 (0.74, 0.91) and 0.76 (0.65, 0.90), respectively), while first exposure >5 years following THA/TKA was not associated with revision risk. In relation to duration of statin therapy, participants exposed for more than 5 years in total (vs <1 year) had a reduced risk of revision (HR (95% CI) 0.74 (0.62, 0.88)).

**Conclusions:** Statin therapy initiated up to 5 years following THA/TKA may reduce the risk of revision arthroplasty. The mechanisms by which statin therapy is linked with a reduced risk of revision surgery are not completely understood, though does not appear to be related solely to an effect on osseointegration of the primary prosthesis, which occurs primarily in the early (<1 year) postoperative period.

#### OP0337 ASSOCIATION BETWEEN METABOLIC SYNDROME AND TRAJECTORIES OF KNEE PAIN: A 10.7-YEAR FOLLOW-UP STUDY

F. Pan<sup>1</sup>, J. Tian<sup>1</sup>, F. Cicuttini<sup>2</sup>, C. Ding<sup>1</sup>, G. Jones<sup>1</sup>. <sup>1</sup>Menzies Institute for Medical Research, University of Tasmania, Hobart; <sup>2</sup>Department of Epidemiology and Preventive Medicine, Monash University Medical School, Melbourne, Australia

**Background:** Metabolic syndrome (MetS) has been suggested as having a role in the pathogenesis of osteoarthritis (OA). However, no study has assessed whether MetS and its components are associated with knee pain and its change over time.

**Objectives:** To identify distinct trajectories of MSP over 10.7 years in an older population, and to examine risk factors for identified trajectories.

**Methods:** 1099 participants (mean age 63 years) from the population-based Tasmanian Older Adult Cohort study were recruited at baseline. 875, 768 and 563 participants attended years 2.6, 5.1 and 10.7 follow-up, respectively. Demographic, psychological, lifestyle and comorbidities data were obtained at baseline. Knee radiographic OA was assessed by X-ray at baseline. Group-based trajectory modelling was applied to identify distinct trajectories of MSP. Multi-nominal logistic regression was used for the analyses with adjustment for potential confounders.

**Results:** 985 participants were included for the analyses, three pain trajectories were identified: 'Mild pain' (52%), 'Moderate pain' (33%) and 'Severe pain' (15%) with 32% of participants having Mets. MetS was significantly associated with increased risk of both 'Moderate pain' (relative risk [RR]: 1.47, 95% confidence interval [CI]: 1.10 to 1.96) and 'Severe pain' (2.22, 1.54 to 3.20) relative to 'Mild pain' in univariate analysis. After adjustment for age, sex, smoking, physical activity, emotional problems, comorbidities and radiographic OA, central obesity was associated with increased risk of both 'Moderate pain' (1.70, 1.17 to 2.49) and 'Severe pain' (3.28, 2.16 to 4.98), and MetS and its components (hypertriglyceridemia and low HDL) were only associated with increased risk of 'Severe pain' (p<0.05). However, these associations became weak and non-significant after further adjustment for body mass index (BMI), but hypertension became significantly protective with 'Moderate pain' (0.70, 0.50 to 0.99). Similar associations were found in those with knee OA (RR: 1.70 to 2.75, all p<0.05).

**Conclusions:** The Mets is predominantly associated with knee pain trajectories through central obesity, and hypertriglyceridemia and low HDL can predict 'Severe pain' trajectory in those with Mets. An unexpected inverse association between hypertension and moderate pain trajectory needs a further investigation, which may reflect an interaction between blood pressure and pain sensitivity in 'Moderate pain' trajectory.

#### Big data for musculoskeletal research

#### OP0338 RELATIONSHIP OF PROVIDER DENSITY ON TOTAL JOINT REPLACEMENT OUTCOMES

B. Mehta<sup>1,2,3</sup>, J. Szymonifka<sup>4</sup>, S.A. Dey<sup>3</sup>, I.Y. Navarro-Millan<sup>2,3</sup>, L.A. Mandl<sup>2,3</sup>, A. R. Bass<sup>2,3</sup>, L.A. Russell<sup>2,3</sup>, M.L. Parks<sup>5,6</sup>, M.P. Figgie<sup>5,6</sup>, J.T. Nguyen<sup>4</sup>, S. M. Goodman<sup>2,3</sup>. <sup>1</sup>Columbia Mailman School of Public Health; <sup>2</sup>Rheumatology, Weill Cornell Medicine; <sup>3</sup>Rheumatology; <sup>4</sup>Biostatistics, HOSPITAL FOR SPECIAL SURGERY; <sup>5</sup>Orthopaedics, Weill Cornell Medicine; <sup>6</sup>Orthopaedics, Hospital for Special Surgery, New York, USA

**Background:** The proportion of providers in a geographical location (provider density) has been associated with improved surgical outcomes in hand and wrist surgery, appendicitis and other high-volume procedures, demonstrating the importance of access to care.

**Objectives:** The purpose of this study is to assess the association of provider density with Total Knee Replacement (TKR) and Total Hip Replacement (THR) outcomes.

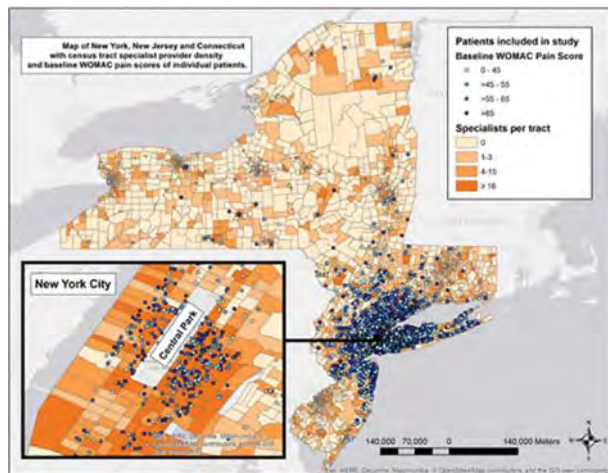

**Methods:** Individual patient-level variables were obtained from a single institution TKR and THR registry between 5/1/07 and 2/1/11. Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC) pain and function scores at baseline and 2 years after elective TKR and THR were collected and retrospectively analysed. We included patients living in New York, Connecticut and New Jersey which is the catchment area for the hospital. Individuals' geocodable addresses were used to obtain the number of primary care physicians (PCPs) and specialists in each census tract using the ArcGIS software. Provider density was calculated and broken down into percentage quartiles. Comparisons were made using Kruskal-Wallis tests.

**Results:** A total of 3606 TKR, and 4295 THR patients were included. (figure 1) Mean number of PCPs was 5.4(SD 9.5) and specialists were 15.8(SD 41.1) per census tract. The median number of PCPs were 2 (IQR 1, 6) and specialists were 3 (IQR 1, 13). Neighbourhood poverty or education correlated poorly with the number of PCPs and specialists. Baseline WOMAC pain and function scores (table 1) are statistically significantly better in neighbourhoods with a higher proportion of specialists, but not PCPs. These differences were no longer present 2 years after surgery.

**Abstract OP0338** – Table 1 Association of specialist proportions in neighbourhoods with WOMAC\* scores

Proportion of Specialists per census tract	Baseline WOMAC* median (IQR)	p-value	2-year WOMAC* median (IQR)	p-value	Baseline WOMAC* median (IQR)	p-value	2-year WOMAC* median (IQR)	p-value

\*WOMAC - Western Ontario and McMaster Universities Osteoarthritis Index

**Abstract OP0338** – Figure 1 Map of New York, New Jersey and Connecticut with census tract specialist provider density and baseline WOMAC pain scores of individual patients.

**Conclusions:** Patients from neighbourhoods with fewer specialists seek arthroplasty with worse baseline pain and function than those from neighbourhoods with more specialists. However, once these patients receive arthroplasty (i.e. specialty care), these differences resolve by 2 years. These data suggest that once a patient can access specialty care in the health care system, their outcomes improve despite worse baseline pain and function.

**OP0339 DEVELOPMENT OF A PREDICTIVE MODEL OF RADIOLOGICAL DAMAGE IN PATIENTS WITH RHEUMATOID ARTHRITIS BASED ON ARTIFICIAL INTELLIGENCE**

J.M. Lezcano<sup>1</sup>, J. Ivorra-Cortes<sup>2</sup>, R. López Mejías<sup>3</sup>, J. Martín<sup>4</sup>, B. Fernandez-Gutiérrez<sup>1</sup>, M.A. González-Gay<sup>5</sup>, A. Balsa<sup>6</sup>, I. González-Alvaro<sup>6</sup>, F. Salazar<sup>7</sup>, L. Abásolo<sup>1</sup>, L. Rodríguez-Rodríguez<sup>1</sup>. <sup>1</sup>Hospital Clínico San Carlos, Madrid; <sup>2</sup>Hospital La Fe, Valencia; <sup>3</sup>Hospital Marqués de Valdecilla, Santander; <sup>4</sup>Instituto López-Neyra, Granada; <sup>5</sup>Hospital de La Paz; <sup>6</sup>Hospital de la Princesa e IIS-IP; <sup>7</sup>CIMNE, Madrid, Spain

**Background:** Rheumatoid arthritis (RA) is a chronic inflammatory disease associated with increased mortality and disability. Although different factors associated with prognosis have been identified, it is still difficult to predict the evolution of a specific patient.

**Objectives:** Our objective is to train and validate a predictive model of disease severity using radiological damage as a surrogate marker, based on Artificial Intelligence techniques, and using clinical and genetic data.

**Methods:** Four independent cohorts were included (892 patients with 1667 hand X-rays). Radiological damage was measured with the Sharp/van-der-Heijde score (SvdH). The variables to be predicted [total value of SvdH, erosion component (ES) and joint narrowing (NS)] were logarithmically transformed. As clinical predictors, age at onset of symptoms, sex, duration of the disease at the time of each radiograph, year of onset of symptoms and presence of rheumatoid factor were used. As genetic variables, the single nucleotide polymorphism data obtained from the Immunochip genotyping platform (Illumina) were used. In addition, an interaction between each polymorphism and the duration of the disease was introduced. Three cohorts were used for the selection of variables, generation of predictive models and internal validation. The fourth cohort was used to perform the external validation of the models. Regression trees with random effects were generated using the R package 'REEMtree'. The goodness of fit of the models was measured using the root mean squared error (RMSE) and the intraclass correlation coefficient (ICC).

**Results:** In the cohorts where the predictive models were developed, the RMSEs for total SvdH, ES and NS were 3.16, 1.02 and 2.29 units of the Sharp/van-der-Heijde score, respectively. The ICCs were 0.96, 0.87 and 0.95, respectively. In the external validation cohort, the RMSEs were 7.13, 3.53 and 4.81 units of the Sharp/van-der-Heijde score, respectively. The ICCs were 0.90, 0.78 and 0.88.

For the total SvdH, the best fit model contained the variables 'age of onset of the symptoms of RA' and the interaction between duration of the disease and 3 polymorphisms: rs10752907, rs4405161 and rs2501617. For the ES, it contained the variables 'age of onset of AR symptoms', the polymorphism rs7769752 and the interaction between disease duration and 6 polymorphisms: rs12410412, rs117029499, rs72925969, rs869186, rs11258464, rs4781952. For the NS, it contained the variables 'age of onset of AR symptoms', 'gender', and the interaction between disease duration and 9 polymorphisms: rs3814055, rs1020822, rs13157991, rs152294, rs2914190, rs10824537, rs2637229, rs114136906 and rs4958241.

**Conclusions:** It is possible to generate predictive models of radiological damage of great precision using Artificial Intelligence techniques. This could allow early stratification of patients according to prognosis.

It is necessary to validate these models in other populations.

FRIDAY, 15 JUNE 2018

**From big data to personalised medicine in paediatric rheumatic diseases**

**OP0340 EVIDENCE BASED RECOMMENDATIONS FOR CORTICOSTEROID TAPERING/DISCONTINUATION IN NEW ONSET JUVENILE DERMATOMYOSITIS PATIENTS FROM THE PRINTO TRIAL**

G. Giancane, C. Lavarello, A. Pistorio, F. Zulian, B. Magnusson, T. Avcin, F. Corona, V. Gerloni, S. Pastore, R. Marini, S. Martino, A. Pagnier, M. Rodiere, C. Soler, V. Stanevicha, R. Ten Cate, Y. Uziel, J. Vojinovic, E. Fueri, A. Ravelli, A. Martini, N. Ruperto, on behalf of PRINTO. *Clinica Pediatrica e Reumatologia – PRINTO, Istituto Giannina Gaslini, GENOVA, Italy*

**Background:** At present no clear evidence based guidelines exist to standardise the tapering and discontinuation of corticosteroids (CS) in juvenile dermatomyositis (JDM).

**Objectives:** To provide evidence-based recommendations for CS tapering/discontinuation through the analysis of the patients in the PRINTO new onset JDM trial. Secondary objective of the study was to identify predictors of clinical remission and CS discontinuation.

**Methods:** New onset JDM children were randomised to receive either prednisone (PDN) alone or in combination with MTX or CSA. All children were given initially intravenous methylprednisolone, and then PDN starting with 2 mg/kg/day. Gradual tapering according to a specific protocol could lead to the safe dose of 0.2 mg/kg/day by month 6, then discontinued at month 24. Major therapeutic changes (MTC) were defined as the addition or major increase in the dose of MTX/CSA/ other drugs or any other reasons for which patients were dropped from the trial. Patients were divided according to clinical remission (CR) (CMAS=52 and MD global=0 for 6 continuous months) into two major groups. Group 1 included those on CR, who could discontinue PDN, with no MTC (reference group). Group 1 was compared with those who did not achieve CR, without or with MTC (group 2 and 3, respectively). JDM core set measures (CSM) were compared within the 3 groups. We also calculated the gold standard group 1 median change in the CSM in the first 6 and over 24 months and applied a logistic regression model to identify predictors of CR with PDN discontinuation.

**Results:** 139 children were enrolled in the trial: 47 on PDN, 46 on PDN +CSA and 46 on PDN +MTX. We identified 30 (21.6%) patients for group 1, 43 (30.9%) for group 2 and 66 (47.5%) for group 3. At baseline all 3 groups had no differences in the CSM. Already in the first 2 months a clear differential trend in disease activity measures, according to clinical remission status and PDN discontinuation, could be identified. From the observation of the median change in the CSM of group 1 in the first 6 months, the following recommendations could be extrapolated: decrease corticosteroids from 2 to 1 mg/kg/day in 2 months if the MD-global, parent-global, CHAQ, DAS, CMAS, MMT or Phs measures have changed of at least 50%; from 1 to 0.5 mg/kg/day in the following 2 months if the MD-global, CHAQ, DAS, CMAS show a change of at least 20%; in the following 2 months (month 4–6) corticosteroids can be tapered up to the safe dose of 0.2 mg/kg/day, if the disease activity measures remain at low/normal values. We finally ran a logistic regression model that showed that the achievement of PRINTO criteria 50–70–90 at 2 months from disease onset, an age at onset >9 years and the combination therapy PDN +MTX, increase the probability of clinical remission from 4 to 7 times (table 1).

**Abstract OP0340** – Table 1 Logistic regression model for the outcome: achievement of remission (n/tot: 28/130; 21.5%)

	OR (95% CI)	P <sup>a</sup>
<b>Responder at 2 months:</b>		0.0076
Printo-50 (vs. not responder/Printo-20)	5.41 (1.37 - 21.32)	
Printo-70 (vs. not responder/Printo-20)	6.90 (1.91 - 24.99)	
Printo-90 (vs. not responder/Printo-20)	4.46 (1.08 - 18.38)	
Age at onset > 8.53 years (≤ 8.53 years)	4.64 (1.69 - 12.71)	0.0017

## Triple T: T cells, technologies and therapies

### OP0341 INCREASED FREQUENCY OF CIRCULATING CD4 +CXCR5-PD1HI PERIPHERAL HELPER T (CTPH) CELLS IN PATIENTS WITH SEROPOSITIVE EARLY RHEUMATOID ARTHRITIS (RA)

P. Fortea-Gordo<sup>1</sup>, L. Nuño<sup>1</sup>, A. Villalba<sup>1</sup>, D. Peiteado<sup>1</sup>, I. Monjo<sup>1</sup>, P. Sanchez-Mateos<sup>2</sup>, A. Puig-Kröger<sup>2</sup>, E. de Miguel<sup>1</sup>, A. Balsa<sup>1</sup>, M.E. Miranda Carus<sup>1</sup>.  
<sup>1</sup>Rheumatology, Hospital La Paz – IdiPAZ; <sup>2</sup>Immuno-oncology, Hospital Gregorio Marañón, Madrid, Spain

**Background:** A novel population of CD4 +T cells with B cell helping capacity has been described in the synovial tissues and peripheral blood of seropositive RA

patients with an established disease, and termed 'peripheral helper' (Tph) cells. (Rao DA et al, Nature 2017) Tph cells are characterised by the lack of CXCR5 together with a bright expression of PD-1 (CD4 +CXCR5-PD-1<sup>hi</sup> T cells). As opposed to CD4 +CXCR5+PD-1<sup>hi</sup> follicular helper T cells (Tfh), Tph cells are not located in lymphoid organs but accumulate in inflamed tissues. Tph cell numbers have not been previously examined in early RA (eRA).

**Objectives:** To study the frequency of circulating CD3 +CD4+CXCR5-PD-1<sup>hi</sup> Tph cells (cTph), in patients with eRA.

**Methods:** Peripheral blood was drawn from DMARD-naïve early RA patients (eRA) (2010 ACR criteria) with a disease duration <24 weeks (n=42), and healthy controls (HC) matched for age and gender (n=42). For comparison, blood was also drawn from 66 patients with established RA (disease duration >2 years), 45 patients with Spondyloarthritis (SpA), and their age and gender-matched HC (one HC per patient). In addition, synovial fluid from 7 patients with established RA and 3 patients with SpA was examined. Established RA patients were receiving low-dose oral methotrexate and were naïve for biological agents. SpA patients were receiving NSAIDs, low-dose oral methotrexate and/or sulphasalazine and were naïve for biologicals. After isolation by Ficoll-Hypaque gradient, PBMCs were stained with antibodies to CD3, CD4, CXCR5, ICOS and PD-1, and examined by flow cytometry.

**Results:** The frequency of circulating CXCR5- cells gated for CD4 +T cells was not different among the studied groups. In contrast, eRA patients demonstrated an increased frequency of circulating CD4 +CXCR5-PD-1<sup>hi</sup> Tph and CD4 +CXCR5-PD-1<sup>hi</sup>ICOS+ T cells. When examining seropositive (RF and/or ACPA+, n=25) and seronegative eRA patients (RF- and ACPA-, n=17) separately, it was evident that the above described alterations were only apparent in seropositive eRA. Likewise, increased cTph numbers were observed in seropositive (n=47) but not seronegative (n=19) established RA, and not in SpA patients (n=45), which is consistent with data reported by Rao et al. Interestingly, this increased cTph cell frequency was observed only in seropositive RA patients with an active disease (DAS28 >2.6, n=24), whereas the numbers of cTph cells in established RA patients who had achieved remission (DAS28 <2.6, n=23) were not different from HC. Furthermore, Tph cells were present in the synovial fluid of seropositive RA (n=4) but not of seronegative RA (n=3) or SpA (n=3).

**Conclusions:** Tph cells may play an important role in the pathogenesis of seropositive but not seronegative RA. An increased cTph cell frequency is a marker of active, seropositive RA.

### OP0342 ALTERED FREQUENCY AND FUNCTION OF MAIT CELLS IN SYSTEMIC SCLEROSIS REVEALED BY HIGH DIMENSIONAL MASS CYTOMETRY AND TRANSCRIPTOME ANALYSIS

B. Paleja<sup>1</sup>, A. Low<sup>2</sup>, P. Kumar<sup>1</sup>, S. Saidin<sup>1</sup>, A. Lajam<sup>1</sup>, L. D/O Thanna Bathi<sup>1</sup>, L. Lai<sup>1</sup>, C. Chua<sup>1</sup>, S. Albani<sup>1</sup>. <sup>1</sup>Translational Immunology Institute; <sup>2</sup>Department of Rheumatology and Immunology, Singapore General Hospital, Singapore, Singapore

**Background:** Systemic sclerosis (SSc) is an autoimmune disease characterised by excessive fibrosis of skin and internal organs, and vascular dysfunction<sup>1</sup>. Association of T and B cell subsets have been reported in SSc, however there is lack of systematic studies of functional relations between immune cell subsets in this disease<sup>2,3,4</sup>. This lack of mechanistic knowledge hampers targeted intervention.

**Objectives:** In the current study we ought to determine differential immune cell composition and heterogeneity in peripheral blood of SSc patients and its impact on disease severity and progression.

**Methods:** Mononuclear cells from blood of SSc patients with interstitial lung disease (ILD, n=10) or No ILD (n=10) and healthy controls (n=10) were analysed by mass cytometry using a 36 marker (cell-surface and intracellular) panel to aid in identification of major PBMC lineages including T cells, B cells, monocytes and NK cells and their subsets. Transcriptome analysis (m-RNA sequencing) was performed on sorted T and B cell subsets. Unsupervised clustering of mass cytometry data was performed using in-house developed analysis software MARVIS. This software combines dimension reduction and clustering steps to identify all possible cellular subsets. Further, custom R scripts helped in identifying nodes that were differentially expressed between the study groups and also phenotype of these nodes.

**Results:** Unsupervised clustering performed revealed significant differences in the frequencies of T cell and B cell subsets. Most strikingly we identify a 3 fold decrease in frequencies of Va7.2+CD161+mucosal associated invariant T cells (MAIT) in SSc patients and 2 fold increase in total B cells, particularly

CD19 +CD27 naive cells. A subset of memory CD8 +T cell, expressing CXCR3 was found to be increased in SSc patients as compared to healthy controls. Transcriptome analysis of sorted B cell and T cell subsets showed decrease in genes related to survival and increased expression of apoptotic genes in CD4,CD8 T and MAIT cells from SSc patients. Genes related to exhaustion and leukocyte migration were highly expressed in T cells from patients.

**Conclusions:** This study provides an in depth analysis of systemic immune composition in SSc with the potential to delineate mechanisms of pathogenesis and identify diagnostic and/or therapeutic targets. This is the first demonstration of dysfunction of MAIT cells in SSc and further characterisation of their function in this context is required.

## Navigating the world of digital health

### OP0343-HPR AN ECONOMIC EVALUATION OF A TAILORED GUIDED INTERNET-BASED COGNITIVE BEHAVIOURAL INTERVENTION FOR PATIENTS WITH RHEUMATOID ARTHRITIS AS AN ADDITION TO USUAL CARE

M. Ferwerda<sup>1,2</sup>, S. van Beugen<sup>2</sup>, H. van Middendorp<sup>2</sup>, H. Visser<sup>3</sup>, H. Vonkeman<sup>4</sup>, M. Creemers<sup>5</sup>, P. van Riel<sup>6</sup>, W. Kievit<sup>7</sup>, A. Evers<sup>2</sup>. <sup>1</sup>Medical Psychology, Radboud University Medical Centre, Nijmegen; <sup>2</sup>Health, medical and neuropsychology, University of Leiden, Leiden; <sup>3</sup>Rheumatology, Rijnstate hospital, Arnhem; <sup>4</sup>Arthritis Centre Twente, Medisch Spectrum Twente and University of Twente, Enschede; <sup>5</sup>Rheumatology, Jeroen Bosch Hospital, Den Bosch; <sup>6</sup>Scientific institute for Quality of Healthcare; <sup>7</sup>Radboud Institute for Health Sciences, Radboud University Medical Centre, Nijmegen, Netherlands

**Background:** Within the field of rheumatoid arthritis (RA), patients report decreased health-related quality of life (HRQoL) as a result of living with physical factors such as pain and psychological factors such as negative mood. As these factors are associated with the disease trajectory, health care utilisation, and workplace disability of patients, these factors lead to significant societal health expenses. In a recent randomised controlled trial, improvements in especially psychological functioning (e.g., depressed mood) were found by offering tailored, therapist guided cognitive behavioural therapy online.<sup>1</sup> Although internet-based cognitive behavioural therapy holds promise for implementation and cost-reductions, scarce research is available on the cost-effectiveness of these treatments.

**Objectives:** A cost-effectiveness study from a societal perspective was conducted alongside a randomised controlled trial on a tailored and therapist-guided internet-based cognitive behavioural intervention (ICBT) for patients with elevated levels of distress, as an addition to usual care alone in order to inform stakeholders on implementation of this treatment.

**Methods:** Data were collected at baseline/pre-intervention, 6 months/post-intervention, and three-monthly thereafter during one year follow-up. Effects were measured in quality-adjusted life years (QALYs) and costs from a societal perspective including healthcare sector costs (including healthcare use, medication, and intervention costs), patient travel costs for healthcare use, and costs associated with loss of labour.

**Results:** The intervention improved quality of life compared to usual care alone ( $\Delta$  QALYs=0.059), but also led to higher costs ( $\Delta$ =€ 4.211,44), which reduced substantially when medication costs were left out of the equation ( $\Delta$ =€ 1.862,72). Most (93%) of the simulated ICERS were in the north-east quadrant, suggesting a high probability that the intervention is effective in improving HRQoL, but at a greater monetary cost for society compared to usual care alone.

**Conclusions:** A positive effect on quality-adjusted life years is seen in the intervention group compared to the control group. However, cost-ratios show that this comes at a greater cost to society. The substantial costs in this population are generated by medication costs, for which no group differences could be found. The cost-benefit ratio improves when the costs for medication are not taken into account.

Based on the effects for improvement of quality of life, implementation of the intervention is recommended, yet on the side of costs, further study is warranted.

FRIDAY, 15 JUNE 2018

## The rheumatologist-orthopaedic surgeon connexion in secondary fracture prevention

### OP0344 FRAME STUDY: THE FOUNDATION EFFECT OF REBUILDING BONE WITH ONE YEAR OF ROMOSUZUMAB LEADS TO CONTINUED LOWER FRACTURE RISK AFTER TRANSITION TO DENOSUMAB

F. Cosman<sup>1</sup>, D.B. Crittenden<sup>2</sup>, S. Ferrari<sup>3</sup>, A. Khan<sup>4</sup>, N.E. Lane<sup>5</sup>, K. Lippuner<sup>6</sup>, T. Matsumoto<sup>7</sup>, C.E. Milmont<sup>8</sup>, C. Libanati<sup>9</sup>, A. Grauer<sup>2</sup>. <sup>1</sup>Helen Hayes Hospital; Columbia University, West Haverstraw; New York; <sup>2</sup>Amgen Inc., Thousand Oaks, CA, USA; <sup>3</sup>Geneva University Hospital, Geneva, Switzerland; <sup>4</sup>McMaster University, Hamilton, Ontario, Canada; <sup>5</sup>UC Davis Medical Center, Sacramento, CA, USA; <sup>6</sup>Osteoporosis Polyclinic, Inselspital, Bern University Hospital and University of Bern, Bern, Switzerland; <sup>7</sup>University of Tokushima, Tokushima, Japan; <sup>8</sup>UCB Pharma, Brussels, Belgium

**Objectives:** Romosozumab (Romo), a sclerostin antibody, has a dual effect of increasing bone formation and decreasing bone resorption. In the FRAME study (NCT01575834), one year of Romo treatment resulted in large bone mineral density (BMD) increases at the lumbar spine (LS) and total hip (TH) versus placebo (Pbo).<sup>1</sup> The differences between groups remained after all subjects transitioned to denosumab (DMAb) during the second year of study. Here, we further characterise the BMD gains seen during the FRAME study and examine the effect of building bone with Romo on fracture-risk reduction after transition to DMAb.

**Methods:** Subjects in FRAME were randomised to receive monthly Romo 210 mg or Pbo for 12 months, after which all subjects received 6-monthly DMAb 60 mg for an additional 12 months. Endpoints for the current analysis were mean change from baseline in BMD T-score, percentage of subjects with a BMD gain, and fracture incidence in the second year of the FRAME study, including new vertebral, clinical (nonvertebral and symptomatic vertebral), and other fracture categories.

N = Number of subjects with values at baseline and at least one post-baseline visit at or before month 12. Data are percent change in BMD from baseline to month 12 by individual subject at the lumbar spine. N = included subjects with baseline and  $\geq 1$  post-baseline measurement; missing data were imputed by last observation carried forward. X-axis represents each individual subject. Dotted horizontal lines reflect 3%, 5%, and 10% BMD gain from baseline to month 12. Lines with arrowheads below the X-axis represent the percent of subjects with the indicated BMD gains (> 0%,  $\geq$  3%,  $\geq$  5%, and  $\geq$  10%). BMD, bone mineral density.

**Abstract OP0344** – Figure 1 Percent change in lumbar spine BMD from baseline to month 12 by individual subject

**Results:** 7180 subjects were included in the study (Romo, n=3589; Pbo, n=3591). At month 12, the mean change from baseline in LS BMD T-score was 0.88 for Romo and 0.03 for Pbo. At month 24 (after both treatment groups received DMAb in the second year) mean increases in LS BMD T-score were 1.11 for Romo/DMAb and 0.38 for Pbo/DMAb. At month 12, the mean changes in TH BMD T-score were 0.32 for Romo and 0.01 for Pbo. At month 24, mean changes in TH BMD T-score were 0.45 for Romo/DMAb and 0.17 for Pbo/DMAb. In the Romo group, 99% of subjects showed an increase in LS BMD at month 12, with 89% achieving  $\geq 6\%$  gains (figure 1). Administration of Romo during the first year led to reductions versus Pbo in the relative risk of fractures during the second year, despite both groups receiving DMAb in the second year (reductions of 81% for vertebral fractures [ $p < 0.001$ ]; 32% for clinical fractures [ $p = 0.052$ ]; 39% for major osteoporotic fractures [ $p = 0.034$ ]).

**Conclusions:** Romo versus Pbo resulted in substantially higher BMD T-score increases after one year. After transition to DMAb, BMD gains in both treatment groups were similar in the second year. One year of Romo treatment, followed by transition to DMAb, resulted in unprecedented gains in BMD and substantially reduced fracture rates during the second year even though subjects in both groups received DMAb. These data support the clinical benefit of rebuilding the skeletal foundation with Romo treatment before transition to DMAb.

OP0345

#### DENOSUMAB COMPARED WITH RISEDRONATE IN GLUCOCORTICOID-TREATED SUBJECTS: RESULTS FROM THE FINAL 24-MONTH ANALYSIS OF A RANDOMISED, DOUBLE-BLIND, DOUBLE-DUMMY STUDY

K.G. Saag<sup>1</sup>, N. Pannacciulli<sup>2</sup>, P. Geusens<sup>3</sup>, J.D. Adachi<sup>4</sup>, O.D. Messina<sup>5</sup>, J. Morales-Torres<sup>6</sup>, R. Emkey<sup>7</sup>, P.W. Butler<sup>8</sup>, X. Yin<sup>2</sup>, W.F. Lems<sup>8</sup>. <sup>1</sup>Department of Medicine, University of Alabama, Birmingham, Birmingham AL; <sup>2</sup>Research and Development, Amgen Inc., Thousand Oaks CA, USA; <sup>3</sup>Department of Internal Medicine, Maastricht University, Maastricht, Netherlands; <sup>4</sup>Department of Medicine, McMaster University, Hamilton ON, Canada; <sup>5</sup>Department of Rheumatology, Cosme Argerich Hospital, Buenos Aires, Argentina; <sup>6</sup>Hospital Aranda de la Parra, Leon, Mexico; <sup>7</sup>Clinical Research, Emkey Arthritis and Osteoporosis Clinic, Wyomissing PA, USA; <sup>8</sup>Department of Rheumatology, VU University Medical Center, Amsterdam, Netherlands

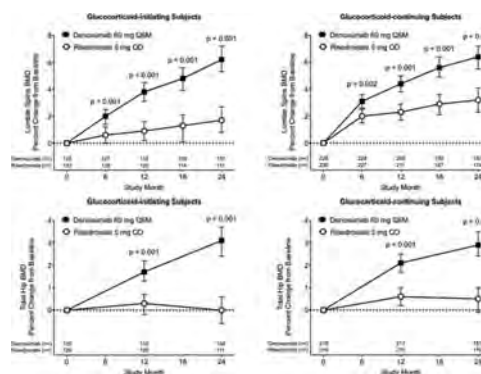

**Background:** Denosumab 60 mg subcutaneously Q6M increased spine and hip BMD significantly more than risedronate 5 mg orally QD at 12 months in glucocorticoid-treated subjects (as previously reported<sup>1</sup>).

**Objectives:** This analysis compared the BMD effects of denosumab vs risedronate and further characterised denosumab safety in this population at 24 months.

**Methods:** This phase 3, randomised, double-blind, double-dummy study enrolled adults  $\geq 18$  years receiving  $\geq 7.5$  mg daily prednisone (or equivalent) for  $< 3$  months (glucocorticoid-initiating subpopulation) or  $\geq 3$  months (glucocorticoid-continuing subpopulation). All subjects  $< 50$  years had history of osteoporotic fracture. Glucocorticoid-continuing subjects  $\geq 50$  years had lumbar spine (LS), total hip (TH), or femoral neck BMD T-scores  $\leq -2.0$ , or  $\leq -1.0$  and history of fracture. Subjects were randomised 1:1 to denosumab 60 mg subcutaneously Q6M or risedronate 5 mg orally QD for 24 months. This analysis assessed denosumab superiority over risedronate for percentage change from baseline in LS and TH BMD at 24 months.

**Results:** Of 795 randomised subjects, 590 (74.2%) completed the 24 month study (glucocorticoid-initiating: 109/145 denosumab, 117/145 risedronate; glucocorticoid-continuing: 186/253 denosumab, 178/252 risedronate). Denosumab

was superior to risedronate for increases from baseline in LS and TH BMD at all timepoints assessed through 24 months in each subpopulation (figure 1). Adverse events, serious adverse events (including infection), and fractures were similar between groups.

**Abstract OP0345** – Figure 1 Bone mineral density percentage change (95% CI) from baseline through month 24

**Conclusions:** In conclusion, denosumab was superior to risedronate for increases in spine and hip BMD through 24 months. The overall safety profile was similar between groups. Denosumab may offer a valuable osteoporosis treatment option for patients receiving glucocorticoids.

#### What's new: latest advances in treatment in JIA and osteoarthritis

#### OP0346-PARE A PARTNERSHIP IN IMPLEMENTATION: ADAPTING AN OSTEOARTHRITIS GUIDEBOOK ACROSS EUROPEAN CULTURES – WITH PATIENTS, FOR PATIENTS

L. Campbell<sup>1</sup>, JIGSAW-E Patient Champions<sup>1,2,3,4,5,6,7,8</sup>, S. Blackburn<sup>1</sup>, J. Meesters<sup>8</sup>, M. De Wit<sup>2</sup>, D. Schiphof<sup>8</sup>, T. Vliet Vlieland<sup>8</sup>, S. Bierma-Zeinstra<sup>7</sup>, N. Østerås<sup>9</sup>, S. Pais<sup>3</sup>, E. Roos<sup>4</sup>, N. Evans<sup>1</sup>, K. Dziedzic<sup>1</sup>. <sup>1</sup>Research Institute for Primary Care and Health Sciences, Keele University, Keele, UK; <sup>2</sup>VU University Medical Center, Amsterdam, Netherlands; <sup>3</sup>Centre for Biomedical Research, University of Algarve, Algarve, Portugal; <sup>4</sup>University of Southern Denmark, Odense, Denmark; <sup>5</sup>University of Algarve, Algarve, Portugal; <sup>6</sup>Diakonhjemmet Hospital, Oslo, Norway; <sup>7</sup>Erasmus MC-University Medical Centre, Rotterdam; <sup>8</sup>Leiden University Medical Center (LUMC), Leiden, Netherlands

**Background:** A guidebook for patients with osteoarthritis (OA) was co-developed with UK patients during an OA research study.<sup>1–3</sup> The JIGSAW-E project is now disseminating and implementing the OA management guidelines and Guidebook in clinical practice in UK, Netherlands, Norway, Denmark and Portugal.<sup>4</sup>

**Objectives:** To study the translation and cultural adaptations of the OA Guidebook appropriate for local context and use by patient champions and health professionals together.

**Methods:** A project launch meeting led to the creation of an international panel of Patient Champions and the adaptation of the OA Guidebook as a priority project. 15 Patient Champions with OA were collaborative partners of the project's local Communities of Practices (CoP) (UK:2, Norway:2, Netherlands:5, Denmark:5, Portugal:1) (figure 1). CoPs also engaged with OA patient organisations. Cultural adaptation of the OA Guidebook by CoPs: 1) review of UK OA Guidebook and existing written patient information; 2) translation; 3) cultural adaptation: review of content, images and layout; 4) consistency check with national guidelines; 5) production; 6) review and approval; 7) shared learning across countries via Skype. Each CoP adopted a process appropriate to their specific context

**Results:**

**Abstract OP0346-PARE** – Table 1 Development of culturally adapted versions of the OA Guidebook in each country.

Country	Developments to date
Netherlands	The Dutch team produced a full version of the OA Guidebook, revised the translated text and recommended new images to better reflect Dutch patients. Now available in hard copy and on a OA patient website: <a href="http://www.poly-artrose.nl/">www.poly-artrose.nl/</a>
Norway	The Norwegian CoP supplemented an existing OA handbook ('ActiveA') with a 'Feeling Positive' chapter from the UK version. The Patient Champions commented on the new chapter which will be made available on the JIGSAW-E website.
Denmark	The Danish team produced a concise version of the OA Guidebook, containing vital written information for patients at first consultation. The Patient Champion helped to adapt translations for the short version.
Portugal	The Portuguese team are working with the local health administration and patient organisations to culturally adapt a full Portuguese translation of OA Guidebook

**Abstract OP0346-PARE** – Figure 1 The JIGSAW-E international panel of patient champions

**Conclusions:** It is feasible and effective to involve patient champions in the cultural adaptation and dissemination of consistent and accurate patient information to support the implementation of OA guidelines in clinical practice.

OP0347

#### SHARE DECISION MAKING AID FOR JUVENILE IDIOPATHIC ARTHRITIS: MOVING FROM INFORMATIVE PATIENT EDUCATION TO INTERACTIVE CRITICAL THINKING

Y. El Miedany<sup>1,2</sup>, H. Lotfy<sup>3</sup>, N. El Aroussy<sup>1</sup>, D. Mekawy<sup>1</sup>, S.I. Nasef<sup>4</sup>, W. Hassan<sup>5</sup>, Y. Farag<sup>3</sup>, S. Almedany<sup>6</sup>, G. El Deriny<sup>7</sup>, M. Eissa<sup>8</sup>, M. El Gaafary<sup>9</sup>, on behalf of PRINTO Egypt. <sup>1</sup>Rheumatology and Rehabilitation, School of Medicine Ain Shams University, Cairo, Egypt; <sup>2</sup>Rheumatology, Darent Valley Hospital, Dartford, UK; <sup>3</sup>Pediatrics, School of Medicine Cairo University, Cairo; <sup>4</sup>Rheumatology and Rehabilitation, School of Medicine Suez Canal University, Ismailia; <sup>5</sup>Rheumatology and Rehabilitation, School of Medicine Banha University, Banha; <sup>6</sup>Rheumatology and Rehabilitation, School of Medicine Tanta University, Tanta; <sup>7</sup>Pediatrics, School of Medicine Alexandria University, Alexandria; <sup>8</sup>Rheumatology and Rehabilitation, School of Medicine Cairo University; <sup>9</sup>Community and Public Health, School of Medicine Ain Shams University, Cairo, Egypt

**Background:** Shared decision making (SDM) is an emerging trend in paediatrics. Currently available SDM interventions are mere information on the disease or medication and often fail to engage the children in the medical decision process. It has been suggested that future decision aids should consider developing separate more appropriate tools in order to better engage the children.

**Objectives:** To develop, and evaluate an illustrated and interactive evidence-based SDM aid for children living with inflammatory arthritis, able to inform them about the pros and cons of their disease as well as the available treatment options, and help them to make an informed shared decision.

**Methods:** A multidisciplinary team defined criteria for the SDM as to design, medical content and functionality, for children. Development was according to the international standard (IPDAS). Eight categories emerged as highly important for shared decision making: 1. What is arthritis? 2. Why do we treat arthritis? 3. What are my targets? 4. What are the available treatment options? 5. Progressometer/ my chances of improvement? 6. How soon will the medications kick in and how to take them? 7. Potential side effects? 8. For how long shall I take the medication. Each category is supported by simple illustrations showing the state of the joint in the different scenarios whether the child take treatment or not, whereas at the end of each category the child is asked to make a decision in view of the information given. 94 children with juvenile idiopathic arthritis, evaluated the tool, in a randomised controlled study, in comparison to control group composed of 95 patients treated according to standard protocols.

**Results:** The shared decision making aid was developed to offer information about the disease, the risks and benefits of treatment. 97.5% of the children included reported comprehensibility of >90/100. the progressometer helped the children identify the importance of taking treatment for their disease. The patients' adherence to anti-rheumatic therapy was significantly ( $p<0.01$ ) higher in the SDM group, whereas stopping DMARDs for intolerance was significantly ( $p<0.01$ ) higher in the control group at 12 months of treatment. There was significant improvement in the functional ability as well as quality of life measures in the SDM group ( $p<0.01$ ), whilst absence from school was significantly higher in the control group ( $p<0.01$ )

**Conclusions:** This Illustrated-interactive SDM aid for children living with idiopathic inflammatory arthritis was found to be a simple, user-friendly tool which can be implemented in standard clinical practice. The illustration and interactive style made it more attractive to the children. The developed SDM offered the children evidence-based information about the pros and cons of treatment options, improved their understanding of the disease, communication with their treating clinician as well as their ability to make an informed decision.

#### MASS SPECTROMETRY IMAGING ANALYSIS OF SYNOVIUM DIFFERENTIATE PATIENTS WITH PSORIATIC AND RHEUMATOID ARTHRITIS

B. Rocha<sup>1</sup>, B. Cillero-Pastor<sup>2</sup>, C. Ruiz-Romero<sup>1</sup>, A. Cuervo<sup>3</sup>, R.M. Heeren<sup>2</sup>, J. D. Cañete<sup>3</sup>, F.J. Blanco<sup>1</sup>. <sup>1</sup>Proteomics Unit-ProteoRed/ISCIII, Rheumatology Research Group, Iñibic-C. Hospitalario Universitario A Coruña, A Coruña, Spain; <sup>2</sup>The Maastricht Multimodal Molecular Imaging Institute (M4I), Division of MSI, Maastricht University, Maastricht, Netherlands; <sup>3</sup>Arthritis Unit, Rheumatology Department, Hospital Clinic, IDIBAPS, Barcelona, Spain

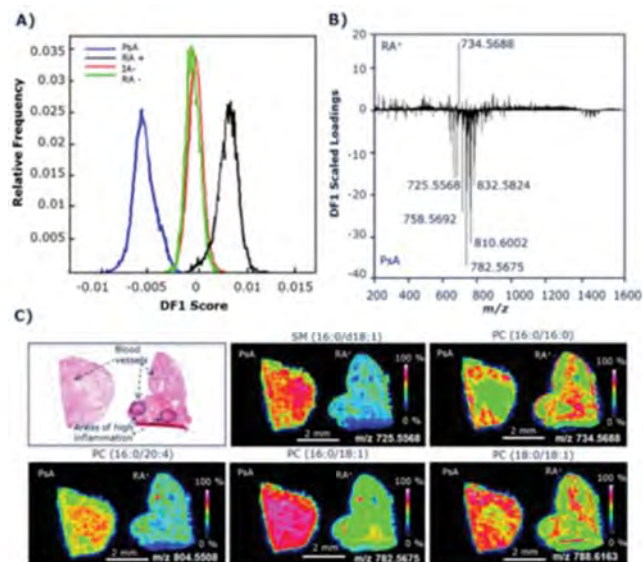

**Background:** Rheumatoid arthritis (RA) and Psoriatic arthritis (PsA) are systemic inflammatory diseases characterised by a chronic form of arthritis, often leading to

irreversible joint damage. Both are highly heterogeneous and complex disorders, presenting major challenges in diagnosis and treatment. The signs and symptoms of RA and PsA are similar especially at the earlier phases of the disease, so it can be difficult to distinguish them on clinical grounds. Lipids and metabolites have been associated with pathological events in both diseases as contributors of the inflammation process. Accordingly, the local lipidome and metabolome from the inflamed tissue may be more reliable in predicting the disease status than the current diagnostic methods, since the synovium is one of the main target tissues of both pathologies.

**Objectives:** To identify lipid and metabolic profiles in the synovium using Mass Spectrometry Imaging (MSI) that would have the potential to distinguish between patients with RA and PsA.

**Methods:** Synovium biopsies from 25 patients with PsA, 21 with RA (16 seropositive and 5 seronegative) and 10 with IA (Indeterminate arthritis) were included. Tissue sections were deposited on conductive slides and coated with different matrices for lipid and metabolite extraction. MALDI images were acquired on a rapifleX MALDI TissueTyper time-of-flight instrument. Multivariate data analysis was used to look for the lipids and metabolites with the highest differences among groups.

**Results:** MALDI-MSI revealed differential lipid and metabolic profiles among all compared groups. Discriminant analysis (DA) performed on lipid data acquired in positive ion mode displayed a good separation of patients with PsA and RA, especially seropositive RA (figure 1A). PsA showed higher lipid content, mainly phospholipids and sphingolipids, compared to seropositive RA (figure 1B and 1C). Some of them showed a specific localization within tissue. Experiments performed in negative ion mode showed that phosphatidylinositols and phosphatidic acids content varied among groups. Accordingly, DA allowed the separation of PsA from RA and IA patients, mainly from seronegative RA. PsA and RA groups were also distinguished based on synovium metabolic signatures. Sugars including *N*-acetylhexosamine 6-sulfate (*m/z* 282.0276), glucuronic acid 1-phosphate (*m/z* 273.0026) and *N*-acetylneuraminic acid (*m/z* 290.0876) displayed a stronger intensity in RA synovium when compared to PsA.

**Abstract OP0348 – Figure 1.** A) Histogram distribution and B) Discriminant function 1 (DF1) loading plot. DF1 negative scores are specific to PsA synovial tissue and positive scores to seropositive RA. C) Spatial mapping positive-lipid ions in synovium sections. Scale bar shows normalised intensities. **Conclusions:** For the first time, PsA and RA synovial membranes have been classified by MALDI-MSI. PsA synovium was characterised by a higher content of phospholipids compared to seronegative and seropositive RA. However, sugar metabolites displayed a stronger intensity in RA synovium when compared to PsA. Metabolic and lipid signatures here reported could support clinical decision-making in the diagnosis of RA and PsA.

### REMAINING PAIN AND WIDESPREAD PAIN DISTRIBUTION DURING THE FIRST 12 MONTHS AFTER RA DIAGNOSIS

Y.C. Lee<sup>1</sup>, O. Schieir<sup>2</sup>, M.-F. Valois<sup>3</sup>, S.J. Bartlett<sup>3</sup>, G. Boire<sup>4</sup>, B. Haraoui<sup>5</sup>, C. Hitchon<sup>6</sup>, E. Keystone<sup>7</sup>, D. Tin<sup>8</sup>, C. Thome<sup>9</sup>, J. Pope<sup>10</sup>, V. Bykerk<sup>7,11</sup>, on behalf of CATCH. <sup>1</sup>Northwestern University Feinberg School of Medicine, Chicago, IL, USA; <sup>2</sup>University of Toronto Dalla Lana School of Public Health, Toronto; <sup>3</sup>McGill University, Montreal; <sup>4</sup>Universite De Sherbrooke, Sherbrooke; <sup>5</sup>Institut de Rheumatologie de Montreal, Montreal; <sup>6</sup>University of Manitoba, Winnipeg; <sup>7</sup>University of Toronto, Toronto; <sup>8</sup>Southlake Regional Health Center, Newmarket; <sup>9</sup>Southlake Regional Health Center, Newmarket; <sup>10</sup>Western University, London, Canada; <sup>11</sup>Hospital for Special Surgery, New York, NY, USA

**Background:** The incidence of fibromyalgia (FM), a chronic widespread pain syndrome, is highest in the first year after RA diagnosis.<sup>1</sup> These 12 months may represent a critical window during which acute inflammatory pain transitions to chronic non-inflammatory pain. To prevent this transition, more data are needed about the course and predictors of pain during this time.

**Objectives:** 1) To describe the evolution of pain during the 12 months after RA diagnosis, and 2) to identify predictors of remaining pain and widespread pain (previously described as ‘fibromyalgic RA’)<sup>2</sup> at 12 months.

**Methods:** Data were obtained from early RA patients in the Canadian Early Arthritis Cohort (CATCH), a prospective inception cohort. Primary outcomes were: 1) remaining pain above the Patient Acceptable Symptom State (PASS), defined as 4/10 on a pain intensity numerical rating scale,<sup>3</sup> and 2) widespread pain, defined by tender joint count (TJC28) – swollen joint count (SJC28) ≥ 7.<sup>2</sup> Descriptive statistics were used to summarise the frequency of remaining pain and widespread pain over 12 months. Logistic regression models were used to identify predictors of remaining pain and widespread pain at 12 months. Variables forced into the multivariable models included age, sex, SJC28, ESR, depression, back pain, OA, sleep problems, HAQ-disability index (DI), MTX use, non-MTX conventional synthetic DMARD (csDMARD) use and NSAID use. Additional variables considered for inclusion via a backward selection process were race, education, income, FM, number of comorbidities and steroid use. Both models were adjusted for their respective baseline values.

**Results:** 1270 patients were included, with mean (SD) age of 53.9 (14.5) years, symptom duration of 5.8 (3.0) months and baseline DAS28 of 5.0 (1.4). The percentage of patients with remaining pain decreased from 64% at baseline to 24% at 12 months. The percentage of patients with widespread pain decreased from 9% to 5%. The strongest predictors of 12 month remaining pain were sleep problems (highest quartile OR 2.2, 95% CI: 1.2 to 3.9), pain intensity >4/10 (OR 2.1, 95% CI: 1.3 to 3.4) and higher HAQ-DI score (OR 1.5, 95% CI: 1.1 to 2.0). The strongest predictors of 12 month widespread pain were higher HAQ-DI score (OR 1.8, 95% CI: 1.1 to 3.1) and higher number of comorbidities (OR 1.2, 95% CI: 1.0 to 1.5). Baseline non-MTX csDMARD use was associated with lower likelihood of widespread pain (OR 0.5, 95% CI: 0.3 to 0.8).

**Abstract OP0349 – Table 1** Multivariable logistic regression models for the association between baseline characteristics and a) remaining pain (pain NRS>4), and b) widespread pain distribution (TJC28-SJC28≥7)

Baseline characteristics	Remaining Pain <sup>1</sup> OR (95% CI)	Widespread pain <sup>2</sup> OR (95% CI)
Age (for change of 10 yrs)	0.8 (0.7, 1.0)	0.7 (0.6, 0.9)
Baseline pain intensity > 4/10	2.1 (1.3, 3.4)	2.1 (0.8, 5.4)
Sleep problems, quartiles		
≥0 and <2	REF	REF
>2 and ≤5	1.8 (1.1, 3.1)	0.7 (0.3, 1.9)
>5 and ≤8	1.8 (1.1, 3.0)	0.9 (0.4, 2.2)
>8 and ≤10	2.2 (1.2, 3.9)	1.0 (0.3, 2.7)
Missing	0.6 (0.1, 5.6)	2.2 (0.2, 24.3)
HAQ-DI	1.5 (1.1, 2.0)	1.8 (1.1, 3.1)
Number of comorbidities	1.1 (1.0, 1.3)	1.2 (1.0, 1.5)
Non-MTX csDMARD use	0.8 (0.6, 1.1)	0.5 (0.3, 0.8)

<sup>1</sup>Adjusted for sex, education, income, SJC28, ESR, depression, back pain, osteoarthritis, MTX use, NSAID use  
<sup>2</sup>Adjusted for sex, SJC28, ESR, depression, back pain, osteoarthritis, MTX use, NSAID use, baseline pain distribution

**Conclusions:** Despite improvements in pain during the first year after RA diagnosis, 24% continued to report remaining pain above the PASS, and 5% reported widespread pain at 12 months. Patients at greatest risk for 12 month remaining pain were those with sleep problems, severe pain and disability at baseline. Patients at greatest risk for widespread pain were those with high baseline disability and many comorbidities. Baseline inflammation was not associated with 12 month pain outcomes.

**DEPRESSION AND ANXIETY IN AN EARLY RHEUMATOID ARTHRITIS INCEPTION COHORT. ASSOCIATIONS WITH EPIDEMIOLOGICAL, SOCIOECONOMIC AND DISEASE FEATURES**

G.E. Fragoulis, J. Cavanagh, M.H. Derakhshan, C. Paterson, D. Porter, I. B. McInnes, S. Siebert. *Institute of Infection, Immunity and Inflammation, University of Glasgow, Glasgow, UK*

**Background:** Co-morbid depression and anxiety occur in the context of rheumatoid arthritis (RA). Their characteristics, including associations with RA features, have not been examined previously in an early RA inception cohort with longitudinal follow up data.

**Objectives:** To examine the frequency of anxiety and depression in patients with early RA, over time and to explore associations with epidemiological, socioeconomic and disease-related features.

**Methods:** The Scottish Early Rheumatoid Arthritis (SERA) inception cohort recruited newly diagnosed RA patients (fulfilling ACR-EULAR 2010 criteria) followed-up thereafter every 6 months. Pre-specified clinical, laboratory and psychosocial features, including anxiety and depression scores (measured by the hospital anxiety and depression scale; score range: 0–21 for each one), were recorded at baseline and at follow-up. Non-parametric tests and logistic regression models were used to examine the nature and magnitude of associations.

**Results:** Data from 848 RA patients were available. Frequency of anxiety and depression at baseline was 19.0% and 12.2% with a reduction at month 12% to 13.4% and 8.2% ( $p=0.004$  and  $p=0.01$ , respectively). Anxiety and depression scores were correlated with DAS28 at all time points, including baseline (all  $p<0.0001$ ). Change in DAS28 (final-baseline) was correlated with change in depression and anxiety scores at month 6 ( $p<0.0001$ ,  $r=0.265$  and  $p=0.001$ ,  $r=0.230$ ) and 12 ( $p<0.0001$ ,  $r=0.288$  and  $p<0.0001$ ,  $r=0.217$ ). In univariate analyses, anxiety and depression scores were associated with various features, at different time points (table 1). CRP was highly associated with depression but not anxiety scores at all time points, with change in CRP correlating with change in depression scores (month6;  $p<0.0001$ ,  $r=0.185$  and month12;  $p<0.0001$ ,  $r=0.302$ ). Multivariable analysis indicated that anxiety score at baseline was associated with female gender ( $p=0.01$ ,  $\text{Beta}=0.133$ ), younger age ( $p=0.007$ ,  $\text{Beta}=-0.181$ ) and patient global assessment score (PGA) ( $p<0.0001$ ,  $\text{Beta}=0.201$ ), and at month 6 and 12 with low BMI (month 6,  $p=0.024$ ,  $\text{Beta}=-0.091$ ; month 12,  $p=0.002$ ,  $\text{Beta}=-0.139$ ), PGA (month 6,  $p<0.0001$ ,  $\text{Beta}=0.222$ ; month 12,  $p<0.0001$ ,  $\text{Beta}=0.248$ ) and baseline anxiety scores (month 6,  $p<0.0001$ ,  $\text{Beta}=0.623$ ; month 12,  $p<0.0001$ ,  $\text{Beta}=0.586$ ). For depression scores, multivariable analysis indicated association at baseline with PGA ( $p<0.0001$ ,  $\text{Beta}=0.286$ ) and at month 6 and 12 with PGA (month 6,  $p<0.0001$ ,  $\text{Beta}=0.306$ ; month 12,  $p<0.0001$ ,  $\text{Beta}=0.320$ ), CRP levels (month 6,  $p=0.006$ ,  $\text{Beta}=0.150$ ; month 12,  $p=0.002$ ,  $\text{Beta}=0.171$ ) and baseline depression (month 6,  $p<0.0001$ ,  $\text{Beta}=0.422$ ; month 12,  $p<0.0001$ ,  $\text{Beta}=0.356$ ) and anxiety scores (month 6,  $p<0.0001$ ,  $\text{Beta}=0.189$ ; month 12,  $p=0.008$ ,  $\text{Beta}=0.170$ ).

**Abstract OP0350 – Table 1** Variables associating with high anxiety and/or depression score at baseline and at month 6 and 12. 1) ANOVA test, compared to employed and to retired individuals, 2) patient global VAS used for DAS28 calculation. 3) average alcohol units/week. NA: not applicable, BMI: body mass index, IM: intramuscular. \*by mouth, \*intramuscular

ESR	0.016	0.116			0.029	0.130
CRP	<0.0001	0.163	<0.0001	0.152	0.004	0.112

**Conclusions:** Depression and anxiety are significant comorbidities at the time of RA diagnosis. While there are also associations with socioeconomic and other

variables, the close relationship between CRP and depression provides further support to the already compelling data linking inflammation and depression. Changes in the anxiety and depression scores, in tandem with disease activity over time, requires further investigation.

**FIRST DIAGNOSIS OF UVEITIS IS NOT HIGHER AMONG JUVENILE IDIOPATHIC ARTHRITIS (JIA) PATIENTS RECEIVING ETANERCEPT COMPARED TO METHOTREXATE**

R. Davies<sup>1</sup>, D. De Cock<sup>1</sup>, L. Kearsley-Fleet<sup>1</sup>, A. Ramanan<sup>2,3</sup>, K.L. Hyrich<sup>1,4</sup>, on behalf of British Society for Paediatric and Adolescent Rheumatology Etanercept Cohort Study. <sup>1</sup>Arthritis Research UK Centre for Epidemiology, Manchester Academic Health Science Centre, University of Manchester, Manchester; <sup>2</sup>Pediatric Rheumatology, University Hospitals Bristol NHS Foundation Trust; <sup>3</sup>Ophthalmology, School of Clinical Sciences, University of Bristol, Bristol; <sup>4</sup>National Institute of Health Research Manchester Musculoskeletal Biomedical Research Centre, Manchester Academic Health Science Centre, Manchester University NHS Foundation Trust, Manchester, UK

**Background:** Uveitis is a common comorbidity among patients with juvenile idiopathic arthritis (JIA), occurring in approximately 1 in 10 JIA patients. Among other risk factors such as early age at JIA onset, shorter disease duration and oligoarticular subtype, the use of etanercept (ETN) may also increase the risk of developing uveitis. However, previous studies have produced conflicting results, often limited by small sample sizes and limited follow-up time.

**Objectives:** To determine if patients receiving ETN have a higher risk of developing uveitis for the first time compared to patients receiving methotrexate (MTX).

**Methods:** The study population comprised JIA subjects recruited to the BSPAR ETN Cohort Study at point of starting ETN or MTX. Only patients with no prior history of uveitis were included. This was an on-drug analysis, whereby events were only included if the patient was on ETN or MTX at the time of uveitis onset. Follow-up began from date of first treatment to first uveitis diagnosis, discontinuation of ETN or MTX, most recent follow-up up to 30/11/16 or death, whichever came first. Crude incidence rates of uveitis per 100 person years (pyears) were calculated. Hazard ratios (HR) comparing risk of uveitis with ETN versus MTX were calculated using propensity adjusted Cox regression.

**Results:** Of 1517 patients, 1009 were registered to the ETN cohort (all receiving ETN) and 508 to the MTX cohort. ETN patients were older, with longer disease duration, and were less likely to have persistent oligoarthritis. The mean age at uveitis diagnosis was 8 years in the ETN cohort versus 5 years in the MTX cohort. The HR adjusted for age and gender, disease scores, disease duration, baseline steroid use, co-morbidity, ILAR subtype, and ethnicity found a lower risk of developing uveitis in patients receiving ETN compared to MTX (0.30, 95% CI (0.10–0.90)) (table 1).

**Abstract OP0351 – Table 1**

	Patients taking MTX	Patients taking EN
Subjects (n)	508	1009
Age, median (IQR)	9 (3–13)	11 (8–14)
Gender, % female	71	69

ILAR subtype, n (%)		
Persistent oligoarthritis	84 (17)	53 (5)
Other non-systemic JIA	424 (83)	955 (95)
Person years exposure	908	2471
New diagnosis of uveitis	18	15
Crude incidence rates per 100 pyears	2.4 (1.4–3.9)	0.6 (0.3–1.0)
Unadjusted HR (95% CI)	ref	0.24 (0.11–0.52)*
Age & Gender adjusted HR (95% CI)	ref	0.41 (0.18–0.95)*
Fully adjusted HR (95% CI)	ref	0.30 (0.10–0.90)*

\* $p<0.05$

**Conclusions:** Within this cohort of UK children with JIA, a new diagnosis of uveitis is not more common among children receiving ETN compared to MTX, even after taking into account differences in age and disease duration between the cohorts. This is reassuring given there is a possible increased risk of uveitis among children with JIA receiving ETN. Age appears to be a major influencing factor as patients in the MTX cohort were younger thus at a higher risk of uveitis. For patients with a high uveitis risk other treatment options could have been

selected, leading to possible confounding by indication, which in turn makes ETN look protective. Researchers should take these selection biases into account when analysing their results.

## Gut bacteria: the boss of the immune system

OP0352

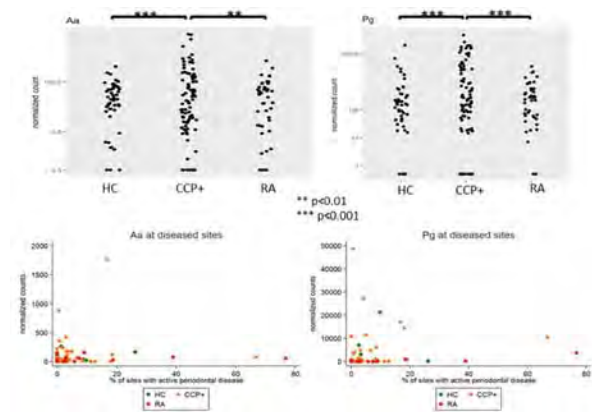

### AN INCREASED PREVALENCE OF PERIODONTAL DISEASE, PORPHYROMONAS GINGIVALIS AND AGGREGATIBACTER ACTINOMYCETEMCOMITANS IN ANTI-CCP POSITIVE INDIVIDUALS AT-RISK OF INFLAMMATORY ARTHRITIS

K. Mankia<sup>1</sup>, Z. Cheng<sup>2</sup>, T. Do<sup>2</sup>, J. Kang<sup>2</sup>, L. Hunt<sup>1</sup>, J. Meade<sup>2</sup>, V. Clerehugh<sup>3</sup>, A. Speirs<sup>3</sup>, A. Tugnait<sup>3</sup>, E. Hensor<sup>4</sup>, D. Devine<sup>2</sup>, P. Emery<sup>1</sup>. <sup>1</sup>Rheumatology, Leeds Institute of Rheumatic and Musculoskeletal Medicine and NIHR Leeds Biomedical Research Centre; <sup>2</sup>Oral Microbiology, University of Leeds; <sup>3</sup>Leeds Dental Institute, Leeds Teaching Hospitals Trust; <sup>4</sup>Rheumatology, Leeds Institute of Rheumatic and Musculoskeletal Medicine, Leeds, UK

**Background:** The prevalence of periodontal disease is increased in RA, and periodontitis is associated with the bacterium *Porphyromonas gingivalis* (Pg), which can citrullinate arginine residues.<sup>1</sup> These observations suggest periodontitis may be a key initiator of RA-related autoimmunity. Importantly, clinical periodontal disease, and the relative abundance of periodontal bacteria have not been described in seropositive individuals at risk of developing RA who do not have synovitis.

**Objectives:** To investigate the prevalence of periodontal disease and the relative abundance of key periodontal bacteria in anti-CCP positive at-risk individuals without synovitis.

**Methods:** Anti-CCP positive individuals with musculoskeletal symptoms but no clinical synovitis (CCP+), early RA (RA) patients and healthy controls (HC) were recruited. CCP +underwent a 38 joint ultrasound (US) assessment. Periodontal examination was performed by a dentist; six sites per tooth were assessed for clinical attachment level (CAL), pocket depth (PD) and bleeding on probing (BOP). Periodontal disease sites (PDD) were defined as CAL $\geq$ 2 mm and PD  $\geq$ 4 mm. A clinical consensus was agreed for each case by three dentists. DNA, isolated from subgingival plaque from diseased and healthy periodontal sites, was paired-end sequenced (Illumina HiSeq3000). Taxonomic and functional profiles were obtained from MG-Rast and differences between groups studied using DESeq2. Mann-Whitney U tests were used to compare groups and Spearman Rho used for correlations. For metagenomic data, Wald test was used to compare relative abundance.

**Abstract OP0352** – Figure 1 Relative abundance of *Aggregatibacter actinomycetemcomitans* (Aa) and *Porphyromonas gingivalis* (Pg) according to RA status and extent of periodontal disease

**Results:** 48 CCP+, 26 RA and 32 HC were recruited. Groups were balanced for age, sex and smoking. All but 2 (96%) CCP +had no US synovitis (greyscale  $\geq$ 1 and power Doppler $\geq$ 1). Dentists classified 73% CCP+, 38% HC (p=0.02) and 54% RA as having clinical periodontitis. The percentage of periodontal sites with CAL  $\geq$  2 mm, PD  $\geq$  4 mm, BOP, PDD and active PDD (PDD +BOP) were all greater in CCP +compared to HC (p<0.05) and similar to RA. In non-smokers, PDD and active PDD were more prevalent in CCP +compared to HC. Metagenomic data indicated CCP +had increased relative abundance of both Pg

and *Aggregatibacter actinomycetemcomitans* (Aa) compared to HC (p<0.001) and RA (p<0.01). However, clinical periodontitis was only associated with increased relative abundance of Pg (p<0.001) but not Aa. Furthermore, the relative abundance of Pg was associated with the percentage of sites with active PDD in CCP+ (p=0.05) and HC (p=0.04) but this was not seen for Aa (figure 1).

**Conclusions:** We report an increased prevalence of periodontal disease, Pg and Aa in anti-CCP positive at-risk individuals without synovitis. Interestingly, relative abundance of Pg, but not Aa, was associated with periodontitis, suggesting potential mechanistic differences that require further exploration. These data support the concept that periodontal inflammation and periodontopathic bacteria may both be important in the initiation of RA-related autoimmunity.

## Multi-disciplinary management of complex persistent pain

OP0353-HPR

### THE EFFECTS OF ARTHRITIS GLOVES ON HAND PAIN IN PEOPLE WITH RHEUMATOID OR INFLAMMATORY ARTHRITIS: A RANDOMISED CONTROLLED TRIAL (A-GLOVES TRIAL)

A. Hammond<sup>1</sup>, Y. Prior<sup>1</sup>, C. Sutton<sup>2</sup>, S. Cotterill<sup>3</sup>, C. Heal<sup>3</sup>, E. Camacho<sup>3</sup>, on behalf of The A-GLOVES research team. <sup>1</sup>Centre for Health Sciences Research, University of Salford, Salford; <sup>2</sup>Lancashire CTU, University of Central Lancashire, Preston; <sup>3</sup>School of Health Sciences, Manchester University, Manchester, UK

**Background:** Arthritis (compression) gloves are commonly provided to people with rheumatoid arthritis (RA) and undifferentiated inflammatory arthritis (IA) in the UK health service. These apply pressure and warmth to relieve hand pain, stiffness and improve hand function. A systematic review identified little evidence to support their use.<sup>1</sup>

**Objectives:** This randomised controlled trial tested effectiveness and cost-effectiveness of mid-finger length compression (intervention) gloves (20% Lycra: commonest glove model provided) with control gloves (i.e. oedema gloves: 11% Lycra: fitted at least one size too big) in people with RA and IA.

**Methods:** Both gloves, which had similar thermal qualities although the control gloves did not provide compression, were provided by rheumatology occupational therapists, following training.<sup>2</sup> Participants were also given brief advice on hand exercise and joint protection. Adults with RA/IA and persistent hand pain were randomised 1:1 to the two glove types, stratified by disease modifying anti-rheumatic drug (DMARD) change in previous 12 weeks. The primary outcome was dominant hand pain on activity Visual Analogue Scale (VAS:0–10); other outcomes included night hand pain, hand stiffness (both 0–10 VAS); Measure of Activity Performance Hand (MAP-HAND: 0–3). Multiple linear regression was undertaken to estimate the effect of group allocation on hand pain during activity, adjusting for the stratification variable and baseline values. Cost-effectiveness used individual patient level costs (intervention plus healthcare utilisation) and health benefit data (EQ-5D) to calculate costs and QALYs.

**Results:** 206 participants were randomised (103 to each glove type): median age 59 years [IQR 51,67]; women:166 (81%); mean disease duration: 8.2 (SD 9.5) years; employed:76 (37%); right hand dominant:185 (90%). Of these, 163 (79%) completed 12 week follow-up questionnaires. Both groups reported similar adherence to glove wear (mean 5.2 days/week). At 12 w, hand pain scores in both groups similarly improved: the between-groups mean difference of 0.1 was not statistically significant (95% CI: -0.47 to 0.67;p=0.72). There were no significant differences between groups on any measures, with both groups improving similarly between baseline and 12 w. 73% in both groups considered gloves beneficial. Intervention gloves had higher costs (£552 (SD £464); control £391 (SD £543) but comparable benefits to control gloves. Intervention gloves would cost £83 700 to gain one QALY and were not likely to be cost-effective.

**Conclusions:** Compression (intervention) and loose-fitting arthritis (control) gloves had similar effects on hand pain, stiffness and function. Therefore, compression is not the 'active ingredient' in arthritis gloves. Loose fitting gloves providing warmth were perceived as equally effective by participants. We do not know if the therapist effect is important or whether ordinary gloves providing warmth would provide similar results.

**Osteoarthritis: a vascular disease**

**OP0354 RADIOGRAPHIC EROSIONS ARE ASSOCIATED WITH FLUORESCENCE OPTICAL IMAGING ENHANCEMENT IN HAND OSTEOARTHRITIS**

Ø. Maugesten<sup>1</sup>, S. Ohrndorf<sup>2</sup>, S.V. Hestetun<sup>1</sup>, T.K. Kvien<sup>1</sup>, T. Uhlig<sup>1</sup>, I.K. Haugen<sup>1</sup>. <sup>1</sup>Department of Rheumatology, Diakonhjemmet Hospital, Oslo; <sup>2</sup>Dept. of Rheumatology and Clinical Immunology, Charité Univ.smedizin, Berlin, Norway

**Background:** Erosive hand osteoarthritis (OA) is a phenotype characterised by more inflammation and erosions of the subchondral bone. Fluorescence optical imaging (FOI) is a novel imaging technique demonstrating altered microcirculation in wrist and finger joints as a sign of inflammation. No previous hand OA study has explored the validity of FOI against radiography.

**Objectives:** The aim of the current study was to explore the association between radiographic findings and FOI enhancement in the distal (DIP) and proximal interphalangeal (PIP) joints.

**Methods:** The NOR-HAND study is an observational hand OA study, in which 251 patients (88% female, median age 61 (interquartile range 56–66) years, 35% erosive hand OA) underwent FOI and x-rays of both hands. The FOI-scan was performed after the administration of an intravenous fluorescence dye (indocyanine green, ICG) and 360 images (1/second) were produced in 6 min. Based on the inflow and washing out of the dye the pictures were divided into 3 phases. Finally, the prima vista mode (PVM) represented a composite picture of the first 240 images of the examination. For each phase, fluorescence enhancement in the joints was graded from 0–3 based on signal intensity. Radiographic severity of the joints was evaluated with the Verbruggen Veys (VV) anatomical phase scoring system, which is based on the assumption that OA in finger joints will progress through different phases. To study whether more advanced radiographic phases were associated with FOI enhancement in the same joint, we applied logistic regression analyses with generalised estimating equations adjusting for age, sex, BMI and absence/presence of erosive hand OA, defined at patient level as having at least one DIP and PIP joint(s) in the erosive or remodelled phase.

**Results:** FOI demonstrated no and uncommon enhancement of the metacarpophalangeal and thumb base joints, respectively, thus we analysed DIP and PIP joints only. FOI enhancement was most commonly seen in phase 2 and PVM, also in the non-affected joints (table 1). The frequency of enhancement was lower for phase 3 and in particular for phase 1. Joints in the erosive phase had statistically significantly higher odds of FOI enhancement in phase 1, 2 and PVM as compared to the non-affected joints (table 1). Having erosive hand OA in other DIP and PIP joints was also associated with FOI enhancement (p<0.05 in all phases except in phase 1), and our stratified analyses confirmed that FOI enhancement in the non-erosive phases was more common in the erosive vs the non-erosive hand OA patients.

**Abstract OP0354 – Table 1 Odds of FOI enhancement in joints with increasing radiographic severity according to the verbruggen veys anatomical phase scoring system**

**Conclusions:** Joints in the erosive phase have more frequent FOI enhancement than non-affected joints. Furthermore, FOI enhancement in non-erosive phases is more common in patients with erosive vs non-erosive hand OA, suggesting that erosive hand OA is a more inflammatory phenotype. FOI enhancement in phase 2, 3 and PVM was common in joints without radiographic pathology, whereas enhancement in phase 1 was uncommon in joints with severe pathology. Thus,

there is a need to consider other FOI scoring methods for the assessment of FOI enhancement in hand OA.

**Emerging topics in the management of the antiphospholipid syndrome**

**OP0355 PULMONARY THROMBOECTOMY IS A CURATIVE RESOLUTION FOR CHRONIC THROMBOEMBOLIC PULMONARY HYPERTENSION ASSOCIATED WITH PRIMARY ANTIPHOSPHOLIPID SYNDROME: A RETROSPECTIVE COHORT STUDY**

C. Li<sup>1</sup>, J.L. Zhao<sup>1</sup>, Y. Zhao<sup>1</sup>, S. Liu<sup>2</sup>, Q. Wang<sup>1</sup>, M.T. Li<sup>1</sup>. <sup>1</sup>Department of Rheumatology, Peking Union Medical College Hospital; <sup>2</sup>Department of Cardiac Surgery, Fu Wai Hospital, Chinese Academy of Medical Science, Beijing, China

**Background:** Chronic thromboembolic pulmonary hypertension (CTEPH) is a rare and life-threatening condition with a poor prognosis in antiphospholipid syndrome (APS) patients. A specialised and multidisciplinary evaluation are needed for APS associated CTEPH. As a curative option for CTEPH, pulmonary thromboendarterectomy (PTE) requires careful risk and benefit assessment in APS patients.

**Objectives:** This retrospective cohort study aimed to investigate the clinical manifestations and prognosis of CTEPH in APS patients with or without PTE.

**Methods:** Consecutive patients with APS associated CTEPH diagnosed between January 2012 to September 2017 at Peking Union Medical College Hospital were retrospectively evaluated. Patients were divided into two groups by whether underwent PTE or not. Demographics, clinical manifestations, antiphospholipid antibodies profiles, target medications, treatment were collected as possible influencing factors. Chi-square test was used to analyse the short-term prognosis while Kaplan Meier curve and log rank test were used to analyse long-term prognosis (outcome events: deterioration of cardiac function or death).

**Abstract OP0355 – Table 1 Baseline demographic and clinical characteristics of 20 APS associated CTEPH patients**

Variables	Total (n=20)	With PTE (n=8)	Without PTE (n=12)	P-value

III, n(%)				

**Results:** A total of the 20 APS associated CTEPH patients were enrolled, 8 underwent PTE and 12 without PTE. Common CTEPH developed by these patients included chest pain, dyspnea on exertion, cough and hemoptysis. Chi-square test (p=0.01) and Kaplan Meier curves (Log rank test, p=0.04) showed that there was statistically significant difference in both short-term and long-term prognosis among patients with PTE and without PTE. On the other hand, Cox regression analysis showed diagnosis (PAPS or SLE-APS), aPL (antiphospholipid antibody) profiles, thrombocytopenia, other Thrombotic Events, target therapies,

baseline WHO FC have no effects on the prognosis of CTEPH in patients with APS.

**Abstract OP0355** – Figure 1 Kaplan-Meier survival curves of APS patients associated CTEPH after treatment (anticoagulation and/or PTE).

**Conclusions:** After a full specialised and multidisciplinary risk-benefit evaluation to limit the risk of thrombosis or bleeding and to manage possible thrombocytopenia, for those CTEPH developed in APS patients, PTE is a curative resolution.

**OP0356** **PLASMA BLAST PROLIFERATION IS ASSOCIATED WITH TOLL LIKE RECEPTOR 7 POLYMORPHISMS AND UPREGULATION OF TYPE I INTERFERON, CONTRIBUTING TO THE ANTIBODY PRODUCTION IN ANTIPHOSPHOLIPID SYNDROME**

R. Hisada, M. Kato, E. Sugawara, Y. Fujieda, K. Oku, T. Bohgaki, O. Amengual, S. Yasuda, T. Atsumi. *Department of Rheumatology, Endocrinology and Nephrology, Faculty of Medicine and Graduate School of Medicine, Hokkaido University, Sapporo City, Japan*

**Background:** Antiphospholipid antibodies (aPL) as pathogenic autoantibodies in systemic lupus erythematosus (SLE) and antiphospholipid syndrome (APS) are supported by a number of clinical, *ex vivo* and animal studies. Nevertheless, aPL are not eliminated by corticosteroid administration or immunosuppression. Novel therapy targeting aPL production is currently unmet needs, in contrast, little is known on its pathological mechanism.

**Objectives:** This study aimed to clarify the mechanism of aPL production by lymphocyte subset analysis, genomic analysis and *ex vivo* experiments.

**Methods:** B cell and T cell subsets, a total of 21 subsets, were evaluated in peripheral blood mononuclear cells (PBMC) of 26 primary APS (PAPS), 18 SLE-associated APS (SLE/APS) patients and 10 healthy controls by flow cytometry. Twenty-one single nucleotide polymorphisms (SNP), which were shown to be associated with autoimmune or thrombotic diseases, were analysed in genomic DNA of those patients by TaqMan genotyping assay. Interferon (IFN) score was calculated based on the mRNA expression of Ly6e, Mx1, IFIT1 and IFIT3 in PBMC. To evaluate the aPL-producing capability of plasmablasts, PBMC obtained from APS patients were cultured following depletion of CD19 +CD20+ or CD19+CD20 cells and the culture supernatants were applied to aPL measurements by enzyme-linked immunosorbent assay and cell assay using  $\beta$ 2GPI/HLA-DR7 overexpressing HEK293T cells.<sup>1</sup>

**Results:** In PAPS and SLE/APS patients, plasmablasts, Th2 cells and Th17 cells were increased while pre- and post- switched memory B cells, regulatory B cells and regulatory T cells were decreased compared to healthy controls. Genomic analysis revealed that the increase of plasmablasts ( $p=0.032$ ) and the decrease of memory B cells ( $p=0.013$ ) were more pronounced in patients with a risk allele of SNP in toll like receptor 7 (TLR7) gene (rs3853839). IFN score was significantly higher in the TLR7 SNP risk allele carriers, confirming the downstream signalling of TLR7 ( $p=0.029$ ). *Ex vivo* experiments showed that aPL, including anti-cardiolipin/ $\beta$ 2-glycoprotein I-HLA class II complexes -IgG and -IgM, were present in the culture supernatant of CD19 +CD20+depleted PBMC from APS patients, but not in that of CD19 +CD20 depleted cells.

**Conclusions:** Our data indicate an important role of plasmablasts in the production of aPL. Furthermore, plasmablast proliferation was associated with TLR 7 and type I IFN, suggesting a common pathophysiology in SLE and APS. Targeting plasmablasts might be a novel, immunological therapeutic approach in the treatment of APS.

**The links between gout and kidney function**

**OP0357** **HYPERECHOIC DEPOSITS IN THE RENAL MEDULLA ARE ASSOCIATED WITH SEVERE GOUT AND DECREASED EGFR: A TRANSVERSAL STUDY IN 503 VIETNAMESE PATIENTS**

T. Bardin<sup>1,2</sup>, K.M. Tran<sup>1</sup>, Q.D. Nguyen<sup>1</sup>, N.H. Le<sup>1</sup>, P. Richette<sup>2</sup>, P. Le Van<sup>3,4</sup>, J.-M. Correas<sup>5</sup>, M. Resche-Rigon<sup>6</sup>. <sup>1</sup>French-Vietnamese Gout Research Center, Vien Gut general clinic, Ho Chi Minh City, Viet Nam; <sup>2</sup>Rheumatology, hôpital Lariboisière, Paris, France; <sup>3</sup>Radiology, Cho Ray Hospital; <sup>4</sup>university of Medicine and Pharmacy, Ho Chi Minh City, Viet Nam; <sup>5</sup>radiology, Hôpital Necker; <sup>6</sup>Biostatistics, hôpital Saint Louis, Paris, France

**Background:** Renal medulla crystal deposits have been demonstrated by pathology in severe gout but little studied by ultrasound (US) scan.

**Objectives:** To assess the frequency of hyperechoic renal medulla (HERM) in gouty patients and factors associated with their development.

**Methods:** Renal US scan using a Ecube 9 echograph (Alpinion S. Korea), was performed in gout patients (ACR/EULAR criteria) consecutively seen at the Vien Gut general clinic, Ho Chi Minh City, Vietnam, and receiving no ULT at presentation. Age and sex of patients, gout features, associated diseases, serum (S) uric acid (UA), eGFR (MDRD), urinary lab stick parameters, urine UA/creatinine ratio, and fractional clearance of urate (FCU) were recorded. Patients with HERM were counted and compared with those who had no medullary deposits by the Wilcoxon rank sum test for continuous variables and the Fischer exact test for categorical variables. Multivariable logistic model was used to assess relation between variables at inclusion in the study and presence of medulla deposits.

**Results:** 503 consecutive patients (500 males) were included. They had a median age of 46 years, median BMI of 25 kg/m<sup>2</sup>, median gout duration of 4 years. 280 (56%) had clinical tophi, 154 (31%) urate arthropathy, 28; 56% urolithiasis, 112 (22%) hypertension, 58 (11.5%) type 2 diabetes, 5 (1%) coronary heart disease. Their median eGFR was 78 ml/min, SUA 423 micromol/L, FCU 0.063, urine UA/creatinine ratio 0.253, urinary pH 6.

Diffuse and bilateral HERM on the B mode with frequent twinkling artefacts on the Doppler mode was identified in 181 (36%) of the 503 patients. Univariate analysis showed that HERM associated with higher age, longer duration of gout, clinical tophi, urate arthropathy ( $p<0.0001$  for each of the variables), higher uricemia ( $p=0.001$ ), hypertension ( $p=0.0008$ ), CHD ( $p=0.0006$ ), lower eGFR ( $p<0.0001$ ), leucocyturia ( $p=0.02$ ), proteinuria ( $p=0.02$ ). No association with US-diagnosed urolithiasis, hematuria, urine UA/creatinine ratio, FCU and urinary pH was found. In multivariate analysis, log of the duration of gout (OR: 2.22 (CI: 1.63–3.08),  $p<0.001$ ), clinical tophi (OR: 8.21 (4.23–16.91)  $p<0.001$ ), urate arthropathy (OR: 3.74 (2.18–6.52,  $p<0.001$ ), and lower eGFR (OR: 0.86 (0.75–0.99) for each 10 ml/min decrease,  $p=0.04$ ) were significantly associated with HERM.

**Conclusions:** In our gout population, HERM was observed in 36% of patients, correlated with decreased renal function, and clearly associated with severe gout, but not with features of uric acid lithiasis.

**OP0358** **WHY DO NOT ALL CHRONIC KIDNEY DISEASE PATIENTS GET GOUT? IMPAIRED NEUTROPHIL CHEMOTAXIS IN HYPERURICEMIA-RELATED CKD**

Q. Ma<sup>1</sup>, M. Sellmayr<sup>1</sup>, F. Preitner<sup>2</sup>, H.-J. Anders<sup>1</sup>, S. Steiger<sup>1</sup>. <sup>1</sup>Klinikum der Universität München, Medizinische Klinik und Poliklinik IV, Nephrologisches Zentrum, München, Germany; <sup>2</sup>University of Lausanne, Center for Integrative Genomics, Lausanne, Switzerland

**Background:** One characteristic feature of acute gout is the infiltration of neutrophils into the inflamed joints, where they recognise monosodium urate (MSU) crystals leading to an acute inflammatory response. The development of chronic kidney disease (CKD) is associated with increased serum uric acid (UA) levels also known as hyperuricemia, a major risk factor for gout. Despite hyperuricemia, acute gout is less frequent in CKD patients. However, the effects of hyperuricemia on leukocyte chemotaxis in CKD are not fully understood.

**Objectives:** We hypothesised that hyperuricemia affects neutrophil chemotaxis in CKD patients. Furthermore, we made use of a novel mouse model of chronic uric acid nephropathy.

**Methods: Human study:** Serum was collected and neutrophils isolated from CKD patients or healthy subjects. Serum BUN (blood urea nitrogen), creatinine and uric acid levels were measured. Neutrophil transwell assays were carried out and the number of migrated neutrophils towards fMLP, human IL-8 determined by flow cytometry. **Animal study:** Six week old Alb-creERT2;Glut9<sup>lox/lox</sup> mice (ki/ki) and mice without active Cre (+/+) were injected with tamoxifen. The ki/ki mice received either a high fat diet with Inosine (HFD+Ino) to induce hyperuricemia-associated CKD or a chow diet with Inosine (Chow+Ino) to induce only hyperuricemia without CKD. Control +/-mice either received HFD+Ino or Chow+Ino diet. After two weeks, all groups were injected either with MSU crystals or vehicle into a preexisting air pouch, a mouse model for acute gouty arthritis. After 12 hours, neutrophil infiltration and the extent of inflammation were assessed via flow cytometry, ELISA, and colorimetric assays.

**Results: Human study:** Compared to healthy subjects, CKD stage 5 patients presented with significant higher levels of serum BUN (14.1 vs 52.1 mg/dl,  $p=0.001$ ), creatinine (1.5 vs 9.3 mg/dl,  $p=0.001$ ) and UA (2.3 vs 10.3 mg/dl,  $p=0.001$ ). Neutrophils from CKD patients showed an impaired migratory ability due to the down-regulation of the adhesion molecules P-Selectin and  $\alpha\beta$ Integrin.
