Deficit of 400 ktons of refined zinc in 2017

Challenge in zinc exploration

New discoveries

- <Size
- Mineralogy
- Geometry
- <grade
- >depth

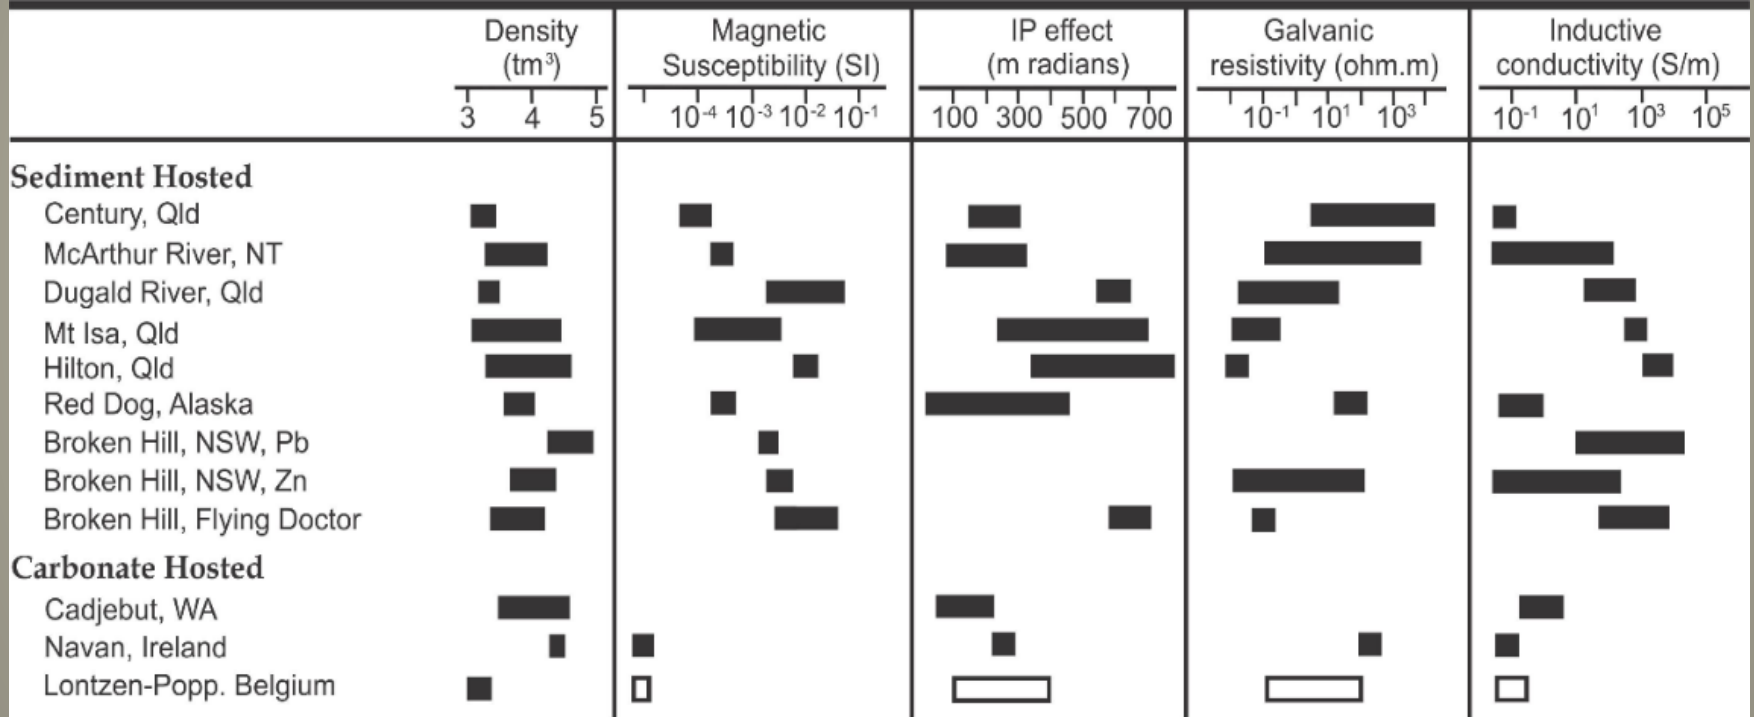

Sphalerite is hard to prospect

One of the most resistive sulphide

Density < other sulphides

Non-magnetic

Geophysics on Zn ore deposit

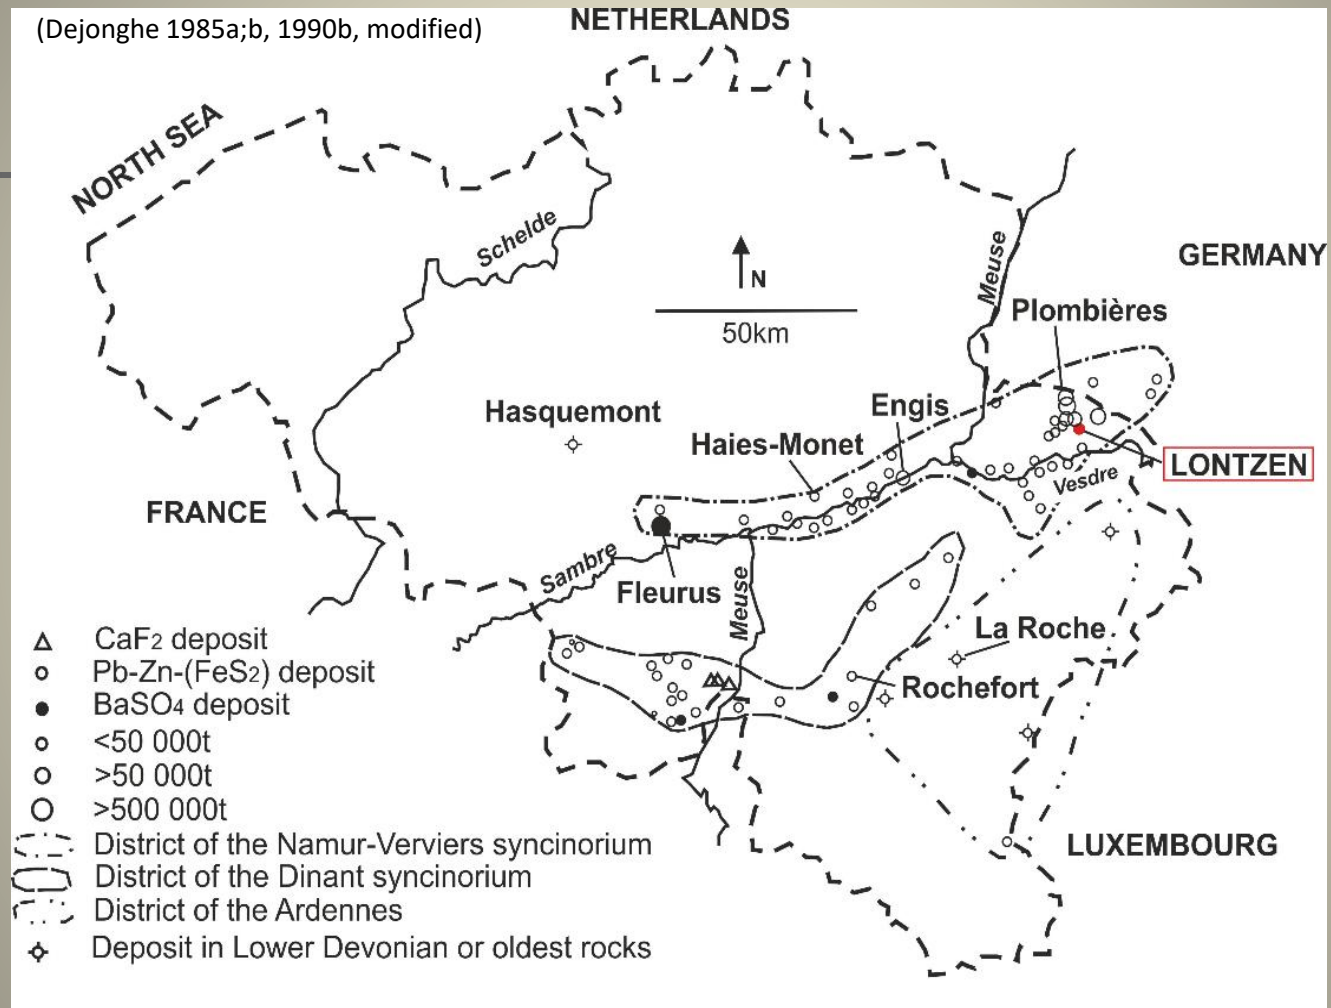

A decorative horizontal line with a wavy, pulse-like shape on the left side, extending across the top of the slide.

Incorporation of prior information

Incorporation of prior information

Mineralogy	Resistivity (ohm.m)	Chargeability (mV/V)
Sphalerite+ galena (10%)+ pyrite/marcasite ore	10	30
Sphalerite + galena ore (10%)	20	20
Sphalerite ore (10%)	50	15

Inversion parameter

Inversion using CRTomo inversion code
(Kemna 2000)

$$\Psi(m) = \|W_d(d - f(m))\|$$

Incorporation of prior information

$$\Psi(m) = \underbrace{\|W_d(D - f(m))\|^2 + \lambda(\|W_m(m - m_0)\|^2)}_{\text{Smoothness-constraint inversion}} + \underbrace{\alpha\|m - m_0\|^2}_{\text{Reference model inversion}}$$

Smoothness-constraint inversion

Reference model inversion

Incorporation of prior information

Step 1: Gridding

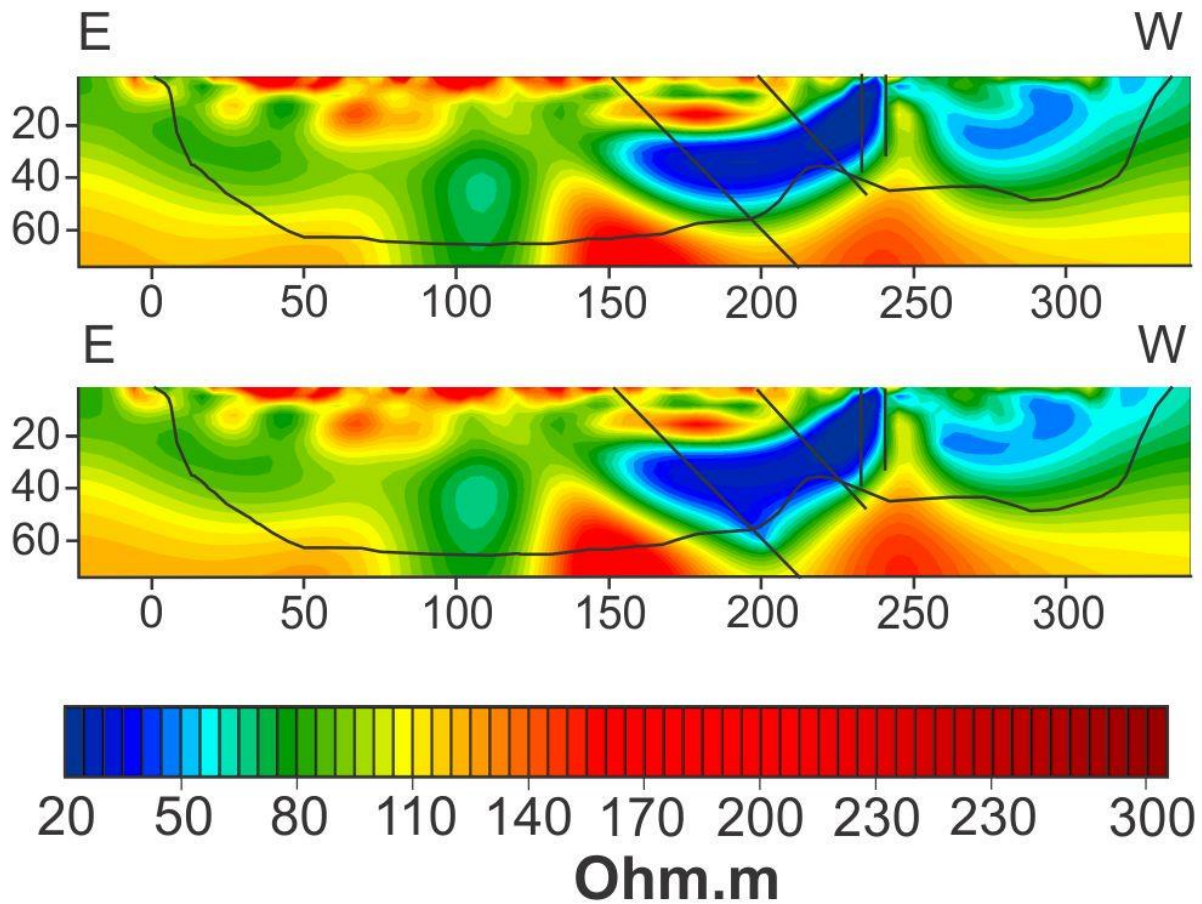

Inversion using reference model with average resistivity and weight for each cell

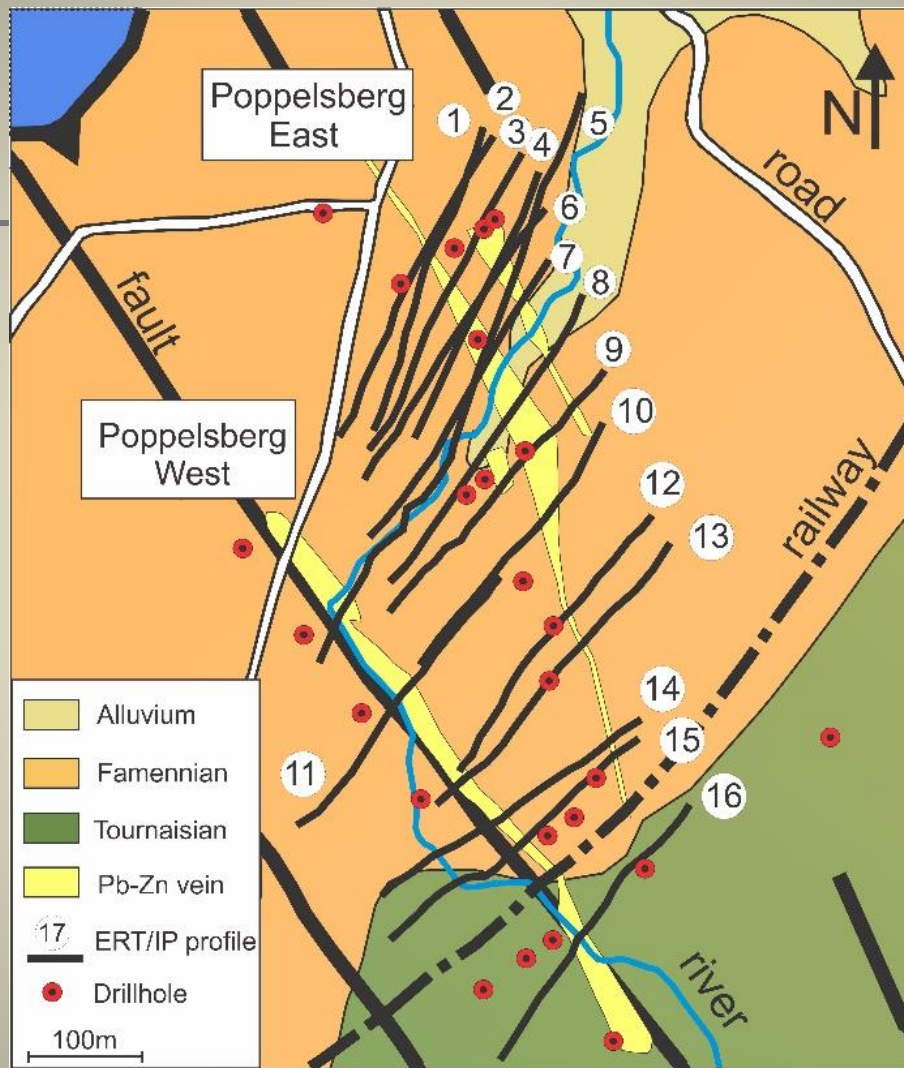

Incorporation of prior information

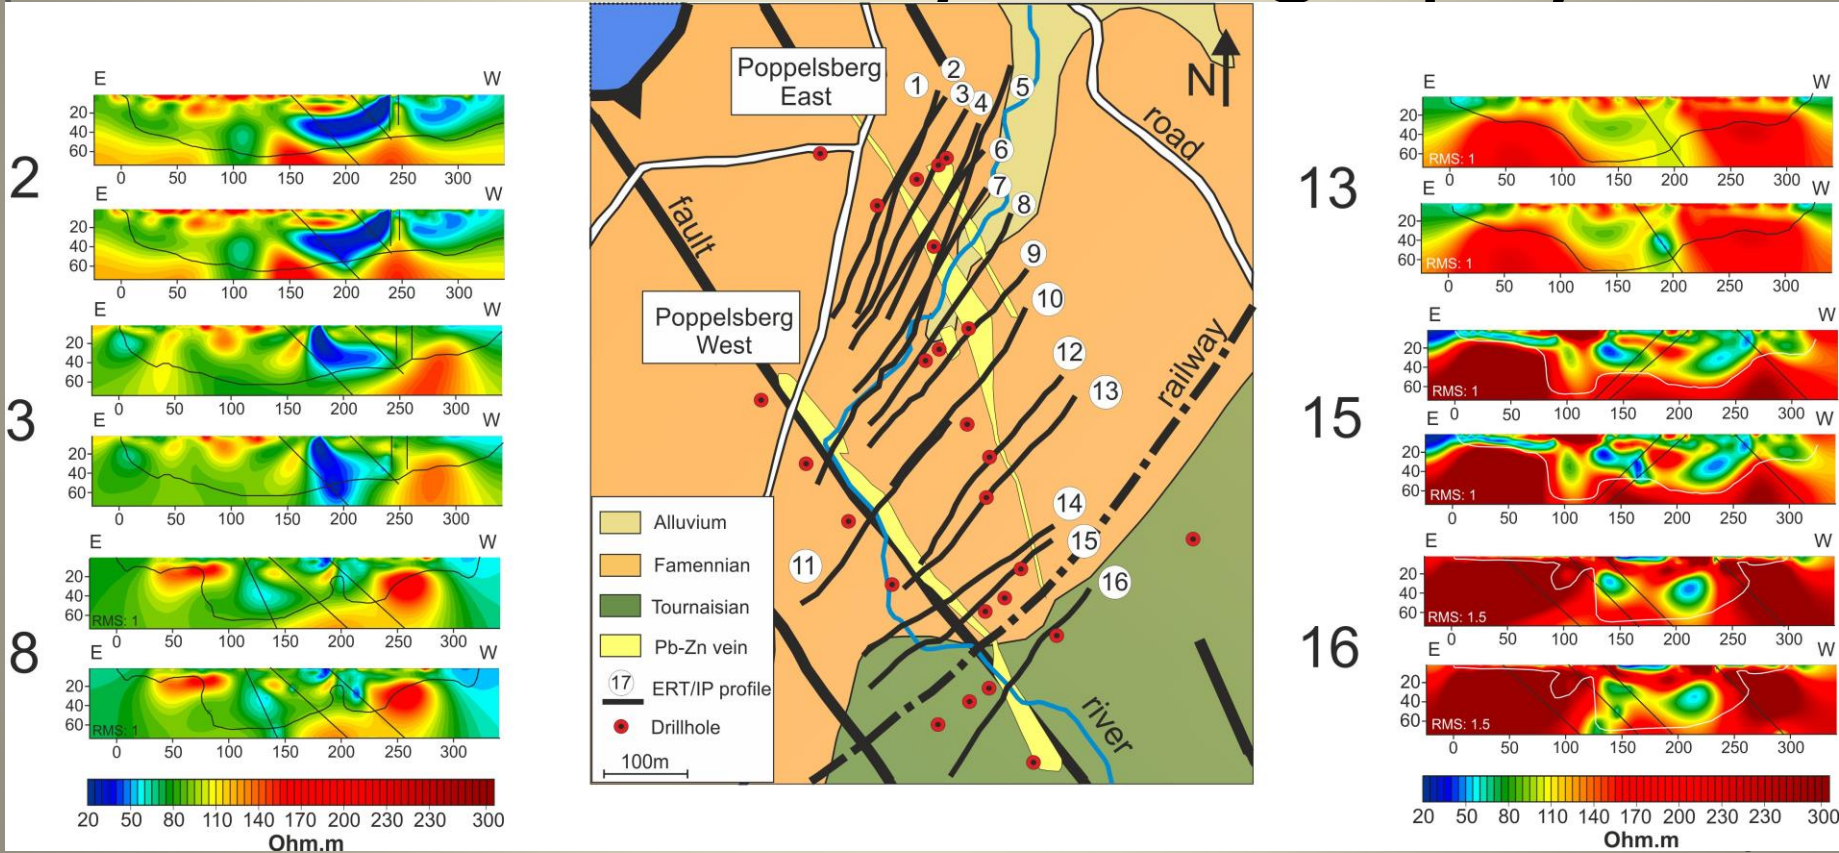

Step 2: Inversion using reference model with average resistivity + constraints

Electrical Resistivity Tomography

Incorporation of prior information

+

- Include ponctual reliable data in the model
- Decrease the number of mathematical solutions
- Local modification of the solution
- Reliable info beyond the DOI limit

-

- No petrophysical information about mineralization
- Ponctual information
- Projection of the data on the grid

Conclusion

- Constraints improve quality of the signal especially beyond the DOI at depth
- Improve the structure of the mineralization
- Weight and prior value have locally big impact (no petrophysical info)
- Careful with emplacement of the drill
- No geological info insert because of faults
