

First results in the use of milk MIR spectra in the detection of lameness in Austrian dairy cows

Axelle Mineur

Co-promoters:

Pr. Nicolas Gengler (GxABT)

Pr. Johann Sölkner (BOKU)

Supervisor:

Dr. Christa Egger-Danner (ZuchtData)

2017-09-21

Prevalence

- Varies greatly across farms (Austria and abroad)
 - On average: 20 - 40%
 - Certain farms: > 75%
- Many environmental factors
 - Pasture
 - Tie- or free-stall
 - ...

Importance of lameness

Locomotion scoring

- Assessment of lameness
 - Many systems
 - Based on levels
 - Differences in:
 - Gait
 - Back arch
- For this research
⇒ Sprecher *et al.*, 1997
 - Trained staff!

Objective

Assess the possibility of using milk composition to detect and predict potential lameness.

Lameness, metabolic disorders & milk composition

Theory

METABOLIC DISORDERS

- Body fat mobilization – Ketosis
- Sub Acute Ruminant Acidosis

Lameness, metabolic disorders & milk composition

Theory

METABOLIC DISORDERS

- **Body fat mobilization – Ketosis**
- Sub Acute Ruminant Acidosis

Body fat mobilization - Ketosis

1. F:P ratio \uparrow , NEFA, C18:1cis9
2. Citrate
3. BHB, acetone

1. Smaller feed intake
2. F:P ratio \uparrow , NEFA, C18:1cis9
3. Citrate
4. BHB, acetone

Body fat mobilization - Ketosis

1. F:P ratio
2. Citrate
3. BHB, a

ed intake
, NEFA,
one

Body fat mobilization - Ketosis

1. F:P ratio \uparrow , NEFA, C18:1cis9
2. Citrate
3. BHB, acetone

1. Smaller feed intake
2. F:P ratio \uparrow , NEFA, C18:1cis9
3. Citrate
4. BHB, acetone

Lameness & milk composition

Practice

Mid-infrared (MIR) spectroscopy

Milk samples

MIR analysis

MIR spectra

- Prediction
 - **Major milk components**
 - Fat
 - Protein
 - Urea
 - Lactose

Need of relevant data

“Efficient Cow” data

- July to December 2014
- FOSS instruments (FTIR-MIR)
- 9324 records (3895 cows, 122 farms)
- Classification
 - Sound = locomotion scores 1, 2
 - Lamé = locomotion scores 3, 4, 5
 - 8% of lame cows

RINDERZUCHT AUSTRIA (ZAR)

Calibrations using PLS-DA

- Calibration
 - 2/3 of records
- Validation
 - 1/3 of records

- Sensitivity = true positives
 - Truly lame
 - Locomotion scores: 3, 4, 5

- Specificity = true negatives
 - Truly sound
 - Locomotion scores: 1, 2

Results of calibrations

- All data
 - 11 latent variables (LV)

ALL*	Sensitivity (%) (lame)	Specificity (%) (sound)
Calibration	63	63
Validation	60	62

- Subsets

Results of calibrations

- Breed (% of lame records, locomotion score 3, 4, 5)
 - Brown Swiss: 5.6%, Simmental: 6.5%, Holstein: 9.5%
 - 11 LV

ALL subset		Sensitivity (%) (lame)	Specificity (%) (sound)
Simmental	Calibration	(71) +8	(62) -1
	Validation	(62) +2	(59) -3
Brown Swiss	Calibration	(68) -5	(70) +7
	Validation	(67) +7	(63) +1
Holstein	Calibration	(68) +5	(70) +7
	Validation	(43) -17	(71) +9

Results of calibrations

- Best result
 - Very specific lesion: Heel horn erosion

ALL subset	Sensitivity (%) (lame)	Specificity (%) (sound)
Calibration	(88) +15	(93) +20
Validation	(85) +15	(91) +19

Conclusions

- Interesting results of calibration
 - More research needed to confirm results
- Great variability – complex trait
 - Causes: potential opposite effects on milk composition
 - Breeds: difference predisposition to lameness
 - Parities: reflecting development and age differences
- More data needed => cover variability

Perspectives and ideas for future research

- Classical + Innovative data
 - Dairy cow performance
 - MIR, vet, hoof, sensor data
- Definition of novel traits
 - Lameness
 - Metabolic disorders

Perspectives and ideas for future research

- Genetic studies
 - Genetic variabilities
 - Correlations with other traits
- Develop genomic evaluations
- Collaboration with breeding association (AWÉ)
 - Wellness index => genomic evaluation services

First results in the use of milk MIR spectra in the detection of lameness in Austrian dairy cows

Sub Acute Ruminant Acidosis

1. Rumen pH
2. Bacteria in blood
3. Laminitis
4. F:P ratio ↓

Hypocalcaemia

- Ca deficiency
- Hoof horn quality ↓
- Weakness
- Claw lesions

Luckily:

RINDERZUCHT AUSTRIA (ZAR)

Calibrations using PLS-DA*

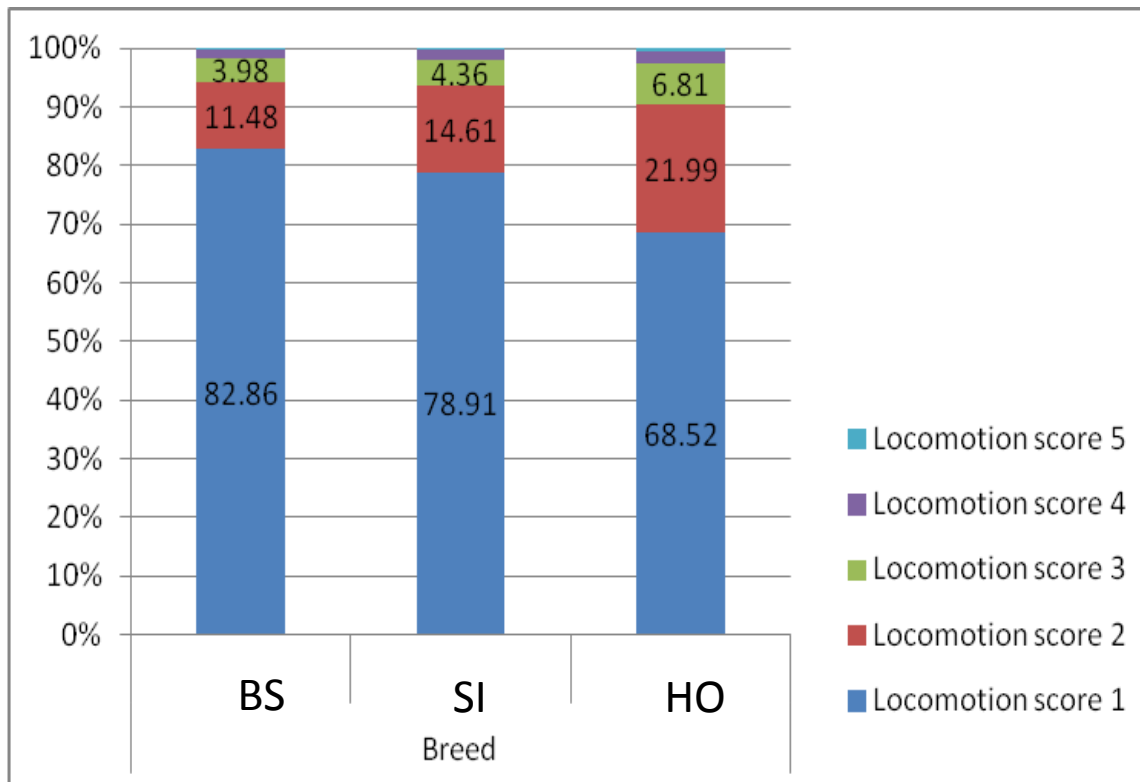

- Classic MIR
 - Spectra
 - ⇒ Sound or lame
 - Subsets

MIR predicted traits

Results of calibrations

- Breed (% of lame records, locomotion score 3, 4, 5)
 - Brown Swiss: 5.6%
 - Simmental: 6.5%
 - Holstein: 9.5%

Results of calibrations

- Parity (% of lame records, locomotion score 3, 4, 5)
 - Heifers: 2.49%
 - 7+ lactations: 16.3%

Results of calibrations

- Parity (% of lame records, locomotion score 3, 4, 5)
 - Heifers: 2.49%
 - 7+ lactations: 16.3%
 - 11 LV

ALL subset		Sensitivity (%) (lame)	Specificity (%) (sound)
Heifer (lact 1)	Calibration	(73) +10	(67) +4
	Validation	(56) -4	(65) +3
Young (lact 1 or 2)	Calibration	(71) +8	(59) -4
	Validation	(49) -11	(58) -4
Old (lact >2)	Calibration	(68) +5	(60) -3
	Validation	(60) =	(61) -1

Results of calibrations

- Complex relationship
 - Lameness
 - Milk composition
- Often better for specificity (sound) than sensitivity (lame)
