

# Beyond 256 shades of grey: Quantitative MRI for probing brain microstructure

# Studying structural organisation & plasticity?

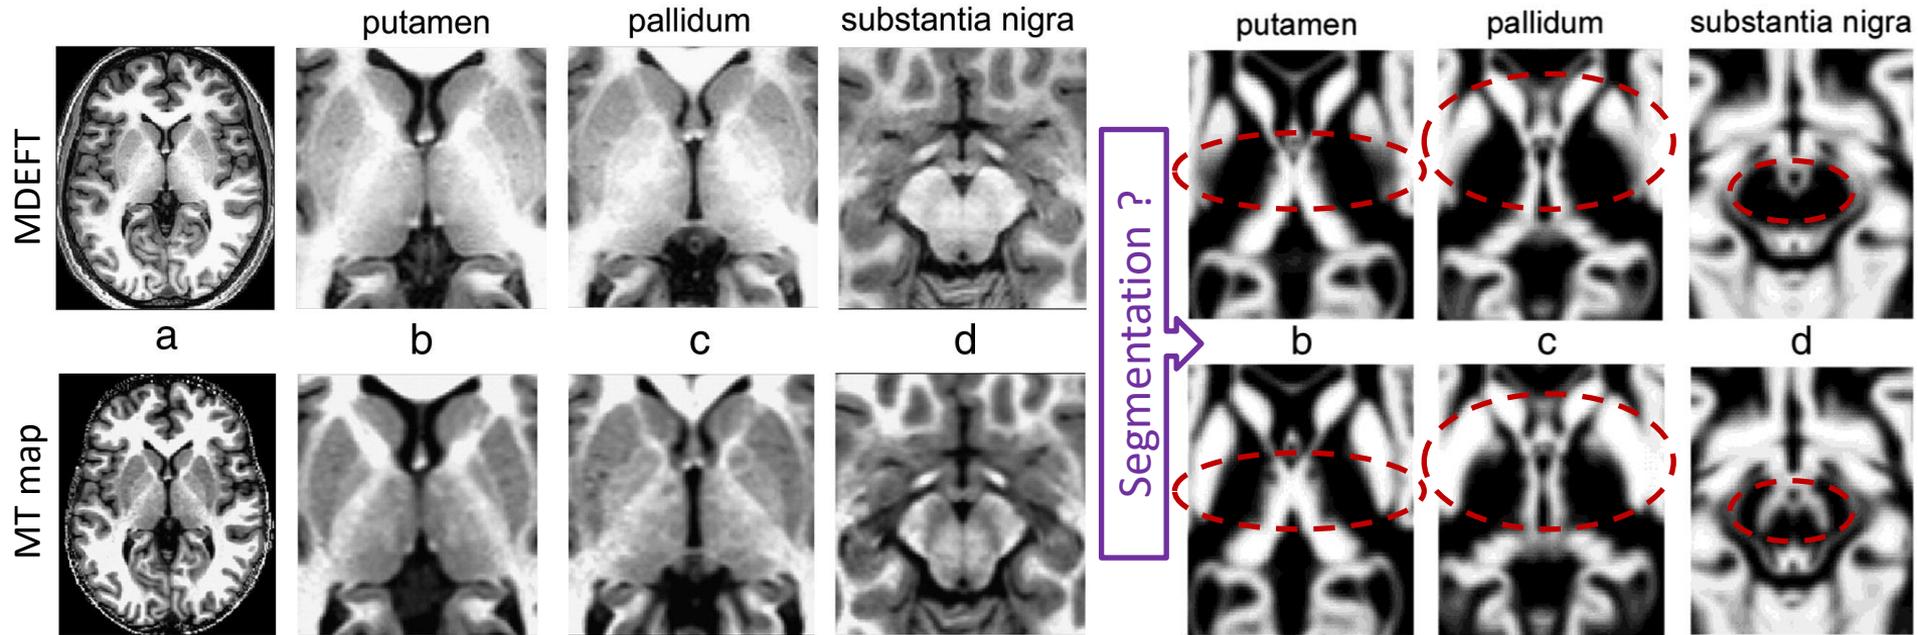

- ▶ T1-weighted MPRAGE image
- ▶ Observe differences across groups or changes over time

⇒ Macroscopical changes observable via **morphological changes** (i.e. in GM density, cortical thickness,...)

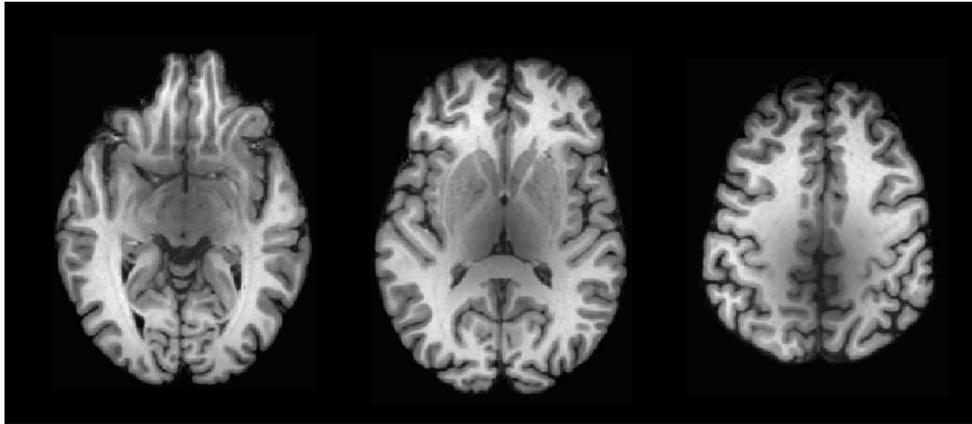

# Interpreting morphological differences

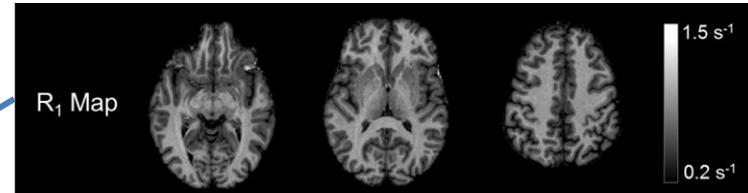

# Interpreting morphological differences

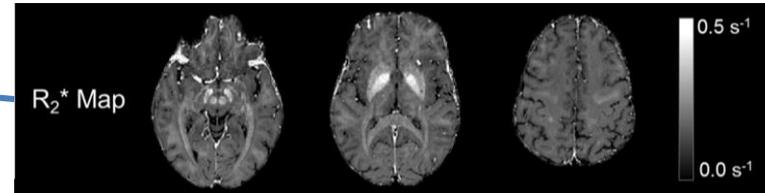

Signal Intensity = f ( sequence parameters,  
scanner hardware,  
physical MRI parameters )

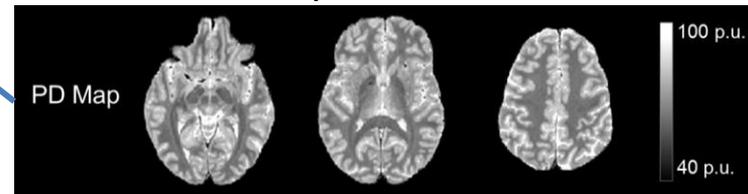

Longitudinal Relaxation Rate

Effective Transverse Relaxation Rate

Proton Density

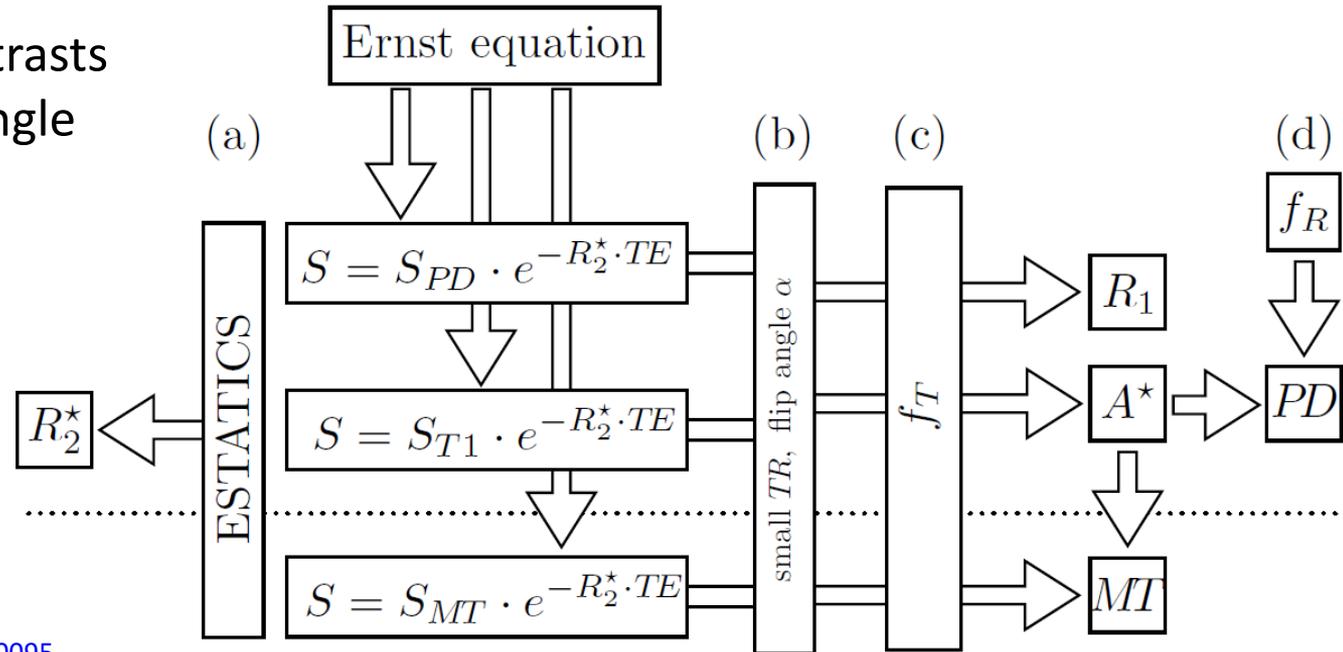

⇒ quantitative MRI

# Multi-Parameter Mapping (MPM) Protocol

## Whole-brain mapping of physical tissue properties:

- Fieldmaps ( $B_0/B_1^+/B_1^-$ )
- FLASH volumes
  - T1, PD, MT contrasts
  - Low/high flip angle
  - Multi TE
- Ernst equation

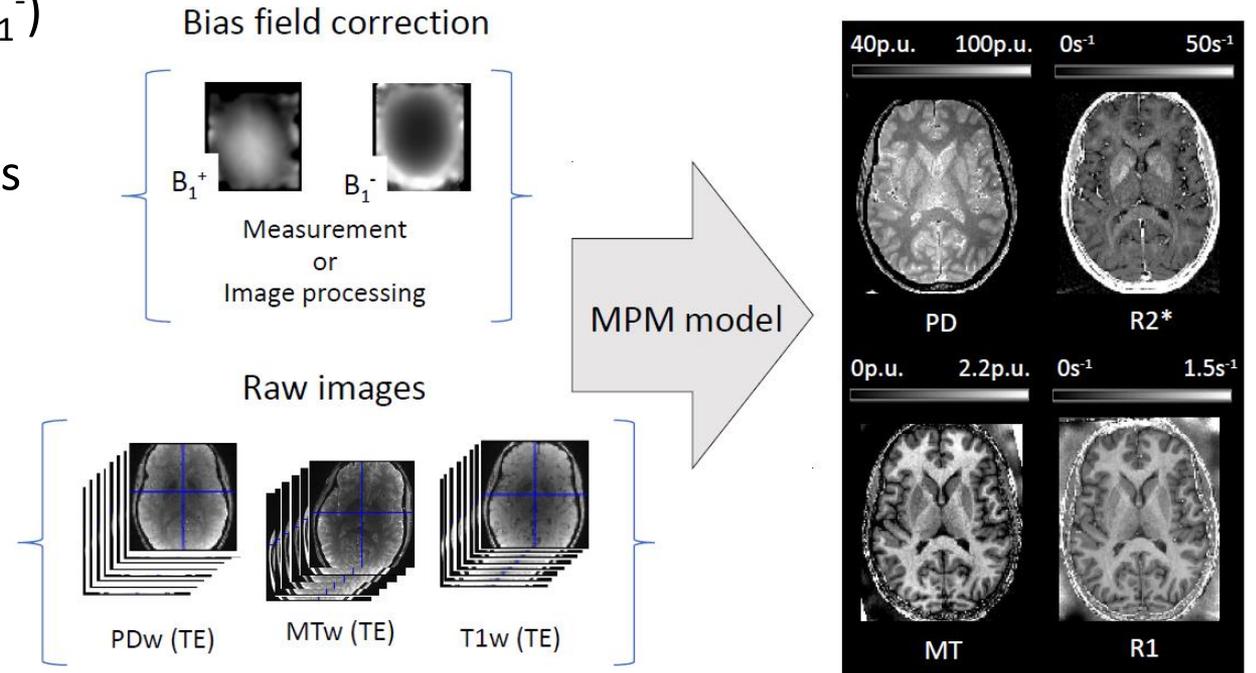

# Multi-Parameter Mapping (MPM) Protocol

## Whole-brain mapping of physical tissue properties:

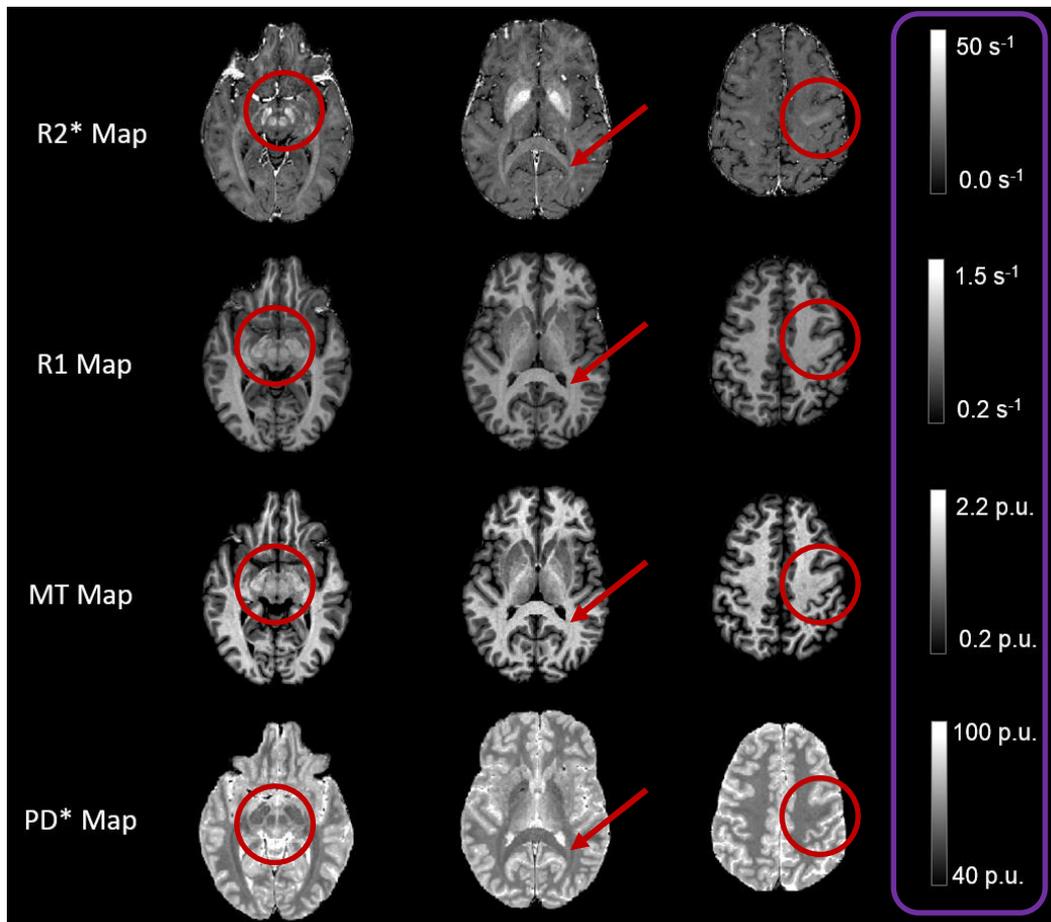

- Fieldmaps ( $B_0/B_1^+/B_1^-$ )
- FLASH volumes
  - T1, PD, MT contrasts
  - Low/high flip angle
  - Multi TE
- Ernst equation

NIfTI images and JSON metadata (acquisition parameters: flip angle, TE, TR, MT on/off, ...)

NIfTI images and JSON metadata (processing parameters & description)

# MPM Protocol results

## Four quantitative MRI (qMRI) parameters

- Down to 800 $\mu$ m isotropic resolution with whole brain coverage
- Includes calibration for transmit and receive fields
- Less than 30 minutes scanning at 3T

# qMRI interpretation

R2\*

# Inter-individual differences: Aging

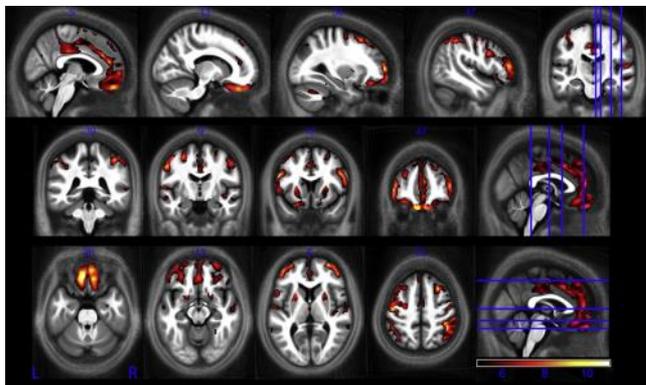

Broad age-related effects ( $p < 0.001$  uncorrected, for display purpose only)

# Inter-individual differences: Aging

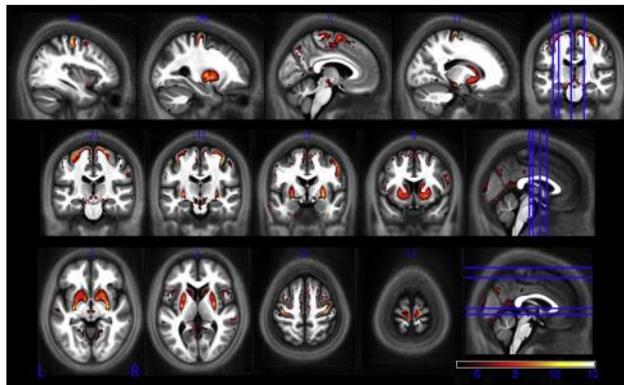

Age-related effects ( $p < 0.05$  FWE corrected) per map

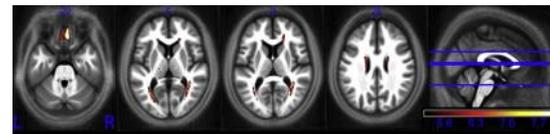

GM atrophy

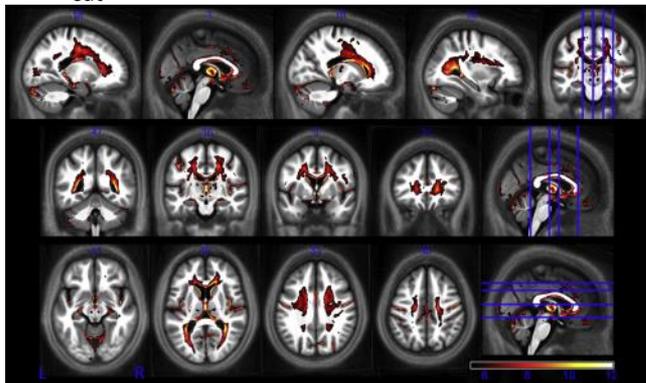

R2\* increase

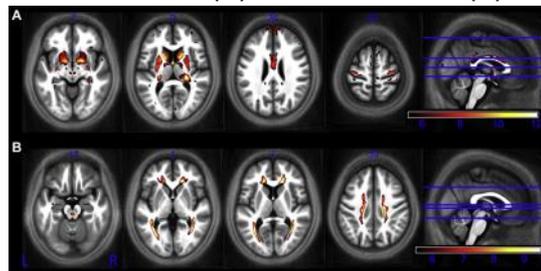

R2\* decrease

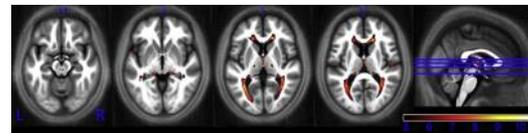

MT<sub>sat</sub> decrease increase

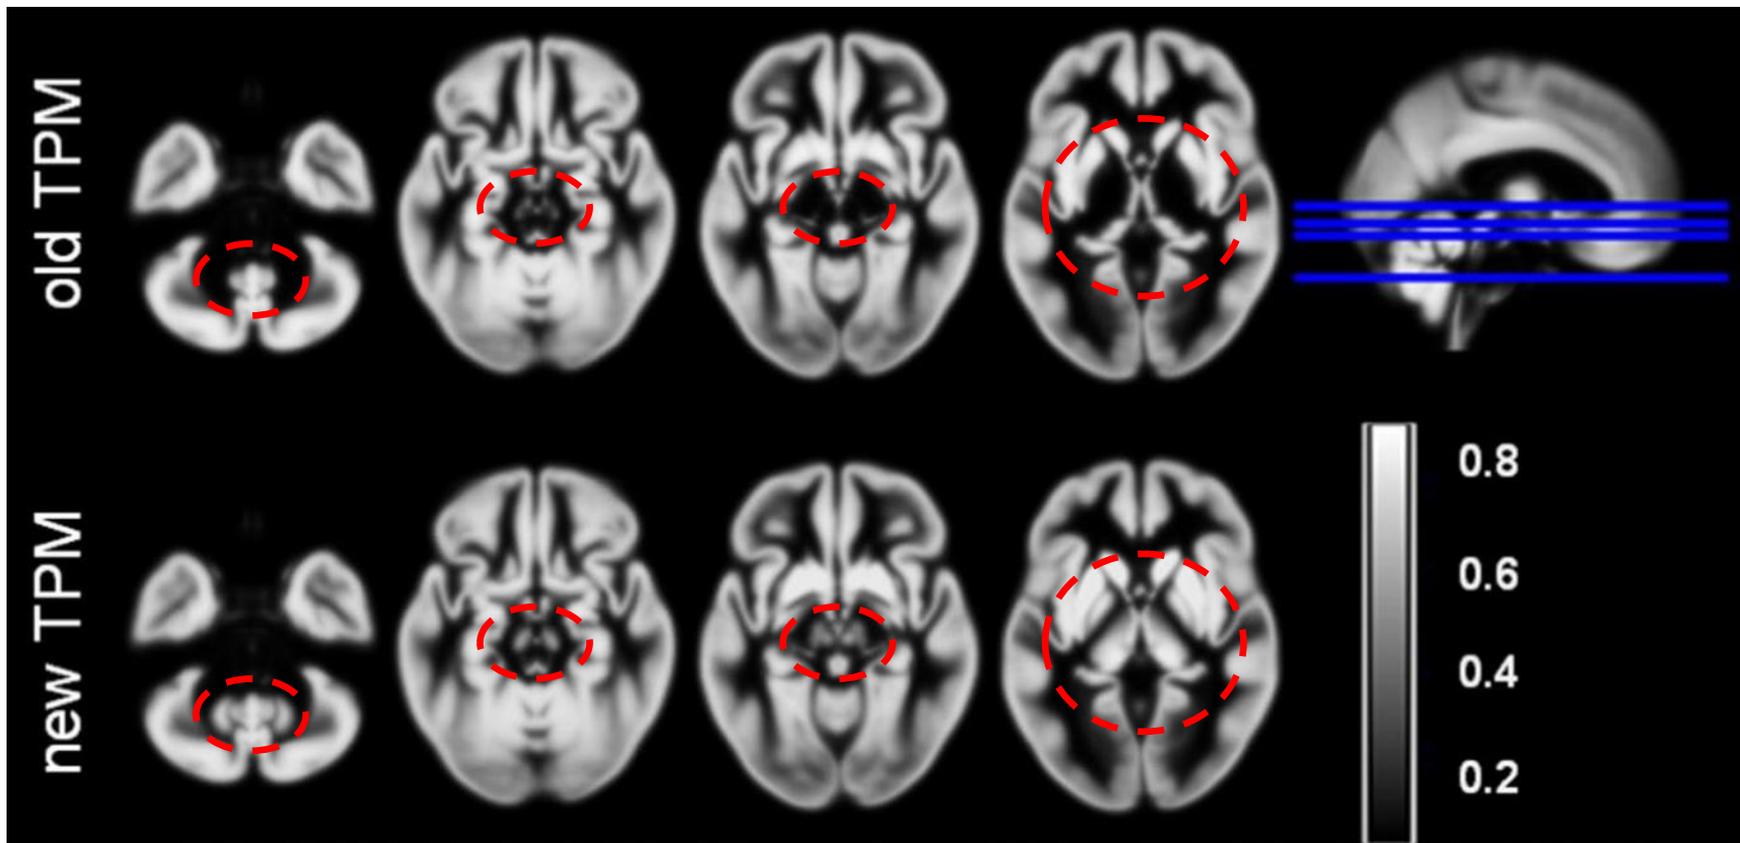

PD decrease (A) and increase (B)

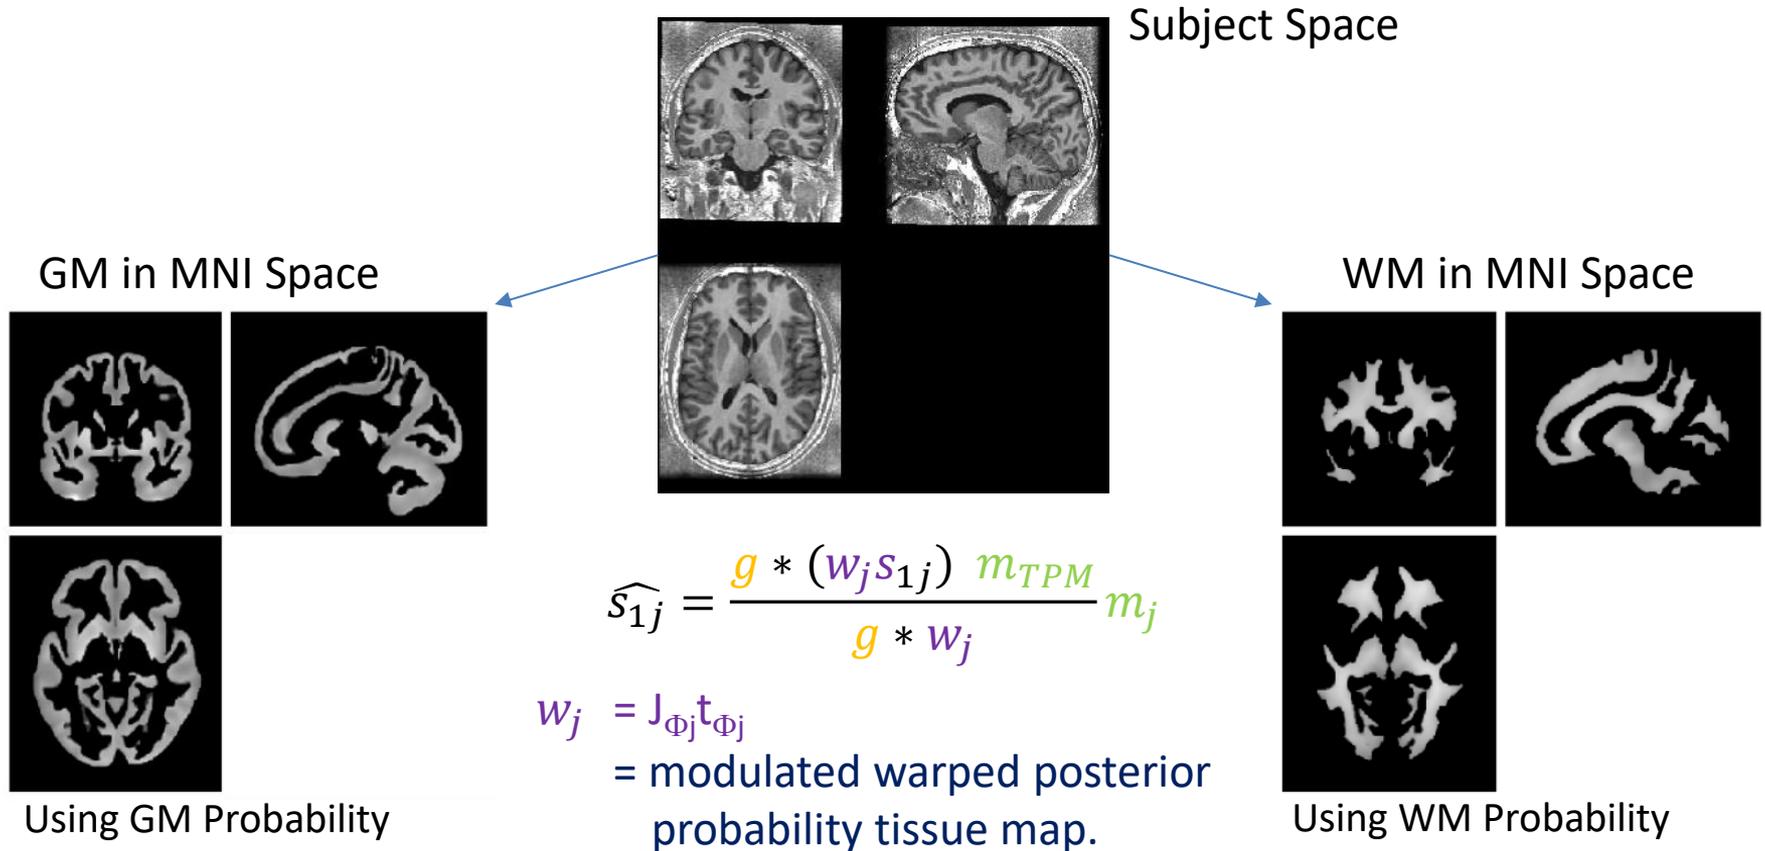

R1 decrease

# Segmentation issue: tissue probability maps

# VBQ: warping & tissue-weighted smoothing

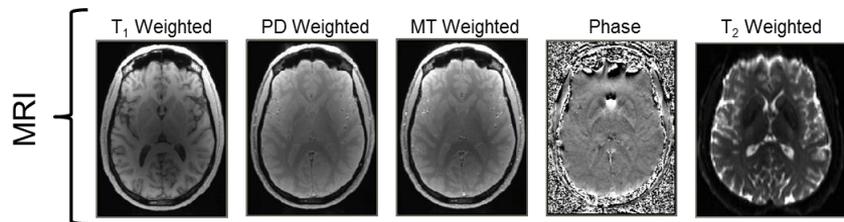

# Conclusions

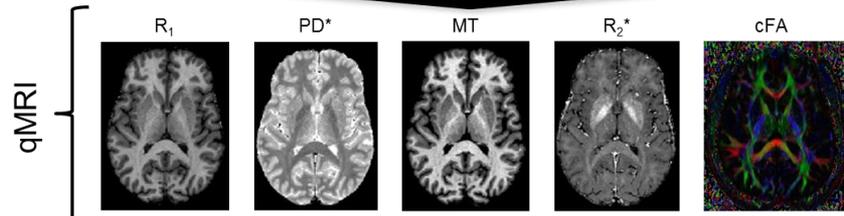

- ▶ Morphometry still useful but...
- ▶ qMRI biomarkers
  - enhance specificity
  - disentangle effects via multi-modal quantification
  - reproducible across scanner
- ▶ getting closer to *in vivo* histology using MRI
  - follow tissue changes w/o (or before...) volume changes
  - (explore structure/function relationships)

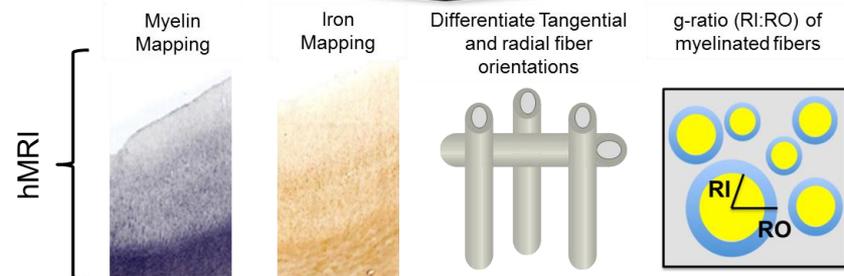

# In vivo histology using MRI (hMRI)

Physical Models

Biophysical Models

Begin by getting quantitative maps of specific parameters

The ultimate target is biological mapping

# Perspectives

- ▶ Improve MRI acquisition sequence:  
speed, SNR, resolution, different scanners,...
- ▶ Improve image reconstruction & processing:  
noisy voxels, automatization, data & meta-data organization (BIDS),...
- ▶ Linking to neuro-biological tissue properties:  
combining with PET, clinical applications,...
- ▶ Need specific software tool:  
e.g. “hMRI toolbox” (SPM add-on) & qMRlab to create and process maps
