Regional variation in the *Coffin Texts*,

A study of sentence structure, verbal structure and graphical forms

PhD thesis submitted by Jorke Grotenhuis for the title of Docteur en Langues, Lettres et Traductologie, under supervision of Jean Winand

Année académique 2020 - 2021

List of abbreviations, terminology and other technical information ............................................. L

1. Introduction ............................................................................................................................. 1
   1.1. Regional conditioned variation ....................................................................................... 1
   1.2. Aims of the study .............................................................................................................. 3
   1.3. Corpus .............................................................................................................................. 4
   1.4. Data set ............................................................................................................................. 7
   1.5. History of scholarship ....................................................................................................... 8
   1.6. Structure of the Research ............................................................................................... 10
   1.7. Approach .......................................................................................................................... 10

2. Database and encoding .......................................................................................................... 17
   2.1. Database encoding .......................................................................................................... 17
       2.1.1. Main encoding table ................................................................................................. 18
       2.1.2. Lemma table ............................................................................................................ 22
       2.1.3. Sentences table ........................................................................................................ 23
       2.1.4. Spellings table ......................................................................................................... 24
       2.1.5. Coffins and spells tables .......................................................................................... 25
       2.1.6. The encoding process ............................................................................................. 25
   2.2. Encoding in practice ......................................................................................................... 27

3. Visualising regional variation using sentence structure ......................................................... 33
   3.1. Introduction ..................................................................................................................... 33
   3.2. Method ............................................................................................................................. 33
       3.2.1. Analysis ..................................................................................................................... 33
       3.2.2. Spells as proteins ...................................................................................................... 37
   3.3. Spell 1 ............................................................................................................................... 43
       3.3.1. Introduction .............................................................................................................. 43
       3.3.2. Results and discussion ............................................................................................ 45
3.12. Spell 10 ................................................................. 71
  3.12.1. Introduction ....................................................... 71
  3.12.2. Results and discussion ........................................... 72
  3.12.3. Conclusions ....................................................... 74
3.13. Spell 11 ................................................................. 74
  3.13.1. Introduction ....................................................... 74
  3.13.2. Results and discussion ........................................... 75
  3.13.3. Conclusions ....................................................... 76
3.14. Spell 12 ................................................................. 77
  3.14.1. Introduction ....................................................... 77
  3.14.2. Results and discussion ........................................... 78
  3.14.3. Conclusions ....................................................... 80
3.15. Spell 13 ................................................................. 80
  3.15.1. Introduction ....................................................... 80
  3.15.2. Results and discussion ........................................... 81
  3.15.3. Conclusions ....................................................... 82
3.16. Spell 14 ................................................................. 82
  3.16.1. Introduction ....................................................... 83
  3.16.2. Results and discussion ........................................... 84
  3.16.3. Conclusions ....................................................... 85
3.17. Spell 15 ................................................................. 85
  3.17.1. Introduction ....................................................... 85
  3.17.2. Results and discussion ........................................... 86
  3.17.3. Conclusions ....................................................... 87

Acknowledgements

As any endeavour in live, it is impossible to do anything entirely on my own, so hereby I would like to give thanks to the following people.

First and foremost, I would like to thank my supervisor Prof. Dr Jean Winand (ULiège). Without all his aid, support and suggestions I would not have been able to perform this research, nor would it have become what it is today. Secondly, I would like to thank the Anneliese Mayer Research Award introduced by Prof. Dr. Joachim Fr. Quack (Universität Heidelberg), awarded to Prof. Dr. Jean Winand, which allowed me the opportunity to expand my horizons by joining the Thot Sign List project, and which provided the funding to pursue this work. Additionally, I would like to thank Stéphane Polis, who was not only my supervisor for the Thot Sign List project, but was willing to answer my never-ending barrage of questions, and always provided good suggestions or comments in regard to my work on both the sign-list and this thesis.

Next, I would like to thank the following people for their invaluable aid. First, Prof. Dr. Olaf Kaper (Universiteit Leiden), who not only supported my application to the position in Liège, but additionally gave me access to the De Buck archives in Leiden, which provided me with all the photographic material I could need for this work. For the same reason, I would like to thank The Netherlands Institute for the Near East (NINO). Additionally, I would like to thank Dr. Koen Donker Van Heel, who supported my application to the position in Liège. I would like to thank Patricia Rigault and the Musée de Louvre, who gave me access to the photographic material and the actual coffins in the collection of the Musée de Louvre. I would like to thank Tobias Konrad (Johannes Gutenberg-Universität Mainz), who gave me access to his Master thesis, about a coffin (M1Be), which is not yet published, and as someone who works in the same field, was a great source of discussion regarding our subjects. I would like to thank Dr. Kata Jasper, who was willing to share her PhD thesis with me, which was extremely helpful to me. Moreover, she was willing to proofread my thesis, through which she provided many suggestions for improvement. I would like to thank Prof. Dr. Carlos Gracia Zamacona, who gave me access to his unpublished PhD thesis, and all his articles, including an unpublished one, which was of great aid to me for the verbal aspect of the Coffin Texts.

Additionally, I would like to thank Pieter Valkema, who helped me with the bio-informatica section of this work. Without his help, chapter 3 and 4 would not have been possible. I would like to thank Mathias van der Leeuw, who helped me with the medical definitions and literature, and who was willing to proofread my thesis.

Furthermore, I would like to thank Dr. Aurore Motte, Dr. Laurence Neven and Dr. Nathalie Sojic for their willingness to proofread this work, and all their useful suggestions and comments. In the same vein, I would like to thank Lucas Ausems and Dr. Jan Vos, for their aid in proofreading this work. I would like to
thank Dr. Matthijs Wibier as well, for his willingness to proofread nearly everything I have written during my career in Egyptology, and all his advice.

I would like to thank all my colleagues in Liège, Emmanuella Ahishakiye, Valerie Elias, Andrea Fanciulli, Dr. Thanasis Georgakopoulos, Anne-Claude Honnay, Guillaume Lescuyer, Jean-Luc Maloir, Dr. Michèle Mertens, Dr. Hamid Moein, Dr. Aurore Motte, Dr. Laurence Neven, Dr. Renaud Pietri and Dr. Nathalie Sojic for all their aid, suggestions and help keeping me sane during the last four years. Additionally, I would like to thank all my many colleagues over the world, who I have had the privilege to meet, and with whom I had many fruitful discussions, who are too numerous to mention here.

Finally, I would like to thank my friends and family, who supported me though all these years. I wish to especially thank my parents, Henri and Greet Grotenhuis, for all their support and willingness to listen to me when I (as usual) talked with way too much detail about my subject.

I would like to end these acknowledgments with a slightly adapted phrase from CT spell 398: lmt nb.t smh.t n-i m-rmt.w ipw nis.t n-i in nfr.w: Everyone who I have forgotten among these people, are those who are invoked for me by the gods!
List of abbreviations, terminology and other technical information

All the hieroglyphic transcripts were made by using the JSesh Hieroglyphic Editor,\(^1\) with the exceptions of single signs, which were added using Unicode. For the terminology of hieroglyphic functions, the taxonomy of Polis and Rosmorduc was used.\(^2\) For the place names in Egypt, the standardized forms of the Digital Topographical Bibliography were used.\(^3\)

List of terminology used in this work:

Dendrogram: A diagram representing a tree.

Early period of coffin decoration in Deir el-Bersha:

Graphical form: The 2-dimensional format representing the positions of hieroglyphic signs within a word.

Later period of coffin decoration in Deir el-Bersha:

Owner: Person named on the support. Note that due to usurpation, it is possible for one support to have multiple owners.

Phrase: Unit of text, comprising of a functional clause.

Spelling: The sequence of hieroglyphic signs used to write a word, without regard for their 2-dimensional interaction.

Support: The object which carries the Coffin Texts, usually a coffin. Note that it is possible for one support to provide two or more witnesses.

Token: A unique entry in the database with an Id number, usually used for a single word.

Unique variation: A variation which does not occur in the same position in any other witness.

Unique phrase: A phrase which varies in one or more aspects from all other witnesses with the same phrase.

Witness: A single variant of the Coffin Texts.
1. Introduction

1.1. Regional conditioned variation

At a first glance, the culture of ancient Egypt might be considered monolithic and singular. However, this view would be too limited, and simplistic at best. As humanity has proven time and time again, their actions are rarely simple or singular. In a country of the size of Egypt, especially in ancient times, it cannot be assumed that all their material culture would have been created in one location, using one style only. Rather, one needs to assume that with the exception of some items, the material culture of ancient Egypt should have been created on a more local level, within the different regions of Egypt. This should allow the introduction of local preferences, which could lead to local traditions.

It would be assumptive if this was not the case for language as well. Based on a quick comparison to any modern country, dialect should have existed in ancient Egypt, which is sometimes called ‘The Common Sense Principle’. This is visible as well in a text from the 19th dynasty, in a line from the letter of Hori to Amenemope: `st mi md.t n s idH.w hn' s n sbw ‘It (his words) are as the words of a man of the Delta together with a man of Elephantine’. Another example of socio-linguistic variation, although more diastratic than diatopic, can be found on the stela of Mentuweser: `ink mdw r r-² sr.w šw.y m qd pš.w (I am one who spoke according to the style of the officials, one who is free of saying pš). Mentuweser makes it clear here that he did not use the ‘low’ speech of the people. However, as Kupreyev argues that the article pA originates from the dialect of the north, even in a diastratic examples there are signs of dialect. Thus, that there were dialectal differences in Egypt was even noted in ancient Egypt itself.

However, to prove and document the different dialects in ancient Egypt is an entirely different manner. Any study in ancient Egyptian dialect is generally hampered. First and foremost, the language is no longer in use, which reduces the availability of material that can be studied to written sources only. This creates the issue that the discovery of phonological iso-glosses is severely restricted, as Winand states: ‘to say the least, hieroglyphic writing has never been very cooperative in this respect’. Moreover, these written sources only reflect a minority of the material produced in Ancient Egypt. Finally, the written

6 Fischer-Elfert (1983), p. 157; Fischer-Elfert (1986), p. 238. However, it needs to be noted that the interpretation is problematic.
7 Polis (2018), p. 68-72. Diastratic variation is linguistic variation based on the social dimension.
8 Polis (2018), p. 66-68. Diatopic variation is linguistic variation based on the geographical dimension.
9 Ransom (1913).
11 However, Allen (2009), 267-269, suggest to read qd pš as ‘antiquated speech’ instead, reflecting the early Middle Kingdom tendency to ‘consciously adopt Memphite froms of the Old Kingdom in their art and architecture.’
material was produced by a small segment of the population that was literate.\textsuperscript{15} These issues make any distinct study of dialect in ancient Egypt problematic.

A definition of dialect is ‘any variety of a language spoken by a group of people that is characterized by systematic differences from other varieties of the same language in terms of structural or lexical features’.\textsuperscript{16} Although dialect is often connected with phonetic features, this is far from being the only criterion. A regional structural pattern could find itself in use even though the regional phonetic format is not visible. For example, the word ‘needs’ in English is most commonly followed by a gerund. For example: ‘the yard needs mowing’. However, in Texas, United States of America, it is possible to complement ‘needs’ with a passive participle instead. For example: ‘the yard needs mowed’.\textsuperscript{17} The intention is clear, even though the structure of the phrase changes noticeably.

It could be argued that these variations could be inserted into the written language, consciously or unconsciously. Although it is not intended to claim that a close study of the same texts from different locations can provide a structure of a dialect concerning ancient Egyptian sources,\textsuperscript{18} it should be possible to create distinctions between different regions based on structural or lexical features. It is the intention in this work to show different methods for approaching regional variation patterns in the text, even though it is outside the scope of this work to actually create a framework of dialect in ancient Egypt.

Ideally, there could be a case made for the inclusion of additional features into what is considered dialect. In ancient Egyptian scripts, which consist of a higher number of graphemes that are generally used by modern languages, it could be possible to discover regional preferences in the uses of specific graphemes, or in their underlying structure.\textsuperscript{19} One could wonder if this should not be included into the commonly understood definition of dialect, under the requirements that it is systematic, on a structural level. If true, it could be argued that for scripts like Egyptian hieroglyphs, the structural features of a dialect could include the visual representation as well.\textsuperscript{20}

Although research into dialect in pharaonic Egypt is not a new concept,\textsuperscript{21} these approaches are usually on a diachronic axis,\textsuperscript{22} i.e. discussing a chronological progression, and most commonly limited to Coptic, where research concerning dialect is less disputed.\textsuperscript{23} This diachronic approach is the primary approach in textual criticism as well, where the focus lies on making families of manuscripts, and form these families

\textsuperscript{16} Bergmann, Hall, & Ross (2007), p. 407.
\textsuperscript{17} I am indebted to Dr. Christian D. Casey for providing this example to me.
\textsuperscript{18} As the provenance of a text does not mean that it is where the text was composed.
\textsuperscript{19} Regulski (2018), p. 262.
\textsuperscript{20} Which can be seen in the graphical form of the name of the god Ha in Asyut, which is remarkably distinct from the habitual graphical form of the name in other regions. See Jasper (2019), p. 48-56. However, it would suffice to consider this regionalism, rather than dialect, as dialect is normally restricted to linguistic phenomena.
\textsuperscript{21} Edgerton (1951); Roquet (1979); Allen J. P. (2004); Gundacker (2010); Uljas (2010,a); Allen J. P. (2013), p. 5-6; Kupreyev (2014); Winand (2015); Gundacker (2017); Winand (2018).
\textsuperscript{22} Polis (2018), p. 60-61.
based on their dependencies into a stemma.\textsuperscript{24} However, a stemma does not necessarily reflect the regional aspect.\textsuperscript{25} In textual criticism, more focus is placed on the chronological development of a text, rather than the variations that occur in the actual texts, or to visualise their shared regional patterns.

In this work, the focus lies rather on a diatopic approach. Thus, instead of providing a familial connection over time, a distinct period will be chosen, where the different witnesses of a text are compared without creating a chronological distinction. Thus, the origin of the actual support is compared, not their linguistic heritage.

1.2. Aims of the study

In this work, the \textit{Coffin Texts} are used as a text corpus in order to visualise regional variation, on the level of sentence structure, verbal structure and verbal use. As an actual study of dialect in the Pharaonic period should be considered out of reach,\textsuperscript{26} this study intends to approach the next best thing, namely linguistic regional patterns in the language. However, as only limited research has been performed on this level,\textsuperscript{27} the scope of this study is not to provide lists of regionally conditioned morphologies or structures, but rather to provide the means to visualise the existence of these patterns. Thus, it is intended to show that these patterns exist, rather than explain what these patterns are. Due to the limitations of the ancient Egyptian language, and especially the limited amount of material that has survived the ages, it would be impossible to actually create these types of lists without knowing where to look for these variations. In this case, the focus of the work lies on the aspect of what happens, rather than explain why something happens. Therefore, the quantity of variations, rather than the quality of variation is the focus of this work. Thus, the work performed in this study is rather considered a first epistemological step on the road, that would hopefully lead to distinguishable patterns, rather than to provide these patterns.

Additionally, it is intended to show the possibilities of automatization in this process by using algorithms, searchable databases and visualisation programs, which will be discussed in detail in the following chapters. By using these ‘modern’ tools, the Egyptologist will, to some extent, be removed from the process of comparison, in order to reduce underlying biases, and allow for the reproduction of the results by other studies. Moreover, it is intended to show the functionality of the processes detailed in this work, even though only based on one type of texts. However, it is intended to suggest that the methods described in the following chapters could not only be implemented in other types and stages of the ancient Egyptian language, but exported to any other written language as well.

However, the method used is not intended as a system suited for diachronic approaches to the text, nor to create or imply ancestry files regarding the texts studied. Thus, it is not the intention of this work to

\textsuperscript{25} Although aspects of the diatopic axis will be serviced as well.
\textsuperscript{26} Loprieno (1982), p. 76-77.
\textsuperscript{27} As Polis (2018), p. 68, states: ‘there can be no doubt that the dialectal study of pre-Coptic Egyptian is still in its infancy’.
create a history of a specific text, rather the focus lies solely on the resulting witnesses, and if it is possible to visualise patterns on a regional level in these resulting witnesses.

Second, this work will not concern itself with a palaeographical study of the texts, rather only a linguistic approach is used. Thus, the structure of the text, rather than the graphical form of the hieroglyphs will dealt with in this study. Although this would be highly desirable, it falls outside the scope of this study.\(^{28}\)

Third, although full transliterations and translations for the studied spells and witnesses will be provided, as these form the basis on which the further research is based, these translations are not intended as additions to or replacements for existing translations.\(^{29}\) Nor is it intended to provide social, historical or religious context for these spells.

### 1.3. Corpus

For the purposes of this work, the Coffin Texts were chosen as a text corpus. First and foremost, it needs to be stated that the distinction of Coffin Texts as a separate entity is fraught with problems, as it is rather a part of the mortuary liturgies\(^{30}\) which constantly developed during the pharaonic period, and beyond.\(^{31}\) Moreover, although seemingly treated as their own entity, the Coffin Texts should be considered part of the decoration pattern of Middle Kingdom coffins. This decoration was clearly guided by underlying principles, which Willems calls ‘grammaire du sarcophage’,\(^{32}\) echoing the decoration principles of Graeco-Roman temple construction known as ‘grammaire du temple’.\(^{33}\) However, the terminology is functional, as in general terms the Coffin Texts appear in the Middle Kingdom,\(^{34}\) as first suggested by Schenkel.\(^{35}\) Additionally, it needs to be noted that some spells originally considered Coffin Texts have been attested in the Old Kingdom as well.\(^{36}\)

The corpus currently known to Egyptologists as the Coffin Texts was in use in the Middle Kingdom, although the composition of some of these texts did occur in an earlier period.\(^{37}\) For example, spell 313 is currently known from one witness from Deir el-Bersha only (BSC), but based on its metrics and the frequent references to Heracleopolis it is suggested that the text itself could be dated to the Heracleopolitan period.\(^{38}\) The tradition of inscribing mortuary liturgical texts on coffins remained in use,

---

\(^{28}\) However, at the time of writing, Tobias Konrad is performing his PhD research project on the cursive hieroglyphic script of the Coffin Texts. See: Konrad (2017), The Use of Cursive Hieroglyphic Script on Middle Kingdom Coffins. https://doi.org/10.5281/zenodo.1306342 (accessed 13-05-2020).

\(^{30}\) However, as von Lieven (2019), p. 115, points out, the Coffin Texts were not solely funerary.

\(^{33}\) Derchain (1962).

\(^{34}\) Willems (2014), p. 133-134.

\(^{35}\) Schenkel (1962), p. 116-123.

\(^{38}\) Buchberger (1993), p. 470-471. I am endebted to Dr. Kata Jasper for drawing my attention to this spell.
although its popularity diminished over time. In the Memphite and Theban regions, the use of Coffin Texts was most prevalent in the early part of the Middle Kingdom. However, in Middle Egypt, the use remained popular for a longer period. It might be significant as well that the decline in the popularity of using Coffin Texts can be correlated to the decline of the power of the Middle Kingdom nomarchs.

Originally in Egyptology, the occurrence of Coffin Texts was attributed to the ‘democratisation’ of the mortuary liturgies, where the Pyramid Texts, which were solely intended for royalty, became more widely used in Egypt. This was suggested to be related to the upheaval in Egypt during the First Intermediary Period, where due to the fragmentation of central rule, the material which was considered royal became available to a wider section of the population. This scholarly view most likely resulted from the period of upheaval in the world when this theory developed. However, as Willems points out, the earlier occurrence of Coffin Texts than the Middle Kingdom, makes this position problematic. Therefore, it might be better to consider the Coffin Texts as part of a wider collection of liturgies of mortuary texts, instead of a distinct entity, which can be supported as well by the fact that Pyramid Texts and Coffin Texts occur on the same support together. This melange is visible in the linguistic position of the Coffin Texts as well, which features aspects of Old Egyptian and Classical Egyptian.

It should be noted that the accessibility by the Ancient Egyptians to Coffin Texts should be considered limited at best. An extensive study by Willems shows that only a minute section of the ancient Egyptian population would have had decorated coffins, with only a fraction of these coffins being decorated with Coffin Texts (only 0.068% of the population would have had a coffin with Coffin Texts). Thus, it can be assumed that the use of Coffin Texts was still limited to the elite of the elite (the upper upper class). Additionally, although there is seemingly no restriction to the availability of Coffin Texts in Egypt itself, the majority of the sources are limited to three major regions, namely the Memphite region, the Theban region and Middle Egypt. Thus, it seems that this type of decoration was more popular in these major regions than in the other parts of Egypt.

The corpus of the Coffin Texts is usually considered to originate from the Memphite region. However, Lapp suggests Deir el-Bersha as a possible origin, based on the coherency of the spell sequences. Gestermann provides an explanation for the vastness and variety of the material that retains this Memphite origin. She suggests that the funerary text material which was used in the Memphite region was taken over by the Theban court, and then moved away from the Memphite region. However,

---

42 Moret (1922).
43 For a full history of the development and current applicability of this theory, see Willems (2014), p. 124-135.
44 Willems (2014), p. 133-134, with further literature.
48 Willems (2014), p. 165-167. Aswan and Gebelein are two examples of Coffin Texts sources outside these regions.
instead of moving the material directly to Thebes, she suggests that the archive of texts was first moved to Hermopolis, which became the centre for diffusion of Coffin Texts. So, due to what Willems calls the ‘Theban policy’ of the Theban court, the vastness and variety of material at Deir el-Bersha might be the result of the relocation of this material to Hermopolis, rather than being the origin of the texts. Additionally, it might be unwise to identify one region only as the origin of such a broad corpus of texts. Although the Memphite region most likely provided a sizable section of the material, it should not be assumed that all material considered as Coffin Texts would have the same origin.

More pragmatically, the Coffin Texts were chosen as corpus for this work, as methodologically a substantial corpus of the same texts from different locations was required. The publishing method used by de Buck is highly useful to linguistic variation studies, as it places the same phrases from different witnesses next to each other. Finally, this corpus limits the period studied to material dated to the 11th and 12th dynasty. However, due to uncertain dates of some supports, witnesses outside this period will sometimes be included as well.

However, there is an underlying issue that does persist with this corpus, which might influence any study regarding regional variation, as the majority of the supports originate from the same general region. In the publication of de Buck, there is a sheer prevalence of Middle Egypt origin (69.1%), in comparison to the other regions. Additionally, only 15.4% represent both north and south Egypt. In practice, this means that in de Buck, Deir el-Bersha, Meir, and to some extent, the Theban area is over-represented.

Based on the decoration patterns which are attested for the decorated coffins, at least for the early Middle Kingdom, it is clear that the coffins were created locally, with their own local traditions. These coffins were most likely created in local workshops, perhaps associated with the local governor or temple. Therefore, it can be assumed that the Coffin Texts on the decorated coffins would be added locally as well. Thus, it stands to reason that there would have been some local repository for the texts, which would be transmitted to the coffin. Luckily, some sections of this type of material did survive, known as ‘Vorlagen’-papyri. In this type of material, the owner is referred to as mn pn (this someone),

---

54 I am completely aware that Coffin Texts were used outside this period, as part of the mortuary liturgies, but as the majority of the supports in de Buck originate from this period, I considered it a good cut-off point.
55 For example, Papyrus Gardiner II, which is dated by Allen T. G. (1950), p. 30-31, to the 6th dynasty, which Bidoli (1976), p. 25, sincerely doubts, as according to Bidoli the criteria of the script mentioned in Allen do not suit the photographs and facsimile of the original. Rather, he expects a later date in the First Intermediate Period. Gestermann (2003), p. 206, suggest that an early First intermediary Period dating is more probable, even though a sixth dynasty would be possible as well. Lapp (2014), p. 219-220, notes that due to the use of the A1 sign (𓀀) with the first person the date cannot be earlier than the 8th dynasty.
57 This overrepresentation of one region is mirrored in late Egyptian as well, where more than 80% of the material originates from the Theban area. See Winand (2018), p. 494.
which needs to be replaced by the name of the owner when transcribed on behalf of a specific individual. However, this process does not always occur correctly, as can be seen in B2Bo, where the phrase *i mn pn* (Oh, this someone) is found, whereas this support normally uses the name of the owner.

In the process of transmission from ‘*Vorlagen*’ to the final product, there were chances of variations, intentional or unintentional, that could influence the final form of the text. These variations from different witnesses of the same text can include variation due to errors or miscomprehension of the scribe, but just as well because of intentional changes. Although a reproduction ‘*à l’identique*’ did occur in Ancient Egypt, conscious variation did occur due to particularities at a local (dialectal features) or personal level (idiosyncrasies), or intentional modernisations of the text. Additionally, as the ‘*Vorlagen*’ text was on papyrus, a perishable material, it is very likely that ‘*Vorlage*’ needed to be copied from time to time, which mechanically increased the possibilities of variations occurring within the precursor, and the final product based on it.

For example, mismatches caused by inner dictation could happen when copying text to a coffin. In the case of *CT* spell 7, there is a phrase section which in the majority of the witnesses is written as *hrw-s pw nfr n šn.t* (this good day of her of playing music). However, it is clear that the word *šn.t* was poorly understood, or misheard by the artist, as some of the other witnesses have homonyms of this word. B4Bo, B6C and B1P use *šn.t* (rowing), and T1NY used *šn.t* (resting). As one can see here, an unconscious variation could sneak into the text easily.

If a variation occurred in the precursor text, it can be assumed that any witness based on that texts would use the variations in that ‘*Vorlage*’. These variations should be considered an addition to any other variations that occurred during the normal process of copying text to a coffin. Although the example above occurred most likely on some unconscious level, it needs to be assumed that conscious changes were made as well, based on ancient sacerdotal selection of content based on local idiosyncrasies, or innovation of the scribe or compiler, based on their own initiative.

### 1.4. Data set

Due to the size of the *Coffin Texts*, a selection needed to be made. Willems mentions a total of 289 (+23?) coffins which contain *Coffin Texts* and/or *Pyramid Texts*, which would be impossible to handle in
its entirety within a limited timeframe. It must be noted that this number is based on actual coffins, while the number of supports for Coffin Texts is substantially higher. Additionally, the entirety of the publication of Coffin Texts of de Buck would be too large, as it consists of 2928 pages, for a total of 1185 spells. Fortunately, for studying regional variations, there is a high number of spells which are of limited interest, only attested in de Buck in one region, or one witness, coined unique spells. Of course, the occurrence of unique spells over different regions could be interesting to deal with, but falls outside the scope of this work. Thus, only a selection of spells was used for the purpose of this research. CT Spell 1-27, 30-33, 36, 75, 89, 94-97, 151, 154, 162, 165-167, 215, 225, 335, 355 and 398.

For these spells, only the supports found in the publication of de Buck were used, even though these only represent a selection of all the Coffin Texts material. The inclusion of supports outside de Buck would be beneficiary, but as de Buck provided a wealth of sources, and the material outside de Buck is often difficult to access, the choice was made to focus on the material provided in de Buck. In appendix 1, there is a full list of supports used in this work and their meta-data.

### 1.5. History of scholarship

In an identical fashion to Pyramid Texts, most studies on the Coffin Texts are limited to particular spells or spell groups for thematic reasons, or sections of the spells are used for theological themes. Additionally, as one should expect, there are multiple studies regarding specific coffins as well. However, any systematic study of the Coffin Texts themselves is still lacking. It is understandable, when

---

70 de Buck (1935) CT I, for spell 1-75, de Buck (1938) CT II, for spell 76-163, de Buck (1947) CT III, for spell 164-267, de Buck (1951) CT IV, for spell 268-354, de Buck (1954) CT V, for spell 355-471, de Buck (1956) CT VI, for spell 472-786, de Buck (1961) CT VII, for 787-1185.
71 Appendix 2 contains a full list of the spells in de Buck and Allen with the number of witnesses, from which region, and length in publication pages.
72 Billson (2010), p. 5, an unpublished M.Phil. thesis. However, it is not unlikely that new supports with Coffin Texts will be discovered over time, which will provide an additional attestation of what used to be a unique spell.
73 Gracia Zamacona (2020), pp. 12-13, in press at the time of writing, the exact page numbers are not yet known to me.
74 The rational regarding the selection of spells is discussed in more detail in chapter 2.1.6.
75 The only exception to this is M1Be, for which material was kindly provided to me by Tobias Konrad.
76 For a full list regarding Coffin Texts material, I would like to refer to Willems (2014), p. 230-315, which has a full concordance of Middle Kingdom Coffin Texts manuscripts.
77 Note that this reflects the general scholarship regarding the scope of this work, as the long and multi-faceted history of scholarship concerning the mortuary liturgies of Ancient Egypt deserves its own study.
78 Morales (2013), p. 7-8, who analysed the transmission of pyramid texts into the Middle Kingdom.
79 For example: Willems (2001), who showed that spells 30-41 were part of a liturgical sequence, which was most likely recited during festivals in the necropolis; Bonanno (2018), who discusses spell 94-96 and 488-500, and showed the underlying continuity in these groups in the mortuary literature; Priskin (2019), which is a detailed study of spell group 154-160 as a composition of the phases of the moon, and discussing the origins and continuations of the spells.
80 For example: Bickel (1994), who used Coffin Texts as examples for sequences of cosmogonic notions; Kemboly (2010), who used Coffin Texts passages in his discussion regarding evil in ancient Egypt; Jasper (2019), who used Coffin Texts passages for her discussion of the god Ha.
81 For example: Willems (1996), a publication and study of the coffin of Heqata (A1C); Meyer-Dietrich (2006), a publication and study of the coffin of Senebi (M3C).
the sheer size of the corpus is taken into consideration, that only a selection of the material can be approached in a time efficient manner, which supports a thematic approach.

Any discussion of the scholarship of the Coffin Texts must include the monumental work performed by de Buck. This publication of the Coffin Texts needs to be regarded as a singular achievement, without which many studies regarding the Coffin Texts would not have been possible.

In regard to studies about the decorations of Middle Kingdom coffins, to which the Coffin Texts belong, one will need to turn to the work of Willems. Although the Coffin Texts themselves are not the focus, his seminal work Chests of life is one of the essential resources regarding Middle Kingdom coffins and their decoration. Additionally, he has provided publication of coffins; additional studies regarding Middle Kingdom coffin decoration; multiple studies regarding the social, religious and archaeological context of Coffin Texts; or intention, in general, or as specific spell groups. However, regarding the Coffin Texts, his focus lies mostly on the social and religious context, rather than regional features.

One of the major frontrunners for a digital approach to the Coffin Texts is Schenkel, who is responsible together with several collaborators for an extensive Coffin Texts database. He was thus in the capacity of discussing multiple different aspects of the linguistic features of the Coffin Texts. However, these studies are thematic surrounding specific verbal forms, and do not discuss any regional conditioned features. More recently, an partial additional database was made by Gracia Zamacona, which focused on the specific verbs (verbs of motion). As he notes: ‘Indeed, we can find without doubt an inspiring model in the research group Ramsès under the direction of St. Polis and Prof. Winand of the University of Liège.

Specifically, in regard to regional variation studies, Hoffmeier took some interest in regional aspects of theological differences between the witnesses, based on the exact location of spells within the support, and the potential changes regarding divinities in the text. However, his results were inconclusive in regard to distinct regional patterns.

91 Schenkel (1996); Schenkel (1999); Schenkel (2000,a); Schenkel (2004); Schenkel (2005); Schenkel (2005).
92 Gracia Zamacona (2013).
For any verbal studies of the *Coffin Text*,95 one has to refer to Gracia Zamacona,96 who has performed multiple in-depth studies about the verbs of motion and studies on the spatial and temporal aspect of the language in the *Coffin Texts*.

The notion of textual criticism in the *Coffin Texts* is far from new.97 A major achievement in this field has been done by Jürgens,98 which provided stemmas for multiple spell groups.99 However, this is usually focussed on the diachronic evolution, in order to locate the origin of a spell, or its development in the funerary liturgies. However, by using these stemmas he was able to suggest the existence of regional groups.

Any specific study on diatopic linguistic regional variation in the *Coffin Texts* is, however, still lacking. Therefore, this thesis is intended to address this absence.

1.6. Structure of the Research

In the following chapters three different, but interconnected approaches of research will be used to visualise regional variations in the *Coffin Texts*. In chapter 2, the database that was used will be introduced. In chapter 3, a new method to visualise the regional variation based on sentence structure will be presented, which has most in common with traditional textual criticism, while being partially automated. In chapter 4, the process introduced in chapter 3 will be applied, but limited to the verbal structure, specifically the morphological, lexical and syntax variations. In chapter 5, the graphical forms of the verbal lemmas will be studied, in order to localize regional preferences in the form and sign use. Additionally, the visual representation of the first-person stative ending will be discussed.

1.7. Approach

The methodology varies throughout this work, and is discussed appropriately in the respective chapters. However, it is worthwhile to present the general approach used in this work. It is most clearly visible in the database100 that was created for this study. This approach does understandably influence the final results, due to the choices made in the process of encoding the data. These choices were informed by my views regarding the grammar of ancient Egyptian and the function of transliteration. It is only appropriate to address these views.

For allocating of the function of words, the morphology is of primary importance for me, as for Middle Egyptian I find it a necessity, within reason, to provide an explanation for every sign which occurs in the word. This will extend even to the transliteration, where I prefer to retain the common phonetic value

---

95 Although it is common for grammatical and verbal studies to include material from the *Coffin Texts*, it is rarely the sole focus. For example, see: Vernus (1990) or Winand (2006,b).
96 Gracia Zamacona (2001); Gracia Zamacona (2008); Gracia Zamacona (2010,a); Gracia Zamacona (2010,b); Gracia Zamacona (2012); Gracia Zamacona (2015).
99 His work covers spell groups 1-27, 30-32, 33-37, 75-83, 162+164, 225-226 and 343+345.
100 See chapter 2 Database and encoding, for more details.
associated with the sign, even in cases of false archaism. For example, in CT spell 75, in the following phrase:

\[ n \overline{s}(w).n \overline{p} w \overline{b}z-i \text{ in } ir.y \, ?w \, wsir \]

My soul is not guarded by the guardian of the limbs of Osiris.

In this phrase, the \( sd.m.n.tw-f \) is written with a V13 (\( \rightleftharpoons \)) sign, rather than the X1 (\( \rightleftharpoons \)) sign which would be expected. However, this does not extend to the Old Egyptian distinction between the \( s \) and the \( z \), which is no longer visible in the Coffin Text, thus I read the O31 (\( \rightleftharpoons \)) and the S29 (\( \rightleftharpoons \)) both as \( s \). In a similar vein, I use \( rdl \) for the verb ‘to do, to make’, rather than \( rd\). Moreover, this strict reading of written features does extent to the lexical level as well. For example, in CT spell 32, there is the phrase: \( dr-f \, ih-k \) (he will expel your pain). However, one of the major variations is: \( dr-f \, ih-k \) (he will expel your shout). Here, there is a homonym, \( ih \) (pain) versus \( ih \) (shout). The distinction is based on the classifiers, as A2 (\( \rightleftharpoons \)) and G37 (\( \rightleftharpoons \)) are used respectively. Thus, if a distinction can be made based on a classifier, I would do so, even if the resulting word used is less sensible.

Additionally, I prefer to limit the modern corrections made to a text, and rather try to make the texts work as written rather than adjusting the text freely based on similar texts or assumed reductions. This even includes the addition of the first-person suffix pronoun, especially when it was written out in an earlier or later section of the same text on the same witness. For example, in CT spell 225, where Pap.Berl has: \( wn \, k\overline{s}s.\, wt \, gbb \, tp.(y)-\overline{h}w.t \, ptr[.\, w] \) (the door bolts of Geb and the shutters of the two celestial windows are opened), where the other witnesses add a suffix pronoun or the name of the owner after \( wn \). Based on the closest similar witness, S1C, it could be argued that the \( =i \) suffix pronoun

\footnotesize{\begin{itemize}
\item[101] For me, transliterations serve as a representation of the variability observed in the text, rather than a tool to represent standardization of my understanding what is written.
\item[102] de Buck (1935) CT I, p. 396,b (B2L).
\item[103] However, it could be argued that this phrase should be read as \( n \, ss(w).n \overline{p} w bz-i \) instead. But based on the other witnesses with this phrase, for example G1T, I found the \( sd.m.n.tw-f \) more likely here. Moreover, the use of the agentive \( in \, ir.y \, ?w \, wsir \) phrase supports the reading of a passive here.
\item[104] For example, in the word \( ss\overline{p} \) (light), in de Buck (1935) CT I, p. 358,c, which is written both with O31 (B3C, B2L and M5C), and with S29 (the other witnesses).
\item[105] de Buck (1935) CT I, p. 104,a (B1P).
\item[106] de Buck (1935) CT I, p. 104,a (B4L).
\item[107] Even though it could be argued that these two lemmas are actually extensions of each other, that the shout implied here is specifically a shout of pain. For the purposes of encoding (see chapter 2.1.2), I took these two as separate lemmas, as it would allow me to easily separate the two variants. Moreover, the separation was based on van der Molen (2000), p. 50, who has two separate lemmas for \( ih \) as well, as he considers \( ih \) (misery, pain) a variant of \( sh \) (misery, pain), see van der Molen (2000), p. 5. However, it is not unlikely that there is only the single lemma \( ih \) (which might include \( sh \) as well), which takes different classifiers based on its shade of meaning. However, a study on homonyms etc. in Ancient Egypt would be beneficial to address these issues.
\item[108] de Buck (1947) CT III, p. 214,c.
\end{itemize}}
should be added. However, as the phrase still works with k33 wt gbb as the subject of wn, no addition has been made.

The second level of the criteria of the function of a word is based on the syntax. These can consist of obvious forms like the iw(-f) sdm.n-f,\(^{109}\) for example, in CT spell 16: iw ms.n sw zs.t (Isis brought him forth).\(^{110}\) Thus, if morphology does not give a clear indication on the form of the word, the syntax is used as the deciding feature of the function.\(^{111}\)

Note that during the encoding process of the database, I only gave syntax labels to sdm-f forms, and did not include any syntax labels for the imperative, relative sdm-f forms, contingent sdm-f forms and finite verb forms. At the time of encoding, I considered the syntax label of these verbal forms of less importance for the purpose of variation, as for the purposes of variation, the distinction between, for example, a sdm-f and participle would suffice, and any other syntax markers would be visible in the sentence structure.\(^{112}\) For example, in CT spell 225, phrase III,220-221,c, the majority of the witnesses have a subjunctive sdm-f: sdm=im ib-i (may I have power in my ib-heart),\(^{113}\) where Y1C has an imperfective active participle: sdm m ib-i (who has power in my ib-heart).\(^{114}\) Here the use of a sdm-f versus a participle is already a variation, in which I considered the additional details to be of less importance, as the variation is not only with the verbal form, but is visible in the structure due to the absence of the first person suffix pronoun in the sentence structure of Y1C.\(^{115}\) Thus, as the variation is visible in the sentence structure as well as the verbal form, the addition of syntax label was considered to be of lower importance.\(^{116}\) However, this is an oversight, as there is no theoretical basis for the

---

\(^{109}\) Note that in the database there are 417 attestations of the iw(-f) sdm.n-f pattern and 168 attestations of the iw(-f) sdm-f pattern, of which 19 attestation include the suffix pronoun after iw (CT I,33,a, I,51,b, I,330,c, I,364,b, I,366,b, I,375,e, III,240,b, IV,87,k, IV,193,d-f), and 39 attestations include a substantive after the iw (CT I,44-45e-a, I,51,b, I,51,d, I,53,b, I,74,i, I,364-365,b, I,400,c, II,286,b, III,180,c). Note that I consider iw-f sdm-f/sdm.n-f and iw NP sdm-f/sdm.n-f to be the same pattern, see Collier (1992), p. 59, or Borghouts (2010,a), p. 218-219. Note however that I consider a sdm-f and sdm-n-f different verb forms that share a similar pattern.

\(^{110}\) de Buck (1935) CT I, p. 48,a (B4Bo).

\(^{111}\) Which is this case would be a circumstantial sdm.n-f with the pattern iw(-f) sdm-f.

\(^{112}\) This is the most common type of variation of the verbal structure. Variation in the same verbal form did occur, for example in de Buck (1951) CT IV, p. 208-209,c, where Sqq1C, Sqq2C, Sqq7C and M1NY have ‘emphatic use’, while the majority of the other witnesses have ‘balanced sentence’ for the nominal sdm-f. This variation is not visible in this phrase, but occurs rather through IV,208-209,d, where Sqq1C, Sqq2C, Sqq7C and M1NY have a sdm.n-f, instead of the sdm-f which occurs in the majority of the other witnesses. Thus, even here the variation can be seen in the structure, although based on the following phrase. However, this type of variation is rare for the sdm-f forms, and even rarer for the forms in which the syntax value was not yet added.

\(^{113}\) de Buck (1947) CT III, p. 220,c (S2C,a).

\(^{114}\) As discussed above, I prefer not to add the first-person suffix pronoun to the phrase if it is not written, even though it can be argued here that the addition should be made here. Note that the ‘who’ is based on III,220,b, which would read together hs ink sdm m ib-i (Ho, it is me who has power in my ib-heart).

\(^{115}\) As another example, this would be visible in the distinction between a sdm-f and infinitive as well, as any other syntax markers would be visible in the sentence structure, which would provide a variation in the sentence structure itself. Although iw-f sdm-f and iw-f hr sdm would function in a similar manner, the addition of the hr would directly be ground for a variation between the witnesses. Moreover, in the encoded sections of the Coffin Texts, there is no instance of the iw-f hr sdm construction, even though it does occur in the Coffin Texts.

\(^{116}\) As for the purposes of chapter 3, the variation of Y1C is visible in the sentence structure (absence of the first suffix pronoun), which is distinct from the other witnesses. Or in chapter 4, where the distinction between sdm-f
inclusion syntax labels in some but not all verbal forms.\textsuperscript{117} I intend to correct this oversight in a future update of the database.

The final criterium is the context used to suggest a function to a word. This is the broadest category, and although initially the function is always based on the text itself, the other witnesses with the same text are taken into regard as well.\textsuperscript{118}

For the verbal aspect of Middle Egyptian grammar, I prefer clear distinctions between the verb forms, which are based on the principles discussed above, in the following order: morphology $>$ syntax $>$ context. Although I admire the theories set forth by Polotsky\textsuperscript{119} and Junge,\textsuperscript{120} which Depuydt coined the Standard Theory,\textsuperscript{121} I have to agree with its detractors\textsuperscript{122} that by now the Standard Theory is no longer tenable.\textsuperscript{123} I find the idea of a structural predictive model used in the Principle of Parallelism\textsuperscript{124} an admirable ideal, as it suits my mental mindset which prefers clear borders and predictability.\textsuperscript{125} However, as it devalues the morphological aspects,\textsuperscript{126} it is for me a reason to abandon the principle. However, even though I consider the Standard Theory and Principle of Parallelism to questionable,\textsuperscript{127} I follow the suggestion of Ockinga to ‘adopt individual observations’ of Standard Theory, while not embracing the entire system.\textsuperscript{128} Thus, to some extent I prefer the maximalist model of Schenkel,\textsuperscript{129} rather than the minimalist model,\textsuperscript{130} even though I prefer $sdm$-f forms with a wide range of functions over single function forms. Nonetheless, I consider myself closer to Schenkel than to Allan.\textsuperscript{131}

As a visual example of my comprehension of the verbal forms, figure 1.1 shows the functions of the $sdm.n$-f form, following the grammar of Ockinga.\textsuperscript{132}

\footnotesize
and participle would suffice to differentiate between Y1C and the other witnesses, as for both these chapters the occurrence of a variation is more important than which form the variation takes. See chapter 3.2.1.1 for a discussion of the issues concerning variation.

\textsuperscript{117} For example, the distinction between $iw$+stative and $iw$-suffix pronoun+stative is currently not encoded in the database.

\textsuperscript{118} As explained in note 103.

\textsuperscript{119} Polotsky (1965); Polotsky (1976).

\textsuperscript{120} Junge (1978); Junge (1989).

\textsuperscript{121} Depuydt (1983).

\textsuperscript{124} Depuydt (1993), p. 11-12.

\textsuperscript{125} Note that there is a recent trend towards a more liberal and multilayered approach, see for example Collier (2016), Uljas (2016) and Winand (2016).

\textsuperscript{127} Over the last 40 years, the advocates of the Polotskyan theory have diminished, with Depuydt remaining one of the main advocates, for example, see Depuydt (2011) or Depuydt (2017), p. 5-12.

\textsuperscript{128} Ockinga (2005), p. XIV. This grammar functioned as my introduction to Middle Egyptian, and therefore shaped my comprehension of the verbal system.

\textsuperscript{129} Brose (2015), p. 8-9, which is based on Schenkel (2006) and Schenkel (2012), p. 183-286.

\textsuperscript{131} Allen (2011); Allen (2014).

\textsuperscript{132} Ockinga (2005), p. 38-41.
In figure 1.1 one can see my approach to the *sDM.n=f*, in which I prefer to have one form with multiple functions, rather than a single form for every function. For the *sDM.n=f*, based on morphological evidence, I follow the observations of Stauder\(^\text{133}\) and Uljas\(^\text{134}\) over Schenkel\(^\text{135}\) in the regard that I consider that there is one *sDM.n=f* form rather than the ‘split *sDM.n=f* hypothesis’.\(^\text{136}\) This is represented in the leftmost level, which is based on morphology alone. The other levels are rather based on a combination of syntax and context. Thus, for me there is one *sDM.n=f*, which can be divided in sixteen labels based on the function.\(^\text{137}\)

The borders between the different levels in figure 1.1 are rarely clean cut, and rarely based on one aspect. For example, the first level, *sDM.n=f* is solely based on morphology, but this cannot be said for the other levels, nor are they usually understood in this specific order. Instead, these levels are usually based on a combination of morphology, syntax and context, and often a higher-level label is given based on a lower level. For example, the *iw(=f) sDM.n=f* function is shown in the rightmost level, where in practice this feature actually informs the label circumstantial, instead of the reverse. Even so, the label *sDM.n=f* would always be given first, due to the addition of a N35 suffix (…) to the verb. Additionally, the different levels of figure 1.1 should not be considered a hierarchical structure, but rather a convenient

---

\(^{133}\) Stauder (2014,a); Stauder (2014,b); Stauder (2014,c); Stauder (2016), p. 176-178.

\(^{134}\) Uljas (2010,b).

\(^{136}\) Based on Schenkel (2009). However, Stauder (2014,c), p. 271 notes that he does not intend to claim that there is only one *sDM.n=f* forms, rather that there is no evidence of two stress patterns in *sDM.n=f*.

\(^{137}\) As I do not disagree that the functions suggested to the two forms exist. Note that I consider the relative *sDM.n=f* a distinct form, which is true for the imperfective relative *sDM=f* and prospective relative *sDM=f* as well.
manner to depict the different labels, as for example, I do not consider the active or passive label more important than the label in the fifth level.\textsuperscript{138}

However, it needs to be noted that the form of figure 1.1 cannot be directly extrapolated for the $s_{dm}m$-f forms, as these forms show morphological variation based on the second level. For example, due to the gemination in the $2ae$ gem. and $3ae$ inf. verb forms for the nominal $s_{dm}m$-f, it would not be possible to make one level for $s_{dm}m$-f and one for nominal, circumstantial etc., but it would require the creation of multiple distinct $s_{dm}m$-f forms, which can overlap in morphology. Thus, the first two levels of the $s_{dm}m$-f forms would be combined, which results in multiple different $s_{dm}m$-f forms, before additional features are added.\textsuperscript{139} However, in practice I temporarily make the distinction of $s_{dm}m$-f, to separate the form from the $s_{dm}m.n$-f, $s_{dm}m.1$-f, $s_{dm}mm$-f, $s_{dm}m.tw$f,\textsuperscript{140} $s_{dm}m.k3$-f, $s_{dm}m.in$-f and the finite verb forms,\textsuperscript{141} before I allocate the distinct indicative,\textsuperscript{142} nominal, circumstantial, subjunctive and prospective\textsuperscript{143} labels, based on the morphology first, followed by the syntax and context.\textsuperscript{144}

However, as often with such an approach, it is common not to have any morphological or syntax features to decide the label to be applied. Usually, it is possible to base any readings on context. For example, in CT spell 398: $i\ r\ ^m.y\ svh.t$-f, $wbn\ m\ imn$-f, $psd\ m\ sh.t$-f, $nbb\ hr\ bix$-f (Oh, Re, who is in his egg, who rises in his sun disk, who shines in his horizon, who swims upon his firmament).\textsuperscript{145} In these phrases the verbs $psd$ and $wbn$ do not show gemination, but the verb $nbi$ does. Thus, as the verb $nbi$ is an imperfective active participle,\textsuperscript{146} which is part of a similar structure (verb-connector-substantive+$f$) used in all the phrases, it can be easily assumed that $psd$ and $wbn$ should be read as imperfective active participles as well. Thus, I often use the underlying phrase structure of the spells to inform my

\textsuperscript{138} Following the suggestion by Roccati (2006), I do not consider the passive $s_{dm}m.(w/y)$ to be a separate verb form, even though it can have a morphological feature $(.w$ or $.y$ ending), because, for example, the $s_{dm}m.n$-f can occur as a passive as well, see Allen (2011), p. 13. Note that in practice, I only rarely used the active label, so if unlabeled, a verb form should be considered active, unless the passive label is added, or if it is a $s_{dm}m.tw$-f, $s_{dm}m.n.tw$-f or $s_{dm}mm$-f, which are passive by nature. Only with the $s_{dm}m.t$-f and the participles I included the ‘active’ label in every instance.

\textsuperscript{139} For a full list of the verbal structures used in this work, see appendix 4. However, it could be argued that these morphological features are less distinct than suggested, and that there is only one $s_{dm}m$-f form, with an extensive list of potential functions. See Allen (2011).

\textsuperscript{140} Note that due to the morphological feature I consider the $s_{dm}m.tw$-f its own form, even though functionally it simply functions as a passive form of a $s_{dm}m$-f form.

\textsuperscript{141} Which I consider distinct forms due to the morphological features, even though they could be considered adaptations of the basic $s_{dm}m$-f form.

\textsuperscript{142} Note that in the Coffin Text, the indicative $s_{dm}m$-f is still used in multiple functions beside the negation. Additionally, I used the terminology used of Loprieno (1995), p. 77, 184, 210, for this form, rather than the (historic) perfect described in Ockinga (2005) p. 41.

\textsuperscript{143} Due to some morphological features (for example $msn$ in the subjunctive for the lemma $msn$) and some specific syntax functions (for example the $in$-construction for the prospective), I did maintain a separation between the two forms in my descriptions. See Vernus (1990), p. 15-60, and Schenkel (2000,b), p. 27-101.

\textsuperscript{144} For a practical example, see chapter 2.2, where I show an example of the encoding process used in the database, with explanations of the choices I made to allocate what label was given to the different forms.

\textsuperscript{145} de Buck (1951) CT IV, p. 292,b-294,b (T1C,b).

\textsuperscript{146} Due to the absence of a subject, the verb form is most likely finite. Due to the gemination of the $b$, it is most likely a participle, which due to the gemination has to be imperfective. The lemma $nbi$ is transitive, thus passive is unlikely.
interpretation of the function of verb forms when morphology and syntax do not inform a choice. However, it is possible that even the context does not give a clear distinction. For example, in CT spell 225: $shm\cdot k m\ ib\text{-}\k$ $shm\cdot k m\ hs\ .\ ty\cdot k$ (may you have power in your ib-heart, may you have power in your hs.ty-heart). However, even though I translated a subjunctive $sdm\cdot f$ (wish clause) here, there is no morphological or syntax feature to proof that this is correct. Based on the morphology of the verb form, and the syntax, it could other $sdm\cdot f$ form as well. However, as these are spells, and in the phrase before these phrases the owner of the coffin is addressed, I find the subjunctive $sdm\cdot f$ more likely than the other options. However, by default I use a nominal or circumstantial $sdm\cdot f$ when the syntax allows for their use.

In general, I have a near mathematical approach to the language, with strict separations between the different grammatical forms, even if they are functionally similar. In general, I consider any Egyptian text as correct, and try to remain close to the original, even when dealing with obvious corruptions. The priority of my interpretation is based on the following order: morphology > syntax > context. I prefer a multilevel system in regard to the verbal forms, in which the function of a verb form derives from a general main form, from which multiple functional distinctions spread out, rather than considering each different function its own entity. Due to my work with digital tools, which rarely leave any room for overlapping borders, I prefer a strict order if possible, rather than fuzzy borders between the forms and functions.

---

147 de Buck (1947) CT III, p. 220,c-d (T1L).
148 Note that in some witnesses, only one $shm$ is written for multiple phrases, and that the suffix pronoun $-k$ can be replaced by $-i$ or the name of the owner as well.
149 Nominal $sdm\cdot f$ (You have power), prospective (You will have power), indicative $sdm\cdot f$ (You had power). However, as the $shm$ is on the initial position in the clause, any circumstantial $sdm\cdot f$ is of course excluded.
150 In the case of the finite verb forms without morphological features, the choice is usually based on which form provides the most functional translation.
151 However, even though I draw relatively strict borders, these borders are based on a combination of morphology, syntax and context, rather than only one aspect (even though morphology has the priority).
152 I am aware of human agency in the copying of texts, which can create variation which might not be significant on a linguistic level. However, as this work deals with the occurrence of variation, rather than the reasons behind variation, I considered beneficial to retain as much variation as possible, as in my opinion a regional conditioned variation can originate from both intentional and unintentional variation.
153 Even though fuzzy borders are closer to a representation of reality.
2. Database and encoding

For the purpose of collecting and storing data for this work, a new database was created. This chapter will discuss the structure of the database and the encoding process used.

2.1. Database encoding

The structure of the database constructed for this work was inspired by the underlying database structure of Ramses Online.\(^{151}\) This structure was chosen based on the beneficiary style of encoding, which is done on a word by word basis. Advantages are the ability for searching based on words, an inherent limit to the number of mistakes which occur during encoding, as the system forces the encoder to think on every word. Additionally, it allows for the possibility of adding notes on a word basis, as well as a sentence basis. Moreover, it allows the encoding of the spelling of the words and any other type of required detail, such as morphology, syntax and what type of variation occurs between the different witnesses of a text. The one major drawback to this database structure is the high amount of time needed to encode any text, due to the number of fields to encode. This time-consuming issue has led to an exclusive focus on the verbal system in the encoding process of this work, so that only the verbal forms were encoded in full, while for example, substantives and connectors were only added as bare tokens, which only denoted their basic function.\(^ {152}\) The database used for this project was created by Prof. Dr. Jean Winand, using the program Filemaker Pro 15,\(^ {153}\) and expanded upon by myself. The relational model of the database is as follows (figure 2.1):

---

\(^{152}\) Such as substantive, demonstrative, independent, dependent or suffix pronoun, particle etc. Only spell 30, 355 and part of spell 75 was encoded in full, as these were the first three spells that were encoded, at which point the time-consuming nature was clearly noticed, and the decision was made to limit the full encoding to the verbal system. However, it is my intention to eventually fully encode these other tokens as well.

As one can see in figure 2.1, the database consists of one central section (Encoding Main CT), into which five different tables feed data, which concerns different features. There is a separate table for the spells (Spell CT), the witnesses (Coffin CT), the lexicon (Lemma CT), the sentences (Sentences), and the spelling of words (Spellings). These separate tables store their own sections of data, of which certain sections are used for the general encoding process.

2.1.1. Main encoding table

The texts are encoded as tokens, which are single data points that represent a single word of the encoded spell from one witness. The main encoding process takes place in the Encoding Main CT window (figure 2.2):
This table consists of the following features:

- **Id main**: This is an automatically generated Id code, which functions as identifier code for the token.
- **Form**: This is a free text field for the form of the word as it occurs in the transliteration of the phrase.
- **Lemma**: The lemma to which this word belongs. This field is generated from the Lexicon table (figure 2.4, see below), using the Id Lemma field, based on the code associated with the lemma.
- **Morphology**: These four fields consist of drop-down menus based on morphological data, separated between the four fields based on different levels of data.\(^{154}\)
- **Colour**: This field allows the colour of the ink of the token to be registered.\(^{155}\)
- **Sense of writing**: This records the general direction of writing of the text, based on the orientation of the hieroglyphs.\(^{156}\)
- **Syntax**: This field consists of a drop-down menu where the syntactical use of the word in the phrase is recorded.

\(^{154}\) This extends from general type of word at the morphology 1, so substantive, demonstrative, connector, participle etc. For a description and terminology used for the verbal system in this work, see appendix 4. Note that often different features were merged, for example, a active relative *sdm. n=f* would be encoded with morphology 1: *sdm. n=f*, morphology 2: active relative, rather than separating relative and active in two different fields.

\(^{155}\) In case of lost text, the colour is assumed to be black, unless it can be reasonably suggested that red ink was used instead.

\(^{156}\) Note that the orientation is based on the majority of the hieroglyphs in a column, and in case of retrograde writing does not necessarily reflect the reading direction of the columns. Additional features as these were noted as comments.
• **Subject**: In this field the type of subject is recorded. Note that this is added to the token that has a subject, rather than the token that is the subject.

• **Text** and **Translation**: These two fields are generated using the Id sentence field, as the sentence are encoded in their own *Sentences* table (figure 2.5, see below).

• **Type of variant**: This field allows the encoder to mark the type of variation which occurs between this token, and a similar token in another witness. Note that a variant which is most commonly used between the witnesses, i.e. the form that occurs in the majority, is usually not marked in the database.\(^{157}\)

• **Comment**: This free text field allows for any comment concerning the token to be added.

• **Coffin sigla**: This field is generated from the *Coffin CT* table (see 2.1.5).

• **De Buck**: These three fields refer to the book, page and section of the text in the publication of de Buck in which this token occurs. This field is generated from the *Sentences* table together with the *Text* and *Translation* fields.

• **Spell**: This field is a drop-down menu, based on the data encoded in the *Spell CT* table (see 2.1.5), which allows the token to be attached to a spell.

• **Coffin sigla variant**: This field allows an additional marker to be added to the token, to clarify its connection to one witness of a spell, when a support provides multiple witnesses of the same spell.

• **Id Spelling**, **Spelling Glyph code** and **Spelling image**: These three fields concern the spelling of the token. These fields are generated from the *Spellings* table (figure 2.6, see below), using the id code of the spelling.

• **Editorial remarks**: This check-box system allows the encoder to mark specific editorial remarks concerning the tokens. For example, if the token was partially or fully reconstructed by the encoder. This field includes any other editorial remark, like ambiguity in the token or modern influence in the encoding. Usually these editorial remarks are explained in the comments field.\(^{158}\)

It must be noted that any field can be left empty, depending on the need of the encoder, or if the field actually applies to the token in question.

Some additional remarks regarding the spelling section of the tokens is in order. The spelling consists of the code\(^{159}\) used, and an image. The program Jsesh\(^{160}\) is used for the creation of the images. However, the image is not automatically generated by the code, as the Jsesh program has not yet been embedded into the database. Thus, the images of the tokens are manually encoded in the database. Note that the images are displayed as if written as a line, although the code is written in a way that it will generate a

---

\(^{157}\) Note that this is not an automatic feature of the database, but that this needs to be performed by the encoder.

\(^{158}\) Note that there is one more field in the encoding main, namely the classifier field. This field will not be used for the purposes of this work, as it was created for cooperation with the Iclassifier project [https://www.iclclassifier.pw/](https://www.iclclassifier.pw/) (accessed 03-12-2019).

\(^{159}\) The code referred to is the code used to encode hieroglyphic texts, sometimes known as MdC code (Manuel de Codage: Buurman, Grimal, Hainsworth, Hallof, & Plas (1988) or Jsesh code. These code numbers, are based on the codes used for signs in the sign-list of Gardiner (1957), p. 438-548, although with an extended repertoire of signs.

correct image if the image is displayed as a column. For example, the word *slm* can be written as S29-S42-G17, or S29*S42-G17, which when displayed as a line would look identical, but when displayed as a column would look different, see table 2.1:

|---------------------------------|---------------------------------|-----------------------------------|-----------------------------------|

Table 2.1 Display differences between two different codes for *slm*, when displayed as a line and when displayed as a column.

This variation will be described as the graphical form, as it is possible for the same spelling to have a different order of sign placement in regard to the other signs. Thus, for the purposes of this work *spelling* will refer to the signs and their sequential order, whereas *graphical form* will describe the signs in their position in regard to each other. This means that one spelling can have multiple graphical forms. However, for the purposes of the database, the name spelling was kept for the fields, even though the glyph code and spelling image sections (see figure 2.2) technically describes the graphical form, rather than the spelling.161

The use of the display as a line was chosen due to space considerations in the database, but as most of the *Coffin Texts* are actually written as columns, the codes used for the images will reflect the column-based writing. Additionally, it must be remarked that the images are created as standardised hieroglyphs, following the publication of de Buck,162 which usually do not accurately depict the actual written form in the original. For example, a token for *inn* is added in the database in standardised hieroglyphs, but the original actually looks like figure 2.3.163 As most of the *Coffin Texts* material is written in some form of cursive hieroglyphs, the conversion to standard hieroglyphs was considered an important feature in order to ease non-palaeographical studies.164 Moreover, hieroglyphic transcriptions were used in de Buck as well. Additionally, only a limited amount of photographic material of the witnesses was easily accessible. Therefore, using one type of visualisation was considered beneficiary.

---

161 I kept the names as they are in the database, as the need for the separation between spelling and graphical form only emerged during a later stage of the research.
162 de Buck (1935) *CT I*, p. xiii.
163 Image from the coffin of *ikr* (G1T), © Museo Egizio, Turin.
164 The witnesses vary strongly on the cursive hieroglyphic scale, varying between near hieroglyphic script, to near hieratic script. For a full list of script type per witness, see appendix 1.
2.1.2. Lemma table

Five different tables supply data for the main encoding section. As a repository for the different lemmas used in the database, the Lemma CT table was created. This provided the database with a stable data points which functions as a lexicon. This table (figure 2.4) consist of the following features:

- **Id main**: This field automatically generates an id code for the Lemma tokens. This will ensure that every lemma token has its own distinct code.
- **Lemma**: In this field, the transliteration of the lemma is added, based on its form as it would occur in the dictionary.
- **Translation**: This field gives the standard translation of the lemma.
- **Class of word**: In this field, the class of the lemma is added. Note that it is possible to have multiple classes associated with one lemma, for example in the case of causative verbs.
- **Sub class of word**: This field consists of a drop-down menu, in which a sub-class can be selected. Based on the class of the lemma, this can be highly varied. For example, a verb will be given its type, and a substantive could be marked as a geographical location or god.

For the purposes of encoding, it has to be noted that it was intended to limit the number of different lemmas. As an example, the adverb *im* does not have its own lemma entry, but as it originated from the connector *m*, the lemma encoded for the adverb *im* is connector *m*, and the differentiation is made on the main encoding level instead. Additionally, it is possible that some spellings on the main encoding level do not reflect the lemma at all. For example, the particle *ist*, which can be written as *st*, *ist*, *isk* and *sk* are all bound to the same lemma. Compound words were however added as separate entries, although not entirely structurally.

---

165 Some compound connectors were added, and some compound verbs, like *ms²-hrw*, but as these are technically phrases, it could be argued that they should represent two different lemmas. However, due to the form in which *ms²-hrw* can be written, the placement of the classifiers often suggests that the phrase was a single construct for the Ancient Egyptians as well. Although attempts were made to limit the number of compound entries, no real structural system was used to decide if an entry should be a compound or not.
2.1.3. Sentences table

In a second table, the sentences were provided. These sentences usually correspond to the separation into phrases used in the publication of de Buck.\textsuperscript{166}

![Figure 2.5 Display of the sentences table.](image)

This table (figure 2.5) consists of the following features:

- \textit{Id main}: this code is automatically generated, and creates a unique data point for every phrase encoded.
- \textit{CT volume, CT page and CT section}: These free texts fields provide the location of the phrase in the publication of de Buck. In order to improve searchability, Arabic numerals are used, instead of the Roman numerals used in de Buck.
- \textit{Coffin Sigla}: This free text field allows the phrase to be bound to one witness. Note that this field is not generated from Coffin CT table (see Coffins and spells tables, chapter 2.1.5). This separation allows the field to remain empty, in case multiple witnesses use the exact same phrase. Additionally, it allows the addition of additional markers\textsuperscript{167} to the sigla of the witness.
- \textit{Egyptian text}:\textsuperscript{168} This free-text field holds the transliteration of the phrase.
- \textit{Translation}: This free-text field holds the translation of the phrase.
- \textit{Comment}: This free-text field allows the addition of comments for the phrase. Note that comments concerning the entire sentence are usually here, where the comments considering specific tokens on the main encoding level are usually not mentioned here.
- \textit{Bibliography}: This free-text field allows for the addition of any relevant bibliography to be added to the phrase.

\textsuperscript{166} de Buck (1935) \textit{CT I}, p. xiii-xiv.
\textsuperscript{167} Usually an ,a or ,b, directly based on de Buck.
\textsuperscript{168} As the tokens have an image of the graphical form of the tokens, no transcription was added of the entire phrase.
2.1.4. Spellings table

The third table (figure 2.6) concerns the spelling used for the different tokens encoded at the main level. This repository allows the collection of different spellings and graphical forms, based on the criteria discussed above.\footnote{See Main encoding table.} The table consists of the following features:

- **Id Spelling**: This id code is automatically generated, and provides the different spellings with a unique data point.
- **Form**: this is a transliteration of the basic form of the spelling, to aid the search of a specific spelling or graphical form.\footnote{Note that only one transliteration is chosen, even if the spelling or graphical forms can be used for different lemmas. For example, the form of D46 (𓊇) is dr.t, but it can be used for dl or wd as well. The transliteration is usually based on the initial encounter of the graphical form, or the most common use of the sign or sign-group.}
- **Spelling Glyph**: This field holds the code by which the image can be generated. Note that this code is based on JSesh, taking into account the principles discussed above.\footnote{See Main encoding table.}
- **Spelling Visual**: This field holds the image of the graphical form of the spelling, created by using JSesh. However, this is done by copying the image from JSesh, as the program has not yet been embedded into this database.

Figure 2.6 Display of the spelling table.
• **Comments**: this is a free text field, in which comments regarding the spelling or graphical form can be added. These comments usually concern sign specific details that currently cannot be covered correctly by the available graphemes in Jesh.

2.1.5. **Coffins and spells tables**

The fourth table concerns the different supports for the witnesses of the *Coffin Texts* which are encoded. Although mostly coffins, these include different sources as tomb decoration and papyri as well. A full extensive list of the supports used for this study\textsuperscript{172} has been provided in appendix 1. This table is used as a repository for the different supports, and allows the allocation of tokens to one specific support.

The final table concerns the spells encoded in the database. This provides a repository that allows the tokens to be allocated to a specific spell. The spell numbers are accompanied by the exact location in de Buck, and any other related literature.

2.1.6. **The encoding process**

The process of encoding was performed on a spell by spell basis, on a sentence by sentence basis. Thus, after a spell was chosen, every sentence for every witness was encoded, by encoding every token of the sentence sequentially per witness, before moving on to the next sentence. The tokens of the verbal forms were encoded in full, whereas the non-verbal tokens were only encoded in a limited manner. These sentences were normally encoded following the phrase separation of de Buck, but two or more phrases from de Buck were combined in certain cases. Generally, the witness order of de Buck was maintained.

Due to evolving views on the types of spells needed for this work, the selection process of the spells that were to be encoded was relatively random. Initially CT spell 30, 355 and 75 were chosen due to their perceived suitability for initial tests. Following this, CT spell 1-27 were encoded, following a principle of structured encoding of spells starting from CT spell 1. Due to the development of the methods of analysis, it became clear that some spells are more suitable than others. As CT spell 18 and 19 only had witnesses from one region, namely Deir el-Bersha, they were of limited use for research concerning regional variation. From that point on, only spells with at least eight witnesses from at least three different regions were selected. Additionally, it became clear that longer spells were less problematic for the method used for the analysis,\textsuperscript{173} so longer spells were chosen. In appendix 2, a table concerning the

\textsuperscript{172} Although it is not intended to imply that these are the only supports with *Coffin Texts* available, but rather that these reflect only the material used for the purpose of this work.

\textsuperscript{173} This issue will be discussed in chapter 3.2.2 Spells as proteins.
spells, number of witnesses, region of origin and length\textsuperscript{174} was provided. The last spells selected for encoding\textsuperscript{175} were chosen based on this table.

For the general encoding, the following principles were used:

1) Every text is treated as if fully correct, and additions, corrections and deletions on the side of the encoder of the database were kept to a bare minimum. On the other hand, if the corrections were made by the ancient Egyptians themselves, they are encoded following the final form after the correction.\textsuperscript{176} If the phrase grammatically agrees with the rules of modern Egyptological linguistics, that is to say, the phrase is grammatically ‘correct’, even though it does not yield much sense, the phrase is added as written. For example, in CT spell 75, there is the phrase \textit{n m\textsubscript{3.n} sn sw} (they do not see him),\textsuperscript{177} and a variant phrase \textit{m\textsubscript{3.n} sn sw} (after they saw him).\textsuperscript{178} The former is used in seven witnesses,\textsuperscript{179} and the latter in three.\textsuperscript{180} Although it can be easily assumed that the negative particle \textit{n} is missing in these instances, and should be provided by the encoder, the phrase is grammatically functional and therefore it is encoded as it was written. In the same manner there are two phrases\textsuperscript{181} in CT spell 225 discussing the eating of abomination, and in some witnesses\textsuperscript{182} the negation is not written. Clearly this does not make sense, as no Egyptian would want to eat his abomination, but as the phrases are grammatically functional, they are encoded as they were written. Additionally, when dealing with problematic cases such as the first-person suffix pronoun, the same rules apply. If a witness writes the first-person suffix pronoun any point in the spell, it will never be provided where it is not written, unless the phrase ceases to remain functional. For example, in CT spell 335, Sq1Sq has the phrase \textit{wn=i m t\textsubscript{3} i iy.n <x i> m niw.t=i} (May I exist on my land, after I came from my city).\textsuperscript{183} In this witness, the first-person suffix pronoun is written as a M17 (𓋑), and this is not added after \textit{iy.n}. Based on the approach discussed here, the suffix pronoun would not be provided by the encoder, as it is written at the other locations in this phrase. However, as the connector \textit{m} directly follows the \textit{s\textsubscript{dm} n-f}, a suffix would be expected, and is therefore added. This principle was maintained even in the case of obvious errors or changes, as long as the error or change is grammatically functional. For example, in CT spell 75, B1P has the phrase \textit{nd-i hpr.w-i m niw.t} (while I question my creation from Nut)\textsuperscript{184}. In the other witnesses, it is not the goddess Nut that is mentioned here, but Nun. Here, it seems that the craftsman mistook a Z1 (𓋕) for a X1 (𓋕), and the A40 (𓋕)

\textsuperscript{174} I need to point out here that the length in this table is based on the number of pages used in de Buck, and that I am aware that this is a deceptive method of selecting based on length. Due the style of publication, it is possible that a spell with many witnesses will cover 20 pages, where a spell half the number of witnesses would only cover 10 pages, in which case the number of phrases might actually be the same. However, as the number of witnesses was considered of high importance as well, I consider that although deceptive, the number of pages is still a good indication of the length of the spell.

\textsuperscript{175} Spell 215, 225 and 335.

\textsuperscript{176} For example, in: de Buck (1935) \textit{CT I}, p. 8,a (Y1C).

\textsuperscript{177} de Buck (1935) \textit{CT I}, p. 389,c (B1Bo).

\textsuperscript{178} de Buck (1935) \textit{CT I}, p. 389,c (B2L). Note that this can be read as \textit{m\textsubscript{3}sn sn sw} (may they see him) as well.

\textsuperscript{179} B1Bo, B3C, G1T, M5C, M23C, M28C, T3C.

\textsuperscript{180} B2L, B1P, S1C.

\textsuperscript{181} de Buck (1947) \textit{CT III}, p. 234,b-c. Note that these two phrases are highly variable on other points as well.

\textsuperscript{182} T9C, B2Bo, B4Bo.

\textsuperscript{183} de Buck (1951) \textit{CT IV}, p. 206,b (Sq1Sq).

\textsuperscript{184} de Buck (1935) \textit{CT I}, p. 332,c (B1P).
for B1 (𓁐), which is a possibility in the type of cursive script which is used in this witness.\textsuperscript{185} However, although the origin of the variation is clear, it is encoded in the form that it was written, as the phrase is functional with Nut or Nun.

2) Any lacuna was reconstructed if possible. Due to requirements of the method described in chapter \textsuperscript{3.2}, and the way de Buck published the material,\textsuperscript{186} every lacuna has been restored. The reconstructions were based on a different witness belonging to the same owner, or the same region,\textsuperscript{187} before taking other factors in regard. For these reconstructions, the length of the lacunae in de Buck were considered as correctly transcribed. In the database, comments were attached to the phrases which required some explanation regarding the origin of the reconstruction.

3) Every entry should be validated by conferring with an original image of the text. Of all principles, this one was the most often broken, due to the difficulty to obtain photographic material of the supports. When possible, the available material of the originals was used to verify the reading of de Buck. Based on an in-depth study of the material concerning CT spell 75 from the archives of de Buck in Leiden,\textsuperscript{188} it became clear that the transcriptions are nearly without errors. For CT spell 75, one of the more common issues that occurred structurally were for example the use of M13A (𓇅) in the original, where de Buck transcribed M13 (𓇅), or the use of N37A (𓈚) in the original, where de Buck transcribed N37 (𓈚). Mistakes concerning misread signs or incorrectly placed signs were nearly non-existent. Due to this case study, the publications of de Buck were considered trustworthy for the purposes of this work.

2.2. Encoding in practice

As the database reflects the encoded text, it would be beneficial to include an example of the encoding process and explaining the rationale behind the choices that were made.

For this purpose, CT spell 3, from the witness B1P, was used as an example.\textsuperscript{189} Note that in order to show the reasoning behind the allocation of the labels, the glossing system proposed by Di Biase-Dyson, Kammerzell and Werning\textsuperscript{190} was used, rather than to export the tokens from the database. Note as well that for practical reasons, the tokens were written horizontally, rather than the vertical form of the columns which were used in the original text.

\textsuperscript{185} See appendix 1 for more detail.
\textsuperscript{186} de Buck (1935) CT I, p. xiii.
\textsuperscript{187} I am mindful of the inherent bias of this principle of reconstruction, as this could unconsciously support my theory by creating false results.
\textsuperscript{188} I am indebted to Prof. Dr. O.E. Kaper and the Netherlands Institute for the Near East (NINO) for allowing me to access this material.
\textsuperscript{189} de Buck (1935), p. 10,a-f. The witness B1P was chosen for this example, as I was able to verify the transcription in de Buck with images of the original text.
\textsuperscript{190} Di Biase-Dyson, Kammerzell & Werning (2009). However, note that these glosses do not represent the exact encoding in the database, as the suffix pronouns were encoded as separate tokens.
In this first phrase, the first token poses some issues, as it is written with a D54 (𓇀) classifier. Therefore, it could be read as the verb hsi (to descend) as well. However, the other witnesses do not include this classifier, where they do include it in the verb hsi in I,10,c. Thus, it can be assumed that this is the interjection hsi instead. The other tokens of this phrase are simply substantives (masculine singular), or the demonstrative pn. Note however that wsir was only included in B1P and B15C, and that MC105 did not use this phrase at all.

In this phrase, šsp was read as an imperative (finite form, first position in the phrase), to imply a command to the deceased, who was addressed in I,10,a. However, this is only one of the viable interpretations. Instead of reading an imperative followed by a reflexive dative, it could be a nominal (due to the initial position) sdm.n-f (due to the addition of the N35 (𓇁)), emphatic use (default form, there are no sdm.n-f forms in an adjacent phrase to form a balanced sentence, nor is it used after an connector). In this case, the phrase would read: ‘You have taken your staff, your loincloth and your two sandals’, a statement rather than a command. However, it could be read as a participle (finite form), to create an attributive clause to the spi pn in I,10,a. Note that this could be either an imperfective (who takes for himself) or perfective (who took for himself), as there are no morphological features to distinguish between the two forms. Theoretically the šsp could be read as other sdm=f forms as well (there are no morphological features to distinguish between the different sdm=f forms), using mdw=k etc. as a nominal subject (the n=k would be considered a dative moving between the verb and the subject). However, this would make the sdm=f passive. Nonetheless, the imperative was chosen as this spell seems to be a statement towards the deceased, commanding an action that results into the consequences of phrase I,10,d-f.

---

191 Note that B6C does include the D54 classifier in both I,10,a and I,10,c as well.

192 It is notable that the other witnesses from Deir el-Bersha, B2Bo, B3Bo, B4Bo and B6C are all dated to the early period of coffin decoration in Deir el-Bersha, whereas B1P and B15C belong to the later period.

193 For example, nominal sdm=f, emphatic use: ‘Your staff, your loincloth and your two sandals were taken for you.’

194 However, I need to admit that this could be due to the influence of the translation by Faulkner (1973), p. 2.
The other tokens of this phrase are substantives and suffix pronouns. However, it is remarkable that the dual is made clear by both the double S33 (𓋸) classifier and the inclusion of the Z4 (𓏭) in this witness. Note that in MC105, the only witness of this spell that did not come from Deir el-Bersha, mdw and tbw.ty were not written.

CT I,10,c (B1P)

\[ h₃=k \quad r \quad dsd₃.t \]

descend:PROS=2SG.M ALL tribunal-COLL:F

so that you descend to the tribunal.

The first token of this phrase is challenging, and would depend more on the translation used in the other phrases, rather than morphology and syntax. However, the direct addition of the V31A (𓎢) makes it most likely that this is not a finite verb form, but rather a sdm-f form. Additionally, there is no gemination of the G1 (𓄿), therefore it could not be a nominal sdm-f, which would show gemination with a 3ae inf. lemma. There are two likely candidates for this token, namely the circumstantial sdm-f, pattern temporal clause (default, there are no additional syntax features) or the prospective sdm-f, pattern final or consecutive clause implying purpose (as it follows the imperative in I,10,b). As this phrase was interpreted as a command to deceased, to cause a positive result, the prospective was chosen here, to state the reason for the taking of the staff, loincloth and sandals, as the deceased needs to be well equipped when facing the tribunal. However, the circumstantial sdm-f is just as likely: 'while you descend to the tribunal', making the act of taking the staff, loincloth and sandals a feature that occurred during the travel to the tribunal. Additionally, this token could even be read as a subjunctive sdm-f (wish clause): may you travel to the tribunal, following the command in I,10,b with a wish.

The connector r is clearly directional in this phrase, while the dsd₃.t is a substantive. Note that the addition of the A50 (𓀻) classifier in dsd₃.t is unusual, especially as it does not occur in I,10,f. Note that B15C added h₃ wsir ḏḥwty-nḥt pn (Ho, the Osiris, this ḏḥwty-nḥt) before the phrase, and that B6C used a nominal subject after h₃, and left out the r dsd₃.t.

CT I,10,d (B1P)

\[ ms²-ḥrw=k \quad r \quad ḥft-yw=k \]

be_justified:SBJV=2SG.M ALL enemy-M:PL=2SG.M enemy-F:PL=2SG.M

May you be justified against your male enemies and your female enemies,

---

195 As ḥṣi is a 3ae inf. lemma, an infinitive (status pronominalus) would be unlikely, as a X1 (𓏏) should be added. Even though the X1 is not an absolute requirement, the fact that it occurs in no other witness, makes it highly unlikely that this form could be read as an infinitive.

196 ḥft.yw and ḥft.ywt were written next to each other as a double column, so the V31A (𓎢) should be read twice.
The compound verb $ms^r-hrw$ does not show any morphological features, and can therefore be interpreted in multiple ways, as was the case with I,10,c. Even though theoretically possible, the infinitive would be unlikely, as would any of the other finite verb forms due to the V31A which follows. For this form, multiple $sdm=f$ forms are possible, as there is no gemination or other morphological features. As this phrase was considered a new sentence, the circumstantial $sdm=f$ is not possible, as $ms^r-hrw$ is on the initial position of the sentence. Thus, the reading of this token came down to the interpretation of the spell on the whole. Here, a subjunctive (wish clause), was chosen, as this spell was interpreted as something that still needs to occur. Thus, some sort of future tense would be assumed, in where well-wishing was preferred over the affirmative future: ‘You will be justified against’. However, a present tense affirmation, using a nominal $sdm=f$ (emphatic use), is possible: ‘You are justified against’.

The connector $r$ has to be opposition, due to the juxtaposition between vindication and enemies. The enemies are the main source for variation in this phrase, as the distinction between male and female enemies does not occur in B4B0 and B6C, which use only $hft.yw$, although this is the collective for both genders, rather than the female plural, as both a male and female classifier is used. B15C only uses the masculine plural. B2B0, B3B0 and MC105 repeat the connector $r$ before both $hft.yw$ and $hft.ywt$, instead of the single connector $r$ used in B1P. 

CT I,10,e (B1P)

\[
\begin{array}{cccc}
  r & irr-w & <irr>-wt & r-k \\
  \text{ALL} & \text{do\PIA-M.PL} & \text{do\PIA-F.PL} & \text{against}=2SG.M \\
  \text{against those males and females that act against you,} \\
\end{array}
\]

This phrase should be considered a continuation of I,10,d, as a similar structure to the $r hft.yw-k hft.ywt-k$ structure. $irr.w$ and $irr.wt$ are both considered participles here, although one could argue that these are substantives instead. Due to the Z2, these tokens could only be substantives, participles or relative $sdm=f$ forms, as this sign should not occur with any other type of $sdm=f$ or finite verb form. In this phrase, the D21 is considered to be a gemination, rather than an interpretant, and therefore

---

197 Note that I read this as a compound verb form, while it is technically the verb $ms^r$ followed by $hrw=f$ (may your voice be true). However, as a description of justification or vindication, I consider the compound more viable here.

198 Which would not occur with a 3-lit. lemma.

199 However, this is only based on where I prefer to end the sentence, rather than any clear evidence.

200 Which would be a prospective $sdm=f$ (main clause). In my division of the future $sdm=f$, the main clause function belongs to the prospective, but this is more an idiosyncrasy of my encoding, rather than a distinct division based on morphology or syntax (beside the initial position in a sentence).

201 Although it could be argued that the D21 is part of the same double column, and should be read twice.

202 $irr.w$ and $irr.wt$ were written as a double column, with the D4 and D21 only written once.

203 For the Coffin Texts at least.
these are considered imperfective active participles.\(^{204}\) The addition of the X1 (.) makes it clear that \textit{irr.wt} is feminine.

The separate genders create the majority of the variation in this phrase, and every witness has their unique form, as B2Bo, B3Bo and B4Bo use a perfective active participle, rather than the imperfective.\(^{205}\) B2Bo and B6C only write the participle once, as the collective \textit{ir.r.wt/irr.wt} for both male and female.\(^{206}\) In B4Bo, the participles are singular, rather than plural. B6C leaves out the initial connector \textit{r}. B3Bo, B4Bo and MC105 write the construction in its entirety twice, for example in B3Bo: \textit{r ir.r.w r=t r ir.wt r=t}. MC105 added \textit{m hr.r-t-nfr} (in the necropolis) to the phrase, to specify where the opposition occurs. In B15C this phrase was not added.

\begin{verbatim}
CT I,10,f (B1P)
ir-t(y)=sn wɛt-w-mdw hft=k m hrw pn nfr
do-PPO-PL judgement-M.PL in_front_of=2SG.M INS day DEM:M.SG good(M.SG)
\end{verbatim}

they who will do judgements in front of you on this good day,

\begin{verbatim}
m d3d3-t
INS tribunal-COLL:F
\end{verbatim}
in the tribunal.

In this phrase, \textit{ir.t} can be interpreted as multiple different forms. Based on the addition of the X1 (.) and the \textit{=sn} suffix pronoun,\(^{207}\) it could be either an infinitive (status pronominalus), \textit{sdm.t=f}, \textit{sdm.tw=f} or \textit{sdm.t(y)=f(y)}. The \textit{sdm.t=f} is not possible here, as it only used in a negation, or after a connector. A \textit{sdm.tw=f} is unlikely, as a passive reading does not make sense here: ‘they are done judgement’. Although the infinitive would function here, based on the participles in I,10,e, it seems more likely that this construction continues as a \textit{sdm.t(y)=f(y)}.

The rest of the tokens are substantives, connectors, adjectives and demonstratives. Note that some variation occurs in this phrase. B4Bo added the connector \textit{r} before the \textit{ir.t(y)=sn}. B2Bo left out the suffix pronoun after \textit{hft}. B1P is has a unique feature, as it reads \textit{wɛt.w-mdw} (plural), where the other witnesses

\footnotesize
\begin{tabular}{l}
\textsuperscript{204} Based on instances of the perfective active participle of \textit{iri} in this support written only with D4 (.), see de Buck (1935) \textit{CT I}, p. 346,b, 380,b, 382,b (B1P), de Buck (1951) \textit{CT IV}, p. 236-238,c-a (B1P). It is highly unlikely that these participles are passive, due to the \textit{r=k} which follows.
\textsuperscript{205} As there is no D21 (.) added, thus these forms do not geminate.
\textsuperscript{206} Only certain in B2Bo, which has both a male and female classifier. B6C does not have any classifiers, and therefore it could be read as only female as well.
\textsuperscript{207} Could be the dependent pronoun as well, although I find it unlikely here.
\end{tabular}
use the singular. B15C used $\text{d\textcircled{h}s.t nb(.t)}$ (every tribunal), and B6C used $\text{d\textcircled{h}s.t nb.t n.t wsir}$ (every tribunal of Osiris).
3. Visualising regional variation using sentence structure

In order to show that additional avenues should be used to visualise regional variation in textual material, this chapter will introduce a new approach to sentence structure studies as a feature of regional variation. This chapter will discuss the method used to visualise the variation within the witnesses of different Coffin Texts spells. For this visualisation, the spells are treated as if they were protein strands. Additionally, this chapter will show how this method can indicate local patterns in the sentence structure of the spells. The visualisation of these patterns will be discussed on a spell by spell basis.

3.1. Introduction

In a corpus as massive as the Coffin Texts, it is beneficial to use multiple different approaches to study variation, as a complete study of all possible types of variation together would be unwieldy. The first approach of this work will concern the sentence structure. As discussed in the chapter 1.3, it could be assumed that through conscious or unconscious variation, some local influence could enter the material, such as a preference of one type of verb form used over another, or a preference to use particles or not. All of these could sneak into the sentence, and change the structure used, if one compares it with another witness. The challenge lies in visualising these differences, and see if underlying similarities between witnesses can be shown.

It must be noted that the aim of this chapter is not to provide a full list of phrases and structure styles that are available in the different regions in Egypt, but rather to show that it is possible to differentiate between distinct groups of witnesses based on sentence structure alone. Although it might be possible to extract some local features in the sentence structure of the different witnesses from this work, the aim is first and foremost to show a method for discovering similarities between witnesses, and to explore where fertile grounds for additional research lies.

3.2. Method

The following section will present the method used for studying the variation between the witnesses on a spell by spell basis, based on the sentence structure, from the encoding level of the spells themselves, up to the methods used to attain the results. These results will then be discussed on a spell by spell basis, based on the spells selected for this work.

3.2.1. Analysis

In order to allow the analysis on a sentence structure level, analysis files were created by hand on a spell by spell basis. For these files, only the transliteration and the translation of the phrases were taken from the database for the purposes of this analysis. For every encoded spell, the witnesses were set out as
parallel vertical columns, resembling the general structure of the publication of de Buck.\textsuperscript{208} The witnesses were compared on a phrase by phrase basis, and colour coded based on the similarity and variation on a sentence structure level. A zoomed out form of such a file is visible in figure 3.1 in chapter 3.2.2.\textsuperscript{209} If a witness did not have a specific phrase, it was left empty in the comparison. As lacunae have been reconstructed, empty sections reflect the absence of a phrase.

3.2.1.1. Variation

Before continuing, an underlying issue with variation itself should be discussed here. It could be said that not every type of variation is equal, some might be considered less important than others. It is extremely difficult to make an exact scale, without creating problematic grey areas. Such grey areas will complicate any study of variation, as the different levels of importance need to be taken into consideration. However, one can wonder if it is actually possible to differentiate between these levels. The following examples function as an illustration of similar types of variation, but with different levels of importance.

In the case of lemma, it seems obvious that any variation would be important, as a different word is used. In CT spell 75, most witnesses have: $\text{Ts n-f šnw.t}$ (who ties the courtiers together for him),\textsuperscript{210} but S2C uses $\text{ink mšt n-f šnw.t}$ (I am the one who leads the courtiers for him).\textsuperscript{211} Beyond the addition of $\text{ink}$, the verb $\text{Ts}$ is replaced by $\text{mAa}$, which is an obvious variation. Given the change in the translation, it should be considered important. However, when there is a lemma variation which does not influence the translation, it could be suggested that this variation is less important. For example in CT spell 225, T1L has the phrase: $\text{wn n-k k₃₃.wt gbb wn n-k tp(.y)-ḥ₄w.t ptr.wy}$ (the door bolts of Geb are opened for you, the shutters of the two celestial windows are opened for you.),\textsuperscript{212} while B1L has: $\text{wn n-k k₃₃.wt gbb sn n-k tp(.y)-ḥ₄w.t ptr.wy}$.\textsuperscript{213} For the second verb form, B1L uses $\text{sn}$ where T1L uses $\text{wn}$. These are clearly two different lemmas, but as they are synonyms, one could consider the variation less important.

Additionally, variation can occur in the spelling of a word, to the extent that it resembles a different lemma. For example, in the same phrase of CT spell 225, Pap.Ber\textsuperscript{214} has the phrase: $\text{wn k₃₃.wt (₃₃₃₃₃₃₃₃)}$ $\text{gbb tp(.y)-ḥ₄w.t ptr.ty}$ (the door bolts of Geb and the shutters of the two celestial windows are opened),\textsuperscript{215} while Y1C has: $\text{wn k₃₃.r t (₃₃₃₃₃₃₃₃)}$ $\text{gbb tp.y-ḥ₄w.t ptr.ty}$. The variation occurs in the spelling of the word for door bolts. $\text{k₃₃.r}$ is the most common spelling of the word, but $\text{k₃₃.w}$ and many other forms are allocated to this lemma as well.\textsuperscript{216} It could be argued that there are two different lemmas here, or one lemma with two forms. Thus, it is either an important variation, as a new lemma was created, or

\begin{itemize}

\item \textsuperscript{209} Due to the unprintable nature of the excel files created in this manner, they will only be available in a digital format. However, Appendix 3 will provide the transliterations and translations of all the spells and witnesses encoded in the database.
\item \textsuperscript{210} de Buck (1935) CT I, p. 393,d (B1Bo). Note that ‘who’ reflects back to the $\text{ḥ₄wty-nḥt}$ in l,393,c.
\item \textsuperscript{211} de Buck (1935) CT I, p. 393,d (S2C).
\item \textsuperscript{212} de Buck (1947) CT III, p. 214,c.
\item \textsuperscript{213} de Buck (1947) CT III, p. 215,c.
\item \textsuperscript{214} Siglum used by de Buck for Papyrus Berlin 10482. See appendix 1 for more detail.
\item \textsuperscript{215} de Buck (1947) CT III, p. 214,c.
\item \textsuperscript{216} Hannig (2006), p. 917.
\end{itemize}
less important, as it is still the same lemma. The particle *ist* exist in the same vein, as it can occur in many different forms, like *st, ist*, *isk* and *sk*. Usually these are understood to be the same, but it could be argued that one particle should be read as five separate particles instead, albeit with the same function.

Similarly, one can wonder if the presence or absence of a word is an important variation, if the witnesses have an identical feature which sets them apart from the other witnesses. For example, in *CT* spell 225, only S2C,a, Pap.Berl and Y1C use the first person for the owner. S2C,a and Pap.Berl have the phrase: "*nh-i is m t n gbb* (May I even live from the bread of Geb), while Y1C has: "*nh-i m t n gbb* (May I live from the bread of Geb),\(^{217}\) without the particle *is*. Thus, Y1C varies from S2C,a and Pap.Berl. However, one can wonder whether this is important enough to exclude Y1C from the other witnesses, or whether the variation due to the particle *is* should be ignored, as the use of the first person is a more important variation.

In the case of morphology, the same problems of variation scale occur. For example in *CT* spell 215, M22C has the phrase: *nd. n=k hr n r* (you have protected the face of Re),\(^{218}\) while B2L has: *nd-k hr n r* (may you protect the face of Re). Clearly B2L is a morphological variant, as it uses a *sdm-f* where M22C uses a *sdm.n-f*. Due to the change from past tense to future, this can be considered an important variation. However, morphological variation can occur due to context, even if the phrases are visually similar. In *CT* spell 215, S2C has: *shkp=k hr n psd.ty* (while you satisfy the face of the double Ennead),\(^{219}\) while B1Y has: *shkp-k hr n psd.ty* (you satisfy the face of the double Ennead). The phrases look identical, but while *shkp* in S2C is a circumstantial *sdm-f*, in B1Y uses a nominal *sdm-f* instead. The variation occurs due to the preceding phrase, in which S2C used a *sdm.n-f*, and B1Y a *sdm-f*. It could be argued that this morphological variation is less important, as the variation between the witnesses is already visible in the preceding phrase. It should therefore not be repeated, as there is no direct visible variation in this phrase.

In the same vein, the presence or absence of the genitival adjective *n* might seem unimportant, as it would not influence the understanding or translation of the text. On the other hand, in *CT* spell 162, the majority of the witnesses have: *imm. ti pw sn hz* (It is the west wind, the brother of Ha),\(^ {220}\) but BH1Ox and BH2C have: *imm. ti pw sn n hz* (It is the west wind, the brother of Ha).\(^ {221}\) The addition of the genitival adjective here occurs only in the two witnesses from Beni Hasan.\(^ {222}\) Therefore, for the purposes of regional variation, it should be considered important.

A further issue related to variation has to do with how the owner is addressed in the texts. Depending on the spell and witness, the text can refer to the owner with a first-person suffix pronoun, a third

\(\text{\textsuperscript{217}}\) de Buck (1947) *CT III*, p. 234.a.
\(\text{\textsuperscript{218}}\) de Buck (1947) *CT III*, p. 188.b.
\(\text{\textsuperscript{219}}\) de Buck (1947) *CT III*, p. 188.c.
\(\text{\textsuperscript{220}}\) de Buck (1938) *CT II*, p. 395,c (B2Bo).
\(\text{\textsuperscript{221}}\) de Buck (1938) *CT II*, p. 395,c (BH1Ox).
\(\text{\textsuperscript{222}}\) The genitival adjective does not occur in the same phrase in the witnesses from the other regions, which are Aswan, Asyut, Deir el-Bersha, Gebelein, Meir, the Theban area and one from an unknown origin (assumed Asyut). See chapter 3.48.1 for more details.
person suffix pronoun, or even the name of the owner, with or without titles and demonstratives. Although a variation between the first, second and third person should be considered important, the variations surrounding the use of the name of the owner might be less important. For example, in CT spell 225, S1C and S2C use ḫ3 msḥt (Ho, Meshet), where B4Bo uses ḫ3 dlḥwty-nḥt tn (Ho, this Djehutinakht), and B1L uses ḫ3 wsḥ ḫw ʿn (Ho, the Osiris, this Gua). Beyond the intention of calling to the owner of the coffin, there is plenty of variation surrounding the use of titles and demonstratives. It could be assumed that whatever follows the interjection ḫ3 is unimportant, and should be considered as such. Or, one could assign importance to the use of a demonstrative, or the title wsḥ. Thus, the variation might be important or even absent in this case.

Additionally, the gender of the owner might create variation when addressed in the third person. For example, in CT spell 75, B3C has the phrase: ṣwr.t(i) qnd.(t)i r psd.t nb.t (she is more powerful and raging than any Ennead), while B1Bo has: ṣwr(.w) qnd(.w) r psd.t nb.t (he is more powerful and raging than any Ennead). This is a clear morphological variant in the stative endings, due to the gender of the owner. Thus, one could wonder if the gender or the use of the third person stative is the most important feature here.

Furthermore, the spelling of the first-person singular stative can be highly varied. For example, in CT spell 154, S2C has the phrase: iw=i ḫr.ki psd.t ḫwnw (I know the Ennead of Heliopolis), while S1Tū has: iw=i ḫr.k psd.t ḫwnw (I know the Ennead of Heliopolis) and B4L.a has: iw=i ḫr.kwi psd.t ḫwnw (I know the Ennead of Heliopolis). All these witnesses use a first-person singular stative, but all are clearly spelled differently. As the full .kw ending type does not occur in Asyut in this phrase, but only in Deir el-Bersha, it could be considered an important variation. On the other hand, it could be considered that there is no variation here at all, as all use a first-person singular stative.

In summary, all these examples serve to show the complexity when defining levels of variation, depending on the selected point of view. For this reason, it was chosen to use a binary approach to variation, in which every variation was taken as absolute and identical in weight. Although this will allocate variations to some witnesses that only vary by very minor details, it reduces any inherent biases.

The previous being said, the following exceptions were made for the allocation of variation in the sentence structure:

I. Variation due to the gender of the owner of the witness.

---

223 Masculine or feminine, based on the gender of the owner.
224 de Buck (1947) CT III, p. 220-221,b.
226 As most of the other witnesses use the first-person stative here instead.
227 de Buck (1938) CT II, p. 272,a.
228 See chapter 5.4 for more detail about the different types of first-person stative endings.
229 Suffix pronouns concerning the owner, for example, are only regarded as first, second or third person, the gender is not considered a variation. This includes gender variation in statives and participles as well.
II. Variation due to phonetically different spellings of the same lemma.\(^{230}\)

III. Variation in different endings of the first-person singular stative.\(^{231}\)

IV. Variation due to the name of the owner.\(^{232}\)

3.2.2. Spells as proteins

The colour code adopted to denote phrases with a similar structure and variation between the witnesses\(^{233}\) allows the use of a DNA metaphor: the spells inscribed on coffins are proteins.

As this metaphor is the basis of chapter, it would be beneficial to quickly discuss the terms DNA, RNA, and the process by which proteins are formed, although simplified. DNA,\(^{234}\) deoxyribonucleic acid, is the main component of chromosomes, which hold the genetic code of living organisms. These DNA strands, formed of nucleotides twisted in a double helix, commonly rest in cell core.\(^{235}\) RNA, ribonucleic acid, is a molecule that is similar to DNA, although consisting of a singular strand folded onto itself. Overly simplified, RNA is a single strand transcript of DNA, which allows for the movement of the genetic data from the cell core to the other parts of the cell, for a variety of purposes.\(^{236}\) One of its major functions is to facilitate the creation of proteins. Proteins are large molecules, consisting of chains of building blocks, called amino-acids.\(^{237}\) These building blocks are stringed together based on the code provided in the RNA.\(^{238}\) Based on their sequence of amino-acids, proteins are formed as folded strings, which determines its function. In a cell, the proteins are the workhorses, which facilitate nearly any action that takes place in the cell.\(^{239}\) For the purposes of proteins, the information for their creation is held in the DNA, which is transcribed into RNA, which provides the blue-print for the creation of the proteins.

When the colour-coded file discussed in chapter 3.2.1 is viewed at a distance (figure 3.1), one can see similarity between the second to the fourth column from the right. So, one can expect that on a sentence structure level, these could be considered to be similar.

\(^{230}\) Including the different forms of *ist*.

\(^{231}\) Thus, no difference is made between ending type *k*, *kw*, *ki* or *kwi*, for the first person singular, or any other stative ending. However, number will be retained as a variation. Note that this only applies for this chapter, and that in chapter 5.4 this spelling and graphical form variation will be taken into regard.

\(^{232}\) For the purposed of comparison, the name of the owner was replaced by using 'N'. Note however, that the presence of titles or demonstratives are still considered a variation. However, in appendix 3 the names have been restored.

\(^{233}\) See chapter 3.2.1 and figure 3.1.

\(^{235}\) Although some DNA exists in the mitochondria as well.

However, it is tedious to manually sort the witnesses. Therefore, a digital approach would be more suited.

In order to sort the different witnesses, they were treated as if they were protein strings, with each phrase treated as an amino-acid, the building blocks of a protein. One could assume that there might have been a theoretical ideal spell.\textsuperscript{240} This ideal spell should be seen as the DNA which rests in the core of the cell.\textsuperscript{241} To produce a coffin with that spell, the DNA was read, producing an RNA string, which is taken outside the core to be turned into an actual protein. The witness in this metaphor is the protein. Due to the steps the spell has to go through to become a protein, there are chances of changes to the string structure. Some sections might be lost, added or changed. The final protein might thus not fully represent the DNA from which it originated.\textsuperscript{242}

The metaphor of spells as proteins is not only made due to the visual representation created in the analysis file. Considering spells as proteins will allow the use of existing biomedical algorithms and programs as well.

\textsuperscript{240} I want to make clear that this ideal spell is only exists on a theoretical level, and that I do not expect an Ur-text to actually exist for any of the spells.
For this work the program Iq-tree was chosen as a comparison tool. The results of the comparison will be used by Dendroscope. This program allows for the visualisation of the resulting comparisons as a dendrogram, a tree shaped diagram which shows clusters of related material.

In order to use these programs, the different sentence variants have to be converted into amino-acid codes, and extracted into a specific format. Every different colour used was thus allocated a different amino-acid code. These coded were placed in a document in the FASTA format.

![FASTA format](https://zhanglab.ccmb.med.umich.edu/FASTA/)

Figure 3.2 Amino-acid codes of spell 75 extracted and placed in FASTA format. Every letter represents a sentence. The _ represents the absence of a sentence.

In the FASTA format used in figure 3.2, every sentence is represented by a single amino-acid code, where every letter represents a variant of the phrase used. As stated above, variation was based on a

---

245 These codes are included in appendix 3.

246 A FASTA format is a text-based format for representing nucleotide sequences or peptide sequences, using single letter codes to represent base pairs or amino acids. For a full explanation, see [https://zhanglab.ccmb.med.umich.edu/FASTA/](https://zhanglab.ccmb.med.umich.edu/FASTA/) (accessed 18-12-2019). This format was chosen from a selection of different file formats supported by iq-tree.
binary approach, where any variation could be responsible for the allocation of a different amino-acid code.

The use of the FASTA format revealed an underlying issue that was initially not taken into regard when the spells were chosen for encoding. Some spells, for example CT spell 14 and 15, consist of only 5 phrases each. When any comparison is done on these spells, any minor variation unique to one witness will directly have a strong influence on the placement of the witness in comparison to the others. For example, if due to an intentional or unintentional variation one phrase is different, 20% of the witness will be different. Thus, a witness could be assigned to its own group, only due to one variation. In a longer spell, the same unique variation in one phrase should have less impact. Therefore, the encoding process moved away from the structural numerical encoding of spells, and focussed rather on the spells with a higher number of phrases.

### 3.2.2.1. Alternative amino-acid allocation methods

Alternative methods than the binary approach used for this chapter were considered, such as using three amino-acid codes for every sentence instead of one. In this format, the first letter could denote absolute variation, and the other two letters could allow the allocation of levels of variation. For example, the second letter would deal with morphological variation and the final letter with any influence of the owner. The problems discussed in section 3.2.1.1 showed, however, that it is nearly impossible to create a functional system of thresholds and still limit any underlying bias.

Another approach to quantify the graduation of variation was to allocate amino acid codes to every different token of which a phrase consists. This would allow for an extreme detail in notation of variation, in which nearly no detail would be lost. For this purpose, a construct phrase would be created, like in the following table:

---

247 de Buck (1935) *CT I*, p. 43-46.

248 In de Buck, the number of phrases is higher, but to create complete clauses, some of the phrases were combined. In spell 14, I,43,c and I,44,a were combined, as I,44,a only consists of *sp sn.w*. Similarly, I,44,e and I,45,a were combined, as I,44,e only consists of *iv N pn/tn*, while the *sdm-f* of the phrase only follows in I,45,a. Spell 15 has more phrases as well in de Buck, which is discussed in more detail in chapter 3.17.

249 Wherein every variation is considered absolute and identical in weight.
I know the name of this great god who is in it.

Table 3.1 Phrase construct table for phrase IV,196-197,a\textsuperscript{250} from CT spell 335, showing a standardised phrase, and encoded variation patterns based on token position.

i.a.p

Table 3.1 shows the construct phrase, and all the available\textsuperscript{251} variations for the phrase. Note that no code was associated with the absence of a token. Using this format, the most common phrase would exist of the following code: α-β-γ-δ-ε-ζ-η-θ-ι-κ-λ, which is reflected in witness T1C,b, M8C, M4C, T1Be. However, if one takes a look at B3C, there is some clear variation (α-β1-γ1-δ-ε-ζ-η-θ-ι-κ-λ), as it uses the name of the owner instead of the first-person singular suffix pronoun, and therefore the gender of the following stative changes as well\textsuperscript{252} Another witness, B1P, has the code α-γ-δ-ε-ζ-η-θ-ι-κ-λ, as nothing lies between the particle iw and the stative. B9C,a, whose code is α-β-γ3-δ-ε-ζ-η1-ι-κ-λ, is more varied: it did not use a stative for rḥ but rather a participle, moved the ṡ adjective directly after nτr, and did not write the deictic pw after it. Thus, this will allow very precise notation of variation. Although such a method of encoding token by token should be beneficial for a variation study,\textsuperscript{253} it was not used in this work, as it is extremely time-consuming.

Although other methods for marking the variation in the sentences could be used, the binary method in which only one amino-acid code was allocated to a phrase was considered most applicable here. Although it is understood that information will be lost using this binary method, any alternative was

\textsuperscript{250} de Buck (1951) CT IV, p. 196-197,a.

\textsuperscript{251} For all the witnesses currently available to me, see chapter 3.52.1.

\textsuperscript{252} The first-person singular stative was changed into the third person singular feminine stative.

\textsuperscript{253} It might be possible to automate this process in the future, but I have currently not yet performed any study regarding the possibilities of using this process.
considered too problematic or time-consuming to process the high number of possible variations and underlying importance of the variation.

3.2.2.2. Creation of a dendrogram

To visualise the variation in the spells, the FASTA format file was used by the Iq-tree program to construct an evolutionary tree.\(^{254}\) However, for the program to work, the amino-acid sequences of the witnesses need to be aligned correctly and need to be of the same length. Therefore, the absent\(^{255}\) phrases in the witnesses were retained in the sequence as a hyphen (\(-\)). As one can see in figure 3.2, extensive sections of the witness can become marked with a hyphen.\(^{256}\)

The results of the Iq-tree program are produced in a so-called treefile, which is then used by Dendroscope to create a dendrogram. In this dendrogram, witnesses are grouped together based on similarity, which are shown as different branches of the tree. This dendrogram can be visualised in multiple different formats (table 3.2):

<table>
<thead>
<tr>
<th>Rectangular phylogram</th>
<th>Rectangular cladogram</th>
<th>Slanted cladogram</th>
<th>Circular phylogram</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circular cladogram</td>
<td>Inner circular cladogram</td>
<td>Radial phylogram</td>
<td>Radial cladogram</td>
</tr>
</tbody>
</table>

Table 3.2 Different display forms of a dendrogram, based on the results of spell 1.

\(^{255}\) Note that this refers to phrases that were never written for the witness, not phrases that were lost due to damage.

\(^{256}\) In appendix 3, the absence of a sentence is actually depicted using the letter X instead, but is afterwards converted to the hyphen.
In this work, the display as a rectangular phylogram was chosen, because beyond relationship between the witnesses, it shows distance based on inferred change. The rectangular display was chosen for the sake of accuracy, as a circular display or radial display have the tendency to imply a central point of origin. This central point could imply the existence of a precursor text, which is not the intent of this study.

It needs to be noted that even though the processes used for this work originate in biomedical evolutionary studies, any line within any dendrogram uses in this work should not automatically be considered a depiction of ancestry or hierarchy. The lines imply proximity between witnesses only, and should not be interpreted beyond that point. Moreover, it should be made clear here that the dendrogram visualisation is intended to inform additional avenues of traditional research, but will not by itself serve as an explanation of the results.

In the following sections, the spells will be discussed in sequence, following the numbering of the spells in de Buck, for the spells which were included in the database. In general, only the witnesses published in de Buck are included. Due to time constraints, it is rarely possible to locate every witness for a spell. If additional witnesses are known to the author, they will be mentioned with the specific spell, but it is not suggested that these reflect all the available witnesses. The following sections will consist of a short introduction to the spell, followed by an introduction to the available witnesses, and the state of conservation of the witnesses. Finally, the dendrogram for the spells will be discussed, in order to show the functionality of the method used.

3.3. Spell 1

The first spell discussed for the purpose of sentence structure is spell 1. The subject of this spell concerns the deceased identifying himself with several gods, including Horus, the protector of his father. It needs to be noted that this spell should be considered part of a group of spells which runs from spell 1 to spell 27, although there is no witness which has every spell of this spell group.

3.3.1. Introduction

Spell 1 is a short spell, containing only eighteen phrases in total. It should be noted that no witness uses all the phrases available for this spell. In de Buck, this spell has fifteen witnesses in total, although two witnesses originate from the same support. The following table shows the witnesses sorted by region (table 3.3):

---

257 Although it needs to be admitted that some ancestry might be depicted, although I expect the chances of a provable ancestry with supporting arguments occurring to be low.
260 de Buck (1935) CT I, p. 2,c.
261 Jürgens (1996), p. 55-59. The entirety of this spell group will be discussed in chapter 3.29.
262 The full sentence structure file is available in appendix 3.1.
<table>

</tbody>
</table>

Table 3.3 Witnesses sorted by region for spell 1. See appendix 1 for a full list of details concerning every witness.

Based on the table above, one can see that the majority of the witnesses originate from Deir el-Bersha, with seven witnesses, closely followed by the Theban area, which supplied five witnesses. The other attested regions in de Buck all have one witness. It needs to be noted that these witnesses reflect only the material available in de Buck, and do not represent all the witnesses with spell 1 that are currently known.  

As can be expected with this material, most of witnesses are damaged to some extent, and have therefore been reconstructed. The percentage of reconstructions per witness have been visualized in the following graph (figure 3.3):

Figure 3.3 Percentage of reconstruction and damage in the witnesses for spell 1. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.

---

263 Following the description in de Buck (1935) CT I, p. xviii. It needs to be noted however, that it is suggested that Y1C originates from Asyut. See Jürgens (1990), p. 55-56.

264 Jürgens (1996), p. 55-57, mentions an additional witness from Kom el-Hisn, three additional witnesses from Sidmant el-Gebel and one additional witness from el-Lahun.
As is visible here, there was some major reconstruction in T1L and MC105,b, for which more than 50% of the text was reconstructed to some extent. These two are closely followed by B4C, which is more than 40% reconstructed, and S10C, which is more than 30% reconstructed. Although they are not excluded from the work, any results including these witnesses need to be approached with some caution.

3.3.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was produced (figure 3.4):

![Dendrogram](image)

Figure 3.4 Rectangular Phylogram display of the distance between different witnesses of spell 1. Numbers were added to denote the 3 distinct main branches.
As one can see here, for spell 1 there are three main branches, although branch 1 and 2 share a connection, before they are connected to branch 3. The only witness that is not part of these branches is B3Bo.\textsuperscript{265} The different branches will be discussed below.

The first main branch to be discussed is branch 1. This branch actually consists of two sub-branches. Figure 3.5 shows the left sub-branch of branch 1. On this sub-branch are four witnesses, namely T9C, TT319, T1L and MC105,b. It is encouraging that all the witnesses on this sub-branch originate from the Theban area, although MC105,a, which originates from the Theban area as well, is not on this sub-branch, but rather on the right sub-branch. Additionally, as MC105,b was reconstructed for more than 60%, it is possible that the placement of this witness was actually due to the reconstructions of the author.

It needs to be noted that all these witnesses share the same general date between them, of the late 11th dynasty, as they all belong to Willems group Thebes B.\textsuperscript{266} Additionally, all witnesses use the same type of cursive hieroglyphs.

The second sub-branch of branch 1, shown in figure 3.6, is more problematic. It has four witnesses, one from the Theban area, one from Deir el-Bersha, one from Asyut and one from an undocumented origin. The placement of B15C can be considered unusual, as all the other witnesses from Deir el-Bersha were placed either on main branch 2 or 3. Although no clear pattern can be discerned from this sub-branch, there is some remarkable proximity between S10C and Y1C. It is suggested by Jürgens\textsuperscript{267} that Y1C originates from Asyut, which is supported by the close proximity in these results. This is most clearly visible in the following phrase: \textit{irr.\,w bšḥ} (those who make the inundation),\textsuperscript{268} which only occurs in these two witnesses.

The second main branch of the dendrogram consist of only three witnesses, two from Deir el-Bersha, and one from Beni Hasan. Although barely visible, the first and second main branch do actually share a connective point before joining with branch 3, so some commonality between branch 1 and 2 is therefore implied. It needs to be noted that B4Bo shares the same owner with B3Bo, and one would expect some proximity between these two witnesses, which is clearly not the case for this spell,\textsuperscript{269} as B3Bo exists separated from the three main branches. However, the connection between B4Bo and B4C can be seen in I,2,c, where B4Bo has: \textit{ḥwty-ẖnt tn ḫr}

\textsuperscript{265} It needs to be noted that when displayed as a circular phylogram, B3Bo is in center of the circle.

\textsuperscript{266} Willems (1988), p. 110-114.

\textsuperscript{267} Jürgens (1990), p. 55-56.

\textsuperscript{268} de Buck (1935) CT I, p. 4,c (Y1C).

\textsuperscript{269} I could speculate that this variation was actually intentional. In order to make sure that the owner did not receive duplicate spells, or that the fact that this concerns a paired coffin, one witness might have been intended specifically for the inner coffin, and one for the middle coffin.
Finally, the third main branch consists of three witnesses, B1P, B2Bo and B6C, which all originate from Deir el-Bersha. Although these witnesses all originate from the same region, there are no other features that are shared structurally between these witnesses. As shown in figure 3.7, there are two sub-branches. The right sub-branch is reserved for B2Bo, where the other sub-branch contains B1P and B6C. It needs to be noted that B2Bo and B6C share a similar date, namely the late 11th dynasty to the early 12th dynasty, and B1P is dated to the period between Sesostris II and Sesostris III. Due to the dates, one could expect more proximity between B2Bo and B6C than between B1P and B6C. As this is not the case here, it seems that an underlying Deir el-Bersha pattern might exist, even though it is not based on the date of the witnesses.

3.3.3. Conclusions

From the results visualised in the dendrogram for spell 1, the following remarks can be made. Based on the sentence structure, it is possible to differentiate between a pattern used in the Theban area, and one in Deir el-Bersha. There does not seem to be a differentiation between dates of the witnesses, and although sub-groups in Deir el-Bersha are visible, it is not clear where the division originates from.

Additionally, the placement of Y1C indicates that the suggestion of Jürgens regarding the origin of the support, namely Asyut, is valid for this spell.

Regarding spell 1, the method used in this chapter is capable of showing local variation patterns based on the sentence structure used by the witnesses.

3.4. Spell 2

This section will discuss spell 2. This spell continues from spell 1, and concerns the justification of the deceased against his enemies, by command of Geb, who summons the deceased before the tribunal. This spell should be considered part of the same group that spell 1 belongs to.

---

270 de Buck (1935) CT I, p. 2,c (B4Bo).
271 de Buck (1935) CT I, p. 2,c (B4C).
3.4.1. Introduction

Spell 2 is a short spell, consisting of seven phrases in total. There is no witness which has all the available phrases for this spell. In de Buck, there is a total of eleven witnesses, spread over three regions, and one from an unattested origin. The following table shows the witnesses sorted by region (table 3.4):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B15C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, TT319</td>
</tr>
<tr>
<td>Unknown</td>
<td>Y1C</td>
</tr>
</tbody>
</table>

Table 3.4 Witnesses sorted by region for spell 2. See appendix 1 for a full list of details concerning every witness.

As one can see here, the majority of the witnesses originate from Deir el-Bersha, with seven witnesses. There are two witnesses from the Theban area and the other regions provide one witness each. Note that these only reflect the witnesses from the publication of de Buck.

Except for B2Bo, B4Bo, MC105 and Y1C, the witnesses were all damaged to some extent. The percentage of the damage per witness has been set out in the following graph (figure 3.8):

![Figure 3.8 Percentage of reconstruction and damage in the witnesses for spell 2. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.]

As one can see here, the damage to the witnesses for this spell was quite limited. B4C had the highest percentage of damage (more than 30% reconstructed), while S10C has more than 30% damage as well, although lower than B4C. These two witnesses need to be treated with a degree of reservation.

---

275 The full sentence structure file is available in appendix 3.2.

276 Jürgens (1996), p. 58, notes that there is another witness from Kom el-Hisn.
3.4.2. Results and discussion

The following dendrogram was generated, following the method described in 3.2.2 (figure 3.9):

As one can see here, there is a large branch, which can be separated in a small sub-branch and a larger sub-branch. The main branch shares its origin with a horizontal section from which the witnesses not covered by this main branch extend.

As this spell is only seven phrases long, any minor change will more strongly affect the method used, which is in fact what occurred here. In the phrase i.9,c, the witnesses from Deir el-Bersha use \( m\text{šr}-\text{hrw} k r \text{hft.yw} k \)\(^{277}\) (so that you will be justified against your enemies),\(^{278}\) while the witnesses that do not come from Deir el-Bersha, use a variant of the following phrase instead: \( iw m\text{šr}-\text{hrw} < k > r \text{hft.yw} k r \text{irr.wt} r=k r \text{msdq}.w \text{tw \textit{ir.y(y)}-sn wqf-mdw} \text{hft} k \text{m hrw pn} \) (you are justified against your enemies, against those who act against you, against those who hate you, they who will do judgment in front of you on this day).\(^{279}\) As all the witnesses that are not from Deir el-Bersha have some variations within this structure,\(^{280}\) they are all marked as separate structures for the purposes of this work. Even so, all witnesses not using the first phrase structure, are put together on the left sub-branch of the large branch. B6C ended up on this branch as well due to variation in this phrase, although it is structurally a lot closer to the other witnesses from Deir el-Bersha. Here one can see that a minor change in material

\(^{277}\) B6C actually separated \( \text{hft.yw} \) into \( \text{hft.yw} \) and \( \text{hft.ywt} \), making a separation between the male and female enemies, which is not visible in the other witnesses from Deir el-Bersha.

\(^{278}\) de Buck (1935), p. 9.c (B2Bo).

\(^{279}\) de Buck (1935), p. 9.c (Y1C).

\(^{280}\) MC105 and TT319 do not have the particle \( iw \) for example.
with a low number of phrases can misleadingly imply stronger variation or kinship between witnesses. This can result in incorrect interpretations, and should be taken into consideration when using this method.  

Even so, it is encouraging that B4Bo and B3Bo were placed together on a sub-branch, as they belong to the same owner. Additionally, although B6C is there as well, it is encouraging that S10C and Y1C are relatively close to each other, as it supports the idea that Y1C originated from Asyut.

3.4.3. Conclusions

There are only limited statements that can be made regarding sentence structure patterns based on the method used here, as the connections are less coherent, and can imply a result that is difficult to defend when the actual text is considered.

Based on the dendrogram and the phrase that created the issues for this spell, it is possible to suggest that there is a distinction in the pattern used in witnesses from Deir el-Bersha and witnesses from other regions, as long as the underlying problems of a spell with a low number of phrases is taken into regard.

As discussed above, it is clear that a limited number of phrases hampers the functionality of the method used in this chapter.

3.5. Spell 3

The following section will discuss spell 3. This spell continues from spell 2, and is part of the same group of spells to which spell 1 and 2 belong. The spell concerns the compelling of the deceased to go to the tribunal, with his gear, so that he can be justified.

3.5.1. Introduction

Spell 3 is even shorter than spell 2, with only six phrases used. In de Buck, there are a total of seven witnesses, originating from Deir el-Bersha or the Theban area. Except for two witnesses, all six phrases are attested in the witnesses from de Buck. The following table shows the witnesses sorted by region (table 3.5):

---

281 The results here are a clear example why I chose longer spells to encode. Texts which include more phrases are more likely to have more than one divergent phrase, and due to the higher number of phrases, one different phrase will be less influential on the results.
284 B15C, which lacks l,10,e and MC105, which lacks l,10,a and l,10,f.
285 The full sentence structure file is available in appendix 3.3.
<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B6C, B15C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105</td>
</tr>
</tbody>
</table>

Table 3.5 Witnesses sorted by region for spell 3. See appendix 1 for a full list of details concerning every witness.

As one can see here, most of the witnesses come from Deir el-Bersha, with a total of six witnesses. A seventh witness originates from the Theban area. Note that these witnesses only reflect the witnesses from the publication of de Buck.

The witnesses for this spell are mostly intact, with only some minor partial lacunae. The following graph shows the percentage of reconstruction per witness (figure 3.10):

![Graph showing percentage of reconstruction and damage in witnesses for spell 3. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.]

As can be seen here, there is barely any damage, and any reconstructions are only partial.

### 3.5.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was produced (figure 3.11):
As one can see here, there is one main branch, which is separated in two sub-branches. Beyond this main branch are two separate branches which both contain one witness.

It is encouraging that B3Bo and B4Bo occur relatively close, as they are part of a set of coffins. It needs to be noted that this placement is complicated by MC105, which was added to the same sub-branch. As in spell 2, the placement is problematic due to the low number of phrases of this spell. MC105 only has four of the six phrases, and its placement is only due to two phrases (10,c-d), which are similar to B3Bo and B2Bo. Therefore, there is more weight assigned to these phrases than the fact it does not have two of them, which influences the placement within the dendrogram, and therefore the results.

Additionally, as B2Bo and B1P share the same sub-branch, it seems that there is a Deir el-Bersha pattern for this spell, but as B2Bo and B1P do not share the same date, it is unlikely that time of creation had any influence on the structure of the spell. This pattern from Deir el-Bersha is most clearly visible in the following phrase: šsp n=k mdw=k dsl.w=k tbw.ty=k (take your staff, your loincloth and your sandals),\textsuperscript{286} which is used in all the witnesses from Deir el-Bersha. However, MC105 has: šsp n=t d(s)i.w=t (take your loincloth),\textsuperscript{287} which is a clear variation from the witnesses from Deir el-Bersha.

Finally, as this concerns a spell with only one witness that originates from a different region than the others, it is difficult to make any meaningful statements concerning regional patterns.

\textsuperscript{286} de Buck (1935) CT I, p. 10,b (B1P).
\textsuperscript{287} de Buck (1935) CT I, p. 10,b (MC105).
3.5.3. Conclusions

The benefit of the visualisation of the variation in sentence structure for spell 3 is limited, due to the same issues that occurred with spell 2. Additionally, this is complicated by the fact that only one of the seven witnesses is not from the same region as the others. Nevertheless, it can be assumed that there is a sentence structure pattern associated with Deir el-Bersha, although a lot of variation seems to be possible within that general pattern.

Due to similar issues as in spell 2, it seems that the benefits of using the method described in this chapter is severely hampered by limited length in material, in which case traditional methods of comparison seem to be more accurate.

3.6. Spell 4

This section will deal with spell 4. This spell is part of the same group of spells to which spell 1 to 3 belong. The subject of this spell concerns a wish to the deceased, in order for the deceased to receive the benefits of being justified.

3.6.1. Introduction

Spell 4 is a short spell consisting of eighteen phrases. It needs to be noted that every witness only has a selection of these phrases, as there is no witness which has all phrases. In de Buck, this spell consists of twelve witnesses, which originate from three known regions, and one witness is from an unattested origin (Y1C). In the following table, the witnesses are sorted by region (table 3.6):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B15C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, TT319, T9C</td>
</tr>
<tr>
<td>Unknown</td>
<td>Y1C</td>
</tr>
</tbody>
</table>

Table 3.6 Witnesses sorted by region for spell 4. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses originates from Deir el-Bersha, with a total of seven witnesses, followed by the Theban area, which has three witnesses, and one witness from Asyut, and finally one from an unattested origin. These witnesses used for this work only represent the material available in de Buck.

As is the case with the other spells discussed above, most witnesses are damaged to some extent. The following table shows the percentage of reconstruction performed on the witnesses (figure 3.12):

---

290 The full sentence structure file is available in appendix 3.4.
With the exception of B4C, which is more than 30% partially or fully reconstructed, the average damage for the witnesses is relatively low, with S10C having slightly more that 20% partial or full reconstructions, and the others having less than 20%.

**3.6.2. Results and discussion**

The following dendrogram was generated after following the method described in 3.2.2 (figure 3.13):
In this dendrogram, there are two main branches, and a separate branch for B15C. Branch 1 contains 6 of the witnesses, and branch 2 contains 5 of the witnesses. Branch 1 consists of three sub-branches, where branch 2 consists of 2.

Branch 1 will be discussed first. As one can see in figure 3.14, there is common ground between T9C and MC105, which both originate from the Theban area. Moreover, this is visible in the following phrase: *sdš šdi ḫn r ḫw d wr iw.t šdi ḳ[n ḫr] niw.t wr.t* (may this šdi go to the great stairway, may this šdi come to the great city). Here, T9C and MC105 use a nominal subject, where the other witnesses use the second person singular suffix pronoun instead. However, TT319 is instead placed on the right sub-branch, although it shares the same date of creation with T9C and MC105. Based on the text in appendix 3.4, it is clear that nearly every phrase is slightly different from any of the other witnesses, which might explain its placement in a separate sub-branch. Based on Spell 1 and spell 2, it seems reasonable to assume that Y1C and S10C share some proximity to each other, but as one can see, the proximity is limited, as S10C is actually on a sub-branch different from Y1C. Therefore, spell 3 would not serve as support for the suggestion that Y1C

---

291 de Buck (1935) *CT I*, p. 12,a-b (MC105). T9C replaced šdi ḫn with *bws Wolfgang* (the name of the owner).
originates from Asyut, even though they are both on the same larger branch. B4C seems out of place, as it is on the same sub-branch as TT319. Moreover, B4C is the only witness from Deir el-Bersha that is not placed with the other witnesses from Deir el-Bersha. Based on the actual phrases used in this witness, it seems that just as TT319, most of the phrases are in some way different from the other witnesses in this spell. For example: $s^\text{nh}=k \; m \; hft.y\,[w-t]$ (may you nourish with your enemies). Here, B4C uses $s^\text{nh}$ (to nourish), rather than the $s\text{hm}$ (to have power) used in the other witnesses. This high number of unique phrases might be the reason TT319 and B4C are grouped together in the first place. Alternatively, the placement could be due to the reconstructions performed on B4C, but since more than 60% was undamaged, it seems unlikely that the reconstructions would be able to influence the placement to this extent.

The second main branch consist only of witnesses from Deir el-Bersha, which seems to suggest that there was a specific phrase structure in use in this region. Moreover, B2Bo, B3Bo, B4Bo and B6C are grouped relatively close to each other. This seems to validate the used methodology, as these witnesses are all part of the same group in Willems and are dated to the same general period of late 11th dynasty or early 12th dynasty. Moreover, these supports share a specific type of inscription, where the text was first drawn in ink, and then carved into the wood, so that the script was partially drawn and carved. Even so, as B1P, which is dated between Sesostris II and Sesostris III, is in the middle of the other witnesses, it would be unwise to allocate a specific period to the pattern, but rather consider it a local pattern only.

3.6.3. Conclusions

First, based on the dendrogram generated using the method described above for spell 4, there seems to be a distinct pattern in Deir el-Bersha, which separates it from the witnesses that originate from other regions. Second, there seems to be some distinction in the Theban area. However, exceptions exist for both of these remarks, with B4C occurring outside the main Deir el-Bersha branch, and TT319 being situated in a sub-branch different from the other witnesses from the Theban area.

For spell 4, the method used for this chapter seems to be functional, although problematic border cases occur.

---

292 See appendix 3.4 for the full translation and allocated codes in regard to the other witnesses. However this is most clearly visible in l,12-13,e-a and l,13-14,d-a, phrases that occur in B4C, but not in any of the other witnesses from Deir el-Bersha.
293 de Buck (1935) CT I, p. 12-13,e-a (B4C).
294 MC105, S10C, T9C, TT319 and Y1C, as this phrase does not occur in any other witness from Deir el-Bersha. I assume this originated from a corruption, where the S42 (𓌂) was misread as an S34 (𓌃), while the S29 (𓌄) and Aa1 (𓌍) interpretants were maintained. However, due to the editing process of the artist, the N35 (𓌅) interpretant was added as well. The shift between the S42 and S34 is possible in near hieratic cursive script, see Möller (1909), p. 42, 51; no. 449 and 584, as the two signs are remarkably similar.
3.7. Spell 5

The following section concerns spell 5. This spell is considered to be part of the same spells discussed above. The subject of this spell concerns the deceased taking possession of the sky and land, which functions as prerequisites for the vindication of the deceased.

3.7.1. Introduction

This spell is another short spell, with a total of six phrases, of which most witnesses have three phrases at most. In de Buck, there are a total of nine witnesses for this spell, originating from three different regions. In the following table, the witnesses are sorted by region (table 3.7):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B15C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105</td>
</tr>
</tbody>
</table>

Table 3.7: Witnesses sorted by region for spell 5. See appendix 1 for a full list of details concerning every witness.

As one can see here, the majority of the witnesses originate from Deir el-Bersha, with seven witnesses. Asyut and the Theban area provides one witness each. Note that the witnesses used for the work here are limited to the material published in de Buck.

The following table concerns the percentage of reconstruction performed on the witnesses (figure 3.15):

---

299 *B15C* and *B6C* actually have four, and *B4C* only has 2, which are mostly reconstructions. It needs to be noted however that for the purposes of this work, some of the phrases have been combined in the database. The full sentence structure file is available in appendix 3.5.
For this spell, it is clear that B4C is badly damaged, and mostly reconstructed by the author, as more than 70% of the witness is reconstructed. Although included, any results concerning B4C need to be approached with caution.

3.7.2. Results and Discussion

Using the method discussed in 3.2.2, the following dendrogram was created (figure 3.16):

It firstly needs to be noted that due to the limited number of phrases for every witness, there are issues at play here concerning short spells, similar to spell 2. As most witnesses only have three of the phrases
of this spell, it means that one minor change in one phrase might affect the placement of the witness by a third. This might explain most witnesses existing on the top horizontal line, without being separated in branches. There is only one main branch, which contains B3Bo, B4Bo, B1P, B6C and MC105. Based on the actual available text, one can see that this placement is unusual, as the only shared phrase between this witnesses is I,15,b, as the other witnesses have different phrases here. Moreover, as is visible in appendix 3.5, only I,15,b is generally the same phrase, where all other phrases are different from each other to various extents. However, where B1P and B6C have it n-k p.t iw n-k ts (take the sky, inherit the earth), MC105 has the unique phrase: iwi it.n wsir [šdi] tn p.t iw iw.n wsir [šdi tn] ts (the Osiris, this šdi, has taken the sky, the Osiris, this šdi, has inherited the land), making the connection between these witnesses even more dubious.

Due to these issues, it is clear that the method used for this chapter is of limited use for these types of short spells, especially when the level of underlying variation between the witnesses is high, which compounds the issue of a low number of phrases used for the system.

Nevertheless, based on if a specific phrase occurs, and not considering variation within the phrases themselves, it is possible to notice two patterns originating from Deir el-Bersha. The first pattern concerns B2Bo, B3Bo, B4Bo and B1P, which use phrase I,15,b-c and I,16,a-b. The second pattern concerns B6C and B15C, which use I,15,a-c and I,16,a-b. B4C is not considered here, as it was badly damaged, and it cannot be said with certainty if the reconstructions are correct. The witnesses MC105 and S10C use phrase I,15,b-d. If this separation is compared to figure 3.16, one can see clearly that this is not reflected in the image.

3.7.3. Conclusion

Spell 5 is of limited use to visualise regional variation, although it clearly shows the limitations of the method used in this chapter. Nevertheless, based on basic sentence occurrence, there might be two patterns in use in Deir el-Bersha, and there might be a distinction between the pattern used in Deir el-Bersha and outside Deir el-Bersha.

3.8. Spell 6

In this section, spell 6 will be discussed. The spell concerns the rebirth of the deceased during the festival of the new moon. This spell is part of the same group of spells to which spell 1-5 belong, as it is part of the process, prerequisites and effects of the justification of the deceased.
3.8.1. Introduction

Spell 6 is slightly longer than the preceding spells, with a total of fifteen phrases, although every witness only uses a selection of these phrases. As with spell 5, the spell occurs in de Buck in nine witnesses in total, originating from three different regions. The following table sets out the witnesses by region (table 3.8):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B15C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105</td>
</tr>
</tbody>
</table>

Table 3.8 Witnesses sorted by region for spell 6. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses used in de Buck originate from Deir el-Bersha, which provides seven of the nine witnesses. Asyut and the Theban area each have one witness. As in section 3.7.1, it needs to be noted that these witnesses only reflect the material from the publication of de Buck.

The following table shows the percentage of damage for every witness of this spell (figure 3.17):

![Figure 3.17 Percentage of reconstruction and damage in the witnesses for spell 6. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.]

Most witnesses are relatively intact, with the exception of S10C, which is more than 50% damaged. Although S10C is included in the results of this spell, any result containing S10C needs to be approached with some caution.

---

304 The full sentence structure file is available in appendix 3.6.
3.8.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.18):

![Dendrogram](image)

Figure 3.18 Rectangular Phylogram display of the distance between different witnesses of spell 6.

As one can see here, the dendrogram is mostly one branch, to which witnesses B2Bo and B3Bo are connected as separate sections. In left most section of the main branch, there are three witnesses, namely S10C, MC105 and B4C. Although B4C represents a degree of uncertainty, the placement of these witnesses suggests that there is a separate sentence structure pattern outside of Deir el-Bersha. If the image is rendered as a rectangular cladogram however, as in figure 3.19, it becomes clearer that S10C and MC105 are more closely related to each other than to B4C. This can be seen in I,19,a: *r ir*[t(y)]=sn wd wt-mdw hft=t m hrw [pn] (against they who will do judgement in front of you on this day). This phrase varies from the other witnesses, which added the adjective *nfr* after *pn*. The placement of S10C might however be due to the reconstructions made in this witness, as more than 50% was reconstructed.

Additionally, when regarding the right sub-branch of the main branch, which contains B15C and B1P, it is encouraging that these are placed in proximity, because these two coffins are dated close to each other, B15C dated to Amenemhat II, and B1P dated to Sesostris II to Sesostris III. This is comparable to the

---

305 de Buck (1935) *CT I*, p. 19,a (MC105).
other witnesses from Deir el-Bersha, which are dated to the late 11th dynasty or early 12th dynasty. Therefore, it is possible to suggest that there might be two Deir el-Bersha patterns, based on period of construction, although the proximity of B15C and B1P to B6C suggest that this difference is most likely limited at best. For example, this can be seen in I,16,d: n sjh.t(w) dqbi.t hYr-k (because the finger is removed upon you). Here, B15C, B1P and B6C add the connector n before sjh.t(w), which does not occur in the other witnesses.

3.8.3. Conclusions

Based on the dendrogram created for this section, it is possible to make the following remarks. Although the observed differences might be relatively modest, and reconstructed material was included, it seems that there is a difference in sentence structure pattern between witnesses from Deir el-Bersha and outside Deir el-Bersha. Additionally, it seems that there is a difference in the sentence structure pattern used between earlier and later production of coffins in Deir el-Bersha.

For spell 6, the method used in this chapter visualised patterns of regional variation in the sentence structure, and even seemed to allow distinction between two periods of coffin creation in one region, even though the borders are fuzzy.

3.9. Spell 7

The following section deals with spell 7. This spell needs to be considered as part of the same group to which spell 1-6 belong. The spell continues in the group theme of justification, starting with a mythological description of a fight between Horus and Seth, which created the pool in the temple of Heliopolis. In this spell, the deceased is prepared to be justified against his enemies as Horus was against his.

3.9.1. Introduction

This spell is of comparative length to spell 6, with a total of sixteen phrases. As with the other spells discussed above, the witnesses only use a selection of these phrases. Spell 7 is attested in de Buck for eleven witnesses, which originate from three different regions. The following table shows the different witnesses separated by region (table 3.9):

---

308 de Buck (1935) CT I, p. 16,d (B6C).
<table>
<thead>
<tr>
<th>Region:</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T9C, T1L, T1NY</td>
</tr>
</tbody>
</table>

Table 3.9 Witnesses sorted by region for spell 7. See appendix 1 for a full list of details concerning every witness.

For spell 7, the majority of the witnesses originate from Deir el-Bersha, with a total of six witnesses. This is followed by the Theban area, which supplied four witnesses, and finally Asyut, which has one witness. As noted above, these witnesses only reflect the material provided in the publication of de Buck.

The following figure shows the percentage of reconstruction that was performed on the witnesses (figure 3.20):

![Figure 3.20 Percentage of reconstruction and damage in the witnesses for spell 7. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

As one can see here, the damage to the witnesses is relatively modest, with only T1NY, B4C and S10C nearing 40% damage, where the other witnesses are within 10-20% damage in total.

### 3.9.2. Results and discussion

After the method described in 3.2.2 was applied, the following dendrogram was created (figure 3.21):
In this dendrogram, there is a large branch on the left, which is separated into two sub-branches, as well as a smaller branch containing B2Bo and B3Bo, and finally B1P separate from the other branches. It seems that this spell does not have any region-specific patterns of variation, as Asyut, Deir el-Bersha and the Theban area share the same main branch, without any obvious difference in spacing. However, when taking the left sub-branch of the large branch (figure 3.22), T1NY and B4C are grouped together. There is thus no variation based on region. However, in the stemma of Jürgens\footnote{Jürgens (1996), p. 60.} for the entire spell group 1-27 B4C and T1NY are placed together as well, under δ2. There is therefore some underlying similarity between these two witnesses which was visible for Jürgens as well. This can be seen in 1,22,b: \textit{di-tn msz-\textit{hrw wsir ss.t-\textit{hd-\textit{hlt\textit{p} tn m hrw pn}} (may they cause that the Osiris, this \textit{ss.t-\textit{hd-\textit{hlt\textit{p}}, is justified on this day).}}\footnote{de Buck (1935) \textit{CT I}, p. 22,b (B4C). T1NY replaced \textit{ss.t-\textit{hd-\textit{hlt\textit{p}}} \textit{tn} with \textit{n(y)-sw-\textit{i\textit{k\textit{r}} pn} instead (name of the owner).}} Here, B4C and T1NY vary from the other witnesses due to the addition of the \textit{di-tn}. It needs to be noted that B4C and T1NY were both nearly 40\% reconstructed to some extent, which may be the reason for the proximity of these two witnesses.

The right sub-branch of the large branch does not show any local underlying pattern, as B6C and B4Bo are part of the smaller branches to which T9C and T1L belong. Moreover, B3Bo and B2Bo are on their own branch and belong to the same coffin group as B4Bo and B6C. As such, it seems that there is common ground here between B3Bo and B2Bo, but not with B4Bo, which makes the existence of an underlying pattern on a local basis unlikely, as B3Bo and B4Bo belong to the same owner, and likely have been created around the same time. However, it is possible that the variation between B3Bo and B4Bo was intentional, in order to create some variation between the two witnesses of the same spell.
3.9.3. Conclusions

Due to the variety of the regions in the largest branch, it seems that for spell 7 there is no regional sentence structure pattern. Although B2Bo and B3Bo share a close proximity, B4Bo and B6C, which belong to the same group in Willems, do not. This makes it unlikely that there is any regional sentence structure pattern in Deir el-Bersha for spell 7.

In spell 7, the method used in this chapter seems to work satisfactory, although there are no results that imply any pattern of sentence structure on a regional basis.

3.10. Spell 8

Spell 8 is the subject of this section. This spell should be considered part of the same group of spells to which spell 1-7 belong. This spell discusses the process of justification of the deceased in front of the tribunal, while the deceased is supported by divinities that are called \( p\text{fr} \) (the one who envelops) and \( \text{fr} \) (the one that stands).

3.10.1. Introduction

Spell 8 is another short spell, with a total of eight phrases. With some exceptions, all phrases are used by the witnesses. In de Buck, this spell occurs in a total of ten witnesses, who originate from three different regions. The following table shows the different witnesses sorted by region (table 3.10):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T9C, T1L</td>
</tr>
</tbody>
</table>

Table 3.10 Witnesses sorted by region for spell 8. See appendix 1 for a full list of details concerning every witness.

For this spell, the majority of the witnesses originate from Deir el-Bersha, which provides six witnesses, where the Theban area supplied three witnesses, and Asyut one.

The percentage of reconstruction for the witnesses in this spell is set out in the following figure (figure 3.23):

---

314 Willems (1988), p. 70-74, Deir el-Bersha group B.
317 de Buck (1935) CT I, p. 25,a (T9C).
318 S10C, B4C, MC105, T9C and T1L. The full sentence structure file is available in appendix 3.8.
As is visible in the figure, the average damage to the witnesses is light. B4C has more than 30% full or partial reconstructions, where T1L has slightly more than 20%.

3.10.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.24):
In this dendrogram, there are two main branches, of which the first main branch is separated into two sub-branches. B1P was placed on a separate branch. The left sub-branch of branch 1 contains S10C, MC105, T9C and T1L. As these witnesses are placed on a separate sub-branch, there might be a pattern to these witnesses that is distinct from the witnesses from Deir el-Bersha. S10C is in this sub-branch as well, so it seems that there is a distinction from Deir el-Bersha, but not a clear distinction between Asyut and the Theban area.\(^{319}\)

The second main branch contains B3Bo, B4Bo and B4C. The fact that B3Bo and B4Bo occur in close proximity to each other is encouraging, as they belong to the same owner. Additionally, these witnesses share a feature, unlike the other witnesses from Deir el-Bersha, as the owners of B3Bo, B4Bo and B4C are all female.\(^{320}\)

As this spell is short, any placement of the witnesses in the dendrogram is dubious, due to the problems discussed in spell 2, 3 and 5. The placement of B4C on the same sub-branch of B4Bo is already unusual, as these witnesses share a feature, unlike the other witnesses from Deir el-Bersha, as the owners of B3Bo, B4Bo and B4C both have unique sentence structure variations, it seems that dissimilarity to any other witness has more to do with the placement than any actual proximity.

As one can see in appendix 3.8, for most phrases of this spell the witnesses are highly varied. This leads to dubious placement for every witness, as they will be connected based more on differences than similarities.

For example, in I.24.a, where nearly every witness is varied to some extent. In this phrase, B3Bo has: 
\[i.\text{n}d\ hr\-\text{tn} d\text{s}d\text{r}.t n\text{tr} wdf.\text{t}(i)=s d\text{hwty}-n\text{ht} t\text{n} (\text{greetings to you, tribunal of the god, she who will judge this}\ d\text{hwty}-n\text{ht})\]; B2Bo has: 
\[i.\text{n}d\ hr\-\text{tn} d\text{s}d\text{r}.t n\text{tr} wdf.\text{t} s\text{w} ws\text{ir} d\text{hwty}-n\text{ht} t\text{n} (\text{greetings to you, tribunal of the gods, who judge him, the Osiris}\ d\text{hwty}-n\text{ht})\]; B4Bo has: 
\[i.\text{n}d\ hr\-\text{tn} d\text{s}d\text{r}.t n\text{tr} wdf.\text{t}(i)=s d\text{hwty}-n\text{ht} t\text{n} (\text{greetings to you, tribunal of the god, who judges her, the Osiris, this}\ d\text{hwty}-n\text{ht})\]; B1P has: 
\[i.\text{n}d\ hr\-\text{tn} d\text{s}d\text{r}.t n\text{tr} wdf.\text{t} s\text{w} ws\text{ir} sp\text{i} p[n]\text{t} im=s (\text{greetings to you, tribunal of the god, who judges him, the Osiris, this}\ sp\text{i}, in it)\]; B6C has: 
\[i.\text{n}d\ hr\-\text{tn} d\text{s}d\text{r}.t n\text{tr} wdf.\text{t} s\text{w} ws\text{ir} \text{h}s-n\text{ht} p\text{n} im=s (\text{greetings to you, tribunal of the god, who judges him, the Osiris, this}\ \text{h}s-n\text{ht}, in it)\]; B4C has: 
\[i.\text{n}d\ hr\-\text{tn} d\text{s}d\text{r}.t n\text{tr} wdf.\text{t}[.t] ws\text{ir} s\text{s}.t-h\text{d}-h\text{tp} t\text{n} im=s m \text{hrw} p\text{n} (\text{greetings to you, tribunal of the god, who judges the Osiris, this}\ s\text{s}.t-h\text{d}-h\text{tp}, in it on this day)\]; MC105 has: 
\[i.\text{n}d\ hr\-\text{tn} d\text{s}d\text{r}.t n\text{tr} wdf.\text{t}(i)=s ws\text{ir} \text{\text{s}d} i\ t\text{n} im=s m \text{hrw} p\text{n} (\text{greetings to you, tribunal of the god, who will judge the Osiris, this}\ \text{s}d\text{i}, in it on this day)\]; S10C has: 
\[i.\text{n}d\ hr\-\text{tn} d\text{s}d\text{r}.t n\text{tr} wdf.\text{t}(i)=sn ws\text{ir} \text{ir} p\text{n} (\text{greetings to you, tribunal of the god, who they judge the Osiris, this}\ \text{ir})\]; T9C has: 
\[i.\text{n}d\ hr\-\text{tn} d\text{s}d\text{r}.t n\text{tr} wdf.\text{t}(i)=sn ws\text{ir} b\text{w} s\text{w} p\text{n} im=s m \text{hrw} p\text{n} (\text{greetings to you, tribunal of the god, who they will judge the Osiris, this}\ b\text{w} s\text{w}, in it on this day)\]; T1L has: 
\[m\text{r}-\text{hrw} ws\text{ir} im=s w\text{p} n (\text{the Osiris, this}\ im=s w, is justified})\].

With the exception of T1L, which is remarkably different, one can see here that

\[\text{\footnotesize 319}\] However, this is rather due to the fact that S10C, MC105, T9C and T1L almost entirely consist of unique phrases, therefore it seems that this branch only exists due to dissimilarity from the other witnesses, rather than any shared underlying structure.

\[\text{\footnotesize 320}\] However, it is not my intention here to imply that this is the reason why these witnesses were grouped together.

\[\text{\footnotesize 321}\] de Buck (1935) CT I, p. 26,c. Moreover, this phrase is mostly reconstructed in B4C.
the variation base on minor features, as in general the statement is similar between the witnesses. For example, B3Bo did not add *wsir before the name of the owner, while B2Bo left out the demonstrative after the name, which did occur in B4Bo, which wrote *wsir as well. Even though the addition of *m hrw pn in B4C, MC105 and T9C is a clear variation which could group these witnesses together, there are still other underlying variation between these witnesses. For example, B4C uses *wdȝ.t (participle), where MC105 and T9C use a prospective relative *sdȝm ȝ t instead, but vary based on the suffix pronoun which follows *wdȝ.t(i), as MC105 uses *s, and T9C uses *sn.323 S10C uses *wdȝ.t(i)=sn as well, but left out the *m hrw pn, and is therefore a variant. Only B1P and B6C are completely similar.324

3.10.3. Conclusions

Based on the dendrogram produced for this spell, it seems that there is a distinct pattern in Deir el-Bersha, in comparison to the witnesses that originate from other regions. It needs to be noted that there is no clear distinction between Asyut and the Theban area.

Due to the limited number of phrases, and the high level of variation between the phrases, it is possible that the dendrogram used here actually gives an incorrect image. Possible bias of the author may amplify the problem, as it results in a distinction between Deir el-Bersha and the witnesses from other regions. Thus, the limited number of phrases, combined with a high number of unique phrases, might give a false positive when using the method shown in this chapter.

3.11. Spell 9

The following section discusses spell 9.325 This spell should be considered a part of the same group to which spell 1-8 belong. The subject of the spell is a speech made by Atum, on behalf of the deceased, to Thot as the leader of the tribunal326 which declares the deceased justified.

3.11.1. Introduction

Spell 9 is a slightly larger spell than spell 6 and 7, as it has a total of seventeen phrases. None of the witnesses contains the entire set of these phrases however. In de Buck, there are a total of ten witnesses. There are six witnesses from Deir el-Bersha, three witnesses from the Theban area and one witness from Asyut (table 3.11):

---

322 Both these cases do not affect the meaning of the phrase, and show one of the underlying issues with the binary approach to variation, as the absence of a demonstrative after a name would make a witness a unique variant.
323 It could be argued that in MC105 the N35 (...) was lost or forgotten, but as the *s is functional, it was encoded as written.
324 As only the name of the owner varies.
Table 3.11 Witnesses sorted by region for spell 9. See appendix 1 for a full list of details concerning every witness.

<table>
<thead>

<td>Theban area</td>
<td>MC105, T9C, T1L</td>
</tr>
</tbody>
</table>

The following figure shows the percentage of damage in the witnesses for this spell (figure 3.25):

![Figure 3.25 Percentage of reconstruction and damage in the witnesses for spell 9. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.]

For most witnesses in spell 9, the damage is relatively minor. B4C is more extensively reconstructed, with nearly 40% reconstructed. Although B4C is included in the results, any results which include B4C need to be approached with some caution.

3.11.2. Results and discussion

Before any discussion takes place concerning spell 9, it needs to be noted that T1L only has two of the 17 phrases, and any placement within the dendrogram is based on limited data, and therefore susceptible to misinterpretation.

Using the method described in 3.2.2, the following dendrogram was made (figure 3.26):
In the dendrogram of spell 9, there is one large branch, with two separate branches for B4Bo and B1P. The large branch is formed as a fan, where one witness is separated from the other witnesses at every division. The final section of the large branch, contains MC105, T9C and S10C. Although not fully separate from the witnesses from Deir el-Bersha, it is encouraging that these witnesses occur in proximity to each other. This implies that although some connection with the witnesses from Deir el-Bersha still exists, one can assume there is a Deir el-Bersha sentence structure pattern, which is not as closely followed by witnesses from other regions. This can be seen in 1,29,b: *in.t.n wsir n ss-f hr* (which Osiris brought to his son Horus).\(^{327}\) In this phrase, MC105, T9C, and S10C add *ss-f* in front of *hr*, which does not occur in the other witnesses.

This distinction from Deir el-Bersha is additionally supported by the phrases used in the witnesses for this spell,\(^{328}\) as S10C, MC105 and T9C have the phrases I,33,b and I,33,c, which do not occur in the witnesses from Deir el-Bersha.

However, due to the separation of B4Bo and B1P from the main branch, and the fan structure of the main branch, it cannot be stated if there is a clear underlying sentence structure for the witnesses from Deir el-Bersha in this spell. There is some clear proximity between the witnesses from Deir el-Bersha, but all witnesses seem to be some variation of each other, as each witness has a high number of unique phrases.

### 3.11.3. Conclusions

The results of the dendrogram of spell 9 shows that a variation, where witnesses from different regions than Deir el-Bersha have two phrases that do not occur in Deir el-Bersha, is reflected in the dendrogram. Thus, for this spell, the method used in this chapter to visualise regional variation at the level of

---

\(^{327}\) de Buck (1935) *CT I*, p. 29,b (MC105).

\(^{328}\) The full sentence structure file is available in appendix 3.9.
sentence structure is functional, although here it is limited to either Deir el-Bersha or any other region in general.

### 3.12. Spell 10

The following section will discuss spell 10. Together with spell 1-27, this spell should be considered part of a group. It concerns how the deceased can move forward, as the portal (sbs) and good roads (ws wt nfr. (w)t) are opened for him, now that the deceased is justified.

#### 3.12.1. Introduction

Spell 10 is another of the small spells of this group of spells, consisting only of seven phrases in total. All phrases are used by the witnesses. In de Buck, spell 10 occurs in a total of nine witnesses, from a total of three different regions. The following table shows the witnesses separated by region (table 3.12):

<table>
<thead>
<tr>
<th>Region:</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T9C</td>
</tr>
</tbody>
</table>

Table 3.12 Witnesses sorted by region for spell 10. See appendix 1 for a full list of details concerning every witness.

In this spell, the majority of the witnesses originate from Deir el-Bersha, with a total of six witnesses. This is followed by two witnesses from the Theban area, and one witness from Asyut. Note that these witnesses only reflect the material in publication of de Buck.

In the following figure, the percentage of damage is set out per witness (figure 3.27):

---

331 de Buck (1935) *CT I*, p. 34,a (B1P).
332 With the exception of B2Bo, B3Bo, B4Bo, B6C and B4C. The full sentence structure file is available in appendix 3.10.
As one can see here, MC105 is badly damaged, with nearly 60% partially or fully reconstructed, closely followed by S10C, which has 50% full or partial reconstructions. Finally, B4C is more than 30% partial or fully reconstructed. Although these witnesses are included in the results, any results including these witnesses need to be approached with caution.

### 3.12.2. Results and discussion

Applying the method discussed in this chapter, the following dendrogram was produced (figure 3.28):
In this dendrogram, there is one big branch, and which separates into two main sub-branches. On the main branch is an earlier sub-branch, on which B2Bo is placed. Beside the main branch, there are two separate branches containing B1P and B4C respectively.

The fact that S10C and MC105 are both on a separate sub-branch would be encouraging, although the extensive damage to these witnesses could imply that the placement is more due to the reconstructions. However, the similarity can be seen in I,33,d: \([\text{wd}(.w) \text{ sb}z] n \text{ wsir \ ir p} n \text{ in } s\tilde{s}.t\) (the portal is opened for the Osiris, this \textit{ir}, by Seshat).\(^{333}\) In Deir el-Bersha, this phrase is for example: \(h\tilde{s} \text{ wsir } dh\tilde{wty-nht} \text{ in } wd(.w) n=1 \text{ sb}z \text{ in } s\tilde{s}.t\) (ho Osiris, this \textit{dh\tilde{wty-nht}}, the portal is opened for you by Seshat).\(^{334}\) As one can see, in S10C and MC105 the owner is not addressed, and only mentioned by name after \textit{sb}z.

This sub-branch could imply that there is a pattern outside Deir el-Bersha, but this is contradicted by the fact that T9C is on the other sub-branch, near B4Bo and B3Bo.\(^{335}\)

Note that these statements are based on the dendrogram alone. In the actual phrases, there are some visible patterns beyond random variation. Phrase I,35,b only occurs in S10C, B4C, B1P, MC105 and T9C, which should set them apart from the other witnesses, and B4C and B1P uses \textit{hm.t-r3} (etcetera), where

---

\(^{333}\) de Buck (1935) \textit{CT I}, p. 33,d (S10C). MC105 replaced \textit{ir p} \text{ by } \textit{\textbf{sdi} tn} (name of the owner). T9C is remarkably similar to S10C and MC105, but left out the \textit{wsir} before the name of the owner.

\(^{334}\) de Buck (1935) \textit{CT I}, p. 33,d (B3Bo).

\(^{335}\) However, this could be due to the fact that I,33,d and I,33,d are unique phrases, even though the general structure resembles S10C and MC105 more than the witnesses from Deir el-Bersha.
S10C, MC105 and T9C use some variant of the phrase \( r \text{ irr.} \text{ wt} \) \( [r-f \text{ r msqd.} \text{ wt}] \) \( sw \) \(^{336}\) (against those male and females who act against him, against those males and females who hate him). It needs to be noted here that S10C, MC105 and T9C all have their own specific variant of this phrase. Thus, one would expect three groups here based on this phrase alone, which would contain B2Bo, B3Bo, B4Bo and B6C in one, B4C and B1P in the second, and S10C, MC105 and T9C in the third.

### 3.12.3. Conclusions

In the dendrogram produced for spell 10, one can see that there does not seem to be a regional sentence structure pattern. As there is a structure visible when taking the phrases themselves into regard, the method used in this chapter may be of limited use in a spell of this length.\(^{337}\)

### 3.13. Spell 11

In this section, spell 11\(^{338}\) will be discussed. This spell is part of the same group of spells to which spell 1-10 belong. This spell concerns the welcome received by the deceased, after the process of justification.\(^{339}\)

### 3.13.1. Introduction

Spell 11 is a longer spell than spell 10, but still relatively short with a total of twelve phrases. None of the witnesses contain all of these phrases. In de Buck, this spell has a total of eight witnesses, which originates from two different regions (table 3.13):

<table>
<thead>
<tr>
<th>Region:</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T9C</td>
</tr>
</tbody>
</table>

Table 3.13 Witnesses sorted by region for spell 11. See appendix 1 for a full list of details concerning every witness.

As one can see here, the majority of the witnesses from this spell originate from Deir el-Bersha, with a total of six witnesses. The two remaining witnesses come from the Theban area. As with the other spells discussed above, there was some damage in the witnesses. The following table shows the percentage of damage for the witnesses (figure 3.29):

---

\(^{336}\) de Buck (1935) \( CT \) I, p. 35,d (S10C).

\(^{337}\) Although it might be possible that one of the other approaches concerning amino-acid code allocation discussed could stabilize the system more than the binary approach used for this chapter.

For this spell, most witnesses are only lightly damaged, with the exception of MC105, which is more than 50% reconstructed. Therefore, any results including MC105 should be treated with caution.

3.13.2. Results and discussion

After the method discussed in 3.2.2 was applied, the following dendrogram was created (figure 3.30):
Figure 3.30 Rectangular Phylogram display of the distance between different witnesses of spell 11.

In this dendrogram, there is one main branch, and two small branches for B1P and B3Bo. As both T9C and MC105 originate from the Theban area, it is encouraging to see that they ended up together on the final section of the main branch. This implies that there is a difference between the sentence structure pattern of Deir el-Bersha, and the Theban area. This can for example be seen in I,37,d: ḫ nt n bsww pn ns.wt gbb (this bsww was in front of the thrones of Geb).\textsuperscript{340} In the same phrase, the witnesses from Deir el-Bersha use a suffix pronoun instead of the name of the owner. Moreover, this is supported in the fact that both MC105 and T9C do not have phrase I,36,c and I,37,b, although this feature is shared by B4C as well, as is visible from the proximity between these witnesses in the dendrogram. Additionally, phrase I,37,e only occurs in MC105 and T9C, which supports the placement here as well. It needs to be noted that witnesses MC105 and T9C differ strongly from each other, based on the phrases used for this spell.\textsuperscript{341} The fact that they are still placed in this proximity to each other is encouraging, as it shows a sentence structure pattern that is different to the witnesses from Deir el-Bersha, even if there is only limited underlying similarity between these two witnesses themselves. However, it is possible that the reconstructions play a significant role as well, as MC105 is more than 50% reconstructed.

3.13.3. Conclusions

In spell 11, even though the spell is short with only twelve phrases, it is possible to make out a regional difference in sentence structure using the method described in this chapter. The Theban area seem to have their own pattern in sentence structure, which can be supported by patterns in the phrases they

\textsuperscript{340} de Buck (1935) CT I, p. 37,d (T9C). MC105 replaced bsww pn with ṣḏ ṭn (name of the owner).

\textsuperscript{341} The full sentence structure file is available in appendix 3.11.
use and do not use. Regarding this spell and spell 2, 3, 5, 8 and 10, it seems that the method used in this chapter requires a minimum of roughly twelve available phrases to function in a beneficial manner.

3.14. Spell 12

The following section concerns spell 12.342 This spell is part of the same group of spells concerning justification to which spell 1-27 belong. This spell concerns the deceased acting in a similar manner to Re, when he rises in the east, and how the gods who supported Horus against Seth, support the deceased as well against his enemies, which is the result of the vindication of the deceased.343

3.14.1. Introduction

Spell 12 is another short spell, with a total of ten phrases available to the witnesses. With the exception of T2C, none of the witnesses use all available phrases, but rather a selection of them. In this spell, there are a total of eleven witnesses, which originate from three different regions (table 3.14):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B15C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T2C, T9C</td>
</tr>
</tbody>
</table>

Table 3.14 Witnesses sorted by region for spell 12. See appendix 1 for a full list of details concerning every witness.

As one can see in the table above, the majority of the witnesses originate from Deir el-Bersha, which provides a total of seven witnesses. This is followed by a total of three witnesses from the Theban area, and finally one witness from Asyut. The witnesses used for this section reflect the material published in de Buck only.

It needs to be noted that although MC105 and T9C have spell 11 and 12, these do not follow each other in their placement in the supports, as is the case with the majority of the witnesses from Deir el-Bersha.344

For this spell, the following figure shows the percentage of full or partial damage which occurred in the witnesses (figure 3.31):

---

344 For the full order of spells used for every witness for spell 1-27, see Jürgens (1996), p. 57-59.
As one can see in this figure, S10C and MC105 are both badly damaged, with MC105 being more than 50% partly or fully reconstructed, and S10C being more than 60% reconstructed. B4C is damaged to a noticeable extend as well, with more than 30% of its tokens reconstructed. These witnesses are included in the results, but due to the damage they have received, any results including them should be approached with caution.

3.14.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was made (figure 3.32):
In this dendrogram, there are two major branches, and two separate branches for B15C and T2C. When considering branch 1, the results of this dendrogram seem encouraging. This branch holds B3Bo, B4Bo and B6C. Of these supports, B3Bo and B4Bo belong to the same owner, and based on Willems, B6C belongs to the same group as B3Bo and B4Bo. Moreover, this is supported by the same type of script used in these supports, which is partly engraved. The connection between B3Bo and B4Bo can be seen in I,39,c: *shr*/*tn n-f stḥ (while you overthrow Seth for him),\(^{345}\) where the other witnesses use the suffix pronoun */sn* instead. However, B2Bo should belong to the same group as well, but is placed on branch 2. Additionally, when taking the actual phrases\(^{346}\) used into regard, the placement of B6C is even more unusual, as it only shares 2 phrases, I,38,c and I,39,b, with B4Bo, which should be its closest neighbour. B1P, shares two phrases, I,38,b and I,38,c with B3Bo and B4Bo as well, thus the use of two phrases that are the same does not seem to inform the placement.

Additionally, phrase I,40,b-c does not occur in Deir el-Bersha, which one would expect to be an important feature of comparison. But, except for T9C and MC105, the witnesses from Asyut and Thebes are separated from each other. Thus, therefore, the dendrogram created for this spell seems only of limited use, and although it shows some proximity correctly,\(^{347}\) it does not seem to be structural.

---

\(^{345}\) de Buck (1935) CT I, p. 39,c (B3Bo).

\(^{346}\) The full sentence structure file is available in appendix 3.12.

\(^{347}\) B3Bo and B4Bo, which share five phrases (I,38,b-c, I,39,a-c), B2Bo and B1P, which share four phrases (I,38,c, I,39,a-c).
3.14.3. Conclusions

For spell 12, the method used in this chapter does not seem to work properly. Although some placement is within expectation, the placement of the witnesses is in some cases difficult to explain. Even so, when ignoring the dendrogram and focussing on the phrases used, it is possible to say that there is a sentence structure pattern used in Deir el-Bersha, as witnesses from other regions have a different pattern, which includes two additional phrases.

3.15. Spell 13

The following section concerns spell 13. This spell belongs to the same group as the spells discussed above. The spell concerns the deceased going forth as one justified by the tribunal of the gods of Pe, Dep and Heliopolis, in the same manner as Horus.

3.15.1. Introduction

Spell 13 is another short spell, with a total of seven phrases. Except for B15C, all the witnesses from Deir el-Bersha use every phrase, while the witnesses from the other regions use a selection of the available phrases. T2C is the shortest witness, as it only uses three of the seven available phrases. In de Buck, this spell occurs in ten witnesses, which originate from three different regions. The following table shows the witnesses separated by region (table 3.15):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B15C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T2C</td>
</tr>
</tbody>
</table>

Table 3.15 Witnesses sorted by region for spell 13. See appendix 1 for a full list of details concerning every witness.

The majority of witnesses originate from Deir el-Bersha, with a total of seven witnesses. The Theban area supplied two witnesses, and Asyut provided one witness. These witnesses reflect only the material published in de Buck.

The following table shows the percentage of damage which occurred in the witnesses (figure 3.33):

---

350 de Buck (1935) CT I, p. 42,c.
351 Note that in de Buck there are actually nine phrases, but in my database I merged l,41,c, l,41,d and l,42,a together.
As one can see in the figure above, the witnesses from Deir el-Bersha are relatively intact, although B4C is more than 30% partially or fully reconstructed. T2C however, is nearly 90% reconstructed, and S10C almost 70%. MC105 is the least damaged witness which does not originate from Deir el-Bersha, although the damage is still more than 40%. Although used for the results, the damaged witnesses should be treated with caution.

3.15.2. Results and discussion

Based on the method described in 3.2.2, the following dendrogram was created for spell 13 (figure 3.34):
In the dendrogram above, one can see that there is one main branch, with two additional branches for B15C and B4C. As S10C, T2C and MC105 share the same sub-branch, even separated between the witnesses of the Theban area and Asyut, it seems that the method used in this chapter works. However, due to the heavy reconstruction that has taken place here, the reason for this may be more the bias of the author352 than the actual text. However, it is in accordance with the fact that all witnesses from Deir el-Bersha use the phrase I,41,a,353 which does not occur outside Deir el-Bersha in this spell. Additionally, the connection between MC105 and T2C can be seen in I,42,b: ḫpš. n-k ḫpš (after you powered power),354 where Deir el-Bersha uses the third person singular suffix pronoun instead.

Moreover, as every phrase from B3Bo is shared with at least one other witness, the other placements seem correct as well. B6C varies in two phrases, I,41-42,c-a and I,42,c and is placed further away from B3Bo, close to B4Bo, which has two different phrases as well, I,42,c and I,43,a. B2Bo is placed close, as it only has one variant phrase, I,41,a. The placement of B1P is clear as well, as it has three different phrases, namely I,41,b, I,42,c and I,43,a. However, the placement of B4C seems unusual when regarding B3Bo, as they share three of the seven phrases, and B4C is on a separate branch, while MC105 and S10C only share one phrase, I,43,b, with B3Bo, but are placed on the same main branch.

3.15.3. Conclusions

Based on the phrases used, it seems that the dendrogram generated using the method described in this chapter works to show regional variation, as there seems to be a distinction between Deir el-Bersha and witnesses from other regions. However, due to damage in S10C, T2C and MC105, this may be more due to reconstruction. Additionally, although the placement of the witnesses seem to fall generally within expectation, it cannot be excluded that the results in the dendrogram were more due to chance than underlying patterns of sentence structure, as the method was shown to have limited functionality in spell 2, 3, 5, 8, 10 and 12, which are of similar length, or even longer than this spell.

3.16. Spell 14

This subsection will discuss spell 14.355 As the spells discussed above, this spell should be considered as part of a group of spells, running from spell 1 to 27. In this spell, the deceased is urged to move away from opposition, in a similar manner as Horus did, and contains a warning to the one who would approach the deceased.356

---

352 As the reconstructions for these witnesses were first and foremost based on each other, due to the perceived, but not fully proven pattern of differentiation between the Deir el-Bersha and the other regions, which seems to be the case in spells 1-12.
353 The full sentence structure file is available in appendix 3.13.
354 de Buck (1935) CT I, p. 42,b (T2C).
3.16.1. Introduction

Spell 14 is a short spell, with a total of five phrases. Except for B4C, which lacks I,43-44,c-a, all these phrases are used by the witnesses. In de Buck, this spell has a total of eleven witnesses, which originate from three different regions. The following table shows the different witnesses sorted by region (table 3.16):

<table>
<thead>
<tr>
<th>Region:</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B15C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T2C, T9C</td>
</tr>
</tbody>
</table>

Table 3.16 Witnesses sorted by region for spell 14. See appendix 1 for a full list of details concerning every witness.

For this spell, the majority of the witnesses originate from Deir el-Bersha, with a total of seven witnesses. Three witnesses come from the Theban area, and one witness comes from Asyut. These witnesses only represent the material published in de Buck.

For this spell, the following figure shows the percentage of damage for every witness (figure 3.35):

![Figure 3.35 Percentage of reconstruction and damage in the witnesses for spell 14. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

In this spell, T2C and MC105 are both badly damaged, with more than 60% fully or partially reconstructed. B4C is almost 40% damaged, and S10C roughly 20%. Especially regarding T2C and MC105 some caution should be taken concerning the results.

---

Note that de Buck has a total of seven phrases instead, but I,43,c and I,44,a, and I,44,e and I,45,a were merged together, to form a complete clause.
3.16.2. Results and discussion

Using the method discussed in 3.2.2, the following dendrogram was made (figure 3.36):

![Dendrogram diagram]

In the dendrogram above, there are two main branches, and one separate branch for B15C. The left branch, consisting of B3Bo, B4Bo and B6C is encouraging, as these witnesses share a same date, and style of script. On the other hand, B2Bo, which should belong to this group as well, is not in the same branch. However, this is not surprising when taking the actual phrases into regard, as the witnesses in the left branch share at least three of the five phrases between each other, where B2Bo shares only two phrases. B2Bo is more akin to B1P in this case, as they share I,44,c: hr.t(i) r-i n.t(y) hr(.w) r-i (you are far from me, who is far from me). Here, B2Bo and B1P have the first person singular, where the other witnesses have the third person singular instead.

The final section of the central branch seems encouraging as well, as it contains all the witnesses that originate outside Deir el-Bersha, which implies a pattern variation which is not used in Deir el-Bersha. This can be seen in I,44,c: hr.t(i) r wsir bwsw pn n.t(y) hr(.w) r-f (you are far from the Osiris, this bwsw, who is far from him), where MC105, S10C and T9C added wsir before the name of the owner, which

---

358 The full sentence structure file is available in appendix 3.14.
359 I,43-44,c-a, 44,b and I,44-45,e-a.
360 I,43-44,c-a and I,44,b
361 de Buck (1935) CT I, p. 44,c (B2Bo).
362 de Buck (1935) CT I, p. 44,c (T9C).
does not occur in the other witnesses. However, B4C is in this section as well, which seems to counter this suggestion. It needs to be noted however, that B4C has a unique sentence structure variation in all the phrases it uses here in comparison with the other witnesses, except for I,44,b: nyt [hr pr] m šntt sp sn. w (you are Horus, who went forth from opposition, who went forth from opposition), which it shares with S10C, due to the use of the ntt hr, rather than the hr pw used in the other witnesses. This implies that the placement of B4C is solely based on this phrase.

3.16.3. Conclusions

In a similar fashion as with spell 13, it seems that although the number of available phrases is low, the dendrogram displays a separation which is supported by the phrases, in opposition to spell 2, 3, 5, 8 and 10. However, as most placement in the dendrogram seems to be based on similarity between three out of five phrases or less, it would be premature to consider the results stable. As B4C shows, only one phrase shared with one other witness can inform the placement within a branch, even if that phrase variation only occurs between the two of them, and not relative to the other witnesses in the same larger branch.

However, based on the dendrogram, and supported to some extend by the phrases used, the dendrogram suggest a separation between witnesses from Deir el-Bersha and other regions, although the placement of B4C complicates this statement.

3.17. Spell 15

The following section deals with spell 15. This spell should be considered to belong to the same group of spells to which spell 1-14 belong. In this spell, the deceased calls upon bn kA (the one who the bull begets), to act as a protector against the enemies of the deceased.

3.17.1. Introduction

Spell 15 is another short spell. The exact length however poses a bit of a problem. Depending on the witness, there are two general patterns in use, where only the first two phrases are similar enough to be compared over every witness of this spell. So, it is not really possible to state how many phrases are available for the spell, but for this work, there are five phrases in total, with the section after the first two phrases consisting of I,46,a, I,46,b and I,46,c, or I,45d, I,46,d and I,46,e.

363 Except for B4C, although this witness replaced the final suffix pronoun with ss.t-hq-f hip tn, and is therefore a unique phrase.
364 de Buck (1935) CT I, p. 44,b (B4C).
366 de Buck (1935) CT I, p. 45,b. Faulkner suggest that the bull is Osiris, and therefore the god that is called upon is Horus, see Faulkner (1973), p. 9, spell 15, note 1.
368 As they form one clause together, I,45,d and I,46,d are treated as one phrase.
369 The full sentence structure file is available in appendix 3.15.
The total number of witnesses in de Buck is eleven, which originate from three different regions. The following table shows the different witnesses separated by region (table 3.17):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B4C, B6C, B15C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T2C, T9C</td>
</tr>
</tbody>
</table>

Table 3.17 Witnesses sorted by region for spell 15. See appendix 1 for a full list of details concerning every witness.

For this spell, seven witnesses come from Deir el-Bersha, three from the Theban area, and one from Asyut. The witnesses used in this section do only reflect the material used in de Buck.

The following figure shows the percentage of damage per witness for this spell (figure 3.37):

![Percentage of reconstruction and damage in the witnesses for spell 15. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

For this spell, MC105 has the most damage, with nearly 70% partially or fully reconstructed. This is followed by T2C, which is 50% damaged. B4C has only full reconstructions, with more than 30% reconstructed tokens. Although these witnesses are included in the results, these results need to be approached with caution.

### 3.17.2. Results and discussion

After the method described in 3.2.2 was applied, the following dendrogram was created (figure 3.38):
As stated above, the distinct variation in the sentence structure pattern which is supposed to exist between witnesses from Deir el-Bersha and the witnesses from other regions, is not reflected in the dendrogram at all, as MC105 is placed on a separate branch and S10C is placed on a sub branch which contain B1P and B6C as well, with whom S10C only has one phrase in common. T9C and B4C are placed together on a sub-branch, while they do not have any phrases in common. However, it needs to be mentioned that with the exception of the first two phrases of the spell, the other phrases used are highly variable, which could be another reason for the dendrogram not resembling the actual phrase structure patterns, as most placement would be based on one or two phrases only. Even so, more proximity would have been expected for B2Bo, B3Bo, B4Bo, B15C and B1P, as they share the same structure in I,46,b: šnt-sn ḫwty-nḥt tn (while they revile the Osiris, this ḫwty-nḥt),\(^{370}\) which does not occur outside Deir el-Bersha.\(^{371}\)

### 3.17.3. Conclusions

The method used for this chapter does not work at all for this spell. There is a clear distinct variation in Deir el-Bersha, and one in the other regions, although B4C shows that witnesses of Deir el-Bersha could use the alternative pattern as well. This is not reflected in the dendrogram at all. Due to the high number of potential variations, and low number of phrases, the placement of witnesses seems random.

---

\(^{370}\) de Buck (1935) *CT I*, p. 46,b (B3Bo). The other witnesses replaced ḫwty-nḥt pn with the name of their owner.

\(^{371}\) B6C has a unique variant of this phrase: šnt-sn ir.t r ḫwty-nḥt pn (while they revile that which was done against the Osiris, this ḫwty-nḥt).
3.18. Spell 16-17

The following section deals with spells 16 and 17. These spells were grouped together based on the suggestion of Faulkner, as he considers the two spells a continuous text, even though there is a separation mark in B3Bo, B4Bo and B1P. These two spells should be considered part of a group of spells, which contains spells 1-27. These two spells concern the deceased becoming the incarnation of Horus, as a manifestation of vindication.

3.18.1. Introduction

Even combined, this spell pair is relatively short, with a total of 20 phrases, of which the witnesses use a selection. In de Buck, there are a total of ten witnesses, which originate from four different regions. The following table shows the witnesses separated by region (table 3.18):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Beni Hasan</td>
<td>BH5C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B4Bo, B6C, B15C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T2C</td>
</tr>
</tbody>
</table>

Table 3.18 Witnesses sorted by region for spell 16-17. See appendix 1 for a full list of details concerning every witness.

For this spell group, the majority of the witnesses originate from Deir el-Bersha, which provides six witnesses. The Theban area supplied two witnesses, and Asyut and Beni Hasan both have one witness. It needs to be noted that these witnesses only reflect the material provided in de Buck. Additionally, it needs to be noted that BH5C only has phrases attested to spell 16, not any of the phrases attested to spell 17.

The following figure shows the percentage of damage which occurred in the witnesses (figure 3.39):

---

374 B3Bo uses a single black horizontal line, B1P uses two red horizontal lines, and B4Bo uses D41 = (grh).
376 The number of phrases is higher in de Buck, due to the combination of phrases to form complete clauses.
For this spell group, the witnesses are relatively intact, with the exception of T2C, which is more than 70% partially or fully reconstructed. Any results which includes T2C need to be approached with caution.

3.18.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.40):
In this dendrogram, there are two main branches, while B15C exist separate from both branches. In the left main branch, only witnesses from Deir el-Bersha occur, namely B2Bo, B3Bo, B4Bo and B6C. This placement on a single branch is highly encouraging, as these witnesses are grouped together in Willems, sharing a date of late 11th dynasty to early 12th dynasty, and share the same type of partially engraved script. Additionally, as these witnesses are placed away from B15C and B1P, which are of a later date,\(^{377}\) there might be some distinction between the structure used in early and later coffin creation in Deir el-Bersha. For example, this can be seen in I,51,b, where B2Bo, B3Bo, B4Bo and B6C have: \(iw=f \text{sSm=f } \text{ánx n nTr.w} \) (He conducts the life of the gods),\(^{378}\) B1P and B15C have: \(iw \text{sSm=f } \text{ánh n ngr.w} \) (he conducts the life of the gods),\(^{379}\) and MC105, S10C and T2C have: \(iw \text{wsir } \text{sdi tn sSm=s } \text{ánx n nTr.w} \) (the Osiris, this \(sdi\), conducts the life of the gods.).\(^{380}\) The difference between B1P, B15C and the other witnesses from Deir el-Bersha is the use of the suffix pronoun after the particle \(iw\). MC105, S10C and T2C replaced the suffix pronoun after the particle \(iw\) with \(wsir\)-name of the owner-demonstrative instead.

The right branch contains B1P, and on a sub branch, S10C, MC105, T2C and BH5C. This placement is encouraging as well, as it suggests that there is a sentence structure pattern distinct from Deir el-Bersha, although it shares some similarities with B1P, as they were placed on the same main branch. However, it does not seem to be possible to make a distinction between these witnesses.

---

\(^{378}\) de Buck (1935) \(CT\) I, p. 51,b (B3Bo).

\(^{379}\) de Buck (1935) \(CT\) I, p. 51,b (B1P). Note that grammatically this phrase is identical to the other witnesses from Deir el-Bersha, as both use a circumstantial \(sdm-f\), syntax \(iw(\cdot f) sdm-f\).

\(^{380}\) de Buck (1935) \(CT\) I, p. 51,b (MC105). Note that S10C replaced \(sdi tn\) with \(ir\) \(pn\) and T2C replaced it with \(dsg i\) \(pn\) (name of the owner).
3.18.3. Conclusions

For the spell group 16-17, the method used in this work seems capable to show regional variation in the sentence structure, as the witnesses from Deir el-Bersha are generally placed separately from the witnesses from other regions. Additionally, it could be suggested that based on the date of the supports, there is some difference in the sentence structure pattern within Deir el-Bersha itself, as earlier witnesses are placed separate from later witnesses.

3.19. Spell 18

This section will deal with spell 18. Like the other spells before it, spell 18 should be considered part of the same spell group to which spell 1-17 belong. The subject of this spell is a wish to the deceased, that he may travel the sky, in the day bark and the night bark: pr-k m skt.t hš-k m ʻnd.t (may you go forth in the night bark, may you descend in the day bark).

3.19.1. Introduction

For the purposes of this chapter, spell 18 of limited use at best, as in de Buck the spell is only attested in Deir el-Bersha, in a total of four witnesses. These witnesses are B3Bo, B6C, B15C an B1P. Its inclusion in this work is due to the earlier process of encoding, and as an example of the use of the method on material that only occurs in one region. Additionally, as the spell group 1-27 will be discussed together in chapter 3.29, its inclusion here seemed appropriate. For this spell there are a total of eleven phrases.

For the witnesses of this spell, the following figure shows the percentage of damage (figure 3.41):

![Figure 3.41 Percentage of reconstruction and damage in the witnesses for spell 18. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.]

For this spell, the damage is light, and the results based on these witnesses can be considered trustworthy.

---

383 de Buck (1935) CT I, p. 54,c-d (B3Bo).
384 See chapter 2.1.6 for more detail.
385 Note that in de Buck, there are a total of fourteen phrases, as I,53,f-g, I,54,c-d and I,54,h-i were merged together to form complete clauses.
3.19.2. Results and discussion

Using the method described in this chapter, the following dendrogram was made (figure 3.42):

![Dendrogram diagram]

Figure 3.42 Rectangular Phylogram display of the distance between different witnesses of spell 18.

In this dendrogram, there are three branches, one for B6C, one for B15C, and one for B3Bo and B1P. Based on the dendrogram alone, there does not seem to be a clear distinction in Deir el-Bersha, as could be expected. The distance between B6C and B3Bo is remarkable however. B3bo and B1P have the same phrase except for one, 1,54,e: \( wd\ n=k\ hr\ ds=f\ nb\ p'=t \) (which Horus himself, lord of the patricians, commands to you).\(^{386}\) This phrase is unique in B1P, as the other witnesses start this phrase with the connector \( m \). As only this phrase varies, the placement on the same sub-branch falls within expectations. However, B6C only varies in one phrase from B3Bo and is placed on a separate branch. In this phrase, 1,54,c-d: \( pr=k\ m\ skt.t\ h\h\ h\ h\ d\ m\ cnd.t \) (may you go forth from the night bark, you descend even into the day bark),\(^{387}\) B6C varies from B3Bo and B1P due to the gemination in \( h\h\ h\h\ d\ ) (to descend), as B3Bo and B1P use \( h\h\ ) instead. The separation of B15C is completely valid however, as it only shares four of the eleven phrases with the other witnesses.

3.19.3. Conclusions

As stated above, the method used in this chapter is not of use for this spell, as all witnesses originate from Deir el-Bersha. There is clear variation in B15C in comparison to the other witnesses. However, any variation in the pattern based on the period of coffin decoration (see section 3.18.2) does not seem to occur here.

\(^{386}\) de Buck (1935) *CT I*, p. 54,e (B1P).
\(^{387}\) de Buck (1935) *CT I*, p. 54,c-d (B6C).
3.20. Spell 19

The following section addresses spell 19. This spell should be considered part of the group of spells which include spell 1-27. This spell concerns the deceased becoming the incarnation of a god, together with Re and Osiris.

3.20.1. Introduction

This is a short spell, with a total of five phrases, which in de Buck only occurs in Deir el-Bersha. As this spell is of limited use for a study in regional variation, its inclusion is due to the earlier encoding process discussed in chapter 2.1.6, and its inclusion in the discussion of the spell group of spells 1-27, discussed below, in chapter 3.29. In de Buck, the spell occurs in a total of five witnesses. The following figure shows the percentage of damage per witness (figure 3.43):

![Figure 3.43 Percentage of reconstruction and damage in the witnesses for spell 19. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

For this spell, B4C is nearly 40% partially or fully reconstructed, while the other witnesses are intact or only slightly damaged. Although included, any result including B4C need to be approached with caution.

3.20.2. Results and discussion

After the method discussed in 3.2.2 was applied, the following dendrogram was created (figure 3.44):

---

In this dendrogram, there are branches with each two witnesses, and a separate one for B15C. The placement of B3Bo and B6C seems encouraging, as they share the same date and script type. But as with spell 2, 3, 5, 8, 10, 12 and 15, this is deceptive, when the actual phrases are taken into regard.  

B3Bo and B6C only share two of the phrases with each other, I,55,a and I,55,e. Compared to B4C and B1P, which are identical based on sentence structure, and B15C, which has one phrase which varies from B4C and B1P. In this phrase, I,55,c, B15C uses: ₐₙₙ ₢ₜₙₖₙ=ₖ (your enemies do not exist), which is the short variant of the phrase used in B1P and B4C, which add ₐₙₙ ᷫₚ-ₜₘₙₜ=ₖ (your opponent does not exist). It seems that the placement of B3Bo and B6C is due to the fact that they are the least like B4C, B15C and B1P, and not because they are similar to each other. For example, in I,55,b, B6C has the unique phrase: iw=ₙ ṯₚ ṯₚₙₙ=ₖ ṯₚ (you are as a god, you will be a god), which varies from the other witnesses, as they include the connector ṯₚ between ṯₚₙₙ=ₖ and ṯₚ.

However, due to the limited variation between B4C, B15C and B1P, it could be possible that the sentence structure pattern of this spell was more open to variation in the late 11th dynasty, and became more fixed in the 12th dynasty.

### 3.20.3. Conclusions

For this spell, the results of the method used in this chapter are of limited use, and deceptive, as it implies a difference in pattern, which is not supported by the actual phrases used. B3Bo and B6C are grouped together because they are both different from the others, not because they share the same pattern. Moreover, as this spell is in de Buck only attested in Deir el-Bersha, any study on regional variation is impossible.

---

390 The full sentence structure file is available in appendix 3.18.
391 de Buck (1935) CT I, p. 55,c (B15C).
392 de Buck (1935) CT I, p. 55,c (B1P).
393 de Buck (1935) CT I, p. 55,b (B6C).
394 For this phrase, and the other unique phrases in this spell (I,55,c-d for B3Bo, and I,55,c for B6C), it is possible that the variations were errors, in which something was lost, or changed by mistake.
3.21. Spell 20

This section concerns spell 20. As discussed in the spells above, this spell should be considered part of the group of spells 1-27. This spell concerns the gifts that Geb has given to the deceased, which allows the reconstruction of the deceased in the necropolis, resembling the reconstruction of Osiris.

3.21.1. Introduction

Spell 20 is relatively short, with a total of twelve phrases. Note that the witnesses only use a selection of these phrases. In de Buck, there are a total of eight witnesses, originating from three different locations. For the purposes of this work, only these eight witnesses published in de Buck were used. The following table shows the different witnesses sorted by region (table 3.19):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beni Hasan</td>
<td>BH5C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B3B0, B4C, B6C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T9C, T1L</td>
</tr>
</tbody>
</table>

Table 3.19 Witnesses sorted by region for spell 20. See appendix 1 for a full list of details concerning every witness.

In de Buck, four witnesses came from Deir el-Bersha, three witnesses came from the Theban area, and one witness came from Beni Hasan. The following figure shows the percentage of damage which occurred for this spell in the witnesses (figure 3.45):

---

396 Only mentioned in witnesses that are not from Deir el-Bersha. See de Buck (1935) *CT I*, p. 56,a.
398 Jürgens (1996), p. 58, mentions additional witnesses from the middle kingdom: Sid1Sid, Sid2C, Sid3X and KH1KH from Sidmant el-Gebel and Kom el-Hisn.
Figure 3.45 Percentage of reconstruction and damage in the witnesses for spell 20. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.

T1L is badly damaged, with nearly 70% partially or fully reconstructed. B4C is nearly 40% partially or fully reconstructed, and MC105 is 30% partially or fully reconstructed. Although these witnesses have been included in the results, any results based on these witnesses need to be approached with caution.

### 3.21.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.46):

In this dendrogram, there are two main branches, and one separate branch for B1P. The left branch contains BH5C, MC105, T9C and T1L. Based on the results of the spells discussed above, this is
encouraging, as it suggests that there is a distinct pattern in the sentence structure between Deir el-Bersha, and the witnesses from other regions. This is visible in the phrases used as well, as \textit{I,56,a} and \textit{I,56,b} are not used in Deir el-Bersha (the right branch), but are used in the witnesses from the left branch. However, as BH5C is part of the latter branch, it cannot be said whether there is a difference in the pattern between Beni Hasan and the Theban area. However, as BH5C does not use \textit{I,56,b}, \textit{I,57,b} and \textit{I,58,a}, which do occur in the Theban area, there could be a difference between them, but this is not visible in the dendrogram. The connection between BH5C and T1L is visible in \textit{I,57,d}: \textit{in.t=s n=k c.wt=k w3.(w)t ir=k} (may it bring your limbs which were far from you to you), as these two witnesses use the suffix pronoun \textit{s} after \textit{in.t}, rather than the \textit{sn} which was used in the majority of the other witnesses.

The second branch has three witnesses from Deir el-Bersha, namely B3Bo, B4C and B6C. This is encouraging as well, as it supports the idea that there is a difference in sentence structure pattern in Deir el-Bersha. The proximity between B3Bo and B6C is expected due to their date and type of script, but the placement of B4C is probably due to the reconstructions, as they were based on B3Bo. The fact that B1P is not part of this branch could imply that there is a difference based on the date of the witness in Deir el-Bersha, but as B6C only shares three of phrases with B3Bo, this is unlikely. Moreover, B1P and B6C are often more similar to each other than to the other witnesses from Deir el-Bersha. For example in \textit{I,57,b}: \textit{htp n-k im.yw is.w=sn} (those who are in their tombs will be gracious to you).\textit{In the other witnesses, the im.yw is replaced by nb.w, including the witnesses outside Deir el-Bersha.}

\subsection*{3.21.3. Conclusions}
For spell 20, the dendrogram shows that there is a difference in the sentence structure pattern between Deir el-Bersha and the other regions. This is supported by the phrases that occur outside Deir el-Bersha, but not in the witnesses from Deir el-Bersha themselves. Thus, the method used for in this chapter to visualize regional variation between the witnesses is functional to the extent that a Deir el-Bersha and non-Deir el-Bersha pattern can be recognised.

\section*{3.22. Spell 21}
Spell 21\textsuperscript{401} is the subject of this section. Together with spell 1-27, this spell should be considered part of a group of spells. In this spell, the deceased is urged to go to Re, where the deceased will be pure.\textsuperscript{402}

\subsection*{3.22.1. Introduction}
In comparison to the other spells in the group of spells 1-27, this spell is relatively long, with a total of 25 phrases. It needs to be noted that the witnesses use a selection of these phrases. In de Buck, there is a

\textsuperscript{399} de Buck (1935) \textit{CT I}, p. 57,d (BH5C).
\textsuperscript{400} de Buck (1935) \textit{CT I}, p. 57,b (B1P).
\textsuperscript{402} Sokolova (2017), p. 80.
total of eight witnesses, from three different regions. The following table shows the witnesses separated by region (table 3.20):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beni Hasan</td>
<td>BH5C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B3Bo, B4C, B6C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T9C, T1L</td>
</tr>
</tbody>
</table>

Table 3.20 Witnesses sorted by region for spell 21. See appendix 1 for a full list of details concerning every witness.

For this spell in de Buck, four witnesses came from Deir el-Bersha, three witnesses came from the Theban area, and Beni Hasan provided one witness. Note that the witnesses used for this work only reflect the material published in de Buck. 403

It needs to be noted here that there is technically another witness for this spell, namely T1C. However, for spell 21-25, it has only some of the same phrases that are used with the other witnesses. Moreover, it is partly in a different order than the order which occurs in the other witnesses for the same group of spells. Due to the reorganisation, and the fact that only some of the phrases of every spell are used, the spell group 21-25 in T1C is considered a separate spell for the purposes of this study, instead of an additional witness with only a few of the phrases that are available for each spell. However, the ‘new’ spell of T1C is provided as a separate entry in appendix 3.25.

The following figure shows the percentage of damage which occurred with every witness for this spell (figure 3.47):

![Figure 3.47 Percentage of reconstruction and damage in the witnesses for spell 21. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

403 Jürgens (1996), p. 58, mentions additional witnesses from the middle kingdom: Sid1Sid, Sid3X and KH1KH from Sidmant el-Gebel and Kom el-Hisn.
For this spell, T1L is more than 40% damaged, where B4C is nearly 30% damaged. The other witnesses are relatively intact. Due to the reconstructions in T1L and B4C, any results including these two witnesses need to be approached with caution.

3.22.2. Results and discussion

Using the method described in this chapter, the following dendrogram was made (figure 3.48):

![Dendrogram](image)

**Figure 3.48** Rectangular Phylogram display of the distance between different witnesses of spell 21.

In the dendrogram of spell 21, there is one big branch, and two separate branches for B4C and B1P. The final section of the bigger branch shows that the pattern seen in the spells discussed above, seem to apply here as well. As BH5C, MC105, T9C and T1L are closer to each other than to B6C and B3Bo, it seems that there is a difference in sentence structure pattern between Deir el-Bersha, and witnesses from other regions. This separation can be seen in I,58,d: \( pr \ r-k r \ p.t \) (go forth to the sky),\(^{404}\) where Deir el-Bersha uses: \( pr-t \ r \ p.t \) (may you go forth to the sky).\(^{405}\) Thus, the witnesses from Deir el-Bersha use a subjunctive \( sḏm-f \), where the witnesses outside Deir el-Bersha use an imperative. Additionally, as one can see in figure 3.49, it can even be suggested that there is a less pronounced but nonetheless obvious difference between the witnesses from the Theban area, and the witness from Beni Hasan. This can be seen in I,60,e: \( iw \ \wln.\ n-k \ \lnb.\ \wt \) (you overthrew the fences),\(^{406}\) where only BH5C included the particle \( iw \). However, this result is based on a single witness, which leads to uncertainty as to how the structure

---

\(^{404}\) de Buck (1935) *CT I*, p. 58,d (BH5C).

\(^{405}\) de Buck (1935) *CT I*, p. 58,d (B3Bo).

\(^{406}\) de Buck (1935) *CT I*, p. 60,e (BH5C).
in Beni Hasan is reflected. Additionally, as T1L is more than 40% reconstructed, its placement could be partially ascribed to the reconstruction.

Although circumstantial, as it is based on the orientation and visualization of the dendrogram, it is remarkable that there is some distance between B3Bo and B6C, and B4C and B1P. This distance could imply that there is some difference in the sentence structure in Deir el-Bersha itself, based on the date of the witness. However, when the actual phrases used for these witnesses are taken into regard, it seems less likely, as the similarity between B3Bo and B6C is less apparent as between B4C and B3Bo, which are quite distant in the dendrogram. This can be seen between B1P and B6C as well, which share the same structure in I,61,d: iw=k w'b ti sp sn.w (you are pure, you are pure), which is used in B1P and B6C, where the other witnesses do not include the sp sn.w. Thus, although a difference is implied by the dendrogram, it cannot be supported by the actual phrases used in this spell.

3.22.3. Conclusions

For this spell, the dendrogram created using the method of this chapter seems to show regional variation in sentence structure. The dendrogram shows a difference between witnesses from Deir el-Bersha, and the other regions, and a separation between Beni Hasan and the Theban area is implied as well.

3.23. Spell 22

The following section will discuss spell 22.409 This spell should be considered part of a group of spells, together with spell 1-27. The spell consists of two themes, first a theme concerning the food offerings given to the deceased. The second section urges the deceased to go forth, and wishes the deceased to have power in his legs, shm-k m rd.wy-k (may you have power in your two legs),411 in different times and places.

3.23.1. Introduction

Spell 22 is of similar length as spell 21, with a total of 22 phrases. Except for B1P and B4C, the witnesses use a selection of these phrases. It needs to be noted that MC105 only has two of the 22 potential phrases, as the lid of the coffin ends, and the spell is not continued on another part of the coffin. In de Buck, there is a total of eight witnesses, originating from three different regions. The following table shows the different witnesses separated by region (table 3.21):

407 The full sentence structure file is available in appendix 3.20.
408 de Buck (1935) CT I, p. 61,d (B6C).
411 de Buck (1935) CT I, p. 69,c (B3Bo).
<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beni Hasan</td>
<td>BH5C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B3Bo, B4C, B6C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T9C, T1L</td>
</tr>
</tbody>
</table>

Table 3.21 Witnesses sorted by region for spell 22. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses come from Deir el-Bersha, with four witnesses. Three witnesses came from the Theban area, and Beni Hasan provides one witness. Note that the material used in this section only reflects the witnesses published in de Buck.

The following figure shows the percentage of damage which occurred in the witnesses for this spell (figure 3.50):

![Figure 3.50 Percentage of reconstruction and damage in the witnesses for spell 22. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

For this spell, the damage is relatively light in the witnesses, with the exception of B4C, which has nearly 40% partial or full reconstructions, and T1L, which has more than 20% partial or full reconstructions. Any result including B4C and T1L should be considered with caution.

### 3.23.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was produced (figure 3.51):

---

412 As explained in chapter 3.22.1, there is an additional witness from the Theban area (T1C).

413 Jürgens (1996), p. 58, mentions additional witnesses from the middle kingdom: Sid1Sid, Sid3X and KH1KH from Sidmant el-Gebel and Kom el-Hisn.
Figure 3.51 Rectangular Phylogram display of the distance between different witnesses of spell 22.

In this dendrogram, there is one main branch, and one additional branch for B1P and B6C. The placement of T9C and T1L, and to some extend MC105 is encouraging, as it implies that there is a sentence structure pattern in the Theban area. It needs to be noted that the placement of MC105 has significant uncertainty, as it only has two of the 22 phrases, and shares only one phrase, I,63,c, with the other witnesses. Nonetheless, the variation between Deir el-Bersha and the Theban area can be seen in I,66,a, where the witnesses from Deir el-Bersha have: \( \text{nd.ty*sn n-t} \) (their two protectresses are yours),\(^{414}\) while the witnesses from the Theban area have: \( \text{nd.ty nd-sn n-k st} \) (the two protectresses, they protect it for you).\(^{415}\) BH5C has a unique phrase here: \( \text{nd.ty r\textsuperscript{*} nd-k st} \) (the two protectresses of Re, may you protect it).\(^{416}\)

Due to the placement of B3Bo on the same sub-branch, it cannot be stated that there is a distinct sentence structure pattern in Deir el-Bersha. However, the placement of BH5C at some distance from the witnesses from the Theban area suggest that there might be a distinct pattern in Beni Hasan as well, but as this is based on only one witness, it cannot be more than a suggestion.

3.23.3. Conclusions

In the dendrogram of spell 22, it is possible to see regional variation, although due to the placement, the border between Deir el-Bersha and the other regions is a lot less clear cut, as is the case in spell 20 and 21. Even though the borders are fuzzy, it is still possible to see a distinct group for the Theban area, although the placement of MC105 there may not be accurate. Based on these results, it can be stated

\(^{414}\) de Buck (1935) CT I, p. 66,a (B3Bo). Note that B1P and B6C use \( \text{=k} \) instead of \( \text{=t} \), as the suffix pronoun refers to the gender of the owner.
\(^{415}\) de Buck (1935) CT I, p. 66,a (T9C).
\(^{416}\) de Buck (1935) CT I, p. 66,a (BH5C).
that for spell 22, the method used in this chapter seems to work to show regional variation between the witnesses.

3.24. Spell 23

The following section of this chapter concerns spell 23.\(^{417}\) This spell should be considered part of the same group of spells discussed above. This spell is a statement that the deceased is not treated as a common criminal, who is about to be executed: \(n rdi.t(w)=t \ m \ hbt \ didi. t \ sbi.w \ im=s \ n \ rdi.tw \ 5s \ w \ n \ hrt=t\)\(^{418}\) (you will not be placed in the place of execution, in which rebels are placed, sand will not be placed to your face).

3.24.1. Introduction

Spell 23 is a relatively short spell, with a total of sixteen phrases,\(^{419}\) of which every witness has a selection. In de Buck, there are a total of seven witnesses for this spell,\(^{420}\) which originate from three different regions. The following table sorts the witnesses by region (table 3.22):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beni Hasan</td>
<td>BH5C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B3Bo, B4C, B6C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>T9C, T1L</td>
</tr>
</tbody>
</table>

Table 3.22 Witnesses sorted by region for spell 23. See appendix 1 for a full list of details concerning every witness.

As one can see above, the majority of the witnesses originate from Deir el-Bersha, which provides four witnesses. The Theban area supplied two witnesses,\(^ {421}\) and Beni Hasan has one witness. Note that the material used for this section only reflects the witnesses published in de Buck.

The following figure shows the percentage of damage which occurred in every witness (figure 3.52):

---

\(^{418}\) de Buck (1935) CT I, p. 70,d - 71,a (B3Bo).

\(^{419}\) The number of phrases in de Buck is actually 17, as I merged 71,h and 72,a together.

\(^{420}\) Jürgens (1996), p. 58, mentions two additional witnesses, Sid1Sid and KH1KH from Sidmant el-Gebel and Kom el-Hisn.

\(^{421}\) As explained in chapter 3.22.1, there is an additional witness from the Theban area (T1C).
The witnesses in spell 23 are relatively undamaged, as the highest percentage of damage occurs in B4C, which is less than 30%. Thus, for this spell, the influence of reconstruction on the results should be limited.

3.24.2. Results and discussion

After applying the method discussed in this chapter, the following dendrogram was produced (figure 3.53):

In this dendrogram, there is one main branch, and three small branches containing one witnesses each. The three small branches are an expected result, when taking the phrases in regard, \footnote{The full sentence structure file is available in appendix 3.22.} which are highly
variable between the witnesses, so any common ground between any witness actually seems more based on how little they share between them.

For the purposes of this chapter, the placement of all witnesses that are not from Deir el-Bersha is encouraging, as it implies a difference between the structure of Deir el-Bersha and the other regions. For example, this is visible in I,70,b, where the witnesses from Deir el-Bersha have: \( n \ ip.t(w)=T \ n \ ddh.t(w)=T \ n \ hnr.t(w)=T \) (you will not be assessed, you will not be imprisoned, you will not be restrained). In the same phrase, T9C has: \( n \ ip.t(w)=k \ n \ hnr.t(w)=k \) (you will not be assessed, you will not be restrained), leaving \( ddh.t(w)=k \) out. T1L has: \( n \ ip=k \ n \ hnr=k \ n \ ddh.t(w)=k \) (you were not assessed, you were not restrained, you will not be imprisoned), which uses and indicative \( sm=f \) for \( ip \) and \( hnr \), and moved \( ddh.t(w) \) to the back. Finally, BH5C has: \( n \ ip.t(w)=k \ n \ hni.t(w)=k \) (you will not be assessed, you will not be restrained), which is similar to T9C, although \( hnr \) is written as \( hni \). However, it needs to be noted here that the placement of BH5C, T9C and T1L is more due to their lack of common ground. T9C and T1L have only 2 phrases in common, I,71,c and I,71,d, where BH5C shares two phrases with T1L: I,71,b and I,71,d. BH5C shares only one phrase with T9C: I,71,d. However, BH5C, T9C and T1L have only a limited number of phrases in common with the witnesses of Deir el-Bersha.

3.24.3. Conclusions

Although some regional variation is implied in the dendrogram, it is deceptive as the witnesses of this spell are all remarkably varied from each other in their sentence structure. However, it is intriguing to note that the method actually allows grouping on limited similarity as well, although one could expect random chance to be a major factor such that this method should in this case bit be solely relied upon.

3.25. Spell 24

This section will discuss spell 24. This spell should be considered part of a spell group together with spell 1-27. This spell concerns the cacophony of sounds which is created by the gods, after the deceased is justified.

3.25.1. Introduction

The total number of available phrases in used in spell 24 is eighteen, but with exception of B4C, B6C and B1P, only a small selection is used, as BH4C and B3Bo have two phrases, T9C has six phrases, and

---

423 de Buck (1935) CT I, p. 70,b (B3Bo). Note that B1P and B6C use \(+k\) instead of \(+T\), as the suffix pronoun refers to the gender of the owner.
424 Although \( hni \) is a variant of \( hnr \), I counted this as a variation, as it might imply a phonetic development for this lemma in Beni Hasan.
425 Usually one or two phrases at most, depending on the witness from Deir el-Bersha.
426 In as far as relying on one method only should not be considered prudent in general.
429 De Buck actually has 20 phrases, but I,73,d and I,74,a, and I,75,e-f have been merged.
T1L has three phrases. In de Buck, this spell is attested in seven witnesses, originating from three different regions. The following table shows the witnesses per region (table 3.23):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beni Hasan</td>
<td>BH5C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B3Bo, B4C, B6C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>T9C, T1L</td>
</tr>
</tbody>
</table>

Table 3.23 Witnesses sorted by region for spell 24. See appendix 1 for a full list of details concerning every witness.

As one can see above, four of the seven witnesses came from Deir el-Bersha. Two witnesses came from the Theban area,\(^{430}\) and one witness came from Beni Hasan. For the purposes of this section, only the witnesses from the publication of de Buck have been used.\(^{431}\)

The following figure shows the percentage of damage which occurred in the witnesses of this spell (figure 3.54):

![Figure 3.54 Percentage of reconstruction and damage in the witnesses for spell 24. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

With the exception of B4C, which is more than 30% partially or fully reconstructed, the witnesses for this spell are undamaged, or barely damaged. As B4C is included in the results, its placement needs to be considered with some caution.

3.25.2. Results and discussion

After the method discussed in 3.2.2 was applied, the following dendrogram was produced (figure 3.55):

\(^{430}\) As explained in chapter 3.22.1, there is an additional witness from the Theban area (T1C).

\(^{431}\) Jürgens (1996), p. 58, notes that there is another witness from Sidmant el-Gebel (Sid1Sid).
As discussed above, there is a clear difference between the left branch, containing BH5C, B3Bo, T9C and T1L, as they only have a few of the eighteen phrases. The fact that they were placed on the same branch shows that the program will separate correctly based on the existence of a phrase or not. However, as B3Bo is placed on the same branch as BH5C, T9C and T1L, it cannot be called a feature that only occurs in the regions outside Deir el-Bersha. This is partly due to 1,73-74,d-a: *iw ḫ3.n n-t bik* (the falcon has screeched to you),\(^{432}\) which is used by BH5C, T9C and T1L as well, where B1P and B4C have: *iw ḫ3.n-k in bik* (you have been mourned by the falcon).\(^{433}\) However, the placement of T9C creates a problem, as this witness actually has more phrases than B3Bo, BH5C and T1L, so some distance would have been expected from this group.

Although the long version of this spell is restricted to Deir el-Bersha in the current available material, the dendrogram does not correctly reflect this, as B4C, B6C and B1P are all on different branches. This can be explained however, as within the section of phrases only shared between them, they have five phrases where every witness has their own sentence structure, even though they are minor variants of each other. For example, 1,74,e, where B1P has: *iw ḫ3.n-k in ḍr.ty* (you have been mourned by the two kites), B5C has: *iw ḫ3.n n-k ḍr.ty* (the two kites have screeched for you), and B4C has: *iw ḫ3 n-t ḍr.ty* (the two kites screech for you). Thus, the separate placement can be supported, although a general branch for this group would have been expected.

### 3.25.3. Conclusions

The method used in this chapter seems functional for this spell, as it clearly separates the witnesses with the short version of the spell from the ones with the long version. However, due to variation in the long version, the dendrogram produced does not show the similarity between the witnesses of the long version, except that they are distant from the short version. Additionally, as B3Bo is placed with the witnesses from the other regions, the dendrogram does not show regional variation clearly, even though

\(^{432}\) de Buck (1935) *CT I*, p. 73-74,d-a (B3Bo).

\(^{433}\) de Buck (1935) *CT I*, p. 73-74,d-a (B1P). B6C has a unique phrase, which uses a *ṣdm-* instead of a *ṣdm.n-*.
the long version only occurs in witnesses from Deir el-Bersha in de Buck, while B3Bo shows it was not
the sole version used for this spell for this region.

3.26. Spell 25
The following section will discuss spell 25.\textsuperscript{434} As with the other spells discussed above, spell 25 should be
considered part of a group, which contains spell 1-27. In this spell, the deceased is given a parcel of land
in the valley\textsuperscript{435} by Re.\textsuperscript{436}

3.26.1. Introduction
Spell 25 is short, with a total of eleven phrases. With the exception of B4C and B1P, the witnesses only
have a selection of these phrases. In de Buck, there are a total of six witnesses, which come from three
different regions. The following table shows the witnesses sorted by region (table 3.24):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Beni Hasan</td>
<td>BH5C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B4C, B6C, B1P</td>
</tr>
<tr>
<td>Theban area</td>
<td>T9C, T1L</td>
</tr>
</tbody>
</table>

Table 3.24 Witnesses sorted by region for spell 25. See appendix 1 for a full list of details concerning every witness.

In de Buck, Beni Hasan provides one witness, Deir el-Bersha supplied three witnesses, and the Theban
area has two witnesses.\textsuperscript{437} Note that the material used for this chapter only reflect the material available
in de Buck.\textsuperscript{438}

For the witnesses, the following table (figure 3.56) shows the percentage of damage which occurred in
them:

\textsuperscript{434} de Buck (1935) CT I, p. 76,a - 77,b; Speleers (1946), p. 9, 167; Faulkner (1973), p. 16; Barguet (1986), p. 169-170;
\textsuperscript{435} I assume this to be a valley in the netherworld.
\textsuperscript{436} Sokolova (2017), p. 80.
\textsuperscript{437} As explained in chapter 3.22.1, there is an additional witness from the Theban area (T1C).
\textsuperscript{438} Jürgens (1996), p. 58, notes that there is another witness from Sidmant el-Gebel (Sid1Sid).
The witnesses in this spell are relatively intact, with the exception of B4C, which is nearly 40% partially or fully reconstructed. Thus, any results including B4C need to be approached with some caution.

3.2.6.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.57):

In this dendrogram, there is one main branch, separated into two sub-branches for BH5C and T9C, and B4C and B6C respectively. Finally, there is a separate branch for B1P, and one for T1L.

The sub-branch of BH5C and T9C is encouraging, as it shows that there is a sentence structure pattern for this spell that is different from the patterns used in Deir el-Bersha. This can be supported by the fact that BH5C and T9C do not have phrase I,76.a. For example, this is visible in I,76,j, where the witnesses from Deir el-Bersha have: *imi n-f in r* sśm sw ('give to him,' so says Re, 'guide him.'), where BH5C and T9C have: *imi n-f r* sśm-f sw (give Re to him, may he guide him). However, as T9C only has five of the eleven phrases in total, of which only two are similar to BH5C, its placement in this branch is dubious.

---

439 de Buck (1935) CT I, p. 76,j (B1P).
440 de Buck (1935) CT I, p. 76,j (T9C). Note that this could be read as: Give to him Re, may he guide him.
Moreover, as T1L shares three phrases with BH5C, and uses the same number of phrased as BH5C, one would expect more proximity with T1L, which is on its own branch, than between T9C and BH5C.\footnote{Even though these phrases (I,76,c, I,76,f and I,76,i) are shared with Deir el-Bersha as well.}

Additionaly, when the witnesses from Deir el-Bersha are taken into regard, the same issue occurs, as B4C and B6C are placed on the same sub-branch. This seems encouraging, as they are both older than B1P, which would explain the separation. However, B4C and B1P share eight phrases,\footnote{I,76,a, I,76,c, I,76,f-j and I,77,b.} where B4C and B6C only share four,\footnote{I,76,f-h and I,77,b.} so one would rather expect B4C and B1P to share a branch.

3.26.3. Conclusions

As with earlier short spells that have been discussed above, the results visualised in the dendrogram of spell 25 are deceptive, as they suggest similarity between witnesses that cannot be supported when the actual phrases are taken into regard, upon which different grouping would have been expected. However, simply based on one phrase, one could suggest that there is a difference in sentence structure pattern between Deir el-Bersha and the other regions. Although this is visualised in the dendrogram, the other issues with this spell show that this is likely due to chance.

3.27. Spell 26

The following section concerns spell 26.\footnote{\textit{de Buck} (1935) CT I, p. 77,c - 78,m; \textit{Speleers} (1946), p. 9, 168-169; \textit{Faulkner} (1973), p. 16-17; \textit{Barguet} (1986), p. 170; \textit{Carrier} (2004,a), p. 40-41; \textit{Gracia Zamacona} (2008), p. 1105, 1283.} This spell should be considered part a single spell group that compromises spells 1-27. The spell states that the fear (\textit{snfd}), respect (\textit{šfš.t}) of the deceased exists among the spirits, as the deceased is justified.\footnote{\textit{Sokolova} (2017), p. 80.} This is followed by a wish that the deceased may travel in the netherworld.

3.27.1. Introduction

For the purposes of regional variation, this spell is of limited use, since in de Buck, the four attested witnesses of this spell originate from Deir el-Bersha. This spell has nonetheless been included, to facilitate the discussion of the spell group of spells 1-27 in chapter 3.29. The spell is relatively short, using a total of fourteen phrases,\footnote{\textit{In the Buck the number of phrases is higher, but some phrases were merged.}} of which the witnesses only use a selection, except for B4C, which uses every phrase. The following figure shows the percentage of damage which occurred in the witnesses (figure 3.58):

\begin{figure}
\centering
\includegraphics[width=\textwidth]{figure3_58}
\caption{Percentage of damage in witnesses for spell 26.}
\end{figure}
The witnesses in this spell are relatively intact, with the exception of B4C, which is nearly 40% partially or fully reconstructed. Therefore, any results including B4C should be approached with some caution.

### 3.2.7.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was produced (figure 3.59):

In this dendrogram, there are three branches, with the central branch containing B6C and B15C. These two witnesses were most likely placed together as they uniquely share one phrase, l,78,d-e, in addition to the phrases they have in common with the other two witnesses, or phrase structures that only occur in either of them. B1P and B4C have: *lw ḫnmm.t m sw.t-ib n wsir spi pn* (the sun-folk are in joy because of the Osiris, *this spi*),\(^{447}\) where B6C and B15C have: *lw ḫnmm.t m sw.t-ib n Ỉḥ3-nḥt pn* (the sun-folk are in joy because of this Ỉḥ3-nḥt).\(^{448}\) As one can see, the only difference in phrase l,78,d-e is the use *wsir* (Osiris) before the name of the owner in B1P and B4C. Therefore, as only one phrase is involved, it would be presumptive to claim that there is a specific structure pattern for these B6C and B15C, outside of the unique variation of the other witnesses of this spell.

### 3.2.7.3. Conclusions

As all the witnesses originate from the same region, spell 26 is of limited use for the purposes of this chapter. However, it shows that the method used in this chapter is sensitive enough to correctly place

\(^{447}\) de Buck (1935) *CT I*, p. 78,d-e (B1P). Note that B4C uses *ss.t-ḥdt-ḥtp tn* instead of *spi pn* (name of the owner).

\(^{448}\) de Buck (1935) *CT I*, p. 78,d-e (B1P). Note that B4C uses *ḏḥwy-t-nḥt pn* instead of *Ỉḥ3-nḥt pn* (name of the owner).
witnesses based on shared similarity in comparison to the other witnesses, even if it concerns one data point.

3.28. Spell 27

This section will discuss spell 27,\(^{449}\) the final spell in what should be considered a group of spells, running from spell 1 to spell 27. This spell is a statement of the successful justification of the deceased,\(^{450}\) made clear in the phrase \(n\ m\ t\-k\) (you did not die).\(^{451}\)

3.28.1. Introduction

Spell 27 is a relatively short spell, consisting of eighteen phrases in total, of which every witness uses a selection. In de Buck, this spell is attested in four witnesses, that originate from three different regions. The following table shows the witnesses sorted by region (table 3.25):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B4C</td>
</tr>
<tr>
<td>Theban area</td>
<td>MC105, T9C</td>
</tr>
</tbody>
</table>

Table 3.25 Witnesses sorted by region for spell 27. See appendix 1 for a full list of details concerning every witness.

Two of the witnesses of this spell come from the Theban area, and Asyut and Deir el-Bersha both provide one witness. Note that the material used in this section only reflect the material published in de Buck.

The following table shows the percentage of the damage which occurred in the witnesses (figure 3.60):

\(\text{Sokolova (2017), p. 80.}

\(\text{de Buck (1935) } CT I, \text{ p. 80,b (T9C).}\)
In this spell, MC105 is nearly for 50% partially or fully reconstructed, and B4C is nearly 30% reconstructed. Due to this damage, any result which included these two witnesses needs to be approached with caution.

### 3.28.2. Results and discussion

The method described in 3.2.2 led to the creation of the following dendrogram (figure 3.61):

![Dendrogram](image)

In this dendrogram, which nearly represents a rectangular cladogram, there are three branches, one for S10C, one for B4C, and one for MC105 and T9C. If one holds the hypothesis that regional variation can be visualised using the sentence structure, the results for this spell are ideal. Although it only concerns four witnesses, every region has its own branch. This can be seen in l,79,c, where MC105 and T9C have: *in snq.t-t ir.t špss=k* (it is his foundation that made your nobility),\(^{452}\) B4C has: *in int.t=t ir.t šps.t-t* (it is your fetter which made your nobility), and S10C has: *in snq.t-k ir.t šps=k* (it is your foundation that made your nobility). In these phrases, the Theban area uses *f* after *snq.t*, where S10C uses *k* after *snq.t*, while B4C replaced *snq.t* with *int.t*, while following the suffix pronoun structure of S10C. However, the placement of MC105 could be more due to the method of reconstructing the phrases, as these reconstructions were usually based on T9C.

---

\(^{452}\) de Buck (1935) CT I, p. 79,c (T9C).
Additionally, MC105 and T9C have multiple phrases that are not used by S10C and B4C which may underlie their separation from MC105 and T9C.

3.28.3. Conclusions

For spell 27, the method used for this chapter shows clearly the regional variation in sentence structure pattern, as every region is placed on its own branch of the dendrogram.

3.29. Spell group 1-27

In this section the method outlined in chapter 3.2 will be applied simultaneously to the entire spell group of spells 1-27 discussed before, instead of a single spell at the time. This approach is possible due to the fact that every spell of this group was encoded.

The following table will show the spells used per witness of this group (table 3.26):

\[^{453}\) S10C does not use I,79,i-k and I,80,c.
\[^{454}\) B4C does not use I,79,f, I,79,i, I,79,l-n and I,80,b. Additionally it uses I,78-80,o-a, which only occurs in this witness.
Table 3.26 Occurrence of spells in for every witness in spell 1-27.

It needs to be noted here that this table only reflects the occurrence of the spell, and is not intended to represent the order of the spells on the supports.\(^{455}\) It needs to be mentioned as well that as MC105 has two witnesses for spell 1, two witnesses are in the table for spell 1, but for all the other spells where MC105 only has one witness, the spells have been grouped under MC105,a.

As there is not one witness that has all the spells, it was necessary to fill these openings in the .faa file, as discussed in chapter 3.2.2. For the purpose of this section, every spell that is not attested in a witness was treated as if it was a missing phrase, so it was replaced in the .faa file with a number of hyphen signs equal to the number of phrases in that spell.

\(^{455}\) See Jürgens (1996), p. 57-59, for actual tables concerning the order of spells on the supports.
3.29.1. Results and discussion

Using the method of this chapter, but this time for 27 spells in sequence, the following dendrogram was created (figure 3.62):

![Dendrogram Image]

Figure 3.62 Rectangular Phylogram display of the distance between different witnesses of spell 1-27. Numbers were added to indicate the 2 distinct main branches.

As one can see in the figure above, there are two main branches, and a separate branch for S10C. Branch 1 consist of two sub-branches, the left sub-branch containing B1P, and the right sub-branch containing the rest of the witnesses of branch 1. On this right sub-branch, a further division can be made into two sub-branches, one containing B4C, B15C and MC105,b, the other containing B2Bo, B3Bo, B4Bo and B6C. The placement of all the witnesses from Deir el-Bersha on branch one is encouraging, as it supports the suggestion that there is a distinct sentence structure pattern in Deir el-Bersha, when compared with the other regions in which this spell group is attested.

However, there is one witness which complicates this result, namely MC105,b, which originates from the Theban area. But, as this witness has only one spell of the 27 spells, it can be assumed that its placement has considerable uncertainty. Moreover, as shown in figure 3.3 in chapter 3.3.1, MC105,b is badly damaged, and due to the extent of reconstruction that took place, any placement could be due to the reconstruction, instead of the original text of this witness. Therefore, this witness should be ignored.
As one can see in figure 3.63, there is another encouraging feature which occurs in this spell group, namely that B2Bo, B3Bo, B4Bo and B6C share the same sub-branch. These witnesses belong to the same group in Willems, and they use the same technique of inscription, where the text is first written in ink, and then incised. Moreover, it is fitting that B3Bo and B4Bo are placed together, as they belong to the same owner. It is encouraging that these four witnesses have been grouped together, in comparison to the other witnesses from Deir el-Bersha, as this implies the existence of a distinct sentence structure pattern in the late 11th dynasty or early 12th dynasty in Deir el-Bersha, when compared to other periods of coffin creation in Deir el-Bersha.

With the exception of S10C and MC105,b, branch 2 consists of all the witnesses that do not originate from Deir el-Bersha, which as stated above, suggests that there is a distinction between the sentence structure of witnesses from Deir el-Bersha, and those from other regions. However, as Y1C and BH5C share the main branch, it is not clear whether there is a difference in the sentence structure pattern between Y1C, BH5C and the witnesses from the Theban area, even though Y1C and BH5C are on either extreme of the branch.

As S10C is on its own branch, it could be suggested as well that there is a sentence structure pattern for Asyut as well, in comparison to the other regions. However, this statement would be based on one witness only, and therefore should not be considered with much weight.

When the dendrogram created for this spell group is compared to the stemma for this spell group in Jürgens, there is only similarity on the greater branches. This is most likely due to different criteria used for the comparisons. Branch 1 can be compared to type $\epsilon$ in general, but it does not resemble any of the sub-types of this section, as for example B6C and B15C are divided in two separate sub-branches in the dendrogram, whereas in Jürgens they are both part of type $\epsilon$4. The same can be said in of branch 2, as it is generally comparable to Jürgens type $\delta$1, but B4C is part of type $\delta$ in Jürgens, but not part of the same group in the dendrogram.

However, the suggestion of Jürgens that Y1C originates from Asyut is not visible in this dendrogram, even if it is suggested in the three spells that S10C and Y1C share. It is possible that the distance between S10C and Y1C is due to the fact that S10C has fifteen of the spells, and Y1C only three, which gives too few datapoints between the two witnesses in comparison to the potential connections between other witnesses.

---

3.29.2. Conclusions

Based on the dendrogram created for the spell group of spells 1-27, it seems that it is possible for regional variation based on sentence structure to be visualised when dealing with spell groups as well, even if not all the spells are available for every witness. Moreover, when taking the problematic short spells 2, 3, 5, 8, 10, 12, 15 and 19 into regard, it seems that the issues due to a low number of phrases are limited as well, as the program has more material to base its allocation on. Based on the dendrogram, created in this section, it seems that there is a difference in sentence structure pattern between Deir el-Bersha and the other regions. Additionally, it seems that there is a distinction within Deir el-Bersha as well, based on the period of coffin creation.

3.30. Spell 30

The following section will discuss spell 30.\(^{458}\) This spell should be considered part of a spell group consisting of spells 30-32, which is closely related to a spell group consisting of spells 33-37.\(^{459}\) Additionally, these two groups should be considered related to the spell group of spells 38-41 as well.\(^{460}\) These spell groups are considered part of a type of texts which Assmann\(^{461}\) refers to as ‘Verklärung’ texts.\(^{462}\) Moreover, it should be considered part of a group of texts that represent a ‘dramatic argument’, constituting a dialogue.\(^{463}\) However, as Willems\(^{464}\) notes, it should not be perceived as a play that occurred as part of the funerary proceedings, but rather a performance of a priest. The dialogue of this spell might have been recited as part of a mortuary ritual, performed during seasonal festivals: \(\text{m tp-tr nb n hr.t-nfr} \) (in every seasonal festival of the necropolis).\(^{465}\)

The spell itself concerns a statement given by the gods of the horizon concerning the deceased being received by the \(\text{imn.tt nfr.t} \) (beautiful west),\(^{466}\) the goddess of the west, after the deceased has finished the process of justification.

3.30.1. Introduction

Spell 30 is a medium sized spell, with a total of 33 phrases that are available to the witnesses, when the title of the spell sequence is included. However, it needs to be noted that only four witnesses, S1C, S2C, B1L and T1L,b\(^{468}\) have a title. None of the witnesses use every phrase that is available, but rather a

\(^{461}\) Assmann (1986).

\(^{463}\) Ogdon (1982).

\(^{466}\) de Buck (1935) CT I, p. 83,f (S1C).

\(^{467}\) de Buck (1935) CT I, p. 88,b (B1P).

\(^{468}\) It needs to be noted that in T1L,b, the title of the spell group 30-32 is actually written preceding spell 33, although I trust de Buck that the title belongs with spell 30-32.
selection of the available phrases. In de Buck there are a total of 21 witnesses for this spell,\(^{469}\) which originate from five different regions. It needs to be noted however, that the supports T1L and B12C provide two witnesses each. The following table shows the witnesses sorted by region (table 3.27):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S1C, S2C, S5C, S6C, S10C, S11C, S12C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B12C,a, B12C,b, B13C, B1L, B3L, B4L, B1P</td>
</tr>
<tr>
<td>el-Lisht</td>
<td>L2Li</td>
</tr>
<tr>
<td>Meir</td>
<td>M24C, M25C</td>
</tr>
<tr>
<td>Theban area</td>
<td>T1L,a, T1L,b</td>
</tr>
</tbody>
</table>

Table 3.27 Witnesses sorted by region for spell 30. See appendix 1 for a full list of details concerning every witness.

Most of the witnesses come from Deir el-Bersha, which provides nine witnesses in de Buck, although two of the nine witnesses come from the same support. Asyut supplied seven witnesses. Meir and the Theban area have two witnesses each, although both witnesses of the Theban area come from the same support. Finally, there is one witness that came from el-Lisht. Note that the material used in this section only reflects the material published in de Buck.

The following figure shows the percentage of damage which occurred in the witnesses for this spell (figure 3.64):

\(^{469}\) Jürgens (1995), p. 195, notes additional witnesses: S16C, S2Tü, S1X and S6P from Asyut, and pLouvre E 15594, which is of unknown origin. Willems (2001), p. 258, note 16, mentions that Sid4Sid from Sidmant el-Gebel has this spell as well.
In this spell, the witnesses from Meir nearly no longer exist, as both witnesses are close to 90% partially or fully reconstructed. B12C,a is 50% partially or fully reconstructed, L2Li is more than 40% reconstructed, and B13C is more than 30% reconstructed. S1C and S2C are both nearly 30% partially or fully reconstructed, while the remaining witnesses are relatively undamaged. Although the damaged witnesses are not excluded from this work, their placement in the results should be approached with caution.

3.30.2. Results and discussion

After the method described in 3.2.2 was used, the following dendrogram was created (figure 3.65):
In this dendrogram, there is one large branch, on which most of the witnesses were placed, and a smaller one for S1C and S2C, and a final branch for B1P.

In the final section of the left sub-branch of the large branch (figure 3.67), on the right-hand side, there is a collection of two branches of witnesses from Asyut, one containing S5C, S10C and S12C, and the other S6C and S11C. This section of the branch includes a sub-branch consisting of B1L and B3L as well. As B1L and B3L are on the same section, it cannot be said that this is a visualization of a specific Asyut sentence structure pattern. However, based on the phrases used, the placement of B1L and B3L is a bit unusual, as they have ten phrases that do not occur in the witnesses from Asyut in this section, with the exception of S5C, which only lacks four phrases in comparison to B1L and B3L. Thus, the proximity of B1L and B3L to this section of witnesses from Asyut is probably less close than shown here, which is supported when a rectangular cladogram is used instead (figure 3.66), where one can see that the Asyut group is on a different branch than B1L and B3L. Thus, based on this alternative visualisation, there are still signs that there is an Asyut sentence structure pattern in this section. However, based on I,82,b: ds.yt m r n l̄bbs.w (and a shout from the mouth of the

Figure 3.65 Rectangular Phylogram display of the distance between different witnesses of spell 30.

Figure 3.66 Spell 30: Rectangular cladogram display of the final section of the left sub-branch of the main branch.

Figure 3.67 Spell 30: Final section of the left sub-branch of the large branch.

\footnote{90-91,a-d, 92-93,a-c, 94,a-c.}
there is some connection between B1L, B3L, S5C, S6C, S10C, S11C and S12C, as these all have the same structure, where B2Bo, B3Bo, B1P, M24C, M25C and T1L,a-b have: $\text{ds.yt } m \ r \ n \ h'b.t.\text{.(w)t}$ (and a shout from the mouth of the $\text{hbs.w}$ with $\text{nhb.t.(w)t}$). In this phrase, S1C and S2C have: $\text{ds.yt } m \ [n\text{hb.t.(w)t]}$ (And a shout from the $\text{nhb.t.(w)t}$), which does not use the $r \ n$, and B12C,b, B13C and B4L have: $\text{ds.yt } m \ h\text{bs.w}$ (and a shout from the mouth of the veiled ones), which does not write the genitival adjective $n$.

However, beside the witnesses from Asyut, there are two more witnesses which are on their own branch. S1C and S2C are grouped not with the other witnesses of Asyut, and seem to form their own distinct group. Their placement together is encouraging, as they are part of a set of coffins which belongs to the same owner. As they are placed separate from the other witnesses from Asyut, it can be suggested that two different patterns for this spell were in use there, although it is possible that S1C and S2C use a unique variation in the sentence structure that does not reflect Asyut entirely.

In the stemma of spell groups 30-32 and 33-37 in Jürgens one can observe the same general groups, as S1C and S2C are part of type $\Theta$, where the other witnesses are part of type $\nu$, although the subdivision in Jürgens is not the same as seen here. The proximity of S5C, S6C, S10C, S11C and S12C to the witnesses of Deir el-Bersha is visible in Jürgens as well, as these are all part of the large group $\kappa$, though not divided in the same manner beyond this point. However, this section deals with one spell, where Jürgens deals with eight spells, so some differences are expected.

When considering the witnesses from Deir el-Bersha, it is encouraging that they are generally grouped together, on the same section of the large branch. However, as B1P and B3Bo are placed apart from these sections, and there is no clear sub-branch devoted to these witnesses, it seems that the underlying similarity between these witnesses is limited. It needs to be noted that the distance between B2Bo and B3bo is somewhat unusual, as they do share fourteen phrases with each other, as they are dated to the same period, and share the same type of inscription. More proximity would have been expected. However, they do share the same structure in 1,88,b: $\text{iw.(ti) ntr rnp} \ ms.n \ inn.t \ nfr.t \ iy \ min \ m \ ts 'nh'$ (welcome, young god, whom the beautiful west brought forth, who came today from the land of the living), which varies from the other witnesses, which have for example: $\text{iw.(ti) m htp i} \ nn.t \ ntr \ rnp} \ ms.n \ inn.t \ nfr.t \ iy.n=k \ min \ m \ ts 'nh'$ (welcome in the peace of the west, young god, whom the beautiful west has brought forth, after you came today from the land of the living), or: $\text{iw.(ti) m htp ntr rnp} \ ms.n \ inn.t \ iy \ min \ m \ ts 'nh'$ (welcome in peace, young god, whom the west brought forth, who came today from the land of the living).

---

471 de Buck (1935) CT I, p. 82,b (S6C).
472 de Buck (1935) CT I, p. 82,b (T1L,a).
473 de Buck (1935) CT I, p. 82,b (S1C).
474 de Buck (1935) CT I, p. 83,b (B12C,b).
476 de Buck (1935) CT I, p. 88,b (B2Bo).
477 de Buck (1935) CT I, p. 88,b (T1L,a). This structure is used in T1L,b as well.
478 de Buck (1935) CT I, p. 88,b (B4L). This structure is used in B13C as well.
In the right final section of the large branch (figure 3.68), there is T1L,a-b and L2Li. The placement of T1L,a and T1L,b is not unusual, as they come from the same support, but the placement of L2Li is. Nearly every phrase that L2Li uses has a unique structure, with the exception of I,93,a and I,93,c, which it shares with T1L,a. However, it must be noted that these phrases are shared with B2Bo, B3Bo, B1L and B1P as well, so it could have likely been placed near either of these. The placement of L2Li might thus be random, as it shares so few phrases with the other witnesses. In Jürgens, T1L,a-b and L2Li are not placed close, but are two distinct types, β and ι, so it is not unlikely that the placement here is more due to lack of commonality with the other witnesses in this spell, than actual similarity between el-Lisht and the Theban area.

Finally, the placement of M24C and M25C might suggest a regional pattern, but as both were heavily damaged, this may be purely due to the reconstructions performed on the text. Therefore, their placement, even if it supports the idea of a regional pattern used in Meir, should be discarded.

3.30.3. Conclusions

For spell 30, the dendrogram does not clearly visualise regional patterns in the sentence structure, as many borders between regions are fuzzy. However, there is some indication of two sentence structure patterns in Asyut, although one of the two patterns are related to the pattern structure used in Deir el-Bersha. As is visible with T1L,a-b and L2Li, there are problems with the method used in this chapter when dealing with witnesses that are divergent from the other witnesses.

3.31. Spell 31

This section will discuss spell 31.479 This spell should be considered a group together with spell 30 and 32, which is closely related with the spell group of spells 33-37, and spells 38-41. This spell continues the discourse of spell 30, in three similarly structured couplets, which consists of the structure: ‘May you see ... The young god is similar to you’.480 This discourse is most likely performed by the same gods who spoke in the last section of spell 30.481 In the spell, the deceased is wished to witness the falcons and bulls in their birth places.

3.31.1. Introduction

This spell is short, with a total of seven phrases, although in de Buck the number is higher482. Note that every witness only uses a selection of these available phrases. In B2Bo, B12C,a-b, B13C, B1L and B4L, this spell was written in the form of a table, where the phrases Ỉḫ ms-k (therefore, may you see)483 and iw tt

---

482 In order to create complete clauses, many phrases were merged together. There were ten phrases in de Buck.

483 de Buck (1935) CT I, p. 97,b (B12C,b).
**n=k ntr rmp** (the young god is similar to you)\(^{484}\) where written as lines, and the rest of the phrases were written as columns.\(^{485}\)

In de Buck, this spell occurs in a total of sixteen witnesses\(^{486}\) of which two supports, T1L and B12C provided two witnesses. These sixteen witnesses came from four different regions. The following table shows the witnesses sorted by region (table 3.28):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S5C, S10C, S11C, S12C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B12C,a, B12C,b, B13C, B1L, B3L, B4L, B1P</td>
</tr>
<tr>
<td>el-Lisht</td>
<td>L2Li</td>
</tr>
<tr>
<td>Theban area</td>
<td>T1L,a, T1L,b</td>
</tr>
</tbody>
</table>

Table 3.28 Witnesses sorted by region for spell 31. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses in de Buck originate from Deir el-Bersha, which provides a total of nine witnesses. Asyut supplied four witnesses, while the Theban area has two witnesses, and el-Lisht one. Note that the witnesses used in this work only resemble the material available in de Buck.

The following figure (figure 3.69) shows the percentage of damage which occurred in the witnesses.\(^{487}\)

---

\(^{484}\) de Buck (1935) *CT I*, p. 97,d (B12C,b).

\(^{485}\) For the purposes of the database, it means that the line, which should be read before and after every column, needed to be encoded as separate, reconstructed phrase. However, the duplication of the phrase would not have been necessary for the Egyptians themselves to understand that the line should be read multiple times.

\(^{486}\) Jürgens (1995), p. 195, notes the following additional witnesses: S19C, S21C, S2Tu and S6P from Asyut, and *pLouvre E 15594*, which is of unknown origin. Willems (2001), p. 268, note 53, mentions that Sid4Sid from Sidmant el-Gebel has this spell as well.

\(^{487}\) Note that due to the table format of B2Bo, B12C,a-b, B13C, B1L and B4L have in the database a higher number of tokens that are counted as a reconstruction, but these were not included in the figure.
As one can see in this table, L2Li is nearly 60% partially or fully reconstructed. B4L is more than 30% reconstructed, and B12C,a is nearly 30% reconstructed. The other witnesses are relatively undamaged. Note that any result based on B12C,a, B4L and L2Li should be regarded with some caution.

### 3.31.2. Results and discussion

After the method discussed in this chapter was applied, the following dendrogram was created (figure 3.70):
In this dendrogram, there is one main branch, separating into two sub-branches which follow after the splitting of B12C,b and T1L,b. Additionally, there are two small branches, separately for B12C,a and B13C. As one can see immediately, there are no real regional sections, as every sub-branch has at least one witness from at least three regions. Only the right final section of the main branch shows some regional proximity, between B2Bo, B1L and B1P. This is however completely deceptive, as B1P does not share any similar phrases with any of the other witnesses.\footnote{The full sentence structure file is available in appendix 3.29.} For example, in I,96,b-c, B1P has: \(i\hbar \ d\bar{i}=i\ m\ z\ w\ s\i\ r\ s\i\ p\ i\ n\ b\ i\ k.w\ m\ s\\lower{1pt}s.w=s\i\ n\) (therefore, may I cause that the Osiris, this \(s\i\ p\i\) sees the falcons in their nests),\footnote{de Buck (1935) CT I, p. 96,b-c (B1P).} where the most common structure is: \(i\hbar\ m\z-k\ b\ i\ k.w\ m\ s\\lower{1pt}s.w=s\i\ n\) (therefore, may you see the falcons in their nests).\footnote{de Buck (1935) CT I, p. 96,b-c (T1L,a). Used in B12C,a-b, B4L, S11C and T1L,a-b.} This occurs L2Li as well, which uses a unique sentence structure in all its phrases, for example in I,97,b-c: \(m\ s\s\n-f\ p\n b[i]k.w\ m\ b\i\ k.w\ m\ s\\lower{1pt}s.w=s\si n\) (may this \(s\s\n-f\) see the falcons in their nests).\footnote{de Buck (1935) CT I, p. 99-100,d-a (B12C,a). Note that the reconstruction of \(i\hbar\ m\z-k\) is due to the table format in which this spell is written. Note that B12C,b duplicates the \(m\z-k\), which should be considered a dittography.} These two witnesses should have expectedly been placed on their own branch.

Although T1L,a and T1L,b are on the same general branch, they are strongly not in proximity of each other, which is unusual, as they are nearly identical, with the exception of phrase 98,a-b, where one uses a singular for \(m\s\w.t\), and the other the plural.

A similar problem occurred in B12C,a-b, which have a similar structure in five of the six phrases that were used, but are nevertheless placed far away from each other, on different branches. Additionally, more proximity would have been expected between B12C,a-b and B13C, as they share the same phrase structure in I,99-100,d-a, which is separate from the other witnesses. Here B12C,a-b and B13C have: \(<i\hbar\ m\s\n-k>\ w\i\ r\ m\ d\w\ m\ s\^h\ n\ k\ s\ i\ m\ t\) (oh, may you see Osiris in Busiris, in the dignity of the bull of the west),\footnote{de Buck (1935) CT I, p. 98-100,d-a (T1L,a). Used in B4L and T1L,a-b, the other witnesses all have their own unique form.} where the majority pattern under the other witnesses is: \(i\hbar\ m\z-k\ w\i\ r\ m\ d\w\ m\ s\^h-f\ n\ k\ s\ i\ m\ t\) (oh, may you see Osiris in Busiris, in his dignity of the bull of the west).\footnote{de Buck (1935) CT I, p. 98-100,d-a (T1L,a). Used in B4L and T1L,a-b, the other witnesses all have their own unique form.} Although B13C has three phrases out of six that are different from these witnesses as well, the placement in the dendrogram would have been expected to be closer.

Only the section concerning S5C, S10C and S12C are placed together according to expectation, as they share four phrases, and have one phrase, I,98-100,d-a, which varies between them. The remoteness of S11C fits as well, as S11C uses a phrase structure in I,96,b-c that is different from the other witnesses from Asyut.

### 3.31.3. Conclusions

For this spell, the method used in this chapter does not work at all. The placement of the witnesses seems completely random, and cannot be supported by the actual phrases used between the witnesses. It can be assumed, when compared to spell 2, 3, 5, 8, 10, 12, 15 and 19, that the short length of the spell influences the results to the extent that they do not resemble expectation based on the structure of the
phrases used. Although some of the witnesses from Asyut were placed within expectations, it could be argued that this placement was random when compared to the placement of the other witnesses.

### 3.32. Spell 32

Spell 32\(^{493}\) is the focus of this section. Together with spell 30 and 31, it should be considered part of a spell group, which itself is closely related to spells 33-37 and spells 38-41. This spell continues the discourse started in spell 30 and 31. Although it is unclear who the initial speaker is,\(^ {494}\) the second section of the spell is a discourse spoken between Osiris and the beautiful west. The discourse in this spell concerns the arrival of the deceased at Osiris and the beautiful west, and the reception he receives.

#### 3.32.1. Introduction

Of the spell group of spells 30-32, this spell is the second longest, with a total of 23 phrases,\(^ {495}\) of which the witnesses use a selection. In de Buck, there are a total of 20 witnesses,\(^ {496}\) from five different regions. There are two supports, B12C and T1L which provide two witnesses each. The following table shows the witnesses separated by region (table 3.29):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S1C, S2C, S5C, S10C, S11C, S12C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B12C,a, B12C,b, B13C, B16C, B1L, B3L, B4L, B1P</td>
</tr>
<tr>
<td>el-Lisht</td>
<td>L2Li</td>
</tr>
<tr>
<td>Meir</td>
<td>M25C</td>
</tr>
<tr>
<td>Theban area</td>
<td>T1L,a, T1L,b</td>
</tr>
</tbody>
</table>

Table 3.29 Witnesses sorted by region for spell 32. See appendix 1 for a full list of details concerning every witness.

In de Buck, the majority of the witnesses come from Deir el-Bersha, which provided ten witnesses. The second largest number of witnesses come from Asyut, which supplied six witnesses. The Theban area has two witnesses, and el-Lisht and Meir both gave one witness. Note that for the purposes of this work, only the witnesses published in de Buck were used.

---

\(^{494}\) Willems (2001), p. 273. Note that Willems disagrees with the idea that it is Osiris who speaks here, which is suggested by other authors. Note however that B1P seems to write in l,102,a that it is Osiris who speaks, although i could be considered an interjection here as well.

\(^{495}\) In de Buck, the actual number of phrases is higher, as some phrases were merged.

\(^{496}\) Jürgens (1995), p. 195, mentions additional witnesses: S20C, S2Tu from Asyut, and pLouvre E 15594, which is of unknown origin. Willems (2001), p. 270, note 60, mentions that Sid4Sid from Sidmant el-Gebel has this spell as well.
The following figure shows the percentage of damage which occurred in the witnesses for this spell (figure 3.71):

![Figure 3.71 Percentage of reconstruction and damage in the witnesses for spell 32. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

Of the witnesses of this spell, M25C is the most damaged, as it is more than 70% reconstructed. B4L and B12C,a are both nearly 40% reconstructed. The other witnesses are relatively intact. Although M25C is included in this work, any results including M25C should be regarded with caution.

### 3.32.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.72):
In this dendrogram, there are two main branches, of which branch 2 is the largest, and consists again out of two main sub-branches. Finally, there is B1P, which is on its separate branch.

On the first main branch, there are three witnesses, S10C, S11C and S12C. This placement is encouraging, as it suggests the existence of a specific sentence structure pattern in Asyut. As these three witnesses only use five of the 23 phrases, their placement is as one would expect. However, S12C does not share any phrases with S10C and S11C, but is on the same branch, as it is the same length. For example in l,104,a, S10C and S11C have: \textit{dr=k ih=f} (you will expel his pain),\footnote{de Buck (1935) \textit{CT} I, p. 104,a (S10C). Note that S11C uses \textit{-s} rather than \textit{-f}, as the owner is female.} where S12C has: \textit{dr=f ih=k} (he will expel your pain), which occurs in B12C,a, B1L and B1P as well.\footnote{Note that the majority of the witnesses use the homonym \textit{ih} (shout) instead, as these use a A2 (𓀁) classifier, where these witnesses use a G37 (𓅪) classifier.} Thus, although S10C and S11C use identical phrases, it seems that this branch is based more on the length of the spell, than any underlying pattern.\footnote{Although it could be argued that number of phrases used should be considered a part of the pattern as well.}

Concerning the right branch of branch 2, it is interesting to see that it holds a witness of every region, except Deir el-Bersha. This suggest that there is a pattern in Deir el-Bersha which is not shared by the other witnesses, although there is no clear variation between the other regions themselves. On the final section of the right sub-branch of branch 2, one finds S1C, S2C and M25C. As M25C is mostly reconstructed, its placement can be discarded. This leaves S1C and S2C, which belong to the same owner. As S1C and S2C are placed in a different branch than the other witnesses from Asyut, the suggestion can be made that S1C and S2C follow a different pattern to the other witnesses from Asyut, which are with the exception of S5C on the first main branch. This is supported by the fact that S1C and S2C use phrases l,104,b to l,107,c, where S10C, S11C and S12C use l,100,c to l,104,c, so they should be on a separate branch. Moreover, this is visible in l,104,c: \textit{s'=r-f n=k ṣkr=k n s'ḥ śm.w} (he will cause your
adornment to ascend for you, to the dignity of the summer),\(^6\) where B2Bo, B3Bo, B12C,a-b, B13C and B4L have: \(\text{s}_r f \text{ s}kr=k n \text{s} \text{h} \text{sm}.w\) (he will cause your adornment to ascend to the dignity of the summer),\(^7\) S10C and S11C have: \(\text{s}_r=k \text{ s}kr=f n \text{s} \text{h} \text{sm} \text{w} \text{w}\) (you will cause that his adornment ascends to the dignity of the summer)\(^8\) and T1L,a-b have: \(\text{s}_r=f n=k \text{ hkr} . w=k n \text{s} \text{h} \text{sm}.w\) (he will ennoble your adornments for you, to the dignity of the summer).\(^9\) The other witnesses all have unique variations.

The left section of the second main branch is interesting as well, as it contains all the witnesses from Deir el-Bersha, which suggests the existence of a specific Deir el-Bersha sentence structure pattern in regard to the witnesses from other regions. For example, in I,107,d, which only occurs in Deir el-Bersha and el-Lisht. Here, Deir el-Bersha has: \(\text{hmn} \text{t} \text{v}\) (while I enfold you),\(^10\) while L2Li has: \(\text{hmn tw}\) (who embraces you),\(^11\) which varies due to the absence of the first-person singular suffix pronoun. However, this Deir el-Bersha pattern is contradicted by the placement of SSC. This witness is only one phrase longer than S10C, S11C and S12C, although it only shares phrase I,102,a with these witnesses. As this witness shares the phrases I,100,c and I,104,b\(^12\) with Deir el-Bersha, it is assumed that this primarily informed the placement, and not the length of the witness here.

Finally, the final section of the left sub-branch (figure 3.73) shows an additional interesting feature. In Deir el-Bersha, there is a group of witnesses, B12C,a-b, B13C and B4L, that in I,103,a and I,108,a, replace the name of the owner with the following phrase: \(\text{i} \text{t} \text{i pf} \text{h} \text{y} \text{r}.w=i pf \text{h} \text{yw} \text{i pf} \text{h} \text{z} . \text{n} \text{i} \text{n} \text{f pf}\) (this father of mine, this attendant of mine, this protector of mine, this one to whom I have gone down).\(^13\) This is actually visible in the dendrogram, as these four witnesses are grouped together. However, the presence of B16C complicates the rationalization, as this witness only has the final five phrases of the spell, even though four of these are identical with B13C. In spell 33, B16C has the full spell, and there the witness uses the \(\text{i} \text{t} \text{i pf}\) phrase as well, thus the placement here seems correct. As there is a clear phrase that is different, it is possible to suggest that there are at least two different sentence structure patterns in Deir el-Bersha.

There is one potential complication with the placement of B4L however. B3L and B4L belong to the same owner, \(\text{sn}\), and are assumed to have been found as a pair. As they are a pair, one would expect a similar period of creation, and therefore, to some extent, the same phrase structure for the text, which is due to the \(\text{i} \text{t} \text{i pf}\) phrase not the case. In Willems,\(^14\) they are not of the same inner decoration pattern,

---

\(^6\) de Buck (1935) CT I, p. 104,c (S1C).
\(^7\) de Buck (1935) CT I, p. 105,c (B12C,b). This phrase is a variant, where the \(n=k\) is not written.
\(^8\) de Buck (1935) CT I, p. 104,c (S10C). This phrase is a variant, where the \(n=k\) is not written, and the second person suffix pronoun was used after \(\text{s} \text{h}\), and the third person suffix pronoun after \(\text{skr}\). Note that the G43 (\(\text{h}\)) of \(\text{sm}.w\) was duplicated for some unknown reason in this witness.
\(^9\) de Buck (1935) CT I, p. 104,c (T11,a). In this phrase, the \(\text{s} \text{r}\) was replaced with \(\text{s} \text{h}\) instead.
\(^10\) de Buck (1935) CT I, p. 107,d (B1P).
\(^11\) de Buck (1935) CT I, p. 107,d (L2Li).
\(^12\) Although it must be mentioned that this phrase is shared with the witnesses from the Theban area and el-Lisht as well.
\(^13\) de Buck (1935) CT I, p. 103,a (B12C,b).
namely IVab for B4L, and VIII for B3L. Therefore, it is possible that these two supports might not have originally belonged together,\(^{509}\) which could explain the difference in sentence structure as well.

### 3.32.3. Conclusions

For spell 32, the method used in this chapter seems functional, as it mostly visualises the differences between groups that would be expected. In this chapter, there are two sentence structure patterns for Asyut, although one of these is shared with el-Lisht, Meir and the Theban area as well. Additionally, there is a separate pattern in Deir el-Bersha, which can be separated in two patterns. Thus, for spell 32, the method used in this chapter is capable to visualize regional variation, and is even capable of visualizing variation in Asyut and Deir el-Bersha.

### 3.33. Spell group 30-32

As Jürgens considers spell 30 to 32 to be a group together, it will be treated here as was done for spells 1-27 in chapter 3.29. The following table (table 3.30) shows which witnesses use which spell, as not all the witnesses have all three spells of this group:

| Spell: S1C S2C S5C S6C S10C S11C S12C B2Bo B3Bo B12C,a B12C,b B13C B16C B1L B3L B4L B1P L2Li M24C M25C T1L,a T1L,b |
| 30 | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |
| 31 | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |
| 32 | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |

Table 3.30 Occurrence of spells in for every witness in spell 30-32.

Note that this figure only shows the occurrence of the spell, not the order in which the spells were added on the support. Spells that did not occur were treated as discussed in chapter 3.29.

### 3.33.1. Results and discussion

After the method described in 3.2.2 was applied, the following dendrogram was created (figure 3.74):

\(^{509}\) It is not my intent to state that one of the coffins was usurped, but rather that they might have been made in different workshops, or at different points of time. As the context of the origin of these two coffins is uncertain, see Willems (1988), p. 76, I wonder if these were not two separate coffins of two physicians named Sen that were buried in the same shaft.
In this dendrogram, there is only one main branch, on which most witnesses are placed. S1C and S2C both have their own branch. The main branch has multiple sub-branches.

First, when observing the right final section of the branch, there are three witnesses placed here, T1L, a, T1L, b and L2Li. This placement is interesting, as T1L, a and T1L, b are placed together in Jürgens\(^\text{510}\) as well, as type 8. However, the placement of L2Li is unusual here, since in spell 30-32, it usually varies in most phrases from all the other witnesses, so it is better to assume that this branch is more due to a lack of similarity with the other witnesses, as discussed in spell 30.

All the witnesses from Asyut, with the exception of S1C and S2C are found together on the same sub-branch (figure 3.75). This suggests that there are two distinct patterns used in Asyut, one which shares features with Deir el-Bersha, and one which is quite different. This is visible in Jürgens as well, as S5C, S6C, S10C, S11C and S12C are considered type ν, although it needs to be mentioned that this dendrogram does not reflect the subdivision found in Jürgens. However, Jürgens placed S1C and S2C under type θ, which is reflected by the separate placement of these two witnesses.

Then, the middle section of the main branch (figure 3.76) contains every witness from Deir el-Bersha, with the exception of B1P, which diverges from the group at an earlier stage. It needs to be noted here that the pattern within Deir el-Bersha is clearly visible here as well. As one can see in figure 3.76, B12C, a-b, B13C, B16C and B4L are on

\(^{510}\) Jürgens (1995), p. 199. Note that this stemma does include the group of spells 33-37 as well, which are not addressed in this dendrogram.
their own branch, which can be supported by the *it-i pf* phrase\textsuperscript{511} used in these witnesses. In Jürgens, this group exists as well as its own entity, as type ξ, although not using the same sub-division.

Concerning the left sub-branch of the main branch, it is encouraging to see that with the exception of B1P, this follows type κ in Jürgens quite closely, as it contains both sections of Deir el-Bersha witnesses, and the larger group of Asyut witnesses.

As additional features, the dendrogram places B1L and B3L together, which occurs in Jürgens as well (type λ4). However, it places M24C and M25C together, which does not occur in Jürgens, although it needs to be noted that the placement of M24C and M25C is most likely due the high number of reconstructions that were performed there, instead of any true underlying pattern of sentence structure.

### 3.33.2. Conclusions

For this spell group, the method used in this chapter is capable to visualize regional variation in the sentence structure. Moreover, it is additionally capable of visualising different patterns which were used within regions, as at least two patterns are visible in Asyut and Deir el-Bersha. Moreover, this group approach corrected the issues that occurred in spell 31, which shows that the method is more viable in longer spells, instead of shorter spells.

### 3.34. Spell 33

The following section will discuss spell 33.\textsuperscript{512} This spell should be considered part of the spell group 33-37, which is closely related to spell group 30-32,\textsuperscript{513} and spell group 38-41. In this spell, there is first an appeal to two groups of gods, the *ntr.w im.yw hh.w* (the gods who are with the primeval gods),\textsuperscript{514} and the *psd.t im.t štš.w* (the ennead which is in secrets),\textsuperscript{515} after which the deceased is spoken to by the beautiful west, and commanded by Osiris.

#### 3.34.1. Introduction

In spell 33, the witnesses have access to a total of 42 phrases.\textsuperscript{516} Note that the witnesses only use a selection of these phrases. In de Buck, there are a total of sixteen witnesses,\textsuperscript{517} which come from five different regions. The supports B12C and T1L both provided two witnesses. The following table shows the different witnesses sorted by region (table 3.31):

\textsuperscript{511} See chapter 3.32.2 for more details.
\textsuperscript{514} de Buck (1935) *CT I*, p. 111,c (B1P).
\textsuperscript{515} de Buck (1935) *CT I*, p. 111-112,d-a (B1P).
\textsuperscript{516} Note that in de Buck, the number of phrases is higher, as some of the phrases have been merged together.
\textsuperscript{517} Jürgens (1995), p. 195, mentions an additional witness, pLouvre E 15594, which is of unknown origin.
Table 3.31 Witnesses sorted by region for spell 33. See appendix 1 for a full list of details concerning every witness.

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S1C, S2C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B2Bo, B3Bo, B12C,a, B12C,b, B13C, B16C, B1L, B3L, B4L, B1P</td>

<td>L2Li</td>
</tr>
<tr>
<td>Meir</td>
<td>M25C</td>
</tr>
<tr>
<td>Theban area</td>
<td>T1L,a, T1L,b</td>
</tr>
</tbody>
</table>

The majority of the witnesses come from Deir el-Bersha, which provided ten witnesses. Asyut and the Theban area both supplied two witnesses. Finally, el-Lisht and Meir both have one witness. Note that for the purposes of this section, only the material published in de Buck was used.

The following figure shows the percentage of damage which occurred in the witnesses (figure 3.77):

![Figure 3.77 Percentage of reconstruction and damage in the witnesses for spell 33. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.]

As one can see in the table above, M25C is badly damaged, with nearly 70% partially or fully reconstructed. B13C is more than 50% partially or fully reconstructed, and B4L more than 40%. The other witnesses are relatively intact, although S2C and B12C,a both are over 20% partially or fully reconstructed. All the witnesses are included in the results for this spell, but any results including the badly damaged witnesses need to be approached with caution.

3.34.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.78):
Figure 3.78 Rectangular Phylogram display of the distance between different witnesses of spell 33.

In this dendrogram, there is a large main branch, containing fourteen of the witnesses, which itself is separated into multiple sub-branches. Beside the main branch there is a separate branch for B12C,a, and one for L2Li. The separation of L2Li falls within expectations, as it has many distinct phrases in comparison to the other witnesses, \(^518\) with 19 of the 34 phrases that this witness uses having their own distinct structure. For example, in I,115,b, the majority of the witnesses have: \(hp \text{ m } htp \text{ hnm-i tw}\) (travel in peace, so that I may envelop you), \(^519\) where L2Li has: \(hp \text{ m } htp \text{ hnm tw}\) (travel in peace, enveloping you). \(^520\) The separation of B12C,a is sensible as well, as it only has four of the 42 potential phrases, of which three are not shared with the other witnesses.

The placement of T1L,a and T1L,b on their own sub-branch is encouraging, as they are nearly identical, and have only seven of the 42 phrases available, and they belong to the same support. Their distinction from the other witnesses can be seen in I,111,c, where they have: \(hs \text{ nfr. w nb. w hh. w}\) (ho gods, lords of

\(^{518}\) The full sentence structure file is available in appendix 3.31.
\(^{519}\) de Buck (1935) CT I, p. 115,b (B2Bo).
\(^{520}\) de Buck (1935) CT I, p. 115,b (L2Li). Here, the first person singular suffix pronoun was not added. Note that I did not add it, as for example in de Buck (1935) CT I, p. 141,a (L2Li), it was actually written, even though this witness writes the first person suffix pronoun with the M17 (\(_DEC\)). In this support, there is the preference to limit the hieroglyphs of animates, as it uses partial forms of hieroglyphs for the hieroglyphs of animates instead.
the chaos gods),521 where the other witnesses have: i nt. w imy. w hh. w (oh, gods who are with the chaos gods).522 Here, T1L,a-b replaced the interjection i with hz, and replaced imy. w with nb. w.

The same can be said for S1C and S2C, which belong to the same owner, and are both on the same branch. These two witnesses have only eight of the 42 phrases, and are nearly identical as well. For example, this can be seen in l,119,b, where S1C and S2C have: mi ir.t.n-f n hz. w.n-f n=sn (like that which he has done for those to whom he has descended),523 where the other witnesses have: mi hz. w.n-f n=sn (like those to whom he has descended).524 Here, S1C and S2C add ir.t.n-f n before hz. w.n-f. M25C has only seven phrases, with the phrases used similar to the selection of S1C and S2C. Therefore, some proximity would have been expected, but is not visible here. However, since M25C is mostly reconstructed, its placement could be an effect of the reconstructions, rather than any original sentence structure pattern.

The central sub-group of the main branch contains a group of witnesses from Deir el-Bersha, B2Bo, B3Bo, B1L, B3L and B1P, which suggests that a distinct sentence structure pattern exists in Deir el-Bersha for this spell. However, these do not include all witnesses from Deir el-Bersha, as B12C,b, B13C, B16C and B4L are not in this group. These witnesses pose a problem, as they share a feature that does not occur in the other witnesses, namely the use of the it=i pf phrase,525 which in these witnesses occurs in l,114,a, l,116,b and l,121,b. Due to this specific phrase construction, one would expect a separate group, which is not observed here. Rather, these witnesses are spread out over the branch. Additionally, based on the many phrases that are shared amongst the witnesses, more proximity would have been expected. For example, in l,119,a, B2Bo, B3Bo, B1L, B3L and B1P have: ‘pr.n-f t3 m hm.t.n-f (he has equipped the land even with that which he did not know),526 where B12C,b, B13C, B16C and B4L have: ‘pr.n-f t3 m rh.t.n-f (he has equipped the land even with that which he knew),527 where the lemma hm (to not know) was replaced by rh (to know). Based on the combination of the dendrogram and the phrases used, it is possible to suggest that there were two distinct sentence structure patterns in Deir el-Bersha for this spell.

Finally, as stated in chapter 3.32.2, this spell supports the idea that although B3L and B4L share the same owner, they were likely not created as a pair. The placement in the dendrogram shows that they do not belong to the same sentence structure pattern. This is most clearly visible in the use of the it=i pf phrase structure in B4L, which does not occur in B3L. Additionally, the difference is supported by the fact that they use a different internal decoration pattern.

521 de Buck (1935) CT I, p. 111,c (T1L,a).
522 de Buck (1935) CT I, p. 111,c (B1P).
523 de Buck (1935) CT I, p. 119,b (S1C).
524 de Buck (1935) CT I, p. 119,b (B4L).
525 Discussed in more detail in chapter 3.32.2.
526 de Buck (1935) CT I, p. 119,a (B1L).
527 de Buck (1935) CT I, p. 119,a (B4L).
3.34.3. Conclusions

For this spell, the method used in this chapter is clearly capable to visualize regional differences in the sentence structure patterns used in the witnesses, as every region has its own sub-branch in the dendrogram. However, there is only one sub-branch for Deir el-Bersha, where one would expect two sub-branches. Although the second group consisting of B12C,b, B13C, B16C and B4L are on the same general vertical level, they do not show the proximity that would have been expected concerning the number of phrases they share between them.

3.35. Spell 36

This section will discuss spell 36. This spell should be considered part of a group of spells which run from spell 33 to 37, and are closely related to the spell group 30-32 and spell group 38-41. This spell is a discourse, where the ritualist first speaks to Osiris, stating the actions, knowledge and aims of the deceased. This is followed by a statement of Osiris, requesting the beautiful west to let the deceased enter. The beautiful west then asks in what manner the deceased should be received, which is answered by Osiris. Finally, the deceased is requested to proceed.

3.35.1. Introduction

For this spell, there are in essence two versions, a short version, used in B1L, B3L and B1P, which consists of thirteen phrases, and a long version, used in B3Bo, B12C, B13C,a-b, B16C, B4L and L2Li, which consists of 46 phrases, although not all these phrases are used by every witness. In de Buck, there are a total of ten witnesses, which originate from two different regions. Note that the support B13C provided two witnesses. The following table shows the witnesses sorted by region (table 3.32):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deir el-Bersha</td>
<td>B3Bo, B12C, B13C,a, B13C,b, B16C, B1L, B3L, B4L, B1P</td>
</tr>
<tr>
<td>el-Lisht</td>
<td>L2Li</td>
</tr>
</tbody>
</table>

Table 3.32 Witnesses sorted by region for spell 36. See appendix 1 for a full list of details concerning every witness.

As one can see here, in de Buck this spell is mostly attested in Deir el-Bersha, with the witness from el-Lisht being the only exception. For this work, only the witnesses used in de Buck were used.

---

529 Willems (2001), p. 303-304. Note that Willems mentions that Isis is the one who asks the deceased to proceed, but in phrase l,145,d: i.t in imm.t nfr.t (which is said by the beautiful west), it is clear that it is the beautiful west is the one who speaks here.

530 In de Buck, the number of phrases is higher, as some of the phrases have been merged.

531 The full sentence structure file is available in appendix 3.32.

532 Jürgens (1995), p. 195. mentions an additional witness, plouvre E 15594, which is of unknown origin.
In the following figure (figure 3.79), the percentage of the damages which occurred in the witnesses is set out:

![Bar chart showing percentage of reconstruction and damage in the witnesses for spell 36. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.]

The witnesses of this spell are mostly intact, except for B13C,a and B13C,b which are nearly 70% and more than 80% partially or fully reconstructed. Although these two witnesses are included in this study, it needs to be remarked that any result which includes these two witnesses needs to be approached with caution.\footnote{Although it needs to be noted that there was a lot of similarity between B12C and B13C in spells 30-33, so the reconstructions were usually based on B12C, and I consider these reconstructions relatively safe.}

3.35.2. Results and discussion

After the method discussed in section 3.2.2 was applied, the following dendrogram was created (figure 3.80):
In this dendrogram, there is one great branch, which contains the majority of the witnesses, and two small branches containing B1P and B3L. It needs to be stated here that for any study of regional variation, this spell is of limited use, as it contains witnesses of only two regions.

As discussed above, there are technically two variants of this spell, a short and long version. It is encouraging to see that this is to some extent visible in the dendrogram, as B1L, B3L and B1P, which all use the short version, are separated from the other witnesses that use the long version. This can be seen in I,138,b as well, where the witnesses with the short version have: *htm n-f wrš.w-f im-f* (while his watchers perish for him with him),\(^534\) while the witnesses with the long version have: *sdš n-f wrš.w-f im-f* (while his watchers tremble for him at him),\(^535\) where *htm* is replaced by *sdš*. However, this is not as clear as would be expected, as B1L is on the main branch, with the long versions, and B1P and B3L being separate branches. As B1L and B1P share eleven of their thirteen phrases with each other, and B3L shares nine out of the thirteen phrases with B1L and B1P, more proximity between these three would have been expected. However, based on the stemma of Jürgens for the spell group 30-32 and 33-37,\(^536\) the proximity between B1L and B3Bo does fall within the expectation, as both B3Bo and B1L belong to type λ, although part of different sub-types.

\(^534\) de Buck (1935) CT I, p. 138,b (B1P). Note that B3L has a unique variation, as it uses *wrš* (singular), rather than *wrš.w* (plural).
\(^535\) de Buck (1935) CT I, p. 138,b (B12C).
The placement of B12C, B13C,a, B13C,b, B4L and B16C (figure 3.81), as the final section of the main branch, is highly encouraging. As discussed earlier, these witnesses use the it=i pf phrase when the other witnesses use the name of the owner. As these witnesses are placed together, it can be argued that this represents a specific sentence structure type in Deir el-Bersha for this spell. This is supported as well by the placement of B3Bo, which is quite far removed from the other long versions of this spell in Deir el-Bersha. As this witness does not use the it=i pf phrase, there is a clear difference between the B3Bo and the other witnesses with the long version of this spell, which is reflected in the dendrogram.

Additionally, L2Li is placed more or less as expected, as it is part of the group of witnesses with the long version of the spell. However, its separation from the other witnesses is clear as well, as this witness has many unique sentence structure patterns that set it apart from the other witnesses. For example, in I,144,d, where L2Li has: imi nhm ssnb-n-f pn (let this ssnb-n-f not shout),537 where the other witnesses have: imi=f nhm (let him not shout).538

3.35.3. Conclusions

Although spell 36 is of limited use for the study of regional variation in the sentence structure, it does visualise some interesting features. The dendrogram shows that there are at least two sentence structure patterns in use in Deir el-Bersha. However, the third pattern, in form of a shorter version of the spell is not clearly depicted, although the witnesses with this short version are some distances away from the long versions in the dendrogram. Additionally, it is encouraging that L2Li was placed on the same branch as the other witnesses which use the long version, even though it has many variations in sentence structure that are not shared by the other witnesses.

Although not all the outlines are as clear as would be preferred, it seems that the method used in this chapter is capable of visualizing the variation in the sentence structure correctly in spell 36.

3.36. Spell 75

The following section will discuss spell 75.539 The subject of this spell concerns the deceased becoming (hpr) the incarnation of Shu,540 or the wind or air, as Shu is the air dividing the land and the sky.541 The

537 de Buck (1935) CT I, p. 144,d (L2Li). Here this witness uses the name of the owner, rather than a suffix pronoun.
538 de Buck (1935) CT I, p. 144,d (B16C).
540 Literally the bA of Shu, the soul of Shu.
interpretation of the deceased being like air is supported by phrases like: *ink bꜣ šw nṯr sḏk irw* (I am the spirit of Shu, the god invisible of shape),\(^{542}\) or: *ink nṯr nḫš irw* (I am the god who is exhaled of shape).\(^ {543}\) These types of phrases show the underlining influence of the Heliopolitan theology for this spell.\(^{544}\) Spell 75, together with spells 76 to 83, are known as the book of Shu.\(^ {545}\)

### 3.36.1. Introduction

Spell 75 is attested in de Buck in a total of 24 witnesses, from a total of eight different regions. Only spell 162 and 390 have witnesses attested from the same number of regions.\(^ {546}\) Additionally, spell 75 has the second highest number of witnesses in de Buck, with only spell 335 having more witnesses. In this section, an additional witness, M1Be, will be added, which was not published in de Buck.\(^ {547}\) The following table shows the witnesses sorted by region (table 3.33):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aswan</td>
<td>A1C</td>

</tr>
<tr>
<td>Theban area</td>
<td>T3C</td>
</tr>
</tbody>
</table>

Table 3.33 Witnesses sorted by region for spell 75. See appendix 1 for a full list of details concerning every witness.

As one can see in the table above, the highest number of witnesses originate from Meir, which provided nine witnesses. Deir el-Bersha supplied eight witnesses, while Asyut has three witnesses. Finally, Aswan, Beni Hasan, Gebelein, Saqqara and the Theban area all have one witness each. Note that these witnesses only reflect the material currently available for this work.

---

\(^{542}\) de Buck (1935) *CT I*, p. 316,b (S1C).

\(^{543}\) de Buck (1935) *CT I*, p. 338,c (T3C).

\(^{546}\) Not including *Pyramid Texts* used in Middle Kingdom coffins, as PT 213 Allen, J. P. (2006) *CT 8*, p. 46-57, is attested in 8 different regions as well.

\(^{547}\) I am indebted to Tobias Konrad for providing the material concerning M1Be to me.
This spell is the second largest spell encoded in the database, consisting of 191 phrases, where the longest spell, spell 335, has 314 phrases. Not every phrase is attested in each witness, since every witness uses a selection of these phrases.

The following figure (figure 3.82) shows the percentage with which the witnesses were partly or fully reconstructed:

![Percentage of reconstruction and damage in the witnesses for spell 75. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

Although every witness is included in the results, caution should be taken in regard to B7C, M6C, M23C and Sq5C, as all these witnesses are more than 70% partially or fully reconstructed. Therefore, any result might be based more on the suggested reconstruction, rather than the original text.

---

548 In de Buck, the number of phrases is actually higher (217), but as most of these are due to tactical use of space in the publication, not based on actual phrase structure, some phrases were combined to create functional clauses.

549 The full sentence structure file is available in appendix 3.33.

550 Although B7C is badly damaged, I consider the reconstruction to be relatively certain, as the reconstructions are based on B1P, B2L and B1C, which share the same use of A50 (𓀻) for the first person with B7C. This function is...
3.36.2. Results and discussion

After applying the method described in 3.2.2, the following dendrogram was produced (figure 3.83):

![Dendrogram Diagram]

Figure 3.83 Rectangular phylogram display of the distance between the different witnesses of spell 75. Numbers were added to indicate the 3 distinct main branches.

As can be observed in figure 3.83, there are three major branches in this dendrogram. These are branch 1, which contain sixteen of the witnesses, branch 2, which contains two witnesses, and branch 3, which contains six witnesses. The only witness not on any other branch is S1C.\textsuperscript{551} These different branches will be discussed below. Additionally, the different branches will be compared as well to the stemma graph in Jürgens.\textsuperscript{552}

\footnotesize
\textsuperscript{551} It needs to be noted that the fact that S1C is not on any of the branches is remarkable, as Faulkner (1973), p. 74, note 1, and Carrier (2004,a), p. 184-201, use this as their basis of translation. However, when this dendrogram is displayed as a circular phylogram, S1C is clearly in the middle of the circle. Therefore, it can be argued that some merit to their choice exists.

Figure 3.84 concerns a group of four witnesses, all from Deir el-Bersha. Due to shared features beside the text itself, the placement of these witnesses as a group is beneficiary. All these witnesses share the same date of creation, based on the date proposed for these four supports by Willems, specifically a period between Sesostris II and Sesostris III. However, it needs to be noted that B7C is more than 90% reconstructed and moreover, in Willems, B7C is considered of group Deir el-Bersha E, instead of Deir el-Bersha D, to which B1C, B1P and B2L belong. Therefore, there might have been some differences between these witnesses, which are no longer preserved in the text.

Another shared feature of these witnesses is in the use of the A50 hieroglyph (𓀻). This sign is used in these witnesses for the first person. This use is currently only attested in B1Be, B1C, B2C, B5C, B9C, B10C, B11C, B12C, B15C, B17C, B18C, B20C, B1L, B2L, B1P, B2P, B1Y, and not anywhere outside Coffin Texts or Deir el-Bersha. Based on these two features, one would expect that these four witnesses share a common origin, even before sentence structure is taken into regard.

However, their connection can be seen, for example, in I,326-329,c-a, where they have: nd=sn hpr.w=i (they ask about my creation), where the majority of the other witnesses have: nd=sn hpr.w=i m-ɛ nnw (they ask about my creation from Noun), which add m-ɛ nnw to the phrase, or B3C and B1Bo, which use the name of the owner: nd=sn hpr.w n ss.t-ḥd-ḥtp tn m-ɛ nnw (they ask about the creation of this ss.t-ḥd-ḥtp from Noun), or A1C and G1T, which replaced nd (to ask) with ḳts (to lift up) instead: ḳts=sn hpr.w=i m-ɛ nnw (they lift my creation up from Noun).

---

555 To my current knowledge, based on research I performed for the Thot Sign List (www.thotsignlist.org), see Borghouts (2010,b), p. 21, and Gardiner (1957), p. 447, although these do not specify that the use is region and period specific. However, in Schenkel (1996), p. 126, it seems that it occurs in Sq3C as well, but I have not been able to locate where in the support this is the case.
556 de Buck (1935) CT I, p. 326-328,c-a (B2L).
557 de Buck (1935) CT I, p. 327-329,c-a (M4C).
558 de Buck (1935) CT I, p. 326-328,c-a (B3C). Note that B1Bo replaced ss.t-ḥd-ḥtp tn with ḳhwty-ḥnt pn (name of the owner).
559 de Buck (1935) CT I, p. 327-329,c-a (G1T).
Additionally, in the stemma of Jürgens, this group is part of his type λ2 and λ3, although in his work the λ type concerns all witnesses of Deir el-Bersha, which does not overlap with the results shown in figure 3.83, as the other witnesses from Deir el-Bersha are placed on the third main branch, which is discussed below.

In the left sub-branch of branch 1 (figure 3.85), one finds A1C and G1T. That these two witnesses end up in close proximity to one another is puzzling, if one considers that these witnesses were found in Aswan and Gebelein, which are geographically far removed from one another. However, Willems groups these two together with T3C, as he suggests that there was most likely a First Intermediate Period southern school of artists.560 The fact that based on sentence structure, A1C and G1T are placed in proximity to each other is thus encouraging, and would support this hypothesis.561 Although, if T3C should be considered a group with them, it does not end up in proximity with them in spell 75. Rather, T3C is placed on the second main branch. In Jürgens, on the other hand, A1C and G1T are grouped together as well, under type β, while T3C is part of type ι, which follows the direction of the results presented here.

Based on these results, it can be argued that A1C and G1T share a common origin, which could be part of the First Intermediate Period southern school of artists, as suggested by Willems. However, due to a lack of additional witnesses from either Aswan or Gebelein, and the connection with Thebes through T3C, it cannot be stated with certainty where these witnesses would have originated.562

On the central section of the right sub-branch (figure 3.86), the witnesses from Meir are grouped together, BH2C from Beni Hasan having its own small sub-branch before the large Meir group starts. This separation is visible in Jürgens as well, as BH2C falls under type δ. This can be seen in the number of unique phrases, for example I,316-317,b: *ink bs n sfg irw* (I am the spirit of the one who is hidden of shape),563 where M4C, S1C and S2C have the most complete form of this phrase: *ink bs šw nṯr sfg irw* (I am the spirit of Shu, the god invisible of shape),564 even though M3C, M6C, M20C and M28C reduce the phrase to: *ink bs* (I am the spirit),565 while A1C and G1T only have: *sfg irw* (invisible of shape).566 It needs to be noted that this group, although clustered together, are all part of a larger sub-branch, instead of being a distinct sub-branch themselves.

561 See phrase I,326-328,c-a above.
562 If one works on the assumption that the creation of coffins of this tradition was based in one location, instead of multiple locations.
563 de Buck (1935) *CT I*, p. 317,b (BH2C).
564 de Buck (1935) *CT I*, p. 316,b (S1C).
565 de Buck (1935) *CT I*, p. 316,b (M3C).
566 de Buck (1935) *CT I*, p. 317,b (G1T).
It is encouraging that all nine witnesses of Meir are generally grouped together, even though there is no clear subsection devoted to witnesses from Meir. In Jürgens, the Meir group is separated on two different types, namely η and μ. However, this separation is not visible here.

It has to be noted that M6C and M23C were heavily damaged, and that for M28C and M-Ann, the transcriptions in de Buck were not based on the originals, as they are now lost, but rather on transcriptions made by Daressy and Kamal. Moreover, some material exists only as fragments of the original coffins, for example M20C, which is only a lid, and M23C only consists of fragments of a coffin. Most witnesses from Meir belong to Willems group Meir B, which are dated to Sesostris I or early in the reign of Amenemhat II. The exception is MSC, however, which belongs to Willems group Meir A, which is dated to Amenemhat I. It is clear that some common ground between the witnesses of Meir exists, but that no further statements can be made based on spell 75 alone. For example, this is most clearly visible in I,322-323,b, where all the witnesses from Meir except for M4C have: *di=i nrw=f n ḫr mn=f* (while I place the fear of him to whom searches for his name), where A1C, G1T, S14C, T3C and M4C have: *di nrw=f n ḫr.w mn=f* (who placed the fear of him to whom searches for his name), where the -i suffix was not used, or B1C and B1P, which replace nrw with ssw: *di=i ssw.w=f ḫr.w mn=f* (while I place his guardians against whom searches for his name).
The second main branch of the dendrogram (figure 3.87) consists of two witnesses, T3C and S14C. As T3C is considered similar to A1C and G1T (cf. above), one would expect some proximity between these witnesses, which did not occur here. However, in Jürgens, these T3C and S14C occur together as well on their own type, namely ι1. Even so, this could be due to the reconstructions that were performed on S14C, as it is more than 40% partially or fully reconstructed, usually based on S1C, S2C or T3C.

Before discussing the final main branch, a few words about S1C are in order. As noted in appendix 1, S1C and S2C are part of a set of coffins, which belong to the same owner. Therefore, assuming that the two coffins were made at roughly the same time, the argument can be made that the text would be similar as well. This is not the case, which leaves open the question whether the variation was made intentionally.

Figure 3.88 shows the left sub-branch of branch 3. This sub-branch contains two witnesses from Deir el-Bersha. This is promising, as these witnesses are grouped together in Willems, based on stylistic features, and are therefore dated to the same period, i.e. the late 11th dynasty or early 12th dynasty. Additionally, these witnesses share the same type of script. The text was first drawn in ink, and then carved into the wood, so that the script was partially drawn and carved. This shared type of script and the similar dates of the witnesses allows the assumption that their proximity based on sentence structure shows a similar origin. On the other hand, it has to be noted that in Jürgens, B1Bo is type λ and B6C is type κ, which are related to each other, but not as close as this result suggests.

The final section is the right sub-branch of branch 3 (figure 3.89). Due to the high percentage of damage (more than 70%), the placement of Sq5C should not be considered important, as multiple phrases have been reconstructed based on B3C. The placement of B4C in proximity to B3C seems beneficiary, as B3C and B4C share the same owner. However, as B4C only has two of the 191 phrases, its placement has large uncertainty. Moreover, although they are on a different sub-branch, the proximity of B3C and B4C to B1Bo and B6C is interesting. Willems notes that B3-4C occupies an intermediate position between the witnesses created in Deir el-Bersha during the reign of Amenemhat I, and those created during the reign of Amenemhat II. This intermediate position is visible as well in the script used in B3-4C. They have the pre-inked

---

577 de Buck (1935) CT I, p. 314,c, 315 note 2*.
incised script used in B1Bo and B6C with sections only written in ink. The connection between B1Bo, B3C and B6C is visible in I,318,c, where B1Bo, B3C and B6C have: ss.t-hdq-htp in imy dr n ntr hpr ds-f (this ss.t-hdq-htp is the one who is in the side of god who came into being (by) himself), where S14C and T3C use the first person instead: ink imy dr hpr ds-f (I am the one who is in the side of the one who came into being (by) himself), while M3C, M6C, M20C, M28C and M-Ann add ntr before hpr ds-f: ink imy dr n ntr hpr ds-f (I am the one who is in the side of the god who came into being (by) himself).

Finally, S2C exists on its own sub-branch, which implies some similarity with the other witnesses of branch 3, while remaining distinct. It has to be noted that this grouping of witnesses does not occur in Jürgens, where all these witnesses belong to their own type, namely Sq5C to type α, S2C to type θ and B3C to type λ1.

3.36.3. Conclusions

Based on the results of the sentence structure dendrogram of spell 75, the following remarks can be made. First, as the witnesses of Deir el-Bersha are separated over two different branches, it can be assumed, at least for spell 75, that for Deir el-Bersha there were two distinct periods of coffin decoration. Moreover, as discussed above, this can be supported by stylistic and textual features, with B3-4C resembling more proximity to the earlier period of coffin decoration, although already displaying features of later period decoration. It has to be noted though that no claim can be made if it is a development within the same workshop, or if another new workshop took over.

Second, there are clear indications that the witnesses from Meir share a common origin, even though the borders are fuzzy. However, the general style of the sentence structure is shared with the later period witnesses from Deir el-Bersha, as the sub-section of Deir el-Bersha is directly connected to the branch of which the Meir witnesses are part as well.

Finally, there is some clear common ground between A1C and G1T, which is supported by stylistic features as well. Even though the stylistic features would suggest that T3C should share the common ground, based on the sentence structure it is clear that T3C is quite far removed from A1C and G1T in textual features, as T3C occurs on a different branch.

Based on these results, it seems that for this spell, the protein sequence method used in this chapter is capable to show regional variation in the sentence structure, even to the extent that two periods of coffin creation in one region is implied.

---

579 Based on photographs that I took in the Museum of Egyptian Antiquities in Cairo.
580 de Buck (1935) CT I, p. 318,c (B3C). Note that B1Bo replaced ss.t-hdq-htp tn with dhwty-nht pn and B6C replaced it with ḫs-nht pn (name of the owner).
581 de Buck (1935) CT I, p. 318,c (T3C).
582 de Buck (1935) CT I, p. 318,c (M3C).
583 If one assumes there were only two workshops, which is dubious at best.
3.37. Spell 89

The following section discusses spell 89.\textsuperscript{584} This spell concerns the deceased going forth against his enemies, to plead his case against his enemy in the tribunal, as: \textit{iw nhm.n-f tsw m fnd-i n iy.yt h rw.w-i} (He has taken away the breath from my nose, before my days had come).\textsuperscript{585}

3.37.1. Introduction

This spell is relatively short, consisting only of sixteen phrases. However, the witnesses only use a selection of these phrases. In de Buck, this spell consists of a total of eight witnesses, from a total of four different regions, although the origin of one witness is not certain. The following table shows the witnesses sorted by region (table 3.34):

<table>
<thead>
<tr>
<th>Region:</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S1C, S2C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B1Bo, B2Bo, B4C</td>
</tr>
<tr>
<td>Gebelein</td>
<td>G2T</td>
</tr>
<tr>
<td>Theban area</td>
<td>T1L</td>
</tr>
<tr>
<td>Uncertain</td>
<td>Pap.Berl.\textsuperscript{586}</td>
</tr>
</tbody>
</table>

Table 3.34 Witnesses sorted by region for spell 89. See appendix 1 for a full list of details concerning every witness.

For this spell, the majority of the witnesses came from Deir el-Bersha, which provided three witnesses. Asyut has two witnesses, and Gebelein and the Theban area supplied one each. Finally, the origin of Pap.Berl. is uncertain.

The following table shows the percentage of damage which occurred in the witnesses for this spell (figure 3.90):

\textsuperscript{585} de Buck (1938) \textit{CT II}, p. 58,b-c (B2Bo), although it needs to be noted that it is not entirely clear who the he is, as it could refer to \textit{sfg inw} (the one hidden of shape) as well, who is mentioned in II,57-58,d-a.

\textsuperscript{586} Regulski (2015), p. 301, mentions that the art dealer who sold the papyrus to Borchardt suggested the papyrus came from Asyut.
For this spell, S2C is more than 80% partially or fully reconstructed, T1L more than 50%, and B4C over 30%. The other witnesses are relatively intact. Although all these witnesses are included in this work, any result including S2C, T1L and B4C needs to be considered with caution.

### 3.3.7.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.91):

For spell 89, there are two branches, and a separate one for S1C. On a first glance, it seems that there are no regional specific patterns, as the witnesses are placed all over the dendrogram. The only region that has two witnesses on the same branch is Deir el-Bersha, with B1Bo and B4C. However, when the phrases that are used in these witnesses are taken into regard, it becomes clear that the connection between B1Bo and B4C is not based on similarity, but rather dissimilarity. In total these two witnesses share two phrases between them, and most of the other phrases are unique variations in sentence structure. This is the case as well for T1L, which is on the same branch. For example, II,57,c, where the

---

587 The full sentence structure file is available in appendix 3.34.
majority pattern is: sdm mdw=i hnt=f (who hear my word together with him). G2T has a passive sdm=f here: sdm.w mdw=i hnt=f (while my word is heard together with him), while B1Bo has the name of the owner instead of the suffix pronoun -i: sdm.t mdw dhwty-nht pn hnt=f (who hear the word of this dhwty-nht together with him). B2Bo has sdm.t instead of sdm: sdm.t mdw=i hnt=f (who hear my word together with him), where T1L uses a sdm.n=f, and added the particle iw, while replacing the suffix pronoun -i with the name of the owner: iw sdm.n-f mdw imsw [pn] hnt=f (he has heard the word of this imsw together with him). B4C is similar to T1L, but used a sdm=f rather than a sdm.n-f, and used mdw as the subject instead of the suffix pronoun -f: iw sdm mdw [s3.t-hd-htp tn hnt=f] (the word of this s3.t-hd-htp is heard together with him.). However, it cannot be stated that the purpose of the left main branch is only dissimilarity, as S2C and Pap.Berl. share a total of eight phrases.

In general, there are many sources of variation concerning sentence structure in this spell, with many unique variations in the sentence structure of the phrases. This might have influenced the placement of the witnesses, as it seems random. For example, S1C and G2T share eight phrases, and are the only witnesses that have the phrase II,59,c. However, G2T is placed on the same branch that B2Bo occupies, and they only share five phrases in total.

3.37.3. Conclusions

For spell 89, the method used in this chapter does not seem functional, as it is nearly impossible to see any reasoning behind the placement of the witnesses. It is assumed, that due to the high level of unique sentence structure variation in this spell, coupled with a relatively low number of phrases, there is too little stability for the method to work correctly. Moreover, as can be seen with B1Bo and B4C, the results are deceptive, as the proximity is based on dissimilarity, instead of similarity.

3.38. Spell 94

This section will discuss spell 94. De Buck considers this spell, together with spells 95-97 as a group, which contain within them a variant of spell 89. However, Bonanno rather regards spell 94-96 as a group, with spell 97 belonging to a group of spells that runs from spell 97-104. For the purposes of this work, the grouping of Bonanno is followed.

This spell is a statement by the deceased, where he identifies himself with the soul of Osiris, and the son of Osiris. This process seems to have included a copious amount of copulation, as the verb nk (to copulate) occurs often in this text.

---

588 de Buck (1938) CT II, p. 57,c (S1C). This structure is used in S1C, S2C and Pap.Berl. All the other witnesses have unique phrases.
589 Although there is the possibility that this spell has no clear regional sentence structure patterns at all.
591 de Buck (1938) CT II, p. 67, note 1*.
3.38.1. Introduction

Spell 94 is relatively short spell, with a total of 20 phrases. The witnesses use only a selection of these phrases. In de Buck, there are a total of eleven witnesses, of which the supports S1C, S2C and B1C all provided two witnesses each. However, for the purposes of this work, B1C was treated as one entry only, as B1C was completely lost, and its inclusion in de Buck was more due to the witness being attested in spells 95-97. As de Buck states himself: ‘This MS is so fragmentary that the length of the lines can be determined only approximately’. Therefore, as the witness B1C,b would be nothing more than a complete reconstruction, it was considered impractical in regard to this study. The following table sorts the witnesses based on region (table 3.35):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S1C,a, S1C,b, S2C,a, S2C,b</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B1C, B1L, B3L</td>
</tr>
<tr>
<td>Meir</td>
<td>M3C, M28C, M31C</td>
</tr>
</tbody>
</table>

Table 3.35 Witnesses sorted by region for spell 94. See appendix 1 for a full list of details concerning every witness.

The highest number of witnesses come from Asyut, although this is deceptive, as they originate from only two supports belonging to the same owner. Deir el-Bersha and Meir both supplied three witnesses. Note that the material used in this section only reflects the material published in de Buck.

The following table shows the percentage of damage in the witnesses (figure 3.92):

593 In de Buck the actual number of phrases is 22, but four phrases were merged into two.
594 de Buck (1938) CTII, p. 67, note 2*.
595 Based on my method for reconstruction, it would be a copy of B1C,a, without any variation. Although a case could be made that B1C did have a second version at some point, it is possible as well that this spell never existed in its second form, so I considered discarding it preferable here.
Figure 3.92 Percentage of reconstruction and damage in the witnesses for spell 94. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.

As one can see in the figure above, S2C,b and M31C are both badly damaged, with nearly 80% of the tokens partially or fully reconstructed. S1C,b and S2C,a are both heavily damaged as well, with more than 50% partially or fully reconstructed. The other witnesses are relatively intact. 596

That S1C,a is undamaged, in regard to the other witnesses from Asyut in de Buck, seems interesting, but it needs to be noted here that S1C,a actually only has three phrases of the 20, and these are barely similar to the same phrases in the other witnesses, or even the same support. Although all witnesses are included in the final results, it has to be remarked that any result which includes S1C,b, S2C,a, S2C,b and M31C need to be approached with caution.

3.38.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.93):

596 Although I need to note that M28C is actually nearly completely lost now, and the witness in de Buck is based on earlier publications. See de Buck (1938) CT II, p. 67, note 3*.  

153
Figure 3.93 Rectangular phylogram display of the distance between the different witnesses of spell 94.

In this dendrogram, there is one large branch, on which most witnesses are placed, and two small ones, each containing one witness each, B1C and B3L. Note that it should not be considered important that B1L is on the main branch but close to B1C and B3L, as any reorientation of the dendrogram could place B1L at the other side of the dendrogram.

The placement of the three witnesses from Meir on the final section of the main branch is encouraging, as it suggests a common sentence structure pattern in the witnesses from Meir. Although this pattern would be related to the pattern used in Asyut, as these share the same main branch, it is distinct enough to warrant its own sub-branch. This is visible as well because M3C and M28C used the same phrases, and only have one phrase where they do not use an identical sentence structure. Their distinction from the other witnesses can for example be seen in II,68,b: *iri n wsir m ḥw iw=f-f* (who was made for Osiris from the efflux of his flesh). Although most of the other witnesses have the same structure, the distinction lies with ḥw (efflux), which is written as ḫw in the other witnesses. Even though both ḥw and ḫw should be considered part of the same lemma, it is remarkable that the loss of the ḫ only occurs in Meir. The placement of M3C, M28C and M31C falls within expectation, as based on Willems, they belong to the same group, Meir group B, and their decoration pattern is relatively similar.

Additionally, the placement of S1C,a-b and S2C,a-b is encouraging as well, as it suggests a sentence structure pattern in Asyut as well. However, as most of these witnesses are badly damaged, this could

---

597 Except for the witnesses with a unique phrase: B1L left out the connector m, S2C,a left out iw=f-f, S1C,a replaced *imy* with genitival adjective *n* and S1C,b added the suffix pronoun -*f* after ḫw.

be due more to the reconstructions that occurred. Additionally, as was discussed in chapter 3.36.2, the witnesses from S1C and S2C have the tendency to be different by design, so any placement in proximity of each other would tend outside expectation. The reconstructions could be dominantly responsible for similarity as opposed to the original content of the witnesses. Even so, in II,70,b S1C,b and S2C,a-b have a distinct structure from the other witnesses: sn|d.t n kf|t-s] (which is feared because of its uncovering), where the other witnesses have: sn|d.t ntr|w kf|t-s (which the gods fear, its uncovering) which replaces the n with ntr|w, while reading the sn|d.t as a relative sdm=f, instead of a participle.

Although a separate branch between the witnesses from Deir el-Bersha would have been preferred, their placement can be explained due to a relatively high number of phrases with a unique structure that occurs in those witnesses. Additionally, they share only seven of the 20 phrases between all three of them, which are generally shared with the witnesses that are from the other regions as well. Therefore, their separate placement can be explained.

3.38.3. Conclusions

For spell 94, it seems that the method used in this chapter is able to visualise regional variation in the sentence structure, as there is a clear distinction between the three regions that have this spell. However, in Deir el-Bersha, there seems to be a lot of freedom in the structure, as it does not show a real common ground. This is visible in Asyut and Meir, which occupy distinct sections of the main branch. However, the distinction of Asyut could be due more to the reconstructions, as these were heavily damaged.

3.39. Spell 95

This section will deal with spell 95. This spell should be considered a group together with spells 94 and 96, based on Bonanno, and the fact that these spells occur together on the supports as well. This spell is addressed to a guardian of the gates by the deceased, who states how he will go forth in the day.

3.39.1. Introduction

Spell 95 is a short spell, consisting of only seven phrases, of which only S2C,a and S2C,b have all seven phrases. As discussed above, the method used in this chapter is problematic with shorter spells, and the inclusion of this spell is only because it belongs to a group, so that this group of four spells can be studied as a unit as well, in chapter 3.41. In de Buck, this spell occurs in a total of eight witnesses, that

---

599 de Buck (1938) CT II, p. 70,b (S2C,a).
600 de Buck (1938) CT II, p. 70,b (B3l).
601 M28C has a unique phrase here, as it used n|tr instead of ntr|w, and added a n-f before ntr.
603 Or some sort of cakes, based on the X4 (…) classifier used in the witnesses from Deir el-Bersha.
originate from a total of three regions. Two supports provided two witnesses for this spell, namely B1C\textsuperscript{604} and S2C. The following table shows the witnesses sorted by region (table 3.36):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S2C,a, S2C,b</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B1C,a, B1C,b, B1L, B3L</td>
</tr>
<tr>
<td>Meir</td>
<td>M3C, M28C</td>
</tr>
</tbody>
</table>

Table 3.36 Witnesses sorted by region for spell 95. See appendix 1 for a full list of details concerning every witness.

For this spell, the majority of the witnesses come from Deir el-Bersha, which provided four witnesses. Asyut and Meir both supplied two witnesses. Note that the witnesses used for this section only reflect the material published in de Buck.

The following figure shows the percentage of damage which occurred in the witnesses (figure 3.94):

![Figure 3.94 Percentage of reconstruction and damage in the witnesses for spell 95. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.]

B1C,b is badly damaged, with more than 90% of its tokens reconstructed.\textsuperscript{605} S2C,a-b were both badly damaged as well, S2C,b was nearly 90% fully or partially reconstructed, and S2C,a more than 50%. M28C was more than 20% partially or fully reconstructed, while the other witnesses were relatively intact. Although all these witnesses were included in the results, any results including S2C,a-b or B1C,b should be considered dubious at best.

### 3.39.2. Results and discussion

After the method described in 3.2.2 was applied, the following dendrogram was produced (figure 3.95):

\textsuperscript{604} In contrary to spell 94, there are actually some signs left in this spell for B1C,b, so here the witness is actually included.

\textsuperscript{605} In total, there were just 3 of the 33 tokens visible.

156
In spell 95, the dendrogram has two main branches, and a lesser one for B3L. The separate branch for S2C,a and S2C,b is encouraging, as it suggests that S2C has a separate sentence structure pattern from the other witnesses. This is supported by the fact that S2C,a-b use phrase II,73,c, which only occurs in these witnesses. Additionally, they only share phrases with each other, and not with the other witnesses, which supports their placement. For example, II,73,b, where S2C,a-b have *pr.n-i hrw* (I have gone forth in the day)\(^{606}\), where the witnesses from Meir add the demonstrative *pn* after *hrw: pr.n-i m hrw pn* (I have gone forth in this day),\(^{607}\) while the witnesses from Deir el-Bersha use a prospective *sdm-f* instead of a *sdm.n-f*: *pr.y-i m hrw* (I will go forth in the day).\(^{608}\) However, as both S2C,a and S2C,b are badly damaged, it is not unlikely that reconstructions are more the cause of the placement than the actual text that was used here.

The placement of M3C and M28C is within expectation as well, as they share three phrases, of which the structure only occurs in Meir. What cannot be explained however, is the placement of B1C,a-b and B1L on the same branch, as they only share one phrase, II,73,a with M3C. Thus, one would expect that they should not share the same branch as M3C and M28C, or if they do, that M28C would be in the place of M3C and vice-versa. Moreover, as B3L shares three phrases, II,72,d, II,73,b and II,74,a with B1C and two phrases, II,72,d and II,73,b with B1L, it would be placed a lot closer to the other witnesses from Deir el-Bersha than to Meir. However, the placement of B3L is not surprising, as three of the six phrases have

\(^{606}\) de Buck (1938) *CT II*, p. 73,b (S2C,a). Note that S2C,b is a complete reconstruction.

\(^{607}\) de Buck (1938) *CT II*, p. 73,b (M3C).

\(^{608}\) de Buck (1938) *CT II*, p. 73,b (B1C,a). Note that the *y* ending was only visible in B1C,a and B1L.
an unique structure.\textsuperscript{609} The placement of B1C,b was obvious however, as the reconstruction was based on B1C,a.

### 3.39.3. Conclusions

As seen in spell 2, 3, 5, 8, 10, 12, 15, 19 and 31, a low number of phrases seem to influence the results to the extent that the method used in this chapter cannot be trusted. Even though some grouping based on region is visualised in the dendrogram, when compared to the actual phrases used, a clearer division between the three regions would have been expected. Asyut, Deir el-Bersha and Meir all have a distinct pattern, albeit with a lot of unique sentence structure pattern variations. Therefore, the placement seems random, even if the results partially resemble the results that would have been expected.

### 3.40. Spell 96

The following section will discuss spell 96.\textsuperscript{610} Together with spells 94 and 95, it should be considered part of a group of spells. This spell can be separated into three parts. In the first the deceased is stated to go forth, as he is the soul of Osiris, with whom he copulates. The second section concerns the deceased travelling as Re, as the deceased made the soul of Re and vice-versa: \textit{in r' iri bz-i spi iri bz n r’} (It is Re who made my soul, \textit{spi} made the soul of Re).\textsuperscript{611} The final section is quite similar to spell 89, as the deceased addresses the guardian of the battleground, stating his power over his enemies, and his willingness to appear in the tribunal, to be justified.

#### 3.40.1. Introduction

This spell is the longest spell in the spell group of spells 94-96, with a total of 54 phrases.\textsuperscript{612} The witnesses use a selection of these phrases to form their variant of spell 96. This spell occurs in de Buck in a total of ten witnesses, which come from three different regions. The supports S2C and B1C both provided two witnesses for this spell. The following table shows the witnesses sorted by region (table 3.37):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S2C,a, S2C,b</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B1C,a, B1C,b, B1L, B3L</td>
</tr>
<tr>
<td>Meir</td>
<td>M3C, M28C, M30C, M37C</td>
</tr>
</tbody>
</table>

Table 3.37 Witnesses sorted by region for spell 96. See appendix 1 for a full list of details concerning every witness.

\textsuperscript{609} II,73,a, II,74,b and II,74,c.

\textsuperscript{611} de Buck (1938) CT II, p. 83,c (B1C,a).

\textsuperscript{612} The actual number is higher, as some phrases were merged together.
Both Deir el-Bersha and Meir provided four of the ten witnesses, while Asyut supplied two witnesses. Note that the witnesses used in this section only represent the material published in de Buck.

Additionally, it needs to be noted that M30C and M37C only have part of the spell, as they are only fragments. S2C,a and S2C,b end their variant of the spell before the third section of the spell starts, as they continue with something completely different. B1C,a ends the spell early, as the lid ends before the spell was finished.

The following figure shows the percentage of damage which occurred in the witnesses in this spell (figure 3.96):

![Figure 3.96 Percentage of reconstruction and damage in the witnesses for spell 96. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

For this spell, half of the witnesses are badly damaged. S2C,b, B1C,b and M30C are more than 80% partially or fully reconstructed. M37C is nearly 80% partially or fully reconstructed. S2C,a is more than 50% partially or fully reconstructed. The other witnesses are relatively intact, with only M28C having over 20% partial or full reconstructions. Although all witnesses are included, any results including the badly damaged witnesses need to be approached with caution.

3.40.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.97):

---

613 de Buck (1938) CT II, p. 83, note 5*.
In this dendrogram, there are two main branches, and a separate branch for B3L. On a quick glance, there does not seem to be a regional pattern here. S2C,a and S2C,b are on the final section of left branch, and placed together. As they share the same shorter version of this spell, the placement falls within expectations. Moreover, this can be seen in II,79,a, where they have: *i.n sn nfr.w [r] wsir* (they have said, the gods, to Osiris),\(^614\) while the witnesses from Meir replace the *sdm nfr* with a participle followed by the connector *in: i in sn nfr.w [r] wsir* (which is said by them, the gods, to Osiris)\(^615\) and the witnesses from Deir el-Bersha added *nb.w* after *nfr.w*, and left out the *r wsir: i.n sn nfr.w nb.w* (they have said, all the gods).\(^616\) However, due to the extensive damage in S2C,a-b, it cannot be said if this is due to the reconstructions or not. Additionally, M3C was placed on this branch, which seems unusual as M3C only shares six phrases with S2C,a-b, and more phrases with the other witnesses from Meir.

The placement of B1C,a-b and B1L seems encouraging, until B3L, which is on another branch is considered. Although B3L has a high number of unique structures in its phrases, this is the case for B1L as well, and there seems to be a limited advantage to B1L over B3L with B1C,a-b. Additionally, as B1C,a-b and B1L are placed on the same branch as M30C, M37C and M28C, some resemblance should be expected. However, this is limited, as the witnesses from Meir are usually different in sentence structure. For example in II,86,c, where the witnesses from Deir el-Bersha have: *shmt imf* (while I have

---

\(^614\) de Buck (1938) *CT II*, p. 79,a (S2C,a).
\(^615\) de Buck (1938) *CT II*, p. 79,a (M3C).
\(^616\) de Buck (1938) *CT II*, p. 79,a (B1L).
...power over him),\textsuperscript{617} while the witnesses from Meir have: $shm=i$ $hft.yw=i$ (while I have power over my enemies),\textsuperscript{618} where the $im=f$ was replaced by $hft.yw=i$.

Based on the codes given to the phrases, a reason for the relatively random placement of the witnesses can be given. Nearly every witness has a high number of unique phrase structures, when compared to the other witnesses. These unique variations likely give the program too few phrases to base placements on. However, another possible explanation is that there is no regional sentence structure pattern for this spell.

3.40.3. Conclusions

Based on the dendrogram created for this spell, there does not seem to be a clear regional pattern in the sentence structure. Although a pattern for Asyut and Deir el-Bersha is suggested, the placement of the other witnesses does not lead to a clear picture. Thus, for this spell, the method described in this chapter seems less useful if the preferred result is to provide a visual representation of regional variation in the sentence structure.

3.41. Spell group 94-96

As spell 94-96 are supposed to be considered a group, they should be studied in this manner as well. This group of spells will be treated here as was done for spells 1-27 in chapter 3.29, and spells 30-32 in chapter 3.33. The following table will show the spells used per witness of this group (table 3.38):

<table>
<thead>

Table 3.38 Occurrence of spells in for every witness in spell 94-96

Note that the order in which the spells occur is the same as seen in this table, as the spells follow each other sequentially in the witnesses. The witnesses that did not have one or more of the spells were treated as described in chapter 3.29.

3.41.1. Results and discussion

Using the method discussed in 3.2.2, combined with the adaptations discussed in chapter 3.29, the following dendrogram was created (figure 3.98):

\textsuperscript{617} de Buck (1938) \textit{CT II}, p. 86,c (B3L).
\textsuperscript{618} de Buck (1938) \textit{CT II}, p. 86,c (M3C).
In this dendrogram, there are three branches, one large branch in the centre, which contains three sub-branches, a smaller branch on the left, which contains B1C,a-b, and one final branch for S1C,a. The placement of B1C,a-b falls within expectations, as B1C,b was badly damaged, and reconstructed based on B1C,a, and therefore nearly identical. Therefore, its placement is predetermined. Second, the separation of S1C,a falls within expectations as well, as it only has a few phrases of spell 94, which are structurally different from the other witnesses.

In the central branch, there are two sections of witnesses from Meir, which suggest some similarity in the sentence structure in Meir. Note that the separation between the two groups of Meir witnesses follows in general the same separation pattern as seen in figure 3.97 (chapter 3.40.2), where M3C existed on a separate branch from M28C and M37C as well. However, as most of the witnesses from Meir were badly damaged, any placement could have been due to the reconstructions that were performed.

The right sub-branch of the central branch contains S1C,b, S2C,a and S2C,b, suggesting a distinct sentence structure pattern in Asyut as well. However, the idea that a distinction exists in Asyut and Meir is contradicted by the placement of B1L and B3L. These witnesses from Deir el-Bersha are both connected to either Asyut or Meir, which weakens the suggestion that there is a distinct sentence structure pattern in these regions. Moreover, based on the results seen in spell 95 and 96, one would expect more proximity between B1C,a-b and B1L, instead of its connection to the witnesses from Meir. In regard to the results of spell 94 to 96 separately, the placement of B3L is unusual as well, as in all these spells it is placed on its own branch, without any proximity to any witness from Asyut.

3.41.2. Conclusions

Due to the confusing results created using this spell group, it seems that the method used in this chapter does not work for this spell group, even if some results fall within expectation. Alternatively, it could be
argued that the method does not work because there is no clear regional variation in the sentence structure for these spells.

However, there seems to be a suggestion in the dendrogram of a distinct sentence structure pattern in Asyut and Meir respectively, even if their borders are indistinct.

3.42. Spell 97

This section will discuss spell 97. This spell should be considered part of a group of spells which run from spell 97-104. In this spell, the deceased identifies himself with Thot, after which he appeals to the eye of Horus to be taken with it. Finally, the deceased appeals to Atum.

3.42.1. Introduction

This spell is another short spell, consisting only out of eight phrases, of which the witnesses use a selection. In de Buck, this spell is attested in a total of nine witnesses. These witnesses come from a total of four different regions. The following table shows the witnesses sorted by region (table 3.39):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S10C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B1Bo, B4C, B1L, B3L</td>
</tr>
<tr>
<td>Meir</td>
<td>M3C, M28C, M37C</td>
</tr>
<tr>
<td>Theban area</td>
<td>T1L</td>
</tr>
</tbody>
</table>

Table 3.39 Witnesses sorted by region for spell 97. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses for this spell come from Deir el-Bersha, which provided four witnesses. Meir supplied three witnesses, and Asyut and the Theban area both have one witnesses. The witnesses used in this section only reflect the material published in de Buck.

The following figure shows the percentage of damage which occurred in the witnesses (figure 3.99):

---

621 In de Buck this is actually a total of nine phrases, but II,92,b-c were merged together to form a complete clause.
622 This spell was originally added based on the grouping of de Buck of spells 94-97, to be studied as a group, as by the time I encoded this spell, I was already aware of the issues that usually occur regarding the method used in this chapter concerning short spells.
In this spell, M37C and T1L are both badly damaged, as M37C has nearly 70% of its tokens partially or fully reconstructed. T1L is for more than 50% partially or fully reconstructed. The other witnesses are relatively intact, with only B3L and B4C having more than 20% partial or full reconstructions. Although all witnesses of de Buck are included in this section, any results based on these witnesses need to be approached with caution.

3.42.2. Results and discussion

After applying the method described in 3.2.2, the following dendrogram was made (figure 3.100):
In this dendrogram, there is one main branch, which divides into two sub-branches, after M3C branched off in the first stage. Beside this main branch there are two small branches, one for B1L and one for B3L. The right sub-branch of the main branch, which contains M28C and M37C, is encouraging, as it suggests a sentence structure pattern in Meir. This can be seen in II,92,d, where M28C, and M37C have: šd-s wî (so that it will take me), where in B3L and B1L the pronouns are changed to -i and sw: šd-i sw (so that I will take him). As there is a separate sub-branch for M3C, this pattern from Meir is not used by all the witnesses from Meir, which is clearly visible in M3C, which only used four of the eight phrases, while M28C and M37C use six of the eight. Moreover, M3C only shares two phrases with M28C, and three with M37C, so its separate placement is valid. As stated above, M37C was badly damaged, so its similarity with M28C might be more due to the reconstructions, than the original text used.

The left sub-branch seems more disordered. However, these four witnesses share a specific feature, as they only have four phrases of the eight, which supports their placement. Moreover, this branch is actually another branch of dissimilarity then similarity, as for every witness, three of the four phrases have a unique structure used only in that witness. The pair B1Bo and S10C share the single phrase II,91,c between them: n dlhwty ikr im=s (because Thot, the excellent one, is in it), where B4C and T1L have dlhwty ikr (Thot, the excellent one), leaving out the connector n and the im=s. In comparison, the other witnesses have: ink dlhwty ikr (I am Toth, the excellent one), which has ink instead of the connector n, and left out the im=s. This could explain the relative proximity of B4C and T1C, as well as that of S10C and B1Bo.

Finally, B1L and B3L are placed on their own branches, even though based on the phrases used, they should have been on one branch together, as they share five out of the seven phrases they use, and they both use phrase II,92,e, which only occurred in these two witnesses. Note that although they appear close in figure 3.100, this is meaningless, as a reorientation in the visualisation could place them on either side of the dendrogram.

3.42.3. Conclusions

In this spell there is a low number of phrases, so that the method described in this chapter seems to work, in a deceptive fashion. Most of the separation has seemingly been based on the specific phrases used, and not on underlying similarity in the sentence structure, with the exception of M28C and M37C. Moreover, there is a complete sub-branch dedicated to dissimilarity, as the only clear uniting factor between these witnesses is the number and position of the phrases used, not the similar sentence structure used. Additionally, B1L and B3L would have been expected to be placed on the same branch,

---

623 de Buck (1938) CT II, p. 92,d (B3L).
624 de Buck (1938) CT II, p. 92,d (M28C).
625 B4C uses five phrases, as it is the only witness with a title. The full sentence structure file is available in appendix 3
626 de Buck (1938) CT II, p. 91,c (B1Bo).
627 de Buck (1938) CT II, p. 91,c (T1L).
628 de Buck (1938) CT II, p. 91,c (B1L).
which did not occur. Although the dendrogram used here suggests some level of proximity, this is only based on the visualisation pattern chosen.

3.43. Spell 151

The following section will discuss spell 151.\(^{629}\) This spell concerns the movement of the deceased in the netherworld, while the deceased sails in the bark of Re.

3.43.1. Introduction

This spell is relatively short, consisting of a total of seventeen phrases.\(^ {630}\) However, all the witnesses only use a selection of these seventeen phrases. In de Buck, this spell occurs in a total of eight witnesses, which originate from four different regions. The following table shows the witnesses separated by region (table 3.40):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S14C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B1Bo, B2Bo, B3Bo, B1C</td>
</tr>
<tr>
<td>el-Lisht</td>
<td>L1Li</td>
</tr>
<tr>
<td>Saqqara</td>
<td>Sq6C, Sq3Sq</td>
</tr>
</tbody>
</table>

Table 3.40 Witnesses sorted by region for spell 151. See appendix 1 for a full list of details concerning every witness.

Most of the witnesses come from Deir el-Bersha, which supplied four witnesses. Saqqara provided a total of two witnesses, while Asyut and el-Lisht have one witness each. Note that the witnesses used in this section only reflect the material published in the Buck.

The following figure shows the percentage of damage which occurred in the witnesses (figure 3.101):

\(^{630}\) In de Buck, there are actually 19 phrases, as some phrases were merged together in the database.
As one can see above, the witnesses in this spell are relatively intact, with only Sq3Sq reaching the 20% partial or full reconstruction mark, with most tokens only being damaged, not fully lost. Therefore, the results are considered to be a representation of the original, and not unduly influenced by reconstructions.

3.43.2. Results and discussion

Before proceeding to the dendrogram, it needs to be stated that phrases used in this spell are extremely varied, with the majority of the phrases used by the witnesses showing some sort of unique variation in the sentence structure, which does not occur in the other witnesses.

Using the method described in 3.2.2, the following dendrogram was created (figure 3.102):

---

631 The full sentence structure file is available in appendix 3.39.
In this dendrogram, there is one major branch, which contains the majority of the witnesses, and two small separate branches for Sq3Sq and S14C respectively.

The placement of B1Bo, B2Bo, B3Bo and B1C in the final section seems encouraging, despite some distance between them, as it implies a similar structure. However, this is deceptive, as these witnesses are highly dissimilar. The placement of B1Bo in proximity to B3Bo is based on two phrases, II,257,a and II,257,b, in which they use the same structure. B2Bo branches off one level higher, but has only one phrase that can be linked to other witnesses, namely II,255-256,d-a, which it shares with B1C and Sq6C and Sq3Sq. Thus, it shares no phrases with B1Bo and B3Bo. This might seem unusual, as B1Bo and B2Bo belong to the same owner. However, there is a clear form of variation which occurs in this spell between them. B1Bo uses the third person singular when referring to the owner in the text, while B2Bo uses the first person singular. Therefore, it seems that the variation between B1Bo and B2Bo was intentional.

B1C and Sq6C share a total of three phrases, which can explain their connection.

However, Sq6C and Sq3Sq are on different branches, which based on the low level of similarity in the Deir el-Bersha section seems unusual. These witnesses share a total of four phrases. For example, II,256,c: \( \text{wn} \ hz.t \ w' \) (the tomb of the sole one is opened),\(^{632}\) where L1Li and S14C add a genitival adjective between \( hz.t \) and \( w' \): \( \text{wn} \ hz.t \ n.(t) \ w' \) (the tomb of the sole one is opened).\(^{633}\) The other witnesses have unique phrases, as B2Bo only has \( \text{wn} \) (who are opened), B1Bo replaced \( w' \) with \( rw' \): \( \text{wn} \ hz.t \ rw \) (the tomb of the lion is opened) and B1C added the genitival adjective \( n \) and replaced \( w' \) with \( Sw' \): \( \text{wn} \ hz.t \ n.(t) \ Sw \) (the tomb of Shu is opened).\(^{634}\) Moreover, as Sq6C does not use the final four phrases, it could be argued that Sq6C should be on the separate branch, not Sq3Sq.

Finally, it could be argued that S14C and L1Li should have been placed on the same branch, as they share a total of four phrases between them as well, which is not reflected in the dendrogram, since they exist on different branches.

3.43.3. Conclusions

For this spell, it cannot be said with certainty if the method used in this chapter works correctly. The results produced are deceptive, as they imply a distant connection between the witnesses from Deir el-Bersha, which cannot be supported by the actual phrases used. Moreover, the low number of phrases that connect the witnesses from Deir el-Bersha should have done the same to the witnesses from Saqqara, which is not the case.

Based on this spell, it is clear that spells with a high level of unique sentence structure variation are of limited use when approached with the method discussed in this chapter. Moreover, due to the deceptive nature of the placement of the witnesses from Deir el-Bersha, the method seems incapable of visualizing any regional pattern in the sentence structure used. However, it can be argued that there is

\(^{632}\) de Buck (1938) CT II, p. 256,c (Sq6C).

\(^{633}\) de Buck (1938) CT II, p. 256,c (S14C). Note that the genitival adjective could be a connector as well: ‘the tomb is opened for the sole one.’

\(^{634}\) Could be read as: ‘the tomb is opened for Shu.’
no regional pattern which occurs in this spell, and that this spell allowed for a lot of liberty in its actual form.  

3.44. Spell 154

Spell 154 is the subject of the following section. This spell should be considered part of a group of spells, which run from spell 154 to spell 160, which is called the book of the moon. This spell is additionally an example of the continuous nature of the mortuary literature, as this spell survives into the corpus of the Book of the Dead, as chapter 115. However, the order in which the spells of this group occur as part of the Coffin Texts are not retained.

Spell 154 concerns the knowledge of the deceased concerning the origins of the month, and why months are not uniform in length. This explanation is done through a narrative, structured as: A occurred, so B came to be.

3.44.1. Introduction

This spell is one of the longer spells used in this work, as it consists of a total of 44 phrases. The witnesses use a selection of these phrases to create their version of this spell. In de Buck, this spell is attested in a total of 21 witnesses, although there are three supports, S1C, S9C and B4L, who provide two witnesses each. The 21 witnesses come from three different regions. The following table shows the witnesses separated by region (table 3.41):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S1C,a, S1C,b, S2C, S3C, S9C,a, S9C,b S2P, S3P, S1Tü</td>
</tr>
<tr>
<td>Meir</td>
<td>M38C</td>
</tr>
</tbody>
</table>

Table 3.41 Witnesses sorted by region for spell 154. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses for this spell come from Deir el-Bersha, which provided eleven witnesses. Asyut supplied nine witnesses and Meir has one witness. Note that the material used in this section only reflects the material used in de Buck.

---

635 Although it could be argued as well that the spell was poorly understood by the Ancient Egyptians as well, which allowed for a high level of variation due to errors in transmission.

The following figure shows the percentage of damage which occurred in the witnesses (figure 3.103):

![Percentage of reconstruction and damage in the witnesses for spell 154. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

S3C is badly damaged, as it is more than 90% partially or fully reconstructed. B1Y is mostly gone as well, as more than 70% is partially or fully reconstructed. S3P is more than 50% partially or fully reconstructed, while S9C,a-b and S2C are somewhere between 30% and 40% reconstructed. The other witnesses are relatively intact. All these witnesses are included in the results, although any results including the heavily damaged witnesses need to be approached with some caution.

### 3.44.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was produced (figure 3.104):
In this dendrogram, there is one large branch, and two small branches, one containing S3C and S3P, the other containing S2P. When the vertical distance is taken into regard, there is the suggestion that there is some pattern variation which occurs in Asyut, although not everywhere, as S1C,a-b and S9C,a-b are placed with the other witnesses for this spell, which occurs on the lower section of the dendrogram. For example this can be seen in II,280,d, where the witnesses from Asyut, except for S1C,a-b and S9C,a-b have: \( r^p \text{ pw } hnp. n \text{ sw } imy \text{ ins=f} \) (it is Re, the one who is in his red linen has snatched him),\(^{642}\) where the other witnesses have: \( r^p \text{ pw } hpi. n \text{ sw } imy \text{ ins=f} \) (it is Re, the one who is in his red linen has met him),\(^{643}\) where \( hnp \) (to snatch) is replaced by \( hpi \) (to meet).

The final section of the main branch (figure 3.105) is interesting. It contains witnesses from all three regions, which at first glance seems to exclude the idea of a regional pattern in the sentence structure. However, the placement of these witnesses together is not unremarkable, as these four witnesses have in common that they only have a small section of the available text. S9C,a uses fourteen of the 44 phrases, B9C,b uses only four, B4C only uses five phrases and M38C uses only five phrases as well. So, it seems that this branch represents the short versions of this spell.\(^{644}\)

The proximity between S1C,a and S1C,b falls within expectation as well, including the distance between these witnesses and S2C, which belongs to the same owner. As seen in spell 75 as well, there usually is a difference between witnesses from S1C and S2C, which is assumed to be intentional. Additionally, the sentence structure pattern used in S1C,a-b is quite different from the

\(^{642}\) de Buck (1938) CT II, p. 280,d (S2P).

\(^{643}\) de Buck (1938) CT II, p. 280,d (B2Bo).

\(^{644}\) However, I need to point out here that these witnesses do not use the same sections of phrases as each other. The full sentence structure file is available in appendix 3.40.
other witnesses from Asyut, which is clearly visible in the dendrogram. In spell 30 this was obvious as well, which seems to suggest that S1C, and to some extent S2C, use a structure in the phrases that is distinct from other witness from Asyut.

Due to the inclusion of the branch containing S1C,a-b, and the final section of the main branch, it cannot be stated clearly that there is a pattern in the sentence structure in Deir el-Bersha, even if there seems to be some support for this from the general placement of all the witnesses from Deir el-Bersha in relative proximity. If a pattern exists that can be assigned to Deir el-Bersha however, it seems to be a general pattern at best. This general pattern can be seen in II,284,b, where the witnesses from Deir el-Bersha have: \( hpr \ fsk \ pw \ n \ iwnw \) (that which came to be, it is the shorn one),\(^{645}\) while Asyut has: \( hpr \ fsk \ pw \) (that which came to be, it is the shorn one),\(^{646}\) that does not include the \( n \ iwnw \). As B2Bo shares a branch with B9C, there does not seem to be any effect on the pattern based on the moment of coffin creation, as was seen in spell 75. Moreover, the placement of B2Bo with B9C seems a bit unusual, as B2Bo has six additional phrases at the start of the spell, which do not occur in B9C.

### 3.44.3. Conclusions

For spell 154, the method applied in this chapter seems to have limited results in regard to visualizing regional variation. However, some variation between Asyut and Deir el-Bersha is implied in the dendrogram, due to the vertical distance between the top and the lower section of the dendrogram.

Additionally, as there is to some extent a separate branch for the shorter witnesses of this spell, it seems the method used in this chapter is capable of separating these witnesses, although any grouping seems to be purely based on length of the spell.

### 3.45. Spell 162

The following section will discuss spell 162.\(^{647}\) This spell should be considered a separate spell,\(^{648}\) although it started its existence included with spell 164. Over time spell 162 became a separate entity,\(^{649}\) as spell 164 was no longer used for multiple supports, while spell 162 was retained by these supports.

In essence, spell 162 consists of two parts, which Jürgens\(^{650}\) calls 162a and 162b. The separation is made clear in B1Bo, which separated the two sections by including an additional title: \( \text{'nh m f\'w m hpr.t-ngr hpr} \)

\(^{645}\)de Buck (1938) CT II, p. 284,b (B4L,b). Note that B2Bo and B9C do not have a phrase here.

\(^{646}\)de Buck (1938) CT II, p. 284,b (S1Tü).

173

m ḫḥ ‘pr (Living on air in the necropolis, coming to be as the equipped spirit). ⁶⁵¹ 162a is known as the ‘La chanson des quatre vents’, ⁶⁵² or the song of the four winds. This ‘song’ is made up from four stanzas, which each describe one of the four winds. It is considered to be a composition that did not originate from a funerary context. ⁶⁵³

In 162b, the second section of this spell, the deceased greets the four winds, proclaiming his knowledge about them and their existence. Finally, the deceased invites the winds into a bark, asking them to navigate while the deceased creates his own bark to sail the stairway of fire, ⁶⁵⁴ in the same manner as Re did, while remarking that the deceased will possess provisions. ⁶⁵⁵

3.45.1. Introduction

Spell 162 is another relatively long spell, as it has a total of 48 phrases. ⁶⁵⁶ However, every witness only uses a selection of these phrases. It needs to be noted that A1C and B3Bo only have a small section of the spell, as both only have four phrases of the 48. ⁶⁵⁷ In de Buck, this spell occurs in a total of fourteen witnesses, which originate from a total of seven different regions, and one witness, Y1C, coming from an uncertain origin. ⁶⁵⁸ The following table shows the different witnesses sorted by region (table 3.42):

<table>
<thead>
<tr>
<th>Region:</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aswan</td>
<td>A1C</td>
</tr>
<tr>
<td>Asyut</td>
<td>S2C</td>
</tr>
<tr>
<td>Beni Hasan</td>
<td>BH2C, BH1Ox</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B1Bo, B2Bo, B3Bo, B4Bo, B6C</td>
</tr>
<tr>
<td>Gebelein</td>
<td>G1T</td>
</tr>
<tr>
<td>Meir</td>
<td>M22C, M23C</td>
</tr>
<tr>
<td>Theban area</td>
<td>T3C</td>
</tr>
<tr>
<td>Unknown</td>
<td>Y1C</td>
</tr>
</tbody>
</table>

Table 3.42 Witnesses sorted by region for spell 162. See appendix 1 for a full list of details concerning every witness.

⁶⁵¹ de Buck (1938) CT II, p. 398,e-f (B1Bo).
⁶⁵² Drioton (1942).
⁶⁵⁶ In de Buck the actual number of phrases is higher, as some of the phrases have been merged. The full sentence structure file is available in appendix 3
⁶⁵⁷ A1C: II,389,b-390,c; B3Bo: II,390,d-391,e.
⁶⁵⁸ Following the description in de Buck (1935) CT I, p. xviii. It needs to be noted however, that it is suggested that Y1C originates from Asyut, see Jürgens (1990), p. 55-56.
The majority of the witnesses come from Deir el-Bersha, which provided 5 witnesses. Beni Hasan and Meir both supplied two witnesses, and the other regions all have one witness. Note that the witnesses used here only reflect the material published in de Buck.\textsuperscript{659}

The following table shows the percentage of damage which occurred for the witnesses (figure 3.106):

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure3.106.png}
\caption{Figure 3.106 Percentage of reconstruction and damage in the witnesses for spell 162. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.}
\end{figure}

For spell 162, M23C is badly damaged, as it is nearly 90% fully or partially reconstructed. This is not surprising, as there is only a fragment of the coffin left. On this fragment only some of the words of this spell are left.\textsuperscript{660} S2C is heavily damaged as well, with nearly 50% of the tokens being partially or fully reconstructed. The other witnesses are relatively intact, although M22C is still more than 20% partially or fully reconstructed. All the witnesses from de Buck are included in the results of this section, although it needs to be remarked that any result which includes M23C or S2C need to be approached with caution.

3.45.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was created (figure 3.107):

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure3.107.png}
\caption{Figure 3.107 Dendrogram showing the relationship between the witnesses for spell 162.}
\end{figure}

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure3.108.png}
\caption{Figure 3.108 Schematic representation of the relationship between the witnesses for spell 162.}
\end{figure}

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure3.109.png}
\caption{Figure 3.109 Comparison of the damage levels in the witnesses for spell 162. Grey shows no damage, blue shows partial damage and red shows full damage.}
\end{figure}

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure3.110.png}
\caption{Figure 3.110 Distribution of the witnesses for spell 162. Grey shows no witnesses, blue shows one witness and red shows two witnesses.}
\end{figure}

\textsuperscript{659} Jürgens (1995), p. 95, mentions an additional support with this spell from the Theban area, T1Bal.
\textsuperscript{660} Note that I only reconstructed the sections of the spell based on de Buck, although it can be assumed that the entire spell used to be intact previously.
In his dendrogram, there is one large branch in the centre, which contains most of the witnesses. Beside this branch there is a branch for Y1C and G1T, and one for A1C. Only in the most superficial form does this dendrogram resemble the stemma of Jürgens, and even then, there are many exceptions. For example, the large central branch can generally be compared with type ɣ, but as T3C is on this branch, and not with G1T or A1C, which would be part of type β, it does not compare. However, this can be explained by the fact that G1T and T3C only share nine phrases with each other, while Y1C and G1T share eleven phrases, so that G1T should be closer to Y1C than T3C.

In the stemma of Jürgens, the regions are generally neatly divided, which is clearly not the case in the dendrogram produced here. The only regional grouping that does take place here is B6C, B2Bo, B3Bo and B4Bo, which seem encouraging, as these supports are dated to the same period, and use the same technique of inscription. However, the placement of B3Bo cannot be supported at all. Not only does this witness only have four of the 48 phrases, these phrases are all structurally unique, and not shared with the other witnesses. Additionally, as B1Bo should belong to the same group, but is on a separate sub-branch, there are no signs of a connection. On the other hand, B2Bo, B4Bo and B6C form the same division as seen in the stemma of Jürgens, where B6C resembles type λ₁, and B2Bo and B4Bo type λ₂. However, the connection between B2Bo, B4Bo and B6C can be seen in II,396,c, where they have: \( \text{frw. w mhw. t rsw inn. ti isb. t} \) (the winds: the north wind, the south wind, the west wind, the east wind), while B1Bo has the unique phrase: \( \text{rs w mhy. t rsw inn. ti isb. t} \) (the south wind, the north wind, the south wind, the west wind, the east wind), which is similar, although it leaves out the \( \text{frw. w} \) at the start of the phrase, and it has the winds in a different order. S2C has a similar phrase to B2Bo, B4Bo and B6C as well: \( [\text{fr}]w. w rsw mhw. t [inn. ti] isb. t \) (the winds: the south wind, the north wind, the west wind, the east wind), where the winds are in a different order. Y1C is another witness with a unique structure, as it has the connector \( m \) in front of very wind, and uses the singular \( \text{frw} \), rather than the plural: \( \text{fr w m rsw m} \)

---

\( ^{662} \) As B1Bo has a high number of unique phrases.

\( ^{663} \) de Buck (1938) CT II, p. 396,c (B6C).
The wind is as the south wind, as the north wind, the east wind, as the west wind. BH1Ox, G1T and M22C use a different structure: \( \text{tsw} \ \text{pw} \ \text{n} \ \text{nh} \ \text{imn.ti} \) (the west wind is the breath of life),\(^{664}\) while BH2C and T3C have two unique versions of this structure, as they both leave out the \( \text{pw} \) and T3C changed the \( \text{imn.ti} \) (the west wind) into \( \text{imn.t} \) (the west).

In general, every witness has a high number of phrases that are structurally unique, as well as a limited number of sites to base the placement on, which most likely complicated the placement. This is quite clearly visible in T3C. This witness has sixteen phrases that are shared with other witnesses, and seventeen that are structurally unique within this witness.

It is not unlikely that the high number of unique variations in the sentence structure could be due to the binary method used in this chapter to specify variation. A more gradual approach could provide more stable results here, as it would reduce the number of variant phrases that are unique to only one witness.

### 3.45.3. Conclusions

For spell 162, the method used in this chapter does not seem to indicate any pattern in the sentence structure that can be considered regional. Moreover, some placements of witnesses in the dendrogram, like B3Bo cannot be supported based on the actual phrases used. Therefore, the visualisation of this dendrogram is dubious. However, as seen in T3C, there is a high number of unique variations in the sentence structure, which could influence the results, as it would create a low number of positions where the different witnesses can be connected, which would destabilise the results.

### 3.46. Spell 165

The following section deals with spell 165.\(^{665}\) This spell is most likely part of a group of spells that runs from spell 165 to spell 167, as nearly all the supports in de Buck write these spells together as a group, and they all concern the consumption of food. This is made clear in the title of spell 165: \( \text{r} \ \text{wnm} \ \text{t} \ \text{hr(y)} \ \text{wdh.w} \ \text{n} \ \text{r} \ ^{\text{rdl.t}} \ \text{sw.wt} \ \text{m} \ \text{iwnw} \) (A spell of eating the bread which is upon the offering table of Re, and placing offerings in Heliopolis).\(^{666}\)

Spell 165 consists of two separate statements made by the deceased, one concerning the meal, and one concerning the offerings. Each of these two statements has a similar structure, where the deceased calls upon an entity which is related to the process, followed by an explanation of his suitability to partake in the offerings.

\(^{664}\) de Buck (1938) CT II, p. 396,c (M22C).

\(^{666}\) de Buck (1947) CT III, p. 5,a-b (B3C).
3.46.1. Introduction

This spell is relatively short, with a total of 20 phrases. Of these phrases, the witnesses use a selection, with the exception of M22C, which has every phrase. In de Buck, there are a total of fifteen witnesses for this spell, although two witnesses are provided by the same support, B2L. It needs to be noted that the witness B2L,b only has one phrase,⁶⁶⁷ which is the first phrase after the title. The fifteen witnesses originate from four different regions, as shown in the following table (table 3.43):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S1C, S2C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B1Be, B2Bo, B3Bo, B4Bo, B1C, B3C, B5C, B17C, B2L,a, B2L,b</td>
</tr>
<tr>
<td>Meir</td>
<td>M2C, M22C</td>
</tr>
<tr>
<td>Saqqara</td>
<td>Sq10C</td>
</tr>
</tbody>
</table>

Table 3.43 Witnesses sorted by region for spell 165. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses come from Deir el-Bersha, which provided ten witnesses. Asyut and Meir both have two witnesses, and Saqqara supplied one witness. Note that the witnesses used in this section only reflect the material published in de Buck.

The following figure shows the percentage of damage which occurred in the witnesses (figure 3.108):

![Figure 3.108 Percentage of reconstruction and damage in the witnesses for spell 165. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

Most witnesses in this spell are relatively intact, with the exception of M22C, which is more than 80% partially or fully reconstructed. Sq10C is more than 40% damaged, and M2C is nearly 40% damaged. S2C

⁶⁶⁷ de Buck (1947) CT III, p. 6.a.
and B3Bo both are slightly over 20% damaged. All witnesses are included in the result, although any result including M22C, M2C and Sq10C need to be approached with caution.

### 3.46.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was produced (figure 3.109):

![Dendrogram](image)

Figure 3.109 Rectangular phylogram display of the distance between the different witnesses of spell 165.

For spell 165, the dendrogram has one large branch, on which most of the witnesses are placed. Additionally, there are two branches for S1C and S2C. The distance between S1C and S2C is remarkable, as based on the phrases that they use, they only vary in five out of the nineteen, so more proximity would have been expected. However, their sequence is quite different from the other witnesses, which at least explains their distance from the large branch. This is visible in III,10,a, where S1C and S2C have: $s\text{sm}.t \; s\text{w}.t \; m \; i\text{wnw} \; h\text{r} \; h\text{3w}.w\text{t} \; r^r \; r^r \; nb$ (who will control the offering in Heliopolis on the altars of Re, every day),\(^{668}\) where the majority of the other witnesses have: $s\text{sm} \; s\text{w}.w\text{t} \; m \; i\text{wnw} \; h\text{r} \; h\text{3w}.w\text{t} \; r^r \; r^r \; nb$ (who controls the offerings in Heliopolis on the altars of Re, every day),\(^{669}\) which uses the imperfective active participle rather than the prospective active participle for $s\text{sm}$. M2C and M22C have their own variant: $[s\text{sm}] \; s\text{w}.t \; m \; i\text{wnw} \; h\text{r} \; h\text{3w}.w\text{t} \; r^r \; r^r \; nb$ (who controls the offering in Heliopolis on the altars of Re, every day),\(^{670}\) which is similar to the majority, while using the singular $s\text{w}.t$, rather than the plural.

---

\(^{668}\) de Buck (1947) *CT III*, p. 10,a (S1C). Note that the reading of $s\text{sm}.t$ is uncertain, as it could be a $s\text{qm}.tw-f$ as well.  
\(^{669}\) de Buck (1947) *CT III*, p. 10,a (B2Bo).  
\(^{670}\) de Buck (1947) *CT III*, p. 10,a (M2C).
As B2L,b only consists of a single phrase (III,6,a), its placement in the dendrogram can be discounted, as it could have been placed in proximity to nearly any other witness, except for B1Be, B1C, B17C and B2L,a, which all do not have this phrase. When B2L,b is discounted, M2C and M22C are placed in closer proximity, which could imply a specific pattern in Meir. However, the extensive reconstructions that occurred in these witnesses may explain this as well.

Finally, the lower section of the main branch contains all witnesses from Deir el-Bersha, which suggests that there was a sentence structure pattern there. However, the placement of Sq10C in the same section counters this argument. When taking the phrases used in B3Bo and Sq10C into regard, a different reason for their placement becomes visible. They are not placed together due to similarity, but rather dissimilarity, as B3Bo and Sq10C share only two phrases between them. B3Bo actually has a high number of phrases with a unique structure, as fifteen of its nineteen phrases are unique. This is the same for Sq10C, who has nine phrases with a unique structure, out of twelve phrases. Additionally, as Sq10C is badly damaged, its placement might have been influenced by reconstructions.

Nonetheless, this does not mean that the entire branch is based on dissimilarity. The argument can be made for B4Bo to some extent, as it has nine phrases with a unique structure out of eighteen, which could explain its placement on the same general branch as B3Bo and Sq10C. However, this is not the case for B1C, B3C, B17C, B2L,a, which are remarkably similar, even though some unique phrase structures exist within these witnesses. For example, this group can be seen in III,8,b, where they have: m rnp.t tn m hrw pn nfr n ṭm.t (in this year, in this good day of the ṭm.t shrine),\(^671\) while M2C and M22C have: hrw pn nfr n ṭm.t (this good day of the ṭm.t shrine), which leaves out the m rnp.t tn m section. The other witnesses all have their own unique structure.

Of the B1C, B3C, B17C and B2L,a group, B3C has the highest number of unique phrases, with eight out of nineteen phrases. Its placement in proximity to B2L,a seems to be solely based on one phrase, III,8,a, which structure is only shared between these two witnesses. It needs to be noted, that except for B1C, B17C and B2L,a, every witness from Deir el-Bersha seems highly variable in the sentence structure used, with may unique phrase structures occurring in these witnesses.

Regardless, a general Deir el-Bersha theme can be suggested, based on the placement of the witnesses. However, a clearer distinction such as a difference between periods of coffin decoration that occurred in spell 75, cannot be discerned here. For example, B2Bo and B5C do not share the same period of coffin creation, as B2Bo is dated to the late 11th dynasty or early 12th dynasty, where B5C is dated to Sesostris II-III.\(^672\)

---

\(^{671}\) de Buck (1947) *CT III*, p. 8,b (B3C). Note that B1Be has this structure as well.

\(^{672}\) Willems (1988), p. 77-78.
3.46.3. Conclusions

For this spell, the method used in this chapter seems to work, as a distinction between witnesses from Asyut, Meir and Deir el-Bersha is implied. However, as Sq10C and B3Bo prove, some branches seem to be based on dissimilarity, instead of similarity.

3.47. Spell 166

The following section concerns spell 166. Together with spell 165 and 167, this spell should be considered part of a group. In this spell, the deceased identifies himself as the bull of Kenset, to divinities who are called the one who hears and the one who unstops, in order to request the offering loafs which are with Horus and Min.

3.47.1. Introduction

Spell 166 is a short spell, which only has eight phrases in total. This spell is included in this work because it is part of a spell group, even though in previous sections, short spells proved to be problematic. In de Buck, this spell is attested in a total of thirteen witnesses, that originate from three different regions. The following table shows the witnesses sorted by region (table 3.44):

<table>
<thead>
<tr>
<th>Region:</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S1C, S2C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>
<td>B1Be, B2Bo, B3Bo, B4Bo, B1C, B3C, B5C, B17C, B2L</td>
</tr>
<tr>
<td>Meir</td>
<td>M2C, M22C</td>
</tr>
</tbody>
</table>

Table 3.44 Witnesses sorted by region for spell 166. See appendix 1 for a full list of details concerning every witness.

As with spell 165, the majority of the witnesses come from Deir el-Bersha, which provided 9 witnesses. Asyut and Meir both have two witnesses each. The witnesses here only reflect the material from the publication of de Buck.

The following figure (figure 3.110) shows the percentage of reconstructions which occurred in the witnesses:

---

The witnesses in this spell are relatively undamaged, with the exception of M22C, which is more than 50% partially or fully reconstructed. Therefore, any result including M22C needs to be approached with some caution.

### 3.47.2. Results and discussion

After the method described in 3.2.2 was applied, the following dendrogram was produced (figure 3.111):

![Dendrogram](image-url)
In this dendrogram, there is one big branch, containing most of the witnesses, and two additional branches, one for S2C, and one for S1C and B3Bo.\textsuperscript{674} This placement makes little sense, as S1C and B3Bo only share two phrases, and S1C and S2C share seven out of the eight phrases. Therefore, a separate branch for S1C and S2C would have been more sensible than the current result here.

The only section of this spell that falls within expectation is the sub-branch containing B1Be, B1C, B3C, B17C and B2L. These witnesses share a clear feature that separates them from the other witnesses, namely that they do not have the first phrase of the text. Therefore, their placement is encouraging. However, although all these witnesses share the same date, the suggestion that there is a sentence structure pattern in use in Deir el-Bersha in this period (Amenhotep II - Sesostris III) that is different from an earlier period (late 11th dynasty, early 12th dynasty),\textsuperscript{675} cannot be made, as B5C, which is part of the Sesostris II-III period, is not on this branch. Moreover, as B5C does have the first phrase, it does not seem to be a distinct feature in this spell.\textsuperscript{676} However, it could be argued that during the later period of coffin creation, there were at least two structural patterns for this spell in Deir el-Bersha. This can be seen in III,15,b, where B1Be, B1C, B3C, B17C and B2L have: \textit{t.w r ts hr hr} (bread is at the land with Horus),\textsuperscript{677} while B2Bo and B4Bo have the singular \textit{t} instead of the plural \textit{t.w}: \textit{t r ts hr hr} (bread is at the land with Horus).\textsuperscript{678} B5C has the unique phrase: \textit{t.w=i hr hr} (my bread is with Horus), which adds the suffix pronoun \textit{i} after \textit{t.w}, and left out the \textit{r ts}. B3Bo has an unique phrase as well: \textit{h.t fd.w r ts hr hr} (four offerings are at the land with Horus), which is more similar to the structure from Asyut: \textit{t fd.w r ts hr hr} (four loaves of bread are at the land with Horus).\textsuperscript{679}

The placement of B5C and M2C is another case where the placement is purely based on dissimilarity with the other witnesses, rather than any similarity between the witnesses on the branch. Although B5C shares some similarity with the other witnesses, as four of its phrases are shared with at least one of the other witnesses, this is not the case with M2C. This witness not only has five of the eight phrases, the lowest number of phrases in this spell, four of these five phrases have a unique structure that is not shared with the other witnesses. It seems that its placement is solely based on phrase III,15,a, and the fact that it has the first phrase of this spell, which would place it near M22C or B5C.

### 3.47.3. Conclusions

Although some patterns are correctly depicted in the dendrogram, other obvious groups (S1C and S2C), are not placed in proximity. Therefore, it seems that the method used in this chapter has only limited functionality for spell 166. The main reason for this seems to be the limited length of the spell. However, although not clearly visible on the dendrogram, this spell does seem to have a distinct sentence structure pattern in Asyut and Deir el-Bersha. Additionally, Deir el-Bersha might have two sentence

\textsuperscript{674} Although it is not clearly visible in figure 3.111, it is clearly visible when the dendrogram is depicted as a cladogram, instead of a phylogram.

\textsuperscript{675} Which would be represented by B2Bo, B3Bo and B4Bo.

\textsuperscript{676} Although it is possible that in B5C the owner or artist decided to use a different manuscript than was used for the other witnesses.

\textsuperscript{677} de Buck (1947) \textit{CT III}, p. 15,b (B17C).

\textsuperscript{678} de Buck (1947) \textit{CT III}, p. 15,b (B4Bo). Note that M22C has the same structure here.

\textsuperscript{679} de Buck (1947) \textit{CT III}, p. 15,b (S1C).
structure patterns in the period of coffin creation during the reign of Sesostris II-III, although B5C shows that both patterns could be used.

3.48. Spell 167

The following section will discuss spell 167.\textsuperscript{680} Together with spell 165 and 166, this spell should be considered a group. In this spell, the deceased identifies himself with Re-Atum, which allows him to partake in the food at the altar of Re. He calls out to the butler of Re, and states that the double Ennead is satisfied, as the butler has given food to the deceased. This is followed by statement, which Hematet caused him to say, where the deceased state that he moves together with the two gods who descended to their food, travelling in their coils when they move as snakes, traveling on their wings when they move as falcons.

3.48.1. Introduction

Spell 167 is the longest spell of this group, with a total of 34 phrases. The witnesses use a selection of these 34 phrases to create their version of this spell. In de Buck, there are a total of twelve witnesses, which originate from three different regions. The following table shows the witnesses separated by region (table 3.45):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>
<td>S1C, S2C</td>
</tr>
<tr>
<td>Deir el-Bersha</td>

Table 3.45 Witnesses sorted by region for spell 167. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses for this spell come from Deir el-Bersha, which provided eight witnesses. Asyut and Meir both supplied two witnesses. Note that the witnesses here only reflect the material which is available in the publication in de Buck. Additionally, it needs to be noted that M23C only has a small section of the spell, as it is a fragment which only held part of the last columns of this spell. Although it is possible that originally this support had spell 165 and 166 as well, the only part of the spell that is included in this work is based on what was visible, and what could be extrapolated from there.

The following table shows the percentage of damage which occurred in the witnesses (figure 3.112):

With the exception of B4Bo, which is more than 30% partially or fully reconstructed, every witness that does not come from Meir is relatively intact. The witnesses from Meir on the other hand, are mostly lost. As M23C is only a fragment of a coffin, it is obvious that more than 90% is reconstructed. M22C is badly damaged as well however, as nearly 70% of the tokens of this witness were partially or fully reconstructed. Every witness was included in the results, although it needs to be remarked that caution should be taken in regard to M22C, M23C and B4Bo.

3.48.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was produced (figure 3.113):
The dendrogram above has four branches in total, two larger branches, and two small branches for S1C and S2C. The left larger branch contains seven of the witnesses, while the right larger branch contains the remainder. As was previously seen in spell 166, the distance between S1C and S2C cannot really be explained. Although some variation exists between them, there should be enough similarity to place them together,\textsuperscript{681} which nonetheless did not happen. That they should be closer can be seen in III,25,b: \textit{prr=i r dnh.ww=sn} (I go forth at their wings),\textsuperscript{682} where the witnesses from Deir el-Bersha and Meir have: \textit{pr=i hr dnh.ww=sn} (I will go forth upon their wings),\textsuperscript{683} where they use a prospective \textit{sdm-f} rather than a nominal \textit{sdm-f} and replaced the connector \textit{r} with \textit{hr}.

Contrarily, the placement of B1Be, B1C and B17C on the same branch falls completely within expectations, as spell 166 previously suggested that they are quite similar. Moreover, B2L branches off at an earlier stage, which is directly visible when the first four phrases of the spell are compared,\textsuperscript{684} which are different from the phrases used in B1Be, B1C and B17C. For example, III,17,c, where B1Be, B1C and B17C have: \textit{ḥr=f sgb hr wdb.w sgb} (stand, abundance, upon the riverbanks of the flood),\textsuperscript{685} where the other witnesses replaced \textit{wdb.w} with \textit{wdhw.w}: \textit{ḥr=f sgb hr wdhw.w sgb} (stand, abundance,
upon the altars of abundance). However, the placement of B2Bo on this branch is harder to explain, as it is structurally quite different.

The grouping in the right main branch is less clear. B4Bo, B3C and B5C do share the feature that all these witnesses have a higher number of phrases with a unique structure than the other witnesses from Deir el-Bersha have. Even so, within this branch, the placement of B4Bo closer to B3C should be expected, as B4Bo shares seven phrases with B3C, where B5C only shares three phrases with B4Bo and two with B3C. It can therefore be assumed that this branch is based on dissimilarity. However, some connection between B4Bo and B3C can be seen in III, 19,c: di=k Hnq.t n dhwyty-nht tn (and while you give beer to this dhwyty-nht), where B2o and B5C have only Hnq.t (and beer), while B1Be, B1C, B17C and B2L have: di=k n-i Hnq.t (and while you give beer to me), which replaces the name of the owner with the first-person suffix pronoun, and moves the dative construction in front of the Hnq.t.

The witnesses from Meir furthermore seem to share some common ground, although the extensive damage to these witnesses could mean that the reconstructions rather than the original text are the reason here. Even though mostly reconstructed, the fact that M23C ended up in the vicinity of M22C is encouraging, as it shows that witnesses are placed together, even when parts of the text are lost, beyond reasonable reconstruction.

The placement of the witnesses from Deir el-Bersha on two separate branches, suggests that there were at least two sentence structure patterns available. However, as seen with spell 165 and 166 as well, there is little evidence that these two patterns are distinctly bound to one period of coffin creation.

3.48.3. Conclusions

As was seen with spell 165 and spell 166, the method used in this chapter seems functional for this spell, but leads to some issues that are difficult to explain. Even though some sections are placed within expectations, others (S1C and S2C) are placed on different branches, even though they should be placed on their own branch.

However, the dendrogram produced suggests that there are regional differences in the sentence structure patterns used, even though not as clearly as preferred. In a similar manner as in spell 166, there is a suggestion that there are two sentence structure patterns in use in Deir el-Bersha, although there seems to be a lot of liberty in their application.

---

686 de Buck (1947) CT III, p. 17,c (B2L). Note that B2Bo, B5C, M22C and S2C spelled altar as wdhw, while B3C and S1C spelled it as wdhwh instead. Note that B4Bo has a unique structure, as it added the genitival adjective n before sgh, while it used wdhwh.w, rather than wdbh.w.
687 de Buck (1947) CT III, p. 19,c (B4Bo). Note that B3C replaced dhwyty-nht with s3.t-hd-hip (name of the owner).
688 de Buck (1947) CT III, p. 19,c (B5C).
689 de Buck (1947) CT III, p. 19,c (B17C).
3.49. Spell group 165-167

As spells 165-167 are supposed to be considered a group, it would be sensible to study these spells in this manner as well. This group of spells will be treated using the same method that was used for spells 1-27 in chapter 3.29, spells 30-32 in chapter 3.33 and spells 94-96 in chapter 3.41. The following table shows the spells used per witness of this group (table 3.46):

Table 3.46 Occurrence of spells in for every witness in spell 165-167.

Note that the order in which the spells occurs is the same as seen in this table, as in the witnesses the spells follow each other sequentially. The witnesses that did not have one or more of the spells were treated as described in chapter 3.29.

3.49.1. Results and discussion

Using the method described in chapter 3.2.2, with the additions discussed in chapter 3.29, the following dendrogram was produced (figure 3.114):

Figure 3.114 Rectangular Phylogram display of the distance between different witnesses of spell 165-167.
In this dendrogram, there is one main branch, containing all the witnesses, and two smaller branches for S1C and S2C. S1C and S2C seem close in this visualisation, but when the dendrogram is reoriented, they can end up on either side of the dendrogram. However, based on the structure these witnesses used in the separate spells, a separate branch for these two witnesses would have been preferred.

All three witnesses from Meir are placed in the final section of the main branch (figure 3.115). This could be considered a sign of a regional sentence structure pattern. Unfortunately, as these witnesses are usually badly damaged, their placement could be due to the reconstruction, rather than an actual kinship.

The distant placement of B2L,b falls within expectations as well, as it consists of only a single phrase in spell 165. The same could be said of Sq10C, which only has spell 165 as well, and was relatively unique in its sentence structure. This is clearly visible in the distance between these two witnesses and the remainder of the large branch.

The central section of the large branch is completely occupied by all the witnesses from Deir el-Bersha, which suggest that there is a distinct pattern in the sentence structure that is in use there. Moreover, there are signs of the division between two patterns of Deir el-Bersha which were previously visible in spell 166 and 167, in the two sub-branches that form after B4Bo. However, due to the placement of B5C, it cannot be stated that this variation is based on the period of coffin creation.

3.49.2. Conclusions

In this spell group, the method used in this chapter seems to work, as the different regions group together. However, the borders are vague, and S1C and S2C, which should belong on the same branch, are placed as separate entities from each other. Even though this separation does make these two witnesses distinct from the large branch, a clearer connection between these two witnesses would have been preferred.

Even with the underlying issues, the method is capable of visualizing that there are variations in the sentence structure, that can be argued to be regional. Moreover, although the border is fuzzy, there seem to be at least two patterns of sentence structure in use in Deir el-Bersha.

3.50. Spell 215

The following section will discuss spell 215. Based on the title: *tm wnm hs tm swr wsš.t m hr.t-nfr* (Not eating excrement and not drinking urine in the necropolis), this spell should thematically be considered part of a group of spells, known as the ‘Abscheu’ spells, a group of spells within this

---

691 de Buck (1947) *CT III*, p. 175,b-c (B3C).
category considered dialogue-free within this category.\textsuperscript{693} In this spell, the deceased is first made similar to Re, specifying that he will receive the same treatment as Re. Following this, four aspects of Ptah are stated to repeat the actions of Horus towards his father in the tribunal, where the deceased is stated to be as Horus. Finally, the deceased is stated to receive food in a similar manner as Re, by his butler, \textit{sgiving} (abundance).\textsuperscript{694}

3.50.1. Introduction

This spell is one of the medium sized spells, having a total of 42 phrases.\textsuperscript{695} However, every witness only uses a selection of these phrases to form their version of this spell. In de Buck, the spell is attested in a total of eleven witnesses.\textsuperscript{696} These witnesses originate from three different regions. Two witnesses, which come from the same support, P.Gard.2, are from an unknown origin.\textsuperscript{697} The following table shows the witnesses separated by region (table 3.47):

<table>
<thead>
<tr>
<th>Region</th>
<th>Witness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asyut</td>

</tr>
<tr>
<td>Meir</td>
<td>M22C</td>
</tr>
<tr>
<td>Unknown</td>
<td>P.Gard.2,a, P.Gard.2,b</td>
</tr>
</tbody>
</table>

Table 3.47 Witnesses sorted by region for spell 215. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses come from Deir el-Bersha, which provided six witnesses. Asyut supplied two witnesses, Meir has one witness, and two witnesses come from P.Gard.2. Note that the witnesses that are included in this section only represent the material published in de Buck.

The following figure shows the percentage of damage which occurred in the witnesses (figure 3.116):

\textsuperscript{693} Buchberger (1993), p. 67. However, this does not mean that there are no spoken sections in the spell.
\textsuperscript{694} de Buck (1947), p. 186,b (B2Bo).
\textsuperscript{695} In de Buck, the actual number of phrases is higher, as some phrases have been merged.
\textsuperscript{696} Topmann (2002), p. 6, mentions two additional witnesses, B1B from Deir el-Bersha, and Sq5Sq from Saqqara.
\textsuperscript{697} However, Schenkel (1996), p. 125, suggest that P.Gard.2 actually originates from Asyut.
The witnesses with this spell are relatively intact, with the exception of M22C, which is nearly 50% partially or fully reconstructed and B1Y which is nearly 40% partially or fully reconstructed. Additionally, S2C is over 30% reconstructed. All witnesses are included in the results below, but any results including M22C, B1Y and S2C need to be approached with some caution.

3.50.2. Results and discussion

Using the method described in chapter 3.2.2, the following dendrogram was created (figure 3.117):
In this dendrogram, there is a big central branch, which holds eight of the witnesses. Additionally, there is a small branch holding B1Y and P.Gard.2,b, and finally a separate branch for S1C. Based on the phrases used in S1C, the separate placement of S1C is not unexpected, as this witness uses sixteen structurally unique phrases out of the 28 phrases.

The distance between P.Gard.2,a and P.Gard.2,b falls within expectations as well, as during the encoding process, it became clear that these two witnesses represented two different versions of the same spell. However, the placement of P.Gard.2,b in the same branch as B1Y does not seem to make sense. 15 out of the 21 phrases P.Gard.2,b uses are structurally unique in this witness, although four of the six phrases P.Gard.2,b shares with other witnesses are shared by B1Y. Still, B1Y shares fifteen phrases with B2Bo, but is placed on a different branch.

The placement of P.Gard.2,a is encouraging, as it is on the same sub-branch as S2C. As Schenkel suggest the papyrus originates from Asyut, this placement seems to support this result. Thus, if this assumption is correct, the dendrogram suggests the existence of a sentence structure pattern in Asyut, which is distinct from the other regions. For example, this is visible in III,178,b, where S1C, S2C and P.Gard.2,a have: $hkr\ 'r\ hkr=i$ (the hunger of Re is my hunger), where B1Y and P.Gard.2,b have: $hkr=i\ hkr\ 'r$ (my hunger is the hunger of Re), where the position of the $hkr\ 'r$ and $hkr=i$ are switched. All the other witnesses have a unique phrase, for example M22C, which includes $pw: hkr\ 'r\ pw\ hkr=i$ (my hunger is the hunger of Re) or B3C which used $pw$ and the name of the owner instead of the suffix pronoun $i$: $hkr\ ss.t-hd-htp\ pw\ hkr\ 'r$ (the hunger of Re is the hunger of $ss.t-hd-htp$). However, as S1C and P.Gard.2,b show, multiple patterns would be available in Asyut.

The left final section of the central branch suggests that there might be a distinct sentence structure pattern in Deir el-Bersha as well. However, M22C complicates this suggestion. As M22C has a high number of phrases that are shared with the other witnesses from Deir el-Bersha, the placement here seems correct. As this spell has only one witness from Meir, which is badly damaged, it is assumed that reconstructions are more responsible for the placement than any original text. Therefore, the placement of M22C in this sub-branch should not hold much weight in regard to discounting the existence of a Deir el-Bersha sentence structure pattern.

3.50.3. Conclusions

In spell 215, the method used in this chapter seems to be capable of visualising the existence of regional patterns in the sentence structure. Moreover, the placement of P.Gard.2,a gives credence to the idea that this papyrus originated from Asyut. Although the borders are fuzzy, there seems to be a sentence structure pattern in both Asyut and Deir el-Bersha, although especially Asyut seems to allow freedom in the sentence structures used.

---

698 The full sentence structure file is available in appendix 3.45.
699 de Buck (1947) CT III, p. 178,b (P.Gard.2,a).
700 de Buck (1947) CT III, p. 178,b (B1Y).
3.51. Spell 225

In the following section, spell 225 will be discussed. This spell should be considered a group, together with spell 226. Additionally, this spell is closely connected with chapter 68 of the Book of the Dead, which is a reworked version of Coffin Texts spell 225. This spell spoken to the deceased, and consists of three themes. In the first theme, it is made clear to the deceased that he is free to move, as the sky and land are opened for him. The second and third theme are similar in structure, as it consists of a long list of phrases with the structure \( \text{shm}=k \text{ m} \) (may you have power over), to wish that the deceased will have control. The spell ends with the command that the deceased rises up and throws off his dust, due to the knowledge that the deceased has.

3.51.1. Introduction

This spell is one of the longer spells that were used for this work, with a total of 80 phrases. The witnesses use only a selection of these phrases to create their version of the spell. In de Buck, the spell is attested in a total of 23 witnesses. The supports S1C, S2C and T1L all provided two witnesses each. However, the two witnesses of S1C and T1L are actually the two parts of the same spell, written in different places in the support, with a small dittography connecting the two sections. Therefore, for the purposes of this work, T1L and S1C are treated as one witness. This is however not the case for S2C, which does consist of two separate witnesses. The 23 witnesses originate from six different regions, and two witnesses, Pap.Berl and Y1C are of uncertain origin. The following table shows the witnesses sorted by region (table 3.48):

<table>
<thead>
<tr>

</tbody>
</table>

Table 3.48 Witnesses sorted by region for spell 225. See appendix 1 for a full list of details concerning every witness.

---

704 The actual number of phrases in de Buck is higher, as some phrases have been merged.

705 Jürgens (1995), p. 207, 209, mentions two additional witnesses, one from Sidmant el-Gebel, Sid1Sid, and one from el-Haraga, Ha2Ha.

706 However, Jürgens (1990), p. 55-56, mentions that Y1C is most likely from Asyut, and Regulski (2015), p. 301, mentions that the art dealer who sold the papyrus to Borchardt suggested the papyrus came from Asyut as well.
The majority of the witnesses of this spell come from Deir el-Bersha, which provided eight witnesses. This is closely followed by the Theban area, which has seven witnesses. Asyut supplied three witnesses, Meir has two witnesses and Saqqara provided one witness. Finally, there are two witnesses of which the origin is uncertain. Note that for the purposes of this work, only the witnesses that were published in de Buck were used.

The following figure shows the percentage of damage which occurred in the witnesses for this spell (figure 3.118):

As one can see above, there is a lot of damage which occurred in the witnesses. M25C and T2Be are both more than 70% partially or fully reconstructed, with M25C nearing 80%. Sq4C and S2C,a are both around 60% partially or fully reconstructed. T2L and MC105 are around 50% partially or fully reconstructed. M2NY and B1Y are both over 40% partially or fully reconstructed. For the remaining witnesses this is up to 30%. All witnesses here are included in the results, but due the high level of damage, the reconstructions might introduce significant bias into the results.

3.5.1.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was produced (figure 3.119):
In this dendrogram, there are two main branches, and one separate branch for S2C,b. At first glance, the result does not resemble the stemma of Jürgens. However, as his stemma includes spell 226, some differences would be expected.

In the left final section of the second branch (figure 3.120), there is a seemingly random group of four witnesses, B1Y, S2C,a, Pap.Berl and Y1C. This placement however, is not random, as these four witnesses share a specific feature in this spell, namely that the owner is referred to in the first person, and not in the second person, which is the case in the other witnesses for this spell. Additionally, this section resembles the result in Jürgens, as all these witnesses are placed under type κ2. On the other hand, the subdivision in type λ (B1Y) and ν (S2C,a, Y1C and Pap.Berl) does not occur here. Moreover, type λ1 (B2Bo, B4Bo) is not reflected here at all. Additionally, this section suggests as well that Pap.Berl and Y1C originate from Asyut. However, this is not the only pattern available in Asyut, as the other two witnesses, S1C,a-b, and S2C,b show, which are not remotely close to this group. This is expected, as they use the second person, instead of the first person. For example, in ill.214-215,a, where B1Y, S2C,a, Pap.Berl and Y1C have: i ink (Oh, it is me), while S1C,b and S2C,b have hs mššt (ho, mššt), which uses the name of the owner instead of the independent pronoun, and replaces the interjection i with hs. The other witnesses have variations of this format, for example M25C, M2NY, T1Be and T1L, which add the demonstrative after the name: hs nfr-sšb tn (ho, this nfr-sšb), or B1C, B1L, B2L, T3Be and T2L, which add wsīr before the name: hs wsīr spi pn (ho, the Osiris, this spi).

B4Bo and Sq4C are closer to S2C,a, Y1C and Pap.Berl, as they retain the

---

708 de Buck (1947) CT III, p. 214,a (Y1C).
709 de Buck (1947) CT III, p. 214,a (S2C,b).
710 de Buck (1947) CT III, p. 214,a (M25C).
711 de Buck (1947) CT III, p. 215,a (B1C).
interjection *i*: ḫwty-nht *tn* (ho, this ḫwty-nht). The other witnesses have unique phrases, as MC105 is a reconstruction, while B2Bo and T2Be both have *mn pn* (this someone) instead of the name. However, B2Bo has the interjection *i*, while T2Be has the interjection *hs*.

Slightly higher up in the second branch, one can find T9C and MC105. There connection can be seen in III,218-219,b, where they have: *wn n±* ḫn.t *rs* (the pelican opens its mouth for you), where B2Bo, M25C, M2NY, S1C,b, S2C,b and T1L and have: *wn n-k r n ḫn.t* (the mouth of the pelican is opened for you), where *r* is moved in front of ḫn.t, and the genitival adjective *n* is added, while the suffix pronoun after *r* is not used. S2C,a, Y1C and Pap.Berl have: *wn n-i r n ḫn.t* (the mouth of the pelican is even opened for me), which use the first person suffix pronoun, rather than the second person suffix pronoun. B1C, B1L and B2L have: *wn r-k * ḫn.t* (Your mouth is opened by the pelican), which makes the mouth of the owner the subject of *wn*, and adds the connector *in*. Finally, T1Be, T2Be and T2L, which replace ḫn.t (pelican) with ḫn.t (lake): *wn n-k ḫn.t* (the mouth of the lake is opened for you). In Jürgens T9C and MC105 were placed together under type β4. However, that is where the resemblance ends, as although these two groups are both part of type κ, they exist on different branches, with the Theban group actually sharing type κ1 with the group discussed above. It is nonetheless clear that there is a distinct pattern in these two groups for the sentence structure.

In the final section of the first branch (figure 3.121), there are two sub-branches, one for T1Be, T2Be and T2L, and another for B1C, B1L and B2L. Both these groups exist in the stemma of Jürgens as well, with type π used for the Theban group, and ξ for the Bersha group. However, that is where the resemblance ends, as although these two groups are both part of type κ, they exist on different branches, with the Theban group actually sharing type κ1 with the group discussed above.

In the right final section of the second branch, one can find T1L, Sq4C and B4Bo. The proximity of T1L and Sq4C seems to fall within expectation, since in Jürgens, they separate at α and β respectively, and therefore share some proximity. This can be seen in III,214-215,c, where they have: *wn n-k kṣṣ. wt gbb wn n-k * tp.(y)-ḥw.t ptr wy* (the door bolts of Geb are opened for you, the shutters of the two celestial windows are opened for you), where the majority of the other witnesses have: *wn n-k kṣṣ. wt gbb tp.(y)-ḥw.t ptr wy* (the door bolts of Geb and the shutters of the two celestial windows are opened for you), which only use *wn n-k* once. Another pattern occurs in Y1C and Pap.Berl, which leave out the

715 de Buck (1947) CT III, p. 218,b (T1L).
716 de Buck (1947) CT III, p. 218,b (Pap.Berl).
717 de Buck (1947) CT III, p. 219,b (B1L).
718 de Buck (1947) CT III, p. 219,b (T2Be). Note that the reconstruction of ḫn.t is based on III,219,c, where the word is visible.
719 See above for an example phrase of the two groups.
720 de Buck (1947) CT III, p. 214,c (T1L).
dative: wn kṣr.ṛt gbb tp.y-hw.t pṛt.ty (the door bolts of Geb and the shutters of the two celestial windows are opened). However, the placement of B4Bo cannot easily be explained, but apparently there is enough similarity.

3.51.3. Conclusions

For this spell, there are clear indications that the method used in this chapter works in order to visualise regional patterns based on sentence structure. It is possible to distinguish between a pattern in Asyut, Deir el-Bersha, and the Theban area. However, as all these locations have other witnesses outside these groups as well, it is clear that although there is a shared pattern, there are multiple other variations available, which do not seem to be restricted to one region. Additionally, the placement of Pap.Berl and Y1C in this spell supports the notion that these witnesses originate from Asyut.

3.52. Spell 335

This section will discuss spell 335. In a similar manner as Coffin Texts spell 154, this spell continues to be used in the corpus of the Book of the Dead, as spell 17. This spell consists of two distinct sections, 335,a and 335,b. However, as an addition to the text of the spell, in the majority of the witnesses, the text is interrupted by glosses, which usually follow a question and answer construction. These glosses, often written in red ink, function as explanations of persons, locations or moments discussed in the text before the gloss. But, as witnesses without any glosses exists, it could even be argued that there are four sections, 335,a with and without glosses and 335,b with and without glosses. Currently there are two interpretations of these glosses. Silverman suggests that the glosses are an example of the Ancient Egyptian editorial process, in order to provide clarification. However, Assmann wonders if these glosses could represent a 'dramatic initiatory interrogation', rather than simply a commentary.

In the first section of the spell (335,a), the deceased first identifies himself with Atum, and states the knowledge and possessions the deceased has as Atum. Then the deceased states the journey he has

---

722 de Buck (1947) CT III, p. 214,c (Y1C). All the other witnesses have a unique phrase.
724 See chapter 3.44.
725 Even though the two texts are different enough from each other to be considered two different texts. However, these variations are mainly in the glosses, while the outline and themes are maintained. See Shalomi-Hen (2000), p. 23.
726 Silverman (1989), p. 34.
made. This is followed by a statement of the deceased clarifying that he belongs among the gods. Finally, the deceased addresses the tribunal.\footnote{Shalomi-Hen (2000), p. 14-18.}

The second section of the spell (335,b) is an appeal to Re, Atum, Osiris,\footnote{Mentioned in the texts by epithets, like nb $n$rw ‘lord of terror’ (see de Buck (1951), p. 316,b), rather than actually naming the god.} and finally Khepri. This is structured in a similar manner, where first the god is called upon, with a list of titles, followed by $n$hm-$k\ wi$ (may you rescue me), after which the deceased names from what he should be rescued, and why. Finally, the text ends with an explanation regarding the use of the spell.\footnote{Note that the final section of the spell is varied to the extent that there is no real similarity between the different witnesses.}

3.52.1. Introduction

Spell 335 is easily the longest spell published in de Buck. In total there are 314\footnote{The actual number of phrases in de Buck is slightly higher, as some of the phrases have been combined to create complete phrases.} phrases, although there is no witness that has all phrases, but rather only as selection of these phrases. In de Buck, the witnesses are partially separated. Some of the witnesses (B15C, Sq2C, Sq7Sq, Sq8Sq, T3L,b\footnote{Note that in de Buck this is simply numbered as T3L, but as there already is a T3L, and T3L,a, in the spell, I named this witness T3L,b.}) were moved to the back of the publication as these witnesses are badly damaged, or in case of Sq7Sq, structurally different from the other witnesses, even though generally the same phrases occur. In de Buck, there are a grand total of 32 witnesses\footnote{However, in his notes, he makes some references to T1Len, named (H), but as it was not included in his actual columns, I left it out.} with this spell, and for the purposes of this study an additional witness, M1Be,\footnote{I am indebted to Tobias Konrad for providing the material concerning M1Be to me.} was added. Note however, that the supports B9C and T1C\footnote{It needs to be clarified here that T1C,a is actually inscribed on the tomb chamber, whereas T1C,b is inscribed on the coffin, see Shalomi-Hen (2000), p. 8.} provide two witnesses each, and T3L provides a total of three witnesses. It needs to be noted that T3L,a only consists of four phrases.\footnote{However, it could be argued that T3L,a and T3L,b should be considered the same witness, where the phrases of T3L,a overlap with T3L,b, as T3L,a only consists of the final 1.5 columns of the back.} The following table shows the witnesses sorted by region (table 3.49):

</tbody>
</table>

Table 3.49 Witnesses sorted by region for spell 335. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses come from Meir, which provides a total of eight witnesses. The Theban area has eight witnesses as well, even though the spell only occurs on five supports. Deir el-Bersha and Saqqara both supplied seven witnesses, although the spell occurs only on six supports in Deir el-Bersha. el-Lisht has two witnesses, and Beni Hasan provided one witness. It needs to be noted that B3C, B9C,b M1Be and Sq4Sq are witnesses which do not include the glosses. B1Y starts with a gloss, and then becomes a witness without glosses. T1C,a is mostly without glosses, except for IV,268,a-d and IV,270,a-c. As the supports B9C and T1C both provided two witnesses, one without glosses, and one with glosses, it is clear that there was a glosed and an un-glossed structure in use at the same time. For the purposes of this work, only the material published in de Buck, with the exception of M1Be, has been used. Spell 335 was commonly inscribed on the lid of the coffin, although depending on the support, it can occur on other locations. As nearly no witness uses what could be considered the entirety of the spell, it is clear that available space had some influence on how much of the phrases of the spell were used. In most witnesses, the spell ends abruptly by writing the name of the owner after the final phrase used in that witness. Thus, the ending of the spell was to some extent planned, even though how much of the spell was actually used was limited by the available space, and only BH1Br actually moves from one section of the coffin to another in order to continue the spell. In combination with the high number of attestations of this spell, it seems that the occurrence of this spell in the coffin was more important than the inclusion of the entirety of the spell.

The sequences of the phrases used in this section are based on the original supports, not the publication of de Buck. In de Buck, for BH1Br, M1Be, M1NY and T1C,b, certain sections of the text occur in a different order than the other witnesses. The structural changes in these witnesses are more akin to a

---

740 As B1P has the spell on the foot, interrupted by spell 470, 472 and 469, for example. Or L1NY, which placed the spell on the back instead of the lid.
reorganisation of paragraphs than actual changes in the order of phrases, which remain the same, although in a different location in the text.

The following figure (figure 3.122) shows the percentage of damage in the witnesses for spell 335:

As one can see above, there are some witnesses for this spell which are badly damaged. B15C and Sq2C are more than 90% reconstructed, which is the reason that de Buck added them separately. T3L,b is nearly 90% reconstructed. Sq8Sq is more than 70% reconstructed. Of the witnesses that de Buck added separately (B15C, Sq2C, Sq7Sq, Sq8Sq, T3L,b), only Sq7Sq is relatively intact. T3L,a is badly damaged as well, even though it only has four of the 314 phrases in total, of which the final phrase is a complete reconstruction. M1C is more than 60% partially or fully reconstructed. B1Y is more than 50% partially or
fully reconstructed. B5C, M54C and Sq7C are more than 40% damaged. The other witnesses are mostly intact. However, it needs to be mentioned that L1NY is much more damaged now than it was when de Buck worked on this witness, and the percentages reflect the state under de Buck, not the current stage of the text. Although all witnesses are included in the results below, any results including B15C, B1Y, Sq2C, Sq8Sq, T3L,a, T3L,b and M1C should be considered with caution. As these are mostly reconstructed, it is not unlikely that their placement is due to the reconstruction, rather than the text that was still visible.

3.52.2. Results and discussion

When the method described in 3.2.2 was applied, the following dendrogram was produced (figure 3.123):  

![Figure 3.123 Rectangular phylogram display of the distance between the different witnesses of spell 335.](image)

In this dendrogram, there is one main branch, which is separated in connected sub-branches at different levels. For the discussion, these results are compared to the stemma created by Rößler-Köhler and Jürgens.

At a first glance, there does not seem to be any clear sign of a regional variation in the pattern. The only branch that shows some regional structure, is the leftmost branch, on which B3C, B5C and B1P were placed. As all these witnesses originate from Deir el-Bersha, there seems to be an underlying pattern there. However, as B9C,a, B9C,b, B15C and B1Y were not placed in proximity to B3C, B5C and B1P, it

---

741 Although some tokens were visible to me and not for de Buck. It seems that he worked from a picture, as he did not differentiate between black and red ink. It was one of the red sections of text he could not see, which is not unlikely on a black and white image.

seems unlikely that there is a clear structure pattern to Deir el-Bersha. Moreover, B15C is mostly reconstructed, and was based on B1P. Thus, it is remarkable that they are quite removed from each other. Additionally, as B3C is a witness without glosses, and B5C and B1P are with glosses, some more distance would be expected. Moreover, where B3C refers to the owner in the third person, B5C and B1P usually refer to the owner in the first person. When compared to Rößler-Köhler, B5C and B1P occur under the same type, κ. However, B3C is actually part of type ζ, together with B9C,b, which is on the other side of the stemma, part of β, where B5C and B1P are part of γ. The connection between B5C and B1P can be seen in IV,208-209,b, which is one of the glosses. Here, B5C and B1P have: schl. it pw itm. w (it is the horizon of Atum), where Sq1C,b, Sq7C, Sq1Sq and T1C,b add the first person suffix after it: schl. it-i pw itm. w (it is the horizon of my father, Atum), while BH1Br, M57C, T1Be, T3L and T3L,b move the pw after schl. and add the genitival adjective before it-i: schl. t pw n.t it-i itm. w (it is the horizon of my father Atum).

As B3C, B9C,b, B1Y, Sq4Sq, T1C,a and M1Be do not use glosses, or limited glosses, some distance between these witnesses and the witnesses with glosses would have been expected. This is the case for Sq4Sq and T1C,a, which are on separate branches at the top of the dendrogram. This is reflected in Rößler-Köhler, where these two witnesses fall under type θ. This is the same for Jürgens, who groups Sq4Sq and T1C,a under type α of the witnesses without glosses. However, the other witnesses without glosses were placed together with the witnesses with glosses in the dendrogram above. However, the proximity between Sq4Sq and T1C,a might not be due to similarity, as Sq4Sq is habitually written in the second person, or with the name of the owner. For example, in IV,282-283,a, Sq4Sq has: wsir ipi-ḫr-ssnb-f pn ntk miw pw ɾs (the Osiris, this ipi-ḫr-ssnb-f, you are this great cat), where the majority of the other witnesses, including T1C,a has: ink miw pw ɾs (I am this great cat), which has the first person instead.

The fact that Sq7Sq was placed on its own branch is completely expected. This witness uses a structure that is quite different from the other witnesses, and has a few phrases that only occur in this witness, or two instances of the same phrase, which only occurs once in the other witnesses.

---

744 In IV,186,b, IV,188,a, IV,198,a, IV,202,c, IV,228,b, IV,250,b and IV,276,a B1P uses im.y-r pr spi pn instead of the first person. However, based on my approach to variation, this would not make B1P similar to B3C, as B1P added a title, which does not occur in B3C.
745 de Buck (1951) CT IV, p. 208,b (B5C).
746 de Buck (1951) CT IV, p. 208,b (T1L,b).
747 de Buck (1951) CT IV, p. 209,b (T1Be). The other witnesses (B9C,a, L3Li, L1NY, M4C, M7C, M1NY, Sq2C, T2Be) all have unique variations.
749 de Buck (1951) CT IV, p. 208,b (T1C,a).
750 The use of the name of the owner does occur in B3C and B1P as well. However, in these witnesses the name of the owner replaced the independent pronoun, rather than having both the name of the owner and the pronoun.
751 For example IV,304,b, dšdš.t pw n.t šnw (it is the tribunal of the šnw court), which occurs after IV,254,b and IV,303,b. See de Buck (1951), p. 412-413.
The sub-branch on the right (figure 3.124) contains B9C,a, B9C,b, M1Be, M4C and Sq1Sq. Of these witnesses, B9C,b and M1Be are witnesses without the glosses. Due to the lack of the glosses, it is encouraging that B9C,a and B9C,b are on the same branch, although on different sub-branches due to the glosses. The placement of M1Be seems to follow the stemma of Jürgens, where B9C,b and M1Be are part of type β, even though B9C,b further down, as part of type γ, which is a subsection of β. This, except for the connection between B3C and B9C,b, is reflected here. However, due to the placement of witnesses from Meir and Saqqara, it cannot be said that this branch reflects a regional pattern. That there is some connection between B9C,a, M4C and Sq1Sq is reflected in the stemma of Rößler-Köhler, even though the connection is different. Although all these three witnesses are bound under type γ, B9C,a is directly connected to γ, where M4C and Sq1Sq fall under type ο, which is not visible here, as there seems to be a closer connection between Sq1Sq and B9C,a here, instead of a direct connection between M4C and Sq1Sq. However, any connections in this sub-branch might actually resemble a lack of similarity, as all witnesses have a high number of unique phrases.

It is only in the final sub-branches of the dendrogram (figure 3.125) where some results occur that could be considered akin to a regional pattern. M1C and M54C were placed on the same sub-branch, which is as expected as they are remarkably similar. For example, in comparison to the other witnesses from Meir, M1C and M54C used the M17*Z1 group (𓀀) to denote the first person, instead of A1 (𓀀) or A40 (𓀀). However, as the reconstructions were based on this observation, the placement might have been fabricated through the reconstructions. However, the connection between M1C and M54C can be seen in IV,212-213,b, where they have: swb *sbt rh.yt im=f (in which the offerings of the people are purified), where the majority of the other witnesses do not include the im=f: swrb *stt rh.yt (which purifies the offering of the people). In Rößler-Köhler, M1C and M54C were placed under type ξ, although with M54C and M1NY diverging as type σ. As one can see in figure 3.125, this is the exact opposite, with M1C and M54C on the same sub-branch, and M1NY diverging at an earlier stage. Based on the encoding process used, this would reflect the text in its encoded state, as M1NY shares similarity with M1C and M54C, but diverges at multiple stages. It seems that the connection in Rößler-Köhler is rather based on the fact that M1C ends a lot earlier than M54C and M1NY, instead of a clear underlying pattern between the two witnesses. However, a general proximity between M1C, M1NY and M54C is not unlikely, as all are dated to the reign of Amenemhat II.

---

753 de Buck (1951) CT IV, p. 213,b (M54C).
754 de Buck (1951) CT IV, p. 212,b (M8C).
On the same branch of M1C and M54C (see figure 3.125) is another sub-branch section, which contains T3L, T3L,b, T2Be and T3Be. This suggests there is a pattern in use in the Theban area, which is related to some of the Meir witnesses. That T3L and T3L,b are grouped together is not remarkable, as T3L,b is reconstructed based on T3L, and its placement here would be expected. The connection between T2Be and T3Be is expected as well, as Willems calls these supports ‘so strikingly similar that no useful purpose would be served by discussing them separately’.756 However, as T1Be and T2Be belong to the same owner, some proximity between the two witnesses would have been expected, which is not the case here, as T1Be diverges from this sub-branch two levels higher. However, as seen with other supports belonging to the same owner, this variation might be intentional. A clear variation between T1Be and T2Be exists in the first person, where T1Be habitually uses M17 (𓇋), where T2Be and T3Be use A1 (𓀀).

Nonetheless, the connection between T1Be, T2Be and T3Be can be seen in IV,306,b, where they have: ḫr ḫrw ṣm.w (as for the keepers of the wounds),757 while the other witnesses use a completely different structure, for example in Sq2C and T1C,b: ḫr-ḥntt ḫr ḫw ṣm.w (because I know your names),758 or B9C,a, which has [ḥr]-ḥntt ḫr ḫw [ḥw] (because I know), or M54C: [ḥr-ḥntt] ḫr ṣm.w (because of the knowledge of names), or L1NY: ḫr-ḥntt ḫw[i] ḫw ḫw ṣm.w ṣm.w ṣm.w (because I know your names, I know your names).

On the right most section of the branch of figure 3.125, there is a sub-branch for M8C and M7C, which fall within expectation, as these supports belong to the same owner.759 This can be seen in IV,222-223,b, where M7C and M8C have: pr.t=i ṣm ṣb3 ḫs ḫsr (so that I go forth from the holy portal),760 where the majority have a circumstantial ṣḏm-f instead: pr=i ṣm ṣb3 ḫs ḫsr (while I go forth from the holy portal),761 while B5C and B1P have a nominal ṣḏm-f: prr=i ṣm ṣb3 ḫs ḫsr (I go forth from the holy portal),762 B9C,a and T1Be replace the connector ṣm with ḫr: pr=i ḫr ṣb3 ḫs ḫsr (while I go forth upon the holy portal)763 and Sq1C, Sq2C, and Sq7C, which use a circumstantial ṣḏm.n-f: pr.n=i ḫr ṣb3 ḫs ḫsr (after I went forth upon the holy portal).764 As M7C and M8C exist on the same general branch as M1C, M54C and M1NY, it could be argued that there is a pattern in Meir, which can be further divided into two groups, based on the date of the supports, as M7C and M8C are dated to the reign of Sesostris II-III. However, due to the presence of witnesses from the Theban area, and one from el-Lisht, it cannot be stated that this pattern is uniquely based in Meir.

However, the branch as depicted in figure 3.125 does not occur in Rößler-Köhler,765 where M1C, M54C and M1NY are completely on the other side of the stemma than T2Be, T3Be and T3L,a. Moreover, only

763 de Buck (1951) CT IV, p. 222,b (B9C,a).
764 de Buck (1951) CT IV, p. 222,b (Sq1C).
M7C and M8C are grouped together in the stemma as $\varepsilon$, whereas T2Be and T3Be are part of $\lambda$, where T3L and T2Be part of $\pi$, which descends from $\lambda$.

On the right side of the central sub-branch (figure 3.126), there is another suggestion of a regional bound group. These consist of three witnesses from Saqqara, Sq1C, Sq2C and Sq7C. The proximity between these witnesses falls within expectations, as they were found in the same tomb, and are typologically similar.

Moreover, in Sq1C and Sq7C, the witnesses replaced the use of humanoid figures with the Z1 ($\𓏤$), which includes any use of a humanoid figure in the first person. However, the placement of Sq2C might be more due to modern reconstruction, which was based on Sq1C and Sq7C, as more than 90% of the witness is partially or fully reconstructed. In Rößler-Köhler, Sq1C and Sq7C are placed together as well, as part of type $\rho$, although this is connected to type $\mu$, to which B1Y and L3Li belong, which is not the case in the dendrogram.

The right sub-branch of figure 3.126 is more difficult to explain. M57C and T3L,a share the same sub-branch, although a bit distant. However, T3L,a only has four phrases, and due to the limited shared data-points could end up nearly everywhere. The placement of M57C is difficult to explain on the other hand, as it does not share much connection with the witnesses from Saqqara, or T3L,a. However, in the stemma of Rößler-Köhler, M57C is likewise far removed from any other witnesses from Meir, although not connected to T3L,a or Sq8Sq as is the case here. Sq8Sq is mostly reconstructed, which makes its placement more remarkable, as these reconstructions were commonly based on Sq1Sq, as these witnesses share a unique phrase, IV,219,c-g: $\text{wṣḏ-wr rnsf sṯz pw iṣb.t m iwnw s pw n mrs.t mtw.t ḫḥ.(w) rnsf sṯz pw iṣn.t m nṣ-sṛf}$ (the sea is its name, it is the passage of the east in Heliopolis. It is the lake of $\text{mrš.t}$, the semen of millions is its name, it is the passage of the west in Naref). However, as Sq1Sq ends after IV,230,a, and Sq8Sq end after IV,262,b, a large section of its reconstruction was based on the other witnesses from Saqqara. These were mainly Sq1C and Sq7C. Therefore, its placement seems more due to reconstruction than what the original text used to be. Based on the placement, it seems that this sub-branch exists as a group of witnesses that share enough data-points with the other witnesses of the central sub-branch to be included, but should be considered a group of dissimilarity, instead of similarity.

The final sub-branch of the central sub-branch has two witnesses, L3Li and T1Be. The similarity between these two witnesses are not reflected at all in Rößler-Köhler, as L3Li is part of type $\mu$, and T1Be is part of type $\lambda$. However, in the encoding process there were many similarities in the structure noted between T1Be and L3Li, which is reflected in de Buck, as he placed T1Be and L3Li next to each other.

---

767 de Buck (1951) CT IV, p. 219,c-g (Sq1Sq).
768 de Buck (1935) CT I, p. xv, where he notes: ‘and to keep families of manuscripts together only if the mutual resemblance was very strong and the difference from others very striking.’ The fact that L3Li interrupts the T1Be, T2Be and T3Be columns should therefore be considered important.
In regard to el-Lisht, it is clear that the two witnesses with this spell do not reflect a shared pattern in this region, due to the distance between them. Moreover, this is visible in Rößler-Köhler as well, where the distance between L3Li and L1NY is remarkable as well.

Finally, there is a branch containing B1Y and BH1Br. As B1Y does not have glosses, and BH1Br does, the placement on the same branch seems unlikely. Moreover, there are multiple phrases that are unique to BH1Br only,\(^{76}\) which would separate BH1Br from the other witnesses. This is the case in Rößler-Köhler, where it is placed as a separate entity, under type π, θ, ξ and ο. It is assumed that these two witnesses are placed together here as a sign of dissimilarity, rather than similarity.

### 3.52.3. Conclusions

In spell 335, the method used in this chapter does not seem to give a clear sign of regional variation in the sentence structure pattern. In theory, due to the length and the high number of witnesses, this spell should be considered ideal. However, there is a high level of variation, which makes it nearly impossible to make any clear statements, except based on the final sub-branches of the dendrogram. Due to the use of glosses or the lack thereof, the absence of entire paragraphs, or simply due to the spell ending early due to the available space for this spell on the support there are a high number of ‘-’ code points in the data. This can destabilise the result created with iq-tree.\(^{77}\) Even so, some signs of regional patterns do occur, although it is clear that there is a lot of freedom in this spell.

There are signs of at least two sentence structure patterns in use in Meir, which can be separated based on the date of the supports. One consists of M1C, M54C, and to some extent M1NY, dated to Amenemhat II. The other group consist of M7C and M8C, and is dated between Sesostris II and Sesostris III. Deir el-Bersha seems to provide a distinct group as well, even though not all witnesses from Deir el-Bersha are bound to use it. Finally, there seems to be a distinct pattern for Saqqara, although only for a group of supports that originate from the same tomb.

Thus, there are some signs of regional patterns, even though exceptions for every region exist. However, it needs to be remarked that there are no sentence structure patterns for this spell that are unique to one region.

### 3.53. Spell 355

The following section will discuss spell 355.\(^{77}\) In this spell, the deceased shows his mastery over the wind. Using the house that was built for him by Seshat,\(^{78}\) the deceased shelters from the wind, by sitting on the opposite side of the building.

\(^{76}\) IV,187,d-f, IV,193,d-f, IV,195,e, IV,201,f, IV,209,e-g, IV,211,c-d, IV,239,e, IV,243,d, IV,261,d, IV,281,d, IV,293,e-f.

\(^{77}\) 25 of the witnesses have more than 50% gaps or ambiguity, and of the 314 data-points, there are only 66 sites which are constant, so there is a very high level of variation.

\(^{77}\) Ptah in B1Bo,a, Sekhmet in B1Bo,b.
3.53.1. Introduction

This is a relatively short spell, with a total of 22 phrases. The witnesses use a selection of these phrases to form their version of this spell. In de Buck, there are a total of eleven witnesses, that originate from a total of six different regions. The support B1Bo provided two witnesses. The following table shows the witnesses sorted by region (table 3.50):

Table 3.50 Witnesses sorted by region for spell 355. See appendix 1 for a full list of details concerning every witness.

The majority of the witnesses originate from Deir el-Bersha, which provided five witnesses. Asyut has two witnesses, and the other regions all supplied one witness. The witnesses used in this section only represent the material which was published in de Buck.

The following figure shows the percentage of damage which occurred in the witnesses (figure 3.127):

![Figure 3.127 Percentage of reconstruction and damage in the witnesses for spell 355. Grey shows undamaged tokens, blue shows partial lacunae and red shows full lacunae.](image)

M22 and S2C are badly damaged, as both witnesses are around 70% partially or fully reconstructed. BH3Ox is nearly 40% partially or fully reconstructed, and B4C is over 20% partially or fully reconstructed.
The other witnesses are relatively intact. All these witnesses are included in this work, although any result including these witnesses need to be approached with caution.

3.53.2. Results and discussion

After the method described in 3.2.2 was applied, the following dendrogram was created (figure 3.128):

![Dendrogram Image](image)

Figure 3.128 Rectangular phylogram display of the distance between the different witnesses of spell 355.

For this spell, the dendrogram has one large branch, and two small branches, which contain A1C and B1Bo,a. In general, it needs to be noted that every witness in this spell has a high number of phrases that use a unique structure, which might explain the results here.\(^773\)

As B1Bo,a and B1Bo,b come from the same support, some similarity between them would have been expected, which is not the case here. Their placement on different branches does fall within expectations. B1Bo,a has eleven out of fifteen phrases that have a unique sentence structure, which explains its separation from the other witnesses. This for example can be seen in V,3,c, where B1Bo,a uses a subjunctive sḏm-f: ir iw.t p.t tn mḥ(y).t (if this sky comes as the north wind),\(^774\) where the other witnesses use a prospective sḏm-f instead: ir iwi p.t tn mḥ(y).t (if this sky comes as the north wind).\(^775\) B1Bo,b is more similar to the other witnesses however, as it shares seven of its twelve phrases

\(^773\) The full sentence structure file is available in appendix 3.49.

\(^774\) de Buck (1954) CT V, p. 3,c (B1Bo,a). Due to the addition of the X1 (.) with iwi, the distinction between the phrases was made, even though they are practically identical.

\(^775\) de Buck (1954) CT V, p. 3,c (B1Bo,b).
with other witnesses, which explains its placement on the large branch, even though nearly half of the phrases used in this witness have a unique structure.

The only section that resembles a regional pattern is in the left sub-branch of the large branch, which contains B2Bo, B4Bo and B4C. This grouping of witnesses suggests the existence of a Deir el-Bersha pattern. The placement of M22C does complicate this, but as this witness is mostly reconstructed, it is possible that this placement is rather due to the reconstructions, instead of the original text. The clearest connection between B4Bo and B4C is the use of the name of the owner, for example in V,2,b: pr dhwy-nyt in kd.n ss.t (the house of this dhwy-nyt, which Seshat build),\(^{776}\) where the majority of the other witnesses have: pr=i pw kd.n ss.t (this house of mine, which Seshat built),\(^{777}\) which uses the first-person suffix pronoun.

### 3.53.3. Conclusions

The method used in this chapter to visualise regional patterns in the sentence structure does not provide any clear results in this spell. Although there is a suggestion of a distinct pattern in Deir el-Bersha, both witnesses from B1Bo make it clear that variation is possible. It is assumed that the high level of phrases with unique structures is responsible for the placement of the witnesses, although it could be possible that there is no sentence structure pattern in this spell that can be considered regional.

### 3.54. Spell 398

Spell 398\(^{778}\) is the final spell that will be discussed in this chapter. Together with spells 396 to 405, this spell should be considered part of a group of spells designated the Ferryman spells.\(^{779}\) This spell concerns part of the journey of the deceased in the Netherworld, moving from the western to the eastern horizon.\(^{780}\) However, in essence the ferryman spells are not about the journey, but rather the test the deceased need to pass before entering the ferry.\(^{781}\)

The spell itself consists of three sections, the introduction, a list and the conclusion. In the introduction, the deceased requests the ferryman to bring a ship, which is followed by a few questions of the ferryman to the deceased to prove his identity. Finally, as the ship is not yet made, the deceased requests that it is created.\(^{782}\)

---

\(^{776}\) de Buck (1954) CT V, p. 2,b (B4Bo). Note that B4C replaced dhwy-nyt in with ss.t-hd-htp tn.

\(^{777}\) de Buck (1954) CT V, p. 2,b (G1T).

This introduction is then followed, although not always physically on the support, by a list. This list consists of columns divided into two parts, the upper part being a catalogue of parts of a ship, and the lower part the mythological explanation.\textsuperscript{783} In the witnesses of Meir, this is constructed as two phrases, separated by a \textit{m} (G17, 𓊝), which was written in its own field.

Finally, there is the conclusion, which consists of another section of answers the deceased has to provide to the ferryman.\textsuperscript{784} It needs to be noted that not all sections of the spell are always added, as for example M13C only has the list, where G2T has the introduction and the conclusion, but not the list.

3.54.1. Introduction

Due to the list, this spell is one of the longer spells that were used in this work. In total, this spell has 115 phrases,\textsuperscript{785} although the witnesses only use a selection of these phrases. In de Buck, this spell is attested in a total of twelve witnesses. However, for this work, thirteen witnesses will be used, as an additional witness (M1Be) was made available.\textsuperscript{786} These witnesses originate from four different regions. The following table shows the witnesses sorted by region (table 3.51):

<table>
<thead>
<tr>
<th>Region:</th>
<th>Witness:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aswan</td>
<td>A1C</td>
</tr>
<tr>
<td>Gebelein</td>
<td>G1T, G2T</td>
</tr>
<tr>
<td>Theban area</td>
<td>T3L</td>
</tr>
</tbody>
</table>

Table 3.51 Witnesses sorted by region for spell 398. See appendix 1 for a full list of details concerning every witness.

For this spell, the majority of the witnesses come from Meir, which provided nine witnesses. Gebelein has two witnesses, and Aswan and the Theban area supplied two witnesses each.

The following figure shows the percentage of damage which occurred in the witnesses (figure 3.129):

\begin{itemize}
\item \textsuperscript{783} Jéquier (1911), p. 37-38.
\item \textsuperscript{784} Willems (1996), p. 167.
\item \textsuperscript{785} In de Buck, the number of phrases is higher, but some phrases have been merged.
\item \textsuperscript{786} I am indebted to Tobias Konrad for providing the material concerning M1Be to me.
\end{itemize}
M6C, M13C and M46C are badly damaged, with around 70% of their tokens partially or fully reconstructed. M1Be, M4C and M21C are all more than 30% partially or fully reconstructed, and M3C and M5C are more than 20% partially or fully reconstructed. The other witnesses are relatively intact. Due to the high level of reconstruction that took place in M6C, M13C and M46C, any results based on these witnesses should be treated with some caution.

3.54.2. Results and discussion

Using the method described in 3.2.2, the following dendrogram was produced (figure 3.130):
In this dendrogram, there is one main branch, which contains the majority of the witnesses, and two separate branches for A1C and G1T. Here, it is instantly clear that there is a difference in the sentence structure between the witnesses from Meir, and those from the other regions, as all the witnesses from Meir are on the same sub-branch. This is obviously true, and clearly visible in the difference between the witnesses from Meir, and A1C and G1T. In the list itself, the witnesses from Meir separate the part of the ship, and the mythological explanation, by the connector $m$, creating a $A + m + B$ structure. However, A1C and G1T do not use the connector, which creates a $A + B$ structure.

As A1C and G1T share such an obvious similarity, it would have been preferred to see them together on a branch. The perceived distance in this dendrogram could however be construed as an effect of the visualisation pattern used. When the dendrogram is visualised as a circular phylogram (figure 3.131), it is clear that these two witnesses are a lot closer. As was seen in spell 75, these two witnesses should be considered a group, which should be considered part of the same tradition. However, as was seen in spell 162, there is usually some distance between their actual structure, which is seen in this spell as well, as these two witnesses have multiple phrases with a unique structure that is not shared with any other witness.\textsuperscript{787}

\textsuperscript{787} The full sentence structure file is available in appendix 3.50.
The separation of G2T and T3L is within expectation as well, as both these witnesses do not have the list section, but only the introduction and the conclusion. However, as T3L has numerous phrases with a unique sentence structure, it falls within expectation that some distance should exist between G2T and T3L. G2T is correctly placed in proximity to G1T, as it is remarkably similar to G1T,\footnote{Which would be expected, as both supports belong to the same owner.} with the exception that the list is not added. The separation between A1C, G1T, G2T and T3L can be seen in V,123,d, which does not occur in Meir. Here, A1C, G1T and G2T have: \textit{mh r=k s(y) whr.t} (complete her of the shipyard),\footnote{de Buck (1954) CT V, p. 123,d (G2T).} where T3L does not have \textit{whr.t: [m]h r=k s(y)} (complete her).\footnote{de Buck (1954) CT V, p. 123,d (T3L).}

Finally, even though it is clear that there is a distinct sentence structure pattern in Meir, some additional remarks can be made. Four witnesses from Meir, M4C, M5C, M6C and M2NY were placed on the same sub-branch (figure 3.132), which implies that there are multiple patterns available in Meir. This is clearly supported in the list section of the spell. At phrase V,127,b, there is a shift in the parts of the ship that is discussed. From this point on in the list, the B phrase stays the same, while the A phrase is one object behind the other witnesses. For example, M3C uses \textit{hsf.wt=s} (her repelling edges) at V,127,b, where M4C uses this at 128,a. However, although this seems a perfect grouping, there is one witness which complicates this, M21C. This witness has the same switch which occurs in M4C, M5C, M6C and M2NY, but is not on the same branch. Rather, it is placed together with M1Be, which does not have this switch. No clear explanation can currently be given for this result, although it does not disprove the existence of a sentence structure pattern for Meir in general.

3.54.3. Conclusions

In spell 398, the method used in this chapter works to visualise the existence of regional patterns in the sentence structure, which is especially visible in the witnesses from Meir, which are placed together on the same section of a branch. Additionally, a connection between A1C and G1T is visible, however this is more easily visible when a circular phylogram is used. Finally, the dendrogram suggest the existence of at least two sentence structure patterns that were available in Meir, although this is complicated by the placement of M21C on a different branch, even though it shares an identical characteristic with M4C, M5C, M6C and M2NY.

3.55. Conclusion and final remarks

This chapter served the purpose of introducing a new method of visualising variation in sentence structure, where the phrases of the spells were treated as the amino-acids of a protein. It was argued that this method could be used to visualize that these sentence structure patterns could be considered regional, which could lead to new topics of research.
In general, it seemed that the method used in this chapter is functional in that regard. However, some problems with the method have come forth, and will be addressed here, with some suggestions how to solve these issues, or at least limit their impact.

**Spell length:**

As seen in spells 2, 3, 5, 8, 10, 12, 15, 19, 31 and 95, the length of the spell has a strong influence on the final result. As one could expect, any comparison would be more stable, when a high number of data points are compared. Unfortunately, the short spells do not provide enough data points. Therefore, the method used in this chapter is of limited use in these cases. However, when dealing with spell groups, this problem can be overcome, as the multiple spells will create a higher number of data points. This should result in more stable results.

Additionally, an alternative approach than the binary system for denoting variation which was used in this chapter might benefit the results as well. If one would use the alternative approach discussed in chapter 3.2.2.1, in table 3.1, a higher number of data points will be achieved, as in this case, every token will become a data point, instead of the current method which only results in one data point per phrase. For example, in spell 2, for witness B4Bo, this would change six data points into a total of 26. However, as stated in chapter 3.2.2.1, the major drawback of this method is the time intensive nature, until it can be automated.

In general, if no changes on the method of this chapter are applied, it would be recommended not to apply this method on texts that have less than 20 phrases.

**Unique variation:**

As was seen in multiple spells, there are often many phrase structures that are unique in regard to the other witnesses. As these provide data points that cannot be linked with other witnesses, it has the tendency to create unexpected placement of witnesses in the dendrogram. When combined with texts with a low number of phrases, it makes the results produced unreliable at best. Additionally, it enhances the possibility that groups of witnesses are made based on dissimilarity, rather than similarity. This is problematic, as it can provide deceptive results.

The problem with unique variation can however be tempered by utilising a different method of denoting variation than was used here, as the binary approach has the tendency to increase the number of unique datapoints. As stated above in regard to spell length, a coding based on the tokens, rather than the phrases might be beneficial. This would not remove the unique feature, but rather limit its impact, as the other tokens of the phrase might still be similar to the other witnesses. This would provide additional stability.

Additionally, if available, the addition of new witnesses could help mitigate this issue. The additional witnesses might contain the same variation, which would provide stability, as the number of unique
variations will lower. This would greatly benefit the stability of the program. However, additional witnesses could just as well exacerbate any problems, by introducing new unique variations.

*Distant placement of similar witnesses:*

In the dendrograms created for this chapter, there are often one or two witnesses that are placed on the top section, on two separate branches used solely for one witness, that would have been expected to be placed together.

This issue is most likely due to the fact that there is nearly never a complete intact version of the spell, that includes all phrases, which forces the program to work on what is in essence incomplete data. A possible method to solve this issue is to include a construct witness, which would be an ‘ideal’ version of the spell, which includes every phrase, based on the most prevalent phrases between the witnesses. However, the creation of this construct witness would not only be time consuming, but fraught with bias as well, as it would be up to the encoder to decide what the construct phrase would look like. Here, a method based on the available tokens, as discussed in chapter 3.2.2.1, in table 3.1 would be a potential source for these phrases, although more research of the possibilities of such a method still needs to be pursued.
4. Visualising regional variation using the verbal structure

In chapter 3, it was argued that it is possible to visualize regional variation based on the sentence structure. However, it became clear that a binary approach to denote variation has the tendency to create problems with the method used, due to a high number of unique variations. This chapter will show an alternative approach, using the same method. Instead of using the entire text of the spells, as was the case in chapter 3, the focus will lie only on the verbal structure of the text. In a similar manner as was used in chapter 3, the visualisation of variation in the verbal structure of the witnesses will be discussed on a spell by spell basis.

4.1. Introduction

When applying a binary approach to variation, it is inevitable that problems will occur. Any type of variation can turn a phrase into a variant phrase. For example, the use of the genitival adjective \( n \), or the use of a plural. Therefore, it might be beneficial to approach the variation of the texts solely on the basis of one aspect. In this chapter, the aspect that will be studied is the verbal structure, as it is considered to be susceptible to variation. For the purpose of this chapter, verbal structure refers to the lemma, morphology and syntax of the verbal forms used, and their position in the phrase. However, the spelling of the verbal form will not be considered here, but rather in chapter 5.

The main goal of this chapter is to visualise patterns in the verbal structure of the spells. However, it is not intended to provide a detailed list of the entire verbal structure of the witnesses in the spells used for this work.\(^{791}\) The focus of this chapter lies on the variation between the different witnesses. Therefore, phrases in which no variation occurs are not included in this chapter. Based on this variation, dendrograms will be created for the spells, which visualise the connections between witnesses on a verbal level. Through this visualisation, it should be possible to inform additional avenues of research in regard to patterns of verbal use, which might be regionally influenced.

4.2. Method

In general, the same method discussed in chapter 3.2.23.2 will be used in this chapter. Thus, the protein sequence method will be applied here, using the program \(\text{iq-tree} \) for the comparison between the witnesses\(^ {792}\) and the program Dendrogram for the visualisation.\(^ {793}\) However, certain adaptations in the preparations for these programs needed to be made in order to allow for the comparison of verbal forms instead of phrases.

\(^{791}\) However, it would be possible to extract this verbal structure from the database created for this work.
\(^{792}\) See chapter 3.2.2 Spells as proteins.
\(^{793}\) See chapter 3.2.2 Spells as proteins, using the same format for the visualization of the dendrogram, namely the rectangular phylogram.
Where in chapter 3 every phrase of every witness was used for the comparison, this will not be the case here. Instead, only a selection of these phrases was used. Phrases in which no verbal forms occur would be of limited use in a verbal analysis. Therefore, these phrases were excluded. Additionally, phrases with a verbal construction, but in which there is no variation in the lemma, morphology, syntax or position of the verbal forms would be of limited use for a study concerning variation. As there would be no variation between the witnesses, this would only add an identical amino-acid code between the witnesses. Therefore, these phrases were excluded from the analysis as well. Even though it could be argued that these phrases should be included in the analysis, tests based on CT spell 1 showed that the addition could create problems, rather than benefits. As not all the witnesses have the same phrases, these would create different clustering patterns which are informed by the occurrence of a phrase, rather than the underlying verbal structure.

As discussed in chapter 3.2.2, the Iq-tree program needs a file consisting of amino-acid codes. For this purpose, analysis files were created. In order to create comparable structures, the verbal forms for every phrase were separated in groups, based on lemma, morphology, syntax and position.

For example, take CT spell 75, phrase 316-317,a. In S2C, the following phrase is used: hpr.n-i m h`.w ntr ds-f (I have come into being from the body of the god himself). In this phrase, there is only one verbal form, namely the hpr.n, a nominal sdm.n-f (emphatic use). This would be considered part of a verb group, as the same structure occurs in other witnesses as well, namely S14C, T3C, B1Bo, B6C, M3C, M20C, M4C, M5C, M6C, M28C, M-Ann and M1Be. However, S14C, T3C, B1Bo, B6C, M3C, M20C, M4C, M5C, M6C, M28C, M-Ann and M1Be are not completely similar to S2C and the other witnesses. Although they share the same group for hpr.n, these witnesses have another verbal form in their phrase, for example S14C: hpr.n-i m h`.w ntr hpr ds-f (I have come into being from the body of the god who came into being (by) himself). In addition to the hpr.n, this witness has hpr, a perfective active participle, masculine singular. Thus, even though S2C and S14C share one of the two groups, they clearly do not have the same verbal structure in this phrase. S2C only has one verbal form, whereas S14C has two. In B3C, another variation occurs: ts.n ss.t-hd-hpt in m h`.w ntr hpr ds-f (This ss.t-hd-hpt has been knitted together from the body of the god who came into being). In this phrase, hpr.n has been replaced by ts.n, which is a clear variation in lemma. However, except for a nominal subject, the morphology, syntax and position in the phrase are identical. Additionally, the participle hpr is identical to S14C. This means that B3C shares the second group with S14C. That said, the position of the verb forms are important as well, as is seen in B1C: hpr.n-i ts.n-i m h`.w ntr hpr ds-f (after I came to be and was knitted together from the body of the god who came into being by himself). In this phrase, hpr.n and ts.n are both used, which clearly separates this witness from S14C, as three verbal forms are used instead of two. Even though the final verb form for S14C and B1C is the participle hpr, which is identical in lemma, morphology and syntax, the participle will not be allocated to the same group in S14C and

794 However, I am completely aware that the addition of new witnesses could affect this approach, as they might have a verbal structure variant not yet attested in the other witnesses, which would force the inclusion of another phrase, and therefore an additional amino-acid code into the analysis.

795 See appendix 5.

797 For a full list regarding the terminology used for this work, see appendix 4.

798 Kindly provided to me by Tobias Konrad.
B1C, as it is the third verbal form in the phrase, instead of the second. Even though the additional verb form used in B1C would suffice to separate this witness from the other witnesses,\textsuperscript{799} for the sake of consistency the separation was maintained.

It is not uncommon that witnesses leave out one of the verbal forms in any phrase. In this chapter, only the verbal structure is taken into account, and therefore the position of the verb form in regard to the other verb forms matter. As one can see in S2C, which left out the participle \textit{hpr}, this could include cases where the expected structure of the phrase is visible in the non-verbal sections. Moreover, this separation based on position will even include cases where a verbal form became a substantive, as the verbal form no longer exists. For example, in CT spell 75, B6C has: ‘\textit{h2-nht} pn sr \textit{spr.w} w\textit{is=f} (This \textit{h2-nht} is the magistrate of the crew of his bark).\textsuperscript{800} In this phrase, B6C replaced the verb \textit{sri} (to command) with the substantive \textit{sr} (magistrate), by adding an A40 (𓀭) to the spelling of the word. However, it needs to be made clear that position does not refer to the position of the token in the phrase, but rather to the position of the verbal form in regard to the other verbal forms in the same phrase.

For every phrase in which variation in the verbal structure was found, the verbal forms of the witnesses were separated in different groups. These groups were used to allocate the amino-acid codes. For the example above, S2C would be group 1, S14C would be group 1+5, B3C would be group 2+5, and B1C would be 3+4+6.\textsuperscript{801} Each different group sequence would be allocated a separate amino-acid code, thus for this phrase, S2C would be R, S14C would be N, B3C would be D and B1C would be C. The same grouping procedure was repeated for every applicable phrase of this spell.

In general, a binary approach was used to denote the groups, thus any variation in lemma, morphology, syntax or position would create a new group. However, some exceptions did apply:

I. Subject. The use of a nominal subject or pronominal subject was not considered a variation, although the use of the name of the owner in the text could reorganise the positions of the verbal forms, in which case it would be a variation. This is one of that reasons spelling is not considered a variation (see point V), as for example the prospective \textit{s\textsc{d}m-f} might have a \textsc{w} ending instead of a \textsc{y} ending, when a nominal subject is used.

II. Gender of the owner. Especially with statives and participles, the gender of the owner can create a morphological variant. In appendix 5 these gender-based variations are entered as separate groups, but for the purposes of analysis, these groups were treated as if they are identical.

III. The verbs \textit{i\textsc{w}i} and \textit{i\textsc{i}i}. Although in the database encoded as separate lemmas, for the purposes of analysis, these two verb forms are treated for the verbal structure as identical.\textsuperscript{802}

IV. Spelling. For the purposes of this chapter, the actual spelling of the verbal forms used is ignored.

\textsuperscript{799} Therefore, one could mark the \textit{hpr} as ‘final position’ for both, but I chose to separate these cases in order to be thorough, and limit the chances for incorrect placement.

\textsuperscript{800} de Buck (1935) CT I, p. 324,b.

\textsuperscript{801} See appendix 5.31.

\textsuperscript{802} Following Winand (1991).
For the applicable phrases, these codes were extracted into a file in the FASTA format, after which the method described in chapter 3.2.2 was applied in order to produce a dendrogram. As stated in chapter 3.2.2, the protein-sequence method used here is only a visualisation of proximity between the verbal structure of the witnesses. It is not intended to provide detailed lists of the different verbal structure patterns used for these witnesses, but rather to show where new avenues for research might lie. Moreover, although the visualisation in the dendrogram has lines connecting the different witnesses, these lines should not be considered familiar or chronological connections between the witnesses.

It needs to be noted, however, that every problem which occurs with this method discussed in chapter 3 will apply here as well. Short spells are less likely to result into functional dendrograms, as often these spells are reduced to one or two phrases in which verbal variation occurs. In these cases, the spell will be discussed, but no dendrogram will be produced, as these dendrograms will be based on a too limited number of data points. Additionally, these spells with a low number of phrases can be easily sorted manually. As discussed in chapter 3.55, unique variation is a strong detriment to the functionality of the protein-sequence method, but it is assumed that due to the focus on the verbal structure, the data-points used are less prone to unique variation. Most commonly, unique variations occur in the substantives, connectors, demonstratives and pronouns, rather than the verbal forms. Therefore, the occurrence of unique variation should be less prevalent, which helps stabilising the method used. However, any issue due to a low number of data points cannot be evaded.

In the following sections, the verbal structure of the spells will be discussed in a similar manner as in chapter 3.3-54.

4.3. Spell 1

In this section, the verbal structure of spell 1 will be discussed. In this short spell, there are only two phrases in which some level of variation occurred in the verbal structure. Due to this low number, a manual approach will be used here rather than to create a dendrogram. In total, there are four different patterns of verbal structure variation which occur. B2Bo, B3Bo, B4Bo, B4C, B6C, MC105,a, MC105,b, S10C, T1L, T9C, TT319 and Y1C use the same pattern. In this pattern, these witnesses have the imperative in I,6-7,b: *wsir ss.t-ḥd-ḥtp in ṭs tw [hr isb(.y)=t] (the Osiris, this ss.t-ḥd-ḥtp, raise yourself upon your left side) and the imperative in I,6-7,c: *imi ʿn hr inn=t (place yourself upon your right side). B15C, B1P and BH5C all have their own unique pattern. However, most of these variations could alternatively be interpreted as errors. Only BH5C is different from the other witnesses in both phrases.

---

803 Although I must admit that it is possible to extract these pattern descriptions from appendix 5.
804 For example, spell 3 and 26 only have one phrase with verbal structure variation.
805 Which results in a dendrogram where there is one long horizontal line at the top, to which most witnesses are connected, with maybe one or two branches for the witnesses that vary from the pattern used by the other witnesses.
806 For more detail regarding background, witnesses and reconstructions, see chapter 3.3.
807 See appendix 5.1 regarding the phrases in question.
808 de Buck (1935) CT I, p. 6,b (B4C).
809 de Buck (1935) CT I, p. 6,c (B3Bo).
as B15C and B1P only vary in the second phrase. In I,6-7,b BH5C has the imperative *imi*, followed by the imperative *ts*: *wšrn-nḥt ṣn imi ts ḫr ḫsbt(y)+k* (the Osiris, this *ḥmn-nḥt*, place and raise yourself upon your left side). In I,6-7,c, both B1P and BH5C have a prospective *sdm-f*: *dl-i ts ḫr ḫsbt(y)+k* (I will place you upon your left side). In the same phrase, B15C corrupted the V13 (𓎑) of *ts* into a V31A (𓎑), turning the dependent pronoun into a first person stative ending: *dl.kw innn=k* (while I am placing your right side).

Based on these results, it is clear that in regard to spell 1, there is no regional conditioned variation regarding verbal structure of this spell, as Asyut, Deir el-Bersha and the Theban area all share the same verbal structure in the phrases in which any level of verbal structure variation occurs. The only exception to this is BH5C, which has a different verbal structure than the other witnesses in the phrases with verbal structure variation. However, as this is based on two phrases, and one witnesses, it would be assumptive to suggest the existence of a distinct pattern in Beni Hasan.

### 4.4. Spell 2

Spell 2 is similar to spell 1, with a total of two phrases in which verbal variation occurs. Therefore, it will be discussed manually, instead of creating a dendrogram. In total, there are six different patterns used here. The majority of the witnesses use the same pattern, which is encouraging, as all these witnesses come from Deir el-Bersha. Only one witness from Deir el Bersha (B6C) does not follow the same pattern entirely, as it is solely responsible that I,8,c is included in this section at all. Here, B6C has a indicative *sdm-f*: *rdi n-k bṣ₂-k imy tś śvw.t=k imy.ś șṭz.w* (your soul which is in the land and your shade which is in the secret places caused for you), where the other witnesses have a *sdm.tw=f*: *rdi.t(w) n-t bṣ₂-t imy tś śvw.t-t imy.t șṭz.w* (that your ba which is in the land and your shade which is in the secret places be given to you). The four other patterns occur due to I,9,c. In this phrase the witnesses from Deir el-Bersha end the phrase after *ḥfft.yw=k* (your enemies), where MC105, S10C, TT319 and Y1C add a variant of: *r irr.wt r-k r msdq.w tw ir.t(y)=sn wḏ-*mdw ḫft=k m hrw pn* (against those who act against you, against those who hate you, they who will do judgment in front of you on this day). It is the variation in this phrase that creates a different pattern for MC105, S10C, TT319 and Y1C. Thus, it is clear that there is a pattern used in Deir el-Bersha, that differs from the other witnesses, visible in the verbal structure, although the extension of the phrase would make that quite clear already.

Unfortunately, the method used for noting the variation creates an issue here as well. S10C and Y1C share a specific feature in this phrase, which does not occur in the other witnesses. S10C and Y1C added *iw* before the *msḏ-ḥrw*, which changed the morphology and syntax of these witnesses. However, as the verbal structure varies in the later section of the phrase, the method used here would separate these

816 S10C separated *irr.wt* into two verb forms, *irr.w* and *irr.wt*, to clarify that both genders apply here. Additionally, Y1C used *msdq.w* where S10C used *msdq.wt*.  

219
witnesses, which would cause the similar feature between these witnesses to be lost. This connection is important, as Jürgens\textsuperscript{817} suggests that Y1C originates from Asyut, which this variation would support.

Based on this spell, there seems to be a regional conditioned pattern used in the verbal structure. Deir el-Bersha is clearly distinct from the other witnesses, although rather though not using a section of a phrase. However, the method of this chapter falls short, as it creates four separate patterns for MC105, S10C, TT319, Y1C. When only the first verb of the phrase is taken into regard, it would furthermore be possible to differentiate between an Asyut and Theban area pattern.

4.5. Spell 3

For the method used in this chapter, spell 3\textsuperscript{818} is even worse than spell 1 and spell 2, as it only has one phrase, I,10,e, in which any verbal variation occurs. This again means that a dendrogram cannot be created, as Iq-tree needs at least two data points per witness to function. Additionally, based on this single phrase, there is no regional conditioned pattern variation, as the only two witnesses with a similar structure are B1P and MC105, from Deir el-Bersha and the Theban area. Here, they have both a masculine and feminine imperfective active participle: \textit{ir irr.w ir-\textsuperscript{t} r irr.wt r-\textsuperscript{t} m hr.t-n} (against those males who act against you, against those females who act against you in the necropolis).

Therefore, beyond the lack of evidence of a regional conditioned pattern for this spell, the method used in this chapter does not work for this spell.

4.6. Spell 4

Spell 4\textsuperscript{821} is less problematic for the method used here, as it has four phrases\textsuperscript{822} in which verbal variation occurs. However, the majority of witnesses are clustered together,\textsuperscript{823} which results in a deceiving dendrogram, as they would be displayed as a horizontal line. Additionally, when a dendrogram is created, there is a case of dissimilarity being clustered together. S10C and TT319 were placed on the same branch, while there is no data point between them which could inform this placement. For example, in I,11,b, TT319 has a \textit{sdm.n}: \textit{sn n gbb *r.ty=f hr-\textsuperscript{t} (after Geb opened his two jaws upon you)}, where the other witnesses have a nominal \textit{sdm.n}: \textit{sn n=k gbb *r.ty=f hr=k (Geb opens his two jaws for you upon you)}.\textsuperscript{824} Moreover, S10C varies in one data point from the majority group, which makes it placement even more unusual, as this is the case for B6C as well, although based on a different phrase.\textsuperscript{825} Although S10C and Y1C vary in one of the phrases (I,12,c), this does not oppose the suggestion of Jürgens that Y1C originates from Asyut. It could be argued that the variation in S10C

\textsuperscript{822} See appendix 5.4
\textsuperscript{823} B2Bo, B3Bo, B4Bo, B4C, B15C, B1P, MC105, T9C and Y1C.
\textsuperscript{824} de Buck (1935) \textit{CT I}, p. 12,c (Y1C).
\textsuperscript{825} B6C varies on I,11,e and S10C varies on I,12,c.
occurred due to an error, as it is the only witness that does not follow the same pattern as all the other witnesses. In this phrase, S10C has: \textit{st sr}f=k \textit{r} \textit{ts} (may your warmth be kindled to the land), where the other witnesses have \textit{st=k n=k sr}f=k \textit{r} \textit{ts} (may you kindle for yourself your warmth to the land).

For this spell, the method used in this chapter does not seem to work, most likely due to the limited number of phrases on which the results are based. Moreover, due to unique variation, there is a tendency to create clusters of dissimilarity. Additionally, there is no evidence for the existence of a regional conditioned pattern.

4.7. Spell 5

Although spell 5 only has three phrases in which variation in the verbal structure occurs, it is actually practical to include the dendrogram here, as there is a lower number of witnesses with the same data points. Using the method described in this chapter, the following dendrogram was created (figure 4.1):

![Dendrogram Image]

Figure 4.1 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 5.

In this dendrogram, there are two main branches, of which the left one divides into two sub-branches. Based on the three phrases, B4Bo and B1P should occur on the same branch, which it does. However, B4C is included here, because the final phrase (I,16,b) does not occur in this witness. Thus, its placement is based on the first two phrases only, which means it could have been placed together with B6C and B15C as well. The fact that B6C and B15C occur on the same branch falls within expectations as well. This can be seen in I,16,b, where B2Bo, B5Bo and B1P have an imperfective active participle: m\textit{s^c-hrw} r

---

826 In I,12,c, S10C did not add the 2nd person suffix pronoun after the verb, which caused me to read the \textit{sdm=f} as passive rather than active, which caused the creation of an additional group. See appendix 5.4 for more detail.

827 de Buck (1935) CT 1, p. 12,c (B1P).

828 For more detail regarding background, witnesses and reconstructions, see chapter 3.7.

829 B4Bo and B1P, and B15C and B6C have an identical structure.

830 See appendix 5.5 for more detail.
While B3Bo, B6C and B15C have a nominal $sdm=f$: $mz^r-hrw=k$ r $hft.ywt=k$ (you are justified even against your male and female enemies). The placement of MC105 is more unusual, as it only shares one phrase (I,15-16,c-a) with either the B4Bo, B4C and B1P group, or the B6C and B15C group. However, as it varies from B2Bo, B3Bo and S10C, its placement on this branch seems suitable. This can be seen in the structure of I,15,b, where MC105 has the circumstantial $sdm.n=f$: $iw$ $it.n$ $wsir$ $[Sdi]$ $tn$ $p.t$ $iw$ $iw^c.n$ $wsir$ $[Sdi$ $tn]$ $ts$ (the Osiris, this $Sdi$ has taken the sky, the Osiris, this $Sdi$ has inherited the land), where the other witnesses have two imperatives: $it$ $n=k$ $p.t$ $iw^c$ $n=k$ $ts$ (take the sky, inherit the earth).  

The placement of B2Bo and B3Bo is within expectation as well, as they share the first two data points, although vary in the final one. However, the placement of S10C is more dubious. In the same manner as MC105, it does not have the final phrase, and only shares the first phrase with the other witnesses. Therefore, it seems that the separation into two main branches is based on I,15-16,c-a. Here, B4Bo, B4C, B6C, B15C, B1P, and MC105 have a prospective relative $sdm=f$: $nm.w$ $ir=f$ $nhm=f$ $p.t$ $m^c$-$k$ $m$ $nTr$ $pn$ $rnpw$ $nfr$ (who is he who will take this sky away from you, as the good young god?) where B2Bo and B3Bo have an imperfective active participle: $nm$ $ir=f$ $nhm$ $p.t$ $m^c$-$k$ $m$ $nTr$ $pn$ $rnpw$ $nfr$ $im$ (who is the one who takes this sky away from you, as the young and good god there?), while S10C has an infinitive: $in-nm$ $r$ $n$ $[hm$ $p.t$ $tn]$ $m^c$-$k$ (who will take this sky away from you?).

However, it is not possible to suggest that there is regional conditioned variation in the verbal structure, as the two witnesses that do not originate from Deir el-Bersha are placed on either branch. Additionally, although there are some separate patterns in Deir el-Bersha that occur, it cannot be supported by the date of the witnesses. If the date of creation would have some influence, B2Bo, B3Bo, B4Bo and B6C should be relatively similar, which is not the case. Additionally, although not visible in the dendrogram, an argument could be made that there is variation between Deir el-Bersha and the other regions, simply by the occurrence of I,16,b, which does not occur in MC105 and S10C.

For spell 5, it seems that the method used in this chapter works, although there is no clear evidence of regional conditional variation in the verbal structure. Moreover, spell 5 shows that it is possible that clustering can be based on one data point, which could lead to incorrect results.

4.8. Spell 6

In spell 6, there are a total of 6 phrases in which verbal variation occurs. Using the method described in this chapter, the following dendrogram was created (figure 4.2):

---

831 de Buck (1935) CT I, p. 16,b (B2Bo).
832 de Buck (1935) CT I, p. 16,b (B6C).
833 de Buck (1935) CT I, p. 15-16,c-a (B1P).
834 de Buck (1935) CT I, p. 15-16,c-a (B2Bo).
835 If one assumes that the same manuscript would be used, and that the coffins were created in the same workshop. However, this would be assumptive.
836 For more detail regarding background, witnesses and reconstructions, see chapter 3.8.
837 See appendix 5.6 for more detail.
Above is a prime example that the rectangular phylogram display can create the suggestion of distance where none exists. B1P is on one side of the top line, where B2Bo, B3Bo and B4Bo are on the other side. However, these four witnesses should be clustered on top of each other, as they are identical in structure. Therefore, it is clear that the choice of display might falsely imply differences between the witnesses.

Based on this spell, there seems to be evidence of a verbal structure pattern used in Deir el-Bersha, which is distinct from the other regions. This is visible in I,18,a, where B2Bo, B3Bo, B4Bo, B6C and B1P have a prospective $sdm\_f$ of the lemma $psg$ (to kneel): $psg\ ss.t\ hr\_t$ (Isis will kneel upon you), where B15C has a prospective $sdm\_f$ of the lemma $pzh$ (to scratch): $pzh\_y\ ss.t\ hr\_k$ (Isis will scratch upon you), B4C has a stative of the lemma $psg$: $[psg\_t(i)]\ ss.t$ (You are kneeling, Isis) and MC105 and S10C have a prospective $sdm\_f$ of the lemma $b3gi$ (to be weary): $b3g\_y\ ss.t\ [hr\_k]$ (Isis will be weary under you). However, there are at least two forms in use in Deir el-Bersha, which is clearly visible in I,18,g, which is attested outside Deir el-Bersha, and in B4C and B6C. Here, B4C, B6C and S10C have an feminine plural imperfective active participle: $r\ msdd\_w(t)\ tw$ (against those, male and female, that hate you), where MC105 has both a masculine and feminine imperfective active participle: $r\ msdd[d\_w]\ tn\ r\ msdd[.t]\ tn$ (against those males that hate you, against she who hates you). On the other hand, this could be argued as free variation as well, as B1P and B2-4Bo are clustered together, while B1P is decorated by a different style, and at a later date, which shows that the variation is not based on the period of coffin construction.

It needs to be noted however that the dendrogram implies proximity between MC105 and S10C. This is in fact deceptive, as these witnesses only share one identical data point (I,18,a). Thus, the branch is rather based on the dissimilarity from the witnesses from Deir el-Bersha, rather than actual similarity.

838 de Buck (1935) CT I, p. 18,a (B3Bo).
839 de Buck (1935) CT I, p. 18,a (S10C).
840 de Buck (1935) CT I, p. 18,g (B6C).
between these two witnesses. Sadly, currently the material available for this work only has one witness from Asyut and one from the Theban area, which is too limited to make any statements regarding the regions beyond Deir el-Bersha.

For this spell, the method used in this chapter functions to show regional conditioned variation in the verbal structure. However, it needs to be noted that for spell 6 only the general form of the dendrogram should be taken into regard, as MC105 and S10C are placed on the same branch, even though they are dissimilar in their structure from each other, and are placed here due to their dissimilarity from the witnesses from Deir el-Bersha.

4.9. Spell 7

In spell 7, there are nine phrases in which variations occur. Using the method described in this chapter, the following dendrogram was created (figure 4.3):

![Figure 4.3 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 7.](image)

In this dendrogram, the placement of B2Bo and B3Bo falls within expectations, as they have an identical verbal structure in the phrases where variation occurs. One could be tempted to suggest that there are two patterns in use in Deir el-Bersha, as there are two branches on which the witnesses of Deir el-Bersha occur. For example, in I,23,b, where B2Bo and B3Bo have a nominal $sdm=f$ followed by a infinitive of the lemma $hn$ (to play music): $mr n\bar{d}m ib n ss.t hrw=s pw nfr n \_hn.t$ (as the heart of Isis is sweet this, her good day of playing music), where B4Bo, B4C, B6C and B1P have a nominal $sdm=f$ followed by an infinitive of the lemma $hn$ (to row): $mi n\bar{d}m ib n ss[.t] hrw=s pw nfr n \_hn.t$ (as the heart of Isis is sweet

---

841 For more detail regarding background, witnesses and reconstructions, see chapter 3.9.
842 See appendix 5.7 for more detail.
843 de Buck (1935) CT I, p. 23,b (B3Bo). Note however that this structure is used in MC105, S10C and T9C as well.
this, her good day of rowing). The existence of the third branch, on which witnesses from Asyut and the Theban area were placed, suggests that there is a separate pattern in use outside Deir el-Bersha. However, the placement of T1NY counters this suggestion. Moreover, the connection between the witnesses of the lower branch might be weaker than would seem here. For example, the connection between B4C and B1P consists only of five of the nine phrases, where B4Bo and B4C share only three phrases, while they are on the same general branch. Thus, the similarity on this lower branch might be rather due to the distance from the other two branches, rather than common ground between the witnesses on this lower branch.

All in all, this dendrogram faintly suggests that there are at least three general patterns in the verbal structure to this spell. One pattern for B2Bo and B3Bo, one pattern for witnesses from Asyut and the Theban area and one pattern which is more popular in Deir el-Bersha, but available for the Theban area as well.

The method used in this chapter seems to be of limited use in this spell, even though the placement of the witnesses seems to fall within expectations. There seems to be a pattern in the verbal structure which is used in Deir el-Bersha, and one outside it, even though these are not exclusive. However, as the sentence structure did not support the idea of a regional pattern either, it would be surprising if the verbal structure would create a clear distinction.

4.10. Spell 8

The following section deals with spell 8. In this spell, there are a total of six phrases in which verbal structure variation occurs. Using the method described in chapter 4.2, the following dendrogram was created (figure 4.4):

---

844 de Buck (1935) CT I, p. 23,b (B6C).
845 I,19,c, I,20,c, I,21,c, I,21,d, I,23,b.
846 I,19,c, I,20,c, I,23,b.
847 See chapter 3.9.3.
848 For more detail regarding background, witnesses and reconstructions, see chapter 3.10.
849 See appendix 5.8 for more detail.
In this dendrogram, there are 2 main branches, and a separate branch for B3Bo. Except for the placement of the T1L, it could be argued that there is a verbal structure pattern used in Deir el-Bersha, and one outside Deir el-Bersha. Moreover, it could be suggested that although common ground exists, it is possible to differentiate between Asyut and the Theban area.

However, some reservations need to be made concerning the previous statement. For example, B4Bo and B4C were placed on the same sub-branch, even though they only share the same structure in two of the six phrases.\(^{850}\) The same occurs between B1P and T1L, which share only two phrases.\(^{851}\) However, the B6C and B1P share the same structure three phrases,\(^{852}\) B2Bo and B1P in three phrases,\(^{853}\) and B6C and B2Bo in three phrases.\(^{854}\) If one compares B2Bo and B3Bo, the fact that they were placed on different branches seems even more unusual, as they share the same structure in four phrases.\(^{855}\) A good example of this deceptive structure can be seen in I,25,a, where the witnesses from Deir el-Bersha have two singular participles: \textit{phr} \(\text{h}z-s \ \text{m-sz-s}\) (The one that envelopes is behind her, the one that stands is behind her),\(^{856}\) while the other witnesses have two plural participles: \textit{phr. w} \(\text{hs \ wsir bwsy pn}\ \text{m-sz bwsy pn}\) (Those that envelop are behind the Osiris, this \textit{bwsy}, those that stand are behind this \textit{bwsy}).\(^{857}\) Even though this seems a clear division, B1P actually has the plural participles as well, thus therefore it is not a division between Deir el-Bersha and the other regions.

The distinction of the left branch adheres more to expectations, as MC105 and T9C share the same structure in five of the six phrases.\(^{858}\) The placement of S10C on this same branch is less readily

---

850 I,25,a and I,26,a.
851 I,25,a and I,26,b.

857 de Buck (1935) CT I, p. 25,a (T9C).
858 The only difference occurs in I,24,b, which is extremely varied between the witnesses.
explained, as it only has four of the six phrases\textsuperscript{859} which have variation in the verbal structure, leading to a placement based on I,24,a and I,25,a, which use the same structure as MC105 and T9C.

For spell 8, it seems that the method used in this chapter is capable of visualising regional conditioned variation in the verbal structure, as it is possible to differentiate between a pattern used in Deir el-Bersha, Asyut and the Theban area. However, it seems that the clustering of witnesses is based on half of the data points on average. Combined with the low number of phrases, it is clear that the dendrogram provides a deceptive result.

4.11. Spell 9

In spell 9,\textsuperscript{860} there are a total of twelve phrases\textsuperscript{861} in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was produced (figure 4.5):

![Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 9.](image)

In this dendrogram, there is a clear vertical division between two clusters of witnesses. Remarkably, the top cluster consists of all the witnesses from Deir el-Bersha, with the inclusion of one witness from the Theban area. However, it needs to be noted that T1L only has two of the twelve phrases.\textsuperscript{862} In these two phrases, the structure used in T1L is nearly identical to B6C, which explains its placement here. This distinction between Deir el-Bersha and the other regions, with the exception of T1L, can be seen in

\textsuperscript{859} I,25,b and I,26,a do not occur in S10C.

\textsuperscript{860} For more detail regarding background, witnesses and reconstructions, see chapter 3.11.

\textsuperscript{861} See appendix 5.9 for more detail.

\textsuperscript{862} I,30,a and I,30,b.
I,30,b, where the witnesses from Deir el-Bersha have a participle: \textit{swt} \textit{fj3 hr.wy sth n=f} (He is the one who crushes the testicles of Seth for him),\textsuperscript{863} where the other regions have a nominal \textit{sdm.n=f} \textit{sf.n=f hr.wy sts} (He has crushed the testicles of Seth).\textsuperscript{864} As T1L only has two phrases in this spell, and none of the other phrases, verbal or non-verbal, it could be argued that although similar to B6C, it should be considered its own entity, even its own separate spell here, which shares some features with spell 9.

Even though the upper cluster suggest a Deir el-Bersha pattern, it needs to be made clear that there is a high level of variation between these witnesses. Most connections within Deir el-Bersha are based on four to six phrases with similar verbal structure.\textsuperscript{865} In comparison, MC105 and T9C share nine phrases with the same structure.\textsuperscript{866}

The lower cluster consists of the other witnesses from the Theban area, and S10C from Asyut. Based on this placement, it can be suggested that there is a regional conditioned pattern in the sentence structure in Deir el-Bersha and the other regions.\textsuperscript{867} Moreover, as S10C is on a different sub-branch, it could even be suggested that there are distinct patterns in Asyut and the Theban area as well, even though they are more closely connected to each other. This is most clearly visible in I,30-31,d-a, I,31,b and I,31,c, which do not occur in S10C, rather than a distinct verbal structure pattern of S10C.

For this spell, the method used in this chapter is functional to visualise regional conditioned patterns in the verbal structure. There are clear signs that there is a distinct pattern in Deir el-Bersha, although with much freedom. Additionally, there is a pattern outside Deir el-Bersha, which can be separated in Asyut and the Theban area, although these witnesses are closely related.

### 4.12. Spell 10

This section will discuss spell 10.\textsuperscript{868} This short spell has only three phrases in which verbal variation occurs.\textsuperscript{869} However, as the variation is limited in these phrases, there is no benefit to create a dendrogram on this low number of data points. Moreover, when a dendrogram is created based on these three phrases, the results do not resemble the reality of the structure. I,35,b only has a verbal construction in MC105, S10C and T9C.\textsuperscript{870} Therefore, one would expect that these be placed on a separate branch. Instead, MC105 is clustered with B3Bo, B2Bo, B4Bo, B6C and B1P, even though it has a phrase which does not occur in the other witnesses. Partially, this is due to the fact that in MC105, S10C and T9C have their own unique structure in I,35,b. Here, MC105 has the most extensive structure, as it has four participles: \textit{r msddw s(y) r ms[dd.wt s(y) r ir} \textit{r].w r=s r irr.wt r=s} (against those males who hate her, against those females who hate her, against those males who act against her), where S10C

\textsuperscript{863} de Buck (1935) \textit{CT I}, p. 30,b (B1P). Note that T1L has this structure as well.
\textsuperscript{864} de Buck (1935) \textit{CT I}, p. 30,b (S10C).
\textsuperscript{865} For example, B2Bo and B6C, which are on the same sub-branch, only share I,28,c, I,29-30,c-a, I,30,b, I,32,b and I,33,a.
\textsuperscript{866} Only I,32,b, I,33,a and I,33,b vary.
\textsuperscript{867} Which is most clearly visible in the fact that I,33,b does not occur in the witnesses from Deir el-Bersha.
\textsuperscript{868} For more detail regarding background, witnesses and reconstructions, see chapter 3.12.
\textsuperscript{869} See appendix 5.10 for more detail.
\textsuperscript{870} In de Buck, this phrase has \textit{hm.t-r} (etcetera) in B1P and B4C. B3Bo, B2Bo, B4Bo, B6C. However, MC105, S10C and T9C are actually noted as I,35,d, which should occupy the same position.
only has one for the lemma *iri* and one for the lemma *msdi: r irr.wt [r-f r msdd.wt] sw* (against those males and females who act against him, against those males and females who hate him). T9C only has two participles as well, but has them in the opposite order as S10C: *msdd.wt sw irr.wt* (those male and female who hate him, those females that act).

It is clear that for this spell, due to a low number of data points and unique variation, the method of this chapter does not work. Even though there is a clear point of variation between the witnesses from Deir el-Bersha and the witnesses from other regions, this is not reflected in the resulting dendrogram.

### 4.13. Spell 11

Spell 11\(^{871}\) has eight phrases\(^{872}\) in which verbal structure variation occurs. Using the method described in this chapter, the following dendrogram was produced (figure 4.6):

![Dendrogram](image)

Figure 4.6 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 11.

In this dendrogram, there are two main branches, and a separate one for B3Bo. It is clear that there is no sign of regional conditioned variation, as the witnesses of Thebes are combined with the witnesses from Deir el-Bersha. However, the connections between the witnesses are dubious. For example, B1P and B6C are on the same sub-branch. When the structure is taken into regard, such placement is unlikely, as B1P and B6C only share a similar verbal structure in two of the eight phrases.\(^{873}\) B4C and B1P on the other hand, share four phrases.\(^{874}\) Thus, the placement of B6C seems to be due to dissimilarity.

The proximity between B2Bo and T9C falls within expectations, as they have the same verbal structure. For example, in I,36,d-e, where B2Bo, B3Bo, B6C and T9C have the imperative of *wdi* (to give) followed by the imperative of *iwi* (to come): *dy n-f is ntr.w my ir-tn ntr.w* (give adoration to him gods, come,

---

\(^{871}\) For more detail regarding background, witnesses and reconstructions, see chapter 3.13.

\(^{872}\) See appendix 5.11 for more detail.

\(^{873}\) I,37,a and I,37,b.

\(^{874}\) I,36,d-e, I,37,c, I,37,d and I,38,a.
where B4Bo, B4C and B1P have the imperative of rdi (to give) followed by the imperative of iwi: imy n=s iz ntr.w my ir-iz ntr.w (give adoration to her gods, come, gods). MC105 has a unique structure, as it has a passive circumstantial sdm-f of rdi, followed by the imperative of iwi: rd.y n[s iz my] (while adoration is given to her. Come). It is of note however, that T9C does not have three of the phrases that B2Bo has. The placement is therefore only based on the phrases it does have, and the phrases that do not occur have less influence. Even though this is an intended effect of the encoding process, it is clear that some detail is lost. If phrases that do not occur are taken into regard, there would be a suggestion of a separation between the witnesses from Deir el-Bersha and those from the Theban area, which is not reflected in this dendrogram at all. However, this would be further complicated by B4C, which would be placed with the Theban area based on the phrases that do not occur.

For this spell, the method described in this chapter does not seem to work, although it is not unlikely that there is no regional conditioned variation in the sentence structure here. However, as the influence of the phrases that do not occur is lost, it might be possible to suggest a separation between a Deir el-Bersha pattern and a Theban area pattern, although B4C would make that unlikely.

Spell 12 has only five phrases in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was created (figure 4.7):

![Dendrogram](image)

Figure 4.7 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 12.

It needs to be noted that B2Bo, B4Bo, B15C and S10C should be considered a cluster, as these witnesses use an identical pattern in the verbal structure. The attachment of B6C to this branch falls within

---

875 de Buck (1935) CT I, p. 36,d-e (B3Bo).
876 de Buck (1935) CT I, p. 36,d-e (B1P).
877 I,36,c, I,37,b and I,38,a do not occur in T9C.
878 I,36,c does not occur in B4C, B6C, B1P, MC105 and T9C. I,37,b does not occur in B4C, MC105 and T9C.
879 For more detail regarding background, witnesses and reconstructions, see chapter 3.14.
880 See appendix 5.12 for more detail.
expectations, as it only varies from this group in one phrase (I,39,c). Here, the majority of the witnesses have: \textit{shtr} \textit{tn} \textit{n-f stC} (while you overthrow Seth for him),\textsuperscript{881} where B6C has: \textit{shtr} \textit{n-f stC} (who overthrow Seth for him), where the absence of the suffix pronoun \textit{tn} caused the \textit{shtr} to be interpreted as an imperfective active participle.\textsuperscript{882} T9C has a unique structure in this phrase, as it adds the imperfective participle \textit{msdd}.\textit{w}: \textit{shtr} \textit{n-f lft}.\textit{ywt msdd}.\textit{w} \textit{sw} (while they overthrow enemies and those who hate him for him). The distance of B1P and B3Bo from this cluster is mostly an effect of visualisation, as these witnesses likewise only vary from the main cluster by one phrase (I,40,a). However, as S10C is part of the cluster, it is clear that the verbal structure used is not regionally conditioned.

MC105, T2C and T9C occur on the same branch, which suggests that there is a distinct pattern in the verbal structure which is used in the Theban area. However, this is deceptive. MC105 and T9C only share three phrases\textsuperscript{883} with the same structure, as does MC105 and T2C.\textsuperscript{884} T2C and T9C only share two phrases\textsuperscript{885} with the same verbal structure. Thus, although this branch does use a structure which is different to the Deir el-Bersha and Asyut group, there is too limited underlying similarity to speak of a distinct Theban area pattern, beyond a general difference from the other witnesses. This can be seen in I,39,b, where the witnesses from Deir el-Bersha and Asyut have: \textit{nTR}.\textit{w mdw \textit{hr}-tp-\textit{n hr}} (The gods who speak on behalf of Horus),\textsuperscript{886} where MC105 and T9C have a \textit{sdm}.\textit{t(y)-f(y)}: \textit{nTR}.\textit{w mdw.t(y)-sn \textit{hr} gs \textit{hr}} (The gods who will speak on the side of Horus),\textsuperscript{887} while T2C has a unique structure, as it has a nominal \textit{sdm-f}: \textit{nTR}.\textit{w mdw-s[n hr]-tp \textit{hr}} (The gods, they speak even on behalf of Horus).

For spell 12, the method used in this chapter to visualise regional conditioned variation in the verbal structure works to separate patterns, but only in a deceptive manner. A distinct Theban area pattern is suggested, even though this cluster only exists due to dissimilarity, rather than an underlying pattern. Thus, it would be assumptive to suggest that there is evidence of regional conditioned variation in spell 12.

4.15. Spell 13

The following section will discuss spell 13.\textsuperscript{888} In this spell are four phrases\textsuperscript{889} in which variation in the verbal structure occurs. Using the method discussed in chapter 4.2, the following dendrogram was created (figure 4.8):

\textsuperscript{881} de Buck (1935) \textit{CT I}, p. 39,c (B1P).
\textsuperscript{882} Theoretically it could be read as \textit{shtr n-f} as well, referring to Horus, rather than the gods in I,39,b.
\textsuperscript{883} I,39,b, I,39,d and I,40,a.
\textsuperscript{884} I,39,c, I,39,d, and I,40,a.
\textsuperscript{885} I,39,d and I,40,a.
\textsuperscript{886} de Buck (1935) \textit{CT I}, p. 39,b (B4Bo).
\textsuperscript{887} de Buck (1935) \textit{CT I}, p. 39,b (T9C).
\textsuperscript{888} For more detail regarding background, witnesses and reconstructions, see chapter 3.15.
\textsuperscript{889} See appendix 5.13 for more detail.
Note that in this dendrogram, B3Bo and B2Bo should be considered a cluster, as they are identical. Based on this dendrogram, there is no sign of regional conditioned variation, as the witnesses from Asyut and the Theban area widely distributed. There are signs of a high level of variation, which is most clearly visible in the branch holding B4Bo, B6C and T2C. Although similarity is suggested by the placement, this is deceptive. B4Bo and B6C share the same structure only in one phrase (I,42,b) of the four phrases in which variation occurs. B4C has the same issue, as it is on the branch with B15C and S10C. Technically, B4C and B15C do not share the same structure in any phrase, as B15C does not have I,43,a. B15C and S10C share only one phrase (I,41-42,c-a). Thus, it could be argued that this entire branch consists of dissimilarity as well. This high level of variation between the witnesses can be seen in I,42,c, where B2Bo and B3Bo have an imperative of pri (to go forth) followed by a third person stative for ms²-hrw (to be justified): pr ms²-hrw m-bšh ḫsd$t tw n.t nṯr.w p.yt dp.yt iwn.yt (go forth, justified in the presence of this tribunal of the gods, those of Pe, those of Dep, those of Heliopolis), 890 where B1P and B15C have the imperative for pri, but have a circumstantial sḏm-f for ms²-hrw: pr ms²-hrw=f m-bšh ḫsd$t tw n.t nṯr.w p.yt dp.yt iwn.yt (go forth, justified in the presence of this tribunal of the gods, those of Pe, those of Dep, those of Heliopolis). 891 B6C has the imperative for pri as well, but has the third person stative for ms² (to be true): pr[f] hrw=f ms² m-bšh ḫsd$t tw n.t nṯr.w p dp nṯr.w iwnw (go forth, his voice is true in the presence of this tribunal of the gods of Pe and Dep, the gods of Heliopolis). B4Bo has a nominal sḏm.n-f for pri, and has the stative ms²: pr.n-t hrw=t ms² m ḫsd$t tw n.t nṯr.w p.yt dp.yt iwn.yt (you went forth, your voice true with this tribunal of the gods, those of Pe, those of Dep, those of Heliopolis). MC105 and s10C have the nominal sḏm.n-f for pri, followed by the

890 de Buck (1935) CT I, p. 41,c (T9C).
891 de Buck (1935) CT I, p. 41,c (B1P).
circumstantial ṇm-f for ms^3-hrw: pr. n ḥd.t n[m^3-hrw-s m ḫgs.t] tw [n. t ntr. w p] dp. w n t ntr. w ḫw.t (this ḫh.d went forth, while she is justified with this tribunal of the gods of Pe and Dep, of the gods of Dendera),^892 while B4C has an infinitive for pri, followed by the circumstantial ṇm-f for ms^3-hrw: pr. t ms^3-hrw=k m ḫgs.t n. t ntr. w p. yt dp. w ḫw. yt] (going forth while you are justified with the tribunal of the gods, those of Pe, those of Dep, those of Heliopolis).

In this spell, there is no sign of regional conditioned variation in the verbal structure. Moreover, the method used in this chapter is not functional, as the branches of the dendrogram seem only to reflect levels of dissimilarity, rather than similarity. For this spell, the method suffers from the same issues that occurred in the previous chapter. If there are only a limited number of data points, and a high number of unique variations, which is the case here, the method will create misleading results at best.

4.16. Spell 14

Spell 14^893 only has three phrases^894 in which variation in the verbal structure occurs. For this spell, it is not practical to create a dendrogram, as it consists of a horizontal line with B2Bo, B3Bo, B4Bo and MC105, and a single branch with the other witnesses. The single line represents the fact that the structure in B2Bo, B3Bo, B4Bo and MC105 is identical. The single branch that is created only reflects that the other witnesses are different the B2Bo, B3Bo, B4Bo and MC105 group, thus this resembles a cluster of dissimilarity instead of similarity. For example, in 1,44,c the majority of the witnesses have a second person stative, followed by a third person stative: ḫw.t(i) r=i ḫw.(w) r=i (you are far from me, who is far from me).^895 In the same phrase, B15C has the second person stative, but has a perfective active participle on the second position: ḫw.t(i) r ḫw.t(i) n k n.s A.t n.t nTr.w p.yt (You are far from this ḫw.t(i), who was far from this ḫw.t(i)). B6C has the second person stative, but has an infinitive on the second position: ḫw.t(i) r ḫw.s-nht n n n. n > ḫw.t r ḫw.s-nht n (You are far from this ḫw.s-nht, there is no being far from this ḫw.s-nht). B4C replaced both verbal forms with a subjunctive ṇm-f; ḫw-tn r wsir ss. t-hd-ḥtp ḫw-t n r [wsir ss. t-hd-ḥtp tn] (may you be far from the Osiris ss. t-hd-ḥtp, may you be far from the Osiris, this ss. t-hd-ḥtp). In this phrase, one can see that patterns are based on all phrases, as variation only occurs in Deir el-Bersha, as this phrase is the reason why B4C, B15C and B1P are not part of the B2Bo, B3Bo, B4Bo and MC105 pattern, but does not exclude S10C, T2C and T9C. Beyond the B2Bo, B3Bo, B4Bo and MC105 group, there is one other group with an identical structure, consisting of the witnesses B1P and T9C. This can be seen in 1,44-45, e-a, where the majority of the witnesses have a prospective ṇm-f: iw wsir ḫw.t(i) ḫw. f t i. mr-f m ḫw.w (the Osiris ḫw.t(i) will judge Imeref in Heliopolis), where B15C has a circumstantial ṇm-n-f instead: iw wsir ḫw.t(i) ḫw. f n f m ḫw.w (the Osiris, this ḫw.t(i) judged in Heliopolis). B1P and T9C have a circumstantial ṇm-n-f, but add a prospective relative ṇm-f to the phrase: iw ḫw.f-n t wsw pn mr-f m ḫw.w (this ḫw.w has judged the one who he will love at the pillar of the city). S10C has a third person stative: iw wsir ḫw. pn ḫw.f(w) i. mr-f m ḫw.w (the Osiris, this ḫw, judges Imeref in Heliopolis), while T2C has a passive circumstantial

---

^892 de Buck (1935) CT I, p. 41.c (MC105). Note that there may be biased errors as the issue, as in S10C the pr. n was reconstructed based on MC105, whereas the ms^3-hrw in MC105 was reconstructed based on S10C.

^893 For more detail regarding background, witnesses and reconstructions, see chapter 3.16.

^894 See appendix 5.14 for more detail.

^895 de Buck (1935) CT I, p. 41.c (B2Bo).

^896 Even though B15C varies from the B2Bo, B3Bo, B4Bo and MC105 pattern in every phrase.
sDm-f and adds a prospective relative sDm-f: [iw] wsir dṣgī pn [wḏʾ(.w)-f] in mr-f m [iwnw] (the Osiris, this dṣgī, is judged by the one he will love in Heliopolis). Although it could be argued that there might be a chronological difference between the witnesses from Deir el-Bersha that could inform this separation, the fact that T9C and MC105 are both dated to the 11th dynasty makes this untenable.

It is clear that the method described in this chapter is not suited to visualize regional conditioned variation in the verbal structure, as there is no sign of regional conditioned variation. As witnesses from Deir el-Bersha and the Theban area share identical structures, it is clear that the patterns used are not restricted to one region.

4.17. Spell 15

The following section concerns spell 15. As was seen in chapter 3.17, this spell poses a problem, as it technical consists of two distinct spells, which only share the first two phrases. Moreover, in these phrases there are no variations in the verbal structure. Thus, the variation in the verbal structure of this spell occurs only in two sets of two phrases, which are two distinct groups, that should therefore not be compared. For example, B3Bo has šnt-sn wsirḏhwty-nḥt tn ir.t(y)=sn ḏw.t nb.t r wsirḏhwty-nḥt tn (while they revile the Osiris, this ḏhwty-nḥt, they who will do any evil against the Osiris, this ḏhwty-nḥt), where S10C has: ith [nṯt].w kṣ w ḥr n.t r mdw pf ḏw ḥr n.t r ṣḥm pf ḏw ḥr n.t r ḫs.w.t-sn wsir ir pn ḥr n.t r rdḥ.t-sn wsir ir pn (pull the fettlers of the bulls, while Neith appears against this bad word, while Neith appears against this bad power, while Neith appears against their old age of the Osiris, this ir, while Neith appears against that which they gave the Osiris, this ir). This makes the method used in this chapter not very useful, as it would mean that for this spell two dendrograms should be made. A single dendrogram was created for this spell, but the placement of the witnesses could not be explained, and was therefore not shown. Even though the two groups themselves could suggest a pattern that is unique to Deir el-Bersha, B4C shows that the other pattern cannot simply be revered to as a non-Deir el-Bersha pattern. Moreover, the patterns used outside Deir el-Bersha are all structurally unique, which suggests that any connection between these witnesses are based on dissimilarity.

For spell 15, the method of this chapter does not work, due to its unique structure. However, there are signs of a regional conditioned pattern used only in Deir el-Bersha, although this is more due to the differences between the two different endings patterns of this spell, rather than the underlying verbal structure.

---

897 For more detail regarding background, witnesses and reconstructions, see chapter 3.17.
898 See appendix 5.15 for more detail.
899 One consisting of B2Bo, B3Bo, B4Bo, B6C, B15C and B1P, the other of B4C, MC105, S10C, T2C and T9C. In the appendix, these groups are referred to as spell 15,a and spell 15,b.
900 de Buck (1935) CT I, p. 46, b-c (B3Bo).
901 de Buck (1935) CT I, p. 45, c-d, 46, d (S10C).
902 For example, B6C ended up on the same branch as B4C, MC105, S10C, T2C and T9C, even though it did not share any phrases.
903 Although extremely varied in the exact construction, this phrase, 1,46,d, does convey the same general meaning, which is the reason why they are grouped together.
4.18. Spell 16-17

The following section will discuss spell 16-17,\textsuperscript{904} which are considered a single spell in two parts, based on the suggestion of Faulkner.\textsuperscript{905} In this spell there are thirteen phrases\textsuperscript{906} in which variation occurs in the verbal structure. Using the method described in this chapter, the following dendrogram was produced (figure 4.9):

\begin{itemize}
  \item B3Bo
  \item B4Bo
  \item B15C
  \item MC105
  \item S10C
  \item BH5C
  \item T2C
  \item B2Bo
  \item B6C
  \item B1P
\end{itemize}

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{dendrogram.png}
\caption{Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 16-17.}
\end{figure}

In this dendrogram, there are two branches for witnesses from Deir el-Bersha, and one branch for the witnesses from the other regions. Based on this dendrogram, it could be suggested that there are at least two patterns used in Deir el-Bersha, and at least one pattern used outside Deir el-Bersha. For example, this can be seen in I,48-49,d-a, where the witnesses outside Deir el-Bersha have a circumstantial \textit{sqm.n.f: iw phr.n wsir sdi tn shm.w stš m-hż.w shm.w=s} (The Osiris, this \textit{sdi} has enveloped the powers of Seth, in excess of her (own) powers),\textsuperscript{907} where B2Bo and B3Bo have a nominal \textit{sqm-f: phr n-f shm.w stš m-hż.w shm.w-f} (the powers of Seth serve for him, even in excess of his (own) powers)\textsuperscript{908} and B4Bo, B15C and B6C have a circumstantial \textit{sqm-f: iw phr n-f shm.w stš m-hż.w shm.w-f} (the powers of Seth serve for him in excess of his (own) powers).\textsuperscript{909} B1P has a unique structure, as it has an imperfective active participle instead: \textit{iw phr.w n-f shm.w stš m-hż.w shm.w-f} (those who serve for him, the powers of Seth, are in excess of his (own) powers).\textsuperscript{910} However, caution should be taken regarding the witnesses that do not come from Deir el-Bersha. Although the dendrogram suggest that

\textsuperscript{904} For more detail regarding background, witnesses and reconstructions, see chapter 3.18.
\textsuperscript{905} Faulkner (1973), p. 10, note 1.
\textsuperscript{906} See appendix 5.16 for more detail.
\textsuperscript{907} de Buck (1935) CT I, p. 48-49,d-a (MC105).
\textsuperscript{908} de Buck (1935) CT I, p. 48-49,d-a (B2Bo).
\textsuperscript{909} de Buck (1935) CT I, p. 48-49,d-a (B15C).
\textsuperscript{910} Variation was due to the addition of the Z2 (...) plural strokes to the spelling.
there is common ground between these witnesses, it rather reflects dissimilarity from the witnesses from Deir el-Bersha, rather than any resemblance between the witnesses. For example, S10C and T2C only share the same structure in six phrases.\textsuperscript{911} Moreover, BH5C and T2C only share three phrases,\textsuperscript{912} as BH5C only has the first four phrases with variation in the verbal structure.

Although there seem to be two general patterns in the sentence structure in Deir el-Bersha, the proximity between the witnesses should not be overstated. For example, B6C and B2Bo are on the same sub-branch, but only have the same structure in three phrases.\textsuperscript{913} However, their remaining phrases do put them closer to the other witnesses from Deir el-Bersha. Thus, their placement on the same sub-branch seems to reflect that they are both dissimilar from the other Deir el-Bersha witnesses, but not to the extent that they need to be as far removed as BH5C, MC105, S10C and T2C are. Therefore, it would be prudent to only suggest one general pattern within Deir el-Bersha, in which there is a relatively high level of liberty to what specific structure is used, as can be seen in the example above.

For this spell, the method used in this chapter is capable of visualising regional conditioned variation in the sentence structure. However, the dendrogram additionally suggests close connections between some of the witnesses, which is a result of dissimilarity, rather than similarity between these witnesses. Because of the perceived liberty in the structure, it would be assumptive to suggest more than a distinction in the verbal structure pattern of Deir el-Bersha, and the other regions. However, it is clear that there is a high level of liberty within these two patterns.

4.19. Spell 18

The following section will discuss spell 18.\textsuperscript{914} In de Buck, this spell is only attested in Deir el-Bersha. Therefore, it is of limited use for the study of regional conditioned variation. Moreover, as it only has four witnesses in total, the discussion of variation is of limited use for the purposes of this work. Spell 18 has six phrases\textsuperscript{915} in which verbal variation occurs. However, in most phrases, this is due to B15C being different in its structure from the other witnesses.\textsuperscript{916} This variation is generally due to the occurrence of gemination for the verb forms, while the rest of the construction stays remarkably similar. For example, in I,54,g, B3Bo, B6C and B1P have a nominal \textit{s\textit{qdm-f}: h\textit{izz-k hr ts-wr c} n t\textit{s}} (you descent upon the great east side of the land),\textsuperscript{917} where B15C has a subjunctive \textit{s\textit{qdm-f}: h\textit{izz-k hr ts-wr c} z n t\textit{s}} (may you descent upon the great east side of the land). Thus, it could be argued that the different structure in B15C is due to errors, or the lack of interpretants in the script. The creation of a dendrogram is of limited use here, as B3Bo and B1P have an identical verbal structure in the phrases, and B6C varies only in one phrase from this group. The fact that B3Bo and B1P are identical makes it clear that the pattern of the verbal

\textsuperscript{911} I,48,a, I,48,b, I,48,c, I,48-49,d-a, I,49,b and I,51.d.
\textsuperscript{912} I,47,b, I,48,a and I,48,c.
\textsuperscript{913} I,48,a, I,48,b and I,50,b.
\textsuperscript{914} For more detail regarding background, witnesses and reconstructions, see chapter 3.19.
\textsuperscript{915} See appendix 5.17 for more detail.
\textsuperscript{916} Only in phrase I,54,c-d is there variation between the B3Bo and B1P group and B6C.
\textsuperscript{917} de Buck (1935) \textit{CT} I, p. 54,g (B6C).
structure is not based on the date of coffin creation, as these witnesses are dated to different periods of coffin construction in Deir el-Bersha.

For this spell, the method of this chapter is of limited use, as the spell is only attested in Deir el-Bersha in de Buck. Moreover, except for B15C, the verbal structure is remarkably similar between the witnesses, which can lead to clustering based on dissimilarity.

4.20. Spell 19

The discussion of spell 19\textsuperscript{918} for this chapter is not possible, as there are no phrases in which verbal variation occurs.

4.21. Spell 20

In spell 20,\textsuperscript{919} there are a total of five phrases\textsuperscript{920} in which variation in the verbal structure occurs. When the method described in this chapter is used, the following dendrogram is created (figure 4.10):

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{dendrogram.png}
\caption{Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 20.}
\end{figure}

This dendrogram consists of one main central branch, on which most witnesses are placed, with a separate branch for B3Bo and BH5C. The placement of the witnesses of the central branch shows that there is most likely not a regional conditioned pattern in the verbal structure of this spell, as witnesses from Deir el-Bersha and the Theban area are grouped together. However, I,56,c could suggest a distinct pattern for witnesses outside Deir el-Bersha, as BH5C, T9C and T1L have the same structure, as they have a $sdm.tw=f.\, dl.t(w)\, n=k\, ib=k\, n(.y)\, hl.t=k\, hs.ty=k\, n(.y)\, dt=k$ (while given to you is your heart ($ib$),

\textsuperscript{918}For more detail regarding background, witnesses and reconstructions, see chapter 3.20.

\textsuperscript{919}For more detail regarding background, witnesses and reconstructions, see chapter 3.21.

\textsuperscript{920}See appendix 5.18 for more detail.
which belongs to your belly, your heart (ḥš.ty), which belongs to your body),\(^{921}\) where all the other witnesses have a unique structure. For example B1P, which has a nominal $sdm.n=f$: $rdi.n=i n=k ib=k n(y) m(w).t-k ḥš.ty=k n(y) d.t-k$ (I have given even to you: your heart (ib), which belongs to your mother, your heart (ḥš.ty), which belongs to your body), where B6C has a circumstantial $sdm.n=f$: $iw rdi.n=i n=k ib=k n(y) mw.t-k ḥš.ty=k n(y) d.t-k$ (I gave to you: your heart (ib), which belongs to your mother, your heart (ḥš.ty), which belongs to your body). However, in the other phrases BH5C, T9C and T1L generally follow the patterns of Deir el-Bersha. The placement of BH5C could suggest that a different pattern is used in Beni Hasan, but as it is only one witness, any statement would be assumptive.\(^{922}\)

Moreover, when the actual used phrases are taken into regard, any connection between the witnesses of the central branch becomes difficult to explain. For example, B1P and MC105 are on the same sub-branch, which would suggest relative proximity between these witnesses. However, this is not the case. B1P and MC105 only share two phrases\(^{923}\) with the same structure, where T9C and B1P, which are further removed from each other, share three phrases.\(^{924}\) T9C and T1L share the same structure in four phrases\(^{925}\) however, and are further removed from each other. Thus, the placement of the witnesses on the central branch are problematic to explain.

For spell 20, the method used in this chapter does not seem to work correctly. Although it is clear that there is no clear sign of regional variation in the sentence structure pattern, the placement of specific witnesses in the dendrogram seems to be random.

### 4.22. Spell 21

In spell 21,\(^{926}\) there are a total of eleven phrases\(^{927}\) in which variation in the verbal structure occurs. However, as stated in chapter 3.22.1, one witness from de Buck, T1C, will be left out of this discussion. Due to the different order of the phrases it is considered a separate spell rather than being part of spell 21-25, even though it has some of the phrases used in the other witnesses for spell 21-25. Using the method discussed in this chapter, the following dendrogram was created (figure 4.11):

\(^{921}\) de Buck (1935) CT I, p. 56.c (BH5C).

\(^{922}\) Moreover, the variation is most likely due to the fact that I,57,b and I,58,a do not occur in this witness.

\(^{923}\) I,57,b and I,57,d.

\(^{924}\) I,57,b, I,57,c and I,57,d.

\(^{925}\) Only in I,58,a do these two witnesses vary.

\(^{926}\) For more detail regarding background, witnesses and reconstructions, see chapter 3.23.

\(^{927}\) See appendix 5.19 for more detail.
In this dendrogram, there is one main branch, and two separate branches for B3Bo and B4C. However, the horizontal distance between B3Bo and B4C should not be considered important. Their placement is due to the visualisation of the dendrogram, as they have the same verbal structure in nine of the eleven phrases. Remarkably, this is the case as well for B6C, which varies from B3Bo and B4C in exactly the same phrases.

The dendrogram suggests that even though they are connected, there is clearly a difference between in the structure used in Deir el-Bersha, and the witnesses from the other regions. However, this should be simply due to the occurrence of I,58,c, which only occurs in Deir el-Bersha. Unfortunately, the dendrogram does suggest a connection between witnesses, which is based on dissimilarity. BH5C and T9C occur on the same sub-branch, which suggests a connection. However, these two witnesses only have the same structure in one phrase, thus this branch only exists as these witnesses are different from the witnesses from Deir el-Bersha, rather than similarity between BH5C and T9C. However, in I,58,d, the variation between Deir el-Bersha and the other regions can be seen, as in Deir el-Bersha the witnesses have a subjunctive *sdm-ːf: pr-ː r p.t* (may you go forth to the sky), where the other regions have an imperative instead: *pr r-k r p.t* (go forth to the sky).

For spell 21, the method described in this chapter is capable to visualise regionally conditioned variation in the verbal structure. However, it can only be stated that there is a pattern used in Deir el-Bersha, which is distinct from the witnesses from the other regions. The connection between the other witnesses is due to dissimilarity from Deir el-Bersha, rather than any underlying pattern between them.

---

928 Only in I,58,c and I,60,b does the structure of these witnesses vary from each other.
929 I,60,c.
930 de Buck (1935) *CT I*, p. 58,d (B3Bo).
931 de Buck (1935) *CT I*, p. 58,d (BH5C).
Thus, the dendrogram shows regional conditioned variation, but implies more connections than can actually be proved when the actual verbal structure which is used in these witnesses is studied.

4.23. Spell 22

The following section will discuss spell 22. In this spell, there are a total of eight phrases in which variation in the verbal structure occurs. In the same manner as spell 21, one witness from de Buck, T1C, has been left out of this discussion. When the method used in this chapter was applied, the following dendrogram was created (figure 4.12):

![Figure 4.12 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 22.]

In this dendrogram, the placement of MC105 should be discounted, as it only has one of the phrases in which variation in the verbal structure occurs. The dendrogram suggests that there is a difference between the structure used in witnesses from Deir el-Bersha, and witnesses from Beni Hasan and the Theban area. This is supported by the variation in the structure of the phrases between these two groups, most clearly by the use of a verbal construction in I,66,a, which is non-verbal in the witnesses from Deir el-Bersha.

However, as is only suggested by the vertical distance between T1L and T9C, the connection of BH5C should not be taken as similarity between these witnesses, as BH5C only has the same structure as T1L in I,64-65,c-a, and the same structure as T9C in I,68,a. Thus, its placement here is due to dissimilarity with the other witnesses, and a separate branch for this witness would have been preferred. For example this can be seen in I,65,b, where the witnesses from Deir el-Bersha have a nominal *sdm*f: *didi*f n-k st (and he gives it to you), where T9C and T1L have an imperfective relative *sdm*f: *didi*f n-k (which...}

---

932 For more detail regarding background, witnesses and reconstructions, see chapter 3.23.
933 See appendix 5.20 for more detail.
934 I,63-64,d-a, which could place it in proximity to B4C, B6C, B1P, T9C or T1L.
935 de Buck (1935) *CT I*, p. 65,d (B1P).
he gives to you), while BH5C has and indicative \textit{sdm=f: rdi=f n-k s.t} (he gave it to you). It could be argued that there is a distinction in the pattern of the verbal structure between Beni Hasan and the Theban area, but as this is based on one witness only, it would be assumptive.

In this spell, the method used in this chapter is capable of visualizing regional conditioned variation in the verbal structure, as there is a clear distinction between the witnesses from Deir el-Bersha, and the other regions. However, it falls short in regard to the other regions, as BH5C is quite different from T1L and T9C, which is only suggested by the vertical distance. Thus, in the dendrogram, this variation is lost.

4.24. Spell 23

In spell 23, there are a total of ten phrases in which variation in the verbal structure occurs. In the same manner as in spell 21 and 22, the witness T1C is left out of the discussion. After the method described in chapter 4.2 was applied, the following dendrogram (figure 4.13) was created:

![Figure 4.13 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 23.](image)

In this dendrogram, there are two branches, which B3Bo was placed in the centre. As one witness from the Theban area, T9C, is placed with B4C and B1P, it cannot be suggested that there is a regional conditioned pattern in this spell. Moreover, it seems that both branches are not really a representation of similarity between the witnesses, but rather dissimilarity. B4C and T9C only share the same verbal structure in four phrases, and B4C and B1P four as well. Thus, it seems that the verbal structure of this spell is relatively free. The other branch is even less convincing. Although suggested by the vertical

---

936 de Buck (1935) \textit{CT I}, p. 65,d (T9C). Although \textit{didi} is graphically identical to the witnesses in Deir el-Bersha, I took this as a relative due to the absence of an object.
937 Note that this could be a prospective \textit{sdm-f} as well.
938 For more detail regarding background, witnesses and reconstructions, see chapter 3.24.
939 See appendix 5.21 for more detail.
940 l,70,d, l,71,c, l,71-72,h-a and l,73,a.
941 l,70,b, l,70,d, l,71-72,h-a and l,73,a.
distance in the branch, BH5C and T1L share the same verbal structure only in one phrase (I,71-72,h-a). Here, BH5C and T1L have two imperatives: \( m \, \text{ssp} \, n=k \, \text{št} \, k \, \text{mdw} \, k \, \text{pd} \, t=k \, \text{dzi} \, w=k \, \text{tbw} \, ty=k \, \text{ḫsw} \, k \, n \, \text{ws} \, t \) (take and receive your satchel, your staff, your bow), \(^{942}\) where the other witnesses have a nominal \( \text{sdm} \, n=f: \, \text{ssp} \, n=k \, \text{št} \, k \, \text{dzi} \, w=k \, \text{ḫsw} \, k \, n \, \text{ws} \, t \) (you have taken your satchel, your loincloth and your arrow to the road). \(^{943}\) In general, BH5C only has the same verbal structure in one phrase with every witness, and it shares no similar structure with B3Bo. For example in I,71,a, B3Bo, B4C, B6C and T1L have a \( \text{sdm} \, tw=f: \, n \, \text{rdi} \, (w) \, \text{š} \, w \, n \, \text{hr} \, k \) (sand will not be placed to your face), \(^{944}\) while B1P has a prospective \( \text{sdm} \, f: \, n \, \text{rdi} \, \text{tw} \, \text{š} \, w \, n \, \text{hr} \, k \) (the sand will not place you to your face) \(^{945}\) and BH5C has an infinitive instead: \( \text{nn} \, \text{rdi} \, \text{š} \, (w \, n) \, \text{hr} \) (there is no placing of sand to the face). \(^{946}\) Thus, it could be argued that there is one distinct pattern in the verbal structure in Beni Hasan. However, as the current material only has one witness from Beni Hasan in this spell, the suggestion of a distinct Beni Hasan pattern would be assumptive.

In spell 23, the method used in this chapter does not seem to be able to visualise regional conditioned variation. However, with the exception of BH5C, there seem to be no distinct patterns that could be suggested to be regional. Moreover, it seems that the verbal structure of this spell is relatively free, which makes it unlikely that clear patterns can be discovered to begin with. Even so, the method only creates deceptive results here, as similarity in the sentence structure is suggested, which can barely be supported.

### 4.25. Spell 24

In this section, spell 24\(^{947}\) will be discussed. In this spell, there are six phrases with variation in the verbal structure.\(^{948}\) As was the case with spell 21-23, the witness T1C was not included in these results. Using the method described in chapter 4.2, the following dendrogram was made (figure 4.14):

---

\(^{942}\) de Buck (1935) CT I, p. 71-72,a (T1L).

\(^{943}\) de Buck (1935) CT I, p. 71-72,a (T9C).

\(^{944}\) de Buck (1935) CT I, p. 71,a (T9C).

\(^{945}\) Note that it is possible to read the dependent pronoun \( \text{tw} \) as the \( \text{.tw} \) ending of the \( \text{sdm} \, \text{tw}=f \) as well.

\(^{946}\) Variation due to the negative particle \( \text{nn} \), as all the other witnesses have \( \text{n} \).

\(^{947}\) For more detail regarding background, witnesses and reconstructions, see chapter 3.25.

\(^{948}\) See appendix 5.22 for more detail.
In this dendrogram, there is one branch, and a horizontal line at the top. The horizontal line here should be considered a cluster, as B3Bo, BH5C and T1L have an identical structure. These witnesses represent the short version of this spell. However, T9C is included on this cluster line, which is not correct. B3Bo, BH5C and T1L only have the first two phrases in which variation in the sentence structure occurs, whereas T9C has the final one as well. Thus, some distance would have been expected. However, in this phrase, T9C has a nominal sdm=f (emphatic use): wn n-k ʿz. wy p.t in r (the two doors of the sky are even opened for you by Re), where the other witnesses have a nominal sdm=f (balanced sentence): wn n-k ʿz. wy p.t in r (the two doors of the sky are opened for you by Re).\footnote{de Buck (1935) CT I, p. 75,b (B1P). Although practically the same, phrase I,75,c does not occur in T9C, which means that the syntax cannot be balanced sentence here.}

The branch consisting of B4C, B6C and B1P follows expectations, as it has multiple phrases that do not occur in B3Bo, BH5C and T1L\footnote{I,74,e, I,74,g, I,74,i and I,75,b.} as these witnesses represent the long version of this spell. However, even here the placement is unexpected. B4C and B6C are placed on the same sub-branch, even though B4C is more similar to B1P.\footnote{B4C and B6C share only one phrase with the same structure (I,75,b), where B4C and B1P share four phrases (I,73-74,d-a, I,74,b, I,74,i and I,75,b).} This can be seen in I,74,i, where B6C has a circumstantial sdm-f: iw wp-ws.wt wp-f n-k ws.wt nfr.(w)t (Wepwawet opens good roads for you), where B1P and B4C have a circumstantial sdm.n-f: iw wp-ws.wt wp.n-f n-sf ws.wt nfr.(w)t (Wepwawet has opened good roads for him).\footnote{de Buck (1935) CT I, p. 74,i (B1P).} It is assumed that the unique variation which occurs in I,74,e and I,74,g is to blame here, as all three witnesses have their own unique structure there. As there are only a total of six phrases, any unique variation is likely to distort the results.\footnote{As discussed in length in chapter 3.55.}
For spell 24, the method used in this chapter does suggest two different patterns in the verbal structure. However, only the placement of B3Bo, BH5C and T1L seem to be correct, the other witnesses cannot easily be explained. Thus, the method used in this chapter does not seem to work in a predictable manner, and it could be argued that the placement of the witnesses is random. Even though the distinction between the long and short version of the spell is visible, it seems that the unique variation which occurs in B4C, B6C and B1P is sufficient to make the results untrustworthy.

4.26. Spell 25

In spell 25,954 there are a total of four phrases in which variation in the verbal structure occurs.955 As was the case with spell 21-24, the witness T1C was excluded from these results. When the method described in this chapter was applied, the following dendrogram was produced (figure 4.15):

![Figure 4.15 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 25.](image)

In this dendrogram, there seems to be some distinction between the witnesses from Deir el-Bersha, and the witnesses from Beni Hasan and the Theban area, as BH5C, T1L and T9C are on a separate branch. This is most clearly visible in l,76,j and l,77,a, where there is a clear difference between the witnesses from Deir el-Bersha and the other regions. For example, in l,77,a, BH5C, T9C and T1L have a circumstantial *sdm.:n.f:* *hw htp.:n.f rD rd r dsdj.:t r r-ry r sms.ty w3.ty* (he was gracious of cord at the tribunal, at the court, at the *sms.ty* of the two roads),956 where B1P has a subjunctive *sdm.:f:* *htp.:f n-k r rwD.w r dsdj.:t r r-ry wy sms.ty w3.ty* (may he be gracious to you at the stairways, at the tribunal, at the court of *sms.ty* of the two roads) and B4C has a nominal *sdm.:n.f:* *htp.:n.f n-t m dsdj.:t r r[-ry wy sms.ty w3.ty]* (he was gracious to you in the tribal, at the court of *sms.ty* of the two roads). The vertical distance of B6C likewise falls completely within expectations, as it has only two of the phrases in which there is variation in the verbal structure.957 Moreover, as B6C has a unique structure in l,76,b, its distance from the other witnesses falls within expectations.

---

954 For more detail regarding background, witnesses and reconstructions, see chapter 3.26.
955 See appendix 5.23 for more detail.
956 de Buck (1935) CT I, p. 77,a (T9C).
957 l,76,b and l,77,b. However, B6C does have a phrase in l,77,a, but it is non-verbal.
For spell 25, the method used in this chapter is capable of visualizing regional conditioned variation in the verbal structure. There seems to be a pattern used in Deir el-Bersha, and a separate pattern in the other regions. However, as there are only four data-points, the placement of the witnesses could be considered random, even though they seem to fall within expectation.

4.27. Spell 26

As explained in chapter 3.27, the inclusion of this spell in this chapter is to facilitate the study of the spell group of spells 1-27. The inclusion of spell 26 in this chapter is of limited use, as it only has witnesses from Deir el-Bersha, which would limit any study for regional variation. Additionally, the spell has only one phrase in which variation in the verbal structure occurs, I,77,f-g.958 Thus, it would be pointless to create a dendrogram, as there are only two patterns, one for B6C and B1P, which have a circumstantial $sdm.n-f$: iw rdl n-t s.t-k m-m šh.w n wr n ph.ty-t (I have placed your striking power among the spirits, because of the greatness of your strength).959 Another for B4C and B15C, which have a circumstantial $sdm.f$: iw rdi s.t-t m-m šh.w n wr n ph.ty-t (because of the greatness of your strength).960 There does not seem to be a clear reason why this separation occurs, as these witnesses are all dated to separate periods, being from a different group in Willems.961 However, as B4C and B15C are dated between B6C and B1P, it could be suggested that there was a structure used in the earlier and later periods of coffin creation in Deir el-Bersha, which was interrupted by another pattern in between. As this is based on one data-point, it would be assumptive to give this suggestion much weight.

4.28. Spell 27

The following section will discuss spell 27.962 In this spell, there are three phrases in which variation in the verbal structure occurs.963 Using the method described in chapter 4.2, the following dendrogram was created (figure 4.16):

![Figure 4.16 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 27.](image)

In this dendrogram, MC105 an S10C were places on the same branch, which suggest a connection. However, as was seen with other spells, this branch does not reflect similarity, but rather dissimilarity.

---

958 See appendix 5.24 for more detail.
959 de Buck (1935) CT I, p. 77,f-g (B6C).
960 de Buck (1935) CT I, p. 77,f-g (B4C).
961 Willems (1988), p. 70-77, where B6C belongs to group A, B4C to group B, B15C to group C and B1P to group D.
962 For more detail regarding background, witnesses and reconstructions, see chapter 3.28.
963 See appendix 5.25 for more detail.
MC105 and S10C do not share any phrases with the same structure. To make things worse, MC105 and T9C actually share two phrases with the same structure.\textsuperscript{964} For example, in I,79,h, B4C, MC105 and T9C have a perfective active participle: \textit{mk it-k m-\textit{\textit{h}}nt itr.ty} (who protected your father in front of the two shrines),\textsuperscript{965} where S10C has an infinitive: \textit{mk.t it m-\textit{\textit{h}}nt} (protecting the father in front of). Thus, one would have expected MC105 and T9C to be on the same branch. S10C does not share the same structure with any of the other witnesses, and should therefore have been on a separate branch. As this does not occur, it is clear that the method used in this chapter is not functional. Even so, it is encouraging to see that MC105 and T9C, which are both from the Theban area, share the same structure in two of the three phrases. For example, in I,80,e, where MC105 and T9C have a circumstantial \textit{sDm=f} for \textit{mAa-\textit{\textit{hr}}w} (to be justified): \textit{snD mAa-\textit{\textit{hr}}w=f} (of fear, while he is justified),\textsuperscript{966} where B4C has a third person stative of \textit{mAa} (to be true): \textit{n hr snD \textit{\textit{hr}}w=f \textit{mAa}} (to Horus, the fear of his voice being true). S10C has the circumstantial \textit{sDm=f}, but adds a \textit{sDm.ty=fy} for \textit{iri} (to do): \textit{snD n hr mAa-\textit{\textit{hr}}w[f]} \textit{r hft.ywt=f ir.t(y)-sn wDf-mdw hft m hrw pn} (the fear of Horus, while he is justified against his male and female enemies, who will do judgement against on this day). This suggests that there might have been a distinct verbal structure used in the Theban area.

4.29. Spell group 1-27

In a similar manner to the discussion of the sentence structure (chapter 3.29), it is worthwhile to discuss this entire group of spells as a single entity.\textsuperscript{967} As there is no witness which uses all of these spells, the spells were replaced with a string of hyphens, to the length of the spell. However, only the phrases in which verbal variation occurred where used, following the method of this chapter. It needs to be noted however, that the structure used follows the spell order, rather than the order and occurrence of the spells in the supports.\textsuperscript{968} Additionally, as spell 19 did not have any phrases in which variation in the verbal structure occurred, it was not included.

For the spell group of spells 1-27, the following dendrogram was created (figure 4.17):

---

\textsuperscript{964} I,79,h and I,80,e.
\textsuperscript{965} de Buck (1935) CT I, p. 79,h (T9C).
\textsuperscript{966} de Buck (1935) CT I, p. 80,e (T9C).
\textsuperscript{967} For more detail regarding the occurrence of witnesses per spell, and the additions to the method, see chapter 3.29 and table 3.26.
\textsuperscript{968} See Jürgens (1996), p. 57-59, for actual tables concerning the order of spells on the supports. I am aware that this might substantially affect the results. However, if the spell sequences in the supports are maintained, it becomes nearly impossible to compare the three different groups of Jürgens with each other, due to their varied order of spells.
Figure 4.17 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of the spell group 1-27.

Based on the vertical distance, it could be suggested that there is a pattern in Deir el-Bersha, and one in the other regions, although the placement of MC105,b and T1NY complicates this statement. However, the placement of MC105,b should be discounted. MC105,b only occurs in spell 1, and represents only two of the 139 data-points used for this dendrogram. Additionally, MC105,b was more than 60% partially or fully reconstructed (see figure 3.3). Thus, there should be limited weight given to this placement. The same could be said for T1NY. This witnesses only occurs in spell 7, where it represents nine out of the 139 data-points used. However, as was seen in chapter 4.9, and chapter 3.9.2, T1NY was placed in proximity of the witnesses of Deir el-Bersha. Moreover, this is represented in Jürgens,\textsuperscript{970} where B4C and T1NY are part of type δ2. Thus, even though it only occurs in one spell, the placement still follows the earlier results.

The placement of TT319 falls somewhat within expectations, as it is distant, but connected to B4C and T1NY. This is reflected in Jürgens, where TT319 is part of δ3, whereas B4C and T1NY are δ2. However, as there is an extensive vertical distance, these witnesses should not be considered that similar. Thus, it could be argued that there is a pattern used in the verbal structure Deir el-Bersha, which is only used outside Deir el-Bersha in one witness, in one spell. It is remarkable that there is a specific branch for B2Bo and B3Bo, which is reflected in Jürgens, under type ε2. As B4Bo belongs to the same set of coffins, it is surprising that there is some distance between B3Bo and B4Bo, as these belong to the same owner.

\textsuperscript{969} The total number of phrases for all the spells combined, in which variation in the verbal structure occurs.

\textsuperscript{970} Jürgens (1996), p. 60. However, note that Jürgens differentiates between B4C,a and B4C,b, one on the δ branch (B4C,a), and one on the ε branch (B4C,b).
However, it is not unlikely that there is some intentional variation here. Moreover, the distance between the B2Bo and B3Bo branch and the B4Bo branch is reflected in Jürgens as well, where B4Bo falls under type ε1 instead of ε2.\textsuperscript{971}

Most of the witnesses are at the top of the dendrogram. Apart from the fact that they come from the other regions, there is not much evidence of specific sub-groups in the text. Jürgens suggest that there is a connection between S10C and Y1C (δ6), which is clearly not reflected here.\textsuperscript{972}

Furthermore, there is one sub-branch which is a clear problematic result, namely the connection between BH5C and T2C. Based on their proximity, one would expect that they are similar, but the opposite is the case here. BH5C and T2C only occur together in the same spell for the spell group 16-17, which makes their connection less likely. However, as was seen in chapter 4.18, they were placed on the same sub-branch. As they reflected dissimilarity rather than similarity, it is clear that it is the same here.

Based on the spell group of spells 1-27, the method used in this chapter seems to work, as it suggests a distinct pattern in the verbal structure used in Deir el-Bersha, while the witnesses from other regions use a different, more loosely connected pattern. However, even with a higher number of data-points, the method used is still vulnerable to dissimilar witnesses being placed on the same branch, when they share dissimilarity from the other witnesses.

\textbf{4.30. Spell 30}

The following section will discuss spell 30.\textsuperscript{973} For this spell, there are a total of six phrases in which variation in the verbal structure occurs.\textsuperscript{974} Using the method described in this chapter, the following dendrogram was created (figure 4.18):

\textsuperscript{971} However, in Jürgens these are directly connected, which is not the case here.
\textsuperscript{972} Even though it is not reflected in these results, based on other textual features of these witnesses, I would still support the suggestion that Y1C originated from Asyut.
\textsuperscript{973} For more detail regarding background, witnesses and reconstructions, see chapter 3.30.
\textsuperscript{974} See appendix 5.26 for more detail.
In this dendrogram, there is one main central branch, on which most witnesses were placed, and a small branch containing T1L,a, T1L,b and S2C. Finally, there is the final branch of B1P, M24C, M25C and S1C, which represents a cluster. However, it does not mean that this cluster is completely identical, as B1P has one additional phrase (I,94,a), which does not occur in M24C, M25C and S1C. Moreover, as M24C and M25C were both nearly completely reconstructed (see figure 3.64) their placement is most likely due to the witnesses their reconstruction was based on. However, when compared to the stemma of Jürgens for the spell group 30-32+33-37,975 there is some proximity between M25C and S1C, which are both part of type ζ, even though they are on separate branches (η for M25C and θ for S1C). Even so, the connection with B1P is not reflected there.

The right branch (figure 4.19) would almost suggest a pattern from the Theban area, if S2C was not placed there as well. However, the placement of the witnesses on this branch is deceptive, as T1L,a and T1L,b only vary in the verbal structure of one phrase,976 whereas S2C and T1L,a vary in two phrases.977 The general placement nonetheless does not seem to be out of order. For example, in I,90-91,d, T1L,a-b and S2C have the lemma sfs (to hate): sfs n-k wrš.w-k im=f (while your watchers hate for you with it),978 where the majority of the witnesses have the lemma sds (to tremble): sds n-f wrš.w-f (his watchers tremble for him).979 B3Bo and S5C have unique structures, as B3Bo has the lemma him (to perish): him n-f wrš.w-f im=f (while his

---

976 I,94,a.
977 S2C and T1L,a vary in I,88-89,b and S2C does not have I,94,a.
978 de Buck (1935) CT i, p. 90,d (T1L,a).
979 de Buck (1935) CT i, p. 90,d (S1C).
watchers perish for him at it), while S5C has the lemma \textit{wh}s \ (to shake): \textit{wh}s \ n=f \ wr. \ w=f \ (while his great ones shake (themselves) out for him). Even though the connection with S2C is not visible in Jürgens, T1L,a and T1L,b have their separate type in Jürgens as well (type \(\beta\)), which is not surprising, as they come from the same support. As these two witnesses come from the same support, it would be assumptive to allocate a region-specific pattern to these two witnesses, as it would be based on a single support.

On the central branch, there are signs of regionally conditioned variation. There are two branches for witnesses from Asyut, one for S5C and S11C, and one for S6C, S10C and S12C. This is reflected in Jürgens, where these witnesses from Asyut have their own type. However, as S1C and S2C are placed on different locations, it shows that the other structures were possible in Asyut. For example, in I,84-85,d, where S1C and S2C follow the structure of the majority, that use a circumstantial \textit{sqm}-f: \textit{m}s\textit{sn} \ nrw \ r \ hr. \ w-sn (while they see the fear on their faces), while S5C, S6C, S11C and S12C have a subjunctive \textit{sqm}-f: \textit{m}s\textit{sn} \ nrw \ r \ hr-sn (when they will see the fear on their face). Note that S10C has a unique structure, as it has an indicative \textit{sqm}-f: \textit{m}s\textit{sn} \ nrw \ r \ hr-sn (they saw the fear on their face).

Additionally, there are two separate branches for witnesses from Deir el-Bersha. On the right final section of the main branch (figure 4.20), there is one witness, L2Li, which suggests that this branch is not purely from Deir el-Bersha. However, L2Li only has two of the six phrases, of which one (I,88-89,b) is unique, and the second which it shares with nearly every other witness. Thus, its placement here is random, and can be discounted. Discounting L2Li, this sub-branch perfectly represents type \(\xi\) in the stemma of Jürgens.

The second branch with witnesses from Deir el-Bersha contains B2Bo, B1L and B3L. This branch, in general terms, follows type \(\lambda\) in the stemma of Jürgens. Thus, it seems that there are two distinct verbal structure patterns in use in Deir el-Bersha. This can be seen in I,86-87,b, where B2Bo, B1L and B3L have the lemma \textit{i}s \ (to stride): \textit{i}s-f \ hr \ wz. \ wt \ nfr. \ (w)t \ n. \ (w)t \ imm. \ t \ m \ irw \ n \ sly \ nfr(y) (while he strides upon the beautiful roads of the west in the shape of the divine Akh), where the other witnesses from Deir-Bersha have the lemma \textit{sq}s (to travel): \textit{sq}s-f \ hr \ wz. \ wt \ nfr. \ (w)t \ n. \ (w)t \ imm.\ t \ m \ irw \ [n] \ sly \ nfr(y) (while he travels upon the beautiful roads of the west in the shape of the divine Akh).

In this spell, the method described in this chapter is capable of visualising regional conditioned variation in the sentence structure. In spell 30, there seem to be at least two distinct patterns in Deir el-Bersha, and a distinct pattern in Asyut. However, these patterns are not restrictive, as additional verbal

---

980 Type \(v\), even though the subtypes are not organized as is the case here.
981 de Buck (1935) \textit{CT I}, p. 84,d (B1P).
982 de Buck (1935) \textit{CT I}, p. 84,d (S6C). However, this structure occurs in B4L and B12C,b as well.
983 Could be a subjunctive or nominal \textit{sqm}-f as well.
984 I,88-89,b and I,94,a.
985 Only B1P, T1L,a and T1L,b have a different structure in this phrase.
986 de Buck (1935) \textit{CT I}, p. 87,d (B3L).
987 de Buck (1935) \textit{CT I}, p. 87,d (B4L).
structures are available to witnesses from the same regions. When compared to the results for the same
spell in the sentence structure (chapter 3.30.3), it is clear that the borders which were fuzzy in the
sentence structure, are more clearly distinguished when only the verbal structure is used. Thus,
visualising the variation patterns in the verbal structure can help to enhance the results gathered
through the variation patterns in the sentence structure.

4.31. Spell 31

In spell 31, there is a total of six phrases in which variation in the verbal structure occurs. It needs
to be noted that although B3Bo does have this spell, all its phrases were non-verbal, and therefore this
witness was not used in the results. Additionally, as B2Bo, B12C,a-b, B13C, B1L and B4L were written as
tables, the horizontal phrases were duplicated in the database. For this section, these duplications were
considered separate phrases, as these phrases were intended to be read multiple times.

Using the method described in this chapter, the following dendrogram was produced (figure 4.21):

![Figure 4.21 Rectangular phylogram display of the distance based on verbal structure variation between the different
witnesses of spell 31.]

In this dendrogram, there are three branches, of which two are represented with a long horizontal line
with witnesses. These two branches should be considered clusters of witnesses, rather than the line as
represented here. When rendered as radial phylogram, the dendrogram represents a γ shape, with
clusters at all ends.

As there are witnesses from Asyut, Deir el-Bersha and the Theban area on the lower branch, it is clear
that there is a majority verbal structure pattern for this spell, which is used in multiple regions.
However, the two other branches of this dendrogram show that variation on this structure is possible,
and that this variation only occurs in Deir el-Bersha and el-Lisht. Moreover, the variation in pattern does
reflect the separation in the stemma of Jürgens, as B2Bo, B3L and B1P are part of type λ, and L2Li

---

988 For more detail regarding background, witnesses and reconstructions, see chapter 3.31.
989 See appendix 5.27 for more detail.
exists as its own offshoot of type l. The different structure of B2Bo, B3L and B1P can be seen in l,98-100,d-a, where they have a subjunctive $sg\text{-}f$ of $rdj$ (to give), followed by a subjunctive $sg\text{-}f$ of $m3z$ (to see): $\text{i}h \ di\text{-}i \ m3n \ imy\text{-}r \ pr \ sn \ pr \ wsir \ m \ d\ddw \ m \ s'h\text{-}f \ n \ k\text{3} \ imm\text{.}t$ (oh, may I cause that the overseer of the domain, this $sn$, sees Osiris in Busiris, in his dignity of the bull of the west).\textsuperscript{991} The majority of the other witnesses only have the subjunctive $sg\text{-}f$ of $m3z$: $\text{i}h \ m3z\text{-}k \ wsir \ m \ d\ddw \ m \ s'h\text{-}f \ n \ k\text{3} \ imm\text{.}t$ (oh, may you see Osiris in Busiris, in his dignity of the bull of the west).\textsuperscript{992} However, this is complicated by B1L, which is part of type $\lambda$ as well, but is part of the majority cluster. Moreover, it would be assumptive to associate a distinct verbal structure with L2Li, as it would be based on a single witness.

For this spell, the method in this chapter is capable of visualising regional conditioned variation in the verbal structure, although only to the extent that the outlying patterns are regionally conditioned. For the majority of the witnesses, the structure is stable, and not dependent on region. However, as the outlying patterns can be traced to a single region, it is clear that some regional influence on the verbal structure does exist.

4.32. Spell 32

In this section, spell 32\textsuperscript{993} will be discussed. In this spell, there are a total of fourteen phrases\textsuperscript{994} in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was made (figure 4.22):

![Figure 4.22 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 32.](image)

In this dendrogram, there are multiple deceptive results that need to be addressed first. B3Bo and L2Li were placed on the same branch. However, this branch does not represent similarity, but rather

\textsuperscript{991} de Buck (1935) CT I, p. 98,d (T1L,b).
\textsuperscript{992} de Buck (1935) CT I, p. 98,d (B3L).
\textsuperscript{993} For more detail regarding background, witnesses and reconstructions, see chapter 3.323.31.
\textsuperscript{994} See appendix 5.28 for more detail.
dissimilarity. B3Bo and L2Li only share the same structure in four of the fourteen phrases. As L2Li is quite dissimilar to all the other witnesses, it would have been preferred that it was placed on its own separate branch, as was the case with spell 31. For example, in I,111,a, L2Li has an imperfective active participle: $s^h tw hf s.t ib=k$ (who ennobles you, according to your desire), where the majority of the witnesses have a $sdm.tw=f$: $s^h.t(w)=f hf s.t ib=t$ (may you be ennobled according to your desire). B2Bo, B1L, B3L and B1P have a passive subjunctive $sdm=f$ instead: $s^h=k hf s.t ib=k$ (may you be ennobled according to your desire). At the other end of the dendrogram, S12C was placed on a branch with B1L and B3L. However, S12C only has the first three phrases, after which this witness ends. Even though the structure is the same as B1L in these phrases, the connection is less strong than the dendrogram suggests.

However, the other branches do fall within expectations. S10C and S11C only have the first three phrases with variation in the verbal structure, which is identical. Thus, they were placed as a cluster. S5C is with the same cluster, as it has one more phrase than S10C and S11C, but has the same structure in the first three phrases. B1L and B3L are on the same sub-branch, which reflects type $\lambda_4$ in Jürgens.

The same can be said for B12C,a-b, B13C, B16C and a bit further removed, B4L, which represent type $\xi$ of Jürgens. Thus, even though B2Bo, B3Bo and B1P are less closely connected, it suggests that there are at least two patterns of verbal structure in Deir el-Bersha. This can be seen in I,102-103,a, where B12C,a-b, B13C, B16C and B4L have the circumstantial $sdm.n=f$ of $iyi$ (to come) which is used in the majority of the other witnesses: $ws ir m \tilde{q}dw i.y.n ir pn r bw \tilde{h}r=k im$ (Osiris in Busiris, after this $ir$ came to the place where you are), while they add a relative $sdm.n=f$ of $h3i$ (to descend): $ws ir m \tilde{q}dw i.y.n it=i pf \tilde{h}r.m=i pf y=i pf h3.n=i n=f pf r bw \tilde{h}r hm=k im$ (Osiris in Busiris, after this father of mine, this attendant of mine, this protector of mine, this one to whom I have gone down came to the place where your majesty is), due to the use of the $it=i pf$ phrase used instead of the name of the owner.

The small sub-branch for T1L,a-b follows the stemma of Jürgens as well, where they are part of type $\beta$, separate from the other witnesses. This can be seen in I,104-106,e-a, where T1L,a-b have a prospective relative $sdm-f$ of $mri$ (to love), followed by an relative $sdm.n=f$ of $m3i$ (to bring forth): $s=\tilde{t}$ is $pw mr.y=t ms.n=t ms^f$ (it is your son, who you will love, who you truly brought forth). In the same phrase, the majority of the other witnesses only have the relative $sdm.n=f$ of $m3i$: $s=k$ is $pw ms.n ms^t.t$ (it is your son, who Maat brought forth). As T1L,a and T1L,b come from the same support, it would be assume to suggest that there is a distinct pattern in the verbal structure of the Theban area, until more data from the Theban area can be added.

The final sub-branch consists of S1C, S2C and M25C. If M25C was not added to this branch, it could have suggested an additional distinct pattern from Asyut. However, M25C was mostly reconstructed (see

1000 de Buck (1935) CT I, p. 104-106,e-a (T1L,a).
Figure 3.71) based on S1C, it is not unlikely that the placement is based on these reconstructions, rather than the original text.\textsuperscript{1002} Moreover, as Jürgens connected M25C to S1C and S2C under type ζ, the placement does not seem unlikely.

For spell 32, the method used in this chapter is capable to visualize regional conditioned patterns in the verbal structure. However, some deceptive results occur as well, with the placement of L2Li and S12C. Even so, it is possible to distinguish at least two distinct patterns used in Deir el-Bersha, two patterns from Asyut, and one from the Theban area. However, the structures can be shared with the other regions, and the distinction is sometimes based on how much of the text of this spell is actually used rather than the actual pattern used in the phrases that occur in the witnesses.

4.33. Spell group 30-32

As Jürgens considers spells 30-32 as a group, it would be beneficial to study its underlying verbal structure, as was done for the sentence structure in chapter 3.33. For the witnesses that do not have all of the three spells,\textsuperscript{1003} the missing spells were replaced by a string of hyphens for every phrase in which variation in the verbal structure occurred, in the same manner as was done in chapter 4.29 for spell group 1-27. Using the method described in chapter 4.2, the following dendrogram was created (figure 4.23):

\textsuperscript{1002} However, the choice to reconstruct based on S1C was not random, and it is remarkable that both S1C and M25C end their version of this spell at I,107,c, in the same manner, and it follows the same order in the spells, following this spell from spell 33 (as it moves from I,120,e to I,104,b).

\textsuperscript{1003} For more detail regarding the occurrence of witnesses per spell, and the additions to the method, see chapter 3.33 and table 3.30.
This dendrogram consists of one main branch, and three smaller branches, one containing M24C and M25C, one containing S1C and one containing S2C, T1L,a and T1L,b. In general, the branches of the dendrogram quite nicely resemble the stemma of Jürgens for spell group 30-32+33-37. At the top right of the dendrogram (figure 4.24), there is a sub-branch for T1L,a and T1L,b (type β in Jürgens). Additionally, S1C and S2C (type θ in Jürgens), are not that far removed from each other. This would have been expected to some extent, as S1C and S2C belong to the same owner. The closer connection between T1L,a, T1L,b and S2C is not too surprising, as this occurred in spell 30 as well.

On the other side of the top branch, one can find M24C and M25C. This suggest the existence of a distinct pattern used in Meir. However, as stated above, these two witnesses were mostly reconstructed, and their separate placement is rather a result of the visualisation. When the dendrogram is rendered as a radial phylogram, it becomes clear that S1C, M24C and M25C form a cluster, which is not too surprising, as most of the reconstructions for M24C and M25C were based on S1C.

On the main branch, B3Bo and B16C were placed together. However, the placement of B16C here is random, as B16C only has the final three phrases of the combined 26 phrases of this spell group. Based only on these final phrases, B16C could just as well have been placed in proximity to B12C,b and B13C, with whom it is placed in spell 32. Moreover, as Jürgens groups B16 both with B12C,b and B13C under type ξ, the placement of B16C here seems random.

---

1005 However, as was seen in chapter 3.36.2 as well, it is possible that the variation was intentional.
L2Li was placed on its own sub-branch, which reflects correctly what was seen in spell 31 and spell 32,\textsuperscript{1006} where it has its own distinct form from the other witnesses. This is reflected in Jürgens as well.

The left final sub-branch of the main branch (figure 4.25) represents a grouping which occurred in Jürgens as well, as type ξ. As stated in chapter 3.32.2, these witnesses share a specific phrase,\textsuperscript{1007} which is used instead of the name of the owner. As these witnesses are grouped together based on the verbal structure, and this phrase only occurs once in spell 30-32, it is clear that there is an underlying verbal structure beyond this phrase that separates these witnesses from the other witnesses from Deir el-Bersha.

This distinction is likewise visible for another group of witnesses from Deir el-Bersha, namely B2Bo, B1L and B3L. These witnesses are part of type λ in Jürgens, and represent a second pattern in the verbal structure. However, this division between regions seems less clear here, as S12C and S10C are part of the same general sub-branch (figure 4.26). However, when displayed as a radial phylogram again, it becomes clear that S12C and S10C are clustered closer to S5C, S6C and S11C. This is reflected in Jürgens, where these witnesses are part of type v. Although S12C is indeed closer to B1L than S5C, it does not mean that it should be considered close to B2Bo, B1L and B3L. Thus, these witnesses could still be considered a distinct group in Deir el-Bersha, although some proximity to the witnesses from Asyut exists. However, this is reflected in Jürgens, where both type λ and v are connected to type κ1. Moreover, the entire lower sub-branch resembles the types in Jürgens, as both κ1 and ξ are connected under type κ.

For this spell group, the method used in this chapter is clearly capable to visualise regional conditioned patterns in the verbal structure. Moreover, the dendrogram shows a notable similarity to the stemma of Jürgens. Based on the results here, it is possible to suggest that there are at least two distinct verbal structure patterns in Deir el-Bersha, two in Asyut, and one in the Theban area and el-Lisht. However, both the Theban area and el-Lisht pattern are based on one support only. Moreover, the patterns used in Asyut are akin to the Deir el-Bersha pattern or the Theban area pattern. However, as B16C showed, some placement of the witnesses can be relatively random, if the witness has only a few of the available phrases.

\textsuperscript{1006} Note that in spell 32 L2Li was grouped with B3Bo, forming a sub-branch of dissimilarity.

\textsuperscript{1007} The \textit{it-i pf} phrase, see chapter 3.32.2 for more detail.
4.34. Spell 33

The following section will discuss the verbal structure in spell 33.\textsuperscript{1008} In total, this spell has 21 phrases in which variation in the verbal structure occurs.\textsuperscript{1009} Using the method described in this chapter, the following dendrogram was produced (figure 4.27):

![Dendrogram of verbal structure variation](image)

Figure 4.27 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 33.

In this dendrogram, there is a central branch on which most witnesses were placed. Additionally, there is a separate branch for T1L,a and T1L,b and a branch for B1P. The branch with T1L,a and T1L,b falls within expectations, as these witnesses only have the first three phrases\textsuperscript{1010} of the 21 phrases in which variation in the verbal structure occurs. However, as these belong to the same support, it would be assumptive to suggest that this support on its own represents a Theban area pattern. However, this group is represented in the stemma of Jürgens\textsuperscript{1011} as type β.

On the right final section of the main branch, there is a sub-branch with S1C, S2C and M25C. The inclusion of M25C seems to preclude a pattern for Asyut. However, the extensive reconstructions of M25C (see figure 3.77) which were based on S1C are more to blame for the placement. It needs to be noted that M25C follows a specific structure that only exists in a part of the spell, which is only shared with S1C and S2C. Moreover, as S1C, S2C and M25C fall under type ζ in Jürgens,\textsuperscript{1012} the connection is not completely surprising. This connection can be seen in I,119,a, where S1C, S2C and M25C have a passive nominal \textit{sdm.n-f of ṣpr} (to equip), followed by a relative \textit{sdm.n-f of ṣrḥ} (to know): \textit{ṣpr.n-f m ṣrḥ.t.n-f} (he was equipped even with that which he knows),\textsuperscript{1013} while B2Bo, B3Bo, B1L, B3L and B1P have a nominal

\textsuperscript{1008} For more detail regarding background, witnesses and reconstructions, see chapter 3.34.
\textsuperscript{1009} See appendix 5.29 for more detail.
\textsuperscript{1010} I,112,b, I,112,c and I,113.d.
\textsuperscript{1012} However, in Jürgens there is an additional subdivision, with S1C and S2C being type θ, where M25C is type η.
\textsuperscript{1013} de Buck (1935) \textit{CT I}, p. 119,a (S1C). Passive due to the lack of an object.
$sdm.n.f$ for ‘pr, which is followed by a relative $sdm.n.f$ of $hm$ (to not know): ‘pr.n.f $ts$ $hm.t.n.f$ (he has equipped the land even with that which he did not know). B12C,b, B13C, B16C, B4L and L2Li have a nominal $sdm.n.f$ for ‘pr, which is followed by the relative $sdm.n.f$ of rh: ‘pr.n.f $ts$ $rh.t.n.f$ (he has equipped the land even with that which he knew).

As seen in spell 30-32, there is a division in Deir el-Bersha into two groups. However, it is less clear in this dendrogram. As one can see in figure 4.28, L2Li is connected to the same sub-branch as B12C,a, B12C,b, B13C, B16C and B4L, which belong to Jürgens type ξ. However, as there is substantial distance between L2Li and the other witnesses from this branch, the connection between these witnesses is not that strong. For example in I,113,e, where B12C,b, B13C, B16C and B4L have a second person stative: $sd\ddot{a}.t(i)$ $r=s$ (while you travel to her), while L2Li has a third person stative: $sd\ddot{a}$ $r=s$ (while traveling to her). Moreover, when the dendrogram is displayed as a radial phylogram, the distance much more clearly shows that this should be considered its own pattern, even though there is some similarity between these groups, as phrase I,119,a above shows.

The second group of witnesses from Deir el-Bersha, type λ in Jürgens, is less clear. Their central position in the dendrogram could be interpreted as a group, although it has many fuzzy borders. However, when displayed as a radial phylogram (figure 4.29), there is a central cluster, although without a clear central cluster point. Thus, there is cohesion for this group of witnesses, although there seems to be a lot of freedom in the pattern used. Additionally, there is an additional feature in this spell which clearly separates these witnesses, as they use the name of the owner, where B12C,a, B12C,b, B13C, B16C and B4L use the $it=\ddot{l} pf$ phrase. Thus, there is a clear difference between the two groups from Deir el-Bersha.

For spell 33, the method used in this chapter seems to be capable to visualise variation in the verbal structure. However, when compared to spell group 30-32, the different groups are less clearly defined. Even so, it is possible to distinguish two verbal structure patterns in Deir el-Bersha, a pattern in el-Lisht and one in the Theban area, although these are based on single supports. Finally, there seems to have been a pattern used in Asyut and Meir, which was distinct from the other witnesses, as only a section of the spell is used in these witnesses.

---

1014 de Buck (1935) CT I, p. 119,a (B1P).
1015 de Buck (1935) CT I, p. 113,e (B16C). Note that B2Bo, B3Bo, B1L and B3L have this structure as well.
1016 de Buck (1935) CT I, p. 113,e (L2Li).
1017 see chapter 3.32.2 for more detail.
1018 The distinction between the two groups in Deir el-Bersha can be seen in I,119,a, which is discussed above.
4.35. Spell 36

This section will discuss spell 36. In this spell, there are a total of sixteen phrases in which variation in the verbal structure occurs. As stated in chapter 3.35.1, there are two versions of this spell, a short version used in B1L, B3L and B1P and a long version, used in B3Bo, B12C, B13C,a-b, B16C, B4L and L2Li. Moreover, for the discussion of regional variation, this spell is less useful, as only one witness is not from Deir el-Bersha. Using the method discussed in chapter 4.2, the following dendrogram was created (figure 4.30):

![Figure 4.30 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 36.](image)

In this dendrogram, there is a clear vertical division between B3Bo, B1L, B3L and B1P and the other witnesses. As these witnesses are considered in Jürgens as the same group as well (type $\lambda$), their proximity in this dendrogram seems to likewise reflect the results in Jürgens. However, one would have expected B3Bo to be more distant from B1L, B3L and B1P, as these use the short version of the spell, rather than the long version. On the other hand, in the long version, B3Bo is remarkably dissimilar from B12C, B13C,a, B13C,b, B16 and B4L, which would explain its distance. For example in I,142,c, where B3Bo has a nominal $s\text{dm}.n-f: i\text{wi}.n-s (i)r-s m\text{i} i\text{sst} s\text{h}.\text{t} in m\text{s}w.t\text{t} (\text{In what matter did she come, this renewed spirit?})$, where the other witnesses have a nominal $s\text{dm}=f: i\text{ww}=f (i)r-f m\text{i} i\text{sst} s\text{h} pn m\text{s}w.t\text{t} (\text{In what matter does he come, this renewed spirit?})$.

The lower section of the dendrogram resembles a group in Jürgens as well, as B12C, B13C,a, B13C,b, B16 and B4L are part of type $\xi$. However, as L2Li is connected to the same branch, it seems that L2Li is remarkably similar to this group. This is again an issue in visualization, which is less clear in this format. As one can see, there is some vertical distance between L2Li and the other witnesses. However, when

---

1019 For more detail regarding background, witnesses and reconstructions, see chapter Spell 36.35.
1020 See appendix 5.30 for more detail.
1022 de Buck (1935) CT I, p. 142,c (B12C).
the dendrogram is visualized as a radial phylogram, it becomes clear that B12C, B13C,a, B13C,b, B16C and B4L form a cluster,\textsuperscript{1023} while L2Li cannot be considered part of that cluster. This can be seen in I,143,c, where L2Li has a circumstantial $s\text{dm}\cdot n\cdot f$: $\text{s}\text{sp}\cdot n\cdot s\text{snb}\cdot n\cdot f\cdot p\text{n}\cdot s\cdot t\cdot n\cdot n\cdot r\cdot (y)\cdot t\cdot m\cdot h\text{w}\cdot t\cdot k\cdot s\cdot h\text{d}$ (after this $s\text{snb}\cdot n\cdot f$ has received his divine seat in the mansion of the white bull), where the other witnesses have a prospective $s\text{dm}\cdot f$: $\text{s}\text{sp}\cdot k\cdot n\cdot n\cdot r\cdot w\text{t}\cdot m\cdot h\text{w}\cdot t\cdot k\cdot s\cdot h\text{d}$ (you will receive a divine state in the mansion of the white bull).\textsuperscript{1024}

Even though this spell is of less use for the study of regionally conditioned variation in the verbal structure, it does show some distinct patterns. As seen in spell 30-32 and 33, there are at least two patterns in use in Deir el-Bersha, and based on the placement of B3Bo, it seems that the use of the short or long version of the spell does not strongly influence the separation of these two groups. Additionally, there is a distinct pattern in el-Lisht, even though it shares some similarity with the that B12C, B13C,a, B13C,b, B16C and B4L group. However, the choice of visualisation can strongly influence the results, as the placement of L2Li in figure 4.30 shows a closer connection between L2Li and the other witnesses, than would be inferred when it is visualised as radial phylogram.

4.36. Spell 75

This section will discuss spell 75.\textsuperscript{1025} As one of the longer spells, it has a total of 111 phrases with variation in its verbal structure.\textsuperscript{1026} Beyond the witnesses attested in de Buck, M1Be\textsuperscript{1027} was added as well. Furthermore, as B4C did not include any of the phrases with verbal structure variation, it was excluded from the results.\textsuperscript{1028} Using the method described in chapter 4.2, the following dendrogram was produced (figure 4.31):

\textsuperscript{1023} Although B16C is slightly less closely clustered to the other witnesses.

\textsuperscript{1024} de Buck (1935) CT I, p. 143,c (B16C).

\textsuperscript{1025} For more detail regarding background, witnesses and reconstructions, see chapter 3.36.

\textsuperscript{1026} See appendix 5.31 for more detail.

\textsuperscript{1027} Kindly provided to me by Tobias Konrad.

\textsuperscript{1028} Iq-tree cannot function if one entry only consists of hyphens.
In this dendrogram, there are two sections of interest. First, at the final section of the main branch, there lies a group of witnesses that all originate from Deir el-Bersha. This placement is encouraging, as it suggests the existence of a distinct verbal structure pattern in Deir el-Bersha, although it is related to the pattern used in some of the witnesses from Meir. This distinct grouping of Deir el-Bersha witnesses can be seen in I,398-399,c-a, where they have a prospective sdm=f of im (to not do), followed by the negative complement of swsi (to pass): tm.y sws b2+i m sgw.t hr=sn (my soul will not pass in astonishment upon them),\(^{1029}\) where the other witnesses have a subjunctive sdm=f of swsi: swsi b2+i m gw.t hr=s (may my soul pass in astonishment upon them).\(^{1030}\) Additionally, within this final section of the branch, two sub-branches can be seen, one for B1Bo and B6C, and another for B1C, B7C, B2L and B1P. This can be seen in I,356-357,c, where B1C, B2L and B1P use the lemma snr (to rejoice): snr im.yw šts.w (which those who are in mysteries rejoice),\(^{1031}\) while the other witnesses use the lemma shfi (to acclaim): shfi imy.w šts.w (which those who are in mysteries acclaim).\(^{1032}\) This separation reflects the date and the method used for the script of these witnesses, as B1Bo and B6C belong to an earlier period of coffin creation, and B1C, B7C, B2L and B1P belong to a later period. This is reflected in the script as well, as B1Bo and B6C use a procedure in which the text is incised after application with ink, where the others are painted. Although these witnesses from Deir el-Bersha now are placed on the same sub-branch, it is encouraging that the division between two periods of coffin creation which was seen in chapter 3.36.2 is visible here as well.

\(^{1029}\) de Buck (1935) CT I, p. 398-399,c-a (B1C).
\(^{1030}\) de Buck (1935) CT I, p. 398-399,c-a (T3C).
\(^{1031}\) de Buck (1935) CT I, p. 356,c (B2L).
\(^{1032}\) de Buck (1935) CT I, p. 356,c (B6C). Note that this structure occurs in M3C, M6C, M20C, M28C, M-Ann, S14C and T3C as well.
In a similar manner as occurred in the sentence structure dendrogram, there is a separate sub-branch for A1C and G1T, which supports the idea that these witnesses belong to the same Upper Egyptian school of artists.\textsuperscript{1033} However, T3C, which should belong to the same group is not remotely near these two witnesses, although that occurred in the sentence structure dendrogram as well. For example, this can be seen in I,326-329,c-a, where A1C and G1T have the lemma \textit{w\texttt{t}s} (to lift up): \textit{w\texttt{t}s-sn \texttt{hpr}.\texttt{w}=i m-\texttt{e} nnw} (they lift my creation up from Nun),\textsuperscript{1034} where the other witnesses, including T3C have the lemma \textit{nd} (to ask): \textit{nd=sn \texttt{hpr}(w)=i m-\texttt{e} nnw} (they ask about my creation from Nun).\textsuperscript{1035}

However, there do not seem to be any clear patterns beyond this point. Although all on the same branch, the witnesses of Meir seem to be strongly scattered throughout witnesses from different regions, even though some clustering between M1Be and M3C, and M20C and M28C does seem to occur.\textsuperscript{1036} For example, in I,330-331,c, where M1Be, M3C, M4C, M6C and M20C have a nominal \textit{sqm}=f of \textit{dd} (to speak), followed by a circumstantial \textit{sqm}=f of \textit{gr} (to be silent): \textit{dd-i gr.n psd.t} (I speak after the ennead is silent).\textsuperscript{1037} Here, the majority of the other witnesses, which include M28C and M-Ann, have a prospective \textit{sqm}=f for \textit{dd}, followed by a prospective \textit{sqm}=f for \textit{gr}: \textit{dd-i gr psd.t} (when I speak, the ennead is silent).\textsuperscript{1038} S1C and S2C have a circumstantial \textit{sqm}=f for \textit{dd}, followed by a circumstantial \textit{sqm}=f for \textit{gr}: \textit{iw=i dd-i gr psd.t} (I speak while the ennead is silent).\textsuperscript{1039}

As occurred in the sentence structure dendrogram as well, witness S1C and S2C are placed separate from the other witnesses, and it is only the visualisation that implies their proximity, as alternative orientations of the same dendrogram could place them at either side of the dendrogram. Although these two witnesses belong to the same owner, it cannot be said that they share the same verbal structure pattern. However, it is possible that this variation was intentional.\textsuperscript{1040}

In summation, for spell 75, it is possible to differentiate between a verbal structure pattern of Deir el-Bersha, which can be considered to be regionally conditioned. Thus, the protein-sequence method used in this chapter is capable of visualising regional variation in the sentence structure. However, beside Deir el-Bersha, there does not seem to be any clear distinction between the other regions, with the exception of A1C and G1T, which should be considered a group, as they are relatively mixed together, with some pockets of Meir resembling a separate pattern as well.

\textsuperscript{1034} de Buck (1935) \textit{CT I}, p. 327-329,c-a (G1T).
\textsuperscript{1035} de Buck (1935) \textit{CT I}, p. 326-328,c-a (T3C).
\textsuperscript{1036} Which follows the stemma of Jürgens (1995), p. 135, where M1Be and M3C are part of type \textit{\mu}1, and M20C and M28C are part of \textit{\mu}2. However, Jürgens has M-Ann as part of \textit{\mu}2, while in my dendrogram it is on a different branch, although in the vicinity of M20C and M28C.
\textsuperscript{1037} de Buck (1935) \textit{CT I}, p. 330,c (M3C).
\textsuperscript{1038} de Buck (1935) \textit{CT I}, p. 331,c (M28C).
\textsuperscript{1039} de Buck (1935) \textit{CT I}, p. 331,c (S1C).
\textsuperscript{1040} Even though they sometimes share the same structure, as can be seen in I,330-331,c, discussed above.
4.37. Spell 89

In spell 89, there are a total of eight phrases in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was created (figure 4.32):

![Dendrogram](image)

Figure 4.32 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 89.

In this spell, most witnesses are on a branch at the top, which does consist of multiple sub branches. However, as they are mostly near the top, it suggests that there is some underlying similarity between these witnesses. This is to some extent true, as multiple phrases of this spell only vary in one witness, which is rarely the same witness. For example, in II,58,b, G2T has a passive circumstantial \textit{sdm-f}: \textit{iw nhm.w n-f tzw m fn\dagger-i} (breath is taken away from my nose for him), where all other witnesses have a circumstantial \textit{sdm.n-f}: \textit{iw nhm.n-f tzw m fn\dagger-i} (he has taken away the breath from my nose).

The connection between the witnesses of the sub-branches is less clear. Even though the connection between Pap.Berl. and S2C would serve the suggestion that Pap.Berl. originates from Asyut, this placement is deceptive. Not only does S1C, which belongs to the same owner as S2C show that there are multiple options in Asyut, the affinity to Pap.Berl. is less conclusive than the dendrogram suggests. Only in four out of the eight phrases do these witnesses have the same verbal structure. However they have the same structure in phrase II,55,a, the title which only occurs in B4C, S2C and Pap.Berl. In this phrase, S2C and Pap.Berl have an infinitive of \textit{hsb} (to send): \textit{r n hsb s [b\dagger-f]} (a spell of sending a man and his soul), where B4C has an infinitive of \textit{shm} (to have power): \textit{[s]hm m hft.y} (having power over an enemy).

The only witness which is remarkably distinct from the other witnesses is B4C. This falls within expectations, as it has a unique structure in four out of the eight phrases. For example in II,59,a,

---

\textsuperscript{1041} For more detail regarding background, witnesses and reconstructions, see chapter 3.37.
\textsuperscript{1042} See appendix 5.32 for more detail.
\textsuperscript{1043} de Buck (1938) \textit{CT II}, p. 58,b (Pap.Berl).
\textsuperscript{1044} Regulski (2015), p. 301.
\textsuperscript{1045} II,55,a, II,57,c, II,58,b and II,58,c.
\textsuperscript{1046} de Buck (1938) \textit{CT II}, p. 58,b (S2C).
\textsuperscript{1047} In II,55,a, II,55,c, II,57,c and II,59,a.
where the majority of the witnesses have a circumstantial $sd_m.n=f: iw \ in.n=f \ wi \ r \ s.t=i \ tn$ (he brought me to this place of mine),\(^{1048}\) where B4C has a nominal $sd_m.n=f: in.n=f \ s(y) \ m \ s.t \ tn$ (he has brought her even from this place). Note that Pap.Berl has a unique structure as well, as it has a circumstantial $sd_m=f: iw \ \{iw\} \ ini=f \ wi \ r \ s.t \ tn$ (he brings me to this place).

Thus, based on spell 89, the method described in this chapter does not seem to be capable of visualizing regionally conditioned variation in the verbal structure. However, as there was no sign of regional patterns in the sentence structure (chapter 3.37.3) either, it is not unlikely that for this spell, there is no regional conditioned variation.

### 4.38. Spell 94

The following section will discuss spell 94.\(^{1049}\) In this spell, there are only four phrases\(^{1050}\) in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was produced (figure 4.33):

![Figure 4.33 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 94.](image)

In this dendrogram, there are three branches. The first branch, consisting of S1C,a, S1C,b, S2C,a and S2C,b, suggest the existence of a distinct verbal structure pattern in Asyut. However, the placement of S1C,a within this branch is problematic, as it only has one of the four phrases (II,68,c), which varies from all the other witnesses. Thus, based on this witness, it could be that this branch only exists due to dissimilarity with the other witnesses. However, S1C,b, S2C,a and S2C,b are nearly identical in the verbal structure, so their connection is reasonable. Moreover, their structure is distinct from the other witnesses, which is supported in this dendrogram. This can be seen in II,70,b, where S1C,b and S2C,a-b have an imperfective passive participle, followed by an infinitive: $sn.t \ n \ kf[t-s]$ (which is feared

---

\(^{1048}\) de Buck (1938) *CT II*, p. 59,a (S2C).

\(^{1049}\) For more detail regarding background, witnesses and reconstructions, see chapter 3.38.

\(^{1050}\) See appendix 5.33 for more detail.
because of its uncovering),\textsuperscript{1051} where the other witnesses have an imperfective relative $s\text{dm}=f$: $sn\text{d} ntr.w$ $kf.t=s$ (which the gods fear, its uncovering).\textsuperscript{1052}

Although the sentence structure (chapter 3.38.2) was able to visualize clear regional variation, this is not the case here, as there is only variation in the structure use in Asyut, and none in Deir el-Bersha and Meir.\textsuperscript{1053} The placement of M31C can be considered random, as it only has the first two phrases in which verbal variation occurs, and in these the structure is identical to all the witnesses from Deir el-Bersha and Meir. Thus, it could just as well have been placed on the branch of B1C, B1L, M3C and M28C.

In spell 94, the method used in this chapter is barely capable of visualizing regional conditioned variation in the verbal structure, as the witnesses from Asyut are placed separate from the other witnesses. However, the distinction between Deir el-Bersha and Meir which was visible in the sentence structure is not visible in the verbal structure. Thus, it could be argued that the regional conditioned variation for this spell in Deir el-Bersha and Meir occurs in the non-verbal phrases, rather than the verbal phrases.

4.39. Spell 95

Spell 95\textsuperscript{1054} is a short spell, and has only three phrases\textsuperscript{1055} in which variation in the verbal structure occurs. Using the method described in chapter 4.2, the following dendrogram was created (figure 4.34):

![Dendrogram](image)

Figure 4.34 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 95.

In this dendrogram, there is some distinction between the witnesses from Deir el-Bersha, and the other witnesses. This is most clearly visible in II,73,b, where the witnesses from Deir el-Bersha have a prospective $s\text{dm}-f$: $pr.y+i m hrw$ (I will go forth in the day),\textsuperscript{1056} where the other regions have a nominal

\textsuperscript{1051} de Buck (1938) CT II, p. 70,b (S2C,a).
\textsuperscript{1052} de Buck (1938) CT II, p. 70,b (M3C).
\textsuperscript{1053} As they are structurally identical, see II,70,b discussed above.
\textsuperscript{1054} For more detail regarding background, witnesses and reconstructions, see chapter 3.39.
\textsuperscript{1055} See appendix 5.34 for more detail.
\textsuperscript{1056} de Buck (1938) CT II, p. 73,b (B1L).
The connection between M3C and S2C,a does follow expectations, as these witnesses only vary in II,74,c, which does not occur in S2C,a. The connection between S2C,b and M28C is only based on II,73,b however, and they are grouped based on dissimilarity with the other witnesses. All in all, there does not seem to be a clear sign that there is variation between Asyut and Meir.

For spell 95, the method used in this chapter is capable of visualizing regionally conditioned variation. Based on the verbal structure of II,73,b, there is clear evidence of a distinct pattern in Deir el-Bersha, and another outside Deir el-Bersha. However, as this is based on a single phrase only, it might imply more than can actually be supported.

4.40. Spell 96

In this section, spell 96 will be discussed. In this spell, there are a total of 24 phrases in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was made (figure 4.35):

\[ sd\text{-}m\text{-}f: pr\text{-}n\text{-}i m hrw pn (I have gone forth in this day) \]

B1C,a-b and B1L were placed on the same branch, which falls within expectations, as they have the same structure, except for II,74,c, where B1L has a non-verbal construction instead. The distance of B3L from the other witnesses from Deir el-Bersha falls within expectations, as it has a unique structure in II,73,a, where it has a \( sd\text{mm}\text{-}m\text{-}f \) for \( st\text{s} \) (to inflame), followed by a passive prospective \( sd\text{m}\text{-}f \) of \( st\text{kn} \) (to cause to approach) and a perfective active participle of \( pr\text{i} \) (to go forth): \( st\text{ss} id\text{. wt} st\text{kn} hr\text{. w r-gs pr m hwt-f} \) (the wombs will be inflamed, the faces will be caused to approach beside the one who went forth from his fire). Here, the majority of the other witnesses have the lemma \( sn\text{kn} \) (to damage), rather than \( st\text{kn} st\text{ss} id\text{. wt sn\text{kn} hr\text{. w r-gs pr m hwt-f}} \) (the wombs will be inflamed, the faces will be damaged beside the one who went forth from his fire).

The connection between M3C and S2C,a does follow expectations, as these witnesses only vary in II,74,c, which does not occur in S2C,a. The connection between S2C,b and M28C is only based on II,73,b however, and they are grouped based on dissimilarity with the other witnesses. All in all, there does not seem to be a clear sign that there is variation between Asyut and Meir.

For spell 95, the method used in this chapter is capable of visualizing regionally conditioned variation. Based on the verbal structure of II,73,b, there is clear evidence of a distinct pattern in Deir el-Bersha, and another outside Deir el-Bersha. However, as this is based on a single phrase only, it might imply more than can actually be supported.

4.40. Spell 96

In this section, spell 96 will be discussed. In this spell, there are a total of 24 phrases in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was made (figure 4.35):
Figure 4.35 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 96.

In this dendrogram, there are clear signs of regional conditioned variation in the verbal structure. S2C,a and S2C,b are vertically distant from all the other witnesses, suggesting a distinct pattern in Asyut, although this would be based on a single witness only. This can be seen in II,81,b, where S2C,a-b have a nominal $sdm\cdot n\cdot f$: $i\cdot n$ ws[ir] r-i m i[$rt\cdot t n.t id.t] dšr.t (Osiris has washed my mouth even with the milk of the red cow),\(^{1063}\) where the other witnesses have circumstantial $sdm\cdot n\cdot f$: $iw$ $i\cdot n$ wsir r-i m irt.t n.t id.t (Osiris has washed my mouth with the milk of the cow).\(^{1064}\) The witnesses from Meir are part of a distinct pattern, especially in M30C and M37C which only have the second half of the spell. This can be seen in II,83,b, where the witnesses from Meir have a circumstantial $sdm\cdot n\cdot f$ ($iw$($zf$) $sdm\cdot n\cdot f$), followed by a circumstantial $sdm\cdot n\cdot f$ (tempqr$^{r}$ $sl'$use): $iw$ $dz\cdot n\cdot i$ inn.t $nmi\cdot n\cdot i$ isb.tt p.t (I have crossed the west after I traversed the east of the sky),\(^{1065}\) while the witnesses from Deir el-Bersha have two circumstantial $sdm\cdot n\cdot f$ ($iw$($zf$) $sdm\cdot n\cdot f$) forms: $iw$ $dz\cdot n\cdot i$ inn.t p.t $iw$ $nmi\cdot n\cdot i$ inn.t p.t (I have crossed the west of the sky, I have traversed the west of the sky).\(^{1066}\) However, there is a high level of unique variation which occurs in these witnesses from Meir, especially in M3C. For example in II,87,d, where M3C has a perfective passive participle followed by an imperfective active participle: $iw$ $rd\cdot y$ $n\cdot i$ in $sfg$ $irw$ (that which was given to me by the one hidden of shape), while the other witnesses have passive circumstantial $sdm\cdot f$: $iw$ $rd\cdot i$ $n\cdot i$ $w3\cdot t$ ($i$)$rf$ in $sfg$ $irw$ (a road is given to me by the one hidden of shape).\(^{1067}\) The fact that S2C,a-b is connected to M3C is due to their general dissimilarity from the other witnesses, rather than shared similarity.

\(^{1063}\) de Buck (1938) CT II, p. 81,b (S2C,a).
\(^{1064}\) de Buck (1938) CT II, p. 81,b (B1L).
\(^{1065}\) de Buck (1938) CT II, p. 83,b (M3C).
\(^{1066}\) de Buck (1938) CT II, p. 83,b (B1L).
\(^{1067}\) de Buck (1938) CT II, p. 87,d (M28C).
When compared to the variation in sentence structure (see chapter 3.4.3), it seems that the verbal structure does show clear borders of regional conditioned patterns, which was not visible when the entire sentence structure was taken into regard. Thus, for spell 96, it could be argued that by focussing on the verbal structure, it is possible to visualize regionally conditioned patterns which would be lost when the entire sentence structure is compared. For spell 96, the method used in this chapter shows a clear distinction between the witnesses from Asyut, Deir el-Bersha and Meir, even if this might only be based on dissimilarity from each other, rather than similarity within the different regions themselves.

4.41. Spell group 94-96

As Bonanno\textsuperscript{1068} considers spells 94-96 to be a group, it would be worthwhile to study the verbal structure of the group in addition to single spells, in the same manner as was done for the sentence structure in chapter 3.4.1. For the witnesses that do not have all of the three spells,\textsuperscript{1069} the missing spells were replaced by a string of hyphens for every phrase in which variation in the verbal structure occurred, in the same manner as was done in chapter 4.29 for spell group 1-27 and chapter 4.33 for spell group 30-32. Using the method described in chapter 4.2, the following dendrogram was produced (figure 4.36):

![Dendrogram](image)

Figure 4.36 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of the spell group 94-96.

In this dendrogram there are two main branches, and a separate branch for S1C,a. This branch should be discounted, as it is based on a single data-point.\textsuperscript{1070} The other witnesses from Asyut are placed together on the same branch, which suggest the existence of a distinct pattern in the verbal structure used in Asyut for this spell group.

\textsuperscript{1068} Bonanno (2018), p. 276, 297.
\textsuperscript{1069} For more detail regarding the occurrence of witnesses per spell, and the additions to the method, see chapter 3.4.1 and table 3.38.
\textsuperscript{1070} See chapter 4.38 for more detail.
Even though the witnesses from Deir el-Bersha and Meir are on the same branch, it is clear that there are two distinct patterns in use in these witnesses, which are regionally conditioned.

When compared to the results of the sentence structure (see chapter 3.41.2), it is clear that the non-verbal sections of this spell make it impossible to see regionally conditioned patterns, which are clearly visible in the verbal structure. Thus, the method used in this chapter is not only capable of visualizing regionally distinct patterns in the verbal structure, it allows for the allocation of regional features in the text, which would be lost if only the non-verbal sections of the text were taken into regard. For the spell group of spells 94-96, the verbal structure serves as a stabilising feature for research into regional conditioned variation, as it creates clear borders between the witnesses from Asyut, Deir el-Bersha and Meir.

4.42. Spell 97

In this section, the verbal structure variation in spell 97\textsuperscript{1071} will be discussed. In total, there are four phrases\textsuperscript{1072} in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was made (figure 4.37):

![Dendrogram for Spell 97](image)

Based on this dendrogram, there does not seem to be any regional conditioned variation in the verbal structure, as there are no branches which uniquely have witnesses from one region. The branch with B1L and B3L might seem separated, but this is due to visualization, as T1L has an identical structure to B1L and B3L, with the exception that the phrase II,92,b-c does not occur in T1L. In a radial phylogram, B1L, B3L and T1L form a cluster. M28C and M37C form a cluster as well. However, as M37C is mostly reconstructed (see figure 3.99), this would be expected, as the reconstructions were based on M28C and M3C.

\textsuperscript{1071} For more detail regarding background, witnesses and reconstructions, see chapter 3.42.

\textsuperscript{1072} See appendix 5.36 for more detail.
The connection of B4C to M28C and M37C furthermore falls within expectations, even though this is based on only two data-points.\textsuperscript{1073} The connection between B1Bo and S10C is rather a result of dissimilarity, as they only share the same structure in one phrase (II,92,a), although this variation is unique to B1Bo and S10C. In this phrase, B1Bo and S10C have prospective \textit{s\textit{dm-f}} for \textit{smn} (to establish): \textit{smn-f ūkr.t=t m wp.t rε} (so that he will establish your adornment on the brow of Re),\textsuperscript{1074} while B4C, M28C and M37C have a prospective \textit{s\textit{dm-f}} for \textit{rdi} (to give), followed by a subjunctive \textit{s\textit{dm-f}} of \textit{ptr} (to see): \textit{di-t ptr=s hkr-t m wp.t rε it ntr.w} (so that you will cause that she sees your adornment on the brow of Re, the father of the gods).\textsuperscript{1075} B1L, B3L and T1L have the prospective \textit{s\textit{dm-f}} for \textit{rdi}, followed by a passive subjunctive \textit{s\textit{dm-f}} of \textit{ptr}: \textit{di-i ptr hkr-t m wp.t rε} (so that I cause that your adornment is seen on the brow of Re)\textsuperscript{1076} and M3C has a prospective \textit{s\textit{dm-f}} of \textit{ptr}: \textit{ptr=i b=t=i šw.t=i m wp.t rε} (so that I will see my soul and my feather on the brow of Re).

For spell 97, the method used in this chapter does not seem to visualize regional conditioned variation in the verbal structure. However, it seems clear that the verbal structure variation in this spell is not regionally conditioned, which would make it impossible to visualize it. The placement of the witnesses seems to fall within expectations. Thus, the method does seem to work as intended.

4.43. Spell 151

In this section, spell 151\textsuperscript{1077} will be discussed. In this spell, there are a total of thirteen phrases in which variation in the verbal structure occurs.\textsuperscript{1078} Using the method described in chapter 4.2, the following dendrogram was created (figure 4.38):

\textsuperscript{1073} Phrase II,91,d and II,92,a.
\textsuperscript{1074} de Buck (1938) \textit{CT II}, p. 92,a (B2Bo).
\textsuperscript{1075} de Buck (1938) \textit{CT II}, p. 92,a (B4C).
\textsuperscript{1076} de Buck (1938) \textit{CT II}, p. 92,a (B3L).
\textsuperscript{1077} For more detail regarding background, witnesses and reconstructions, see chapter 3.43.
\textsuperscript{1078} See appendix 5.37 for more detail.
Figure 4.38 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 151.

In this dendrogram, the only evidence of some regional conditioned variation in the verbal structure can be extrapolated based on the vertical position of the witnesses. As all witnesses from Deir el-Bersha are in the upper half of the dendrogram, some similarity could be suggested. This is more clearly visible when the dendrogram is visualized as a radial phylogram (figure 4.39). In the central section of the radial phylogram, one can see that although not truly clustered, the witnesses from Deir el-Bersha are grouped closer together, while the other witnesses are scattered as separate branches. Thus, although these witnesses are not alike, there does seem to be some underlying similarity. This can be seen in II,258-259,c-a, where the witnesses from Deir el-Bersha have a prospective $sdm$-$f$: $hz.yi$ $r$ $ns.ti$ $im.t$ $hz.t$ $wis$ $r'$ (I will descend to the seat which is in the forepart of the bark of Re),$^{1079}$ where L1L has a nominal $sdm.n$-$f$ (balanced sentence): $hz.n$-$i$ $m$ $ns.t$ $im.t$ $wis$ (I have descended into the seat which is in the bark), while Sq3Sq has a nominal $sdm.n$-$f$ (emphatic use): $hz.n$ $snni$ $pn$ $r$ $ns.t$-$f$ $im.t$ $dp.t$ $r'$ (this $snni$ has descended even to his seat, which is in the boat of Re).$^{1080}$

Nonetheless, it would be assumptive to consider this a proper pattern in the verbal structure. It only suggests some underlying similarity, even though the witnesses from Deir el-Bersha are more similar to each other than to the witnesses from the other regions.

As S14C was placed on its own branch, it could be considered a distinct pattern from Asyut. However, this would be based on a single witness. Moreover, the structure in S14C is always shared with at least one other region, except for II,225,a and 256,e. For example, in II,225,a, S14C has the infinitive for $pri$ (to go forth): $pr.t$ $m$ $hz.t$ $m$ $hr.t-nfr$ (going forth from the tomb in the necropolis), where B1C has the

$^{1079}$ de Buck (1938) CT II, p. 258-259,c-a (B1C). Note however that S14C has this structure as well, as there is no structure completely unique to Deir el-Bersha in this spell, as the structure is always shared with at least one other region.

$^{1080}$ Variation between L1Li and Sq3Sq is due to II,258,b, which provided the second $sdm.n$-$f$ for L1Li, as this phrase does not occur in Sq3Sq.
infinitive of wn (to open): \( wn \ h3.t \ m \ grh \) (opening the tomb in the night). B3Bo expands on B1C, adding a subjunctive for pri and an imperfective relative \( sdm-f \) for mri (to love, to wish): \( wn \ r \ n \ h3.t \ pr.t \ s.t \ r \ mrr=\)s (opening the gate of the tomb, so that a woman may go forth according to that which she wishes). For the witnesses from Saqqara there does not seem to be a clear underlying pattern.\(^{1081}\)

For this spell, the method used in this chapter is not capable of visualizing regional conditioned variation in the verbal structure, as it does not seem to exist. There is the suggestion of some underlying similarity in the witnesses from Deir el-Bersha, although it is only visible when a radial phylogram is used. Moreover, it could not be considered a sign of a regional conditioned pattern. It could be argued that there might be a distinct pattern in Asyut. However, as this would be based on one witness only, it would be assumptive at best.

### 4.44. Spell 154

In spell 154,\(^{1082}\) there are a total of nineteen phrases in which variation in the verbal structure occurs.\(^{1083}\) When the method used in this chapter was applied, the following dendrogram was produced (figure 4.40):

![Figure 4.40 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 154.](image)

In this dendrogram, there is one large central branch, and three separate branches. The left branch, containing S3C, S9C,a and S9C,b is problematic. S9C,b only has two phrases\(^{1084}\) in which variation in the verbal structure occurs, and of these two, it only share the same structure with S9C,a in phrase II,266-

---

\(^{1081}\) Sq6C and Sq3Sq only have the same structure in II,256,c and II,258,a, which both share the structure with at least one other region.

\(^{1082}\) For more detail regarding background, witnesses and reconstructions, see chapter 3.44.

\(^{1083}\) See appendix 5.38 for more detail.

\(^{1084}\) II,266-267,d and II,268-269,e.
267,d. Here, S9C,a-b have the infinitive šḥ (to be potent) twice: šḥ ṭp is šḥ m ḫr.t-ṇfr (being potent upon the land, being potent in the necropolis),\(^{1085}\) where the other witnesses have this infinitive once: šḥ m ḫr.t-ṇfr (and being potent in the necropolis).\(^{1086}\) Moreover, the connection between S3C and S9C,a is less compelling than the dendrogram suggests. The connection between these witnesses is that they both have a unique variation in II,270-271,d, rather than a similarity, as the further phrases of S9C,a have the same structure that was used in S2C, S2P, S3P and S1Tū as well. Thus, this branch represents dissimilarity with the other witnesses, instead of an underlying structure.

As M38C is on its own sub-branch, and quite distant from the other witnesses, it could be suggested that there might have been a distinct pattern in the verbal structure of Meir. For example, this is visible in II,272-273,a, where the majority of the witnesses have a first person stative of ṭḥ (to know), followed by a perfective passive participle (feminine singular) of tm (to not do): iw=ḫ ṭḥ.ki ḫsḏ.t ḫwwnw ṭmn.t bs ḫr mż.w ḫs (I know the Ennead of Heliopolis, upon which the great one of the seers was not introduced),\(^{1087}\) where M38C only has the first person stative: iw=ḫ ṭḥ.kwi [ḥsḏ.t ḫwwnw] (I know the Ennead of Heliopolis). However, it would be assumptive to consider the pattern in M38C a regional pattern for Meir, as this is based on one witness only.\(^{1088}\)

The central branch contains all the witnesses from Deir el-Bersha, which provides a clear indication that there was a distinct pattern in the verbal structure. This can be seen in II,284-285,c, where the witnesses from Deir el-Bersha have a ṣḏm. ṭf followed by a subjunctive ṣḏm. ṭ: r ḫḥp.t iw.ḥ. w iw.ḥ sf wi (until the heir comes to be). May he inherit (from me), where the witnesses from Asyut only have the ṣḏm. ṭ: r ḫḥp.t iw.ḥ w (until the heir comes to be).\(^{1089}\) However, S1C,a-b is connected to this branch as well. This can be seen in II,280-281,d, where the witnesses from Deir el-Bersha and S1C,a-b have the lemma ḫḥp (to meet): ṭḥ pw ḫḥp.n ṣw ḫnḥ ins. ṭ (it is Re, the one who is in his red linen has met him),\(^{1090}\) where the other witnesses from Asyut have the lemma ḫḥp (to snatch): ṭḥ pw ḫḥp.n ṣw ḫnḥ ins. ṭ (it is Re, the one who is in his red linen has snatched him).\(^{1091}\) Although it is clear that these witnesses do not follow the same pattern as is used in the other witnesses from Asyut, the connection between S1C,a-b and B1L is less compelling than the dendrogram suggests. In total, there are only eight phrases of the nineteen in which these witnesses have a similar structure.\(^{1092}\) Thus, although S1C,a-b clearly uses a different pattern than what was used in the other witnesses from Asyut, it varies enough not to be considered part of the Deir el-Bersha group. Additionally, although common ground between the witnesses from Deir el-Bersha exists, the multitude of sub-branches makes it clear that there is a reasonable level of freedom in the verbal structure of Deir el-Bersha as well.

\(^{1085}\) de Buck (1938) CT II, p. 266,d (S9C,a).
\(^{1086}\) de Buck (1938) CT II, p. 266,d (S2P).
\(^{1087}\) de Buck (1938) CT II, p. 272,a (S2P).
\(^{1088}\) Moreover, this witness only has four of the nineteen phrases (II,268-269,e, II,268,271,f-c, II,270-271,d, II,272-273,a) in which variation in the verbal structure occurs, which might be the reason for its placement as well.
\(^{1089}\) de Buck (1938) CT II, p. 284,c (S1Tū).
\(^{1090}\) de Buck (1938) CT II, p. 280,d (S1C,a).
\(^{1091}\) de Buck (1938) CT II, p. 280,d (S2P).
For spell 154, the method used in this chapter seems to suggest that there are distinct patterns in the verbal structure for Asyut, Deir el-Bersha and Meir. However, the borders are fuzzy, and especially the placement of S1C,a-b makes any clear distinction problematic. Additionally, as S3C and S9C,a-b show, the connections between the witnesses might lie more in dissimilarity.

4.45. Spell 162

The following section will discuss spell 162. In this spell there are a total of 25 phrases in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was made (figure 4.41):

Figure 4.41 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 162.

1093 For more detail regarding background, witnesses and reconstructions, see chapter 3.45.
1094 See appendix 5.39 for more detail.
In this dendrogram, there are two main branches, with a separate branch for B1Bo. Even though M23C looks like a separate branch as well, when the dendrogram is rendered as a rectangular cladogram, it becomes clear that M23C belongs to the same branch as BH2C, BH1Ox, G1T and M22C (figure 4.42). Due to the fact that there are witnesses from Beni Hasan, Gebelein and Meir on this branch, it is clear that this branch represents a pattern in the verbal structure, but that this variation is not regionally conditioned. Moreover, there are barely any shared structures in this group, which suggests that this branch is based on dissimilarity from the other witnesses.

A1C and T3C share a sub-branch, which is sensible if one considers that these two witnesses seem to represent an Upper Egyptian school of coffin decoration. However, as G1T is placed on a different branch, it does not seem that this school used the same verbal structure in the phrases. Moreover, A1C only has two of the 25 phrases, and the first is a unique variation. Thus, the placement together with T3C could be considered accidental, as the structure in phrase II,390,b is the same in nearly every other witness.

Although there is some clustering between B2Bo, B3Bo and B4Bo, there is no clear sign of a regional conditioned structure in Deir el-Bersha, as B1Bo is quite different from these witnesses, even though it belongs to the same set of coffins. Moreover, B6C, which belongs to the same group in Willems, is similar to both B1Bo and the B2Bo, B3Bo and B4Bo group, which explains its position in the middle. This connection can be seen in II,399,b, where B2Bo, B4Bo and B6C have a nominal sdm-f of dd (to say), followed by a perfective participle of rdi (to give) and a relative sdm-f of smsi (to deliver): dd-i n-k rn-k rn n rdi n-s hri=s sms.y=k (I say your name to you, the name of that which was given to it by me, which you delivered). In the same phrase, B1Bo and S2C have the nominal sdm-f of dd, followed by a relative sdm.n-f of rdi, a nominal sdm-f of rh (to know) and the relative sdm-f of smsi: dd-i n-k rn-k rn n rdi.n-k sn rh-i sms[y-k] (I say your name to you, the name of which you have given them. I know that which you delivered). However, as S2C share the same structure in 20 of the 25 phrases with B6C as well, it is clear that there is no real distinct pattern in Deir el-Bersha. On the other hand, in the

---

1096 II,389,b and II,390,b.
1097 Only S2C has a different structure, and M23C does not have this phrase at all.
1098 de Buck (1938) CT II, p. 399,b (B2Bo).
1099 de Buck (1938) CT II, p. 399,b (B1Bo).
1100 Only in II,390,b, II,395,b, II,399,b, II,403,a and II,403,b.
stemma of Jürgens,\textsuperscript{1101} there is actually a distinction between the Deir el-Bersha group and Asyut,\textsuperscript{1102} in broadly the same groups as seen here.\textsuperscript{1103}

In spell 162, the method used in this chapter is not capable to visualize regional conditioned variation in the verbal structure, as there does not seem to be one. Nonetheless, the method does show that there are two general patterns in use, which are not unique to one region. There seems to be a preference per region to which verbal structure pattern to use, as there is no overlap in one region between the two main patterns.

4.46. Spell 165

The following section will discuss spell 165.\textsuperscript{1104} In this spell there are a total of nine phrases in which variation in the verbal structure occurs.\textsuperscript{1105} The following dendrogram (figure 4.43) was created using the method described in this chapter:

\textsuperscript{1101} See Jürgens (1995), p. 99. However, it needs to be noted that this stemma does not represent spell 162 alone, but numerous additional spells as well.
\textsuperscript{1102} Assuming that Y1C indeed originated from Asyut.
\textsuperscript{1103} Type $\lambda$ for the witnesses of Deir el-Bersha, separated in $\lambda$ for B1Bo, $\lambda$1 for B6C and $\lambda$2 for B2Bo and B4Bo, as seen here. Type $\nu$ for S2C and Y1C. However, Jürgens suggested a closer connection between S2C and Y1C that can be seen in figure 4.41.
\textsuperscript{1104} For more detail regarding background, witnesses and reconstructions, see chapter 3.46.
\textsuperscript{1105} See appendix 5.40 for more detail.
In this dendrogram, there is a main branch and a second branch for S1C and S2C. These witnesses should be considered a cluster, as they use an identical verbal structure. This can be seen in III,7,b, where S1C and S2C have a first person stative for ооруж (to be uninjured): ооруж.ki contre sdb nb (I am uninjured from any restraint).\textsuperscript{1106} While B1Be, B1C, B17C and B2L,a have a first person stative for ооруж, followed by an imperfective active participle for وضوع (to make whole): ushman وضوع wi contre sdb nb (I am uninjured, which makes me whole from any restraint).\textsuperscript{1107} Although damaged, M2C and M22C have a two first person statives for both وضوع and وضوع, followed by an imperfective active participle for وضوع: وضوع.ki وضوع wi contre sdb nb (I am uninjured and I am made whole from any restraint).\textsuperscript{1108} While all other witnesses have a unique structure, for example B4Bo, which has a nominal sdn won for وضوع and a passive nominal sdn won for وضوع: وضوع 실효. won ین sdn won [m contre sdb] (this 실효. won is uninjured and this 실효. won is made whole from the restraint). It could be suggested that S1C and S2C represent a distinct pattern in the verbal structure of Asyut, but as these witnesses belong to the same owner, and are often distinct from each other and other witnesses from Asyut,\textsuperscript{1109} it would be assumptive to assign a pattern in Asyut based on these witnesses alone.

In this dendrogram, there is a sub-branch for B1Be, B1C, B17C and B2L,a. These witnesses represent a cluster of witnesses with the same verbal structure. Moreover, this structure can be clearly seen in III,6,a, which occurs in all witnesses except these four.\textsuperscript{1110} Even though B2L,b is on the other sub-branch, this does not imply that B2L does not belong to this group. B2L,b only consists of one phrase, III,6,a. As this phrase does not occur in B2L,a, B2L,b should be on a different branch. However, its placement in proximity to other witnesses from Deir el-Bersha might be random, as based on this phrase alone, B2L,b could have been placed with S1C and S2C as well.

The right sub-branch contains witnesses from Deir el-Bersha and Meir. However, the placements of M2C and M22C are dubious, as most of the verbal forms of these witnesses have been reconstructed.\textsuperscript{1111} Thus, the placement near the witnesses from Bersha could be due to the reconstructions, rather than the original text. Moreover, the connection between B3C and M2C seems to be based on dissimilarity with the other branches, rather than similarity, as these witnesses only share the same structure in four of the nine phrases.\textsuperscript{1112} In comparison, B2Bo and B3C share the same structure in six phrases.\textsuperscript{1113} Thus, the connection between Deir el-Bersha and Meir is less strong than the dendrogram suggests. Moreover, four of the nine phrases have only one witness which varies, for example in III,6,b, where the majority of the witnesses have the lemma ىشى (to flourish): ىشى mis.t rě ый msf.t rě nb (so that the liver of Re will flourish because of Maat, every day),\textsuperscript{1114} while B5C has the lemma ىشى (to overflow): ىشى.w mis.t rě ый msf.t rě nb (so that the liver of Re will overflow because of Maat, every day).

\textsuperscript{1106} Buck, 1947, p. 7,b (S1C).
\textsuperscript{1107} Buck, 1947, p. 7,b (B1C).
\textsuperscript{1108} Buck, 1947, p. 7,b (M22C). The وضوع.ki is reconstructed in both witnesses.
\textsuperscript{1109} See for example spell 30 (chapter 4.30), 32 (chapter 4.32) and 75 (chapter 4.36).
\textsuperscript{1110} Additionally it can be seen in III,7,b, discussed above.
\textsuperscript{1111} See figure 3.108 in chapter 3.46.1.
\textsuperscript{1112} III,7,a, III,10,a, III,12,a and III,13,a.
\textsuperscript{1113} Only in III,7,b, II,9,b and III,10,a does the verbal structure vary.
\textsuperscript{1114} Buck, 1947, p. 6,b (B1C).
In spell 165, the method used in this chapter is capable of visualizing regional conditioned variation in the verbal structure. There seems to be a distinct pattern in Asyut, even though it is only based on the coffins of one man. Additionally, there seems to be at least two patterns in Deir el-Bersha. One of these patterns is clearly distinct, while the other pattern seems to have more overlap with the witnesses of the other regions. Thus, this pattern could rather reflect a more general pattern for this spell that was used in Meir as well.

4.47. Spell 166

Spell 166 is a short spell, with only three phrases in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was made (figure 4.44):

![Dendrogram](image)

In this dendrogram, there are three branches. The right branch, consisting of B17C, S1C and M2C, falsely suggests some connection between these witnesses. However, only S1C shares some similarity with the other witnesses, whereas B17C and M2C do not share the same verbal structure in with any of the other witnesses. Thus, this branch represents the witnesses that are dissimilar from the other witnesses. This can be seen in III,16,a, where S1C follows the structure of the majority, which use an imperative: imi n-i nn sw.wt (give me these offerings), where B17C has a passive circumstantial sḏm-f: iw rdi.w n-i sw.wt (offerings are given to me), and M2C does not have a phrase. Note that B4Bo has a unique structure, as it has two imperatives: imi n ḏḥwty-nḥt [f.w] ḫr mnnw imi n ḏḥwty-nḥt nn sw.wt (give to ḏḥwty-nḥt bread with Min, give these offerings to ḏḥwty-nḥt).

---

1115 For more detail regarding background, witnesses and reconstructions, see chapter 3.47.
1116 See appendix 5.41 for more detail.
1117 Buck, 1947, p. 16,a (S1C).
The placement of M22C on the left branch can be ignored, as it was more than 50% partially or fully reconstructed.\textsuperscript{1118} However, if M22C is discounted, the left branch becomes a representation of the witnesses from Deir el-Bersha. Within this Deir el-Bersha branch, there is a sub-branch, which resembles the distinct pattern which was seen in spell 165, as B1Be, B1C and B2L were placed on the same sub-branch. Moreover, this is reflected in III,14,a, where B1Be, B1C and B2L have a stative for phr, in the construction $\text{ts-phr}$ (vice-versa): $\text{s\textit{mm.t} im-i s\textit{sn.wt-i ts phr}}$ (the guide with me is my unstopper, and vice-versa).\textsuperscript{1119} All the other witnesses have a unique structure, for example B5C, which has an imperfective active participle (masculine singular) for smt (to hear), followed by an imperfective participle for sdm (to hear) and the stative of the $\text{ts-phr}$ construction: $\text{in smt wi sdm.w ts phr}$ (it is the one who hears me who is heard, and vice-versa), or B4Bo, which only has a imperfective active participle (feminine singular) for smt: $\text{i[n] smt.t}$ (it is the one who hears).

For spell 166, the method used in this chapter seems to be capable to visualize regional conditioned variation in the verbal structure, but only on the condition that certain witnesses are ignored. However, as one of the three phrases with variation in the verbal structure has a unique variation, any placement of witnesses is based on one or two data-points at best. This results in deceptive branches, as B17C and M22C are completely unique in their structure, but are placed on the same branch, as they are dissimilar from all other witnesses. Nonetheless, as M22C is badly damaged, it is possible to suggest that there are at least two distinct patterns in Deir el-Bersha, were the other regions all have their own variations.

4.48. Spell 167

In spell 167,\textsuperscript{1120} there are a total of twelve phrases in which variation in the verbal structure occurs.\textsuperscript{1121} Using the method described in this chapter, the following dendrogram was created (figure 4.45):

\textsuperscript{1118} See figure 3.110 in chapter 3.47.1.
\textsuperscript{1119} Buck, 1947, p. 14,a (B1Be).
\textsuperscript{1120} For more detail regarding background, witnesses and reconstructions, see chapter 3.48.
\textsuperscript{1121} See appendix 5.41 for more detail.
In this dendrogram, there is a large branch at the left, and three single witness branches at the right. Most of the left branch represents witnesses from Deir el-Bersha, with the exception of M22C and M23C. The placement of M23C should not hold real value, as it is mostly reconstructed. Even if the reconstructions are correct, this witness only has the final three phrases, in which the verbal structure is the same as B2Bo. However, the same three data-points occur in M22C as well. Thus, M23C could have likewise been placed with M22C, creating a separate Meir branch. Thus, it could be argued that there is a Deir el-Bersha section in the dendrogram. For example, this can be seen in III,19,a, where the witnesses from Deir el-Bersha have a circumstantial sdm=f: dli-k n=it (while you give bread to me), where the other witnesses have a circumstantial sdm.n=f: rdi.n=k n=it lnk.t (after you gave bread and beer to me).

In spell 165, one could see a clear separate section for B1Be, B1C, B17C and B2L. Of this group, in this spell only B1Be, B1C and B17C are left, as B2L is relatively far removed from this group. This is most likely due to III,16,c and III,17,a, where B2L does not follow the same pattern as B1Be, B1C and B17C. Another separate section exists for B4Bo and B3C, but the similarity between these witnesses represents a divergence from the other witnesses from Deir el-Bersha. In III,19,b and III,19,d these witnesses have a unique variation, even though the other phrases generally use the same structure as the other witnesses from Deir el-Bersha. Thus, this branch represents unique features within Deir el-Bersha, rather than a distinct verbal structure. Even so, in III,22,a, B1Be, B1C, B17C and B2L have a

---

1122 See figure 3.112 in chapter 3.48.1.
1123 III,24-25,c-a, III,25,b and III,26,c.
1124 Buck, 1947, p. 19,a (B2Bo).
1125 Buck, 1947, p. 19,a (S1C). However, it must be noted that B5C follows this structure.
passive nominal $sdm.\text{n}f: wd.t\ ir.n\ sm2=t$ (wd.t, your hair lock has been made),\textsuperscript{1126} while the other witnesses have an imperative: $h3w.t\ ir\ n=i\ sm2=t$ (Mourner, make your hair lock for me).\textsuperscript{1127}

B5C is the only witness from Deir el-Bersha which does not occur with the others, but rather more closely to S1C and S2C. In total, B5C varies in only four phrases form S1C and S2C.\textsuperscript{1128} Thus, there seems to have been some liberty in the verbal structure of the witnesses within Deir el-Bersha. There seems to be less of a connection between S1C and S2C, but as these witnesses only vary in three phrases,\textsuperscript{1129} they should still be considered akin to each other.

For spell 167, it can be argued that the method described in this chapter works. However, the borders are fuzzy, and due to a similar structure at the end of the spell, the placement of M23C seems to be random. Thus, the dendrogram suggests the existence of a general Deir el-Bersha pattern, in which there is a distinct verbal structure pattern, although the picture is perhaps not entirely convincing. Beside this pattern, there is a high level of freedom to the witnesses. Additionally, it could be suggested that there might be a distinct pattern in Asyut. However, the proximity of B5C does make that less likely, even though S1C and S2C are to some extent distinct from B5C.

4.49. Spell group 165-167

As spells 165-167 are considered a group for the sentence structure,\textsuperscript{1130} it would be beneficial to study these spells as a group for the verbal structure as well. For the witnesses that do not have all of the three spells,\textsuperscript{1131} the missing spells were replaced by a string of hyphens for every phrase in which variation in the verbal structure occurred, in the same manner as was done in chapter 4.29 for spell group 1-27, chapter 4.33 for spell group 30-32 and chapter 4.41 for spell group 94-96. Using the method described in chapter 4.2, the following dendrogram was produced (figure 4.46):

\textsuperscript{1126} Buck, 1947, p. 22,a (B17C).

\textsuperscript{1127} Buck, 1947, p. 22,a (S1C). However, it could be read as $ir.n-i$ (I have made) as well.

\textsuperscript{1128} In III,17,a and III,17,b B5C uses a unique variation, and B5C does not have a phrase in III,24-25,c-a and III,25,b. For another example, see III,19,a, discussed above.

\textsuperscript{1129} In III,18,b, III,19,b there is variation between S1C and S2C, although in both cases it represents an unique variation in S1C. III,19,d does not occur in S1C.

\textsuperscript{1130} See chapter 3.46 for more detail.

\textsuperscript{1131} For more detail regarding the occurrence of witnesses per spell, and the additions to the method, see chapter 3.49 and table 3.46.
Figure 4.46 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of the spell group 165-167.

In this dendrogram, there is one central branch, with three single witness branches for S1C, S2C and Sq10C. Although placed on different branches in this dendrogram, S1C and S2C should be considered to be closer than this dendrogram suggests. When rendered as a radial phylogram (figure 4.47), S1C and S2C are more closely clustered together. Although not clustered on one point, there is more proximity between S1C and S2C than figure 4.46 suggests. Additionally, it makes it clear that Sq10C should be considered its own entity as well, although connected to the witnesses from Asyut. However, as Sq10C only occurs in spell 165, its connection is only based on seven data points, as it only used the first seven phrases of spell 165.\textsuperscript{1132} Thus, it could be argued that there is a distinct pattern for Asyut and Saqqara, which are akin to each other. However, this would only be based on one witness of Saqqara, and two witnesses from Asyut, which belong to the same owner.

The central branch represents the witnesses from Deir el-Bersha and Meir. However, some of the placements of the witnesses from Meir are dubious. For example, M23C only has the final three data-points of the combined spells, which caused it to be placed with B2L\textsuperscript{1133} and B2Bo in spell 167. As was the case there, M23C could just as well have been placed with M22C, which has the same final three data-points. This would have falsely created the suggestion of a distinct Meir pattern.

\textsuperscript{1132} See appendix 5.40 for more detail.
\textsuperscript{1133} Note however that B2L in spell 167 is actually B2L,a in this dendrogram.
Due to the three sub-branches of the central branch, it could be suggested that there are three distinct verbal patterns used for this spell group in Deir el-Bersha. The connection of M2C to the right final sub-branch (figure 4.49) at first seems to pose a problem for this statement, but based on the separate spells, it does not seem that this connection is actually based on this group. M2C does not occur in spell 167, and in spells 165 and 166 it is quite different from the group containing B1Be, B1C, B17C and B2L,a. Even though B17C (in spell 166) and B2L,a (in spell 167) are more distant from the core B1Be and B1C structure, they remain similar. However, as B17C represents a unique verbal structure in spell 166, which is the case for M2C as well, the connection here is most likely based on dissimilarity with the other witnesses, rather than an underlying pattern. This is more clearly visible when the dendrogram is displayed as a radial phylogram (figure 4.48), where M2C is quite distant from B17C. Although placed here, M2C should be considered its own entity. Thus, it would be possible to consider this branch as an example of a distinct verbal structure pattern in Deir el-Bersha.

For this spell group, the method used in this chapter is capable of visualizing regional conditioned variation in the verbal structure, although the placement of the witnesses from Meir complicate matters. Moreover, in the case of M2C, the placement is based on dissimilarity, which makes a group which is clearly distinct in the separate spells (B1Be, B1C, B17C and B2L,a) look like they are similar to a witness from Meir. Nonetheless, there seem to be at least three distinct patterns in the verbal structure for Deir el-Bersha, and a separate structure for both Asyut and Saqqara, even though this is currently based on limited data. There might be a distinct structure in Meir as well, however, it seems that this is closely related to the witnesses from Deir el-Bersha.

4.50. Spell 215

In this section, spell 215\textsuperscript{1134} will be discussed. For this spell, there are a total of nineteen phrases in which variation in the verbal structure occurred.\textsuperscript{1135} Using the method described in this chapter, the following dendrogram was produced (figure 4.50):

\textsuperscript{1134} For more detail regarding background, witnesses and reconstructions, see chapter 3.50.
\textsuperscript{1135} See appendix 5.43 for more detail.
Figure 4.50 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 215.

In this dendrogram, there is one main branch, and a second branch for S1C and S2C. Even though they are placed separately, the vertical distance between the witnesses makes it clear that these two witnesses are not as similar as might be suggested here.

Based only on the right sub-branch of the main branch, it could be suggested that P.Gard.2 originates from Deir el-Bersha, as it is on the same branch as B2Bo and B4Bo. However, this connection is deceiving, as P.Gard.2,a only has the same structure in eleven of the nineteen phrases\(^{1136}\) of B2Bo. This is better visible in a radial phylogram (figure 4.51), where there is a clear distance between P.Gard.2,a-b and the B1Bo, B2Bo, B4Bo, B3C, B2L and M22C cluster. Thus the connection between P.Gard.2 and Deir el-Bersha is less certain than figure 4.50 suggests. Even so, some connection between P.Gard.2,a-b and the witnesses from Deir el-Bersha and Meir can be seen in III,186,a, where this group has a passive $sdm\cdot f$: $rdi\ n\ n\ psd\ .ty$ (while water is given to the double Ennead),\(^{1137}\) where S1C and S2C have a passive $sdm\cdot n\cdot f$: $rdi\ n\ n\ f\ dh\ wy\ ty$ (after Thot was given to him).\(^{1138}\) The suggestion that P.Gard.2 originates from Asyut\(^{1139}\) cannot be supported based on the verbal structure in this spell. Furthermore, as seen in spell 30 and 32,\(^{1140}\) it might be unwise to assume the form of a pattern from Asyut based only on S1C and S2C, which often vary from the other witnesses from Asyut.

---

\(^{1136}\) III,180,a, III,180,c, III,181,a, III,181,b, III,183,b, III,186,a, III,186,b, III,187,b III,188,b, III,188,c and III,189,a.

\(^{1137}\) Buck, 1947, p. 186,a (B1Y).

\(^{1138}\) Buck, 1947, p. 186,a (S1C).

\(^{1140}\) See chapter 4.30 and chapter 4.32.
For spell 215, the method used in this chapter is not capable of visualizing regional conditioned variation in the verbal structure, as it does not seem to exist. Moreover, the placement of P.Gard.2 suggests connections between the witnesses that cannot be supported, and only in the radial phylogram display is the distance of this papyrus more visible. The best that can be suggested based on this spell is a pattern used in Deir el-Bersha and Meir, whereas Asyut uses different structures, with a high level of freedom in the verbal structure. If the assumption that P.Gard.2 originates from Asyut is correct, it shows that this free variation is extremely broad. The addition of additional witnesses from Asyut would be extremely beneficial for this spell.

4.51. Spell 225

Spell 225 is one of the longer spells of this chapter, with a total of 30 phrases in which variation in the verbal structure occurs. Using the method described in this chapter, the following dendrogram was made (figure 4.52):

![Dendrogram](image)

Figure 4.52 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 225.

In this dendrogram, there is one main branch, and separate branches for M25C, T1L and S2C,b. The fact that S2C,a and S2C,b ended up on completely different branches would have been expected, as these function remarkably different.

---

1141 For more detail regarding background, witnesses and reconstructions, see chapter 3.51.
1142 See appendix 5.44 for more detail.
1143 Which is clearly visible in the sentence structure of this spell as well (chapter 3.51.2). The difference is most clearly visible in how the text refers to the owner, as S2C,a uses a first person, where S2C,b uses a second person.
In this dendrogram, there are multiple sub-branches which suggest the existence of regional conditioned patterns in the verbal structure. However, as all the different regions occur all over the dendrogram, it only reflects that some specific structures exist, but that these are rarely the only pattern used in that region. For example, there is a small sub-branch for B2Bo and B4Bo. This grouping is beneficial, as these witnesses are both part of the same assemblage of supports. Moreover, in the stemma of Jürgens, these witnesses are placed together as well, under type Α1. This can be seen in III,234-235,c, where B2Bo and B4Bo have a nominal sdm.n-f of wnm (to eat): wnm.n-k st (you have eaten it), where MC105, S2C,b and T1L have a nominal sdm.n-f (negation) of wnm: n wnm.n-f st (he does not eat it), while B1C, B4C, B1L, B2L, M2NY, S1C,a-b, S2C,a and Sq4C have a prospective sdm-f (negation): n wnm=k st (you will not eat it) and T1Be, Y1C and Pap.Berl have an infinitive: n wnm st (there is no eating of it).

Another group from Deir el-Bersha is visible in B1C and B2L, which are grouped together in Jürgens as well, under type ξ1. Additionally, in Jürgens B1L is part of ξ3, which is a separate branch of type ξ, which is visible here as well. Although there are too few witnesses to be certain, it is interesting that there is a separation between the B2Bo and B4Bo group, and the B1C, B1L and B2L group, as there is a clear difference in the date of coffin creation between these two groups. This can be seen in III,218-219,d where B2Bo and B4Bo have a prospective sdm-f of rdi (to give), followed by a subjunctive sdm-f of pri (to go forth): rdi ḫn.t pr=k m hrw (the pelican will cause that you go forth in the day). B1C and B2L only have the subjunctive sdm-f of pri: pr=k m hrw (so that you go forth in the day), while B1L has a circumstantial sdm-f of rdi, followed by the subjunctive sdm-f of pri: di ḫn.t pr=k m hrw (while the pelican causes that you go forth in the day).

A similar group that can be considered regionally conditioned comes from the Theban area. In this sub-branch (figure 4.53), there are only witnesses from the Theban area, and it is clear that they behave in a similar manner. This can be seen in III,220-221,a, where they have a relative sdm.n-f of mri (to love): r bw mr.n-k im (to the place where you loved), while the majority of the other witnesses have an imperfective relative sdm-f of mri: r bw nb mrr.w ib=k im (to every place where your heart loves). B1C, B4C, B1L and B2L have the imperfective sdm-f of mri, followed by the infinitive of pri: r bw mrr.w ib=k im pr.t im m grḥ m hrw (to the place where your heart loves going forth there, in

1148 Buck, 1947, p. 234,c (Y1C).
1149 See Willems (1988), p. 70-78, where B2Bo and B4Bo are dated to the late 11th dynasty or the early 12th dynasty, and B1C, B1L and B2L are dated to a period between Sesostris II and Sesostis III.
1150 Buck, 1947, p. 218,d (B2Bo).
1151 Buck, 1947, p. 219,d (B2L). Note that T2L, Y1C and Pap.Berl use this structure as well.
1152 Buck, 1947, p. 219,d (B1L).
1153 Buck, 1947, p. 221,a (T1Be).
the night and in the day),\textsuperscript{1155} while Y1C has a prospective relative of mrı: r bw mrı. yı-i im (to the place where I will love). The T1Be, T2Be, T3Be and T2L group is a good representation of type π in Jürgens, although not with the same sub-division. However, as MC105, T9C and T1L occur on different branches, it cannot be stated that this is the only pattern available in the Theban area.

Some witnesses that share a specific feature, do not seem to share the same verbal structure. In this spell, B1Y,\textsuperscript{1156} S2C,a, Pap.Berl. and Y1C use the first person when referring to the owner, rather than the second person. Thus, one would expect some connection, as this feature would support the suggestion that Pap.Berl. and Y1C originate from Asyut. Moreover, this is clear in the stemma from Jürgens, where S2C,a, Pap.Berl. and Y1C belong to type v. However, this is clearly not the case here. Even though they all occur on the same general sub-branch (figure 4.54), they are placed quite distant from each other. It is not unlikely that this is partially due to the method which was used here to encode the spells. As stated in chapter 2.1.6, if the first-person suffix is written at one point in the spell, it is never added. In this spell, this led to cases where instead a $sdm\textsuperscript{f}$ form, a participle was being read instead, which caused the creation of a variant, where for the artist none existed. For example, in III,220-221,c, where Y1C has an imperfective active participle: $shm$ $m$ $ib\textsuperscript{i}$ (who has power in my $ib$-heart), while the other witnesses have a subjunctive $sdm\textsuperscript{f}$: $shm\textsuperscript{i}$ $m$ $ib\textsuperscript{i}$ (may I have power in my $ib$-heart).\textsuperscript{1157} Notably, there are clear signs that this branch does not actually represent similarity in the witnesses, but is rather a collection of witnesses that were too dissimilar from the other witnesses. For example, B4C and Y1C are on the same sub-branch, but they only share the same structure in three out of the 30 phrases.\textsuperscript{1158} The connection between B1Y and Pap.Berl. is similarly weak, as they only share the same structure in two phrases,\textsuperscript{1159} although it must be noted that B1Y only has the first five phrases to begin with. As the connection is based on only two phrases, B1Y could just as well have been placed with Y1C, with which it shares the same structure in two phrases.\textsuperscript{1160} Thus, it is clear that this branch represents dissimilarity, rather than an underlying verbal structure.

For spell 225, the method used in this chapter is capable of visualizing regional conditioned variation in the verbal structure. However, it can only do so in specific groups that seem to be regionally conditioned, despite the clear presence of alternative patterns in every region. Moreover, there is a high number of witnesses that were grouped together due to dissimilarity, rather than an underlying verbal

\textsuperscript{1155} Buck, 1947, p. 221,a (B2L).
\textsuperscript{1156} However, this spell has only the first five phrases, and could be placed differently because of it.
\textsuperscript{1157} Buck, 1947, p. 220,c (S2C,a).
\textsuperscript{1158} III,216-217,b, III,236-237,a and III,246-247,d.
\textsuperscript{1159} III,216-217,a and III,216-217,b.
\textsuperscript{1160} III,212,a and III,216-217,b.
structure. Moreover, a clear non-verbal feature of S2C,a, B1Y Pap.Berl. and Y1C is lost in the verbal structure, which shows that one should not solely rely on the verbal structure alone. In this spell, there are signs of a distinct pattern that was used in the Theban area, and two patterns from Deir el-Bersha, the separation of which seems to be based on the date of coffin creation.

4.52. Spell 335

In this section, spell 335 will be discussed. Remarkably, as it is the longest spell in de Buck, this spell has a total of 110 phrases in which variation in the verbal structure occurs. This is actually one phrase less than occurred in spell 75. For this spell, the approach used was slightly changed. For the comparison of the phrases, the structure used in de Buck was followed, rather than the structure as it occurs in the witnesses. In this spell, BH1Br, M1Be, M1NY and T1C,b actually changed the order in which certain sections of the spell occurs. However, this is done by thematic unit, and could be considered moving the order of some of the paragraphs. Therefore, as the cohesion of the phrases within the paragraphs is not affected, the exact placement of the phrases seems less important. Moreover, as the alternative order was maintained in chapter 3.52.2, its adjustment does not seem unlikely. Moreover, if the original phrase order was followed, it would only result in a section of text with unique variations for one witness, even though the structure might be identical. This will reduce the number of phrases with variation in the verbal structure, as there would be many more phrases added that would only exist of two groups, with completely different phrases.

Thus, using the order of phrases as depicted in de Buck, the method used in this chapter was applied to create the following dendrogram (figure 4.55):

---

1161 For more detail regarding background, witnesses and reconstructions, see chapter 3.52.
1162 See appendix 5.45 for more detail.
1163 I am indebted to Tobias Konrad for providing the material of M1Be to me.
Figure 4.55 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 335.

In this dendrogram, there is one large branch, and two separate smaller branches, one for T1C,a and one for M1C and M54C. The extreme vertical distance of T1C,a is not completely surprising, as this witness represents one of the witnesses without glosses. However, if the lack of glosses was the reason for its distance, it is remarkable that this is not the case for B3C, B9C,b, M1Be and Sq4Sq. Thus, T1C,a represents a different verbal structure. The second small branch, consisting of M1C and M54C follows expectations, as they occurred on the same branch in the verbal structure as well. However, in the stemma of Rößler-Köhler, the connection between M1C and M54C is not as close as seen here, as although M1C and M54C are both part of type ξ, M54C and M1NY are together in the sub-type σ. As M1NY is not on this branch, this connection is not supported in this dendrogram.

The visualisation of the main branch shows two separate branches for the witnesses from Deir el-Bersha. On the right final sub-branch of the main branch (figure 4.56), one can find B3C, B9C,b and B1Y. The fact that these witnesses are separated from the other witnesses is ideal, as this group represents the witnesses from Deir el-Bersha which use the version of the spell without glosses. However, it needs to be noted that this branch is connected to witnesses which do have the glosses. Interestingly, in the stemma of Rößler-Köhler, the connection between B3C and B9C,b is there, under type ζ, where

---

1164 B3C, B9C,b, B1Y, M1Be, Sq4Sq and T1C,a do not have glosses, see chapter 3.52.1 for more detail. However, it needs to be noted that B1Y and T1C,a do have some of the glosses.

1165 This is mostly due to the first person suffix, which is habitually written in T1C,b, but not in T1C,a. Thus, where T1C,b would write a sqdm-form, T1C,a would be read as a participle or infinitive instead.

1166 See chapter 3.52.2 as well. However, there are no structures that only occur in these witnesses, as they have unique structures for either M1C or M54C, or the structure is used in other witnesses as well.

B1Y was placed under type μ. Thus, the connection in Rößler-Köhler is not as close as the dendrogram here suggests.

The second sub-branch with witnesses from Deir el-Bersha occurs on the opposite side of the branch (figure 4.57). Here, B5C, B9C,a, B15C and B1P are clustered together. These witnesses represent the witnesses from Deir el-Bersha with glosses. However, the sub-branch includes T1C,b as well, which is the witness from this support that does include the glosses. Although this might look problematic, this does reflect the stemma from Rößler-Köhler, as these witnesses are all grouped under type γ, while B5C and B1P are under the sub-type κ. This sub-division can be seen in IV,222-223,a-b, where B5C and B1P have two nominal $qdmf$ (balanced sentence) forms: $spr-i r t s n sh.tyw (i)m prr[-i] m sbz dsr$ (I arrive at the land of the horizon-dwellers there, I go forth from the holy portal),1168 while the majority of the other witnesses have a nominal $qdmf$ followed by a circumstantial $qdmf$: $spr-i r t s n sh.tyw p.t pr-i m sbz dsr$ (I arrive at the land of the horizon-dwellers of the sky, while I go forth from the holy portal).1169 The only witness that is part of type γ in Rößler-Köhler that is not represented here is M57C, which occurs on a different branch.

In figure 4.58, there is a sub-branch to the right of the main branch, of which figure 4.56 is a part. There is a specific sub-branch for M7C and M8C, which falls within expectations, as these are remarkably similar. This can be seen in IV,222-223,a-b, where M7C and M8C have a nominal $qdmf$ followed by a subjunctive $qdam$: $spr-i r t s n sh.tyw pr.t-i m sbz dsr$ (I arrive at the land of the horizon-dwellers, so that I go forth from the holy portal).1170 In Rößler-Köhler they are part of type ε. The additional branch for T3L is remarkable as well, as the contents therein all belong to the same witness, but have a great variety in length. However, as large sections of T3L,b are reconstructed, based on T3L, the proximity is rather expected. The final sub-branch is not from only one region, as it includes T1Be, T2Be and L3Li. However, as L3Li occurred next to T1Be in the sentence structure (see chapter 3.52.2), its connection here is not surprising. However, when compared with the stemma of Rößler-Köhler, its placement makes less sense, as T1Be, T2Be and L3Li fall under type λ, π, and μ respectively. However, with the exception of Sq1C, Sq7C and T3Be, this entire branch does represent type β in Rößler-Köhler.

In the central left sub-branch of the main branch (figure 4.59), there is another group of witnesses where some of the placement seems to be regionally conditioned, while the rest of the placement of the witnesses is not. The sub-branch containing Sq1C, Sq2C and Sq7C reflects similarity, which is expected, as they were found in the same tomb, and are typologically similar.1171 This can be seen in IV,208-209,c, where they

have a passive nominal $sdm\cdot f$ (emphatic use): $dr\; iw\cdot w=i$ (my wrong doings are expelled),\textsuperscript{1172} where the majority of the other witnesses have passive nominal $sdm\cdot f$ (balanced sentence): $dr\; iw=i$ (My wrongdoing is expelled).\textsuperscript{1173} On the other hand, the other witnesses, L1NY, M1NY and Sq1Sq are less easily explained. Although they all occur in Rößler-Köhler under type $v$, they all belong to different subtypes. It is clear that for these witnesses the variation is not due to the region of origin.

For spell 335, the method used in this chapter to visualize regionally conditioned variation seems to work, although with fuzzy borders, or only in the final sections of the branches. Even so, it is encouraging that the witnesses from Deir el-Bersha were placed on different branches, which reflects the use of glosses. Additionally, there are two distinct patterns from Meir, although they only occur in two witnesses each, and additional patterns are clearly available. There is one distinct pattern from Saqqara as well, although only for a specific group of coffins found in the same context. Finally, there seem to be some patterns in the Theban area, although rather based on a single witness, or, for T1Be and T2Be, shared with a witness from el-Lisht.

4.53. Spell 355

In this section, spell 355\textsuperscript{1174} will be discussed. In this spell there are a total of thirteen phrases in which variation of the verbal structure occurred.\textsuperscript{1175} Using the method described in chapter 4.2, the following dendrogram was made (figure 4.60):

![Dendrogram of Spell 355](image)

Figure 4.60 Rectangular phylogram display of the distance based on verbal structure variation between the different witnesses of spell 355.

In this dendrogram, there is one central branch, which consists of two sub-branches. Additionally, there is a separate branch for B1Bo,a and M22C. As M22C is the only witness from Meir, it would be

\textsuperscript{1172} de Buck (1951) \textit{CT IV}, p. 208,c (Sq1C). Variation is due to the use of a $sdm\cdot n\cdot f$ in IV,208,d. Note that M1NY has this structure as well.

\textsuperscript{1173} de Buck (1951) \textit{CT IV}, p. 208,c (B9C,a).

\textsuperscript{1174} For more detail regarding background, witnesses and reconstructions, see chapter 3.53.

\textsuperscript{1175} See appendix 5.46 for more detail.
assumptive to suggest that it represents a specific Meir pattern. Moreover, as it is more than 70% partially or fully reconstructed,\textsuperscript{1176} which was usually based on B2Bo or B4Bo, it is remarkable that it did not end up on the same branch.

There is some distance between B1Bo,a and B1Bo,b, which come from the same support. Although one would expect this to lead to the same general structure, it is not the case here. This was likely intentional, as B1Bo and B2Bo belong to the same owner, which would mean that the same spell occurred three times for the same person. Moreover, this can be seen in V,3,c, where B1Bo,a has a subjunctive $sdm$-f: $ir$ $i$ $wi$.t $p$.t $tn$ $m$ $mh(y)$.t (if this sky comes as the north wind), while B1Bo,b and the other witnesses have a prospective $sdm$-f: $ir$ $i$ $wi$.t $p$.t $tn$ $m$ $mh(y)$.t (if this sky comes as the north wind).\textsuperscript{1177}

When compared to spell 75, it is remarkable that there is much distance between A1C and G1T, which should be considered part of a group.\textsuperscript{1178} However, for this spell, this clearly does not apply for the verbal structure. This can be seen in V,4,a, where G1T has a nominal $sdm$-n-f: $hms$-$n$-i $hr$ $rsy$ $s(w)$ (I sat even upon the south of it), while A1C and the other witnesses have a prospective $sdm$-f: $hms$-$i$ $m$ $rsy$ $s(w)$ (then I will sit in the south of it).\textsuperscript{1179}

The only section that can be suggested to be regionally conditioned is S1C and S2C, which represent a cluster, as they are nearly identical.\textsuperscript{1180} For example, this can be seen in V,7,a, where S1C and S2C have a nominal $sdm$.n-f of $ith$ (to pull): $ith$.-$n$-i $imm$ $m$ $sr$.t-$i$ (I have pulled the skin even from my nose),\textsuperscript{1181} while the majority of the other witnesses have a infinitive for $ith$: $ith$ $imm$ $m$ $sr$.t (pulling the skin from the nose).\textsuperscript{1182} The other witnesses have unique structures, as G1T has an imperfective passive participle for $wbz$ (to pull): $hn$ $wbz$ $imm$ $sr$.t (the face (is that) which is opened of the skin of the nostril), while A1C has a first person stative for $wbz$: $hn$ $wbz$.k$($wi$) $imm$ $sr$.t-$i$ (the face, I am clearing of the skin of my nostril).\textsuperscript{1183} BH3Ox has a nominal $sdm$-f for $ith$, but is reconstructed: $[ith]$. $iwn$.w ($i$) $imm$ $<m>$ $sr$.t (the colour and skin is pulled even <from> the nostril). However, as S1C and S2C belong to the same owner, it would be assumptive to suggest they represent a distinct structure of Asyut. Moreover, their structure is remarkably similar to B4C,\textsuperscript{1184} which makes it unlikely that there is a truly distinct pattern in Asyut.

In spell 355, the method used in this chapter is not capable of visualizing regional conditioned variation in the verbal structure, as there does not seem to be one. This reflects the result in chapter 3.53.3. Even

\textsuperscript{1176} See figure 3.127 in chapter 3.53.1.
\textsuperscript{1177} de Buck (1954) CT V, p. 3,c (B1Bo,b).
\textsuperscript{1179} de Buck (1954) CT V, p. 4,a (A1C).
\textsuperscript{1180} The only variation occurs in V,4,b and V,4,c, which does not occur in S2C.
\textsuperscript{1181} de Buck (1954) CT V, p. 7,a (S1C).
\textsuperscript{1182} de Buck (1954) CT V, p. 7,a (B4Bo). Occurs in B1Bo,a-b, B2Bo, B4Bo and M22C (reconstructed).
\textsuperscript{1183} This could be read as a relative $sdm$-f as well: $wbz$-k (which you opened).
\textsuperscript{1184} The only variation between B4C and S1C occurs in V,2,a, which does not occur in S1C, and V,5,c, V,6,a and V,7,b, which do not occur in B4C, and V,7,b, where B4C has a different structure.
though the witnesses from Meir and Beni Hasan are on distinct branches, it would be assumptive to suggest that this represents distinct patterns in the verbal structure.

4.54. Spell 398

The final spell of this chapter is spell 398. In this spell, there are a total of 39 phrases in which variation in the verbal structure occurs. Note that for the purposes of this chapter, this spell has an additional witness, M1Be. Using the method described in chapter 4.2, the following dendrogram was produced (figure 4.61):

![Dendrogram](image)

Based on the vertical division alone, there are three clear groups in this dendrogram. One for the witnesses from Meir, one for T3L and a final one for A1C, G1T and G2T. Although the top section of the dendrogram consists of a witness from Aswan, and two from Gebelein, it should be considered one pattern, as these witnesses should be considered one group, representing a south Egyptian school of coffin decoration in the first intermediate period. Thus, it is remarkable that this is reflected in the verbal structure. For example, this can be seen in V,150,c, where A1C, G1T and G2T have an imperfective active $sdm.f$, followed by a relative $sdm.n$-$f$: $ntsn$ $pw$ $\dd$ $w$ $n$-$sn$ $m$ $pr$ $\sn$ $pw$ $\dd$.$n$-$sn$ $hr$ $nb$ (it is them who they take from the storehouse, them who they have taken (to) Horus, the lord). In the same phrase, the witnesses from Meir have an imperfective active participle, followed by the relative $sdm.n$-$f$: $ntsn$ $pw$ $\dd$.$w$ $n$-$sn$ $m$ $\sn$ $pw$ $\dd$.$n$-$sn$ $im$ $n$ $\lr$ $nb$ (it is they who take for them from the storehouse, they who

---

1185 For more detail regarding background, witnesses and reconstructions, see chapter 3.54.
1186 See appendix 5.47 for more detail.
1187 I am indebted to Tobias Konrad for making this material available to me.
1189 de Buck (1954) CT V, p. 150,c (G1T).
they have taken there, for Horus, the lord), while T3L has a relative sḏm·f, followed by the relative sḏm·n=f: [ntsn] pw [š]d=k m-s m pr šntš=pw šd·n=s=m pr hr nb (It is them, who you took from it, from her storehouse, them who they have taken (to) Horus, the lord).

The placement of T3L additionally seems to suggest a distinct pattern of the verbal structure in the Theban area, although it must be mentioned that this is only based on one witness. However, the vertical division makes it clear that it is distinct from the Meir group as well as the south Egyptian school of the first intermediate period.

The final section represents the witnesses from Meir. Here it is clear that there is a distinct pattern in the verbal structure from Meir. However, some internal divisions are visible. M3C, M13C, M21C and M46C are part of the same sub-branch. The fact that these occur on a separate branch is remarkable, as all these witnesses do not have the conclusion section of the spell. Thus, it seems that the program is able to create a divergence in the witnesses from Meir based on the absence of a section of text.

Additionally, there is a sub-branch for M5C and M6C. M6C was badly damaged and reconstructed based on M5C. Thus, the connection between these witnesses could be due to the reconstructions, rather than the original text, such that this sub-branch should not be taken as evidence of a distinct pattern in the verbal structure.

In spell 398, the method described in this chapter is clearly capable of visualizing regional conditioned variation in the verbal structure. In this spell, there are three distinct patterns, all bound to a different region. There is a distinct pattern for the witnesses of the Aswan and Gebelein group, a distinct pattern for the Theban area, and one for the witnesses from Meir. Within Meir, it is possible to see a distinct group, which seems to be based on the absence of the conclusion section of the spell.

4.55. Conclusion and final remarks

In this chapter it was intended to show the benefits of using the protein sequencing method on the verbal structure alone, to analyse whether there are regional conditioned patterns in the verbal structure of the Coffin Texts.

The benefits of studying the verbal structure, rather than the sentence structure was most clearly visible in spell 30, the spell group of spells 94-96 and spell 398. In these spells, there was clear regional conditioned variation, which was less obvious in the sentence structure variation. However, these seemed to be the exception, rather than the rule. Even if some regional conditioned variation can be suggested, the borders between groups are often fuzzy, or there are deceptive results due to branches based on dissimilarity. When the discussion from chapter 3.55 is taken into regard however, this is not completely surprising. Only dealing with the phrases in which variation in the verbal structure occurs leads to a low number of data-points in the majority of spells, often below the minimum of 20 data-

---

1190 de Buck (1954) CT V, p. 150,c (M2NY).
1191 This distinction can be seen in V,105,c, discussed above.
1192 See figure 3.129 in chapter 3.54.1.
point that was suggested in chapter 3.55. As the number of phrases in which verbal variation occurs is always less than the number of phrases that occur in the spell, many separate spells cannot pass this threshold. This is an issue that is difficult to resolve, although it would be possible to reduce the underlying problems by applying this method more on the spell groups, rather than the separate spells.

A major issue that stems from the low number of data-points, combined with unique variation, is the apparent tendency to create branches of dissimilarity. As these cannot be visually distinguished from the other branches, it is a necessity to cross-reference the dendrogram with the amino-acid codes used, which hampers the applicability of the results.

Moreover, the display type of the dendrogram becomes more pressing as well, as in comparison to the sentence structure, there are more clusters of witnesses, which are more clearly visible when a radial phylogram is used, rather than a rectangular phylogram. It seems that in regard to the visualisation, a multiplicity of approaches might be beneficial.

However, some of these issues might alternatively be addressed by changing the approach to allocating. In the same manner as chapter 3, this chapter used a binary approach to allocate variation. Instead, it might be more suitable to allow for a more gradual scale. However, as important variation might be lost because of a less strict approach, it would still not be recommended. On the other hand, a more lenient approach might allow for the limitation of unique variation due to obvious corruptions of the verbal forms.

Overall, the protein sequence method for the visualisation of regional conditioned variation is promising. However, it should not be used on its own, but rather as a supporting feature for additional avenues of research, including the sentence structure variation discussed in chapter 3.
5. Regional variation in the graphical form of the verbal lemmas of the *Coffin Texts*

As chapter 3 and chapter 4 showed, there are signs that the sentence and verbal structure in the Coffin Texts can reflect a regional conditioned pattern. In this chapter, the focus is not on the separate spells, but rather on the corpus as a whole. As a full study of regional conditioned variation in every word in the Coffin Texts would be a monumental task,\(^{1193}\) the focus of this chapter rather lies on the verbal forms. In this chapter, the verbal forms will be studied in order to see if there are regional preferences in the writing, use and occurrence of the graphical form of verbal lemmas.

5.1. Introduction

As one could see in chapter 3 and chapter 4, there are clear signs of regional conditioned patterns in the structure of the *Coffin Texts*, be it in the structure of the phrase, or in the verbal structure. However, as the focus of these chapters was limited to the possibilities of visualizing these patterns, there was only consideration for the existence of these patterns, rather than to explain what they are. It is beyond the scope of this thesis to provide the detailed forms of this structure, even though they could theoretically be extracted. Moreover, as was the case with the earlier two chapters, any type of work regarding this structure would be restricted to spells, rather than the entire corpus. Thus, it would not be possible to make any general claim regarding the language used in the *Coffin Texts* of a specific region.

The aim of this chapter is to describe some features of the graphical forms\(^{1194}\) of the verbal lemmas which were used in the *Coffin Texts*, to point out regional preferences in regard to the graphical forms used for that lemma. The purpose of this description is to show that there are regional patterns in the graphical forms of the lemmas, and that these patterns might be used to support suggested origins of texts.\(^{1195}\) Although this chapter only deals with the *Coffin Texts*, it is intended to show the potential of this approach, regardless of the type of text studied.

The focus will lie on providing visual depictions of the variations in the graphical forms used for every verbal lemma, and describe the variations which can function as distinctive markers that suggest a

1193 For the relatively small section of spells I have encoded in my database, the current number of tokens is 89331. Thus, the total number of tokens for the *Coffin Texts* published by de Buck alone would be massive.
1194 Due to the nature of the hieroglyphic script, spelling is an insufficient description for the 2-dimensional interaction between the graphemes which makes up the word, as spelling only describes the sequence of graphemes used to write a word. I use *graphical form* as a description of the 2-dimensional interaction between the graphemes of a word, as one spelling can have multiple graphical forms.
1195 For example, Y1C, which is assumed to originate from Asyut, see Jürgens (1990), p. 55-56.
regional preference. Due to the nature of the hieroglyphic script, it is possible to assume that the use of one sign over another could represent a regional preference.\textsuperscript{1196}

5.2. Method

In this chapter, the graphical forms will be discussed for the verbal lemmas. Due to the full encoding of the verbal forms in the database (see chapter 2.1.6) only these tokens were used for this chapter. However, as this chapter is only a description of the regional preferences in regard to the graphical forms of the verbal lemmas, the verbal functions themselves and their underlying interactions will not be discussed.

In the Coffin Texts one completely depends on the available material, and the choices that were made in ancient times of what to add to the decoration, and what to leave out. Although it would be possible to extract a list of verb forms from the database to provide some interesting statistics, it would be meaningless. As one spell could describe a future action, where another describes what exists, the morphology of the verbal forms would be extremely influenced by the spells in which these verbal forms occur. Thus, if one region would have only spells of the former type, it would seem that future tense is a feature of the language in that region, in regard to the Coffin Texts. Moreover, it would be possible to suggest that there might be a regional preference to speak with a future tense. This is, of course, nonsense. Thus, even though it would be possible to create a graph showing the occurrence of different $s\text{dm}$-$f$ forms in a specific region, the results would be dependent on a great many different variables, which will not support any statistically significant research. Even when the entire corpus of the Coffin Texts would be included in the database,\textsuperscript{1197} the same problems would arise. Thus, this chapter will not deal with occurrence rates of specific verbal forms.\textsuperscript{1198}

For the purposes of this chapter, the work will only be descriptive. In the following sections, the verbal lemmas attested in the database will be discussed from ɾ to ʧ. For every lemma, all the attestations of the lemma will be extracted from the database, and set out in a table depicting all the graphical forms used for this lemma in the database. Note that the material used in the tables depicts only the encoded material,\textsuperscript{1199} thus will not represent all graphical forms used per lemma in the Coffin Texts, nor all attestations of this lemma.\textsuperscript{1200} As stated in chapter 2.1.1, all the graphical forms are depicted as standardised hieroglyphs, and will rarely perfectly depict the original script.\textsuperscript{1201}

\begin{footnotesize}
\begin{enumerate}
\item\textsuperscript{1196} As Regulski (2018), p. 262, showed, is the case in regard to the sign structure of the hieratic script.
\item\textsuperscript{1197} Which it clearly is not, I barely scratched the surface of all the material available.
\item\textsuperscript{1198} It is not my intention to suggest that there are no regional preferences in regard to the use of specific verbal forms or verbal constructions in the Coffin Texts, rather that the material collected for this work will not be sufficient to perform any scientifically sound statistically research.
\item\textsuperscript{1199} Although material from M1Be was included in chapter 3 and 4, it will not be included in this chapter, as this witness was not encoded in the database. However, as spell 313 which had only one witness (B5C) and the alternative spell 20-25 from T1C were encoded in the database, they will be included.
\item\textsuperscript{1200} I am aware that this might not represent the reality of the lemma and its use, but as there are around 400 verbal lemmas in the database, it would be extremely time consuming to locate and include every graphical form for every lemma.
\item\textsuperscript{1201} Any issues arising due to the script will be discussed with the lemmas themselves.
\end{enumerate}
\end{footnotesize}
Based on the attested graphical forms of the lemma, any regional patterns in the sign use and the position of these graphemes in regard to each other will be discussed. The results of the attestations in the database will then be compared to other attestations of that lemma in the Coffin Texts outside the database, to verify any perceived regional preferences.\footnote{Using van der Plas & Borghouts (1998) as the main source of additional attestations. Note that for the purpose of this verification, only the Coffin Texts material published by de Buck will be used, so even though the lemmas might be attested in the Pyramid Texts sections of the coffin decoration as well, Allen J. P. (2006) CT 8, was not included in this verification process. Nor where any additional sources of Coffin Texts not included in the publication of de Buck.} For the purpose of deciding if a pattern represents a regional preference, any attestation of this feature which occurs outside the region would be considered an argument against such.\footnote{I am aware that a pure mathematical approach to a language is futile, but as I am only dealing with a section of all attestations of a lemma, I assume that one attestation represents a higher chance that the same features are used again in the other region.} It falls outside the scope of this chapter to verify any patterns based on other sources that are not related to the Coffin Texts in the same regions, although that would be a preferred follow-up for the results gathered in this chapter.

In order to allow for the comparison of the graphical forms, some adjustments to the encoded forms needed to be made. Due to the variety of additions made to the stem of the lemma by the morphology of a verbal form, for example the N35 (𓆥) in a \textit{sdm.n}=f, it was necessary to reduce all graphical forms encoded in the database to their stem. The only exception to this principle was to retain the duplicated sign in cases of gemination, as a region might have a preference in the placement of the duplicated sign.

However, although the discussion of the stem of the graphical form will habitually include classifiers as well, some classifiers, for example, the A1 (𓀀) or A40 (𓀭) will be ignored for participles where the border between verb form and substantive becomes extremely vague, for example in \textit{msdq.wt} (those male and females that hate),\footnote{de Buck (1935) CT I, p. 13,d (S10C).} where the A1, B1 (𓁐) and Z2 (𓏥) signs were discounted, as they are not considered classifiers of the stem, but rather of the resulting substantive use of the participle. Note that for the terminology of the functions of the signs, Polis & Rosmorduc was followed.\footnote{Polis & Rosmorduc (2015), p. 158-168.}

As the majority of the Coffin Texts are written in columns, it is useful to provide an additional description of the graphical form. In this chapter, \textit{long format} and \textit{compact format} are used to describe a specific type of graphical form. A \textit{long format} is used to describe a graphical form which depicts the graphemes of the word without writing a grapheme beside another in the column. A \textit{compact format} describes a form in which two or more graphemes are written next to each other in the column. Figure 5.1 shows both the long and compact format of the same spelling of the lemma \textit{slm}. Note that for the purposes of this chapter, all images of graphical forms have been standardised to depict the word as if written vertically from left to right, although the majority of the original attestations of the Coffin Texts would be orientated right to left. However, any alternative orientation of graphemes within words has been maintained.
Although all verbal lemmas encoded in the database have been studied, for the sake of brevity in this chapter, not every lemma has been included. Only the lemmas which provided some signs of a regional preference have been included in this chapter, while not including lemmas that provided a regional preference in the database, which was discounted due to the attestations outside the database, or lemmas where no regional preference could be discerned. However, the full discussion of every verbal lemma has been included in appendix 6.

Moreover, the following lemmas have been excluded from this work, as they are either only attested with substantives or adjectives, have only one attestation in the Coffin Texts, or are problematic:

$s\dd$ (unknown),\(^{1206}\) $i\,s\,i$ (to praise, to adore), $i\,w$ (to wail, to complain), $i\,m\,s\,h$ (to revere, to be revered, to be provided for), $i\,m\,n$ (to hide, to be hidden), $i\,n\,i$ (to shout), $i\,k\,r$ (to be excellent) ‘$w\,s\,i$ (to rob, to steal), $w\,h\,m$ (to burn), $b\,r\,b\,c$ (to bathe, to bubble), $b\,s\,i$ (to spit, to vomit, to spit out), $b\,d\,s$ (to be weak, to be weary), $p\,s\,i$ (to fly),\(^{1207}\) $m\,s\,t$ (to guide, to lead),\(^{1208}\) $m\,s\,w\,i$ (to be new), $m\,n\,h$ (to slay), $m\,n\,h$ (to be splendid), $n\,m\,t$ (to traverse), $n\,h\,s\,i$ (to awake, to be awake), $n\,h\,s$ (to be winding), $n\,h\,t$ (to be strong), $n\,s\,m$ (to burn),\(^{1209}\) $n\,k\,n$ (to be injured), $n\,t\,t$ (to bind, to fetter), $r\,w\,d$ (to be firm), $r\,n\,p\,i$ (to be young), $h\,i$ (to acclaim), $h\,w\,n$ (to be young, to be rejuvenated), $h\,b\,s$ (to clothe, to cover), $h\,r\,s\,t$ (to be red), $h\,s\,b$ (to count, to recon), $h\,m\,t$ (to become three),\(^{1210}\) $h\,n\,i$ (to alight),\(^{1211}\) $h\,n\,f\,i$ (to burn), $h\,n\,t\,i$ (to sail upstream),\(^{1212}\) $h\,n\,d$ (to tread), $h\,r\,p$ (to govern), $h\,k\,r$ (to adorn), $s\,s\,i$ (to be wise), $s\,s\,i$ (to be sated, to prepare),\(^{1213}\) $s\,s\,t$ (to make libation), $s\,i\,n\,i$ (to wait),\(^{1214}\) $s\,i\,n\,i$

\(^{1206}\) One attestation, see de Buck (1951) CT IV, p. 92,g (B5C). However, as the meaning of this lemma is unknown, it cannot be said with certainty if this is even a verbal form.

\(^{1207}\) One attestation, see de Buck (1951) CT IV, p. 245,a, which is a guess. However, this lemma is relatively common in the Coffin Texts, see van der Plas & Borghouts (1998), p. 92 and Gracia Zamacona (2008), p. 453-463, which do not include this phrase in their attestations.

\(^{1208}\) One attestation, see de Buck (1935) CT I, p. 393,d (S2C)), however, the sign used is uncertain, as the other witnesses use $j\,s$ (to tie, to knot). Moreover, this phrase is not attested in van der Plas & Borghouts (1998), p. 121 or Gracia Zamacona (2008), p. 713-714, which makes this reading highly unlikely.

\(^{1209}\) One attestation, see de Buck (1951) CT IV, p. 412, col. 163 (S9q7S9q). As it is not attested in van der Plas & Borghouts, the reading is uncertain, and it is not attested again in the Coffin Texts.

\(^{1210}\) Three attestations from Meir, see de Buck (1954) CT V, p. 155,b (M2NY, M5C, M2C), the translation of this phrase is uncertain.

\(^{1211}\) One attestation, see de Buck (1935) CT I, p. 23,b. Reading is uncertain, as the A2 (𓀁) classifier would allow this to be read as $h\,n\,i$ (to make music) instead. The lemma is common in the CT however, see van der Plas & Borghouts (1998), p. 228 and Gracia Zamacona (2008), p. 1028-1035.

\(^{1212}\) One attestation, see de Buck (1935) CT I, p. 400,a (B1Bb). However, this could be read as $h\,n\,i$ (to be in front of) as well, and this phrase is not attested in van der Molen, van der Plas & Borghouts, and Gracia Zamacona.

\(^{1213}\) One attestation, see de Buck (1951) CT IV, p. 307,e (M54C). However, only this lemma is visible in the phrase, where M57C uses $s\,m\,i$, which makes reading this uncertain. However, other attestations do exist in the Coffin Texts, see van der Plas & Borghouts (1998), p. 241, although they consider the two lemmas of $s\,s\,i$ one lemma instead.

\(^{1214}\) One attestation, see de Buck (1951) CT IV, p. 318,b (M54C), reading of this lemma is uncertain here. Read as part of $s\,i\,n$ (to run) in van der Plas & Borghouts (1998), p. 245, a lemma that does not occur in the database.
(to cause to cut off),\textsuperscript{1215} $s\textsuperscript{b}$ (to purify),\textsuperscript{1216} $\textswab{swh}$ (to endure),\textsuperscript{1217} $\textswab{sw}$ (to suffer), $\textswab{sw}$ (to give to suck),\textsuperscript{1218} $\textswab{sm}$ (to help),\textsuperscript{1219} $\textswab{sm}$ (to be old), $\textswab{sn}$ (to feed),\textsuperscript{1220} $\textswab{snw}$ (to make two),\textsuperscript{1221} $\textswab{snh}$ (to tie up), $\textswab{sr}$ (to warm), $\textswab{shk}$ (to cause to rule),\textsuperscript{1222} $\textswab{shb}$ (to cause to be hushed),\textsuperscript{1223} $\textswab{shn}$ (to rest), $\textswab{shd}$ (to cause to sail upstream),\textsuperscript{1224} $\textswab{ss}$ (to eliminate),\textsuperscript{1225} $\textswab{ss}$ (to cause to hear),\textsuperscript{1226} $\textswab{ss}$ (to cause to be healthy),\textsuperscript{1227} $\textswab{s}$ (to talk),\textsuperscript{1228} $\textswab{st}$ (to pull),\textsuperscript{1229} $\textswab{stn}$ (to cause to approach),\textsuperscript{1230} $\textswab{sh}$ (to hide),\textsuperscript{1231} $\textswab{s}$ (to be blind), $\textswab{s}$ (to be noble), $\textswab{s}$ (to be wise), $\textswab{s}$ (to bind, to string), $\textswab{s}$ (to mourn), $\textswab{kr}$ (to contract), $\textswab{kn}$ (to make two),\textsuperscript{1232} $\textswab{sw}$ (to be upside down), which is used in the other witnesses.

\textsuperscript{1215} One attestation, see de Buck (1935) \textit{CT I}, p. 72,b (B1P), there are no additional attestations in the \textit{CT} according to van der Plas & Borghouts (1998), p. 245.

\textsuperscript{1216} One attestation, see de Buck (1935) \textit{CT I}, p. 144,b (L2Li), where the other witnesses use $s\textsuperscript{b}$ (to purify) instead. This lemma is not attested in van der Molen or van der Plas & Borghouts.

\textsuperscript{1217} One attestation, see de Buck (1935) \textit{CT I}, p. 109,a. Reading is highly uncertain, as this phrase is not mentioned in van der van der Molen (2000), p. 463 or van der Plas & Borghouts (1998), p. 247.

\textsuperscript{1218} Two attestations, see de Buck (1935) \textit{CT I}, p. 143,b (B3Bo, L2Li), in a difficult form, as the other witnesses use $\textswab{sn}$ (reproduction) instead, which could be read for these forms as well. Moreover, in van der Plas & Borghouts (1998), p. 249, this phrase is not attested as verbal construction.

\textsuperscript{1219} One attestation, see de Buck (1947) \textit{CT III}, p. 179,e (P.Gard.2). Although this lemma is attested in the \textit{CT}, see van der Plas & Borghouts (1998), p. 253, the reading of this lemma in this phrase is uncertain, based on an image of the original, where there might be something else than a $s\textsuperscript{b}$ (in 3) before the G17 (3.). Moreover, this phrase is not attested for this lemma in van der Plas & Borghouts.

\textsuperscript{1220} One attestation, see de Buck (1947) \textit{CT III}, p. 14,a. Although the lemma is attested in van der Plas & Borghouts (1998), p. 258, this phrase is added as a separate unique lemma, which meaning is uncertain.

\textsuperscript{1221} One attestation, see de Buck (1954) \textit{CT V}, p. 155,a. In a phrase with an unclear translation, it is possible this lemma does not exist at all.

\textsuperscript{1222} One attestation, see de Buck (1951) \textit{CT IV}, p. 193,e (BH1Br). There are no other attestations of this lemma in the \textit{CT}, see van der Plas & Borghouts (1998), p. 261.

\textsuperscript{1223} One attestation, see de Buck (1935) \textit{CT I}, p. 73,a (T1L). Based on van der van der Molen (2000), p. 536 and van der Plas & Borghouts (1998), p. 263, there are no other attestations in the \textit{CT}.

\textsuperscript{1224} One attestation, see de Buck (1951) \textit{CT IV}, p. 297,a (T3Be), there is only one additional attestation of this lemma in the \textit{CT} according to van der van der Molen (2000), p. 544 and Gracia Zamacona (2008), p. 1269, in de Buck (1956) \textit{CT VI}, p. 329,l (B1L), which only varies by using P1A ($\sim$) instead of P1 ($\sim$).

\textsuperscript{1225} One attestation, see de Buck (1938) \textit{CT II}, p. 55,c (Pap.Berl). Based on van der van der Molen (2000), p. 546 and van der Plas & Borghouts there are no other attestations in the \textit{CT}.

\textsuperscript{1226} One attestation, see de Buck (1947) \textit{CT III}, p. 14,a (B3Bo). Not attested in van der Molen or van der Plas & Borghouts. The reading of this lemma is uncertain in this phrase. Note that I read this lemma as a causative of the lemma $\textswab{sm}$ (to hear), see appendix 6.247.

\textsuperscript{1227} One attestation, see de Buck (1947) \textit{CT III}, p. 7,b (B3Bo), there are no other attestations of this lemma in the \textit{CT} according to van der Plas & Borghouts (1998), p. 266.

\textsuperscript{1228} One attestation, see de Buck (1947) \textit{CT III}, p. 250,a (T1Be), where the other witnesses use $\textswab{s}$ instead. van der Plas & Borghouts (1998), p. 266, give this lemma as 'meaning unknown', without additional attestations.

\textsuperscript{1229} One attestation, see de Buck (1951) \textit{CT IV}, p. 303,b, it is uncertain if this is correct, as in IV,303,a $\textswab{s}$ (wound) is used instead. However, this lemma is attested outside the database, see van der Plas & Borghouts (1998), p. 272.

\textsuperscript{1230} One attestation, see de Buck (1938) \textit{CT II}, p. 73,a (B3Li), there are no other attestations of this lemma in the \textit{CT} according to van der Plas & Borghouts (1998), p. 271.

\textsuperscript{1231} One attestation, see de Buck (1935) \textit{CT I}, p. 60,b (B6C). Due to the A29 (3) classifier, it is not unlikely that this is simply a misspelling of $\textswab{sd}$ (to be upside down), which is used in the other witnesses.
As the study of any regional preferences in the graphical form of the stem of a lemma is restricted to that lemma, an attempt was made to find regional preferences in the visual representation of the morphological features of the verbal forms as well. In section 5.4 the regional patterns in the graphical form of the different ending types of the first-person stative will be discussed.

Sadly, this was the only feature in which any clear regional patterns could be discerned. Attempts were made to see if the use of a *i* prefix was regionally conditioned, or if the use of a written *y/w* ending in the prospective *sdm=f*, relative *sdm=f/sdm.n=f* or participles had any regional preferences. However, these attempts proved fruitless based on the material from the database, and no patterns could be discerned.  

5.3. Graphical forms of the lemmas of verbal forms

In the following sections, the graphical forms of the lemmas will be discussed. Note that any regional feature in the graphical forms should only be considered to apply to the lemma it belongs to, and not be considered a feature that applies to all lemmas of that region. The lemmas will be discussed *s* to *d*, although only the lemmas in which regional preferences could be discerned were added here, while the other lemmas are included in appendix 6.

5.3.1. *awi* (to extend)

In the database, this lemma is only attested twice, both of which occur in Meir. Therefore, the database does not inform any regional preference. Moreover, the two graphical forms (see table 5.1) are quite distinct, which suggests that this verb form is extremely varied in Meir. However, outside the

\[1232 \text{ Attested once in the database, see de Buck (1951) CT IV, p. 268.d (T1C,a), although it could be argued to be an adjective, as it is part of a name of a divinity. Moreover, all other witnesses use 'k (to enter) here. Note that in van der Plas & Borghouts (1998), p. 294, this lemma is only considered as an adjective.} \]

\[1233 \text{ Attested once in the database, see de Buck (1935) CT I, p. 327.b (M-ann). However, de Buck did not see the original, and the alternative version of this witness uses sdm (to hear, to listen) here, which makes the existence of this attestation dubious. However, this lemma is attested outside the database, see van der Plas & Borghouts (1998), p. 297.} \]

\[1234 \text{ Attested once in the database, see de Buck (1938) CT II, p. 390,b (S2C). However, the token is damaged, and the other witnesses use pgs (to open up; see section 5.3.57). However, the lemma gwz is attested in the CT outside the database, see van der Plas & Borghouts (1998), p. 297 and Gracia Zamacona (2008), p. 1436-1439.} \]

\[1235 \text{ One attestation, see de Buck (1935) CT I, p. 80,a (B4C), which van der Plas & Borghouts (1998), p. 313, placed under nwm (number). My translation of this phrase is uncertain, as it is a unique phrase, which is damaged.} \]

\[1236 \text{ Only with the i. prefix there is a slightly higher chance that it occurs in the Theban area with the stative, but as this occurred only in two out of the 133 statives attested in the Theban area, it is meaningless.} \]

\[1237 \text{ van der van der Molen (2000), p. 2.} \]

\[1238 \text{ de Buck (1947) CT III, p. 11,c; de Buck (1954) CT V, p. 149,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 1.} \]
database, a variant of form 2 without the Z1 (𓊍) classifier is attested in Deir el-Bersha as well.\(^{1239}\) Moreover, outside the database it is possible in Deir el-Bersha and the Theban area to include the Y2 (𓏝) classifier.\(^ {1240}\) Nonetheless, the phonetic spelling of form 1 is only attested in Meir.

\[
\begin{array}{|c|c|c|}
\hline
\text{Graphical form stem no.} & \text{Region} & \text{Attestations} \\
\hline
1 & Meir & 1 \\
2 & Meir & 1^{1241} \\
\hline
\end{array}
\]

Table 5.1 Graphical forms of the stem of 𓊍\textit{i}.

5.3.2. 𓊍\textit{ḥ} (to serve)\(^ {1242}\)

The lemma 𓊍\textit{ḥ} only occurs three times in the database,\(^ {1243}\) and all attestations occur in Meir, in the same phrase. It is not unlikely that the use of this form represents a corruption, as G1T and A1C use 𓊍\textit{ḥ} (to be/become a spirit; see section 5.3.6), and M46C and M4C use 𓊍\textit{ḥ\textit{w}i} (to protect; see section 5.3.108) instead. In general, this section of the text is badly damaged for all witnesses from Meir, which compounds the issues. As one can see in table 5.2, the graphical forms are varied. Based on the additional attestations outside the database,\(^ {1244}\) form 2 and 3 are only attested in Meir, while form 1 is attested in Deir el-Bersha as well. However, it is possible outside the database to use a F40 (𓄫) instead of the G1 (𓊍) in Asyut and Deir el-Bersha. Moreover, the A24 (𓀜) classifier can be used in Deir el-Bersha as addition to the D40 (𓊯) classifier.

\[
\begin{array}{|c|c|c|}
\hline
\text{Graphical form stem no.} & \text{Region} & \text{Attestations} \\
\hline
1 & Meir & 1 \\
2 & Meir & 1 \\
\hline
\end{array}
\]

\(^{1239}\) de Buck (1947) \textit{CT III}, p. 156,b (B2Bo,a).

\(^{1240}\) de Buck (1935) \textit{CT I}, p. 222/102 (B16C); de Buck (1961) \textit{CT VII}, p. 25,j (T1Be).

\(^{1241}\) Note that reading this as 𓊍\textit{w}i is highly uncertain, as it might simply be a corruption of 𓊍\textit{w\textit{t}} (offerings). See de Buck (1947) \textit{CT III}, p. 11,c (M2C).

\(^{1243}\) de Buck (1954) \textit{CT V}, p. 145,a.

\(^{1244}\) de Buck (1951) \textit{CT IV}, p. 365,a.
Graphical form stem | no. | Region | Attestations
---|---|---|---
3 | Meir | 1

Table 5.2 Graphical forms of the stem of ḫwḫ.

5.3.3. ḫf (to gorge)

In the database the lemma ḫf occurs in one phrase only, although it is attested in ten witnesses. As one can see in table 5.3, the variation lies mostly in the use of a different classifier, or in a duplication of the ṣf section. Note that in van der Molen ḫsf (form 3) is considered a separate lemma, although still unique to this phrase. Form 4 should be considered a corruption, in which the I9 (𓆑) and G1 (𓄿) switched position.

</tr>
</tbody>
</table>

Table 5.3 Graphical forms of the stem of ḫf.

Although it is based on a single attestation, it could be suggested that Beni Hasan prefers to use a humanoid classifier over the bird here. However, the additional attestations outside the database show that the use of a humanoid classifier occurs in P.Gard.2 as well, which is suggested to originate from Asyut. Therefore, it cannot be assumed to be a local preference.

The use of the ḫsf does present an interesting feature. Even though the attestations come from the Theban area and Gebelein, there seems to be some distinction, as T3C and G1T both considered represent the same southern Egyptian school of artist which seemed to exist in the First Intermediate

---

1245 See de Buck (1951) *CT IV*, p. 365,a (M5C), the G25 (𓂤) is not visible, but de Buck suggest the traces suit a bird. It could simply be a G1 (𓄿) as well.
1247 de Buck (1938) *CT II*, p. 394,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 2.
1249 Even though it would be possible to read it as ḫṣḫ (to lift, to carry) here, the G38 (𓄪) classifier would be unusual.
Thus, the duplication of *af* could suggest a regional preference, even if it only occurred during the First Intermediate Period.

5.3.4. *smm* (to seize, to grasp)

The lemma *smm* is attested thirteen times in the database. However, only eleven attestations are from verbal forms. The majority of the attestations are from spell 75, while one attestation comes from spell 313, a unique spell which only occurs in B5C. The attestations per region are set out in table 5.4, for every graphical form of the stem. Note that as this is a *2ae gem.* lemma and gemination occurs in the database, the table has been divided in gemination and no gemination.

<table>
<thead>
<tr>

| 2                       | Theban area | 1            | 4                       | Deir el-Bersha | 1          |
| 3                       | Asyut      | 2            | 5                       | Asyut      | 1            |

Table 5.4 Graphical forms of the stem of *smm.*

Note that form 5 represents an error by the artist, as the second G1 (𓄿) should be read as a G17 (𓅓). The use of a classifier seems to be the preference in most regions. It is remarkable that form 3 and 5 both use a D36 (𓊘) as classifier, where the D49 (𓊚) and D40 (𓊙) seems more preferable for this verb. Moreover, it has to be a choice by the artist, as the script used in the witnesses (S1C and S2C) is a nearly hieroglyphic form of cursive. This type of script would differentiate between the different signs of the arm, which can become indistinguishable in hieratic and near hieratic cursive script. Thus, it could be

---

1253 de Buck (1935) *CT* I, p. 397,b, 397,b; de Buck (1951) *CT* IV, p. 92,h. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 3.
argued that Asyut prefers to use the D36 as classifier with *simn*. However, as S1C and S2C belong to the same owner, it might be a feature of these two supports instead.

Based on the sole attestation from the Theban area, one could suggest that the Theban area prefers not to add a classifier. However, in the original support (T3C) the verb is written together with *nWdr* as a double column,\(^{1255}\) which could have been the reason why there is no classifier. Outside the database there are no other attestations from the Theban area which use this lemma, although the absence of a classifier is attested in Asyut as well.\(^{1256}\) Thus, although the absence of a classifier might be a feature of the Theban area, it can be left out in other regions.

### 5.3.5. *sr* (to drive away)\(^{1257}\)

This lemma is attested 28 times in the database,\(^{1258}\) although the majority of its attestations come from the name of a divinity in spell 335.\(^{1259}\) Note that the first vowel of this lemma is varied, as it can be written as *i* or *ii* as well. This is most likely a visual representation of the conflation of the *z* phoneme with the *i* in this lemma.\(^{1260}\) In the following table the attestations per region are set out for every graphical form of the stem (table 5.5):

<table>
<thead>
<tr>
<th>Graphical form stem</th>

<td></td>
</tr>
</tbody>
</table>

---

\(^{1255}\) It sometimes occurs in the *Coffin Texts* that the text has repeated features in the text, where for example the subject of a verb is written once in the column, and the two verbs forms are written above it as two columns next to each other, both using the subject that is only written once. Thus, it does not mean that two columns are written in one column, but rather that sections of the phrase in recurrent constructions are written as two columns, instead of repeating parts of the phrase that do not change twice.

\(^{1256}\) de Buck (1938) *CT II*, p. 236,c (S1C,b).

\(^{1257}\) van der Plas & Borghouts (1998), p. 3.

\(^{1258}\) de Buck (1951) *CT IV*, p. 265,d, 266-267,b, 266-267,e; de Buck (1954) *CT V*, p. 152,d-e. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 3.

\(^{1259}\) *n r wr n*-*f ‘the great one is not driven away’ is his name de Buck (1951) *CT IV*, p. 267,c (M57C). Note that the phrase is extremely variable, and in some witnesses the negation is not written.

Based on these attestations, it seems that in Deir el-Bersha there is the preference to not add a M17 (𓋊) to the word. Although the form isr is attested once in the Theban area as well, it occurs more often in Meir. In el-Lisht and Beni Hasan there seems to be a preference for writing isr in a compact format (form 4). Beyond these points, there does not seem to be any clear regional preferences in the spelling of the stem of sr, and especially Meir can be extremely varied in its graphical form.

5.3.6. šḫ (to be/become a spirit, to be potent, to be well)\textsuperscript{1262}

In the database, the lemma šḫ is attested 63 times. However, some of these are substantives,\textsuperscript{1263} and only 52 attestations represent verbal forms.\textsuperscript{1264} In table 5.6, the attestations per region are set out for every graphical form of the stem:

\begin{table}
\begin{tabular}{|c|c|c|}
\hline
Graphical form stem & no. & Region & Attestations \\
\hline
\textbullet & 1 & Meir & 2 \\
\hline
\textbullet & 2 & Meir & 1 \\
\hline
\textbullet & 3 & Theban area & 1 \\
\hline
\textbullet & 4 & Gebelein & 1 \\
\hline
\textbullet & 5 & Aswan & 1 \\

\hline
\textbullet & 7 & Asyut & 1 \\
\hline
\textbullet & 8 & Meir & 4 \\
\hline
\textbullet & 9 & Asyut & 1 \\
\hline
\textbullet & 10 & Meir & 2 \\
\hline
\end{tabular}
\end{table}

\textsuperscript{1261} Note that the V4 (𓋕) is assumed to be a corruption of the T12 (𓋊) due to their similar form.

\textsuperscript{1262} van der van der Molen (2000), p. 6.

\textsuperscript{1263} For example, in de Buck (1935) CT I, p. 4,a (B1P), šḫ.w (the potent ones) is used, even though it could be argued that it is technically a participle.

\textsuperscript{1264} de Buck (1935) CT I, p. 4-5,a, 141,e, 376,b; de Buck (1938) CT II, p. 266-267,d, 273,d-f, 287,d-g, 288-289,a; de Buck (1954) CT V, p. 123,c, 145,a, 157,c-d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 3.
In this lemma, there are only scant signs of regional preference. The graphical form used in Meir is highly varied, but it seems that the G25 (𓁔) is never written with a curl or stroke at its claws. The attestations from the Theban area suggest that the Y2 (𓏝) classifier is always written. However, as this is based on one witness only (T3L), it might be a personal preference of the artist responsible for this witness. Moreover, outside the database the Theban area occurs without an Y2 classifier.¹²⁶⁵ Asyut seems to have a preference for using the interpretant Aa1 (𓁔) and the Y2 classifier, although the interpretant is not always there. Alternative forms occur in Asyut, but are rare in comparison to form 10 and 11.

5.3.7. 𓁔 (to nurse, to bring up)¹²⁶⁶

This lemma is attested 21 times in the database, although ten of these attestations are substantives, as 𓁔.yt (nurse) was encoded as part of this lemma.¹²⁶⁷ Note that all attestations, including the substantives, occur in the same phrase.¹²⁶⁸ Additionally, the use of the B5 (𓁕) represents a standardisation, as the scripts used by the witnesses rarely provide the all the specific details of this complex sign. In table 5.7, the attestations per region are set out for every graphical form:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td></td>
<td>Deir el-Bersha</td>
<td>2</td>
</tr>
<tr>

<td>Asyut</td>
<td>9</td>
</tr>
</tbody>
</table>

Table 5.6 Graphical forms of the stem of 𓁔.

¹²⁶⁵ de Buck (1935) CT I, p. 286,f (T9C).
¹²⁶⁷ As the noun is technically a participle of 𓁔 (she who nurses, i.e. a nurse).
¹²⁶⁸ de Buck (1935) CT I, p. 48,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 6-7.
In this lemma, there are no clear signs of regional preferences for the graphical form of the stem. However, one interesting feature stands out. The addition of a M17*M17 (𓇌) group only occurs in Deir el-Bersha, and more specifically in the witnesses that are dated to Amenemhat II – Sesostris III (B1SC and B1P).\textsuperscript{1270} The other attestations of Deir el-Bersha (B2Bo, B3Bo, B4Bo and B6C) are all dated to the period of the late 11th dynasty until the early 12th dynasty,\textsuperscript{1271} thus it could be suggested that the addition of the M17*M17 is based on the date of coffin creation. However, outside the database, the addition of this group seems to be unique to this phrase, as it is not repeated in the other attestations from the Coffin Texts.

5.3.8. \emph{i} (to say, to speak)\textsuperscript{1272}

In the database, this lemma has 225 attestations. However, only 79 attestations represent verb forms,\textsuperscript{1273} the other attestations are interjections. In table 5.8 the attestations per region are set out for every graphical form of the stem:

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|}
\hline
Graphical form stem no. & Region & Attestations \\
\hline
1 & Deir el-Bersha & 4 \\
& Asyut & 1 \\
& Theban area & 2 \\
2 & Deir el-Bersha & 1 \\
3 & Beni Hasan & 1 \\
4 & Deir el-Bersha & 1 \\
5 & Deir el-Bersha & 1\textsuperscript{1269} \\
\hline
\end{tabular}
\caption{Table 5.7 Graphical forms of the stem of \emph{st}.}
\end{table}

\begin{minipage}{\textwidth}
\footnotesize
\textsuperscript{1269} Note that this form represents a special case, as it only occurs with this witness (B6C). It might be simply a dittography of the \emph{st.wt} before it in the phrase, but due to the duplication of the V13 (𓇌) with a 2-lit verb, I took it as a \textit{sDmm=f} instead here.
\textsuperscript{1270} Willems (1988), p. 74-77.
\textsuperscript{1271} Willems (1988), p. 70-74.
\textsuperscript{1272} van der Molen (2000), p. 11.
\textsuperscript{1273} de Buck (1935) \textit{CT I}, p. 32,a, 94,c, 102,a, 107,b, 121,b, 141,b, 145,a, 145,d, 397,a; de Buck (1938) \textit{CT II}, p. 79,a, 79,b; de Buck (1947) \textit{CT III}, p. 223,f; de Buck (1951) \textit{CT IV}, p. 87,b, 92,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 9.
\end{minipage}
For this lemma, some regional preferences can be distinguished. The addition of a G1 (𓄿) is only attested in the Theban area, although both form 5 and 11 come from the same witness (T1LL). The use of the Y2 (𓏝) classifier is only attested in Deir el-Bersha, likewise from one witness (B1P). In el-Lisht, there is either no classifier, or a Z1 (𓏤), which suggest that this region prefers to avoid the humanoid classifiers. Gebelein is only attested with form 2. Even though this is only a single attestation, the same form is used for the interjection as well, which suggests that form 2 represents the preferred form for Gebelein.

5.3.9. *i3 (to stride)*

There are seventeen attestations of this lemma in the database. Table 5.9 shows the attestations per region for every graphical form of the stem:

---

1274 Context and the other witnesses make it unlikely that this should be read as *i3 (to stride)* instead, see section 5.3.9.
1275 de Buck (1954) *CT V*, p. 120,a.
1276 van der Molen (2000), p. 11.
1277 de Buck (1935) *CT I*, p. 86-87,b; de Buck (1938) *CT II*, p. 68,a, 68,2*, 71,a, 77,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 9 and Gracia Zamacona (2008), p. 12.
For the attestations in the database, there is a clear difference between the attestations from Asyut and Deir el-Bersha, as the long format of form 3 is only attested in Asyut. For the attestations outside the database this is true as well, although there are hardly any other attestations of this lemma in the Coffin Texts.

5.3.10. *i3wi* (to be aged)\(^{1281}\)

There are eighteen attestations of this lemma in the database, although only sixteen attestations from the same phrase in spell 75 are verbal forms.\(^{1282}\) As one can see in table 5.10, there are only two forms used for the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Graphical form 1" /></td>
<td>1</td>
<td>Saqqara</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Deir el-Bersha</td>
<td>4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Meir</td>
<td>6</td>
</tr>
<tr>
<td></td>
<td></td>

<tr>
<td></td>
<td></td>
<td>Gebelein</td>
<td>1</td>
</tr>
<tr>
<td><img src="image2" alt="Graphical form 2" /></td>
<td>2</td>
<td>Deir el-Bersha</td>
<td>2</td>
</tr>
</tbody>
</table>

Table 5.10 Graphical forms of the stem of *i3wi*.

\(^{1278}\) Written as a line in the original witness. Note that the Z1 (𓏤) signs represent filler strokes.

\(^{1279}\) From the same witness (B3L), see de Buck (1938) *CT II*, p. 71,a, 77,c. Due to the A28 (𓀠) classifier is it uncertain if it even is this lemma, the reading is based on S2C which has this lemma in the same phrases. However, it is possible that this represents a corruption of k3l (to be tall, to be high), see section 5.3.179, where the use of the A28 makes more sense.

\(^{1280}\) Note that the Z1 (𓏤) signs represent filler strokes.

\(^{1282}\) de Buck (1935) *CT I*, p. 374-375,d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 10.
The only variation occurs in Deir el-Bersha, where form 2 is used in addition to form 1. However, as the other attestations of this lemma in the Coffin Texts outside this lemma only feature witnesses from Deir el-Bersha, it cannot be said if the other regions might use form 2 as well.

5.3.11. *iṣṭ* (to injure, to be injured, to be missing)\(^{1283}\)

This lemma has a total of seventeen attestations in the database, from the same phrase in spell 154.\(^{1284}\) In the following table, the attestations per regions are shown for every graphical form of the stem (table 5.11):

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Asyut</td>
<td>1</td>
<td>7</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>Deir el-Bersha</td>
<td>2</td>
<td>8</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>

<td>Asyut</td>
<td>1</td>
<td>9</td>
<td>Asyut</td>
<td>1</td>
</tr>
<tr>
<td>4</td>
<td>Deir el-Bersha</td>
<td>2</td>
<td>10</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>Deir el-Bersha</td>
<td>1</td>
<td>11</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td>6</td>
<td>Deir el-Bersha</td>
<td>1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 5.11 Graphical forms of the stem of *iṣṭ*.

For this lemma, there are some signs of regional preferences, without clear borders. Although the use of X1 (𓊦) instead of V13 (𓊫) occurs in Deir el-Bersha as well, it is more common in Asyut. Inversely, Deir el-Bersha is more likely to use the V13 instead of the X1. If a classifier is written, Asyut is more likely to use the D57 (𓊫) than the G37 (𓊪), where Deir el-Bersha uses both classifiers at more or less the same rate.

\(^{1283}\) van der van der Molen (2000), p. 16

\(^{1284}\) de Buck (1938) *CT II*, p. 276-277,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 12.
The use of other classifiers seems to only occur in Deir el-Bersha. Outside the database there is only one additional attestation of this lemma, and the only visible attestations are from the Theban area and Saqqara, which use either form 2 or form 8.

5.3.12. İ•i (to wash)

The lemma İ•i has 26 attestations in the database, although only 21 attestations represent verbal forms. In table 5.12, the attestations per region are shown for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Graphical form 1" /></td>
<td>1</td>
<td>Deir el-Bersha</td>
<td>5</td>
<td><img src="image2" alt="Graphical form 4" /></td>
<td>4</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td><img src="image3" alt="Graphical form 2" /></td>
<td>2</td>
<td>Meir</td>
<td>1</td>
<td><img src="image4" alt="Graphical form 5" /></td>
<td>5</td>
<td>Deir el-Bersha</td>
<td>4</td>
</tr>
<tr>
<td><img src="image5" alt="Graphical form 3" /></td>
<td>3</td>
<td>Papyrus (P.Gard.2)</td>
<td>2</td>
<td><img src="image6" alt="Graphical form 6" /></td>
<td>11</td>
<td>Asyut</td>
<td>4</td>
</tr>
</tbody>
</table>

Table 5.12 Graphical forms of the stem of İ•i.

From the attestations in the database, one could make the suggestion that Asyut prefers to use a long format (form 5) for this lemma. However, form 1 is attested outside the database in Asyut as well. In Meir there seems to be a preference for the compact format (form 1). However, the long format occurs outside the database as well. However, the use of the Y2 (𓏝) seems to only occur in Meir for this lemma. Note that this lemma does not serve as evidence that P.Gard.2 originates from Asyut, as Asyut usually adds the N35A (𓈗) as classifier, which was not added in P.Gard.2.

5.3.13. İ•b (to unite, to be united, to hand over)

In the database, this lemma has a total of 30 attestations. In table 5.13, the attestations per region are set out for every graphical form of the stem:

---

1285 de Buck (1935) CT I, p. 295,c.
1286 Although T2C uses a long format of form 1, and Sq3C used a D56 (𓏝) instead of a D57.
1288 de Buck (1938) CT II, p. 81,b; de Buck (1947) CT III, p. 179,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 13.
1289 de Buck (1954) CT V, p. 292,h (S2C).
1290 de Buck (1961) CT VII, p. 128,f (M2C).
1293 de Buck (1935) CT I, p. 376-377,c, 393,c; de Buck (1938) CT II, p. 76,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 13-14.

Table 5.13 Graphical forms of the stem of $i'b$.

Based on the database, it could be suggested that the attestations from Asyut never add the M17 (𓋀) to the lemma. However, this does occur in Asyut outside the database. In Gebelein, the F18 (𓄏) is always added to the spelling, even in attestations outside the database. There do not seem to be any other additional regional preferences, as the graphical form can be remarkably varied.

---

1294 de Buck (1951) *CT IV*, p. 173.e ([S2C]).
5.3.14. \( \text{iwa} \) (to inherit)\(^{1295}\)

This lemma is relatively common in the database, with 107 attestations. However, only 51 attestations represent verbal forms.\(^{1296}\) In table 5.14, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>

<td>11</td>
<td>Meir</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.14 Graphical forms of the stem of \( \text{iwa} \).

In general, there does not seem to be a regional preference, although some regional features do seem to exist. The absence of the E9 (𓃛) for this lemma (form 10, 11 and 12) is rare, but it is only attested in Deir el-Bersha and Meir. However, outside the database, the absence is attested in the Theban area as well.\(^{1297}\) Nonetheless, based on the database, form 11 and 12 represent the only form in which the attestations from Meir occur,\(^{1298}\) while form 10 seems to be unique to Deir el-Bersha.

---

\(^{1295}\) van der van der Molen (2000), p. 23

\(^{1296}\) de Buck (1935) \textit{CT I}, p. 15,b, 37,f, 41-42,c-a; de Buck (1938) \textit{CT II}, p. 278-279,b, 284-285,c; de Buck (1951) \textit{CT IV}, p. 93,d; de Buck (1954) \textit{CT V}, p. 154,f. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 19.

\(^{1297}\) de Buck (1956) \textit{CT VI}, p. 398,h (T1L).

\(^{1298}\) There is a lack of additional attestations from Meir to verify this claim. However, when used as \( \text{iwa} \) (heir), see de Buck (1938) \textit{CT II}, p. 69,a, the E9 is used in the witnesses from Meir as well.
5.3.15. *ibi* (to be thirsty)\(^{1299}\)

There are 47 attestations for this lemma in the database, but only eleven attestations represent verbal forms.\(^{1300}\) In table 5.15, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Diagram" /></td>
<td>1</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>

<td>2</td>
</tr>
<tr>
<td><img src="image6" alt="Diagram" /></td>
<td>6</td>
<td>Deir el-Bersha</td>
<td>2</td>
</tr>
<tr>
<td><img src="image7" alt="Diagram" /></td>
<td>7</td>
<td>Asyut</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.15 Graphical forms of the stem of *ibi*.

In the database, it can be suggested that the use of the E8 (𓅐) only occurs in Deir el-Bersha. However, outside the database it occurs in the Theban area and Saqqara as well.\(^{1301}\) Additionally, when the attestations beyond the database are included, it becomes clear that form 5 is often used in all regions. Nonetheless, the use of the Y2 (𓌊) classifier seems to only occur in Deir el-Bersha. Moreover, form 2 seems to only occur in Asyut, as all other witnesses add a A2 (𓅑), E8 or N35A (𓅖).

5.3.16. *ini* (to bring, to bring away, to buy)\(^{1302}\)

The lemma *ini* is quite common, and has 233 attestations in the database. However, only 229 of these attestations reflect verbal forms,\(^{1303}\) as the other four attestations are considered substantives.\(^{1304}\) In table 5.16, the attestations per region are set out for every graphical form of the stem. Note that this is

\(^{1300}\) de Buck (1947) *CT III*, p. 19,b, 19,d, 187,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 21. Note that *ib.t* (thirst) was considered to be part of this lemma.

\(^{1301}\) de Buck (1954) *CT V*, p. 19,a (T1C), 22,c (Sq11C).

\(^{1302}\) van der van der Molen (2000), p. 38.

Table 5.16 Graphical forms of the stem of *ini* (to bring).

For this lemma, there are only some vague signs of a regional preference. The use of the D54 (𓊀) classifier is only attested in Gebelein, even though the attestations from Gebelein occur outside the database without the D54 as well. Aswan has one unique feature with form 4, even though this might have simply been an error for a N35 (𓊁), despite the signs being quite different.\(^{1305}\) Beyond these features there are no real meaningful variations that show regional preferences.

---

\(^{1305}\) See de Buck (1954) *CT V*, p. 121,3* and Willems (1996), pl. 21, col. 140.
5.3.17. \textit{ini} (to sever)\textsuperscript{1306}

This lemma has only five attestations in the database, from the same phrase in spell 23.\textsuperscript{1307} In table 5.17, one can see the attestations per region for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>

<td>4</td>
<td>Theban area</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.17 Graphical forms of the stem of \textit{ini} (to sever).

Based on the database, there does not seem to be a regional preference for this lemma, although the D40 (𓊩) classifier only occurs in the Theban area. The only other attestation of this lemma in the \textit{Coffin Texts}\textsuperscript{1308} does not disprove the use of D40 classifier in the Theban area, although the lemma can only be seen fully intact in three of the ten witnesses, due to damage.\textsuperscript{1309}

5.3.18. \textit{int} (to fetter)\textsuperscript{1310}

In the database, there are a total of five attestations for this lemma, from the same phrase of spell 23.\textsuperscript{1311} In table 5.18, the attestations per region are set out for every graphical form of the stem:

\textsuperscript{1306} van der van der Molen (2000), p. 39.
\textsuperscript{1307} de Buck (1935) \textit{CT I}, p. 72,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 30.
\textsuperscript{1308} de Buck (1954) \textit{CT V}, p. 287,c.
\textsuperscript{1309} B2Bo,b, B7Bo,b and M23C,b.
\textsuperscript{1310} van der van der Molen (2000), p. 42.
\textsuperscript{1311} de Buck (1935) \textit{CT I}, p. 70,c. Assumed to be the only attestation in the \textit{Coffin Texts}, see van der Plas & Borghouts (1998), p. 33.

317
As one can see in the table, the graphical forms are extremely varied. Moreover, the use of the V13 (𓀿) is actually rare, which suggests that for this lemma the distinction between the \( t \) and \( t \) has already been lost. The use of the A24 (𓀜) classifier seems to be unique to the Theban area, but as this is only one attestation, it might be unique to this witness (T1L) instead.

5.3.19. \textit{iri} (to do, to make, to perform)

This is one of the most common lemmas in the database, with a total of 836 attestations. In table 5.19, one can see the attestations per region for the graphical form of the stem. Note that this is a \textit{3ae inf.} lemma and gemination occurs in the database, therefore the table has been divided in gemination and no gemination. However, as one can see in form 4, it is possible for the attestations without gemination to have an D21 (𓀿) attached as an interpretant, and therefore look identical to form 9 with gemination.

For additional attestations outside the database, see de Buck (1935) \textit{CT I}, p. 70,c (B6C), could be read as \textit{ini} (to delay) as well.
As one can see in form 3 and 9, for most attestations the same form is used for nearly every region. Nonetheless, there are some features that can represent a regional variation. The addition of M17 (𓇋) is rare, and occurs in Beni Hasan and Deir el-Bersha as well (form 6, 7 and 13), but it is much more common in the Theban area. However, it does not represent any specific period, as it occurs in witnesses dated to the reign of Mentuhotep II (T9C) and to the reign of Sesostris III (T2Be).

The use of the pupil of the eye, D12 (𓁹), for the entire eye, D4 (𓁹), is quite rare in the Middle Kingdom, and seems to only occur in Deir el-Bersha. The use of D21 for ird only occurs in el-Lisht, although it is far

---

1315 de Buck (1938) *CT II*, p. 274, b (B2P), 275, b (B1C).
1316 de Buck (1935) *CT I*, p. 110, c (L2Li), the D21 (𓇋) represents an eye without a pupil.
1317 de Buck (1951) *CT IV*, p. 194, a (Ssq5a). This attestation is problematic, as it does not show gemination where it should, as I took it as a nominal *sqm.tw=f* here. However, the *t(w)* is written with a V13 (𓇋), and it is possible that this sign should be read as an N35 (𓇋) and X1 (𓁹) instead, which would make this a nominal *sqm.n.tw=f*, which is what occurs in the other witnesses. Moreover, this would not require gemination.
from unlikely that this is a modern error, in which the pupil of the D4 was lost, instead of an intentional change.

Even though form 3 occurs in Beni Hasan for the absence of gemination, it is remarkable that in case of gemination, there are always two D21 signs added (form 10 and 13). Moreover, there is one witness in Beni Hasan (BH5C), which always added the interpretant D21, as there is no attestation in this witness with only the D4.

5.3.20. *itH* (to drag, to pull off)\textsuperscript{1318}

In the database, there are 24 attestations of the lemma *itH*.\textsuperscript{1319} In table 5.20, the attestations per region are set out for every graphical form of the stem. Note that the use of the D20 (𓊠) might actually represent the U31 (𓊡), as in near hieratic cursive script these two signs can become indistinguishable.\textsuperscript{1320}

Table 5.20 Graphical forms of the stem of *itH*.

For this lemma, there does not seem to be a regional preference. The only form which is clearly different is form 6, but it is unlikely that this is a regional feature of the Theban area, as de Buck added a sic with the bird.\textsuperscript{1322} Based on the database, it would be possible to suggest that Gebelein and Aswan do not use

\textsuperscript{1318} van der van der Molen (2000), p. 60.

\textsuperscript{1319} de Buck (1935) *CT I*, p. 45,c; de Buck (1954) *CT V*, p. 7,a, 160,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 43-44.

\textsuperscript{1320} See Möller (1909), p. 8, 46, no. 90 and 491.

\textsuperscript{1321} de Buck (1935) *CT I*, p. 45,c (B4Bo). Assumed to be a corruption, as *rtH* (to bake) makes little sense in this phrase.

\textsuperscript{1322} de Buck (1935) *CT I*, p. 45,c (T9C).
the V1 ( classifier. However, outside the database the V1 is used in Gebelein as a classifier.\textsuperscript{1323} Beni Hasan only has an attestation for form 3,\textsuperscript{1324} but as it is the only attestation from Beni Hasan in the \textit{Coffin Texts}, it would be assumptive to suggest it represents a regional preference.

5.3.21. \textit{iti} (to take)\textsuperscript{1325}

The lemma \textit{iti} has 86 attestations in the database.\textsuperscript{1326} In table 5.21, the attestations per region are set out for every graphical form of the stem. Note that with this lemma it is often difficult to know if the X1 (.) should be considered an interpretant, or an addition due to morphology of the verbal form in which it is used.

![Table 5.21 Graphical forms of the stem of \textit{iti}.](image)

\textsuperscript{1323} de Buck (1961) \textit{CT VII}, p. 139,n.
\textsuperscript{1324} de Buck (1954) \textit{CT V}, p. 7,a (BH3Ox).
\textsuperscript{1325} van der van der Molen (2000), p. 60.
\textsuperscript{1326} de Buck (1935) \textit{CT I}, p. 15,b, 23,c, 27,a, 37,c, 37,e, 53,b, 58,a, 79,l, 94,b, 399,c; de Buck (1951) \textit{CT IV}, p. 93,e, 236-237,b, 270,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 44.
\textsuperscript{1327} de Buck (1935) \textit{CT I}, p. 23,c (S10C), reconstruction, only the V15-A24 (𓎁𓀜) group is visible. It is possible that the particle \textit{iw} was written above the V15, instead of only the M17 (𓎁).
\textsuperscript{1328} de Buck (1951) \textit{CT IV}, p. 237,b (M57C). Partially reconstructed, the D40 (𓎁) is not visible, thus might not have been there at all.
\textsuperscript{1329} All attestations are from the same witness (B1P).
As one can see, the majority of the attestations are either form 5 or form 7. However, some regional preferences seem to occur. The use of the initial M17 (𓉇) seems to only occur in the Theban area, as the sole attestation from Asyut in form 2 represents a reconstruction.

The use of a stroke at the toe of the V15 (𓇋) seems to only occur in Deir el-Bersha in the database, but this form is attested outside the database in Beni Hasan as well. Thus, it is unlikely to be a regional preference. The use of a D40 (𓉆) classifier seems to only occur in Deir el-Bersha, as the attestation from Meir (form 8) is a reconstruction. The attestations from Saqqara and el-Lisht do not seem to appear without the X1 interpretant in the database. However, outside the database this is not true for Saqqara, nor for el-Lisht.

5.3.22. *idi* (to be censed)

This lemma has 35 attestations in the database, of which 32 attestations represent verbal forms. In table 5.22, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Table 5.22 Graphical forms of the stem of *idi*.

---

1330 de Buck (1938) *CT II*, p. 116, w.
1331 de Buck (1938) *CT II*, p. 176, g.
1332 *de Buck (1961) CT VII*, p. 9, r, 9, s.
1334 de Buck (1935) *CT I*, p. 21, c, 332-333, a, 333, 2*.

For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 44.
Based on the database, it seems that although the D40 (𓋃) is used as well, Meir has the tendency with this lemma to use D40A (𓋄), which does not occur in the other regions. However, outside the database there are attestations of the D40A in P.Gard.3.1335 However, as there are no coffins with this hieroglyph, it can still function as a regional preference for Meir.

Although the N4 (𓌣) classifier (form 6 and 12) occurs outside Deir el-Bersha as well, it seems that Deir el-Bersha is more likely than either Asyut or the Theban area to use it as classifier. Form 11 seems only to occur in the Theban area, although it is only attested in one witness (MC105).

### 5.3.23. ‘pr (to acquire, to provide, to equip)1336

The lemma ‘pr occurs relatively often, with 98 attestations in the database. However, as this lemma occurs as a substantive and adjective as well, there are only 78 attestations where ‘pr is used as a verb form.1337 Note that the instances of the Aa20 (𓇲) only reflect a standardisation of the graphemes used in the original texts, as the exact form can vary greatly. Table 5.23 shows the different graphical forms of the stem:

1335 de Buck (1961) CT VII, p. 165,i, 167,b.
1336 van der de Molen (2000), p. 70.
1337 de Buck (1935) CT I, p. 86-87,c, 89,d, 119,a, 138,c 141,e, 399,d; de Buck (1954) CT V, p. 145,b, 147,b, 154,b, 157,b, 157,c-d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 51-52.
1338 Note that this form is reconstructed, based on traces visible on a support de Buck did not see himself.
1339 Note that the Aa20c is a placeholder for an unusual variant of this sign, see de Buck (1935) CT I, p. 86,c (S11C).
1340 Note that this is a placeholder for an unusual variant of this sign, see de Buck (1935) CT I, p. 86,c (S10C).
The major variation between the forms is the use of only the Aa20 or the addition of the Y2 (𓏝) classifier. In Aswan and Gebelein there are no attestations of the use of the Y2 classifier. The witnesses A1C, G1T and G2T, which provide these attestations should be considered a group, as they represent a southern Egyptian school of artists in the First Intermediate Period, together with T3C. The fact that both Aswan and Gebelein do not have the Y2 classifier supports that grouping. However, as one can see in form 12, the Y2 classifier is used in the Theban area by T1L. As this witness is dated to the reign of Mentuhotep II-III, it is possible that the complete absence of the Y2 in the form is only limited to Aswan and Gebelein.

In Deir el-Bersha it is possible to use the Y2 classifier or leave it out, although the addition of the Y2 is more likely than the absence. Moreover, witnesses that are dated to the late 11th dynasty and the early 12th dynasty are more likely to leave the Y2 classifier out. Asyut and Meir do not seem to have a specific preference.

5.3.24. "m (to swallow, to devour, to absorb)"

In the database, this lemma is attested thirteen times. For these attestations the verb is constantly used as an imperfective participle, as it is used in the name of divinities: ‘the one who swallows …’. For this lemma, the variation is limited to the use and position of the classifier (see table 5.24).

---

For form 5 only three of the eight attestations do not belong to this group (B16C and B1L), where there is only one attestation of B2Bo with form 9.

de Buck (1951) CT IV, p. 217,d-e, 314,b, 314,d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 52.
The majority of the attestations use the A2 (𓀁) classifier. Meir both has one attestation without a classifier, and one where the A2 has been written next to the G17 (𓅓). However, it would be assumptive to suggest more freedom in Meir, as the absence or the placement of the A2 could be simply due to the amount of space available, rather than any specific pattern. Moreover, the absence of a classifier is attested in Deir el-Bersha as well, as is form 2. Even so, the long format of form 3 is the preferred form for this lemma in most regions. Note that outside the database it is possible in Deir el-Bersha to use a Y2 (𓏝) classifier as well.

The use of the F20 (𓄓) as classifier in the Theban area could suggest a unique feature. However, as this is based on the witness T1Be, which prefers to write the hieroglyphs clustered together, it might have been a choice by the artist to use a sign which could form around the next word, and use less space. On the other hand, the F20 classifier is attested outside the database in T2Be as well.

5.3.25. 𓁁nḥ (to live)

The lemma of 𓁁nḥ is relatively common, with a total of 347 attestations. However, a large number of these attestations are actually substantives or adjectives. In the database, there are a total of 183 attestations where this lemma is used as a verb form. In table 5.25, one can see that the majority of the graphical forms are either form 3 or form 4, which is simply a variation between a long format and a compact format. Form 1 is a rare spelling, in which the word is written phonetically.

---

1347 de Buck (1938) *CT II*, p. 341,b (B9C).
1348 de Buck (1954) *CT V*, p. 51,e (B28o).
1349 de Buck (1938) *CT II*, p. 12,g (B1C, B1P, B2L).
1350 See de Buck (1951) *CT IV*, p. 314,a-b (T1Be), where the final sign of IV,314,a is actually written in front of the D36:M17 group of 𓁁m in the column.
1351 de Buck (1956), p. 145,d (T2Be).
1352 van der Molen (2000), p. 73.
1353 Although it could be argued that the border between a participle and a substantive for this lemma is extremely vague.
1354 de Buck (1935) *CT I*, p. 61,c, 62,f, 79,d-e, 88-89,b, 89,e, 393,f; de Buck (1938) *CT II*, p. 68,a, 71,a, 77,c, 391,b, 391,e, 394-395,c-a, 396,b, 397,a, 398,d, 398,e-f; de Buck (1947) *CT III*, p. 178,c, 234-235,a, 236-237,a; de Buck (1951) *CT IV*, p. 312,c, 313,c, 320,b, 321,a; de Buck (1954) *CT V*, p. 1,a.
Although it is based on the position of the S34 (𓋹), there does seem to be some regional preferences. In Asyut the compact form of form 2 does occur, but it is relatively rare, as it only has three attestations versus 24 attestations of the long format of form 4. Thus, there seem to be a clear preference for the long format in Asyut. This preference would support the suggestion that Y1C originates from Asyut, as it only uses the long format. However, the majority of the attestations in P.Gard.2 and Pap.Berl use form 2, while they are suggested to originate from Asyut as well. Thus, although using the long format in Asyut might be the case for coffins, it does not seem to apply for papyri.

Although not bound to a single region, there seems to have been a preference for using the compact format (form 3) in Saqqara, el-Lisht and Gebelein. In Beni Hasan likewise there seems to have been a preference for the compact format, although the long format occurred there as well. The same is the case for witnesses from Meir, which have a clear preference for the compact writing, although the long format occurs twice. With 42 attestations, it is clear that the preference in Deir el-Bersha lies with the compact form. However, as the long format is attested 26 times as well, there seems to have been some freedom in Deir el-Bersha. In the Theban area there is no preference in the graphical form, as the attestations of form 2 and 4 are about the same.

### 5.3.26. 𓊏 (to fight)

This lemma is relatively common, as it is attested 155 times in the database. However, in the same manner as 𓊏, the lemma is often used for substantives, and is only attested 30 times as a verb.

---

1355 Note that the Z4A (𓋹) represent filler strokes here, as this witness (SSC) prefers to use strokes to fill empty spaces.

1356 P.Gard.2 and Pap.Berl.

1359 van der der Molen (2000), p. 76.

1360 As for example fighter, battlefield and warship were added under this lemma in the database, instead of receiving their own lemma.
form. Note that it was attempted to correctly represent the different graphical forms of D34 (𓀡), and that the exact form should not be considered important. Due to the varied type of script used in most witnesses, the distinctions in the different classes of D34 are usually not clearly visible. In table 5.26, one can see that form 2 is completely unique. This form represents a unique spelling of ‘ḥs as iht, which is currently only attested in Beni Hasan. However, as this is based on only one witness (BH1Br), the current data is not sufficient to suggest that this only occurs in Beni Hasan.

Table 5.26 Graphical forms of the stem of ‘ḥs.

The use of the D40 (𓀡) classifier is less common than the A24 (𓀜), which is rather remarkable, as the A24 takes up a lot more space in the column than the D40 would. The use of the D40 classifier in Saqqara needs to be discounted however, as it is a reconstruction (Sq8Sq). The other two attestations from Saqqara do not have any classifier, which is the case in el-Lisht as well. Thus, it could be suggested that for the most northern attestations of this lemma in the Coffin Texts, there could be a preference for not using a classifier at all, as the other regions like Deir el-Bersha and the Theban area can occur with and without classifier. In Meir however, all the attestations have some sort of classifier attached although the exact form may vary. Thus, it seems that the use of a classifier is preferred in Meir.

---

1361 de Buck (1935) *CT I*, p. 19,c, 325-327,d-a; de Buck (1951) *CT IV*, p. 234-235,b, 292,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 55.

1362 A class is considered a group of graphemes with similar iconic features, see Polis (2020) About That Sign List (TSL). Goal, datamodel and audience of TSL, [http://thotsignlist.org/About](http://thotsignlist.org/About) (accessed 29-06-2020). The new grapheme was made by myself for the TSL, and is currently not yet part of the repertoire of Jsesh.

1363 Note that although it is spelled iht or ‘ḥ here, iht is the more common form of this lemma for the substantive forms in BH1Br.

1364 This witness is one of the witnesses with spell 335 which de Buck added separately, as they are extremely fragmentary. However, the reconstruction was not completely random, as the substantive of ‘ḥs of IV,232,b, see de Buck (1951) *CT IV*, p. 408, is actually written with a D40 classifier.

1365 Including form 4, as I consider the Z1 (𓀢) a classifier here.
The use of the G1 (𓄿) interpretant occurs once in Meir and the Theban area. However, it seems to represent a personal preference of the artist. The use of the humanoid figure in form 1 is extremely rare, and seems to represent an interpretation of de Buck, instead of a distinct separate sign.\(^\text{1366}\)

### 5.3.27. 𓄅 (to stand, to rise up)\(^\text{1367}\)

This lemma occurs relatively often, as it was attested 82 times\(^\text{1368}\) in the database when used as a verbal form.\(^\text{1369}\) In table 5.27, one can see that form 4 is most common, as it is attested 61 times. The use of a classifier is relatively rare, but can occur. Additionally, there are many unique spellings as well.

Table 5.27 Graphical forms of the stem of 𓄅.

One of the features that might reflect a regional preference is the use of the D54 (𓂥) classifier which is attested in Deir el-Bersha, Meir and the Theban area. However, form 6 occurs only in Deir el-Bersha, whereas Meir and the Theban area only use the classifier when there is no D36 (𓂫) before the P6 (𓊢).

\(^\text{1366}\) de Buck (1935) \textit{CT I}, p. 19,c (MC105), de Buck added a sic to this sign, and it seems that it might have been a corruption of the D34 instead, where the weapon was turned into two legs.

\(^\text{1368}\) In total there are 114 attestations, but 32 of these attestations are substantives.

\(^\text{1369}\) de Buck (1935) \textit{CT I}, p. 14,b, 25,a, 25,b, 26,b, 330-331,a, 386,b, 405,d; de Buck (1947) \textit{CT III}, p. 17,c, 186,b, 248-249,d; de Buck (1951) \textit{CT IV}, p. 278,c, 279,d, 281,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 56 and Gracia Zamacona (2008), p. 275-327.
Thus, the combination of the classifier and an initial D36 seems to be unique to Deir el-Bersha, although the form without an initial D36 occurs once as well (form 9). Additionally, the use of the D54 classifier seems to only occur in witnesses from Amenemhat II onwards,\textsuperscript{1370} and thus might represent a development over time.

The use of humanoid signs as classifiers or phonemograms is rare, and only occurs once in the Theban area and twice in two witnesses which are believed to be from Asyut.\textsuperscript{1371} It would be assumptive to base a claim on only three witnesses, but for the lemma Žn the use of a humanoid sign would not support the suggestion that Pap.Berl. and Y1C originate from Asyut.

The use of P7 (𓊣) is only attested twice, once in Deir el-Bersha (form 12) and once in Aswan (form 7). The use of this grapheme seems not to be a regional preference, but rather a feature of the writing style and amount of space available to the artist.

For this lemma, there are only a few signs of regional preference, with fuzzy borders. There is a distinct form where there is an initial D36 when the classifier D54 is used, which only occurs in Deir el-Bersha. However, the use of D54 on its own occurs in Meir and the Theban area as well. The lack of an initial D36 does occur in multiple regions, but is most common in witnesses from the Theban area.

### 5.3.28. Žhm (to extinguish, to quench)\textsuperscript{1372}

In the database, this lemma occurs 27 times.\textsuperscript{1373} As one can see in table 5.28, the graphical form of this lemma is remarkably constant over the various regions.

<table>

</tbody>
</table>

Table 5.28 Graphical forms of the stem of Žhm.

\textsuperscript{1370} The use of a D54 classifier occurs in B1C, B5C, B15C, B17C, B1Y, M4C, T1Be, T2Be and T2L. Only T2L is slightly earlier, as Willems (1988), p. 115, dates it to a period between Sesostris I and Amenemhat II.

\textsuperscript{1372} van der van der Molen (2000), p. 78.

\textsuperscript{1373} de Buck (1935) CT I, p. 21,b, 378-379,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 56.
Form 2 should be considered the same as form 1, as the only variation is the orientation of the classifier. This alternative orientation is due to the fact that in I,378,a, S1C is written oriented to the right, rather than to the left. This causes certain signs, like the V31A (𓎢) to be written as the V31 (𓎡), even if the witness would normally use V31A if the writing was oriented to the left. Thus, the orientation of the glyphs should not represent a regional pattern.

Even though the graphical form of the attestations is relatively constant, there are two attestations from the Theban area that add a M17 (𓇋) or replace the D36 (𓂝) with a M17. It could be suggested that this is a preference of the Theban area, but outside the database there is an attestation from Meir as well. Nonetheless, it is clear that the Theban area is more likely to use the M17 with this lemma, although it is rarely the preferred form.

5.3.29. ‘ḥi (to fly, to fly away)\textsuperscript{1375}

The lemma ‘ḥi is attested eleven times in the database, although all attestations come from the same phrase in spell 335.\textsuperscript{1376} As one can see in table 5.29, there are three different graphical forms, which vary based on the classifier.

<table>

Table 5.29 Graphical forms of the stem of ‘ḥi.

The use of G40 (𓅮) occurs in one witness (M1NY), but this is rather due to the type of script used in this witness. Whereas the other witnesses use a near hieratic cursive script,\textsuperscript{1377} M1NY is much closer to hieroglyphic.\textsuperscript{1378} In hieratic, it is nearly impossible to differentiate between G40 and G41 (𓎊),\textsuperscript{1379} thus it could be argued that the other witnesses might have intended to use the G40, but it can no longer be recognised as such. The additional classifier D54 (𓎌) only occurs in Meir and the Theban area, which

\textsuperscript{1374} de Buck (1954) CT V, p. 115,j.
\textsuperscript{1375} van der van der Molen (2000), p. 78.
\textsuperscript{1376} de Buck (1951) CT IV, p. 310,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 56.
\textsuperscript{1377} Fischer (1976), p. 41, fig. 4, type 3b-4.
\textsuperscript{1378} See appendix 1 for more detail.
\textsuperscript{1379} Möller (1909), p. 21, no. 221 and no. 222.
could suggest that this only occurred in the southern regions of Egypt. However, this suggestion might be assumptive, as there are no additional attestations of this lemma in the Coffin Texts.\footnote{Gracia Zamacona (2008), p. 328.}

5.3.30. $\text{	extcircled{83}$ (to be numerous, to be many)\footnote{de Buck (1938) CT II, p. 90,b, 90,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 57.}}$

This lemma is attested 25 times in the database, but the majority of these attestations are substantive. Only in six attestations is it used as a verb,\footnote{de Buck (1935) CT I, p. 325,a.} in a $\text{nfr-Hr}$ construction. The variation in the spelling is relatively limited, with only three different forms attested (table 5.30):

<table>
<thead>
<tr>

<td>Deir-el-Bersha</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.30 Graphical forms of the stem of $\text{	extcircled{83}$.}

Based on this table, one can assume that Meir prefers only the use of the I1 (𓆈), where Deir el-Bersha can use a variety of graphical forms. However, when compared to the stem of a substantive,\footnote{de Buck (1956) CT VI, p. 139,i (P.Gard.4).} it becomes clear that Meir can include the interpretant G1 (𓄿). However, the use of the phonetic spelling (form 1) is only attested in Deir el-Bersha, even though it occurs in P.Gard.4 as well, although the I1 is included in this witness.\footnote{de Buck (1951) CT IV, p. 145,d (B2L).} The complete absence of the I1 is only attested in Deir el-Bersha, while a Y2 (𓏝) classifier can be included in Deir el-Bersha.\footnote{van der Molen (2000), p. 80.}

5.3.31. $\text{	extcircled{9}$ (to enter)\footnote{de Buck (1935) CT I, p. 141,a, 142,e, 144,c, 144,g, 387,a, 399,b; de Buck (1938) CT II, p. 266,e, 273,d-f, 288-289,b; de Buck (1947) CT III, p. 239,b; de Buck (1951) CT IV, p. 268-269,d, 271,d, 278-279,a, 290-291,c, 306,a, 323,b, 326,j, 326,k. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 57 and Gracia Zamacona (2008), p. 329-385.}}$

The lemma $\text{	extcircled{9}$ is attested 122 times in the database.\footnote{See de Buck (1951) CT IV, p. 269,d (T3Be).} In table 5.31 the different graphical forms of $\text{	extcircled{9}$ are set out. Note that in form 4,\footnote{Which is not impossible due to the near hieratic cursive script this witness (T3Be) uses.} the G1 (𓄿) is considered to be a corruption of a G35 (𓄼).}
Alternatively, it could be the lemma ‘k3 (to be accurate), although it would be the only attestation of that lemma in the database.\footnote{\textsuperscript{1389} Although it occurs often enough in the \textit{Coffin Texts}, see van der van der Molen (2000), p. 80.}

Table 5.31 Graphical forms of the stem of ‘k.

As one can see above, most of the graphical variants are used in multiple regions, and there might be a regional preference, but only to the extent that one graphical form occurs more in one region than the other. For example, Deir el-Bersha uses form 2, 3, 5, 6 and 8, but form 3 and 8 are attested the most. However, in Asyut there is a clear preference to use either form 6 or 8. In these attestations the interpretants D36 (…) and N29 (.) are never written, and the G35 is used in all of them. The D54 (.) classifier is optional, the use of G35 is not. Therefore, if a D36 or N29 is written with ‘k, it seems unlikely that it would have come from Asyut.\footnote{\textsuperscript{1391} It is possible that additional graphical forms that do include the D36 or N29 exist in Asyut, but were not covered by the spells currently encoded in the database.}

\footnote{\textsuperscript{1390} Note that this attestation, de Buck (1935) \textit{CT I}, p. 399,b (M23C) is reconstructed, and could therefore be spelled differently as well.}
5.3.32.  $\text{w3h}$ (to lay down, to offer, to endure)$^{1392}$

In the database there are eight attestations of this lemma.$^{1393}$ In table 5.32, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\text{rasing}$</td>
<td>1</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td>$\text{raising}$</td>
<td>2</td>
<td>Asyut</td>
<td>1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\text{instantly}$</td>
<td>3</td>
<td>Asyut</td>
<td>5</td>
</tr>
<tr>
<td>$\text{instantly}$</td>
<td>4</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.32 Graphical forms of the stem of $\text{w3h}$.

In the database it seems that the Y2 (𓏝) classifier only occurs in Deir el-Bersha. However, outside the database, the Y2 classifier is attested in Asyut and Meir as well.$^{1394}$ The use of the G1 (𓄿) interpretant occurs only in Asyut in the database, but occurs in other regions outside the database as well.$^{1395}$ In the database it seems that only in Deir el-Bersha the V4 (𓍯) phonogram can be left out (form 1), but outside the database this occurs in other regions as well.$^{1396}$ However, it needs to be noted that in Asyut the V4 phonogram is always added for this lemma.

5.3.33.  $\text{w3d}$ (to be green, to be fresh, to cause to flourish)$^{1397}$

This lemma has 22 attestations in the database, but only nine represent verbal forms.$^{1398}$ In table 5.33, the attestations per region are set out for every graphical form of the stem. Note that as de Buck corrected every M13A (𓇅) into a M13 (𓇃), it was only possible to distinguish between the two classes of the same sign in the attestations which were seen by the author. Therefore, the variation between these two classes of the same sign should not be considered relevant.

---

$^{1392}$ van der van der Molen (2000), p. 83.

$^{1394}$ de Buck (1947) $CT$ III, p. 63,c (M57C); de Buck (1951) $CT$ IV, p. 170,c (S2C).

$^{1395}$ de Buck (1935) $CT$ I, p. 128,b (B4L, B13C).

$^{1396}$ de Buck (1935) $CT$ I, p. 134,e (L2Li); de Buck (1956) $CT$ VI, p. 130,c (M3C).

$^{1398}$ de Buck (1951) $CT$ IV, p. 316,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 61.
In the database, it seems that only in Meir and the Theban area the M13/M13A can be used without interpretants or classifiers. Outside the database this is attested in Deir el-Bersha.\textsuperscript{1399} The use of the M14 (𓇆) is only attested in Deir el-Bersha and the Theban area. There do not seem to be any other regional features for this lemma, although it is possible to write this lemma phonetically with a V4 (𓍯) phonemogram outside the database.\textsuperscript{1400}

### 5.3.34. \textit{wˁi} (to be alone, to be unique)\textsuperscript{1401}

This lemma is relatively common in the database, with 191 attestations. However, the majority of these attestations are adjectives or substantives, with only 46 attestations representing verbal forms.\textsuperscript{1402} In table 5.34, the attestations per region are set out for every graphical form of the stem:

\begin{table}[h]
\centering
\begin{tabular}{lll}
Graphical form stem & no. & Region & Attestations \\
\hline
1 & 1 & Saqqara & 1 \\
    &   & el-Lisht & 1 \\
    &   & Beni Hasan & 1 \\
    &   & Deir el-Bersha & 2 \\
    &   & Meir & 3 \\
    &   & Theban area & 2 \\
    &   & Gebelein & 1 \\
2 & 2 & Meir & 5 \\
    &   & Theban area & 3 \\
3 & 3 & Meir & 1 \\
4 & 4 & Saqqara & 4 \\
    &   & el-Lisht & 1 \\
    &   & Deir el-Bersha & 11 \\
    &   & Meir & 7 \\
    &   & Theban area & 2 \\
5 & 5 & Asyut & 1 \\
\end{tabular}
\caption{Graphical forms of the stem of \textit{wˁi}.}
\end{table}

\textsuperscript{1399} de Buck (1947) \textit{CT III}, p. 72,c (B2L).
\textsuperscript{1400} de Buck (1947) \textit{CT III}, p. 72,c (B3Bo, T1L); de Buck (1954) \textit{CT V}, p. 386,b (B1Bo).
\textsuperscript{1401} van der van der Molen (2000), p. 87.
\textsuperscript{1402} de Buck (1935) \textit{CT I}, p. 334,c, 374-375,d; de Buck (1951) \textit{CT IV}, p. 184,d, 186-187,a; de Buck (1954) \textit{CT V}, p. 154,f. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 65.
For this lemma, the use of the T21 (𓌡) alone seems to only occur in Asyut when used as a verbal form, although in Asyut it is more common outside the database to use form 1. Form 2 is only attested in Meir and the Theban area, which is true outside the database as well. In the database, it seems that the G37 (𓅪) classifier is only used in Meir (form 3), but outside the database this is attested in Deir el-Bersha as well.\textsuperscript{1403} Nonetheless, it seems that form 1 and form 4 are the preferred forms for this lemma in all regions.

5.3.35. \textit{wbꜣ} (to drill, to open)\textsuperscript{1404}

In the database, there are 26 attestations for this lemma.\textsuperscript{1405} In table 5.35, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

Table 5.35 Graphical forms of the stem of \textit{wbꜣ}.

\textsuperscript{1403} de Buck (1938) \textit{CT II}, p. 33.e (B2L).
\textsuperscript{1405} de Buck (1935) \textit{CT I}, p. 76.f;j; de Buck (1938) \textit{CT II}, p. 268,a-b, 273,g-h, 288-289.d); de Buck (1951) \textit{CT IV}, p. 89,g); de Buck (1954) \textit{CT V}, p. 7,a, 7,b. For additional attestations outside the database, see de Buck (1938) \textit{CT II}, p. 273,g-h (S1C,b). The sign used should be considered a class of U26 (i).
The use of the G43 (𓊳) phonemogram is only attested in Beni Hasan in the database. However, it occurs in other regions outside the database as well.\textsuperscript{1407} In the database, the addition of the G1 interpretant is only attested in Deir el-Bersha (form 11), but it occurs in Meir as well.\textsuperscript{1408} Furthermore, it seems that Gebelein and Aswan only use form 7, but outside the database form 8 is used in these regions as well.\textsuperscript{1409} The Y2 (𓏝) classifier is only attested in Deir el-Bersha in the database, but occurs outside of it in the Theban area as well.\textsuperscript{1410} Finally, the use of N2 (𓇰) or one of its classes to replace the U26 (𓊬) is only attested in Deir el-Bersha and Asyut, and only rarely. Thus, except in the exact form of the U26 or its variants there might be a regional preference, for example with form 5 and 6 in Asyut. There do not seem to be any additional regional features for this lemma.

5.3.36. \textit{wp꜅} (to scatter light, to illuminate)\textsuperscript{1411}

There are 42 attestations in the database for this lemma.\textsuperscript{1412} In table 5.36, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Image" /></td>
<td>1</td>

<td>2</td>
</tr>
<tr>
<td><img src="image9.png" alt="Image" /></td>
<td>9</td>
<td>Asyut</td>
<td>4</td>
</tr>
</tbody>
</table>

Table 5.36 Graphical forms of the stem of \textit{wp꜅}.

For this lemma, the F13 (𓊳) is not written in Gebelein and Aswan. However, there are no additional attestations of this lemma from these regions in the Coffin Texts to verify whether this is a regional feature.

\textsuperscript{1407} de Buck (1938) \textit{CT II}, p. 164,h (B2L, B2P, Sq3Sq, Sq4C).
\textsuperscript{1408} de Buck (1938) \textit{CT II}, p. 122,a (M48C).
\textsuperscript{1409} de Buck (1938) \textit{CT II}, p. 29,h (G1T, A1C).
\textsuperscript{1410} de Buck (1947) \textit{CT III}, p. 211,j (T3Be).
\textsuperscript{1411} de Buck (1935) \textit{CT I}, p. 340-341,b, 352-353,b, 356-359,d-a, 371,e. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 68.
preference of the two southernmost regions. Moreover, the use of the G43 (𓊭) seems to only occur to the south of Meir in the database (form 6-9). Outside the database this is attested in Deir el-Bersha as well.\textsuperscript{1413} The use of the Y2 (𓊯) classifier is only attested in Deir el-Bersha.

5.3.37. \textit{wn} (to open)\textsuperscript{1414}

This is a common lemma in the database, with 197 attestations.\textsuperscript{1415} In table 5.37, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>

Table 5.37 Graphical forms of the stem of \textit{wn}.

Although the clear majority of the attestations are form 2, which is used in nearly all other regions, there are some features that could be considered a regional preference. The use of the M42 (𓊯) is only attested in el-Lisht and Deir el-Bersha (form 7). Moreover, el-Lisht only uses this form for this lemma, as

\textsuperscript{1413}\textcopyright{} de Buck (1956) \textit{CT VI}, p. 382,j (B1C). Note that it is technically written as \textit{wp$s$} here, as if the artist was trying to write \textit{ps$š$} (to divide; see appendix 6.93). However, reading \textit{wp$š$} makes more sense in this phrase.

\textsuperscript{1414}\textcopyright{} van der Plas & Borghouts (1998), p. 68.

\textsuperscript{1415} de Buck (1935) \textit{CT I}, p. 11,a, 40,d, 56,a, 57,c, 75,d; de Buck (1938) \textit{CT II}, p. 72,b-c, 75,a, 89,b, 91,b, 255,a, 255,c, 256,b, 256,c, 256,e, 268-271,f-c, 270-271,d, 392,b; de Buck (1947) \textit{CT III}, p. 212,e, 214-215,b, 214-215,c, 215,f-g, 218-219,b; de Buck (1954) \textit{CT V}, p. 1.d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 68.

\textsuperscript{1416} de Buck (1935) \textit{CT I}, p. 11,a, 56,a (T9C). As a \textit{s$ḏ$m$š$-} does not make sense in these phrases, I assume this was an error in this witness.
the E34 (𓉵) is not attested in this region for this lemma. Finally, using the O31 (𓉼) as logogram is only attested in Deir el-Bersha.

5.3.38. **wnm (to eat)**

The lemma *wnm* has 133 attestations in the database. However, only 132 attestations represent verbal forms. In table 5.38, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>

1418 de Buck (1935) *CT I*, p. 11,e, 76,c; de Buck (1938) *CT II*, p. 74,b, 75,b-c, 81,a, 394,a; de Buck (1947) *CT III*, p. 5,a, 12,c, 16,c, 17,a, 21,a, 175,b, 184,b, 185,c, 185,d, 234,a, 234-235,c, 236,a; de Buck (1954) *CT V*, p. 136,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 69.
1419 P.Gard.2 and Pap.Berl.
In this lemma, the use of the A2 (𓀁) as logogram (form 1) is only attested in Deir el-Bersha. Moreover, although the use of the double X7 (𓏘) is attested in multiple regions, it is more likely to be used in Deir el-Bersha. The addition of the G17 (𓅓) interpretant seems to only occur in Deir el-Bersha. The use of the M17 (𓇋) as replacement classifier for the A2 is attested in Meir and the Theban area (form 11 and 22), but should be considered features of the supports (M2NY and T1Be), as the A2 is attested often enough in both regions. The use of the double X2 (𓏐) is only attested in Deir el-Bersha and Meir, although it is rare in both regions.

### 5.3.39. **wrr** (to be great)

This lemma is common in the database, with 442 attestations. However, most of these are adjectives or substantives, with only 54 attestations representing verbal forms. In table 5.39, the attestations per region are set out for every graphical form of the stem. Note that form 4 and 5 represent geminating forms.

<table>
<thead>
<tr>

</tbody>
</table>

Table 5.39 Graphical forms of the stem of wrr.

In this lemma, the A19 (𓀗) phonemogram is only used in Deir el-Bersha and Asyut. The use of the Y2 (𓏝) classifier is only attested in Deir el-Bersha, which is true outside the database as well. Form 3 is unique...
to el-Lisht, but should be considered a feature of the witness (L2Li), rather than a regional feature.\footnote{As L1Li and L2Li prefer to write partial forms for the hieroglyphs of animates.}

Note that outside the database it is possible in Saqqara to only write the G36 (⟨⟩) phonemogram.\footnote{de Buck (1935) CT I, p. 280,c (Sq3C).}

5.3.40. *whn* (to overturn, to overthrow)\footnote{van der van der Molen (2000), p. 99.}

In the database there are fifteen attestations of this lemma.\footnote{de Buck (1935) CT I, p. 60,e, 400-401.d-a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 74.} In table 5.40, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td></td>
<td>Theban area</td>
<td>2</td>
</tr>
</tbody>
</table>

Table 5.40 Graphical forms of the stem of *whn*.

There are no regional preferences for this lemma, except for the use of the D40 (⟨⟩) classifier, which is only attested in Deir el-Bersha. Although the database suggests that the O37 (⟨⟩) classifier is only attested in Deir el-Bersha and the Theban area, outside the database this classifier is attested in Saqqara and Asyut as well.\footnote{de Buck (1938) CT II, p. 245,a (S1P); de Buck (1951) CT IV, p. 159,e (Sq6C).}

5.3.41. *whm* (to repeat)\footnote{van der van der Molen (2000), p. 100.}

This lemma has 37 attestations in the database. However, only 34 attestations represent verbal forms.\footnote{de Buck (1935) CT I, p. 8,a, 326-327,b, 393.g; de Buck (1951) CT IV, p. 88,j, 90; 90,9; 90,9; 90,9. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 74.} In table 5.41, the attestations per region are set out for every graphical form of the stem:
### Graphical forms of the stem of *wHm*.

<table>
<thead>
<tr>

<td>4</td>
<td>Theban area</td>
<td>1</td>
<td><img src="image10" alt="Graphical form" /></td>
<td>8</td>
<td>Theban area</td>
<td>1</td>
</tr>
</tbody>
</table>

The use of the Y2 (𓏝) classifier is only attested in Deir el-Bersha and Asyut, which is true outside the database as well. However, the use of the Y2 is rare in Asyut, while much more common in Deir el-Bersha, albeit only in the witnesses of the later period of coffin decoration. Beni Hasan is the only region where the use of the A26 (𓄝) is attested (form 4), which is true outside the database as well. There are no other features which represent a regional preference for this lemma.

#### 5.3.42. *wH3* (to throw off, to shake out)

This lemma has sixteen attestations in the database. In table 5.42, the attestations per region are set out for every graphical form of the stem:

---

1430 de Buck (1935) *CT I*, p. 326.b (T3C). I assume the F35 (𓄜) is a corruption of the F25 (𓄝), as in near hieratic cursive script one can be mistaken for the other, if poorly made. See Möller (1909), p. 15-16, no. 162 and 180.
1432 de Buck (1935) *CT I*, p. 90.d; de Buck (1947) *CT III*, p. 248-249.e. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 75.
Table 5.42 Graphical forms of the stem of \textit{w/js}.

For this lemma, in Asyut there seems to be a preference for the long format of form 2 and 4, both within and outside of the database. The absence of the Aa1 (𓊦) interpretant is only attested in the Theban area (form 5), but its absence is rare. Note that it is possible in Deir el-Bersha to replace the M12 (𓊦) with an M16 (𓇉) instead.\textsuperscript{1434}

5.3.43. \textit{wšb} (to answer, to answer for)\textsuperscript{1435}

This lemma has only six attestations in the database. However, only four represent verbal forms.\textsuperscript{1436} As table 5.43 shows, every attestation has its own form:

Table 5.43 Graphical forms of the stem of \textit{wšb}.

---

\textsuperscript{1433} de Buck (1935) \textit{CT I}, p. 90,d (SS5C). The strokes are filler, as this witness often has strokes added for pure decorative purposes.

\textsuperscript{1434} de Buck (1935) \textit{CT I}, p. 226,c (B12C, B17C, B16C).

\textsuperscript{1435} van der van der Molen (2000), p. 104.

\textsuperscript{1436} de Buck (1947) \textit{CT III}, p. 20,c. Note that van der Plas & Borghouts (1998), p. 77 consider this phrase part of \textit{wšb} (to feed) instead, and does not include this lemma. However, I considered this lemma more suitable in this phrase. However, as both these lemmas are difficult to visually distinguish, I used the entries in \textit{wšb} (to feed) to verify the forms.
In the database, the A2 (𓀁) classifier is only attested in Asyut. Outside the database it is attested in Deir el-Bersha and Meir as well. Nonetheless, it seems that Asyut always includes the A2 classifier, which is true outside the database as well. Additionally, only in Asyut is the F16 (𓉽) classifier added (form 4). Finally, the Y2 (𓏝) classifier is only attested in Deir el-Bersha.

5.3.44. \(\text{wTs} \) (to raise up, to lift up, to carry)

There are only two attestations of this lemma in the database, from the same phrase of spell 75. As table 5.44 shows, both regions have their own form. Form 1 is additionally attested in other regions, but form 2 seems to be unique to Aswan. However, in this lemma the T14 (𓌙) or O30 (𓉽) are habitually written as classifiers, instead of the initial position. Note that it is possible to have the T14 on the second position in Gebelein as well.

<td>Aswan</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.44 Graphical forms of the stem of \(\text{wTs}\).

5.3.45. \(\text{wdi} \) (to put, to place)

There are 50 attestations of this lemma in the database. In table 5.45, the attestations per region are set out for every graphical form of the stem. Note that as this is a 3ae inf. lemma and gemination occurs, the table has been separated in gemination and no gemination.

---

1437 de Buck (1947) *CT III*, p. 204,b (B2Bo, M22C).
1440 de Buck (1935) *CT I*, p. 178,h (B2Bo); de Buck (1947) *CT III*, p. 309,d (T3L).
1441 For example, see de Buck (1935) *CT I*, p. 305,g, and even in Gebelein as well, see de Buck (1938) *CT II*, p. 115,f (G2T).
1442 de Buck (1938) *CT II*, p. 7,b (G1T).
1444 de Buck (1935) *CT I*, p. 31-32,d-a, 36,d-e; de Buck (1938) *CT II*, p. 85,d; de Buck (1951) *CT IV*, p. 87,l, 88,e, 88,i, 90,n, 236-237,a, 300,b, 315,d; de Buck (1954) *CT V*, p. 155,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 78-79.

Table 5.45 Graphical forms of the stem of *wdi*.

Note that the use of the different arms as classifier should not be considered a valid ground for variation, as in near hieratic cursive script these signs resemble each other.\(^{1447}\) Nonetheless, the U32 (𓀲) is only attested in Deir el-Bersha. The use of a A24 (𓁤) classifier only occurs in Saqqara in the database, \(^{1445}\) de Buck (1951) *CT IV*, p. 88,e (B5C). I assume the addition of the G37 (𓀱) classifier is due to the negative nature of the phrase here. \(^{1446}\) de Buck (1951) *CT IV*, p. 237,a (M54C). This witness habitually replaces humanoid hieroglyphs with the M17*Z1 (𓀱) group, thus this form most likely represents form 10. \(^{1447}\) Möller (1909), p. 9.
but occurs outside the database in Deir el-Bersha as well. The use of the Z9 ( חדשות) and the T30 (ב) classifiers are only attested in Meir. However, these represent a specific reading of this lemma together with סף (to inflict a wound). The G37 (antidad) classifier is only attested in Deir el-Bersha, with the classifier representing the negative nature of this lemma in this phrase, rather than a general regional feature.

5.3.46. **wdn (to be heavy, to weigh upon)**

There are eight attestations of this lemma in the database. In table 5.46, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Graphical form stem no.</th>
<th>Region</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Deir el-Bersha</td>
<td>1</td>

<td></td>
</tr>
<tr>
<td></td>
<td>Deir el-Bersha</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Theban area</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

In the database, the absence of the N35 (נקiosis) is only attested in Deir el-Bersha, but outside the database Asyut can leave it out as well. The use of the A24 (א) classifier is only attested in the Theban area, while the D40 (ד) classifier is only attested in Deir el-Bersha. Finally, form 5 is only attested in the Theban area, but seems to be a unique form.

---

1448 de Buck (1956) CT VI, p. 173,j (B1Bo).
1450 de Buck (1935) CT I, p. 71,b, 71,f. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 79.
1451 Note that this form could be easily mistaken for form 6 of wdi, see table 5.45.
1452 Note that this form could be easily mistaken for form 7 of wdi, see table 5.45.
1453 de Buck (1951) CT IV, p. 152,b (S1C,a-b).
5.3.47. *wdi* (to send, to depart)

There are twelve attestations of this lemma in the database.\footnote{de Buck (1951) *CT IV*, p. 314,d, 317,d. This lemma is not attested in van der Molen and van der Plas & Borghouts, as they consider these phrases part of *wdi* (to put; see section 5.3.45). However, the method I used for encoding required the use of this lemma, as *wdi* is a valid lemma.} In table 5.47, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>

\(^{1457}\) van der van der Molen (2000), p. 110.

\(^{1458}\) de Buck (1935) *CT I*, p. 24,a, 26,a, 33,d, 43,a, 44-45,e-a, 47,b, 361,b, 378-391,d-a, 382-383,c, 386,b, 391,b; de Buck (1938) *CT II*, p. 75,a, 90,d, 394,a; de Buck (1951) *CT IV*, p. 234,b, 236,b; de Buck (1954) *CT V*, p. 121,b, 140,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 80.

\(^{1459}\) de Buck (1935) *CT I*, p. 391,b (M28C). As this witness was not seen by de Buck himself, I assume the N37 (𓏝) is a modern corruption of an Y2 (𓏷).

\(^{1460}\) de Buck (1935) *CT I*, p. 24,a (MC105, T9C). I am not certain why the D36 (𓊠) geminates here, as the addition of the X1 (𓏶) in the original makes it unlikely that this should be read as a ṣḏḏm=ḏ, which would not make much sense here to begin with. However, it is remarkable that this only occurs in the Theban area.
5.3.49. *wdb* (to turn, to turn back)

This lemma has 24 attestations in the database. In table 5.49, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Meir</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>9</td>
<td>Deir el-Bersha</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>10</td>
<td>Meir</td>
<td>1</td>
</tr>
</tbody>
</table>

In the database, the use of the G43 (𓅱) on the initial position only occurs in Deir el-Bersha (form 16). However, outside the database this is attested in other regions as well.\(^{1461}\) The V1 (𓅡) classifier is only attested in Deir el-Bersha in the database (form 7), but outside of it occurs in Saqqara as well.\(^{1462}\) In the database it seems the Aa22 (𓌬) is only attested in Deir el-Bersha and Meir (form 13-15), but occurs outside the database in the Theban area as well.\(^{1463}\) The use of the T30 (𓚄) as classifier only occurs in Deir el-Bersha and Meir in the database, but is attested in multiple other regions as well.\(^{1464}\) The A2 (𓀁) classifier is only attested in Beni Hasan and Deir el-Bersha (form 9), and might represent a feature of the more northern attestations of this lemma, although it does not occur in Saqqara or el-Lisht.

---

\(^{1461}\) de Buck (1935) *CT I*, p. 288,h (T1C, Sq3C); de Buck (1951) *CT IV*, p. 126,a (S1C).

\(^{1462}\) de Buck (1938) *CT II*, p. 163,e (Sq3Sq).

\(^{1463}\) de Buck (1935) *CT I*, p. 288,h (T2C).

\(^{1464}\) de Buck (1938) *CT II*, p. 154,e (G2T); de Buck (1947) *CT III*, p. 344,d (S1C, S2C,a); de Buck (1956) *CT VI*, p. 255,h (Sq3C). I assume this classifier is habitually used when *wdb* should be read as a more aggressive form of separation (to sever, to cut off).

\(^{1466}\) de Buck (1935) *CT I*, p. 34,b, 385,b, 387,a; de Buck (1954) *CT V*, p. 139,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 81 and Gracia Zamacona (2008), p. 440-442.

Table 5.49 Graphical forms of the stem of wḏb.

In the database, the D55 (𓀞) classifier is only attested in Meir and Deir el-Bersha. However, outside the database the D55 classifier is attested in Asyut as well. In the database it seems that Asyut always uses the F46 (𓀝) or any of its classes for this lemma (form 5-7). However, outside the database the N21 (𓀕) is attested in Asyut as well. The absence of the V24 (𓀛) and the use of a D46 (𓀞) is only attested in

---

1467 de Buck (1935) CT I, p. 34,b (MC105). Reconstruction, the phrase is completely lost. Could be any other graphical form as well.
1468 de Buck (1935) CT I, p. 385,b (S1C). I assume the N18 (𓀕) is a corruption of the F46 (𓀝) or any of its classes, or for the N21 (𓀕).
1469 de Buck (1935) CT I, p. 34,b (T9C). The V28 (𓀛) is assumed to be a corruption of the V24 (𓀛), and the tusk of form 15 a variation for the N21 (𓀕).
1470 de Buck (1938) CT II, p. 242,d (S1P).
1471 de Buck (1938) CT II, p. 242,d (S1C,b, S2C,d).
Meir, which is true outside the database as well. Note that outside the database it is possible in Meir to use a D40 (𓊲) classifier, or use the F46 as logogram.\textsuperscript{1472}

5.3.50. \textit{bnn} (to beget)\textsuperscript{1473}

This lemma is attested eleven times in the database, where all attestations occur in the same phrase of spell 15.\textsuperscript{1474} The following table sets out the attestations per region for every graphical form (table 5.50):

\begin{center}

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>

<td></td>
<td>3</td>
<td></td>
<td></td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.50 Graphical forms of the stem of \textit{bnn}.
\end{center}

For this lemma, the use of the phallus classifier seems to be restricted to Deir el-Bersha, although the damage in the witnesses from the Theban area makes it difficult to be certain. Moreover, T9C used form 4, where a T30 (𓌪) is used instead of a phallus classifier, which can be assumed to be a corruption. As there are no other attestations in the database or in van der Molen, or in van der Plas & Borghouts\textsuperscript{1477} for the Coffin Texts, it cannot be stated with certainty whether the Theban area used a phallus classifier or not.

5.3.51. \textit{bhni} (to cut up, to cut off, to punish)\textsuperscript{1478}

The lemma \textit{bhni} is attested twelve times in the database.\textsuperscript{1479} In table 5.51 the attestations per region are set out for every graphical form of the stem:

\begin{center}

\textsuperscript{1472} de Buck (1961) CT VII, p. 128,i (M5C, M6C).
\textsuperscript{1473} van der van der Molen (2000), p. 121.
\textsuperscript{1474} de Buck (1935) CT I, p. 45,b.
\textsuperscript{1475} Note that one attestation (B4C) is reconstructed.
\textsuperscript{1476} Note that both attestations (MC105 and T2C) are reconstructed.
\textsuperscript{1477} van der Plas & Borghouts (1998), p. 87.
\textsuperscript{1478} van der van der Molen (2000), p. 122-123.
\textsuperscript{1479} de Buck (1935) CT I, p. 21,a, 402,b-c; de Buck (1951) CT IV, p. 90,m. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 87.
For this lemma, the clear preference lies with form 1.1480 However, there are some distinct features in Deir el-Bersha. The use of the D40 (𓊆) as addition to the T30 (𓊂) classifier seems only to occur in Deir el-Bersha (B1C and B5C), specifically in the witnesses that are dated to the later period of coffin decoration.1481 However, as B1C additionally uses form 1 in the same phrase (I,402,b-c), it is not exclusive. Form 3 occurs only in Deir el-Bersha, in B1Bo. It could be argued that it represents a style from the earlier period of coffin decoration in Deir el-Bersha.1482 However, B6C, which is dated to the same period, uses form 1, thus the use of form 3 is more likely a quirk of this support than a regional preference. The use of the F18 (𓄑) phonemogram in the Theban area seems unique, and does not occur outside the database. Therefore, it would be assumptive to associate this with a single region based on a single attestation. However, the F18 is used as classifier in Beni Hasan.1483

5.3.52. *bs* (to introduce, to initiate)1484

This lemma is attested 25 times in the database.1485 In table 5.52, the attestations per region are set out for every graphical form of the stem:

---

1480 Including with other attestations in van der Molen, for all regions, although variations with other classifiers, see for example de Buck (1961) CT VII, p. 154,s, where A24 (𓊃) is used as a classifier, instead of T30 (𓊂).

1483 de Buck (1938) CT II, p. 116,g (BH3C).

In Asyut, there seems to be a possibility to write *bs* only phonetically, without the addition of a phono-repeat or classifier, which does not occur in the other regions. However, beyond the database, there is an attestation from Deir el-Bersha\textsuperscript{1486} and the Theban area\textsuperscript{1487} that does not include a phono-repeat or classifier. It must be noted that the absence of both is more common in Asyut than in the other regions. In Deir el-Bersha, it is possible to use a A2 (𓀁) as a classifier, which seems to be unique to the region.

5.3.53. \(p^2\) (auxiliary verb, to have done in the past)\textsuperscript{1488}

In the database, there are eighteen attestations of this lemma, from the same phrase of spell 30.\textsuperscript{1489} In table 5.53, the attestations per region are set out for every graphical form of the stem:

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|c|c|c|}
\hline
Graphical form stem & no. & Region & Attestations & Graphical form stem & no. & Region & Attestations \\
\hline
\includegraphics[width=0.1\textwidth]{graph1} & 3 & Deir el-Bersha & 3 & \includegraphics[width=0.1\textwidth]{graph2} & 9 & Deir el-Bersha & 1 \\
\hline
\includegraphics[width=0.1\textwidth]{graph3} & 4 & Asyut & 1 & \includegraphics[width=0.1\textwidth]{graph4} & 10 & Deir el-Bersha & 2 \\
\hline
\includegraphics[width=0.1\textwidth]{graph5} & 5 & el-Lisht & 1 & \includegraphics[width=0.1\textwidth]{graph6} & 11 & Deir el-Bersha & 1 \\
\hline
\includegraphics[width=0.1\textwidth]{graph7} & 6 & Deir el-Bersha & 1 & \includegraphics[width=0.1\textwidth]{graph8} & 12 & Deir el-Bersha & 1 \\
\hline
\end{tabular}
\caption{Graphical forms of the stem of *bs*.}
\end{table}

\textsuperscript{1486} de Buck (1954) CT V, p. 67,c (B2L,b). Note that B2L,a does have the K5 (𓆟) phono-repeat.

\textsuperscript{1487} de Buck (1947) CT III, p. 310,d (T1Be), although the gemination of the \(s\) is unusual if *bs* is a 2-lit verb, which means it might be *bsi* (to flow forth) here instead.

\textsuperscript{1488} van der van der Molen (2000), p. 127.

\textsuperscript{1489} de Buck (1935) CT I, p. 84-85,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 92.
One of the major variations is in the use of the G41 (𓅯) instead of the G40 (𓅮), which occurs in Deir el-Bersha and the Theban area. However, it is not unlikely that this variation occurs due to transcription, rather than original intent, as the witnesses with form 8-10 all use a near hieratic cursive script, in which it is not possible to differentiate between the G40 and G41. However, Deir el-Bersha has one feature which is not attested in the other regions, which is the addition of a circle sign (𓂂) at the end of the word (form 8 and 10). In Asyut it is possible to only add the Q3 (𓊪) interpretant (form 2-4), which is not attested in the other regions. Regrettably, there are no additional attestations of this lemma from Meir outside the database, which makes it impossible to say if the reconstructions are correct.

5.3.54. *phr* (to turn, to go around, to envelop)

In the database there are 92 attestations of this lemma. In table 5.54, the attestations per region are set out for every graphical form of the stem:

---

1490 de Buck (1935) *CT I*, p. 84,c (S11C), assumed to be a corruption, as the *mz* that follows is not written in this, thus the G1 (𓍺) signs could be the remnant of *mz*, instead of interpretants of *phr*.

1491 de Buck (1935) *CT I*, p. 84,c (M24C, M25C), complete reconstruction, could be any other form as well.

1492 Möller (1909), p. 21, no. 221 and 222. Note that the script type of T1L (the Theban area attestations of form 9) is not known to me.

### Table 5.54 Graphical forms of the stem of *phr*.

</table>

Although form 1, 3 and 4 are relatively common for this lemma, it needs to be noted that these forms only occur in the database when used in the construction *špfr* (vice-versa). Only in the Theban area does form 2 occur, although it only occurs in T9C. Outside the database it is attested in T1C as well,\(^{1495}\) while form 2 occurs in Asyut as well.\(^{1496}\) In the database, the use of the F47 (𓄢) instead of the F46 (𓄲),

\(^{1495}\) de Buck (1947) *CT III*, p. 210,c (T1C).
\(^{1496}\) de Buck (1947) *CT III*, p. 379,c (S1C,a).
see form 3, is only attested in the Theban area, but outside the database it is attested in Asyut as well.\textsuperscript{1497} In the database, Gebelein is only attested with a F48 (𓄷), but outside the database form 19 is attested as well for Gebelein.\textsuperscript{1498} However, it seems that only using the two interpretants Q3 (𓊪) and D21 (𓋀) and the classifier D54 (𓂻) is the preferred form in Gebelein for this lemma. The use of the F48 is only attested in Deir el-Bersha, the Theban area and Gebelein (form 4, 11, 17, 20). However, the use of the F49 (𓄷) is only attested in the Theban area (form 12), which is more likely to use F48 or F49 instead of F46. The attestations from Beni Hasan seem to include the Q3, F32 (𓄡) and D21 in all its attestations, which is true outside the database as well.\textsuperscript{1499} Only in Asyut is the F32 replaced by an Aa1 (𓀇). However, this only occurs in S10C (form 5-7), and should be considered a feature of this witness, rather than a regional preference in Asyut. The use of the D55 (𓂽) classifier (form 10 and 16) is only attested in Deir el-Bersha, but all attestations come from the same witness (B2Bo).

5.3.55. \textit{psH} (to bite)\textsuperscript{1500}

The lemma \textit{psH} has seven attestations in the database, from the same phrase of spell 22.\textsuperscript{1501} In table 5.55, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td></td>
<td></td>
<td>Theban area</td>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 5.55 Graphical forms of the stem of \textit{psH}.

For this lemma, there do seem to be some regional preferences. The Theban area seem to prefer the long format of form 3 and 4.\textsuperscript{1502} The use of a Y2 (𓋀) classifier is only attested in Deir el-Bersha, although

\textsuperscript{1497} de Buck (1956) \textit{CT VI}, p. 180,h (S1C).
\textsuperscript{1498} de Buck (1956) \textit{CT VI}, p. 263,b (G1T).
\textsuperscript{1499} de Buck (1961) \textit{CT VII}, p. 107,a (BH4C). However, in this attestation the F46 is used as a phono-repeater, instead of a phonogram.
\textsuperscript{1500} van der Molen (2000), p. 139.
\textsuperscript{1501} de Buck (1935) \textit{CT I}, p. 64-65,c-a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 103.
\textsuperscript{1502} Note that outside the database there are attestations without the A2 (𓀇) classifier as well, see de Buck (1951) \textit{CT IV}, p. 34,f (T1L), but it is constantly written in the long format.
it might be a feature of the witness (B1P), rather than a regional preference. Form 5 suggests that there is a preference in Beni Hasan to use a S29 (š). However, there do not seem to be any other attestations from Beni Hasan in the Coffin Texts, thus it might be simply a feature of the witness (BHSC), rather than a regional feature.

5.3.56. pšn (to split)\textsuperscript{1503}

In the database there are 34 attestations of this lemma.\textsuperscript{1504} In table 5.56, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>

Table 5.56 Graphical forms of the stem of pšn.

In the database, it seems that Deir el-Bersha prefers to use psšn rather than pšn for this lemma, even though pšn occurs in Deir el-Bersha as well (form 5). However, based on the attestations outside the database,\textsuperscript{1506} it becomes clear that psšn is only used in witnesses from the later period of coffin creation in Deir el-Bersha,\textsuperscript{1507} as the earlier witnesses use pšn or psš. The variant psšn occurs in Saqqara and Meir as well, but are more an exception rather than the rule. The addition of an additional classifier beyond the Z9 (š) is rare, and is only attested in Meir and the Theban area. Moreover, the use of the D54 (.Secret) classifier is only attested in Meir, although it is the only attestation of this classifier, and might therefore

\textsuperscript{1503} van der van der Molen (2000), p. 142. Note that psšn van der van der Molen (2000), p. 140 was encoded under this lemma as well.

\textsuperscript{1504} de Buck (1951) CT IV, p. 282-283,b, 287,e, 288-289,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 104. Note that psšn is added under psš (see appendix 6.93) in van der Plas & Borghouts (1998), p. 103.

\textsuperscript{1505} de Buck (1951) CT IV, p. 288,c, (B1P), I consider the G43 (š) an error, rather than reading pw sšn Here.

\textsuperscript{1506} de Buck (1951) CT IV, p. 143 (B2L); de Buck (1956) CT VI, p. 63,l (B2L).

\textsuperscript{1507} psšn is only attested in Deir el-Bersha in the witnesses B9C, B2L, B1P and B1Y, although B1Y is a reconstruction.
represent a feature of the witness (M1NY) rather than a regional feature, as M1NY is attested with form 5 as well.

5.3.57. *pg₃* (to unfold, to open up)

The lemma *pg₃* has twelve attestations in the database. In table 5.57, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td>Deir el-Bersha</td>
<td>2</td>
<td><img src="image8" alt="Image" /></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 5.57 Graphical forms of the stem of *pg₃*.

In this lemma, there does not seem to be any regional preference, as most witnesses use form 4. Gebelein seems to prefer the compact format of form 2, but outside the database form 4 is attested in Gebelein as well. The use of the F51 (𓄼) classifier is only attested in Y1C, and seems to represent a unique feature of that witness. In Beni Hasan the D40 (…) classifier is not used. However, as there are no additional attestations of this lemma in Beni Hasan, it might represent a regional feature, even though form 3 is not unique to Beni Hasan.

5.3.58. *ptr* (to see, to behold)

In the database there are seven attestations of this lemma, in the same phrase of spell 97. In table 5.58, the attestations per region are set out for every graphical form of the stem:

---

1509 de Buck (1938) *CT II*, p. 30,b, 390,d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 104.
1510 de Buck (1938) *CT II*, p. 390,b (T3C). Assumed not to be intentional, but rather due to limited space at the end of a column.
1511 de Buck (1938) *CT II*, p. 138,b (G2T).
1512 de Buck (1938) *CT II*, p. 138,b (S1C, G1T, A1C).
1514 de Buck (1938) *CT II*, p. 92,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 104.
Table 5.58 Graphical forms of the stem of ptr.

In the database, it seems that there are distinct forms for every region. However, outside the database this is not true. Meir is only attested in the database without an eye classifier, but outside the database it is attested with a D5 (𓁺) classifier as well.\textsuperscript{1515} Deir el-Bersha is the only attestation in the database with a D5 classifier, but outside the database it is attested in other regions as well. However, if an eye is added as classifier in Deir el-Bersha, the D5 is commonly used. The use of the D4 (𓁹) as classifier is only attested in the Theban area in the database, which is true outside the database as well. However, it is remarkable that the D5 classifier does not occur in the Theban area, although other eyes like the D10 (𓁺)\textsuperscript{1516} are used as classifier there. The absence of an eye classifier is attested in all the other regions which use this lemma.

5.3.59. *pd* (to stretch out, to spread out)\textsuperscript{1517}

This lemma has nine attestations in the database.\textsuperscript{1518} In table 5.59, the attestations per region are set out for every graphical form of the stem:

\textsuperscript{1515} de Buck (1954) *CT V*, p. 207,e (M1C).
\textsuperscript{1516} de Buck (1951) *CT IV*, p. 383,b (T3Be).
\textsuperscript{1517} van der van der Molen (2000), p. 143-144.
In this lemma, there is some variation in the classifiers. Deir el-Bersha can replace the T9 (𓌒) with the T10 (𓌔), although it seems to be a feature of the witness B1Bo, rather than a regional preference of Deir el-Bersha. The addition of the D54 (𓂻) is only attested in Saqqara and Deir el-Bersha. Note that outside the database form 2 is attested in Saqqara as well. The addition of the D56 (𓂾) in Asyut (form 3) seems to be a unique feature, which is not repeated in the Coffin Texts. However, form 1 and 2 are most commonly used for this lemma in the Coffin Texts.

5.3.60. fsâ (to lift, to carry, to raise)\textsuperscript{1520}

The lemma fsâ is relatively common in the database, with a total of 59 attestations.\textsuperscript{1521} In table 5.60, the attestations per region are set out for every graphical form of the stem. As this lemma is a 3ae inf. lemma, the table is separated due to the occurrence of gemination.

</tbody>
</table>

Even though the Theban area is underrepresented, it has an interesting feature, as the A9 (𓀋) only occurs as a logogram. However, this is only based on one witness (T3C). Attestations outside the database indicate that classifier are used in the Theban as well. The witnesses from Asyut are only attested with form 13 in the database, even though outside the database they are attested with a A9 or equivalent as well. Thus, it cannot be suggested that Asyut prefers to write this lemma phonetically, even though the use of A9 or equivalent signs seems to be less common.

Deir el-Bersha has access to an extreme variety of forms, but based on the database, it seems that the use of the Y2 (𓏝) classifier only occurs in Deir el-Bersha. In Gebelein there seems to be a unique form as well (form 7). However, as it is based on one witness (G1T), it might represent a feature of this witness, rather than regional preference. In Meir, there seems to be a preference to use the A9 or an equivalent sign as a classifier rather than a logogram, when the lemma geminates (see form 16 and 18). However, the A9 or any equivalent can be left out as well (form 13), and is used as a logogram when the lemma does not geminate.

\[^{1524}\] Two attestations are reconstructions from B7C, see de Buck (1935) CT I, p. 366-368,c-a, 368-370,c-a.
\[^{1525}\] de Buck (1935) CT I, p. 368-370,c-a (B1P), the duplication of the A9 (𓀋) is assumed to be a corruption.
\[^{1526}\] All three attestations come from the same witness (M28C).
\[^{1527}\] de Buck (1961) CT VII, p. 38,h.
5.3.61. *fdi* (to pluck, to uproot)\(^{1528}\)

This lemma is rare in the database, with a total of six attestations, in the same phrase of spell 398.\(^{1529}\) As one can see in table 5.61, the spelling is relatively constant, with only some variation in the classifiers.

Table 5.61 Graphical forms of the stem of *fdi*.

Based on the database, only in Meir is the humanoid replaced by an arm. However, outside the database this is attested as well in the Theban area and Deir el-Bersha.\(^{1532}\) Gebelein and Aswan are only attested with the humanoid classifier.

5.3.62. *mAA* (to see)\(^{1533}\)

The lemma *mAA* is one of the common lemmas in the database, with 432 attestations. However, only 397 attestations are verbal forms.\(^{1534}\) In table 5.62 the attestations per region are set out for every graphical form. Note that the forms which include a N35 (𓋕) or S4 (𓈖) represents a subjunctive *sdm-f*.\(^{1535}\)

Table 5.62 Graphical forms of the stem of *m33*.

Form 7, 16 and 23 are the most common forms for this lemma, and are represented in nearly every region. However, some regional preferences seem to occur. The Theban area seems to have a preference not to write the N35 with the subjunctive *sdm-f*, apart from some rare instances\(^{1540}\). The use of the S4 occurs only in Asyut, but as it only occurs in one witness (S11C), it cannot be considered a regional preference.

\(^{1538}\) All from the same witness (B4L). Two attestations are reconstructions due to the tabular form of spell 31, where the same phrase de Buck (1935) *CT I*, p. 96,b, needs to be read for every column below it.

\(^{1539}\) Note that the strokes are decorative here, this form should be considered similar to form 8.

\(^{1540}\) There are 2 attestations with the N35 in the Theban area (form 23), while there are 10 attestations without the N35 (form 1 and 7).
In Gebelein, there seems to be a preference for compact formats (form 6, 13, 15 and 22), although the long format of form 7 is attested as well. Additionally, the G1 (𓄿) is always included in the forms used in Gebelein, which is true for Aswan as well. Moreover, although the Theban area is attested without the G1, this is not true for T3. C. Thus, it could be argued that the constant inclusion of a G1 interpretant is a feature of the First Intermediate Period south Egyptian school of artists.\textsuperscript{1541}

5.3.63. \textit{mīr} (to be true)\textsuperscript{1542}

In the database, this lemma has 45 attestations. However, only 37 attestations represent a verbal form.\textsuperscript{1543} In table 5.63, the attestations per region for every graphical form of the stem are set out:

In the database, form 5 only occurs in Deir el-Bersha, which suggests that it represents a regional preference. However, when compared to form 6, it becomes clear that the use of these two forms are more or less similar. Notably, there is an interesting feature hidden here, as form 5 is more popular with the later period of coffin decoration in Deir el-Bersha, where form 6 is more popular with the earlier period of coffin decoration. However, the forms are not completely exclusive, as form 5 has one attestation from B3Bo, and two from B4C,\textsuperscript{1544} and form 6 has one attestation from B9C.\textsuperscript{1545} Moreover, form 1 and 3 are not attested beyond the reign of Amenemhat II. Thus, the use of the classifier Y2 (𓄼) is

\textsuperscript{1541} Although not uniquely for this group, as for example B5C only attestations with the G1 as well. However, for this period the inclusion is constant, where B1Bo, which is one of the earliest witnesses from Deir el-Bersha can leave the G1 out.

\textsuperscript{1542} van der van der Molen (2000), p. 153.

\textsuperscript{1543} de Buck (1935) CT I, p. 25,b, 37,b, 41-42,c-a, 42,c, 43,a, 43, 78,f, 80,e, 89,e, 113,b-c, 405,e; de Buck (1951) CT IV, p. 184-185,a, 263,c, 266,b, 269,b, 289,b, 298,a 304,b, 318,b 326,h-i, 326,l, 236,n. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 121.

\textsuperscript{1544} B4Bo is dated to the late 11th dynasty and early 12th dynasty, and B4C to Amenemhat I-II. The other attestations (B15C, B3L, B3L and B1P) are dated to Amenemhat II and Sesostris II-III.

\textsuperscript{1545} B9C is the youngest attestation with Amenemhat II, where the other attestations (B2Bo, B3Bo, B4Bo, B4C and B6C) are dated to the late 11th dynasty and early 12th dynasty and Amenemhat I-II.
most commonly a later period of coffin decoration preference in Deir el-Bersha. The use of form 5 is not unique to Deir el-Bersha, as outside the database the form is attested in Asyut as well.\textsuperscript{1546} The attestations from Meir seem to prefer the complete absence of the Y2 classifier.

As form 8 is based on L2Li, a witness de Buck did not see himself, it cannot be said if the use of the U5 (\(\text{𓌶}\)) represents a regional preference, or if this is a feature of the witness itself. However, there are no other attestations of this lemma in the \textit{Coffin Text} for el-Lisht.

\subsection*{5.3.64. \textit{m5-t-hrw} (to be justified)\textsuperscript{1547}}

This lemma was added as a separate entity\textsuperscript{1548}, even though it is technically a sub-lemma of \textit{m5-t} (to be true), as it represents a compound verb. Nonetheless, there are 162 attestations of the lemma \textit{m5-t-hrw} in the database, although only 110 attestations represent a verbal form,\textsuperscript{1549} as the substantive \textit{m5-t-hrw} (justification) was added in the database under this lemma. As one can see in table 5.64, the graphical form of this lemma can be remarkably varied.

Table 5.64 Graphical forms of the stem of mAa-xrw.

In this lemma, a graphical form often occurs in only one witness, and therefore seems to represent a personal preference of the artist, rather than a regional feature. For example, form 32 has six attestations, but all come from the same witness (B4C). Nonetheless, there are some features that can represent a regional preference. The complete phonetic spelling of hrw occurs only in Deir el-Bersha (form 14, 18, 20, 23). However, with the exception of form 20, all these attestations are from the same witness (B3Bo). The addition of the Aa1 (𓋱) and D21 (𓋱) to the P8 (𓋰) in hrw occurs in the Theban area as well (form 21), but is more common in Deir el-Bersha. The other regions only add the G43 (𓅱) to hrw.

Based on the attestations from the database, it is possible to suggest that there is a preference in Asyut to use the long format (form 17, 24, 29 and 30). However, outside the database, compact forms are used as well.\textsuperscript{1550} The use of a Y2 (𓏝) is attested in Deir el-Bersha (form 4, 19, 22 and 27) and the Theban area (16), but is most prevalent in Deir el-Bersha.

\textsuperscript{1550} de Buck (1938) CT II, p. 154,b (S2C).
5.3.65. *msf* (to acclaim)\(^{1551}\)

The lemma *msf* has seven attestations in the database, all from the same phrase in spell 36.\(^{1552}\) In table 5.65, one can see that the majority of variation occurs due to the occurrence of the A2 (𓀁) classifier, and which vessel is used as a phono-repeater.

<td></td>
</tr>
</tbody>
</table>

Table 5.65 Graphical forms of the stem of *msf*.

The attestation from el-Lisht (L2Li) stands out, as it uses a different vessel than the W7 (𓀁) as the phono-repeater. However, as this witness was not seen by de Buck himself, it cannot be said if this represents a regional variant, or if the vessel was a modern transcription instead. Due to the lack of attestations from different regions, it is difficult to say whether the forms from Deir el-Bersha are a representation of a regional preference. However, outside the database there is an attestation from Meir, which added a T14 (𓀁),\(^{1553}\) which does not occur in Deir el-Bersha, or el-Lisht.

5.3.66. *mr* (to be ill, to suffer, to have pain)\(^{1554}\)

In the database, this lemma has 28 attestations. However, only fourteen attestations represent verbal forms.\(^{1555}\) In table 5.66, the attestations per region are set out for the graphical forms of the stem:

---

\(^{1551}\) van der van der Molen (2000), p. 158.

\(^{1552}\) de Buck (1935) *CT I*, p. 141,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 123.

\(^{1553}\) de Buck (1956) *CT VI*, p. 345,b (M57C).

\(^{1555}\) de Buck (1951) *CT IV*, p. 89,m, 303,b; de Buck (1954) *CT V*, p. 155,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 128.
In the database, there are some features that resemble regional preferences for this lemma. In Meir, there seems to be a preference for the long format of form 6 and the absence of a classifier. However, outside the database there is an attestation of form 4 as well,\textsuperscript{1556} even though a classifier is not attested in Meir for this lemma. The use of the G37 (𓅪) classifier is only attested in Deir el-Bersha and the Theban area, including the attestations outside the database. The use of the D40 (𓂡) classifier is only attested in Deir el-Bersha. In Gebelein and Aswan, only the compact format of form 1 and 4 is used, and there is no classifier attested, including the attestations outside the database. Note that form 4 is one of the most common forms for this lemma, and should not be considered a regional variant, but rather the standard form for this lemma in all regions.

### 5.3.67. mr (to bind)\textsuperscript{1557}

In the database there are 20 attestations for this lemma, although all are from the same phrase in spell 225.\textsuperscript{1558} In table 5.67, the attestations per region are set out for every graphical form of the stem:

1. Deir el-Bersha: 1
   - Region: 2
   - Attestations: 1
2. Theban area: 2
   - Region: 1
   - Attestations: 1
3. Asyut: 3
   - Region: 5
   - Attestations: 1
4. Theban area: 1
   - Region: 6
   - Attestations: 1

\textsuperscript{1556} de Buck (1947) \textit{CT III}, p. 3.d (M22C).
\textsuperscript{1557} van der van der Molen (2000), p. 172.
\textsuperscript{1558} de Buck (1947) \textit{CT III}, p. 216-217.b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 128.
\textsuperscript{1559} M25C and M2NY, both these attestations are reconstructions, that cannot be distinguished from \textit{mri} (to love). However, based on the available space in the lacuna, the addition of a classifier seems unlikely.
For this lemma, there is one clear regional variation which occurs in the Theban area, where this lemma is written \textit{mi} rather than \textit{mr}. However, \textit{mr} is used as well (form 5). It could be argued that this is due to the date of the witness, as MC105 (form 5) is dated to Mentuhotep II-IV,\textsuperscript{1560} whereas T1Be, T2Be and T2L (form 7 and 8) are dated to Sesostris I – Amenemhat II (T2L)\textsuperscript{1561} or Sesostris III (T1Be, T2Be).\textsuperscript{1562} Thus, it seems that the use of \textit{mi} for this lemma in the Theban area reflects a later period of coffin decoration.

In Deir el-Bersha, there are some witnesses (B2Bo, B4Bo, B4C and B1Y; form 2 and 3) that include a rectangle (𓈙) sign with this lemma. Based on the attestation from Saqqara (form 4), it could be suggested that Saqqara only uses the S28 (𓋳) as classifier (form 4). However, outside the database, form 5 is used in Saqqara as well.\textsuperscript{1563}

### 5.3.68. \textit{mri} (to love, to wish)\textsuperscript{1564}

The lemma \textit{mri} is relatively common in the database, with 160 attestations. However, only 142 of these attestations reflect verbal forms.\textsuperscript{1565} In table 5.68, the attestations per region are set out for the graphical forms of the stem. Note that this is a \textit{3ae inf.} lemma and gemination occurs in the database, therefore the table has been divided in gemination and no gemination.

</table>

Table 5.68 Graphical forms of the stem of mri.

As one can see in the table, the majority of the attestations are either form 2 or form 9. However, some regional conditioned variation does seem to occur. The classifier Y2 (𓏝) is only attested in witnesses from Deir el-Bersha (form 7, 8 and 11) as well as the N36 (𓈷) phono-repeater. The N37 (𓈙) phono-repeater is only attested in Meir and Deir el-Bersha. The Theban area is the only region where the N36 is used as a phonemogram when this lemma is used as a verb.

5.3.69. msi (to bear, to give birth, to bring forth)\(^{1566}\)

This lemma is relatively common in the database, with a total of 234 attestations. However, only 194 attestations are of verbal forms.\(^{1567}\) In Table 5.69, the attestations per region are set out for every graphical form of the stem. Note that this is a 3ae inf. lemma and gemination occurs in the database, therefore the table has been divided in gemination and no gemination. Due to the extremely varied

Table 5.69 Graphical forms of the stem of **msi**.

---

1575 de Buck (1938) *CT II*, p. 82,b (B3L). The B1 (𓁐) and N33A (𓁐) should be considered one grapheme which functions as a class for B3/B4.

1576 de Buck (1935) *CT I*, p. 88,b (S12C). The Z3 (𓁐) signs are simply filler strokes.

373
In this lemma, there are hardly any regional features when all the humanoid classifiers are treated as the same sign. Nonetheless, minor regional preferences seem to occur. For example, in el-Lisht, Gebelein and Aswan (form 11, 14 and 25), there is no attestation of a humanoid classifier or logogram. The use of the humanoid figure as a logogram is only attested in Deir el-Bersha, Meir and Asyut (form 1-10 and 32), whereas Beni Hasan and the Theban area only use it as a classifier (form 12, 13, 19, 20 and 30). The use of the G17 (𓋷) interpretant is only attested in Saqqara (form 31), although it is extremely rare. The reversed direction of the S29 (𓇣) occurs only in Asyut (form 26 and 34), but this is due to the left to right direction of the writing in this witness (S2C), rather than an intentional variation.

5.3.70. *mki* (to guard, to protect)

The lemma *mki* has only four attestations in the database, from the same phrase of spell 27. In table 5.70, one can see that every region has its own form, although it needs to be noted that one of the attestations from the Theban area (MC105) is a reconstruction.

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Theban area</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>Asyut</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.70 Graphical forms of the stem of *mki*.

Although the database suggests distinct variants in the regions, form 1 is used in other regions as well. The use of a D40 (𓋷) classifier after the V31 (𓋷) or V31A (𓋷) is most common in Asyut, but occurs in Deir el-Bersha as well. The use of a A24 (𓋷) classifier is most commonly attested in Deir el-Bersha, but is attested in P.Gard.2 as well, which is assumed to originate from Asyut. However, the use of the A24 classifier is only attested in Deir el-Bersha for coffin decorations.

---

1578 de Buck (1935) *CT i*, p. 79,h. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 133.
1579 de Buck (1947) *CT III*, p. 190,c (S1C, B2Bo).
1580 de Buck (1954) *CT V*, p. 315,q.
1581 de Buck (1956) *CT VI*, p. 198,d.
1582 (Schenkel, 1996, p. 125.)
5.3.71. *mtn* (to assign)\textsuperscript{1583}

There are only ten attestations of this lemma in the database, from the same phrase in spell 215.\textsuperscript{1584} As one can see in table 5.71, the spelling is relatively constant, and the variation rather takes place in the graphical form.

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Graphical form" /></td>
<td>1</td>
<td>Deir el-Bersha</td>
<td>3</td>
</tr>
<tr>
<td><img src="image2" alt="Graphical form" /></td>
<td>2</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td><img src="image3" alt="Graphical form" /></td>
<td>3</td>
<td>Papyrus (P.Gard.2)</td>
<td>1</td>
</tr>
<tr>

<td>4</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td><img src="image5" alt="Graphical form" /></td>
<td>5</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.71 Graphical forms of the stem of *mtn*.

Based on the table, there does not seem to be a regional preference for this lemma. The only clear exception occurs in P.Gard.2, which uses a N31 (𓊞) classifier rather than a Y2 (𓏝). Outside the database there are only three additional attestations of this lemma,\textsuperscript{1585} which all use the N31 classifier, which is interesting as these are from P.Gard.3 and P.Gard.4. Thus, the use of this classifier might represent a feature of papyri, rather than a regional feature of the *Coffin Texts*.

5.3.72. *mdw* (to speak)\textsuperscript{1586}

This lemma has 217 attestations in the database. However, only 62 attestations represent verbal forms.\textsuperscript{1587} In table 5.72, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>

Table 5.72 Graphical forms of the stem of mduw.

---

1588 de Buck (1951) *CT IV*, p. 253,b (M1NY), the A1 (𓀀) classifier is assumed to be an error for A2 (𓀁), as this witness uses a A40 (𓀭) for the first person.

1589 de Buck (1951) *CT IV*, p. 252,b (Sq1C). The Z1 (𓏤) functions as a classifier, replacing the A2, as this witness prefers to replace the humanoid figures with Z1.

1590 de Buck (1951) *CT IV*, p. 253,b (M1C)) Note that the M17*Z1 (𓇋𓏤) group functions as a classifier, replacing the A2 (𓀁), as this witness dislikes using humanoid figures.
In this lemma, the Theban area is the only region where all the interpretants of the S43 (𓌃) were added (form 6), although this might be a feature of the witness (MC105). The absence of the G43 (𓅱) only occurs in Deir el-Bersha and Asyut. In the other regions the sign is constantly included, even though the G43 is used in Deir el-Bersha and Asyut as well. In el-Lisht, there seems to be a preference for using a compact format (form 2 and 8). Form 9 and 16 represent variants where the A2 (𓀁) classifier was replaced by a M17*Z1 group (𓌃𓌃), but as this occurs in Saqqara and Meir, it most likely reflects features of the witnesses (Sq1C, M1C) rather than a regional preference. Therefore, Saqqara does not use any humanoid classifier for this lemma in the database. However, outside the database the A2 is used in Saqqara as well.\footnote{de Buck (1938) CT II, p. 164,e (Sq3Sq).}

5.3.73. *nbi* (to swim)\footnote{van der van der Molen (2000), p. 217.}

In the database there are 21 attestations of this lemma.\footnote{de Buck (1951) CT IV, p. 294,a, 294-295,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 155 and Gracia Zamacona (2008), p. 744-745.} In table 5.73, the attestations per region are set out for every graphical form of the stem. Note that this is a 3ae inf. lemma and gemination occurs in the database, therefore the table has been divided in gemination and no gemination. Note that the humanoid classifiers (form 5, 6, 8 and 10) represent the closest similarity to the sign used in the original, rather than being exact representations of the signs.

<table>
<thead>
<tr>

\footnote{de Buck (1938) CT II, p. 164,e (Sq3Sq).}
\footnote{van der van der Molen (2000), p. 217.}
\footnote{de Buck (1951) CT IV, p. 294,a, 294-295,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 155 and Gracia Zamacona (2008), p. 744-745.}
\footnote{One of these attestations (B1Y) is a reconstruction.}
As one can see in the table above, the graphical forms of the lemma *nbi* are remarkably varied. However, there are some minor details that suggest a regional preference. The use of the S12 (𓋞) as a phonemogram is only attested in el-Lisht and Meir,\(^{1597}\) although it is more common in Meir. The use of the D40 (𓂡) classifier occurs in Deir el-Bersha and the Theban area (form 13), but is much more common in Deir el-Bersha (form 2, 9, 11 and 14). If the humanoid figures (form 5, 6, 8 and 10) are treated as classes of the same sign, namely a man who is swimming, there is no regional pattern to the use of these classifiers. Otherwise, these different graphemes should be considered unique forms bound to the region where they were attested.

\(^{1595}\) One of these attestations (T2Be) is a reconstruction.

\(^{1596}\) Reconstruction (Sq2C), could be any other spelling as well.

\(^{1597}\) Note that this attestation is based on de Buck (1951) *CT IV*, p. 295,b (L1NY), as the support deteriorated since de Buck worked on it. In the more recent image I had access to (see appendix 1 for more detail) this token is now lost. Therefore, I cannot say with certainty if this transcription is correct.
5.3.74. *nbs* (to burn)

This lemma has only eight attestations in the database. Moreover, there are no additional attestations of this lemma outside the database. In table 5.74, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Graphical form" /></td>
<td>1</td>
<td>Deir el-Bersha</td>
<td>1</td>
<td><img src="image2" alt="Graphical form" /></td>

<td>1</td>
</tr>
<tr>
<td><img src="image3" alt="Graphical form" /></td>
<td>2</td>
<td>Beni Hasan</td>
<td>2</td>
<td><img src="image4" alt="Graphical form" /></td>
<td>5</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td><img src="image5" alt="Graphical form" /></td>
<td>3</td>
<td>Meir</td>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 5.74 Graphical forms of the stem of *nbs*.

For this lemma, there are only minor variation between the regions. The southernmost attestations, Meir and the Theban area, use a Q7 (𓊮) or one of its classes as classifier (form 3 and 4), where the northernmost attestations, Beni Hasan and Deir el-Bersha, do not use a classifier or use a D40 (𓎝) classifier. The use of the V30 (𓎟) as phonemogram is only attested in Deir el-Bersha, as is the use of the O34 (𓊳) instead of the S29 (𓋴). However, there are too few attestations of this lemma to suggest any regional preference with any degree of certainty.

5.3.75. *nf3* (to exhale, to blow)

In the database there are 79 attestations of this lemma, with the majority of the attestations coming from spell 75. However, only 77 attestations are of verbal forms. In table 5.75, the attestations per region are set out for every graphical form of the stem:

---

1599 de Buck (1951) *CT IV*, p. 270, b-271, b, 272, a.
Although form 9 is the favourite form for this lemma in most witnesses, there are signs of regional preferences. In the database, the use of the A2 (𓀁) classifier only occurs in Aswan, Gebelein and the Theban area. Moreover, the attestation from the Theban area is T3C. As these attestations are considered a group representing a south Egyptian school of artists in the First intermediate period, it seems that the use of the A2 classifier with this lemma is a feature of that school.

---

<sup>1603</sup> de Buck (1935) *CT I*, p. 356,a (B6C), the D20 (𓀁) classifier makes this reading most likely.

<sup>1604</sup> de Buck (1935) *CT I*, p. 357,a (M28C), the D20 (𓀁) classifier makes this reading most likely. However, as de Buck did not see this witness himself, it might be a modern error as well.

<sup>1605</sup> de Buck (1935) *CT I*, p. 359-361, d-a (Sq5C). Reconstruction, although there are traces left of the D20.

The Y2 (...) is only attested in Deir el-Bersha, although all attestations are from the same witness (B1C). Including the attestations outside the database, which do not use the Y2 classifier, it might be better to consider this a feature of the support, rather than a regional preference, even though it does not occur outside Deir el-Bersha in the Coffin Texts, and the use of the Y2 classifier is more commonly used in Deir el-Bersha for the other lemmas as well. The absence of one of the phonemograms (form 1, 2 and 4) is only attested in Deir el-Bersha and Meir.

5.3.76. *nmi* (to traverse, to travel)\(^{1607}\)

This lemma has 23 attestations in the database.\(^{1608}\) In table 5.76, the attestation per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>

<td>6</td>
<td>Deir el-Bersha</td>
<td>2</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 5.76 Graphical forms of the stem of *nmi*.

\(^{1608}\) de Buck (1935) *CT I*, p. 53,d, 53,e, 137,b; de Buck (1938) *CT II*, p. 82-83,d-a, 83,b, 83,1*. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 158 and Gracia Zamacona (2008), p. 749-754.
\(^{1609}\) de Buck (1935) *CT I*, p. 137,b (B16C). Could be a corruption, as all the other witnesses have *min* (today) here.
In the database, the addition of the M17 (𓇋) seems only to occur in Deir el-Bersha and Meir. However, outside the database this is attested in Asyut and the Theban area as well. The use of the phonorepeater O5 (𓉕) is only attested in Deir el-Bersha and Asyut, although its use is more common in Deir el-Bersha. However, the different classes of the O5 of form 7 and 9 only occur in Deir el-Bersha. However, outside the database the O5 is used as phonemogram in the Theban area. The use of the D40 (𓂡) classifier is only attested in Deir el-Bersha (form 3 and 6), which is true outside the database as well.

5.3.77. nhm (to rejoice, to shout, to tremble, to quake)

In the database there are fifteen attestations, of which fourteen attestations are of verbal forms. As one can see in table 5.77, the graphical form of this lemma is remarkably constant:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Beni Hasan</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>Deir el-Bersha</td>
<td>11</td>
</tr>
<tr>
<td>3</td>
<td>el-Lisht</td>
<td>2</td>
</tr>
</tbody>
</table>

Table 5.77 Graphical forms of the stem of nhm.

It is difficult for this lemma to suggest any regional preferences, as the majority of the attestations, including those outside the database, are from Deir el-Bersha. Nonetheless, it seems that the use of the D54 (𓂻) classifier only occurs in Beni Hasan, although this is the only attestation from Beni Hasan and the only attestation of the D54 for this lemma in the Coffin Texts. The attestations from el-Lisht suggest that this region does not use a classifier, but outside the database that is true for Deir el-Bersha as well. However, as these are the only attestations from el-Lisht, it might still be a regional preference for el-Lisht, even though the absence of the classifier occurs outside el-Lisht as well.

However, including the attestations outside the database, it seems that this lemma does not occur south of Deir el-Bersha. This is most likely due to the spells in which this lemma occurs rather than an objection to the lemma south of Deir el-Bersha, as the substantive nhm (shout) is attested in Asyut.

---

1610 de Buck (1935) CT I, p. 302,c (T1C, T2C); de Buck (1951) CT IV, p. 352,c, (S1C, S2C).
1611 de Buck (1956) CT VI, p. 414,e.
1614 de Buck (1954) CT V, p. 349,f (B9C).
1615 de Buck (1938) CT II, p. 279,a (S1C,b). However, this is likely an error for whm which is used in the other witnesses, including the S1C,a.
5.3.78. *nḥm* (to take away, to rescue)\textsuperscript{1616}

There are 128 attestations for the lemma *nḥm* in the database.\textsuperscript{1617} In table 5.78, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>

\textsuperscript{1616} van der van der Molen (2000), p. 238-239.

\textsuperscript{1617} de Buck (1935) *CT I*, p. 15,c, 38,a, 52,a, 370-373,c-a); de Buck (1938) *CT II*, p. 58,b, 88,a, 88,b); de Buck (1951) *CT IV*, p. 295,e, 298-299,a, 303,a, 312,b, 319,e, 321,e; de Buck (1954) *CT V*, p. 121,b, 152,d-e. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 161.
In Gebelein, there seems to be a preference for a compact format, as form 10 and 12-16 are not attested in that region. The addition of the interpretant V28 (𓎛) is only attested in Gebelein and Meir. In Deir el-Bersha the N42 (𓈟) is always attested without any other sign next to it, as the attestations from Deir el-Bersha seem to prefer to use the long format of form 10 and 12-16. In the other regions both the compact and long format are attested.

### 5.3.79. nḥn (to be young, to be a child)

In the database there are only six attestations of this lemma, from the same phrase of spell 8. In table 5.79, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>Theban area</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>Theban area</td>
<td>1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>Theban area</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.79 Graphical forms of the stem of nḥn.

As one can see in the table above, there does not seem to be any regional preference in the graphical form of the lemma, as nearly every feature occurs in Deir el-Bersha and the Theban area. However, outside the database it seems that Deir el-Bersha prefers to use the G37 (𓅪) over the A17 (𓀔) as classifier.

---

1618 de Buck (1935) CT I, p. 371,c (M-Ann), the V30 (⟨⟩) is assumed to be a corruption of the N42 (𓈟). However, as de Buck did not see this witness himself, I cannot say if the corruption is modern, or ancient. This might be true for the D34 (𓊠) as well, which could have been a A24 (𓀜) if the script of the original was near hieratic cursive script.

1620 de Buck (1935) CT I, p. 24,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 162.

1621 de Buck (1961) CT VII, p. 312,a.
5.3.80. *ns(i) (to burn)* \(^{1622}\)

In the database, there are a total of 66 attestations of this lemma. However, only 44 attestations represent verbal forms. \(^{1623}\) In table 5.80, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Graphical form" /></td>
<td>1</td>
<td>Theban area</td>
<td>1</td>
<td><img src="image2" alt="Graphical form" /></td>
<td>6</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td><img src="image3" alt="Graphical form" /></td>
<td>2</td>
<td>Aswan</td>
<td>1</td>
<td><img src="image4" alt="Graphical form" /></td>
<td>7</td>
<td>Deir el-Bersha</td>
<td>6</td>
</tr>
<tr>
<td><img src="image5" alt="Graphical form" /></td>
<td>3</td>
<td>Asyut</td>
<td>1</td>
<td><img src="image6" alt="Graphical form" /></td>
<td>8</td>
<td>Deir el-Bersha</td>
<td>8</td>
</tr>
<tr>
<td><img src="image7" alt="Graphical form" /></td>
<td>4</td>
<td>Asyut</td>
<td>2</td>
<td><img src="image8" alt="Graphical form" /></td>
<td>9</td>
<td>Deir el-Bersha</td>
<td>2</td>
</tr>
<tr>
<td><img src="image9" alt="Graphical form" /></td>
<td>5</td>
<td>Meir</td>
<td>1</td>
<td><img src="image10" alt="Graphical form" /></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 5.80 Graphical forms of the stem of *nsr, ns, nsi*.

The use of *nsi* (form 5) is only attested in Meir. The absence of the N35 interpretant is only attested in the Theban area, \(^{1625}\) although it is most likely due to the negation in this phrase. The absence of the F20 (𓄓) phonemogram occurs only in Deir el-Bersha, although rarely. In Gebelein there is a clear preference for the compact format of form 7, although form 7 represents one of the most common forms of this lemma.

\(^{1622}\) van der van der Molen (2000), p. 245. Note that in the database this lemma is under *nsr*, but due to the attestations I decided to add it here as *ns(i)*.

\(^{1623}\) de Buck (1935) *CT I*, p. 362-363,c, 380-381,b, 395,e, 398,e. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 163.

\(^{1624}\) de Buck (1935) *CT I*, p. 398,e (S2C). Reconstruction, might be a different spelling, or not have been written at all.

\(^{1625}\) de Buck (1935) *CT I*, p. 362,c, (T3C).
5.3.81. nsb (to lick, to devour)\textsuperscript{1626}

This lemma has nine attestations in the database.\textsuperscript{1627} In table 5.81, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Graphic" /></td>
<td>1</td>
<td>Deir el-Bersha</td>
<td>1</td>
<td><img src="image2" alt="Graphic" /></td>
<td>4</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td><img src="image3" alt="Graphic" /></td>
<td>2</td>
<td>Theban area</td>
<td>2</td>
<td><img src="image4" alt="Graphic" /></td>
<td>5</td>
<td>Theban area</td>
<td>1</td>
</tr>
<tr>
<td><img src="image5" alt="Graphic" /></td>
<td>3</td>
<td>Saqqara</td>
<td>2\textsuperscript{1628}</td>
<td><img src="image6" alt="Graphic" /></td>
<td></td>
<td>Meir</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Theban area</td>
<td>1</td>
<td></td>
<td></td>
<td>Theban area</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.81 Graphical forms of the stem of nsb.

In the database, there is no real variation in the regions. However, it seems that the attestations from Deir el-Bersha prefer to use a long format (form 1 and 4), rather than the more compact format used in the other witnesses. Outside the database, Deir el-Bersha uses compact formats as well.\textsuperscript{1629} Although it does not occur in the database, the Y2 (...) can be used as classifier,\textsuperscript{1630} but is only attested in Deir el-Bersha.

5.3.82. nš (to drive away, to expel)\textsuperscript{1631}

In the database there are eighteen attestations of this lemma.\textsuperscript{1632} In table 5.82, the attestations per region are set out for every graphical form of the stem:

\textsuperscript{1626} van der van der Molen (2000), p. 246.

\textsuperscript{1627} de Buck (1951) \textit{CT IV}, p. 320,a, 320,e. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 163.

\textsuperscript{1628} de Buck (1951) \textit{CT IV}, p. 407 (Sq2C). Both attestations are reconstructions, and might have been spelled differently.

\textsuperscript{1629} de Buck (1938) \textit{CT II}, p. 44,h.

\textsuperscript{1630} de Buck (1961) \textit{CT VII}, p. 253,b.

\textsuperscript{1631} van der van der Molen (2000), p. 247.

\textsuperscript{1632} de Buck (1938) \textit{CT II}, p. 278-280,e-b; de Buck (1951) \textit{CT IV}, p. 260,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 164.
Table 5.82 Graphical forms of the stem of nš.

In the database, the only variation occurs based on the classifiers A24 (𓀜) and V36 (𓎨). It seems that Asyut and Deir el-Bersha can use either classifier, although the V36 is preferred. Outside the database form 2 is used for Gebelein and Aswan as well,\textsuperscript{1633} which suggests that form 2 is the most common form for this lemma, no matter the region. Meir only uses the A24 classifier, but this seems to be the only attestation in the Coffin Texts, and could therefore be a feature of this witness (M4C) as well.

5.3.83. \textit{nšni} (to rage, to be furious)\textsuperscript{1634}

This lemma is relatively common in the database with a total of 71 attestations. However, only 22 attestations are of verbal forms.\textsuperscript{1635} In table 5.83, the attestations per region are set out for every graphical form of the stem:

\begin{table}[h]
\centering
\begin{tabular}{lll}
\hline
Graphical form & no. & Region & Attestations \\
\hline
\hline
\(\text{\begin{tabular}{c}
\text{\textegr}\\
\text{\textegr}
\end{tabular}}\) & 1 & el-Lisht & 1 \\
& & Beni Hasan & 1 \\
\hline
\(\text{\begin{tabular}{c}
\text{\textegr}\\
\text{\textegr}
\end{tabular}}\) & 2 & Saqqara & 1 \\
& & el-Lisht & 1 \\
& & Deir el-Bersha & 4 \\
\hline
\(\text{\begin{tabular}{c}
\text{\textegr}\\
\text{\textegr}
\end{tabular}}\) & 3 & Theban area & 1 \\
\hline
\(\text{\begin{tabular}{c}
\text{\textegr}\\
\text{\textegr}
\end{tabular}}\) & 4 & Meir & 2 \\
\hline
\hline
\hline
\end{tabular}
\end{table}

Table 5.83 Graphical forms of the stem of nšni.

\textsuperscript{1633} de Buck (1956) \textit{CT VI}, p. 264,j.

\textsuperscript{1634} van der van der Molen (2000), p. 248.

\textsuperscript{1635} de Buck (1951) \textit{CT IV}, p. 239,c, 242-243,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 164.

\textsuperscript{1636} de Buck (1951) \textit{CT IV}, p. 239,c, 243,a (T2Be). Reconstruction, only the first N35 (__) and N37 (__) are visible. It is possible that this witness should only be reconstructed as form 7, which occurs in T1Be (which belongs to the same owner). However, the reconstruction was based on IV,141,a, where only the classifier is visible.
As one can see in the table above, the variation in the graphical form only occurs in the classifier. The use of the D40 (𓉫) classifier is attested in three regions (form 2), although it is remarkable that it does not occur to the south of Deir el-Bersha. The A24 (𓀝) classifier is only attested in the Theban area in the database (form 3), but occurs in Deir el-Bersha as well. The use of the N4 (𓇲) classifier (form 4 and 7) are attested in Meir and the Theban area. Notably, it seems that this is a required Coffin Texts classifier for this lemma in Meir. Although the use of a Sethian animal in the classifier (form 5 and 6) seems to be limited to Saqqara and the Theban area in the database, it occurs in other regions outside the database.

5.3.84. *nk* (to copulate)\(^{1639}\)

The lemma *nk* has 65 attestations in the database.\(^{1640}\) In table 5.84, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Graphical form" /></td>
<td>1</td>
<td>Asyut</td>
<td>9</td>
<td><img src="image2" alt="Graphical form" /></td>
<td>3</td>
<td>Deir el-Bersha</td>
<td>29</td>
</tr>
<tr>
<td><img src="image3" alt="Graphical form" /></td>
<td>2</td>
<td>Asyut</td>
<td>10</td>
<td><img src="image4" alt="Graphical form" /></td>
<td>4</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td><img src="image5" alt="Graphical form" /></td>
<td></td>
<td></td>
<td></td>
<td><img src="image6" alt="Graphical form" /></td>
<td></td>
<td>Meir</td>
<td>8</td>
</tr>
<tr>
<td><img src="image7" alt="Graphical form" /></td>
<td></td>
<td></td>
<td></td>
<td><img src="image8" alt="Graphical form" /></td>
<td></td>
<td>Meir</td>
<td>8</td>
</tr>
</tbody>
</table>

Table 5.84 Graphical forms of the stem of *nk*.

As one can see in the table above, the variation mostly occurs in the classifier. Form 1 and 2 are only attested in Asyut, while form 3 and 4 are only attested in Deir el-Bersha and Meir, although Deir el-Bersha favours form 3. However, outside the database form 1 is attested in Dendera\(^{1641}\) and P.Gard.3.\(^{1642}\) Thus, it is unlikely that there is a regional preference for this lemma.

5.3.85. *ngg* (to cackle, to screech)\(^{1643}\)

In the database there are nineteen attestations of this lemma.\(^{1644}\) In table 5.85, the attestations per region are set out for every graphical form of the stem. Note that as this is a 2ae gem. lemma and gemination occurs in the database, the table has been divided in gemination and no gemination. Note as well that *ngn* and *ngl* are considered alternative spellings for this lemma.

---

\(^{1637}\) de Buck (1938) *CT II*, p. 30,f (B1Bo).
\(^{1638}\) de Buck (1938) *CT II*, p. 340,b (S2P, B4Bo).
\(^{1639}\) van der Molen (2000), p. 250.
\(^{1640}\) de Buck (1938) *CT II*, p. 67,d, 68,d, 68,2*, 70,d, 72,a, 77,b, 78,c, 80,b, 80,d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 164.
\(^{1641}\) de Buck (1951) *CT IV*, p. 72,b (D1C).
\(^{1642}\) *de Buck (1961) CT VII*, p. 182,f (P.Gard.3).
\(^{1644}\) de Buck (1935) *CT I*, p. 74,b); de Buck (1951) *CT IV*, p. 311,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 165.
For this lemma, there are some features that suggest a regional preference. Form 3 is only attested in Deir el-Bersha, and moreover, only in B3Bo and B4C, which are both witnesses which belong to women. However, as there are no additional attestations of \( n_{gn} \) outside the database, it cannot be said whether this is random, or intentional. Moreover, the witness B3C which belongs to the same owner as B4C uses form 5 as well, so the variation might have been random. Form 7 only occurs in the Theban area, but there are no other attestations of \( n_{gi} \) in the Coffin Texts, nor is the G41 (𓀁) used as classifier anywhere else, so this might simply reflect a feature of the witness. The attestations from Meir (form 1 and form 9) seem to suggest that the compact format is preferred in this region. However, there are no other attestations from Meir in the Coffin Texts to validate this preference.

5.3.86. \( nd \) (to consult, to inquire about, to ask)

This lemma has a total of 32 attestations in the database. In table 5.86, the attestations per region are set out for every graphical form of the stem:

---

1645 de Buck (1951) \( CT IV \), p. 311,a (T1C), the A1 (𓀀) is assumed to be a corruption of the A2 (𓀁).
1646 de Buck (1951) \( CT IV \), p. 311,a (T3Be).
1648 de Buck (1935) \( CT I \), p. 323,b, 326-329,c-a, 332-333,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 170.
Table 5.86 Graphical forms of the stem of *nd* (to consult).

In the database, the use of the Aa27 (𓀁) without interpretants is only attested in Asyut (form 1). However, outside the database this is additionally attested in Deir el-Bersha. The use of the A24 (𓀜) as classifier is only attested in the Theban area (form 10), but as these attestations are from the same witness (T3C), it might simply represent a feature of this witness, rather than a regional preference. Beni Hasan is the only region in which the A26 (𓀞) is attested as classifier (form 4). However, there are no other attestations of this sign with this lemma in the Coffin Texts, thus it might reflect a unique feature of the witness BH2C, even though this witness uses form 7 as well.

---

1649 de Buck (1935) *CT I*, p. 332,c (M20C), the A1 (𓀀) is assumed to be a corruption for the A2 (𓀁).
1650 de Buck (1935) *CT I*, p. 332,c, 333,3* (T3C). Due to the A24 (𓀜) it looks more like *nd* (to protect; see section 5.3.87), however, based on the context and the other witnesses, this lemma seems to be more likely here.
1651 de Buck (1935) *CT I*, p. 326-328,c-a (T3C), the G17 (𓅓) is considered to be a corruption for a humanoid classifier.
1652 de Buck (1935) *CT I*, p. 332,c (B1P), the I9 (𓆑) addition should be considered an error, as the lemma *ndf* does not seem to exist, nor does a *nd* make sense in this position.
1653 de Buck (1947) *CT III*, p. 154,a (B2Bo, B3Bo).
5.3.87. *nd* (to protect, to save)\(^{1654}\)

The lemma *nd* is relatively common, with a total of 218 attestations in the database. However, only 200 of these attestations are verbal forms.\(^{1655}\) Note that following Griffiths,\(^{1656}\) the attestations of *nd*-\(h\) (to greet) were encoded under this lemma as well, which provided a large number of the attestations.\(^{1657}\) In table 5.87, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>

</table>

As one can see in the table above, the graphical form of this lemma is remarkably varied. However, it needs to be noted that the position of the signs under the tail of the I10 (𓆓), for example in form 27 and 31 could be considered a modern interpretation, as in near hieratic cursive script the I10 does not necessarily have a long downwards tail,\(^{1666}\) which is the case in hieroglyphic script. It seems that for this lemma there is a clear preference to not use the interpretant N35 (𓊞) over its inclusion, as only 50 attestations out of the 200 attestations use the interpretant N35. However, it is not unlikely that this is due to the imperative, which commonly gets the *i* prefix attached.

Nonetheless, there are some regional features. The attestations from Gebelein and Aswan do not occur without the N35 and I10 as interpretants. Additionally, T3C from the Theban area does not include these interpretants. Thus, there seems to be a preference in the attestations representing the First Intermediate Period southern Egyptian school of artists.\(^{1667}\)

In the database, the use of the A24 (𓀜) classifier is only attested in the Theban area (form 13 and 29).\(^{1668}\) However, outside the database this is attested in Deir el-Bersha and Beni Hasan as well.\(^{1669}\) Therefore, it cannot represent a regional preference.

### 5.3.88. *ndm* (to be sweet, to be pleasant)\(^{1670}\)

In the database, this lemma has 40 attestations, but only 24 of these attestations reflect verbal forms.\(^{1671}\) As one can see in table 5.88, the majority of the attestations are form 3, which is represented in most regions.

---

\(^{1665}\) de Buck (1954) *CT* V, p. 156,c (T3L), the Z11 (𓊞) is assumed to be a corruption of the Aa27 (𓊦).

\(^{1668}\) The A24 (𓀜) of form 20 from Beni Hasan represents a placeholder sign.

\(^{1669}\) de Buck (1951) *CT IV*, p. 17,l (B2Bo, BH1Ox).

\(^{1671}\) de Buck (1935) *CT I*, p. 23,a, 23,b, 24,b, 101,c; de Buck (1951) *CT IV*, p. 93,j. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 170.
Form 2 only occurs in el-Lisht, as it uses a partial form of the hieroglyph G17 (𓉱). However, this resembles a feature of the witness (L2Li) rather than a regional preference.\textsuperscript{1672} In the database, form 4 is only attested in Deir el-Bersha, but outside the database it is used in Asyut as well.\textsuperscript{1673} Likewise, the use of the Y2 (𓏝) classifier is only attested in Deir el-Bersha in the database, but occurs outside the database in Asyut.\textsuperscript{1674} The use of the M29 (𓇛) in the initial position in a verbal form is only attested in Deir el-Bersha and el-Lisht, which is true outside the database as well.\textsuperscript{1675} However, the use of the M29 in the initial position is rare.

### 5.3.89. \textit{nḏri} (to hold fast, to seize, to grasp)\textsuperscript{1676}

The lemma \textit{nḏri} has 29 attestations in the database.\textsuperscript{1677} In table 5.89, the attestations per region are set out for every graphical form of the stem:

---

\textsuperscript{1672} However, the use of partial hieroglyphs for the hieroglyphs of animates is to my knowledge only attested in el-Lisht.

\textsuperscript{1673} de Buck (1938) \textit{CT II}, p. 245,d (S1C,b).

\textsuperscript{1674} de Buck (1956) \textit{CT VI}, p. 170,j (S10C).

\textsuperscript{1675} For example, see de Buck (1961) \textit{CT VII}, p. 65,q (L1Li), 370,a (B6C).

\textsuperscript{1676} van der Molen (2000), p. 261.

\textsuperscript{1677} de Buck (1935) \textit{CT I}, p. 397,b; de Buck (1938) \textit{CT II}, p. 258,a, 393,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 170.
For this lemma, the major variation occurs in the use of the classifier. In the database, there is a remarkable feature between form 3 and form 4. All the attestations from Deir el-Bersha with form 3 are from the early period of coffin decoration, whereas the attestations of form 4 are from the later period of coffin decoration. However, outside the database there is a witness from the later period of coffin decoration (B12C) which uses form 3 as well. Nonetheless, the earlier period of coffin decoration in Deir el-Bersha does not use the D40 (𓋌) as classifier, but rather uses a A24 (𓋐) or no classifier at all. The use of form 1 only occurs in Deir el-Bersha, even though it is only attested in B3Bo, even outside the database. Therefore, it should be considered a feature of this witness, rather than a regional feature. There are no clear regional preferences for the other regions, which commonly use form 2-4.

5.3.90. *rnn* (to rejoice, to praise)

This lemma has seven attestations in the database, from the same phrase of spell 36. Table 5.90 shows that there are only two variations of the lemma in the database, based on the use of the N35 (𓈖) or M22 (𓇑).
Graphical form stem | no. | Region | Attestations
---|---|---|---
| 1 | el-Lisht | 1
| | Deir el-Bersha | 1

| 2 | Deir el-Bersha | 5

Table 5.90 Graphical forms of the stem of *rmn*.

It can be suggested that the use of the M22 for this lemma only occurs in Deir el-Bersha, which is true outside the database, even though the use of the N35 is attested in Deir el-Bersha as well.

### 5.3.91. *rḥ* (to know, to learn)\(^{1684}\)

This is one of the common lemmas in the database, with a total of 378 attestations. However, only 365 attestations represent verbal forms.\(^ {1685}\) In table 5.91 the attestations per region are set out for every witness:

</tbody>
</table>

Table 5.91 Graphical forms of the stem of *rḥ*.

As table 5.91 shows, the form of this lemma is remarkably constant, with most regions using either form 1 or form 5. Form 2 and form 3 are only attested in one witness (M1NY), where the script allows for the differentiation between the Y1 (…) and the Y2 (…) classifier. In the database it seems that Aswan is only attested with form 1, but outside the database form 5 is attested as well.\(^ {1686}\) As el-Lisht only has attestations with form 5, it can be suggested that the addition of the Y2 classifier is a regional feature.

---

\(^{1685}\) de Buck (1935) *CT I*, p. 17,c, 24,b, 26,a, 104-105,d,119,a, 138,c, 139-140,c-a,140,d-e, 140,g, 334-335,b, 340-341,d, 362-363,b, 394-395,c-a, 394,f, 399,c; de Buck (1938) *CT II*, p. 266-267,a, 266-267,b, 266-267,c, 268-269,d, 272-273,a, 273,g-h, 274-275,b, 275,d, 286-287,b, 287-d-g, 390,e, 399,b; de Buck (1951) *CT IV*, p. 192-193,a, 196-197,a, 199,a, 218-219,a, 219,b, 221,a, 245,a, 257,b, 262-263,b, 306,b; de Buck (1954) *CT V*, p. 154,e. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 184-185.

\(^{1686}\) de Buck (1947) *CT III*, p. 311,e (A1C).
Although form 1 and form 5 both occur in Asyut, there is a clear preference for writing this lemma without the Y2 classifier. This occurs in Beni Hasan as well. On the other hand, in Meir there seems to be a preference to include the Y1/Y2 classifier, although enough attestations without the Y2 classifier exist. This likewise seems to be true in Saqqara. In Deir el-Bersha and the Theban area, one is as likely to find this lemma with or without the Y2 classifier. The compact format of forms 2 and 4 are only attested in Meir, but it is assumed that these do not represent regional features, but are compact due to the available space in the column.

5.3.92. \textit{rs} (to wake, to watch)\textsuperscript{1688}

There are four attestations of this lemma in the database,\textsuperscript{1689} but they all represent functional corruptions of \textit{tr-s} (its time) which is used in the other regions. As table 5.92 shows, there are distinct forms for el-Lisht and the Theban area. However, outside the database form 2 is used in Deir el-Bersha as well,\textsuperscript{1690} although the witnesses from Deir el-Bersha prefer to add a D5 (𓁺) classifier. In the Theban area the addition of an eye classifier is likewise more common than form 2.\textsuperscript{1691} Form 1 is a unique form that is not repeated in the \textit{Coffin Texts}, as habitually a T13 (𓌘) or T14 (𓌙) is added.

\begin{tabular}{|c|c|c|}
\hline
Graphical form stem & no. & Region & Attestations \\
\hline
\end{tabular}

\begin{tabular}{|c|c|c|}
\hline
& 1 & el-Lisht & 2 \\
\hline
& 2 & Theban area & 2 \\
\hline
\end{tabular}

Table 5.92 Graphical forms of the stem of \textit{rs}.

5.3.93. \textit{rd} (to grow)\textsuperscript{1692}

In the database there are seventeen attestations of this lemma, from the same phrase of spell 75.\textsuperscript{1693} As can be seen in table 5.93, the variation in the graphical form is limited to the classifier.

\textsuperscript{1687} de Buck (1951) \textit{CT IV}, p. 197,b (M57C), 306,b (M1NY).
\textsuperscript{1688} van der Molen (2000), p. 286-287.
\textsuperscript{1689} de Buck (1951) \textit{CT IV}, p. 239,c, 241,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 185.
\textsuperscript{1690} de Buck (1935) \textit{CT I}, p. 208,e (B17C).
\textsuperscript{1691} de Buck (1935) \textit{CT I}, p. 282,a, 282,b (T1C, T2C).
\textsuperscript{1692} van der Molen (2000), p. 290.
\textsuperscript{1693} de Buck (1935) \textit{CT I}, p. 342-343,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 186.
Table 5.93 Graphical forms of the stem of *rd.*

Form 3 is clearly the common form for this lemma, although the exact form of the M32 (𓇟) can vary lightly. In the database, it seems that the use of the M31 (𓇝) classifier only occurs in Beni Hasan, which is true outside the database as well. Form 2 seems to be a unique form, which only occurs in this phrase. Therefore, this form should not be considered a regional feature of Meir, as the majority of the attestations from Meir use form 3.

5.3.94. *ḥṣî* (to come down, to descend, to go aboard)

This lemma is common in the database, with a total of 148 attestations. In table 5.94, one can see the attestations per region for every graphical form of the stem. As this lemma is a *3ae inf.*, the table is separated due to the occurrence of gemination.

---

1694 de Buck (1956) *CT VI*, p. 121,d, (BH1Ox, BH2C).

</table>

As one can see in the 112 attestations of form 6, it is the preferred form for this lemma in most regions. Form 9 should be considered the same as form 6, as the variation is due to the preference of the witness (L1Li) to use partial forms for hieroglyphs of animates.

The attestations from Gebelein are the only witnesses that do not use form 6, as these all prefer the compact format of form 3. Gebelein is attested with gemination outside the database as well, where it uses a compact form, as the second G1 is placed in front of the D54 in the column. Thus, there seems to be a preference for compact formats in Gebelein. On the other hand, Saqqara and Asyut seem to prefer the long formats (form 6 and 12). In Deir el-Bersha there seems to be a lot of freedom in the graphical form. However, the use of the Y2 classifier only seems to occur in Deir el-Bersha.

### 5.3.95. hAb (to send)

The lemma hAb has a total of 31 attestations in the database. In table 5.95, the attestations per region are set out for every graphical form of the stem:

---

1697 de Buck (1938) *CT II*, p. 29.b.
1698 For this lemma only attested in B12C.
1700 de Buck (1938) *CT II*, p. 55,a, 59,c, 90,c, 259,b; de Buck (1951) *CT IV*, p. 242-243,b, 242,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 191.
<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>

<tr>
<td><img src="image5" alt="Stem Image" /></td>
<td>5</td>
<td>Deir el-Bersha</td>
<td>4</td>
</tr>
</tbody>
</table>

Table 5.95 Graphical forms of the stem of *ḥib*.

Form 1 only occurs in el-Lisht, but is attested in a witness (L1Li) which prefers to use partial versions of hieroglyphs of animates. Therefore, it should not be considered a regional preference, but rather a feature of this witness.\(^{1701}\) The long format of form 5 is not attested in Asyut or Gebelein in the database. However, outside the database, form 5 is attested for Asyut.\(^{1702}\) Nonetheless, Gebelein seems to use some sort of compact form for this lemma, although it can vary from form 4. The absence of the D54 (𓎊) classifier might seem unique in Meir, but outside the database, it occurs in Deir el-Bersha as well.\(^{1703}\)

### 5.3.96. *ḥrw* (to be pleased, to be satisfied)\(^{1704}\)

In the database there are only five attestations of this lemma, all from the same phrase of spell 25.\(^{1705}\) As table 5.96 shows, there are only three forms which vary based on the classifier:

---

\(^{1701}\) Although to my current knowledge the constant use of partial versions of hieroglyphs of animates in the *CT* only occurs in el-Lisht.

\(^{1702}\) de Buck (1947) *CT III*, p. 140,a (S10C).

\(^{1703}\) de Buck (1951) *CT IV*, p. 393,e (B1Bo,b).

\(^{1704}\) van der van der Molen (2000), p. 300.

\(^{1705}\) de Buck (1935) *CT I*, p. 76,h. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 193.
Table 5.96 Graphical forms of the stem of hrw.

Based on the database, the use of the A2 (𓀁) classifier only occurs in Deir el-Bersha. Outside the database the A2 classifier is not used in any other region, although Beni Hasan is attested with a humanoid classifier as well, even though it is not the A2 classifier.

5.3.97. ḥk (to break)

This lemma has one attestation in the database, although it could be considered a corruption of ḥks (to be injured), which is used in the other witnesses. However, as it is a functional lemma, which suits the phrase, it was not corrected. However, there do not seem to be any additional attestations in the Coffin Texts, so this lemma is of limited use for a discussion of regional variation, nor can its form (figure 5.2) be used to suggest a regional preference in Meir for the graphical form.

5.3.98. ḥr̪i (to rejoice)

This lemma has a total of 42 attestations in the database, although only 41 are verb forms. In table 5.97, one can see the attestations per region for every graphical form of the stem. As this lemma is a 3ae inf., the table is separated due to the occurrence of gemination.

---

1706 de Buck (1951) CT IV, p. 20,g (BH2C).
1707 de Buck (1951) CT IV, p. 233,a (M1NY).
1708 See section 5.3.125.
1710 de Buck (1935) CT i, p. 83,e, 96,a, 113,d, 121,c, 356-357,c, 357,f, 357,g, 371,d, 371,f, 387,c, 388,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 197-198.
For this lemma, there are some signs of a regional preference. In Gebelein, only form 1 and 7 are attested. Both these forms use a compact format, which suggests a regional preference for writing compact formats. However, as the attestations come from the same support, it might simply be a feature of the support. On the other hand, the attestations of the Theban area use form 5 and 8. This suggests a regional preference to write this lemma in the long format instead. The use of a Y2 (𓏝) classifier is only attested in Deir el-Bersha in the database.

5.3.99. hpt (to embrace)\textsuperscript{1711}

In the database, the lemma hpt has 28 attestations.\textsuperscript{1712} In table 5.98, one can see the attestations per region for every graphical form of the stem:

\begin{center}
\begin{tabular}{|c|c|c|c|c|c|}
\hline
\textbf{Graphical form stem no.} & \textbf{Region} & \textbf{Attestations} & \textbf{Graphical form stem no.} & \textbf{Region} & \textbf{Attestations} \\
\hline
1 & Theban area & 1 & 6 & Saqqara & 3 \\
 & & & & el-Lisht & 1 \\
 & & & & Beni Hasan & 1 \\
 & & & & Deir el-Bersha & 1 \\
 & & & & Meir & 1 \\
 & & & & Theban area & 2 \\
 & & & & Gebelein & 1 \\
\hline
2 & Meir & 1 & 7 & Meir & 1 \\
\hline
3 & Aswan & 1 & 8 & Meir & 1 \\
\hline
\end{tabular}
\end{center}

\textsuperscript{1711} van der van der Molen (2000), p. 329.
\textsuperscript{1712} de Buck (1951) \textit{CT IV}, p. 278-279,d); de Buck (1954) \textit{CT V}, p. 133,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 202.
### Table 5.98 Graphical forms of the stem of ḫpr.

According to van der Plas & Borghouts, there is only one more attestation in the Coffin Texts beside the attestations of this table. However, according to Carrier, this is actually šḥn (to embrace). In Meir there is a high variety in the forms, although it is the only region where the logogram function of D32 (𓀎) is attested. However, it could be argued that it should be read as šḥn instead. Additionally, the use of a D54 (𓀒) is only attested in Meir. However, as form 6 is attested in nearly every region, it could be argued that there might be some regional variation for this lemma, but that the preference lies with form 6.

#### 5.3.100. ḫmsi (to sit)

This lemma is common in the database, with a total of 187 attestations. Note that the humanoid hieroglyphs used in table 5.99 are at best an interpretation, as they represent different classes of A3 (𓀂) or A7 (𓀚), that are extremely varied due to the near hieratic cursive script used in the majority of the witnesses.

</tbody>
</table>

1717 de Buck (1954) *CT V*, p. 159.e (T3L). Note that it is assumed that the Aa1 (𓊕) is a corruption of the N42 (𓊕).  
1718 de Buck (1935) *CT I*, p. 21.d, the Q1 (𓊕) is used as this is a feminine participle, due to the phonetic value st, and should not be extracted from the stem, even though it is technically not needed due to the S29 (𓊕).
Due to the problem of differentiation of the humanoid hieroglyphs and the high number of forms, it is difficult to suggest any regional preference for this lemma. However, some features do stand out. For example, form 1, 2, 8, 16 and 26 only occur in Asyut. However, these are only attested in two witnesses, S1C and S2C, which belong to the same owner. Moreover, as form 27 and 28 occurs in Asyut as well (S2C, S10C and S14C), it is clear that form 1, 2, 8, 16, and 26 represent a feature of a pair of supports, rather than a regional preference.\(^\text{1720}\)

The attestations from Gebelein (form 12, 32 and 33) show that this region is much more likely to include the interpretants V28 (𓎛) and G17 (𓅓), compared to only a single attestation in the Theban area (form 31). However, the use of these interpretants cannot be considered a feature of the southern attestations, as the attestations from Aswan do not use the V28 and/or G17. Moreover, the G17 is used in Beni Hasan as well (form 19), although form 17 is more commonly used there.

The use of the humanoid figure as a logogram is most common in Asyut, even though it occurs in the Theban area as well (form 10). Moreover, if the suggestion that Y1C originates from Asyut is correct,\(^\text{1721}\) its attestations would support this placement, even though it could be suggested to originate from the Theban area as well, based on this lemma.

Finally, the use of a Y2 (𓏝) classifier seems to only occur in Deir el-Bersha (form 14 and 24). Moreover, these attestations are dated to the reign of Sesostris II-III,\(^\text{1722}\) and could therefore represent a regional pattern of this period of coffin decoration in Deir el-Bersha.

\(^\text{1719}\) de Buck (1935) CT I, p. 331,a (M-Ann), the V30 (𓎟) is assumed to be a corruption of the N42 (𓎡).
\(^\text{1720}\) Even though these forms are not attested outside Asyut, and the use of the A193 (𓎡) sign might still represent a unique feature from Asyut.
\(^\text{1721}\) Jürgens (1990), p. 55-56.
\(^\text{1722}\) B1C, B17C and B2L, see (Willems, 1988, pp. 75-77, although other forms are used in this period as well.
5.3.101.  *ḥnk* (to present, to offer)\textsuperscript{1723}

In the database, this lemma has only six attestations, which all originate from Meir.\textsuperscript{1724} In table 5.100, one can see the different graphical forms of this lemma. Based on attestations outside the database, the use of the M2 (𓆰) in this lemma seems to be a feature unique to Meir, even though it can occur without it (form 1).

</tr>
</tbody>
</table>

Table 5.100 Graphical forms of the stem of *ḥnk*.

5.3.102.  *ḥri* (to be far)\textsuperscript{1725}

There are 22 attestations for this lemma in the database. However, all are from the same phrase of spell 14.\textsuperscript{1726} In table 5.101, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image4" alt="Graphical form 1" /></td>

</tr>
</tbody>
</table>

Table 5.101 Graphical forms of the stem of *ḥri*.

\textsuperscript{1723} van der van der Molen (2000), p. 341.
\textsuperscript{1724} de Buck (1938) *CT II*, p. 74.c, 81.a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 206.
\textsuperscript{1725} van der van der Molen (2000), p. 351.
\textsuperscript{1726} de Buck (1935) *CT I*, p. 44.c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 212-213 and Gracia Zamacona (2008), p. 942-952.
In this lemma, the addition of a second classifier beyond the N31 (𓋢) seems only to occur in Deir el-Bersha. In Asyut, there seems to be a preference for the long format of form 5. However, outside the database form 2 occurs as well in Asyut. Thus, there only seems to be some preference for an additional classifier in Deir el-Bersha, while the attestations from the Theban area and Asyut cannot be distinguished from Deir el-Bersha.

5.3.103. ḥkr (to be hungry)

The lemma ḥkr has a total of 41 attestations in the database. However, only 21 attestations represent verbal forms. In table 5.102, the attestations per region are depicted for every graphical form of the stem:

<table>
<thead>
<tr>

</tbody>
</table>

Table 5.102 Graphical forms of the stem of ḥkr.

There do seem to be some regional preferences for this lemma, as the use of the G37 (𓋢) or Y2 (𓏝) classifier only occurs in Deir el-Bersha. Although form 4 occurs in Asyut, there seems to be a preference to using the long format of form 8 and 9. However, if P.Gard.2 originates from Asyut, it is not reflected in the form, as it constantly uses the compact format of form 3 or 4. Meir does not seem to

---

1727 de Buck (1947) *CT III*, p. 111,c (S2C).
1730 de Buck (1947) *CT III*, p. 187,b (B4Bo). In the original, there is a X1 (𓏏) written below the N29 (𓋢), which I took as a marker for the third person feminine stative. However, it could be argued that it is a corruption of a D21 (𓋢) as well.
1732 de Buck (1947) *CT III*, p. 178,b.
occur without the A2 (𓀁) classifier, but as there are no other attestations outside the database for Meir in the *Coffin Texts*, this assumption is based on limited data.

5.3.104. *Htp* (to be content, to be at rest)\(^{1733}\)

This lemma is relatively common in the database, with a total of 264 attestations. However, only 124 attestations are of verb forms.\(^{1734}\) As one can see in table 5.103, the graphical form of the stem is remarkably constant, with two main versions, form 2 and form 4, which are a compact format and a long format for the same spelling.

<table>
<thead>

</tr>
</tbody>
</table>

Table 5.103 Graphical forms of the stem of *Htp*.

Even though form 2 and 4 both occur in most regions, there are some regional preferences. In Asyut, only form 4 is attested, thus it seems that this region prefers the long format for this lemma. el-Lisht is the opposite, as it prefers the compact format (form 2). Even though both forms occur, Beni Hasan and Meir seem to prefer the compact format over the long format, while the opposite is true for Deir el-Bersha and the Theban area. Only in Saqqara seems the use of form 2 and 4 to be even. The use of the Y2 (𓏝) classifier is rare, and is only attested in Deir el-Bersha and Meir.

5.3.105. *Htm* (to perish, to quench, to be destroyed)\(^{1735}\)

In the database, this lemma has 108 attestations. However, only 92 of these attestations represent verbal forms.\(^{1736}\) In table 5.104, the attestations per region are set out for every graphical form of the stem. Note that the variation in the duck hieroglyphs might be a modern adaptation, rather than a

^{1741} de Buck (1935) CT I, p. 21,a (T11). The V13 (__) is assumed to be a corruption of the U15 (__).
As one can see in table 5.104 above, there is a high number of variations in the form of this lemma, as there are nearly half as many variations in the graphical form as there are attestations. Although attested once in Asyut as well (form 4), in Deir el-Bersha it is possible that the V28 (𓎛) is not written. The use of the partial version of the G17 (𓅓) in form 6 and 43 occurs only in el-Lisht, although it occurs in one witness (L2Li) only. However, as the full forms of birds are used in el-Lisht as well (form 23), it would be assumptive to consider it a regional preference to use partial hieroglyphs for hieroglyphs of animates.

The addition of the D35 (𓊫) seems to only occur in Deir el-Bersha or Asyut (form 7, 25, 29 and 37). In the same vein, the A2 (𓀁) classifier is only attested in Deir el-Bersha and Asyut (form 29 and 35). The use of the A24 (𓀜) classifier is currently only attested in Meir. There do not seem to be any other clear regional preferences for this lemma, as for example form 1 and form 31 represent a unique feature of one support (B2Bo), rather than a regional preference.
5.3.106.  **hdì (to destroy)**\textsuperscript{1742}

In the database, there are a total of fifteen attestations of this lemma.\textsuperscript{1743} In table 5.105, the attestations per region are set out for every graphical form:

<table>
<thead>

<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Theban area</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.105 Graphical forms of the stem of **hdì**.

All three forms are attested in Deir el-Bersha, suggesting a high level of freedom in this region. The other regions are only attested with form 3, which suggests a preference for a long format. However, outside the database it is clear that form 2 can be used in Asyut as well,\textsuperscript{1744} even though the preference lies with form 3. The use of a D46 (𓊉) instead of I10 (𓊋) seems to only occur in B1C, and represents a feature of that support, rather than a regional feature.\textsuperscript{1745}

5.3.107.  **hṛi (to appear, to rise)**\textsuperscript{1746}

In the database, this lemma has 56 attestations. However, only 22 attestations represent verbal forms.\textsuperscript{1747} In table 5.106, the attestations per region are set out for every graphical form of the stem:

\textsuperscript{1742} van der van der Molen (2000), p. 369.
\textsuperscript{1743} de Buck (1935) *CT I*, p. 38,a, 402,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 218.
\textsuperscript{1744} de Buck (1938) *CT II*, p. 300,b (S2P).
\textsuperscript{1745} Even though the use is not attested outside Deir el-Bersha.
\textsuperscript{1746} van der van der Molen (2000), p. 375-376.
\textsuperscript{1747} de Buck (1935) *CT I*, p. 45,d, 46,a, 46,d, 52-53,c-a; de Buck (1951) *CT IV*, p. 87,m, 90,o, 187,d-f. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 222-223 and Gracia Zamacona (2008), p. 969-1020.
Table 5.106 Graphical forms of the stem of *̱i*.

In the database, it seems that the I12 (𓆗) is only used in Deir el-Bersha, but outside the database it is attested in Asyut as well.\(^{1748}\) The use of the Y2 (𓏝) classifier is only attested in Deir el-Bersha and the Theban area in the database, but occurs outside the database in other regions as well.\(^{1749}\) However, form 1 is only attested in Deir el-Bersha, even though it represents a rare form for this lemma.

### 5.3.108. *̱wi* (to protect, to prevent)\(^{1750}\)

There are 60 attestations in the database, but only 59 represent verbal forms.\(^{1751}\) In table 5.107, the attestations per region are set out for every graphical form of the stem:

Table 5.107 Graphical forms of the stem of *̱wi*.

For this lemma, any variation based on the arms is considered of less importance. Even though not all the witnesses missing the D43 (𓆗) sign used a near hieratic cursive script, in which the difference

\(^{1748}\) de Buck (1947) *CT III*, p. 145,d (S2C).
\(^{1749}\) de Buck (1951) *CT IV*, p. 61,h (L2Li), 64,f (BH4C).
\(^{1751}\) de Buck (1951) *CT IV*, p. 256-257,a, 260-261,b; de Buck (1954) *CT V*, p. 144,b, 145,a, 149,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 223.

413
between the D43 and the other arms can be lost, it can be assumed that for the witnesses with a more hieroglyphic script the change is due to the precursor text, rather than an intentional variation.

In the database, the absence of any arm hieroglyph is only attested in Meir and the Theban area. However, outside the database it occurs in other regions as well. The absence of the Aa1 (𓊡) phonemogram is in the database only attested in Deir el-Bersha (form 8), but occurs outside the database in the Theban area as well. Based on the database, one could suggest that in el-Lisht the G43 (𓊤) is always added, while in Beni Hasan it is always left out. However, although this is true for Beni Hasan, this is not true for el-Lisht. Finally, the Y2 (𓏝) classifier is in the database only attested in Meir (form 6), but the Y2 classifier occurs outside the database in Deir el-Bersha as well.

Thus, with the exception of Beni Hasan, it seems unlikely that there is a regional preference in this lemma.

5.3.109.  hbi (to reduce, to deduct, to hush)\textsuperscript{1757}

In the database, there are 33 attestations of this lemma. However, only sixteen attestations represent verbal forms.\textsuperscript{1758} As table 5.108 shows, there are only three graphical forms for this lemma. Form 1 is only attested in Deir el-Bersha, which is true outside the database as well. Note however that this lemma is only attested in Asyut and Deir el-Bersha.

</table>

Table 5.109 Graphical forms of the stem of *ḥbs*.

In the database, it seems that the Z9 (𓏴) classifier only occurs in the Theban area. However, outside the database, the Z9 classifier is attested in other regions as well.\textsuperscript{1761} The use of the A21 (𓀙) classifier is only attested in Deir el-Bersha, which is true outside the database as well,\textsuperscript{1762} although it seems to only occur in B2Bo and B3Bo, which are part of an assemblage. In the database the A58 (𓁃) classifier is only attested in Deir el-Bersha, but outside the database it occurs in Asyut as well.\textsuperscript{1763} However, the use of the D40 (𓇝) classifier is only attested in Deir el-Bersha. In the database, it seems that the O34 (𓊃) is only used in Deir el-Bersha, but it occurs in Meir and the Theban area as well.\textsuperscript{1764} Finally, in Gebelein it is possible to use a G37 (𓅪) classifier, although there is only one attestation of its use.\textsuperscript{1765}

\textsuperscript{1759} van der van der Molen (2000), p. 379.
\textsuperscript{1760} de Buck (1935) *CT I*, p. 19,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 224.
\textsuperscript{1761} de Buck (1935) *CT I*, p. 268,f (B10C); de Buck (1951) *CT IV*, p. 337,b (M7C, M8C); de Buck (1956) *CT VI*, p. 268,u (G1T).
\textsuperscript{1762} Note that B2Bo uses form 3 as well, see de Buck (1954) *CT V*, p. 292,c (B2Bo), but if the transcription in de Buck is correct, it could explain how form 2 and 7 came to be.
\textsuperscript{1763} de Buck (1938) *CT II*, p. 49,c, (S1C).
\textsuperscript{1764} de Buck (1951) *CT IV*, p. 337,b (M7C, M8C, T1Be, T2Be).
\textsuperscript{1765} de Buck (1938) *CT II*, p. 49,c, (G2T).
5.3.111.  \textit{hpi} (to travel, to depart, to encounter)\textsuperscript{1766}

This lemma has 62 attestations in the database, although only 48 represent verbal forms.\textsuperscript{1767} In table 5.110, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>

\textsuperscript{1768} van der Plas & Borghouts (1998), p. 224.

Table 5.110 Graphical forms of the stem of \textit{hpi}.

In this lemma, most of the regions use form 7 or any of its graphical variants. However, form 9-11 are only attested in Deir el-Bersha, which is true outside the database as well. The Y2 (⁇) classifier is only attested in Beni Hasan and the Theban area, and does not occur again with this lemma outside the database.\textsuperscript{1769}

5.3.112.  \textit{hpr} (to come to be, to become)\textsuperscript{1770}

This is a common lemma in the database, with 920 attestations. However, only 827 attestations represent verbal forms.\textsuperscript{1771} In table 5.111, the attestations per region are set out for every graphical form of the stem:

\textsuperscript{1766} van der van der Molen (2000), p. 380.

\textsuperscript{1767} de Buck (1935) \textit{CT I}, p. 115,b, 116,a, 114,c; de Buck (1938) \textit{CT II}, p. 280-281,d; de Buck (1951) \textit{CT IV}, p. 289,b; de Buck (1954) \textit{CT V}, p. 146,b, 147,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 224 and Gracia Zamacona (2008), p. 1022-1027.

\textsuperscript{1768} de Buck (1954) \textit{CT V}, p. 146,b (G1T). I assume the X1 (⁇) is an error.

\textsuperscript{1770} van der van der Molen (2000), p. 380, calls these attestations an incomplete writing for \textit{hpr}, which is used in the other witnesses that have the phrase IV,388-389,b.

\textsuperscript{1771} van der van der Molen (2000), p. 380-381.

\textsuperscript{1771} de Buck (1935) \textit{CT I}, p. 12,d, 73,b, 314,a, 314-315,b, 316-317,a, 316,b, 316-317,c, 318-319,b, 318-319,c, 320-321,a, 324-325,a, 326-327,b, 328-329,b, 330,b, 332,b, 332,c, 334-335,a, 334-335,b, 334-335,c, 336-337,a, 336,b, 338-341, d-a, 342-343,b, 350-353,c-a, 372-373,c, 374-375,c, 374-375,d, 377,a, 384,a, 385,a, 387,a, 388,b, 389,b,

397,a, 400,a 402-403,e-a; de Buck (1938) *CT II*, p. 268-271,f-c, 276-277,c, 278-279,c, 280-281,c, 282-283,b, 284-285,b, 284-285,c, 284-287,e-a, 396,b, 398,e-f, 400,a; de Buck (1951) *CT IV*, p. 184-185,b, 188-189,a, 188,b, 228-229,b, 280-281,a, 288-289,b, 309,a, 310,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 224.

\(^{1772}\) de Buck (1935) *CT I*, p. 324,a (B1P). This witness habitually writes *hpr* with two D21 (−) signs, see form 8 as well. I assume that the precursor text used the L1 (𓆣) with an D21 interpretant. This witness prefers not to use the L1 however, thus the artist replaced every L1 with the Aa1-Q3-D21 group (𓊪𓂋𓆣), but forgot to remove the D21 interpretant.

\(^{1773}\) de Buck (1938) *CT II*, p. 280,c (B4L). The second D21 (−) is assumed to be an error, automatically added after writing the L1 (𓆣).

\(^{1774}\) All from B1P.
For this lemma, Aswan and Gebelein are only attested with the L1 (𓆣) in the initial position, where the other regions both use the L1 in the initial position (form 16-20) and the phonetic spelling of the lemma. However, in Deir el-Bersha it is more likely that the lemma is written phonetically, rather than with the L1 in the initial position. The other regions have the opposite, preferring the initial L1 over the phonetic spelling. The use of the O1 (𓉐) phonemogram is only attested in Deir el-Bersha.

For this lemma, there are some forms that are only attested in one region. Form 14 is only attested in Meir, while form 17 is only attested in Gebelein. Note that this lemma is only written in a long format in Asyut (form 10, 12, 13, 16 and 19).

In Deir el-Bersha, forms both with the L1 and without the L1 occur, but over time it becomes clear that although the L1 is used in both periods of coffin decoration in Deir el-Bersha, the L1 becomes less popular. In the early period of coffin decoration, the L1 is used in 33% of the attestations, whereas in the later period this is reduced to only 8%.

Thus, although the borders are fuzzy, there are some regional preference for this lemma.

---

Form 19, the only form with L1 in the initial position has 41 attestations, whereas the phonetic spelling has 272 attestations.

For the early period of coffin decoration there are 38 attestations with the L1 and 79 attestations without the L1.

For the later period of coffin decoration there are only 15 attestations with the L1 and 181 attestations without the L1.
5.3.113.  $hn$ (to direct)$^{1778}$

There are seventeen attestations of this lemma in the database,$^{1779}$ which are the only attestations of this lemma in the Coffin Texts.$^{1780}$ In table 5.112, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Deir el-Bersha</td>
<td>2</td>
</tr>
<tr>

<td>2</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Asyut</td>
<td>5</td>
</tr>
</tbody>
</table>

Table 5.112 Graphical forms of the stem of $hn$.

In this lemma, the A24 ($\%$) classifier is only attested in Deir el-Bersha, in the witnesses from the earlier period of coffin decoration (B2Bo, B4Bo). The D54 ($\wedge$) classifier is only attested in Deir el-Bersha as well. Asyut on the other hand is the only region where the I3 ($\ldots$) classifier is used. The absence of a classifier, or the use of the D40 ($\ldots$) is attested in both regions.

5.3.114.  $hni$ (to play music)$^{1782}$

There are five attestations of this lemma in the database, from the same phrase in spell 7.$^{1783}$ In table 5.113, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>

$^{1779}$ de Buck (1938) CT II, p. 280-281,e.
$^{1781}$ de Buck (1938) CT II, p. 281,e (S1C,b). I assume the I9 ($\ldots$) is an error for the N35 ($\ldots$).
$^{1783}$ de Buck (1935) CT I, p. 23,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 228.
In the database, form 1 is only attested in the Theban area, but it occurs outside the database in Meir as well.\textsuperscript{1784} For this lemma, Asyut seems to prefer to not use a humanoid classifier, which is true outside the database as well.\textsuperscript{1785} Form 2 is unique to Deir el-Bersha, but as the attestations are from B2Bo and B3Bo belong to the same assemblage, it might be a feature of these witnesses, rather than a regional feature.\textsuperscript{1786}

5.3.115.  \textit{hnp} (to snatch, to steal)\textsuperscript{1787}

There are fourteen attestations of this lemma in the database.\textsuperscript{1788} In table 5.114, the attestations per region are set out for every graphical form of the stem. Note that form 2 and form 3 should be considered to be the same, as the variation between the D37 (𓀜) and D40 (𓀝) here is due to the script, rather than an intentional variation.

Table 5.114 Graphical forms of the stem of \textit{hnp}.

The use of the A24 (𓀜) classifier is only attested in Meir, which is true outside the database as well, although form 1 is rare. In the database it seems that the D54 (𓀝) classifier is only attested in Asyut, but it occurs in other regions as well.\textsuperscript{1789} Moreover, although the database suggests that form 4 is the only form used in Asyut, other classifiers can be used in Asyut as well.\textsuperscript{1790} Nonetheless, form 3 is the preferred form for this lemma in most regions.

\textsuperscript{1784} de Buck (1956) \textit{CT VI}, p. 130,b (M6C).
\textsuperscript{1785} de Buck (1956) \textit{CT VI}, p. 405,o (S10C).
\textsuperscript{1786} As the other witnesses from Deir el-Bersha (B4Bo, B4C, B6C, B1P) with phrase I,23,b use \textit{hmi} (to row; see section 5.3.123) instead.
\textsuperscript{1787} van der Molen (2000), p. 391-392.
\textsuperscript{1788} de Buck (1938) \textit{CT II}, p. 280,d; de Buck (1951) \textit{CT IV}, p. 314,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 228.
\textsuperscript{1789} de Buck (1938) \textit{CT II}, p. 94,c (B1C, B2P); de Buck (1956) \textit{CT VI}, p. 274,k (G1T); de Buck (1961) \textit{CT VII}, p. 58,n (S83C).
\textsuperscript{1790} de Buck (1956) \textit{CT VI}, p. 208,a (S1C).
5.3.116.  hnr (to restrain)\textsuperscript{1791}

There are only seven attestations of this lemma in the database, from the same phrase in spell 23.\textsuperscript{1792} In table 5.115, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Theban area</td>
<td>1</td>
<td></td>
<td>3</td>
<td>Deir el-Bersha</td>
<td>4</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Beni Hasan</td>
<td>1\textsuperscript{1793}</td>
<td></td>
<td>4</td>
<td>Theban area</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.115 Graphical forms of the stem of hnr.

In the database it seems that form 3 only occurs in Deir el-Bersha, but outside the database it occurs in Asyut\textsuperscript{1794} and the Theban area as well.\textsuperscript{1795} The use of the V1 (\(\ddash\)) classifier is only attested in the Theban area in the database, but occurs in Asyut as well.\textsuperscript{1796} Both within and outside the database, form 2 is only attested in Beni Hasan.

5.3.117.  hns (to travel, to traverse)\textsuperscript{1797}

This lemma has eleven attestations in the database.\textsuperscript{1798} In table 5.116, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Deir el-Bersha</td>
<td>3\textsuperscript{1799}</td>
<td></td>

<td>Gebelein</td>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

\textsuperscript{1791} van der van der Molen (2000), p. 394.
\textsuperscript{1792} de Buck (1935) \textit{CT I}, p. 70,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 228.
\textsuperscript{1793} de Buck (1935) \textit{CT I}, p. 70,b (BH5C). I assume the \(r\) weakened into an \(i\), which is why the M17 (\(i\)) is used instead of the D21 (\(\ldots\)). See Peust (1999), p. 140.
\textsuperscript{1794} de Buck (1938) \textit{CT II}, p. 232,a (S2C,d). Note that de Buck transcribed an D20 (\(\ddash\)) instead of a U31 (\(\ldots\)), as these signs are nearly identical in cursive script. See Möller (1909), p. 8, 46, no. 98, 491.
\textsuperscript{1795} de Buck (1961) \textit{CT VII}, p. 18,z (T3C).
\textsuperscript{1796} de Buck (1938) \textit{CT II}, p. 357,a (S2P).
\textsuperscript{1797} van der van der Molen (2000), p. 394.
\textsuperscript{1798} de Buck (1935) \textit{CT I}, p. 393,i, 395,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 228 and Gracia Zamacona (2008), p. 1036-1042.
\textsuperscript{1799} de Buck (1935) \textit{CT I}, p. 395,c (M23C). Reconstruction, could be any other form as well.
In the database, the addition of the D32 ( Assertions in Deir el-Bersha. However, outside the database it occurs in other regions as well. The D40 ( ) classifier is only attested in Deir el-Bersha (form 3 and 6), which is true outside the database as well. Asyut seems to only occur with a O35 ( ) and without a classifier, but form 1 is attested in Asyut as well. The use of the S29 ( ) instead of an O34 ( ) is only attested in Deir el-Bersha and Meir, but occurs outside the database in Saqqara as well.

5.3.118. hnti (to be in front of)

The lemma hnti has eight attestations in the database, from the same phrase in spell 11. In table 5.117, the attestations per region are set out for every graphical form of the stem:

---

1800 de Buck (1935) CT I, p. 277,b (T1C); de Buck (1951) CT IV, p. 35,e (Sq6C); de Buck (1956) CT VI, p. 196,s (P.Gard.2).
1801 de Buck (1947) CT III, p. 191,a (S2C). Note that in form 4, see de Buck (1935) CT I, p. 393,i (S2C) the O35 ( ) is damaged, thus it is possible that this should be read as form 1 as well.
1802 de Buck (1951) CT IV, p. 35,c (Sq6C).
1804 de Buck (1935) CT I, p. 37,d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 229-230 and Gracia Zamacona (2008), p. 1044-1045. Note however that Gracia Zamacona placed this phrase under hnti (to sail upstream) instead.
In the database the absence of the P1 classifier only occurs in Deir el-Bersha. However, outside the database this occurs in the other regions, which all use form 2. Form 1 on the other hand only occurs in Deir el-Bersha, and is not attested anywhere else in the Coffin Texts.

5.3.119. *hṣfī (to travel upstream)*

There are seven attestations of this lemma in the database, from the same phrase of spell 398. In table 5.118, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
<td>Meir</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Theban area</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Gebelein</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Aswan</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>Meir</td>
<td>2</td>
</tr>
</tbody>
</table>

Table 5.118 Graphical forms of the stem of *hṣfī*.

In the database Meir always uses the P1 classifier. However, this classifier or the P2 classifier are used in the Theban area and Saqqara as well, even though the P1 classifier is always attested in Meir. Gebelein is only attested with the U35 in the initial position, without a classifier (form 2). This is true outside the database as well, although form 2 is attested in Asyut as well. The A24 classifier is only attested in Aswan in the database, but occurs in Deir el-Bersha as well. However, form 3 is only attested in Aswan. Note that the D40 classifier can be used in Deir el-Bersha as well.

5.3.120. *ḥṣr (to drive away, to dispel)*

There are 49 attestations of this lemma in the database, but only 43 attestations represent verbal forms. In table 5.119, the attestations per region are set out for every graphical form of the stem:

---

1805 de Buck (1938) *CT II*, p. 178,a (P.Gard.2); de Buck (1951) *CT IV*, p. 118,d (S1P); de Buck (1956) *CT VI*, p. 267,m (G1T), 396,p (T1L).
1808 de Buck (1954) *CT V*, p. 101,b (T1C, T1Be, Sq1C).
1809 de Buck (1947) *CT III*, p. 76,i (S10C,a-b).
1813 de Buck (1935) *CT I*, p. 59,b, 63,c; de Buck (1938) *CT II*, p. 259,b; de Buck (1951) *CT IV*, p. 208,c, 208-209,d, 256-257,c.
In this lemma, the variation in the arm classifiers should be considered a variation due to the script used in the witnesses, rather than an intentional variation. Form 3 is clearly the preferred form of this lemma in all the regions. However, the inclusion of the A60 (𓁅) or the V29 (𓎝) classifier is only attested in Meir (form 5-6). There are no additional features which represents a regional preference.

5.3.121. *ḥti* (to retire, to retreat, to turn back)

There are nineteen attestations of this lemma in the database. In table 5.120, the attestations per region are set out for every graphical form of the stem:

---

**Table 5.119 Graphical forms of the stem of ḫsr.**

<table>
<thead>
<tr>

</tbody>
</table>

---

\(^{1814}\) de Buck (1951) *CT IV*, p. 209,d (L3Li). I assume the D21 (...) was lost, but should be reconstructed.

\(^{1815}\) de Buck (1951) *CT IV*, p. 208,c (Sq4Sq). I assume this is an incorrect spelling of ḫsr.

\(^{1816}\) de Buck (1951) *CT IV*, p. 208,9 (T3L). I assume this is an incorrect spelling of ḫsr.

\(^{1818}\) de Buck (1951) *CT IV*, p. 270-271,b, 272,a; For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 233 and Gracia Zamacona (2008), p. 1091-1093.
In the database, el-Lisht is the only region where no classifier is attested, which is true outside the database as well. The use of the D55 (𓋧) classifier is only attested in Beni Hasan and Meir in the database (form 4 and 8), but occurs outside the database in the Theban area as well.\(^{1819}\) If a classifier is written, the other regions use a D54 (𓋦) classifier, which occurs outside the database in Asyut and Gebelein as well.\(^ {1820}\)

### 5.3.122. 𓊳𓊴 (to seal)\(^ {1821}\)

The lemma 𓊳𓊴 has 31 attestations in the database, although only 29 attestations represent verbal forms.\(^ {1822}\) In table 5.121, the attestations per region are set out for every graphical form of the stem:

---

\(^{1819}\) de Buck (1956) *CT VI*, p. 276,s (TT319).

\(^{1820}\) de Buck (1938) *CT II*, p. 127,f (S1C, G2T).

</tr>
<tr>
<td></td>
<td>Asyut</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>Theban area</td>
<td>1</td>
</tr>
<tr>
<td>13</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
</tbody>
</table>

In this lemma, the D40 (𓊂) classifier is only attested in Deir el-Bersha (form 9), which is true outside the database as well. In the database it seems that Asyut only uses the long format for this lemma (form 8, 12), but outside the database a compact format is used as well, although the long format is much more common in Asyut. The S19 (𓋨) is only attested in the Theban area, although form 11 is the only attestation of the S19 in the *Coffin Texts*, so it might be better to read this hieratic sign as a S20 (𓊃) instead. There are no other variations in this lemma that represent a regional preference.

### 5.3.123. *ḥni* (to row, to convey by boat) **1826**

There are 22 attestations of this lemma in the database. In table 5.122, the attestations per region are set out for every graphical form of the stem:

---

**1823** de Buck (1954) *CT V*, p. 155.c (T3L) Note that the S19 (𓋨) is written in the hieratic form in the original.

**1824** de Buck (1951) *CT IV*, p. 106,d (S2P).

**1825** van der Molen (2000), p. 419.

**1826** de Buck (1935) *CT I*, p. 23,b, 78,i-j, 94,a; de Buck (1938) *CT II*, p. 258,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 236 and Gracia Zamacona (2008), p. 1101-1110.
In the database, the only variation occurs in Deir el-Bersha itself, as all other regions use form 2. However, outside the database the D40 (𓊝) classifier is attested in Asyut as well.\textsuperscript{1827} The use of the N18 (𓊝) is only attested in Deir el-Bersha (form 4-5). Outside the database, there is some additional variation in the other regions as well. In multiple regions it is possible to leave out the classifier,\textsuperscript{1828} or to use the F26 (𓊟) phonemogram instead of the D33 (𓊝).\textsuperscript{1829} Note that it is possible to use the D33B (𓊟) as classifier in Asyut as well. However, form 2 remains the preferred form in all regions.

5.3.124. \textit{ḥnm} (to join, to enfold)\textsuperscript{1830}

This lemma has 55 attestations in the database.\textsuperscript{1831} In table 5.123, the attestations per region are set out for every graphical form of the stem:

\textbf{Graphical form stem} | no. | Region | Attestations |
\hline
1 | Deir el-Bersha | 1 |
2 | el-Lisht | 2 |
3 | Meir | 1 |
4 | Theban area | 1 |
5 | Theban area | 2 |
6 | Theban area | 2 |
7 | Theban area | 2 |
8 | Theban area | 2 |
9 | Deir el-Bersha | 2 |
10 | Deir el-Bersha | 2 |
11 | Deir el-Bersha | 2 |
12 | Deir el-Bersha | 2 |

\textsuperscript{1827} de Buck (1947) \textit{CT III}, p. 77,j (S10C).
\textsuperscript{1828} de Buck (1938) \textit{CT II}, p. 388,n (L1Li); de Buck (1947) \textit{CT III}, p. 75,m (S10C); de Buck (1961) \textit{CT VII}, p. 44,i (T9C).
\textsuperscript{1829} de Buck (1947) \textit{CT III}, p. 112,g (B9C, T1C); de Buck (1954) \textit{CT V}, p. 225,c (S2C).
\textsuperscript{1830} van der van der Molen (2000), p. 422.
\textsuperscript{1831} de Buck (1935) \textit{CT I}, p. 104-106,e-a, 106,b, 107,d, 115,b, 121,a, 145,c; de Buck (1954) \textit{CT V}, p. 156,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 236.
Form 1 is in the database only attested in Deir el-Bersha. However, outside the database it is attested in el-Lisht and the Theban area as well.\textsuperscript{1832} The use of classifiers is only attested in Deir el-Bersha and Meir, which is true outside the database as well. Although the A2 (𓀁) classifier is attested in both regions, it is more likely to occur in Deir el-Bersha. The D40 (𓀂) classifier is only attested in Meir, but is rare. The Y2 (𓏝) classifier is only attested in Deir el-Bersha.

5.3.125. \textit{hks} (to be injured)\textsuperscript{1833}

This lemma has 24 attestations in the database, from the same phrase in spell 335.\textsuperscript{1834} However, these attestations represent all the attestations of this lemma in the \textit{Coffin Texts}.\textsuperscript{1835} In table 5.124, the attestations per region are set out for every graphical form of the stem:

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|c|c|c|}
\hline
Graphical & Region & Attestations & Graphical & Region & Attestations \\
form stem & no. & & form stem & no. & \\
\hline
\text{4} & el-Lisht & 1 & \text{11} & Deir el-Bersha & 6 \\
\hline
\text{5} & Deir el-Bersha & 7 & \text{12} & Meir & 1 \\
\hline
\text{6} & Deir el-Bersha & 1 & \text{13} & Deir el-Bersha & 4 \\
\hline
\text{7} & Deir el-Bersha & 3 & \text{14} & Deir el-Bersha & 3 \\
\hline
\text{Gebelein} & 1 & & & & \\
\hline
\end{tabular}
\caption{Graphical forms of the stem of \textit{hnm}.}

Table 5.124 Graphical forms of the stem of $hks$.

As table 5.124 shows, this lemma is highly varied. However, some regional features occur. In the Theban area it is possible to replace the F32 (𓄡) with an Aa1 (𓆛). Moreover, the Theban area is the only region where the classifier can be left out (form 1 and 6). In Meir it is possible to replace the G37 (𓅪) classifier with an Y2 (𓏝) classifier. In Deir el-Bersha the G37 can be replaced with a D5 (𓁺), referring to $hks.t$, the injured eye of Horus. The use of the O34 (𓊃) instead of the S29 (𓋴) is only attested in Saqqara, while in Deir el-Bersha the S29 can be left out (form 4). Nonetheless, form 9 seems to represent the common form for this lemma. However, it is not unlikely that due to the lack of additional attestations the perceived variations are only features of the witnesses, rather than regional features, as every form except for form 9 is only attested once.
5.3.126. *šswi* (to lengthen)\textsuperscript{1836}

This lemma has only one attestation in the database.\textsuperscript{1837} The form used in B5C (see figure 5.3) represents a unique variant, as there are no other attestations in the *Coffin Texts* with the Y2 (…) classifier. However, the same graphical form without the Y2 is attested in Asyut\textsuperscript{1838} and Deir el-Bersha,\textsuperscript{1839} even though in Deir el-Bersha the long format of the same spelling occurs as well.

5.3.127. *šsm* (to burn up)\textsuperscript{1840}

This lemma has 21 attestations in the database.\textsuperscript{1841} In table 5.125, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>

\textsuperscript{1836} {van der van der Molen (2000), p. 440.}
\textsuperscript{1837} {de Buck (1951) *CT IV*, p. 90.k (B5C). For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 242. Note that I consider the compound *šswi*-ib part of this lemma.}
\textsuperscript{1838} {de Buck (1947) *CT III*, p. 157,b (S1C).}
\textsuperscript{1839} {de Buck (1961) *CT VII*, p. 385,b (B44Bo, B2Bo).}
\textsuperscript{1840} {van der van der Molen (2000), p. 442.}
\textsuperscript{1841} {de Buck (1951) *CT IV*, p. 262-263,a, 263,c. There are no additional attestations in the *Coffin Texts* according to van der Plas & Borghouts (1998), p. 242.
Form 1 is only attested in Meir and the Theban area, which could imply that the use of the O34 (𓊃) is more likely in the southern attestations. The use of the Aa17 (𓊃) phonemogram is only attested in Meir. The use of the U1 (𓌳) phonemogram is attested in Beni Hasan and the Theban area.

5.3.128. *siₜ* (to damage, to cheat, to mutilate)\textsuperscript{1842}

In the database there are eight attestations of this lemma, although only seven represent verbal forms.\textsuperscript{1843} In table 5.126, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Asyut</td>

<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Theban area</td>
<td>1</td>
</tr>
<tr>
<td>5</td>
<td>Deir el-Bersha</td>
<td>1\textsuperscript{1844}</td>
</tr>
</tbody>
</table>

Table 5.126 Graphical forms of the stem of *siₜ*.

In this lemma the classifier does not occur in Asyut. The Theban area is the only region which uses the long format. The D57 (𓌳) classifier only occurs in Deir el-Bersha. However, as these are the only attestations of this lemma in the Coffin Texts, there is a reasonable chance that these variations are random, instead of a regional preference.

\textsuperscript{1843} de Buck (1935) *CT I*, p. 403-404,c-a. There are no additional attestations according to van der Plas & Borghouts (1998), p. 244.
\textsuperscript{1844} de Buck (1935) *CT I*, p. 403-404,c-a (B1P). I assume that the S29 (𓋴) and M17 (𓇋) switched positions, and that this should be considered the same as form 2.
53.129. \textit{s\^m (to swallow, to wash down)}^{1845}

There are seventeen attestations of the lemma \textit{s\^m} in the database, which come from the same phrase in spell 225.^{1846} In table 5.127, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Graphical form 1" /></td>

<td>9</td>
<td>Meir</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.127 Graphical forms of the stem of \textit{s\^m}.

In the database, there are some features that can be considered regional. The use of the Y2 (𝙒) classifier is only attested in Deir el-Bersha, which is true outside the database as well. The F20 (𓄓) classifier is only attested in the Theban area, but as all attestations belong to T1Be and T2Be, which belong to the same owner, it might be a preference of these witnesses, rather than a regional feature. The use of the D40 (𓅒) classifier seems to be unique to Meir. However, there are no other attestations from Meir for this lemma in the Coffin Texts, nor any other attestation of the D40 classifier. In the database Asyut seem to have a preference to habitually include the A2 (𓀁) classifier. However, outside the database the N35A (𓀇) occurs as well,^{1847} even though the use of the A2 classifier remains the preference in Asyut.

Table 5.128 Graphical forms of the stem of \textit{s\textsuperscript{r}}.

\textsuperscript{1848} van der van der Molen (2000), p. 455-456.
\textsuperscript{1849} de Buck (1935) \textit{CT I}, p. 72.c, 104-105,c, 358-359,b; de Buck (1951) \textit{CT IV}, p. 90.j. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 244, under the lemma \textit{si\textsuperscript{r}}.
\textsuperscript{1850} de Buck (1935) \textit{CT I}, p. 104,c (S12C), the Z1 (𓏤) strokes are simply filler.
\textsuperscript{1851} de Buck (1935) \textit{CT I}, p. 72,c, (B6C). Due to the N31 (𓈐) classifier, I assume that the second D36 (…..) is a corruption of the D21 (…..).
\textsuperscript{1852} de Buck (1935) \textit{CT I}, p. 358,b (T3C). Considered a s\textit{dmm}f, hence the duplication of the D21 (…..).
In the database the si’r form of this lemma is only attested in the Theban area (form 9). However, outside the database si’r occurs in other regions as well.\textsuperscript{1853} Form 3 is in the database only attested in Deir el-Bersha, but outside the database in el-Lisht as well,\textsuperscript{1854} thus the use of the O34 (…) cannot be considered a regional feature. The use of the Y2 (…) as classifier is only attested in Deir el-Bersha for text written on the coffins, as it does occur outside the database in P.Gard.2 and P.Gard.3,\textsuperscript{1855} although these attestations use the si’r form of this lemma.

5.3.131. \( s^h (\text{to ennable, to be noble}) \)\textsuperscript{1856}

In the database there are 37 attestations of this lemma. However, one attestation is an adjective, thus only 36 attestations represent verbal forms.\textsuperscript{1857} In table 5.129, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>

\textsuperscript{1853} de Buck (1947) \textit{CT III}, p. 143,f (S2C, B2Be).
\textsuperscript{1854} de Buck (1956) \textit{CT VI}, p. 322,q (L1Li).
\textsuperscript{1855} de Buck (1961) \textit{CT VII}, p. 204,k.
\textsuperscript{1856} van der van der Molen (2000), p. 458.
\textsuperscript{1857} de Buck (1935) \textit{CT I}, p. 20,c, 104,c, 111,a, 143,a, 370-371,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 245-246.
\textsuperscript{1858} de Buck (1935) \textit{CT I}, p. 20,c (T1L). Based on I,20,b, I assume that the artist forgot to add a V28 (l).
For this lemma there are some features that could be considered regional. The use of the Y2 (𓏝) classifier is only attested in the Theban area and Deir el-Bersha. In the database the use of the Y2 classifier is much more common in the Theban area, but outside the database it is clearly quite common in Deir el-Bersha as well. However, the use of the Z5 (𓏯) or Z9 (𓏴) classifier is only attested in the Theban area.

Although the E31 (𓋵) and its classes are often attested in multiple regions, it seems that in Asyut the addition is constant, including in attestations outside the database. Although not attested in the database, P.Gard.2 uses the E31 constantly as well with this lemma, which could support the suggestion that this papyrus originates from Asyut. On the other hand, based on the database it could be suggested that there is a preference in el-Lisht to only use the S20 (𓋳) as classifier. However, outside the database S28 (𓋳) and the absence of a classifier are attested in el-Lisht as well.

5.3.132. saHa (to erect, to set up)

There are seventeen attestations of this lemma in the database, from the same phrase in spell 154. In table 5.130, the attestations per region are set out for every graphical form of the stem:

---

1860 For example, see de Buck (1961) CT VII, p. 237,v, 237,i.
1862 de Buck (1961) CT VII, p. 64,m, 66,j (L1Li).
1864 de Buck (1938) CT II, p. 278-281,e-b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 246.
### Table 5.130 Graphical forms of the stem of ṣḫ₃.

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>

<td>5</td>
<td>Deir el-Bersha</td>
<td>3</td>
</tr>
<tr>
<td>6</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
</tbody>
</table>

The only major variation between Deir el-Bersha and Asyut are form 2 and form 4 in the database. Here, the use of the D54 (𓋣) as classifier is only attested in Deir el-Bersha. However, outside the database the D54 classifier is attested in Meir as well.\(^{1865}\) Nonetheless, the use of the D54 classifier is not attested in any other region. Form 4 cannot be considered a regional preference, as the witnesses S1C,b and S1Tū write the text from left to right, thus the opposite direction of the S29 (𓋳) is most likely due to the different writing direction, rather than an intentional variation.

#### 5.3.133. ṣḫ₃ (to cause to enter)\(^{1866}\)

This lemma only has four attestations in the database.\(^{1867}\) As table 5.131 shows, every attestation has its own graphical form. Although the database suggests that the D54 (𓋣) classifier is not used in Deir el-Bersha, it is used there outside the database.\(^{1868}\) The absence of the G35 (𓋥) seems to only occur in Deir el-Bersha.

\(^{1868}\) de Buck (1935) *CT I*, p. 147,c (B4L).
5.3.134. *sw3i* (to pass)\textsuperscript{1869}

There are only seventeen attestations in the database,\textsuperscript{1870} even though this lemma is relatively common in the *Coffin Texts*.\textsuperscript{1871} In table 5.132, the attestations per region are set out for every graphical form of the stem. With the exception of the use of the Z9 (.), which only occurs in Deir el-Bersha,\textsuperscript{1872} there does not seem to be any regional preference for this lemma.

Table 5.133 Graphical forms of the stem of ṣw3ḏ.

In the database, the use of the D46 (𓊭) instead of the I10 (𓊫) is only attested in Deir el-Bersha (form 10), which is true outside the database as well. Likewise, all the attestations in Asyut are written with a V4 (𓊭), both within and outside of the database.\(^{1875}\) Moreover, the use of the V4 is only attested in Beni Hasan, Deir el-Bersha, Asyut and Meir. Thus, it could be argued that the use of the V4 only occurs to the

\(^{1875}\) There is one attestation, de Buck (1954) CT V, p. 226,k (S2C)) which might be form 3 or 6 instead, but as the M13 (𓊫) is damaged, it could be a V4 (𓊭) as well.
north of Asyut, as it is not attested in the Theban area and further to the south. The addition of the Y2 (𓏝) classifier is only attested in Deir el-Bersha and Meir, which is true outside the database as well. Note that outside the database, the use of an M14 (𓇆) in this lemma is only attested in el-Lisht.\textsuperscript{1876}

5.3.136. \textit{sw\textsuperscript{b}} (to cleanse, to purify)\textsuperscript{1877}

In the database there are 40 attestations of this lemma.\textsuperscript{1878} In table 5.134, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>

Table 5.134 Graphical forms of the stem of \textit{sw\textsuperscript{b}}.

\textsuperscript{1876} de Buck (1947) CT III, p. 72,d (L1Li).  
\textsuperscript{1877} van der van der Molen (2000), p. 463-464.  
\textsuperscript{1878} de Buck (1935) CT I, p. 62,c, 144,b; de Buck (1951) CT IV, p. 212-213,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 247.  
\textsuperscript{1879} de Buck (1951) CT IV, p. 212,b (Sq45q). Note that I took the double N35 (𓏝) as an incomplete N35A (𓈖) classifier, as the column ends after the two N35 signs. However, it would be possible to read this as a \textit{sq\textsuperscript{m.n-f}} as well.

439
In the database, only in Saqqara is a humanoid hieroglyph used (form 1), but outside the database this occurs in Asyut\textsuperscript{1880} and Beni Hasan as well.\textsuperscript{1881} The absence of any classifier (form 2) is only attested in el-Lisht and Deir el-Bersha, but occurs outside the database in the Theban area as well.\textsuperscript{1882} The use of a completely phonetic spelling of the lemma (form 9) only occurs only in Beni Hasan, which is true outside the database as well.\textsuperscript{1883} However, the other regions do include some of the interpretants. In the database, the G43 (𓏶) interpretant is only attested in Meir and the Theban area, but occurs outside the database in Asyut as well.\textsuperscript{1884} The use of the D36 (𓅗) interpretant is only attested in Meir, but occurs outside the database in Deir el-Bersha as well.\textsuperscript{1885} Finally, the D58 (𓅒) interpretant is only attested in Deir el-Bersha and the Theban area. Note that although it does not occur in the database, it is possible in Deir el-Bersha to replace the S29 (.hh) with the O34 (𓅐).

5.3.137. \textit{swr} (to drink)\textsuperscript{1886}

In the database there are fourteen attestations of this lemma.\textsuperscript{1887} As table 5.135 shows, the graphical form of this lemma is remarkably constant:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Beni Hasan</td>
<td>1</td>

\textsuperscript{1887} de Buck (1935) \textit{CT I}, p. 59,d; de Buck (1947) \textit{CT III}, p. 175,c, 236,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 247.
to use a D40 (𓉡) classifier. Moreover, in Deir el-Bersha, Saqqara and the Theban area it is possible to use the A116 (𓉢) classifier as well. Additionally, the A115 (𓉣) classifier is attested in Beni Hasan. Finally, it is possible in multiple regions to not write a classifier at all.

5.3.138. *spd* (to be sharp, to make sharp)

In the database there are nineteen attestations of this lemma, but only seventeen represent verbal forms. In table 5.136, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Graphical form" /></td>
<td>1</td>
<td>Meir</td>
<td>1</td>
<td><img src="image" alt="Graphical form" /></td>
<td>5</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td><img src="image" alt="Graphical form" /></td>

<td>4</td>
<td>Deir el-Bersha</td>
<td>1</td>
<td><img src="image" alt="Graphical form" /></td>
<td>8</td>
<td>Deir el-Bersha</td>
<td>2</td>
</tr>
</tbody>
</table>

Table 5.136 Graphical forms of the stem of *spd*.

In the database, form 1 is only attested in Meir. However, this form is attested outside the database in Deir el-Bersha as well. The D40 (𓉡) and Y2 (𓉣) classifier are only attested in Deir el-Bersha. In Asyut, the M44 (𓇮) is only used as a phonemogram (form 5-8), not as a phono-repeater (form 2-4). In el-Lisht the M44 is only used as a phono-repeater.

<td>1</td>
</tr>
</tbody>
</table>

Table 5.137 Graphical forms of the stem of \textit{sfg}.

There are features in this lemma that can be considered a regional preference. The use of an D4 (𓁹) or D5 (𓁺) classifier is only attested in Meir. The use of the F51 (𓄼) classifier is only attested in Gebelein and Aswan, which represent the southernmost attestation of this lemma. However, form 3 is attested in Gebelein as well, suggesting a preference for a compact format. The Y2 (𓏝) classifier is only attested in Deir el-Bersha.

The other regions use either form 3 or form 9. The database suggests that the Theban area prefers to use the long format of form 9, but outside the database form 3 is attested as well.\textsuperscript{1897} Beni Hasan seems to prefer the long format as well, but as there are no additional attestations of this lemma in the \textit{Coffin Texts} for Beni Hasan, it would be assumptive to suggest that this is a regional preference based on one.

\textsuperscript{1895} van der van der Molen (2000), p. 488.
\textsuperscript{1896} de Buck (1935) \textit{CT I}, p. 316-317,b, 318-319,a, 405,b; de Buck (1938) \textit{CT II}, p. 57-58,d-a, 86,d, 87,d, 88,a, 90,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 252.
\textsuperscript{1897} de Buck (1938) \textit{CT II}, p. 87,d (B1L). The V12 (𓁹) is a placeholder for an unclear sign, which might be an unfinished eye according to de Buck.
\textsuperscript{1898} de Buck (1938) \textit{CT II}, p. 63,f (T1Be).
attestation. Although both the long and compact format is attested in Asyut (form 4 and 9), it seems that the preference lies with the long format.

5.3.140. sm3 (to unite, to join, to partake)\(^{1899}\)

In the database there are 35 attestations of this lemma, but only 26 represent verbal forms.\(^{1900}\) In table 5.138, the attestations per region are set out for every graphical form of the stem:

<table>

Table 5.138 Graphical forms of the stem of sm3 (to unite).

Form 9 only occurs in Saqqara, but most likely is an error in the witness (Sq10C), as it is not repeated in the Coffin Texts.\(^{1902}\) Based on the database, it can be suggested that in Asyut and Meir the G1 (𓄿)
interpretant is never added. However, outside the database this is not true for Asyut. In Asyut the O34 (𓊃) phonemogram is always included inside and outside the database. The use of the Y2 (𓏝) classifier is only attested in Deir el-Bersha.

5.3.141. **smꜢ (to slay, to destroy)**

There are ten attestations of this lemma in the database. In table 5.139, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>

Table 5.139 Graphical forms of the stem of smꜢ (to slay).

For this lemma, the attestations from Meir always include the G1 (𓊃) interpretant in the database, but outside the database the lemma occurs without the G1 interpretant as well. However, it is the only region in which a form without the U1 (𓊃) is possible (form 8), although this form is rare in the Coffin Texts. The one and only use of the E1 (𓃒) classifier in the Coffin Texts is attested in Deir el-Bersha. In the

1905 de Buck (1935) *CT I*, p. 52,a); de Buck (1951) *CT IV*, p. 263,a, 263,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 253.
1906 de Buck (1935) *CT I*, p. 52,a, (B1P). Due to the E1 (𓃒) classifier, it is possible to read this as smꜢ (wild bull) as well.
1907 de Buck (1956) *CT VI*, p. 261,i (M2NY).
database the A24 (𓀜) classifier only occurs in Deir el-Bersha and Meir, but it is attested in Asyut outside the database as well. However, the A24 classifier does not seem to occur in the Theban area.

5.3.142.  \textit{smž} (to put to order, to correct, to cause to be true)\textsuperscript{1909}

There are 15 attestations of this lemma in the database.\textsuperscript{1910} In table 5.140, the attestations per region are set out for every graphical form of the stem. Note that form 5 and form 6 should be considered to be the same, as the N20 (𓀜) and Aa11 (𓀙) can look remarkably similar to each other in cursive script.

</tbody>
</table>

Table 5.141 Graphical forms of the stem of *smn*.

For most of the regions, there is no clear regional preference, as both form 3 and 7 are most commonly attested. In the database, the use of the O34 (𓊃) instead of the S29 (𓋴) is only attested in Deir el-Bersha. This is true outside the database as well. Gebelein and el-Lisht seem to prefer the compact format of form 3, but as there are no additional attestations from Gebelein or el-Lisht for this lemma, it might be a feature of the supports (G1T and L2Li), rather than a regional preference.

5.3.144. *smHi* (to cause to forget)\(^{1914}\)

There are eight attestations of this lemma in the database, although only one represents a verbal form.\(^{1915}\) The form used in B1C (see figure 5.4) is unique, as the attestations outside the database use either an A2 (𓀁) classifier or a G37 (𓅪) classifier.\(^{1916}\) Thus, it seems that the Y2 (𓏝) classifier only occurs in Deir el-Bersha for this lemma.

<tr>
<td></td>
<td>Deir el-Bersha</td>
<td>7</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 5.142 Graphical forms of the stem of *sn*.

As table 5.142 shows, form 4 is clearly the preferred form used in all the regions. Any variation in the database is only attested in Deir el-Bersha and the Theban area. However, form 2 is attested outside the database in Gebelein and Asyut,\textsuperscript{1920} which therefore cannot be considered a regional preference. The use of the D40 (…) classifier is only attested in the Deir el-Bersha and Theban area, which is true outside the database as well. However, it is much more likely to be used in Deir el-Bersha than in the Theban area.

5.3.146. *snc* (to rejoice)\textsuperscript{1921}

In the database there are only three attestations of this lemma, from the same phrase in spell 75.\textsuperscript{1922} Moreover, these seem to be the only attestations of this lemma in the *Coffin Texts*. Additionally, the attestations are all from witnesses that are dated between Sesostris II and Sesostris III (B1C, B2L, B1P), which suggests it is a change which only occurred for that specific group of witnesses, as the other witnesses use *hsi* or *sfr*i instead. There are three graphical forms of this lemma, see table 5.143. However, it could be argued that the humanoid classifier of form 2 should actually be read separately, as

\textsuperscript{1917} van der van der Molen (2000), p. 499.

\textsuperscript{1918} de Buck (1935) *CT I*, p. 11,b, 75,c, 75,e-f, 75,h; de Buck (1938) *CT II*, p. 84,c, 392,c; de Buck (1947) *CT III*, p. 214-215,c, 216,215,f-g, 214-219,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 255-256.

\textsuperscript{1919} de Buck (1947) *CT III*, p. 219,c (T1Be). Reconstruction, only the D36 (…) is visible. Note that it is not unlikely that due the script used in this witness that the D36 should be read as a D40 (…) instead, as form 6.

\textsuperscript{1920} de Buck (1938) *CT II*, p. 120,e (G2T); de Buck (1951) *CT IV*, p. 152,h (S1C,b).

\textsuperscript{1921} van der van der Molen (2000), p. 507.

\textsuperscript{1922} de Buck (1935) *CT I*, p. 356,c. According to van der Plas & Borghouts (1998), p. 257, there are no additional attestations of this lemma in the database.
B1C uses $hh.w$ (the chaos gods) after $sn^r$. As there are no other attestations, it is possible that this lemma is region and period specific.

<td>Deir el-Bersha</td>
<td>1</td>
</tr>
</tbody>
</table>

$^{1924}$ de Buck (1935) *CT I*, p. 104-105,b, 120,f.
As one can see in Table 5.144, the graphical form for this lemma is highly variable, as there are 22 forms for 29 attestations. Note that although a distinction was made between the U19 (𓂔) and U20 (𓂕), this is a modern distinction, as in near hieratic cursive script it is often difficult to differentiate between the two graphemes.

1926 de Buck (1935) CT I, p. 104,b (S12C), the strokes are decorative.
Nonetheless, some features can be considered to be regional. The D54 (𓀶), G38 (𓀺) and Y2 (𓀲) classifiers are only attested in Deir el-Bersha. The use of the K13 (𓀻) instead of the K1 (𓀼) is rare, and only occurs in Asyut and Deir el-Bersha. Additionally, the O34 (𓀹) is used in el-Lisht, instead of the S29 (𓀼). Moreover, the witness (L2Li) replaced the G43 (𓅱) with a partial form of the grapheme, as this witness prefers to use partial hieroglyphs for the hieroglyphs of animates.

**5.3.148. ** *(to be brotherly, to be friendly)*\textsuperscript{1927}

In the database there are twelve attestations of this lemma, from the same phrase of spell 75.\textsuperscript{1928} In table 5.145, the attestations per region are set out for the graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>

Table 5.145 Graphical forms of the stem of *snsn*.

In the database it seems that Gebelein does not use a classifier or the D20 (𓀊) phono-repeater. However, outside the database the D20 occurs in Gebelein as well.\textsuperscript{1929} The use of the Y2 (𓀲) classifier is only attested in Deir el-Bersha. The Theban area seems to prefer a long format (form 7) for this lemma, but

---

\textsuperscript{1928} de Buck (1935) *CT I*, p. 389,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 258.
\textsuperscript{1929} de Buck (1951) *CT IV*, p. 179,j (G1T).
as there are no additional attestations for this lemma from the Theban area, it cannot be said if this is a regional preference, or if this is a feature of the support.

5.3.149.  

snš/sšn (to unstop)$^{1930}$

There are seventeen attestations of this lemma in the database, although only thirteen attestations represent verbal forms.$^{1931}$ Note however that these attestations represent the divinity ‘she who unstops’, which was taken as a participle, although it could be argued that this is a substantive instead. In table 5.146, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>

---

$^{1931}$ de Buck (1947) CT III, p. 13,b, 14,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 267, added under sšn/snš.

$^{1933}$ de Buck (1935) CT I, p. 17,d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 259.
In this lemma, there are some features that could be considered a regional preference. Both within and outside of the database the Y2 (𓏢) classifier only occurs in Deir el-Bersha. The T22 (𓇏) phonemogram is only attested in Asyut, and this seems to be the only attestation for this lemma in the Coffin Texts. In the database it seems that the D40 (𓅏) classifier only occurs in Deir el Bersha (form 4), but outside the database the D40 classifier is attested in Asyut as well. Outside the database there are two additional classifier that are used, B5 (𓂀) and D27 (𓅌). However, as both occur in multiple regions, it should not be considered a regional preference.

5.3.151. \textit{snkn} (to injure, to damage)\textsuperscript{1937}

There are only seven attestations of this lemma in the database. Based on van der Plas & Borghouts, there are no additional attestations of this lemma in the Coffin Texts. In table 5.148, the attestations per region are set out for every graphical form of the stem.

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|c|c|c|}
\hline
Graphical form stem & no. & Region & Attestations & Graphical form stem & no. & Region & Attestations \\
\hline
\includegraphics[width=0.05\textwidth]{stem1} & 1 & Deir el-Bersha & 1 & \includegraphics[width=0.05\textwidth]{stem4} & 4 & Deir el-Bersha & 1 \\
\hline
\includegraphics[width=0.05\textwidth]{stem2} & 2 & Deir el-Bersha & 1 & \includegraphics[width=0.05\textwidth]{stem5} & 5 & Deir el-Bersha & 4 \\
\hline
\includegraphics[width=0.05\textwidth]{stem3} & 3 & Asyut & 1 & & & Theban area & 1 \\
\hline
\end{tabular}
\caption{Graphical forms of the stem of \textit{snk}.}
\end{table}

\textsuperscript{1934} de Buck (1947) \textit{CT III}, p. 360,c (S1C,a). Note that it is possible to read the D40 (𓅏) here as well, but the use of an arm as classifier is certain.
\textsuperscript{1935} de Buck (1935) \textit{CT I}, p. 281,a (T9C); de Buck (1951) \textit{CT IV}, p. 350,a (B2Bo, B4Bo).
\textsuperscript{1936} de Buck (1935) \textit{CT I}, p. 281,a (T1C); de Buck (1951) \textit{CT IV}, p. 182,f (G1T); de Buck (1956) \textit{CT VI}, p. 97,d (B9C).
\textsuperscript{1937} van der van der Molen (2000), p. 515.
\textsuperscript{1938} de Buck (1938) \textit{CT II}, p. 73,a.
\textsuperscript{1939} van der Plas & Borghouts (1998), p. 259.
As these are the only attestations of this lemma, it is possible to suggest some regional preferences. In Deir el-Bersha there is a preference to use the D57 (𓊤) classifier (form 5), which is the classifier used in Meir (form 5) as well. However, Asyut seems to prefer to use the D56 (𓊥) classifier. However, form 2 and 4 belong to the same witness, so it is possible that this is a feature of the support, rather than a regional preference. Only in Meir is a form without a classifier attested (form 3). The compact format of form 1 is only attested in Meir, as the other regions seem to prefer a long format.

5.3.152. snD (to fear, to be afraid)\textsuperscript{1940}

The lemma snD has 62 attestations in the database, but only 45 attestations represent verbal forms.\textsuperscript{1941} In table 5.149, the attestations per region are set out for every graphical form of the stem:

\textsuperscript{1940} van der van der Molen (2000), p. 516-517.
\textsuperscript{1941} de Buck (1935) \textit{CT I}, p. 348-351,e-a, 386,a; de Buck (1938) \textit{CT II}, p. 70,b; de Buck (1951) \textit{CT IV}, p. 91,o-p, 320,d.

For additional attestations outside the database, see van der Plas \& Borghouts (1998), p. 259.
In this lemma, there are some features that can be considered regional. Both within and outside of the database, the D40 (𓊩) classifier and the Y2 (𓊪) classifier are only attested in Deir el-Bersha. The use of the D46 (𓊩) phonemogram/interpretant is only attested in Deir el-Bersha, but occurs outside the database in el-Lisht as well.\textsuperscript{1942} In the database, the Aa27 (𓊩) phonemogram is only attested in Deir el-Bersha and Asyut (form 8 and 9). However, outside the database, the Aa27 phonemogram is attested in Saqqara and Dendera as well.\textsuperscript{1943} The use of a T22 (𓊩) phonemogram is unique in Deir el-Bersha and not repeated in the Coffin Texts. In the database, Gebelein only occurs with form 1, but outside the database form 3 is attested for Gebelein as well.\textsuperscript{1944} In Meir, only form 1 and form 3 are attested, but it seems that there is a preference for form 3.

5.3.153. \textit{sr} (to foretell, to make known)\textsuperscript{1945}

In the database there are 34 attestations of this lemma.\textsuperscript{1946} In table 5.150, the attestations per region are set out for every graphical form of the stem. Note that there is an issue with the E27 (𓊩) in this lemma, as this sign looks more like a E20 (𓊩) in multiple witnesses. However, following the transcription of de Buck, the E27 was used when an animal was written for this lemma.

\textsuperscript{1942} de Buck (1961) \textit{CT VII}, p. 64,s (L1Li).
\textsuperscript{1943} de Buck (1951) \textit{CT IV}, p. 35,l (Sq6C), 72,d (D1C).
\textsuperscript{1944} de Buck (1951) \textit{CT IV}, p. 180,v (G1T).
\textsuperscript{1945} van der van der Molen (2000), p. 519.
\textsuperscript{1946} de Buck (1935) \textit{CT I}, p. 120,e, 140,g, 320-323,d-a, 404-405,c-a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 260.
In Deir el-Bersha, the use of the D54 (𓊅) classifier relatively common. However, it is rarely attested in Meir (form 16) and the Theban area as well.1947 On the other hand, the use of the Y2 (𓊇) classifier is only attested in Deir el-Bersha (form 7), as is the use of the O34 (𓊈) instead of the S29 (𓊇). In the database it seems that the A2 (𓊇) classifier is only attested in Deir el-Bersha and Meir (form 5, 9, 15 and 16).

---

1947 de Buck (1956) CT VI, p. 402,f (T1L).
However, outside the database the A2 classifier is used in Asyut\textsuperscript{1948} and the Theban area as well.\textsuperscript{1949} In general, most regions use form 4, 8 or 13 for this lemma.

5.3.154. \textit{sri (to rule, to command)}\textsuperscript{1950}

This lemma has 34 attestations in the database, but only nineteen attestations represent verbal forms,\textsuperscript{1951} as \textit{sr} (magistrate, nobleman) was encoded under this lemma as well. In table 5.151, the attestations per region are set out for every graphical form of the stem. As this lemma is a 3ae inf. lemma and gemination occurs, the table has been separated in gemination and no gemination.

Table 5.151 Graphical forms of the stem of \textit{sri}.

The use of the A21 (𓀙) as logogram (form 3) only occurs in Asyut, but does not seem to occur again in the \textit{Coffin Texts}. In Deir el-Bersha, it is possible to add an Y2 (𓏝) classifier or replace the A21 classifier with an Y2 classifier, which is true outside the database as well. Outside the database this lemma can be written in Gebelein without the A21 classifier as well,\textsuperscript{1952} although even in Gebelein the absence of the classifier is rare. The use of the O34 (𓊃) instead of the S29 (𓋴) is only attested in Deir el-Bersha.

\footnotesize{\textsuperscript{1948} de Buck (1956) CT VI, p. 53,e (S1C). \textsuperscript{1949} de Buck (1954) CT V, p. 176,l (T1C). \textsuperscript{1950} van der Molen (2000), p. 518-519. \textsuperscript{1951} de Buck (1935) CT I, p. 324-325,b. <td></td>
<td>Theban area</td>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table 5.152 Graphical forms of the stem of *srd*.

For this lemma, the majority of the attestations in the *Coffin Texts* use either form 1 or form 4. However, even though Beni Hasan uses form 1 as well, the M31 (𓇝) classifier is only attested in Beni Hasan, in the same manner as *rd* (to grow; see 5.3.93). Based on the database, it could be suggested that Asyut prefers the long format of form 4. However, outside the database, the compact format of form 1 is attested in Asyut as well.\textsuperscript{1955} Outside the database it is possible in Deir el-Bersha for the M32 (𓂡) classifier to be replaced by the D40 (𓊬) classifier.\textsuperscript{1956}

5.3.156.  *shri* (to acclaim)\textsuperscript{1957}

In the database, there are sixteen attestations of this lemma.\textsuperscript{1958} As table 5.153 shows, there is barely any variation in the spelling, although some variation in the graphical form exists.

\textsuperscript{1953} van der van der Molen (2000), p. 523.
\textsuperscript{1954} de Buck (1935) *CT I*, p. 17,b; de Buck (1938) *CT II*, p. 398,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 260.
\textsuperscript{1955} de Buck (1938) *CT II*, p. 352,a (S1C).
\textsuperscript{1956} de Buck (1938) *CT II*, p. 352,a (B1L).
\textsuperscript{1957} van der van der Molen (2000), p. 525.
\textsuperscript{1958} de Buck (1935) *CT I*, p. 356-357,c, 359,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 261.

<tr>
<td></td>
<td></td>
<td>Aswan</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.153 Graphical forms of the stem of *shai*.

For this lemma, it seems that Meir and Gebelein prefer the compact format of form 1, where Asyut and the Theban area prefer the long format of form 3. For Aswan and Deir el-Bersha, there does not seem to be a preference of one form over the other. However, a compact format is attested outside the database for Asyut and Theban area.\(^{1959}\) Thus, there seems to be a graphical preference for form 1 only for Gebelein and Meir, as there are no other attestations for this lemma from Gebelein and Meir in the *Coffin Texts*.

### 5.3.157. *shri* (to remove, to drive away, to cause to escape)\(^{1960}\)

In the database there are 27 attestations of this lemma.\(^{1961}\) In table 5.154, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>

Table 5.154 Graphical forms of the stem of *sHri*.

Although this lemma is varied in its form, there are only a few variations that represent a regional preference. In the database it seems that Deir el-Bersha always includes the N31 (𓈐) classifier with this lemma. However, outside the database it occurs without the N31 classifier as well,\(^{1963}\) although this seems to be an exception to the rule. Additionally, the D54 (𓅁) classifier is only attested in Deir el-Bersha (form 12). The Y2 (𓏝) classifier is only attested in el-Lisht and Meir, but is only optional in both regions.\(^{1964}\)

\(^{1962}\) de Buck (1951) *CT IV*, p. 211,a (BH1Br). Due to the classifiers I assumed it was an incorrect spelling for *sHri*.

\(^{1963}\) *de Buck (1961) CT VII*, p. 39,l (B10C).

\(^{1964}\) See form 1, 2, 3, 8 and 11 for Meir and *de Buck (1961) CT VII*, p. 2,q (L2Li) for el-Lisht.
5.3.158.  *shtp* (to pacify, to satisfy, to cause to be plentiful)\textsuperscript{1965}

The lemma *shtp* has 48 attestations in the database.\textsuperscript{1966} In table 5.155, the attestations per region are set out for every graphical form of the stem:

| Graphical form stem | no.  | Region               | Attestations | | Graphical form stem | no.  | Region | Attestations |
|---------------------|------|----------------------|--------------| |---------------------|------|---------|--------------|
|                     | 1    | Deir el-Bersha       | 1\textsuperscript{1967} | |                     | 9    | Deir el-Bersha       | 2  |
|                     | 2    | Deir el-Bersha       | 2            | |                     | 10   | Asyut               | 1  |
|                     | 3    | Deir el-Bersha       | 2            | |                     | 11   | Theban area         | 1  |
|                     | 4    | Meir                 | 1\textsuperscript{1968} | |                     | 12   | Beni Hasan           | 1  |
|                     |      |                      |              | |                     | 13   | Deir el-Bersha       | 10 |
|                     |      |                      |              | |                     | 14   | Asyut               | 2  |
|                     |      |                      |              | |                     | 15   | Asyut               | 1  |
|                     | 5    | Beni Hasan            | 1            | |                     | 13   | Deir el-Bersha       | 10 |
|                     |      | Meir                 | 6            | |                     | 14   | Asyut               | 2  |
|                     | 6    | Deir el-Bersha       | 1            | |                     | 15   | Asyut               | 1  |
|                     | 7    | Aswan                | 1            | |                     | 15   | Asyut               | 1  |
|                     | 8    | Meir                 | 1            | |                     | 15   | Asyut               | 1  |

Table 5.155 Graphical forms of the stem of *shtp*.

\textsuperscript{1965} van der van der Molen (2000), p. 527.
\textsuperscript{1966} de Buck (1935) *CT I*, p. 348-349c, 350-351, b; de Buck (1947) *CT III*, p. 188,c; de Buck (1951) *CT IV*, p. 260,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 261-262.
\textsuperscript{1967} de Buck (1935) *CT I*, p. 348c (B1C). As the owner to which this participle reflects to is masculine, I assumed the X1 (𓏏) and Q3 (𓊪) were written in the wrong order. However, it could theoretically be read as an infinitive as well.
\textsuperscript{1968} de Buck (1935) *CT I*, p. 351b (M-Ann). Not seen by de Buck himself, it is possible that the Y1 (𓏛) should be read as an V2 (𓏝) instead.
In the database, the Theban area seems to prefer a long format (form 11 and 13). However, outside the database, the compact format of form 6 is attested as well.\(^{1969}\) Asyut seems to prefer the long format as well (form 10, 13, 14 and 15), but is attested with form 3 outside the database.\(^{1970}\) The use of the X4 (𓀶) classifier occurs only in Asyut, but only when the ‘to cause to be plentiful’ function is used. In Gebelein there is a preference for a compact format for this lemma. In Aswan there is slightly more freedom in the position of the S29 (𓋴), but the X1 (𓀶) and Q3 (𓊪) signs are constantly written next to each other in the column (form 7 and 12). The other regions do not have a clear distinction, although the use of the O34 (𓊃) instead of the S29 is only attested in Deir el-Bersha.

5.3.159. \(\textit{shi}\) (to hit, to chop off, to grasp)\(^{1971}\)

In the database, there are only three attestations of this lemma, from the same phrase of spell 24, all from Deir el-Bersha.\(^{1972}\) As table 5.156 shows, there are only two graphical forms for this lemma, which vary based on the classifier. Outside the database this lemma can occur in Deir el-Bersha with an A24 (𓀷) classifier as well.\(^{1973}\) Note that this lemma seemingly only occurs in witnesses from Deir el-Bersha.\(^{1974}\)

\begin{table}[h]
\begin{center}
\begin{tabular}{|c|c|c|}
\hline
Graphical form stem & no. & Region & Attestations \\
\hline
\text{𓀷} & 1 & Deir el-Bersha & 1 \\
\text{𓀶} & 2 & Deir el-Bersha & 2 \\
\hline
\end{tabular}
\end{center}
\caption{Graphical forms of the stem of \textit{shi}.}
\end{table}

5.3.160. \(\textit{shm}\) (to have power)\(^{1975}\)

This is one of the common lemmas in the database, with a total of 390 attestations in the database. However, only 320 attestations represent verbal forms.\(^{1976}\) In table 5.157 the attestations per region are set out for every graphical form of the stem:

\(^{1969}\) de Buck (1935) \textit{CT I}, p. 300,a (T1C).
\(^{1970}\) de Buck (1938) \textit{CT II}, p. 318,c (S3P).
\(^{1971}\) van der Molen (2000), p. 528. Note that van der Molen has \textit{shi} (to chop off) as a separate lemma.
\(^{1972}\) de Buck (1935) \textit{CT I}, p. 74,d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 262.
\(^{1973}\) de Buck (1951) \textit{CT IV}, p. 55,j (B3L).
\(^{1974}\) There might be an attestation in Asyut, see de Buck (1954) \textit{CT V}, p. 169,d (S1C). However, as the word is damaged, includes an G43 (𓀶) and the other witness from Meir uses \textit{sh} ‘hot’, it is not unlikely that this is something else.
\(^{1976}\) de Buck (1935) \textit{CT I}, p. 12-13,e-a, 13,b, 66-67,e-a, 67,c, 67,d, 68,a, 68,c, 69,a, 69,c, 327,b, 405,e; de Buck (1938) \textit{CT II}, p. 55,a, 56,d, 85,c, 85-86,e-a, 86,c, 90,a, 282-285,c-a, 389,a; de Buck (1947) \textit{CT III}, p. 212,b-d, 220-221,c, 222-223,a, 222-223,c, 222-223,d, 224-225,c, 225,b, 226-227,a, 226-227,b, 226-227,d, 228-229,a, 228-229,b, 228,c, 230,a, 230-231,c, 232-233,a, 242,b, 242,c, 242,d, 243,e, 243,f, 244,a, 244-245,b, 244-245,d, 245,e, 245,e, 245,f-g, 245,h-i, 246,a, 246-247,b, 247,e-f, 247,g, 247,h, 250,b; de Buck (1951) \textit{CT IV}, p. 305,a; de Buck (1954) \textit{CT V}, p. 1,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 263-264.

</table>

\textsuperscript{1977} All from the same witness (T2Be).
In general, it seems that nearly every region prefers form 16 for this lemma. However, the D40 (𓋟) and the Y2 (𓋠) classifier are only attested in Deir el-Bersha. The A24 (𓋢) classifier is attested both in Deir el-Bersha and the Theban area. Aswan is the only region where this lemma is attested without the S42 (𓌁). Form 2 and 3, where the S42 is used as a phono-repeater, is only attested in the Theban area. The clustering of the S29 (𓋡), Aa1 (𓋢) and S42 signs in forms 4-6 only occur in the Theban area, although form 4 and 5 occur only in the witness T2Be, and form 6 only occurs in T9C. Thus, these represent features of the supports, rather than a regional feature.

5.3.161. *sxem* (to embrace, to enclose)

This lemma has eight attestations in the database. In table 5.158, the attestations per region are set out for every graphical form of the stem:

---

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>

</tbody>
</table>

Table 5.158 Graphical forms of the stem of slḥn.

In the database, it seems that form 6 only occurs in Asyut. Contrastingly, outside the database it becomes clear that this is one of the common forms of this lemma, beside form 3. In Asyut, it only occurs with form 6 or without a classifier, the lemma does not occur with the D32 (𓂘) classifier. This seems to be true for Gebelein as well. Form 4 seems to only occur in Beni Hasan, while form 3 is attested in this region as well. The use of the D28 (𓂓) instead of the D32 classifier is only attested in the later period of coffin decoration in Deir el-Bersha (form 1 and 2), but does not occur outside spell 75. Thus, the D28 could be read as the substantive kꜣ here as well, instead of a classifier.

5.3.162. slḥr (to overthrow, to cast down)

In the database this lemma has 25 attestations. In table 5.159, the attestations per region are set out for every graphical form of the stem:

---

1980 de Buck (1947) CT III, p. 181,c (B1C), 323,g (G1T, A1C); de Buck (1951) CT IV, p. 26,j (T1L, Sq6C).
1981 de Buck (1956) CT VI, p. 405,q (S10C).
1982 de Buck (1961) CT VII, p. 97,o (S10C).
1983 de Buck (1956) CT VI, p. 271,f (G1T); de Buck (1961) CT VII, p. 140,i (G1T).
1984 de Buck (1951) CT IV, p. 64,i (BH4C).
1985 Making the phrase in de Buck (1935) CT I, p. 363,f (B2L): slḥn kꜣ=i tꜣ.w nb(.w) (My ka will embrace all the lands).
1987 de Buck (1935) CT I, p. 39,c, 40,a, 59,b; de Buck (1951) CT IV, p. 90,l, 91,c, 211,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 265.
In the database, it is only attested in Deir el-Bersha that the S29 (𓋴) can be replaced by an O34 (𓊃). However, outside the database this occurs in el-Lisht as well.\textsuperscript{1988} It is possible in Deir el-Bersha to use the D40 (𓂡) classifier, which is true outside the database as well. However, the arm classifier in form 4 could be similar, as the D36 (𓂝) and D40 can look similar in near hieratic cursive script.\textsuperscript{1989} This would mean that the arm classifier can be used in the Theban area as well. Note that outside the database it is possible in Deir el-Bersha to use a Y2 (𓏝) classifier as well.\textsuperscript{1990} In the database, it seems that Asyut prefers the long format of form 3. Outside the database the compact format of form 2 is attested in Asyut as well.\textsuperscript{1991}

5.3.163. \textit{ss(w)n} (to destroy)\textsuperscript{1992}

In the database, there are seven attestations of this lemma, from the same phrase in spell 75.\textsuperscript{1993} In table 5.160, the attestations per region are set out for every graphical form of the stem:

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|c|c|c|}
\hline
\textbf{Graphical form stem} & \textbf{no.} & \textbf{Region} & \textbf{Attestations} & \textbf{Graphical form stem} & \textbf{no.} & \textbf{Region} & \textbf{Attestations} \\
\hline
1 & Deir el-Bersha & 1 & & 4 & Theban area & 1 & \\
\hline
2 & Deir el-Bersha & 2 & Theban area & 4 & Theban area & 2 & \\
\hline
3 & Deir el-Bersha & 11 & Asyut & 5 & Deir el-Bersha & 2 & \\
\hline
\end{tabular}
\caption{Table 5.159 Graphical forms of the stem of \textit{sfr}.}
\end{table}

\textsuperscript{1988} de Buck (1951) \textit{CT IV}, p. 49,r (L1Lj).
\textsuperscript{1989} Which is used in T3Be, the attestation of form 4. See Möller (1909), p. 9, no. 99 and 105.
\textsuperscript{1990} de Buck (1938) \textit{CT II}, p. 32,a (B2L).
\textsuperscript{1991} \textit{de Buck} (1961) \textit{CT VII}, p. 105,e (S5C).
\textsuperscript{1993} de Buck (1935) \textit{CT I}, p. 401,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 266.
Based on all attestations in the *Coffin Texts*, it seems that all regions, except for Deir el-Bersha, prefer to use form 1.\(^{1996}\) The use of the E34 (𓊃) or T11 (𓌕) is only attested in Deir el-Bersha. Moreover, the use of the T11 seems to only occur in the later period of coffin decoration. However, this is based on form 3 and 4 alone (B2L, B1P), as it not attested outside the database. Additionally, the use of the D54 (𓊃) and D40 (𓊃) classifier is only attested in Deir el-Bersha as well, although these classifiers do not occur outside the database.

### 5.3.164. \textit{sšp} (to be bright, to make bright)\(^{1997}\)

This lemma has 25 attestations in the database, but only six attestations represent verbal forms.\(^{1998}\) As table 5.161 shows, all the attestations of this lemma in the database are from Deir el-Bersha, although with remarkable variation in the graphical form. Even so, the use of the O34 (𓊃) instead of the S29 (𓊃) is only attested in Deir el-Bersha. Additionally, the use of the D40 (𓊃) classifier is only attested in Deir el-Bersha as well, although rare in the *Coffin Texts* for this lemma.

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|}
\hline
\textbf{Graphical form stem} & \textbf{no.} & \textbf{Region} & \textbf{Attestations} \\
\hline
1 & 1 & Meir & 1 \\
2 & 1 & Asyut & 1 \\
3 & 1 & Deir el-Bersha & 4 \\
4 & 1 & Deir el-Bersha & 1 \(1994\) \\
5 & 1 & Deir el-Bersha & 1 \(1995\) \\
\hline
\end{tabular}
\end{table}

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|}
\hline
\textbf{Graphical form stem} & \textbf{no.} & \textbf{Region} & \textbf{Attestations} \\
\hline
1 & 1 & Deir el-Bersha & 1 \\
4 & 1 & Deir el-Bersha & 1 \\
\hline
\end{tabular}
\end{table}

\(1994\) de Buck (1935) *CT I*, p. 401,c (B2L), I assume this to be an error in which the position of the O34 (𓊃) and N35 (𓊃) where reversed.

\(1995\) de Buck (1935) *CT I*, p. 401,c (B7C) is a reconstruction, based on B1C.

\(1996\) Form 1 is attested in Deir el-Bersha once, see de Buck (1951) *CT IV*, p. 18,f (B2Bo). For the other regions, see de Buck (1938) *CT II*, p. 252,e (S1C,a) and de Buck (1956) *CT VI*, p. 276,x (G1T).

5.3.165. \textit{sk\textasciitilde i} (to make high, to exalt)\textsuperscript{1999}

This lemma has eight attestations in the database, from the same phrase of spell 75.\textsuperscript{2000} In table 5.162, the attestations per region are set out for every graphical form of the stem:

In this lemma, the only variation occurs in Deir el-Bersha, with form 1 only occurring in witnesses from the later period of coffin decoration.\textsuperscript{2001} The use of the Y2 (\textsuperscript{2000} classifier occurs in earlier witnesses from Deir el-Bersha as well.\textsuperscript{2002} Notably, the absence of the A28 (\textsuperscript{2003} classifier (form 1) does not occur in the earlier period of coffin decoration in Deir el-Bersha, nor does it occur in any other region, which all use form 2 and 3, or another graphical form of the same spelling.\textsuperscript{2003}

---

\begin{tabular}{|c|c|c|c|c|c|}
\hline
Graphical form stem & no. & Region & Attestations & Graphical form stem & no. & Region & Attestations \\
\hline
 & 2 & Deir el-Bersha & 1 & & 5 & Deir el-Bersha & 2 \\

\textsuperscript{2000} de Buck (1935) \textit{CT I}, p. 404,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 268.
\textsuperscript{2001} B1C, B2L and B7C. Note that B7C was reconstructed, based on B1C and B2L.
\textsuperscript{2002} de Buck (1951) \textit{CT IV}, p. 69,a (B6Bo).
\textsuperscript{2003} For example, see de Buck (1951) \textit{CT IV}, p. 180,i (G1T).
5.3.166. *skbb* (to cool, to calm, to extinguish)\textsuperscript{2004}

The lemma *skbb* has seventeen attestations in the database, from the same phrase of spell 75.\textsuperscript{2005} As table 5.163 shows, the graphical form for this lemma is highly variable, as there are fifteen separate forms for seventeen witnesses.

Table 5.163 Graphical forms of the stem of $skbb$.

In this lemma, the use of the W16 (𓊑) or its classes (form 7, 8 and 11) are only attested in Deir el-Bersha, which is true outside the database as well. In the database, it could be suggested that the Theban area prefers the long format of form 14, but outside the database a compact format is attested in the Theban area.\footnote{2009} The long format additionally occurs in Deir el-Bersha.\footnote{2010} In Asyut, the W15 (𓊒) classifier is always used, while the N35A (𓊓) classifier is never added. However, as there are no other attestations for this lemma in Asyut, and both witnesses (S1C and S2C) belong to the same owner, this might be a feature of the supports, rather than a regional preference. In the database, only Meir can be written without a classifier, but outside the database that is attested in Deir el-Bersha as well.\footnote{2011} The other regions seem to always include the W15 or N35A classifier.

5.3.167. $skdi$ (to sail, to travel)\footnote{2012}

The lemma $skdi$ has 83 attestations in the database.\footnote{2013} In table 5.164 the attestations per region are set out for every graphical form of the stem. Note that this is a causative 3ae inf. lemma and gemination occurred. The table was therefore separated in no gemination and gemination.

Table 5.164 Graphical forms of the stem of <i>sqdl</i>.

In the database, the D54 (𓊽) classifier occurs only in Meir. However, outside the database the D54 classifier is attested in el-Lisht as well.<sup>2017</sup> In el-Lisht, the Theban area and Aswan the N33 (𓊽) is not used in the database. Although this is true for Aswan outside the database as well, it is not true for el-Lisht<sup>2018</sup> and the Theban area.<sup>2019</sup> Beni Hasan is only attested with the N33 (form 10), but as there are no other

<sup>2015</sup> de Buck (1935) <i>CT I</i>, p. 321,b (A1C). The addition of the A24 (𓊽) classifier seems a remnant of the lemma which is used by the other witnesses, <i>sidi</i> (see appendix 6.215). In near hieratic cursive script, the M17 (𓊽) and Aa28 (𓊽) can easily overlap (see Möller (1909), p. 27, 46, no. 282 and 488), which most likely explains the variation here, although it is remarkable that both the classifiers for <i>skdl</i> and <i>sidd</i> were used here.

<sup>2016</sup> de Buck (1951) <i>CT IV</i>, p. 297,a, (M57C). Note that Gracia Zamacona (2008), p. 1290 considers this a separate lemma.

<sup>2017</sup> de Buck (1947) <i>CT III</i>, p. 263,c (L1Li).

<sup>2018</sup> de Buck (1947) <i>CT III</i>, p. 263,c (L1Li).

<sup>2019</sup> de Buck (1947) <i>CT III</i>, p. 320,h (T3C).
attestations from Beni Hasan with this lemma in the *Coffin Texts*, it cannot be stated if this is a regional feature.

### 5.3.168. sgr (to silence)\(^{2020}\)

There are 34 attestations of this lemma in the database, of which 31 represent verbal forms.\(^{2021}\) In table 5.165, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>

</tbody>
</table>

Table 5.165 Graphical forms of the stem of sgr.

For this lemma, there are a few signs of a regional preference. The A2 (𓀁) classifier is constantly added in Asyut (form 2, 3 and 7), which is true outside the database as well. The use of form 8 is only attested in Beni Hasan, but as there are no other attestations for this lemma from Beni Hasan in the *Coffin Texts*, it

\(^{2021}\) de Buck (1935) *CT I*, p. 320-321,b, 378-379,c, 405,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 270.
\(^{2022}\) de Buck (1935) *CT I*, p. 405,b (T3C). Assumed to be a variant of sgr. However, as all other witnesses use sfg here (as it is the sfg-irw construction, it is possible that T3C simply left out the I9 (…) instead of the D21 (…). However, as shown in section 5.3.139, T3C normally does not add a Y2 (…) classifier to sfg.
\(^{2023}\) de Buck (1935) *CT I*, p. 320,b (B3C). Although this spelling would suggest the lemma gr (to be silent), based on the other witnesses and the structure of the phrase I considered the loss of the s more likely. Moreover, as gr is the start of a new column, it is not unlikely that the artist missed a sign. However, reading gr is possible here: ss.t-ḥd-ḥtp n gr n-f p.t sidd n-f tḥ wy (This ss.t-ḥd-ḥtp, the sky is silent for him, the lands are reduced to order for him).
cannot be stated with certainty if this is a regional preference, or a feature of the support. Except for the problematic form 11, the Y2 (𓏝) classifier is only used in Deir el-Bersha. Moreover, this classifier is only attested in witnesses which belong to the later period of coffin decoration in Deir el-Bersha.\(^{2024}\) The A69 (𓏾) classifier is only attested in Deir el-Bersha (form 9), but occurs only in B1Bo, including attestations outside the database,\(^{2025}\) and represents a feature of this support, rather than a regional preference.

### 5.3.169. \textit{sti} (to shoot, to pour, to thrust)\(^{2026}\)

This lemma has 24 attestations in the database.\(^{2027}\) In table 5.166, the attestations per region are set out for every graphical form of the stem. Note that this is a 3\textit{ae inf.} lemma and gemination occurs, therefore the table has been separated in gemination and no gemination.

Table 5.166 Graphical forms of the stem of \textit{sti} (to shoot).

---

\(^{2025}\) de Buck (1961) \textit{CT VII}, p. 462,c (B1Bo).

\(^{2026}\) van der van der Molen (2000), p. 569-570.

\(^{2027}\) de Buck (1947) \textit{CT III}, p. 216-217,b; de Buck (1951) \textit{CT IV}, p. 89,m, 307,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 270.

\(^{2028}\) de Buck (1951) \textit{CT IV}, p. 307,b (M54C). Reconstruction. Note that the lacuna seemed too small to me to contain anything else.

\(^{2029}\) de Buck (1947) \textit{CT III}, p. 216,b (S2C,a-b). In the original the shield has only one arrow in it, not two.
In the database only Meir uses the F29 (𓄝) as a logogram. However, outside the database this occurs in P.Gard.2 as well,\textsuperscript{2030} although this witness includes a S29 (𓄝) interpretant. In Deir el-Bersha the V13 (𓄞) can be added and the V1 (𓄛) can be included as classifier (form 11). Outside the database, the V13 occurs only in Deir el-Bersha, although the V1 classifier seems not to reoccur in the Coffin Texts. In Asyut the F29 classifier can be replaced by a variant of the T57 (𓄟) with only one arrow,\textsuperscript{2031} There are no distinctive features from the other regions.

5.3.170. \textit{sti} (to burn, to kindle)\textsuperscript{2032}

In the database there are eleven attestations of this lemma, from the same phrase in spell 4.\textsuperscript{2033} In table 5.167, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>

<td>8</td>
<td>Unknown (Y1C)</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.167 Graphical forms of the stem of \textit{sti} (to burn).

In the database, Deir el-Bersha is the only region which adds the V13 (𓄞), which is true outside the database as well.\textsuperscript{2034} In the database it seems that the D40 (𓄜) classifier only occurs in Asyut and Deir el-Bersha. However, outside the database it occurs in Gebelein as well,\textsuperscript{2035} which makes it unlikely that this could be considered a regional feature. In the Theban area and in Y1C there is no classifier written. However, as there is no other attestation of this lemma from these regions, it is possible that this is simply a feature of the supports.

\textsuperscript{2030} de Buck (1956) \textit{CT VI}, p. 45,m (P.Gard.2).
\textsuperscript{2031} See de Buck (1938) \textit{CT II}, p. 343,a (S1C, S2P, S3P).

\textsuperscript{2033} de Buck (1935) \textit{CT I}, p. 12,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 270.
\textsuperscript{2034} See de Buck (1935) \textit{CT I}, p. 250,d (B10C,c). The classifier makes this reading certain.
\textsuperscript{2035} de Buck (1947) \textit{CT III}, p. 305,d (G1T).
5.3.171. \textit{sts} (to inflame)\textsuperscript{2036}

There are seven attestations of this lemma in the database,\textsuperscript{2037} which are the only attestations of this lemma in the \textit{Coffin Texts}.\textsuperscript{2038} In table 5.168, the attestations per region are set out for every graphical form of the stem. Note that with the exception of form 3, all the other attestations are a \textit{s\textdag\textadd{m}n\=f}, which is the reason the G1 (𓄿) is geminating.

</tbody>
</table>

Table 5.168 Graphical forms of the stem of \textit{sts}.

As these are the only attestations of this lemma, the variation might be unique to the witnesses, rather than a true regional feature. Nonetheless, the use of the O34 (𓊃) instead of the S29 (𓋴) is only attested in Deir el-Bersha. Asyut is the only region in which there is no classifier (form 4). Regrettably, there are no features which could distinguish Deir el-Bersha and Meir from each other.

5.3.172. \textit{sti} (to impregnate, to beget, to ejaculate)\textsuperscript{2039}

In the database, this lemma has 75 attestations.\textsuperscript{2040} In table 5.169, the attestations per region are set out for every graphical form of the stem. Note that as this is a 3\textit{ae inf.} lemma and gemination occurs, the table has been separated in gemination and no gemination.

\(^{2042}\) de Buck (1935) *CT I*, p. 364-365,b (M20C, M23C, M28C, M6C, M-Ann). Due to the other witnesses, I placed this with this lemma, as I assume the U15 (𓊗) is a corruption of the phallus.

\(^{2043}\) de Buck (1935) *CT I*, p. 364,b (M3C). Due to the other witnesses, I placed this with this lemma, I assume the U15 (𓊗) is a corruption of the phallus.
In this lemma, Gebelein and Aswan use their own form for *stl*, which is written as *snT* (form 1 and 2). This seems to represent a southern Egyptian form of this lemma, that does not occur north of Gebelein in the *Coffin Texts*. The classifiers D40 (𓊯) and N35A (𓊱) are only attested in Deir el-Bersha, which is true outside the database as well. In Asyut there is a preference to write this lemma in the long form (form 8, 9, 28, 29), and the phallus is constantly included as a classifier. This is true outside the database as well.\(^{2047}\)

The addition of an U15 (𓊯) occurs only in Meir. However, it is not clear if this is a correct transcription, or if this should be read as a different sign altogether.

\(^{2044}\) de Buck (1935) *CT I*, p. 364,c, 366,b (M3C). Due to the other witnesses, I placed this with this lemma, I assume the U15 (𓊯) is a corruption of the phallus.

\(^{2045}\) de Buck (1935) *CT I*, p. 367,b (M-Ann). Due to the other witnesses, I placed this with this lemma, I assume the U15 (𓊯) is a corruption of the phallus.

\(^{2046}\) de Buck (1935) *CT I*, p. 366,b (M20C). Due to the other witnesses, I placed this with this lemma, I assume the U15 (𓊯) is a corruption of the phallus.

\(^{2047}\) See de Buck (1954) *CT V*, p. 308,c (S14C,a), note that this witness replaced the S29 (𓊱) with a O34 (𓊯).
5.3.173.  

*sdA* (to tremble)*2048*

The lemma *sdA* has 41 attestations in the database.*2049* In table 5.170, the attestations per region are set out for every graphical form of the stem. In the same manner as section 5.3.105, the variation due to the protruding feather of the G38 (𓊨) should not be considered important. Therefore, form 5 and 7 and form 8 and 10 should be considered to be the same.

Table 5.170 Graphical forms of the stem of *sdA*.

In the database, only el-Lisht and Beni Hasan use the O34 (𓊃) instead of the S29 (𓋴). This could suggest a regional variation of the northern attestations of this lemma. However, the S29 is used in Saqqara,*2051* and the O34 additionally occurs in Deir el-Bersha,*2052* which makes it less likely to be a feature of the northern regions. The attestations from Asyut only occur in the long format of form 8 in the database. Outside the database, the compact format is attested in Asyut as well,*2053* but overall the long format still seems to be preferred. The A24 (𓀜) classifier is only attested in Meir in the database, but occurs

---

*2050* de Buck (1935) *CT I*, p. 90,d (M24C, M25C). Reconstructed, the form might have been something else entirely.

*2051* de Buck (1951) *CT IV*, p. 36,d (Sq6C).

*2052* de Buck (1935) *CT I*, p. 205,f (B10C,b).

*2053* de Buck (1951) *CT IV*, p. 110,b (S1C).
outside the database in Asyut as well. However, this could still represent a regional feature of the southern section of Middle Egypt. The G33 (𓊭) is used in multiple regions, albeit rarely, and the phonemogram function of form 1 is only attested in Deir el-Bersha.

5.3.174. *sdm (to hear, to listen)*

The lemma *sdm* has 100 attestations in the database. In table 5.171, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>

---

2054 de Buck (1954) *CT V*, p. 390,f (S2C).
2055 Deir el-Bersha and Meir in the database, but attested in Beni Hasan, see de Buck (1956) *CT VI*, p. 194,k (BH3C), and Asyut, see de Buck (1956) *CT VI*, p. 177,c (S1C).
2057 de Buck (1935) *CT I*, p. 28,c, 106-107,d-a, 121,f, 143-144,d-a, 322-323,c, 327,b, 372-373,b, 389,a; de Buck (1938) *CT II*, p. 57,c, 87,b, 90,d; de Buck (1947) *CT III*, p. 13,b, 14,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 274.
2058 de Buck (1935) *CT I*, p. 372,b (S2C). Based on the other versions, *sdm* seems more likely here than *sdm* (to paint).
In the database, the use of the A2 (𓀁) classifier (form 7) is only attested in Meir. However, outside the database it is attested in the Theban area as well. The Y2 (𓏝) classifier is only attested in Deir el-Bersha (form 3), which additionally seems to be true outside the database. In the database el-Lisht only has an attestation which uses the F21 (𓄔) in the initial position (form 1). However, there are no other attestations from el-Lisht for this lemma, thus it is possible the lemma sđm only occurs in el-Lisht with the F21 in the initial position.

There are no other features in this lemma that can be considered regionally conditioned, as nearly every feature of the graphical form is attested in more than one region.

5.3.175.  ṣw (to be empty, to lack)

There are thirteen attestations of this lemma in the database, from the same phrase in spell 165. In table 5.172 the attestations per region are set out for every graphical form of the stem:

2059 de Buck (1935) CT I, p. 143-144,d-a (B6C), one of the rare attestations of a sđmm-f.
2060 de Buck (1935) CT I, p. 312,b (T1C).
2062 de Buck (1947) CT III, p. 9.a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 278.
In the database, the H6 (𓆄) is only used in Saqqara, as the other attestations use the H6A (𓆅) instead. However, outside the database the H6 occurs in Deir el-Bersha as well. Meir and Saqqara are only attested without the N37 (𓈙) interpretant in the database, but outside the database it is used in Saqqara. There are no additional attestations from Meir for this lemma to verify the absence of the N37, although it is remarkable that in šw (to ascend, see section 5.3.176), the attestations from Meir are only attested with a N37 interpretant.

5.3.176. šw (to ascend, to be raised up)

This lemma has sixteen attestations in the database, from the same phrase in spell 75. In table 5.173, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>Deir el-Bersha</td>
<td>2</td>
</tr>
<tr>
<td></td>
<td></td>

<td>Meir</td>
<td>7</td>
</tr>
<tr>
<td>7</td>
<td>7</td>
<td>Deir el-Bersha</td>
<td>1</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
<td>Theban area</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.173 Graphical forms of the stem of šw (to ascend).

In the database, it seems as if Asyut does not use the N37 (𓈙) interpretant. However, outside the database the N37 interpretant is attested in Asyut. In Beni Hasan, Meir and the Theban area, the N37 interpretant is always included. However, as there are no other attestations of this lemma in these regions, it might not be a regional feature. In the Theban area and Asyut, there seems to be a preference of using the H6A (𓆅) over the H6 (𓆄), whereas in Meir and Beni Hasan the H6 is preferred. It seems that nearly all forms are possible in Deir el-Bersha, although the N37 is more likely to be left out. This is true outside the database as well.

---

2063 de Buck (1956) CT VI, p. 294,a (B1Bo).
2064 de Buck (1961) CT VII, p. 54,a (Sq6C).
2066 de Buck (1935) CT I, p. 342-343,c. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 278 and Gracia Zamacona (2008), p. 1341-1342. Note that van der Plas & Borghouts placed this phrase under šwī (to be empty) instead.
2067 de Buck (1947) CT III, p. 77,c (S10C,a).
2068 For example, see de Buck (1956) CT VI, p. 105,a (B10C,b, B9C), 311,n (B1Bo).
5.3.177. **špt (to be angry)**

The lemma špt has seven attestations in the database, from the same phrase of spell 398. In table 5.174, the attestations per region are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>
<th>Graphical form stem no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Gebelein</td>
<td>1</td>
<td>4</td>
<td>Meir</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>Meir</td>
<td>1</td>
<td>5</td>
<td>Meir</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>Gebelein</td>
<td>1</td>
<td>6</td>
<td>Aswan</td>
<td>1</td>
</tr>
</tbody>
</table>

Table 5.174 Graphical forms of the stem of špt.

There are some features in this lemma that could be considered regional. However, it needs to be noted that the distinction between the fishes might be modern, as in near hieratic cursive script the fishes can look similar. In Gebelein and Aswan, the A2 (𓀁) classifier is never used. In the Theban area, the A2 classifier is used, but there are no additional attestations in the Coffin Texts for the Theban area, Gebelein and Aswan. Meir can occur both with and without the A2 classifier, which is true for Deir el-Bersha and Asyut as well. Note that in Deir el-Bersha an Y2 (𓏝) classifier can be used as well.

5.3.178. **šnt (to revile, to oppose, to punish)**

This lemma has 29 attestations in the database, although only six represent verbal forms. As table 5.175 shows, there are only attestations from Deir el-Bersha for this lemma. As there are no other regions, the database cannot be used to suggest regional preferences. However, outside the database this lemma is attested in Asyut as well, where the D54 (𓆣) and Y2 (𓏝) classifiers are not used.

---

2070 de Buck (1954) CT V, p. 151,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 279.
2073 de Buck (1938) CT II, p. 228,a (S2C,c, S2P).
2074 de Buck (1956) CT VI, p. 389,t (B1C).
2076 de Buck (1935) CT I, p. 46,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 281.
2077 de Buck (1938) CT II, p. 231,b.
5.3.179. \textit{k\textbar i} (to be tall, to be high)\textsuperscript{2078}

There are 22 attestations of this lemma in the database. However, only sixteen of these attestations represent verbal forms.\textsuperscript{2079} In table 5.176, one can see that there are only four graphical forms for this lemma, which vary based on the classifier A28 (𓀠), Y2 (𓏝) or the absence of a classifier.

</tbody>
</table>

Table 5.177 Graphical forms of the stem of kd.

The use of A35 as a logogram is only attested in Deir el-Bersha and Aswan in the database, but occurs outside the database in Asyut as well.\textsuperscript{2085} In the database, the W24 (𓊚) phono-repeater is only used in Asyut. Outside the database it occurs in Deir el-Bersha as well,\textsuperscript{2086} but it is a rare variant, as this witness (B1Bo) habitually uses form 4 or 10. The use of a Y2 (𓏝) classifier is in the database only attested in Deir el-Bersha, but occurs outside the database in Asyut as well.\textsuperscript{2087} The use of a D40 (𓊡) classifier is only attested in Deir el-Bersha. The use of the O36 (𓊥) classifier is in the database only attested in Gebelein, in

\textsuperscript{2082} van der van der Molen (2000), p. 658-659.
\textsuperscript{2083} de Buck (1938) CT II, p. 270-271,d; de Buck (1954) CT V, p. 2,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 290.
\textsuperscript{2084} de Buck (1938) CT II, p. 271,d (M38C). Not seen by de Buck himself, and he suggest that the M17 (𓊡) should be read as a Aa28 (𓊥), the Aa1 (𓊥) as a N33 (𓊡) and the Y2 (𓏝) should be read as a D46 (𓊡), see note 5*. However, I currently cannot say if the error is modern or ancient (although I assume modern).
\textsuperscript{2085} de Buck (1951) CT IV, p. 119,g (S1C).
\textsuperscript{2086} de Buck (1956) CT VI, p. 170,g (B1Bo).
\textsuperscript{2087} de Buck (1956) CT VI, p. 170,g (S10C), although it is rare in Asyut.
G1T, but occurs outside the database in Asyut as well. However, it does not seem that the O36 is a regional feature for Gebelein or G1T, as form 4 is attested as well. Beni Hasan seems to prefer the long format of form 10, but as there are no other attestations from Beni Hasan for this lemma, it might simply be a feature of the witness.

5.3.181.  *gmi* (to find, to discover)\(^{2090}\)

In the database, there are 25 attestations of this lemma.\(^{2091}\) As table 5.178 shows, the graphical form of this lemma is extremely constant:

<table>
<thead>
<tr>
<th>Graphical form stem</th>
<th>no.</th>
<th>Region</th>
<th>Attestations</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="G17" /></td>

</tr>
<tr>
<td></td>
<td></td>
<td>Theban area</td>
<td>5</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Gebelein</td>
<td>2</td>
</tr>
</tbody>
</table>

Table 5.178 Graphical forms of the stem of *gmi*.

In this lemma, there is no clear sign of regional preferences. However, it is remarkable that only the northern attestations of this lemma do not include the interpretant G17 (𓅓). However, as Saqqara and el-Lisht have attestations with the G17 as well, it is not the sole form used. Moreover, outside the database, the use of form 1 is attested in P.Gard.2 as well.\(^{2092}\) As all attestations of form 1 occur as a *sdm.n-f*, it might reflect a feature of the *sdm.n-f*, rather than a regional preference.

5.3.182.  *gr* (to be silent, to be quiet)\(^{2093}\)

In the database, there are a total of 23 attestations of the lemma *gr*, however, only nineteen of these are used as a verb form.\(^{2094}\) As table 5.179 shows, the main variation lies in the use of a classifier.

---

\(^{2088}\) de Buck (1956) *CT VI*, p. 61.h (S1C).

</tbody>
</table>

It is clear that form 3, which uses the A2 (𓀁) classifier, is the preferred form to write this lemma in all the regions. However, especially Deir el-Bersha can leave out the classifier, or use a Y2 (𓏝) classifier instead. However, the absence of the classifier is not unique in Deir el-Bersha, as it is attested outside the database in the Theban area and Saqqara as well. On the other hand, Meir is the only region where the A1 (𓀀) classifier is used instead of the A2 classifier.

5.3.183. \(\textit{twr}\) (to show respect to)\(^{2097}\)

This lemma has fourteen attestations in the database, from the same phrase in spell 75.\(^{2098}\) In table 5.180, the attestations per region are set out for every graphical form of the stem:

\(^{2095}\) de Buck (1935) \(CT\ I\), p. 298.g (T9C and Sq3C).
\(^{2096}\) Although this might be due to the modern interpretation of the script, rather than an intentional variation, as the position of the arm might imply both A1 (𓀀) and A2 (𓀁), in which case de Buck needed to make a choice.
\(^{2098}\) de Buck (1935) \(CT\ I\), p. 385,d. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 304.
The use of the Y2 (𓏝) classifier is only attested in Deir el-Bersha, specifically in the witnesses of the later period of coffin decoration. This is true outside the database as well. The D40 (𓀥) classifier is only attested in Meir, although there does not seem to be an additional attestation of the D40 classifier in the Coffin Texts. In Gebelein, there seems to be a preference to not include a classifier (form 1), but as there are no other attestations of this lemma from Gebelein, it might simply be a feature of the support. Finally, the A30 (𓀢) classifier is only attested in Meir (form 4), but outside the database it is attested in Deir el-Bersha as well. However, this might simply be an interpretation of de Buck, as in near hieratic cursive script, which is used in these witnesses (M5C and B3C), it is nearly impossible to differentiate between the A30 and the A4 (𓀃).

5.3.184. ḫ5 (to tie, to knot, to knit together)

There are 74 attestations of this lemma in the database, but only 66 attestations represent verbal forms. In table 5.181, the attestations per region are set out for every graphical form of the stem:

---

2099 de Buck (1935) CT I, p. 385,d (S1C). I assume the A1 (𓀀) is an error, as S2C, which belongs to the same owner, uses an A4 (𓀃) instead.

2100 de Buck (1947) CT III, p. 54,f (B3C).

2103 de Buck (1935) CT I, p. 14,d, 58-59,e-a, 140,b, 316,a, 318-319,b, 336-337,a, 336,b, 393,d; de Buck (1951) CT IV, p. 91,g, 91,o-p, 93,b; de Buck (1954) CT V, p. 122,e. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 314.
Form 1 is only attested in Aswan in the database, but occurs outside the database in Asyut as well. In the database the V1 (𓀊) classifier only occurs in Deir el-Bersha, but occurs outside the database in other regions as well. However, the use of an D37 (𓀋) or D40 (𓀌) classifier (form 5 and 10) are only attested in Deir el-Bersha. In the database it seems that in Asyut the S24 (𓋬) is only used in the initial position, although outside the database form 7 is attested as well. Thus, there does not seem to be a clear regional preference for this lemma.

5.3.185.  

This lemma is attested eleven times in the database. In table 5.182, the attestations per region are set out for every graphical forms of the stem:

---

2104 de Buck (1935) CT I, p. 319,b (M-Ann), I assume the O34 (𓀊) and Y2 (𓀊) were accidentally switched, but I cannot say if it is a modern corruption, or if it occurred on the original as well, as de Buck did not see this witness himself.

2105 de Buck (1954) CT V, p. 213,a (S2C).

2106 de Buck (1947) CT III, p. 77,a (S10C,b); de Buck (1954) CT V, p. 213,a (M22C).

2107 de Buck (1938) CT II, p. 218,e.

2109 de Buck (1951) CT IV, p. 253,d-f, 307,d; de Buck (1954) CT V, p. 139,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 318 and Gracia Zamacona (2008), p. 1454-1469.)
For this lemma, the only real variation occurs in the attestations from Meir, which can have a reduced form (4 and 6), where the F46 (𓄲) and F48 (𓄶) are used without interpretants. However, the fully spelled out forms (1 and 2) occur as well. Outside the database, there are instances of a reduced form in Deir el-Bersha, although not to the extent as form 4 and 6, as there is a N35 (𓈖) interpretant or D54 (𓇪) classifier attached. Thus, the use form 4 and 6 seems to be unique in Meir.

5.3.186.  **dbh (to ask for, to beg, to demand)**

In the database, this lemma is attested ten times, in the same phrase of spell 162. As table 5.183 shows, the form is relatively constant, and the majority of the variation occurs in the classifiers.

2113 de Buck (1938) *CT II*, p. 401-402,c-a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 319.

488
For this lemma, there are signs of a regional preference in the graphical form, based on the use of F18 (𓄑). In Deir el-Bersha and Meir, this hieroglyph is constantly written before the D58-V28 (𓈉) group, including in attestations outside the database. On the other hand, Gebelein places it behind the D58-V28 group. Even though the attestations in the database suggest that this pattern might apply to the northern attestations versus the southern attestations, this is not true. In Aswan,\textsuperscript{2114} the F18 is written before the D58-V28 group. Another attestation from Beni Hasan has the F18 after the group, even though it is more up north than Deir el-Bersha. Thus, for Deir el-Bersha and Gebelein there is a clear preference in the placement of the F18, where the other regions are attested with both placement options for the F18.

5.3.187. \textit{dmfd} (to unite, to assemble)\textsuperscript{2115}

In the database, the lemma \textit{dmfd} is relatively common, with a total of 60 attestations.\textsuperscript{2116} In table 5.184, the attestations per region are set out for every graphical form of the stem:

<table>

</tbody>
</table>

Table 5.184 Graphical forms of the stem of \textit{dmfd}.

\textsuperscript{2114} de Buck (1954) \textit{CT V}, p. 48,b (A1C), although it could be argued that it is written between, rather than in front of or behind.

\textsuperscript{2115} van der van der Molen (2000), p. 795.

\textsuperscript{2116} de Buck (1935) \textit{CT I}, p. 340,c, 352-353,c, 354-355,a, 376-377,a); de Buck (1954) \textit{CT V}, p. 124,c). For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 320.

\textsuperscript{2117} Note that three of these attestations are from M6C, which were all reconstructed. The form is therefore a guess, and could be nearly any other form as well.
In this lemma, there are some variations that suggest a regional preference. In form 1 and 2, the S23 (𓋬) is used as a classifier, where all other forms use it as a logogram.\footnote{Note that for me a logogram can occur with or without interpretants.} The use of S23 as a classifier seems to be a unique feature of Meir, even though nearly every other form is attested in Meir as well.

Form 9 is one of the more common forms, and represents an interesting feature, as the attestations from the Theban area are both from T3C. As the attestations from Aswan (A1C) and most of the attestations for Gebelein use form 9 as well,\footnote{de Buck (1954) CT V, p. 124,c (G1T) is the only exception, as it uses form 3.} it is possible to suggest that for the southern Egyptian First Intermediate Period school of artists there was a preferred form for this lemma.\footnote{Willems (1988), p. 110. Note that the suggestion of grouping A1C, G1T and T3C together originates from Derchain (1952), p. 361.}

Although the exact form can vary, there seems to be a preference in Deir el-Bersha to include the Y2 (𓏝) classifier for every attestation. Based on the database alone, it seems that Asyut has a clear preference for form 6, as no other form is attested. However, form 9 is attested outside the database in Asyut as well.\footnote{de Buck (1947) CT III, p. 29,b.}

5.3.188. \textit{dn} (to kill, to cut off)\footnote{Willems (1988), p. 110. Note that the suggestion of grouping A1C, G1T and T3C together originates from Derchain (1952), p. 361.} 

In the database, this lemma is only attested fourteen times, in the same phrase of spell 335.\footnote{van der Molen (2000), p. 797-798.} In table 5.185, the attestations per regions are set out for every graphical form of the stem:

<table>
<thead>
<tr>
<th>Graphical form stem</th>

</tr>
</tbody>
</table>

Table 5.185 Graphical forms of the stem of \textit{dn}.

Based on this table, one could suggest that Meir exclusively uses A24 (𓋬) or D36 (𓋬) classifiers, and habitually a T30 (𓋬) classifier, whereas the majority of attestations only use a T30 classifier. Additionally,
in the attestations outside the database, the only classifier used is T30, thus the use of A24 or D36 classifier for this lemma seems to only occur in Meir.

5.3.189.  

**dr (to expel, to subdue, to drive out)**

In the database, this lemma is relatively common, with a total of 182 attestations. As table 5.186 shows, the variation in the graphical form is due to the classifier or lack thereof.

</tbody>
</table>

Table 5.186 Graphical forms of the stem of *dr*.

In this table, one can see that form 2 is most commonly used. Form 6 is the most common form of the graphical forms which use a classifier. Although there are no unique forms for any specific region, there are still some regional preferences. Even though form 2 is used in every attested region, it is the only attested form for Asyut, Gebelein and Aswan. Thus, it could be argued that these regions prefer not to add a classifier with this lemma. However, this is not true for Asyut, as it is attested with a A24 (𓀜) classifier outside the database as well.

The sole attestation from Beni Hasan could be a representation of a regional preference for using the D40 (𓀚) classifier. However, outside the database form 2 is used in Beni Hasan as well. Saqqara and el-Lisht are the only attestations which use the D36 (𓀚) as classifier. However, this might represent a

---

2126 de Buck (1935) *CT I*, p. 17,a, 90-91,a, 104-105,a, 117,c, 119,c, 120,e, 121,e, 136-137,d-a, 137,c, 144,c, 392,b, 400,c, 401,b; de Buck (1951) *CT IV*, p. 208-209,c, 256-257,c, 319,b; de Buck (1954) *CT V*, p. 157,a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 320-321.
2127 Assumed to be a corruption in which the D46 (𓀚) was lost. See de Buck (1935) *CT I*, p. 91,a (B12C,b).
2128 de Buck (1935) *CT I*, p. 17,a (B1P). Note that due to the script of this witness, it is nearly impossible to differentiate between the D37 (𓀚) and the D40 (𓀚). See Möller (1909), p. 9, no. 103, 105.
2129 de Buck (1938) *CT II*, p. 137,a (S1C),
2130 de Buck (1938) *CT II*, p. 116,r (BH3C).
feature of the script used in these witnesses, rather than an intentional choice. \(^{2131}\) This would make form 4-5 and form 7 the same as form 6, and thus should not be considered a feature on which a regional preference can be based, beside the use of an arm classifier.

5.3.190. \(d\|\|i\) (to extend, to stretch out, to turn to, to oppose)\(^{2132}\)

In the database, the lemma \(d\|\|i\) is attested 27 times.\(^{2133}\) Note that due to form 3 and 8 (see table 5.187), one could easily mistake this lemma for \(d\|\|i\) (to cross; see section 5.3.191), in which case only context can be used to differentiate between the two lemmas.

</tbody>
</table>

Table 5.187 Graphical forms of the stem of \(d\|\|i\) (to extend).

Although Deir el-Bersha is overrepresented for this lemma, with 21 of the 27 attestations, there is a unique feature in the spelling, namely the use of the P1 (𓊛) classifier, which only occurs in Deir el-Bersha. However, outside the database the P1 classifier is attested in Asyut, Meir, Theban area and Gebelein as well.\(^{2134}\) The D40 (𓄕) and D54 (𓄕) classifier are only attested in Deir el-Bersha, which is true outside the database as well, although rare. Form 10 only occurs in el-Lisht, as it uses only the head of the G1 (𓄿) as interpretant. However, this is a feature of the witness L2Li, rather than a regional

---

\(^{2131}\) As in near hieratic cursive script the signs of the arms can be difficult to differentiate. See Möller (1909), p. 9, no. 99, 100, 103, 105, 106.

\(^{2133}\) de Buck (1935) CT I, p. 74,c, 109,b; de Buck (1938) CT II, p. 272-275,c-a. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 323.

\(^{2134}\) de Buck (1951) CT IV, p. 139,a (S1P); de Buck (1954) CT V, p. 172,g (M2NY,a, M5C,a); de Buck (1956) CT VI, p. 276,m (G1T), 277,m (TT319).
preference. Finally, Asyut seems to prefer a compact format (form 2 and 4) for writing this lemma. However, outside the database, the long format is attested as well.2135

5.3.191.  

\(d\text{si} \) (to cross, to ferry)2136

This lemma is relatively common in the database, with a total of 64 attestations. However, only 59 attestations represent verbal forms,2137 as the substantive \(d\text{si} \) (ferry boat) was encoded under this lemma.2138 Note that it might be difficult to differentiate this lemma from \(d\text{si} \) (to extend; see section 5.3.190), as the differentiation can only be made based on the classifier or context. Moreover, due to the graphical form of \(w\text{d}\text{si} \) (to be hale, to be uninjured; see appendix 6.77) and \(w\text{d}\text{si} \) (to proceed, to go in procession; see appendix 6.78) it can be difficult to differentiate this lemma when a \(w \) is added in the prospective or in a participle,2139 in which only context and the other witnesses with the same phrase can give clarity. Nonetheless, table 5.188 shows the attestations per region for every graphical form of the stem:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Table 5.188 Graphical forms of the stem of \(d\text{si} \) (to cross).

2135 de Buck (1947) *CT III*, p. 391,e (S1C, S2C,b).
2137 de Buck (1935) *CT I*, p. 46,e, 53,d; de Buck (1938) *CT II*, p. 76,a, 82-83,d-a, 83,1*, 83,b, 273-275,c-a, 402,c, 403,d; de Buck (1951) *CT IV*, p. 218-219,a, 220-221,b 226-227,a, 246-247,a, 326,c-d; de Buck (1954) *CT V*, p. 159,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 323 and Gracia Zamacona (2008), p. 1479-1509.
2138 As the substantive can be considered a participle (that which ferries). However, it is not my intention to state that the substantive developed from the verb, or vice-versa.
2139 As these attestations can write \(w\text{d}\text{si} \) as U29*G43 (\(𓊸𓅱\)).
As table 5.188 shows, form 3 and form 9 are the most commonly used, as these represent this lemma most clearly, due to the P1 (𓊛) classifier. However, even though these are two graphical forms of the same spelling, it is clear that the distinction between the two matters, as the attestations from Aswan and Gebelein only use the compact format of form 3. As the witnesses from Aswan (A1C) and Gebelein (G1T, G2T) are considered to both originate from the same First Intermediate Period school of artists of southern Egypt,\(^{2140}\) it could suggest that this school prefers to write a compact format for this lemma.

Although the majority of the regions have at least one attestation with the P1 classifier, this is not the case for Saqqara and el-Lisht. Although the absence of a classifier, or the use of a different classifier is not unique, based on the attestations in the database, one could suggest that the northern attestations of this lemma preferred not to write the P1 classifier, but did not use a classifier, or used the D54 (𓂻) or Y2 (𓏝) classifier instead. However, this is not the case, as the use of the P1 classifier is attested in these regions as well.\(^{2141}\)

5.3.192.  
\textit{dfr} (to search out, to seek)\(^ {2142}\)

In the database, this lemma is attested eighteen times, in the same phrase from spell 75.\(^ {2143}\) Table 5.189 shows the attestations per region, set out for every graphical form of the stem:

\begin{table}
\centering

\end{itemize}
\end{footnotesize}
In Meir, there does seem to be a preference to include the D54 (𓀆) classifier, or no classifiers at all. Although attested once, Meir seems to prefer the exclusion of the T14 (𓌙) classifier. Note that a distinction was made between form 3 and form 6, based on the position of the D21 (𓀇) in comparison to the I10 (𓆓). However, this was based more on de Buck than the originals, as in the near hieratic cursive script of A1C and G1T, the tail of the I10 stays more or less horizontal, which is not reflected in the standardised hieroglyphs. However, this would not be the case for witnesses that are more on the hieroglyphic side of cursive script. If form 3 and 6 are considered the same for A1C and G1T, it is interesting to see that this groups them together with the attestation of the Theban area (T3C), as these should be considered a group. Thus, they seem to prefer the same graphical form for this lemma, even though the form is not unique to this group of coffins.

5.3.193.  

**dnd (to rage, to be angry)**

This lemma is attested 24 times in the database. As table 5.190 shows, the majority of the variation is based on the classifier. However, there is an issue with the use of the F2 (𓀞) and F5 (𓀛) classifier, as these are distinct in hieroglyphic script, but less so in near hieratic cursive script. Thus, it is possible that the separation between the two classifiers was a modern distinction.

---

2144 A unique spelling, where it seems that the T14 (𓌙) was replaced by a V28 (𓅞). However, in comparison to the other attestations of the V28, this one is remarkably larger, so might represent another sign. See de Buck (1935) CT I, p. 322,b (B1P), 323,1*.

2145 de Buck (1935) CT I, p. 322,b (B6C), assumed to be a corruption, as the lemma 𓀇𓊂 combined with the A24 (𓀒) classifier does not make any sense here.

2146 Based on pictures of the original. Images of G1T were provided to me by the Museo Egizio, Turin. For A1C, see Willems (1996), pl. 33.

2147 Fischer (1976), p. 41 (fig. 4), type 2.3a, although type 2 is technically not cursive script.

2150 de Buck (1935) CT I, p. 50-51,c-a, 320,c, 324-327,c-a, 328,b. For additional attestations outside the database, see van der Plas & Borghouts (1998), p. 326.

2151 Möller (1909), p. 14, no. 151 and 154 (especially the example from Papyrus Ebers).

Table 5.190 Graphical forms of the stem of ḏnd.

One remarkable feature is the use of the entire bull as classifier in Beni Hasan, as any other region only writes the head or the head and foreleg of the animal. However, as there are no other attestations from Beni Hasan in the Coffin Texts, it is difficult to say if this represents a regional preference, or if it is a peculiarity of the support (BH2C). The use of the A24 (𓀜) and D40 (𓂡) classifier seems to occur only in to Deir el-Bersha and Asyut, while the use of the Y2 (𓏝) classifier seems to only occur in Deir el-Bersha and Meir, which is true outside the database as well.

5.3.194. Conclusions

As the 193 lemmas above showed, there are regional preferences in the graphical form of the verbal lemmas, although often based on criteria that overlap with other regions. Thus, instead of providing clear regional features for each lemma, the results rather provide a way to exclude certain regions if the provenance of a witness is unknown. Nonetheless, using the graphical form of the stem of verbal lemmas should only be used as a supporting feature.
Even though it would generally be unwise to transport a feature of one lemma to another, it was possible to extract one general trend in Deir el-Bersha. In Deir el-Bersha it was much more likely to replace the classifier of a lemma with a Y2 (𓏝) or D40 (𓋴) classifier, when the lemma does not naturally use that classifier. Moreover, in this period the broad use of the Y2 and D40 classifier is not as common as it becomes in the New Kingdom. Nonetheless, it could be argued that this feature is based on the date of coffin decoration in Deir el-Bersha, as this feature is more common with the witnesses dated to the reign of Amenemhat II and onwards. Additionally, replacing the S29 (𓋴) with a O34 (𓏙) is much more common in Deir el-Bersha in the same period.

Although the use of the Y2 and D40 as generic classifiers is not unique to Deir el-Bersha, it is more likely to occur in that region. However, this variation might be due to the fact that Deir el-Bersha is overrepresented in the Coffin Texts, and it is possible that the same features could be visible in Meir and the Theban area if they had the same representation.

For the verbal lemmas, the strongest evidence for regional preference lies in the classifiers, as there is often a preference for one classifier over another, although rarely only in one region. However, there were cases in which the exact graphical form did matter. For example, in ḫḥs (to throw off; see section 5.3.42) the attestations from Asyut have a clear preference for the long format. Thus, although much less common, there are regional preferences in the graphical form for a lemma, beside the spelling. However, this distinction is rare.

Additionally, although only hinted at in the lemmas, there might be some distinction in the graphical form based on the support, as there might be some variation between the graphical forms on the coffins, and the graphical forms used on papyri. This distinction might provide some insight into the mindset of the artist.

Due to the approach used for the description of the graphical forms of verbal lemmas, any interaction between the context of these lemmas has not yet been researched. Thus, it might be possible that the graphical form of the words before and after the verbal lemmas have influence on their final form. Moreover, it might be possible that the morphology of a lemma could have influence over the graphical form, rather than any region.

Although the database was a great method to collect the different graphical forms, it was often clear that only relying on the database would provide false positives or negatives. For example, this was the case for ḫḥn (to be young; see section 5.3.79), where some regional preference exists, although only visible in attestations outside the database. Thus, a more in-depth study of specific lemmas, including all

---

2152 For example, see snḏ (to fear; see section 5.3.152)
2153 See Chantrain (2014) for a description of the evolution of classifier in the New Kingdom. However, this could be taken as a sign of standardisation in the classifiers.
2154 Although it occurs before this period in Deir el-Bersha as well.
2155 For example, see gmi (to find; see section 5.3.181). Although I did not notice the same in any of the other lemmas. However, it is possible that I simply missed it.
attestations in de Buck and including additional material would be extremely beneficiary to enhance the results gathered in this chapter.\textsuperscript{2156}

Moreover, the selection process of the lemmas can be enhanced, as lemmas with a low number of attestations or a high number of attestations rarely provided any meaningful results. It would be preferred to exclude the most common lemmas, as they rarely provide a regional preference.\textsuperscript{2157} The same is true for the rare lemmas, as one often has to wonder if a feature is regional, or a personal preference of the artist. Although a high number of attestations is preferred over a low number, the work performed on this chapter suggested that 50-200 attestations for a lemma from varied sources provides a relative reliable result.

Nonetheless, this first approach to using the graphical form to visualize regional preferences did provide results, although an addition of material and approaches would be extremely beneficiary. Even so, it is clearly possible to distinguish regional preferences in the graphical forms, although only as a tool of exclusion.

5.4. First person stative

In this section, the regional aspects to the first-person stative will be discussed,\textsuperscript{2158} as it was observed to have some regional conditioned tendencies while these forms were encoded. One of the more interesting features of the first-person stative is that it has multiple different approaches to write the ending after the stem of the verb. In short, the first person stative ending occurs in four different types in the Coffin Texts which were encoded in the database: \textit{.k}, \textit{.ki}, \textit{.kw} and \textit{.kwi}.\textsuperscript{2159} Although the graphical forms of these ending types vary, there seems to be some regional preference of writing one pattern of graphical form of the ending of the first-person stative over another. Table 5.191 separates the four ending types, the different graphical forms and the attestations per region for that ending type:

\begin{table}[h]
\centering%
\begin{tabular}{llll}
\hline
Ending type & Graphical form & no. & Region & Attestations \\
\hline
\textit{.k} & & 1 & Saqqara & 3 \\
 & & & Beni Hasan & 1 \\
 & & & Asyut & 1 \\
 & & & Theban area & 3 \\
\hline
\end{tabular}
\caption{Regional preferences for the first person stative ending.}
\end{table}

\textsuperscript{2156} For example, the inclusion of material not included in de Buck, material from other regions, and including the Pyramid Texts from Middle Kingdom supports as well.
\textsuperscript{2157} For example, \textit{hpr} (to become; see section 5.3.112) was one of the few common lemmas which provided some regional features.
\textsuperscript{2158} For a discussion in regard to the stative, see Kammerzell (1990); Kammerzell (1991,a); Kammerzell (1991); Vernus (1997), p. 17-19; Reintges (2006); Oréal (2009); Oréal (2010); Oréal (2013); Reintges (2015); Brose (2018).
\textsuperscript{2159} Note that the use of the \textit{i} phonetic value is simply to separate the different graphical forms, and does not represents an actual phonetic value, but rather the use of one of the following classifiers: A1 (𓀀), M17*A1 (𓇋𓀀), A40 (𓀬), A50 (𓀂), M17 (𓀘), M17*Z1 (𓀘𓏤) and Z1 (𓏤), where M17, M17*Z1 and Z1 are considered to be alternative writings for a humanoid figure. Based on Kammerzell (1991,a), p. 189-191, it would be better to assume there is only the ending \textit{.kw}, of which the \textit{w} is sometimes not written, and the \textit{i} variants function as a classifier. Note however that Reintges (2015), p. 396 actually has 5 types of endings, as he has \textit{.kiw} as a separate ending, which I consider to be a variant of \textit{.kwi} (see table 5.191, type \textit{.kwi}, form 3, 4 and 14).

</table>
Table 5.191 First person stative, sorted by type, graphical form and region.

Note that in table 5.191, distinctions were made between all types of graphical forms, even if the same signs are written in a longer format, or clustered as a group.\[2160\] Even though this difference might be considered inconsequential, there are some regional pattern differences. For example, in ending type \.ki\, form 4 and 5 use the same signs, even though in form 4 the M17 (𓊁) and A1 (𓀀) are next to each other. For the attestations from Asyut, this does not matter, as both occur. However, Gebelein and Meir both only use form 4, where the Theban area only uses form 5. Thus, the separation between the long form and the compact form is of importance.

For the encoded sections of the Coffin Texts, there are a total of 287 attestations of the first-person stative.\[2161\] The ending type \.k\ has 21 attestations, the ending type \.ki\ has 105 attestations, the ending type \.kw\ has 19 attestations and the ending type \.kw\ has a total of 142 attestations. Of all attestations,
Deir el-Bersha provided 82 attestations, Meir has 62, Asyut used 50, the Theban area gave 37, Saqqara provided 21, el-Lisht used 12, Gebelein and Beni Hasan have seven attestations and Aswan six attestations. Finally, there are two attestations from papyri, one from P. Gard. 2, and two attestations from a source with an uncertain provenance, Y1C.

The following figure shows the percentage of every ending type for every region (figure 5.5):

![Figure 5.5 Percentage of the ending type of the first-person stative, sorted by region.](image)

As figure 5.5 shows, it is rare that all ending types occur in one region. Only in Saqqara and Deir el-Bersha are all four ending types attested. However, both regions seem to have a preference for using the ending type .kwi, as in both cases it occurs around 60%. Additionally, in Deir el-Bersha, there seems to be a preference to use some type of classifier with the first-person stative, as only 9% of the attestations do not show any form of classifier with the first-person stative ending. Saqqara on the other

---

2164 Over a total of 8 witnesses (S1C, S2C, S3C, S9C, S14C, S2P, S3P, S1Tü).
2165 Over a total of 6 witnesses (T1Be, T2Be, T3Be, T1C, T3C, T3L).
2166 Over a total of 6 witnesses (Sq1C, Sq2C, Sq7C, Sq15q, Sq7q, Sq8q).
2167 Over a total of 2 witnesses (L1NY, L3li).
2168 Over a total of 2 witnesses (G1T, G2T).
2169 Over a total of 2 witnesses (BH1Br, BH2C).
2170 Over a total of 1 witness (A1C).
hand seems to be more comfortable with not writing the classifier, as 29% of the attestations do not have some sort of classifier.\footnote{However, it is interesting that the use of humanoid figures only occurs in a total of 3 attestations, all from the same support (Sq7Sq), see table 5.191, ending type \textit{.ki}, form 1. All other classifiers are or a M17 (𓀫) or a Z1 (𓏤), which can easily be lost.}

In Deir el-Bersha, there is a unique feature that clearly separates it from the other witnesses, and which can be used as a provenance tool. In Deir el-Bersha, the A50 (𓀻)\footnote{However not exclusively so, as one can see in table 5.191, ending type \textit{.ki} form 1 and 2 and type \textit{.kw} form 6. See Schenkel (1996), p. 124-127, for more detail regarding the use of the first person in the \textit{Coffin Texts}.} can be used as classifier for the witnesses that are dated to the later period of coffin creation in Deir el-Bersha, between the reigns of Amenemhat II and Sesostris III\footnote{Willems (1988), p. 74-81.}. In total, only 14 attestations with a classifier do not use the A50. However, this is not that remarkable, as the earlier period witnesses usually put the owner in the third person. The occurrence of a classifier or a lack of a classifier is not bound by period, as B4L occurs both with and without classifier, and uses A1 (𓀀) if a classifier is written, although all other later period attestations of a classifier always use the A50 classifier.\footnote{Based on the data currently available, it is not unlikely that the addition of new spells and witnesses might contradict this conclusion.}

Another region which seems to follow a pattern is Asyut. As one can see above, the majority of its attestations are ending type \textit{.ki}, with 6% of its attestations using ending type \textit{.k}.\footnote{A total of three attestations out of 50. Note that all these cases represent a lack of space at the end of a column, thus the variation is due to practical reasons.} Thus, there is a clear preference in the ending type used in Asyut. Although the actual graphical form of ending type \textit{.ki} is varied, it is clear that it usually includes the classifier A1 (𓀀). There are only two more sections that show this clear preference for the ending type \textit{.ki}, namely the two papyri, and Y1C. The fact that these four attestations seem to follow the Asyut pattern perfectly fits, as Y1C, Pap.Berl and P.Gard.2 are all suggested to originate from Asyut.\footnote{See Jürgens (1990), p. 55-56 for Y1C, Regulski (2015), p. 301 for Pap.Berl. and Schenkel (1996), p. 125 for P.Gard.2.} Thus, it could be suggested that if the first-person stative is never written with an \textit{w} in a support, it might originate from Asyut.

The attestations from el-Lisht seem to show a clear preference as well. Where ending type \textit{.kw} is a minority for all the other regions, in el-Lisht it seems to be the preferred format instead. Although one case of the ending type \textit{.kw} occurs,\footnote{de Buck (1951) \textit{CT IV}, p. 245,a. However, this attestation was based on a text not seen by de Buck himself.} and two cases of the ending type \textit{.k},\footnote{de Buck (1951) \textit{CT IV}, p. 306,b, although it needs to be noted that both these attestations are from the same support (L1NY) and same phrase. Moreover, I was not able to verify either case, as they are no longer visible.} it is clear that the witnesses from el-Lisht seem to dislike using the classifier with the first-person stative ending. Moreover, as the only instance of a classifier is a M17 (𓀫), it could be argued that there is no classifier in witnesses from el-Lisht at all. Even so, there seems to be a clear preference of writing an \textit{w} and not using classifiers in el-Lisht.
In Meir, there is a clear preference of using a classifier, preferably using the ending type `.kwi`, which is used in 76% of the cases. Moreover, as 22% of the attestations use the ending type `.ki`, it is clear that in Meir one should expect the use of some type of classifier. There is only one attestation in which the classifier is absent,2179 which is due to the fact that the stative ending was only added at a later date. This witness (M1NY) habitually uses a A40 (𓀭) classifier,2180 which does not occur in any other witness. It can be assumed that if there was space, the artist would have added the A40 as well. Beyond this point, Meir provides a large number of unique graphical forms,2181 which shows that a large variety in exact classifier was visible, and that the use of a classifier was important, rather than the exact form.

Beni Hasan is one of the few regions that does not use the ending type `.kwi`. Instead, 50% of the attestations use ending type `.k`, 33% uses ending type `.ki` and 17% uses ending type `.kw`. However, these percentages involve significant uncertainty, as 50% only represents three attestations in the database. Moreover, these divisions actually represent two different witnesses. Ending type `.ki` is only used in BH2C, which are two attestations that occur in the same phrase.2182 The other four attestations come from BH1Br. Thus, there is no clear regional pattern for Beni Hasan.2183

The Theban area seem to have a preference for using a classifier, as 62% of the attestations uses ending type `.kwi` and 24% uses ending type `.ki`. However, there is a final 14% of the attestations which use ending type `.k`. Ending type `.kw` does not seem to occur in the Theban area. Based on the witnesses which occur in the Theban area, it could be suggested that there is some influence based on the date of the witnesses. T1C only uses ending type `.k` and `.ki`, and is dated to the reign of Mentuhotep III-IV.2184 T3L, which uses all three ending types, is dated to the reign of Sesostris I to Amenemhat II.2185 The final three witnesses, T1Be, T2Be and T3Be, only use ending type `.kwi`. These witnesses are all dated to the reign of Sesostris III.2186 Thus, it seems that over time the preference in the Theban area shifted towards the ending type `.kwi`. However, even though T1C and T3L both use the `.k` type ending, even in these witnesses the majority of the witnesses prefer to add some type of classifier to the ending, as T1C has three attestations without a classifier, and five with a classifier. T3L only has two attestations without a classifier, while having four attestations of ending type `.ki` and `.kwi` respectively. Thus, for the Theban area the preference would lie on using a classifier, usually A1 (𓀀) or M17-A1 (𓇋𓀀), although T1Be does use the replacement M17 (𓇋) or M17*Z1 (𓇋𓏤) instead.

Gebelein has only seven attestations, which except for one attestation,2187 use a classifier with the ending. The preference seems to lie with the ending type `.ki`, although the `.kwi` is possible as well.

2179 de Buck (1951) *CT IV*, p. 306,b (M1NY).
2181 See table 5.191, form 2, 3, 4, 13, 15, 17 and 19.
2182 de Buck (1935) *CT I*, p. 325-327,c-a.
2183 However, as BC2C uses M17 (𓇋) as a classifier, it could be suggested that the use of a humanoid sign in the first-person stative is unlikely in Beni Hasan. However, this might simply represent the idiosyncratic habits of the artist.2184 Willems (1988), p. 110-114.
2187 de Buck (1954) *CT V*, p. 158,b (G1T). However, the sign is badly made in the original, and as there is a type `.ki` in the same column, one could wonder if a mistake was made.
Beyond the preference for using a classifier, it is remarkable that the classifier group is always the same, using the M17*A1 (𓇋𓀀) group next to each other in the column. It seems that the attestations from Gebelein prefer a compact format for the classifier group. However, it needs to be noted that this is based on two witnesses, G1T and G2T, which are assumed be part of the same assemblage.

As the attestations from Aswan are all based on the same witness, it would be assumptive to suggest a distinct pattern in Aswan based on this one source. Even so, there seems to be a preference to use an w in the ending, as only one attestation is without the w. Moreover, the preference lies in using an A1 (𓀀) as a classifier, as all attestations of ending type .kwi use form 6.

Note that it was attempted for all the witnesses to see if there is any reason behind the use of one ending type over another. However, the majority of the witnesses only have one ending type, while in the witnesses with multiple ending types there is often no clear reason behind the variation. However, sometimes a reason is visible, for example in spell 335. Here, T1C,a has ending type .k, where T1C,b has ending type .ki, which might be intentional to distinguish the two witnesses from each other. Or, in the case of Asyut, ending type .k is only used when the stative occurs at the end of the column, and is therefore only used out of practical reason. However, it was not possible to locate grammatical reasons for the use of the different ending types.

Although some overlap does exist, it is clear that there are regional preferences for the ending types of the first-person stative. However, as stated in chapter 5.2, all the following comments are based on the encoded sections of the database. Therefore, any additional attestations of the first-person stative might change these results in a meaningful manner. Nonetheless, it could be argued that the ending type of the first-person stative can be used as a tool to provide (or at least to confirm) provenance to a witness.

In Asyut there is the most clarity, as it nearly exclusively uses the ending type .ki. Thus, if an w is found with the first-person stative, it can be assumed that the witness does not originate from Asyut. In Deir el-Bersha, it is possible to differentiate between the other witnesses, although most clearly on the use of the A50 (𓀻) for the first person, which is only used during the later period of coffin decoration in Deir el-Bersha. Nonetheless, there is a clear preference of using an ending type which includes a classifier. The opposite is true in el-Lisht, where there is a preference of using ending type .kw, and the use of a classifier is rare. Meir on the other hand is an example where the use of a classifier seems preferred, even though the exact sign used for this classifier is dependent on the witness itself. Additionally, Meir has a high number of unique graphical forms for the ending types. In the Theban area there is a preference of using a classifier as well, although it seems that over time the preferred ending type moves from ending type .ki to ending type .kwi.

5.5. Conclusion and discussion

In this chapter it became clear that it is useful to study the graphical forms of the words of a text, in order to locate regional preferences. Both in the graphical forms of the verbal lemmas, and in the ending types and the graphical forms of the first-person stative, it was possible to see regional preferences. However, for both the lemmas and the first-person stative endings, it is clear that these
approaches cannot be used on their own, as they provide an exclusion based on features, rather than allocating a region based on a distinct feature. Thus, instead of a Y2 (…) classifier suggesting it comes from a specific region, it rather shows that it could not have come from a one or more regions. The same is true for first-person stative ending type ḳ, which would suggest that such a witness does not originate from Gebelein.

Nonetheless, specific results from this chapter need to be regarded with some reservation, as it only discusses a small section of the entire corpus of the Coffin Texts. Thus, suggestions and claims might be invalidated by the inclusion of more material. Due to the time intensive nature of this work it was necessary to limit the amount of data used, but this subject deserves more study, as it is clear that regional preferences can be revealed from the graphical form. ‘More data’ should be the preferred continuation of this work, especially for material that did not originate from Deir el-Bersha.

It was the intent of this chapter to show the potential of the study of the graphical forms of the Coffin Texts, which did provide results. Even though the results are based on exclusion rather than inclusion, it is possible to suggest a general region of origin based on the graphical form of a lemma. Even though this approach should only be used in conjunction with other methods, for example those discussed in chapter 3 and chapter 4, the multiplicity of approaches should allow the allocation of materials to their regions of origin.
6. Summary and recommendations

The work performed in this thesis served one main purpose, to try to move slightly closer to the potential evidence of dialect in the Ancient Egyptian language. Although this goal is still out of reach, it was suggested that if dialect itself cannot be approached, it should be possible to find signs of regional influence in the text, as a text is never written in a vacuum. Nonetheless, the underlying question for this work was always: Is it possible to distinguish regional conditioned variation in Ancient Egyptian texts? Thus, rather than providing the why, this study focussed on providing the what.

As any study into variation and patterns of variation needs plentiful data, the Coffin Texts were chosen as a valid subject for this study. It must be noted that this corpus has many issues, namely that it represents material only used for the elite of the elite and it is less clearly divined in Egyptology than the name would suggest. The main reason for the use of this corpus is based on the number of witnesses from a variety of regions that this corpus contains, and moreover, the format in which the Coffin Texts have been published support variation studies.2188

Using the Coffin Texts as corpus, a database was made to collect the texts and translations, to be used as data on which all other work for this thesis was based. Although the database was as first encoded with the inclusion of all possible data for every token, due to the time intensive nature of the encoding process, the focus was placed on the verbal forms only, even though the substantives, adjectives etc. were still encoded in a bare bones form. In this way, it was possible to encode a sufficient number of spells and witnesses, without losing important data along the way. Moreover, the verbal forms gave a strong base for comparison.

In order to deal with the data collected in the database, the work was divided into three distinct approaches to visualize the regional conditioned variation in the Coffin Texts. Thus, in the theme of what, it was only the intention to show that the variation existed, and could be associated with specific regions, rather than provide the pattern, or explain the variations between the patterns.

For the first approach (see chapter 3), the focus was placed on the sentence structure of the phrases which made up the spells. During encoding, it seemed that there were patterns in the sequence of words in a phrase, and their exact form. When set out as columns for every witness, with every identical phrase coloured for the sake of clarity, the file resembled images of chromosomes, when looked at from a distance. Thus, it was possible to apply the following metaphor to the spells: Spells are proteins.

As proteins are strings of amino-acids, spells could be considered to be similar, where a string of phrases would form a spell. Using this metaphor, it was decided that it might be worthwhile to eliminate the author from the process of sorting the spells based on their separate phrases. Moreover, if spells could be considered to behave like proteins, it would be possible to use bio-medical algorithms designed for DNA and protein comparison for Coffin Texts spells as well. Thus, using a binary approach to the

---

2188 See chapter 1 for more details.
2189 See chapter 2 for more details.
allocation of variation, every phrase of every witness was allocated an amino-acid code, which allows the spell to be treated as a protein.

Next, the programs iq-tree and Dendroscope were used to sort and visualise the different spells to see if there were underlying patterns that suggest that the sentence structure of the spells was regionally conditioned. As discussed in detail in chapter 3, it was possible to distinguish between different regions based on the sentence structure. However, some issues with the protein-sequence method did occur, which can be corrected in the future. In general, it is suggested to use an alternative method for allocating amino-acid codes to the phrases than the binary approach on a sentence wide level. This would minimalize the influence of spells with a low number of datapoints or unique variations, providing more stability for the program. Or, to make sure that every witness has at least 20 datapoints before using the iq-tree program.

In chapter 3, based on the sentence structure it was possible to see regional patterns. Moreover, for some spells it was even possible to distinguish between different periods. Thus, the method was clearly capable to visualise the variation in a form that can be supported by existing approaches for provenance and dating.

Chapter 4 applied a second approach to visualise regional patterns that is related to the method used in chapter 3, but rather only applied to the verbal structure used in the phrases. As the sentence structure could be influenced by for example a genitival adjective, an attempt was made to look at the core of the structure of a phrase, excluding every aspect except the verbal forms. Using the same principles as were used in chapter 3, but focusing on the variation between lemma, position and morphology of the verbal forms, it was possible to create the same visualisation used for the sentence structure.

However, the issues that occurred in chapter 3 occurred in chapter 4 as well, especially the problematic underlying issues with a low number of datapoints. However, it was still possible to show regional patterns in the verbal structure, and moreover, in spells 94-96, the results of the verbal structure gave results that showed regional patterns which were not clearly visible in the sentence structure. Nonetheless, although the method used in chapter 4 was capable of visualising a regionally conditioned underlying structure in the verbal structure, the method seemed to function better as a supporting method for regional variation, rather than on its own.

As the third approach (see chapter 5), a more traditional Egyptological approach was used to locate patterns of regional variation in the Coffin Texts. As the verbal lemmas were encoded with all detail, including an image of the graphical form, it was possible to extract and collect these images for the verbal lemmas, so that they could be compared. As it was assumed that consciously or unconsciously

---

2190 Basically, there is variation, or there is no variation, without anything in between. For the reasoning why such a method was used, see chapter 3.2.1.1.
2191 See chapter 3.2 for the full details regarding the method used.
2192 See chapter 3.55 for more details.
2193 See chapter 4.
2194 See chapter 4.2 for more details.
there are preferences in how to write a word in every region, it was attempted to see if these preferences are visible, and if there are any patterns that even go beyond the separate lemmas. However, in order to keep the number of attestations for each lemma under control, only the data from the database was used.

It turned out that there are indeed regional preferences in the graphical forms of specific lemmas, although it is based on exclusion rather than inclusion. Thus, one can suggest that a graphical form does not belong to a specific region, rather than having a clear list of features that only occur in one region. Even though the majority of the regional preferences were based on the classifiers used, there were instances that only one graphical form of a spelling is attested in one region, where other regions use multiple graphical forms. Nonetheless, it was shown that the graphical forms of a lemma can contain regional preferences. However, collecting these preferences is time-intensive, and might be disproven when material outside the database was included.

Section 5.4 included a discussion regarding the regional aspects visible in the first-person stative endings, which showed regional preferences based on ending type and graphical form. Thus, it is not only possible to show regional preferences based on the graphical form of the verbal lemmas, but even based on the morphological features of a verbal form. Moreover, it was possible to show the evolution of the ending type used in Deir el-Bersha and the Theban area. However, this was the only morphological feature in which regional patterns were found, as other avenues came up short.

Returning to the question stated above: Is it possible to distinguish regional conditioned variation in Ancient Egyptian texts? Based on the work performed for this thesis, the answer is clearly positive. Even though the borders in the three approaches are often fuzzy, or provide problematic results, it cannot be denied that in a corpus like the Coffin Texts, it is possible to find patterns that resemble regionally conditioned variation. Therefore, it could be suggested that finding these regional patterns should be possible in other types of texts as well.

Thus, for the work provided here, there are two main paths forward.

The first path forward is to enhance the results gathered in this study. As most of the work was restricted by the material that was collected in the database, it represents only a small fragment of the entire corpus. Thus, the inclusion of the entire corpus of the Coffin Texts would be ideal, if rather ambitious. The additional data can provide additional support for the results, or even stabilise results that are currently problematic. Additionally, it would be useful to remove the final issues from the protein-sequence method used in chapter 3 and 4, by using a word by word amino-acid coding, rather than only sentence based.2195

The second path forward is to export the methods discussed in this work to material that lies outside the Coffin Texts, and preferably different periods as well. This would allow the comparison between the Coffin Texts and other material, to see if the patterns found in the Coffin Texts are actually features of the region, or if they represent regional patterns in the Coffin Texts alone. Moreover, to test the viability

2195 See chapter 3.2.2.1 for more details.
of the protein-sequence method, it might be worthwhile to export this method to another domain entirely. Even though the approach of chapter 5 is only applicable to Egyptology, or any other pictographic language, the methods of chapter 3 and 4 should be applicable in other languages and domains as well.

Appendix 1. *Coffin Texts* supports

The following appendix serves as a list of the supports\(^1\) used for this work. Note that this is not a complete list of all the supports that carry *Coffin Texts*. As this list is primarily based on the same type of list in Willems,\(^2\) references to this list have been excluded. However, more recent publications with the same type of list, have been included. Note that the Sigla of the coffins refer to their form as used in de Buck, and do not always refer to the updated sigla used in Willems.\(^3\)

The following list is organised by region, and gives the siglum, the name of the owner\(^4\) of the support, the gender\(^5\) of the owner, the provenance of the support, the date of the support, based on dynasty and reign,\(^6\) the type of object, the type of script used for the *Coffin Texts*\(^7\) and the inventory number.\(^8\)

Finally, a bibliographical list is given below each support.

---

1. The name support was used here, as the carriers of *Coffin Texts* can be more than only coffins, such as papyrus and tomb chamber walls as well.
2. Willems (1988), p. 19-40. Please note that any other mentions of the supports in the same work have been included.
4. In cases of usurpation or additional names for the owner, all the names are given.
5. Based on the gender used in the *Coffin Texts*, even in cases where the coffin was usurped by a different person with a different gender.
7. Based on Fischer (1976) p. 41 (fig. 4). Note that this refers to the *Coffin Text* material only, as often multiple types of script are used on the support itself, for example the ornamental texts, which are usually type 1, which are hieroglyphic signs with internal detail.
8. If applicable. For material without inventory numbers, the current location (to my knowledge) is mentioned instead.

Appendix 2. Overview of spells, witnesses, regions and witnesses per region in de Buck

The following appendix consists of a table which shows the number of witnesses that occur per spell in de Buck. Additionally, it shows in how many regions this spell is attested, and how many witnesses there are per region. Additionally, the volume of de Buck and the page numbers are provided. Finally, the spells which were encoded for this work have been marked as well. The regions are arranged from northern to southern Egypt, except for the papyri and witnesses from unknown origins, which are gathered at the end of the regions.

It needs to be noted that this file only consists of the witnesses published in de Buck, and that every witness is counted, even if they came from the same support.\footnote{For example, in spell 1, MC105,a and MC105,b are counted as separate witnesses, even though they come from the same support.}
| Spell | Witnesses | Regions | Abusir | Saqqara | el-Riqqa | el-Lish | Sidmant el-Gebel | Bni Hasan | Deir el-Bersha | Meir | Asyut | Qaw el-Kebir | Abydos | Dendera | Theban area | Gebelein | Aswan | Papyrus | Unknown | CT | Page | Encoded |
|-------|-----------|---------|--------|---------|----------|--------|-----------------|-----------|----------------|------|-------|-------------|--------|---------|-----------|----------|-------|---------|---------|
| 1     | 15        | 5       | 1      | 7       | 1        | 5      | 1               |           |                | 1    | 1     | 1           | 1      | 1       | yes        | 1-7      | 1     |         | yes      |
| 2     | 11        | 4       |        |         |          |        | 1               |           |                | 1    | 1     | 1           | 1      | 1       | yes        | 8-9      | 1     |         | yes      |
| 3     | 7         | 2       | 6      |         |          |        |                 |           |                |      | 1     | yes        | 10     |         |            |          |       |         | yes      |
| 4     | 12        | 4       | 7      | 1       | 3        |        | 1               |           |                | 1    | 1     | yes        | 11-14  | 1       |            |          |       |         | yes      |

Appendix 3. Transliteration and translation of encoded *Coffin Texts* spells

The following appendix consists of the transliteration and translation of the separate witnesses of the different spells used in this work. Note that these include all the texts encoded in the database, including the alternative version of spell 21-25 of T1C,\(^{13}\) (see appendix 3.25), which was excluded in chapter 3 and chapter 4. Additionally, it includes spell 313 as well, which was encoded in the database, but not used in chapter 3 and chapter 4, as it only occurred in one witness.

In this appendix, the transliterations and translation are displayed witness by witness, and all the phrases as noted in de Buck are kept. Moreover, the amino-acid code associated with the phrase is displayed as well. For the phrases which do not have an attestation in the witness, the empty phrases were added as well. Note that these empty phrases do not represent a lacuna or damage in the text, rather just the absence of a phrase attested in another witness. However, when there is a large section of phrases without text, these sections were merged into one phrase. Note that for T1C in spell 21-25 and spell 313 there is no amino-acid code, as these spells are currently unique.

Finally, the amino-acid code string of the witness was added below the transcription and translation. Note that the witnesses are organized following the order as they were published in de Buck.

Note that these transliterations and translations are added here without comments or discussion. These are retained in the database. Moreover, the transliteration represents the text as written in the original witness. For example, the use of the \( i \) where the \( I \) should be read, and vice-versa, is intended to represent the original text, rather than an error in the original text.\(^{14}\)

---

\(^{13}\) See chapter 3.22.1 for more details.

\(^{14}\) Even though it is likely that some errors occurred in the database.
Appendix 3.1. Spell 1

Appendix 3.1.1. B3Bo

I,1 (X) –
I,2,a (R) ḫỉ wsir ḏḥwytny-hft ṭn Ho, Osiris, this ḏḥwytny-hft.
I,2,b (R) nṯt ṭw nṯt ṭw.ty You are the lion, you are the double lion,
