

The background features a blue gradient with a glowing globe and a network of white nodes and lines, suggesting a global or networked theme. The text is overlaid on a light gray triangular shape.

# **An extension of CityJSON for the support of point clouds**

Gilles-Antoine Nys, ULiège

**XXIV ISPRS Congress**  
July 2021  
Online event

# Summary

- ▶ **Improvement** of the cartographic representation
- ▶ Following the **3.0 CityGML specifications**, some attributes and features are added to the core module of CityJSON
- ▶ Extension for the **CityJSON** encoding to support point clouds
- ▶ Two solutions are proposed: **inline complex geometries** and **external link to a remote file**.
- ▶ The extended schema is illustrated in **several examples** such as detailed features visualisation, fall-back solution in features reconstruction processes, etc.

# Methodology

How?

# Context - CityJSON

- ▶ **CityGML 3.0 improvements :**
  - Space concept
  - Revision of the transportation module
  - ...
  - Dynamizers
  - Point clouds
  - ...
- ▶ **CityJSON 1.0.1 compliant with CityGML 2.0**

- Kutzner, T., Chaturvedi, K. & Kolbe, T.H. (2020) CityGML 3.0: New Functions Open Up New Applications. *PFG* 88, 43–61  
- Ledoux H, Arroyo Ohori K, Kumar K, Dukai B, Labetski A, Vitalis S (2019). CityJSON: A compact and easy-to-use encoding of the CityGML data model. **Open Geospatial Data, Software and Standards**

# Methodology

- ▶ Extending CityGML XML encoding imposes the **creation of an ADE**
- ▶ Extended CityJSON **are still** CityJSON files

Nys G-A, Poux F, Billen R. (2020) CityJSON Building Generation from Airborne LiDAR 3D Point Clouds. *ISPRS International Journal of Geo-Information*. 9(9):521.

# Conceptual model

- ▶ **Extending the model**
- ▶ Adding the support of **inline complex geometries**
  - **MultiPoint** geometric primitive

```
"_AbstractBuilding": {  
  "geometry": {  
    "type": "array",  
    "items": {  
      "oneOf": [ { "$ref":  
        "../geomprimitives.schema.json#/MultiPoint" } ]  
    }  
  }  
}
```

# Conceptual model

- ▶ *Extending the model*
- ▶ Adding the support of **nested object**
  - Proposition of a new object
    - mimeType
    - pointFile
    - pointFileSrsName

```
"+pointcloud-file": {  
  "type": "object",  
  "properties": {  
    "mimeType": {  
      "type": "string"  
    },  
    "pointFile": {  
      "type": "string",  
      "format": "uri-reference"  
    },  
    "pointFileSrsName": {  
      "type": "string",  
      "default": "EPSG:4326"  
    }  
  }  
}
```

## **QUALITATIVE RESULTS TAKE-AWAY**

Highlights on new capabilities

# A world of points

- ▶ In theory, a model can be **entirely made up of points**.

## Added details

- ▶ **More accurate level** of details can be delivered thanks to point clouds.

# More accurate representation

- ▶ Vegetation can be represented **more accurately**.

# In short

- ▶ **Point clouds** can be stored:
  - Inline geometries
  - Link to external resource
- ▶ Open **new possibilities**:
  - Representation
  - Back-up solution
  
  - And certainly many others ...
