

FUNCTION AND NATURE OF SERIAL ORDER IN WORKING MEMORY

Lucie Attout, University of Liège, Belgium

Theoretical framework

Working memory = capacity to temporarily maintain information in mind and to mentally manipulate it during a short period when we want to reach a specific goal (Cowan & Alloway, 2009).

Hurlstone et al., 2014; Majerus, 2013; Oberauer, 2009; Barrouillet & Camos, 2014

Specific component

- Serial order is a specific and independent component
 - *Distinct impairment in brain-damaged patients or atypical developmental disorders* (Attout et al., 2012; Majerus et al., 2017; Majerus et al., 2018)
 - *Distinct cerebral networks in adults and children*

Majerus et al. (2006), NI

THE FUNCTION OF ORDER WM

Serial order WM

To create a long-term and sustainable representation of the information

dog

god

Serial order
WM

Serial order WM & oral language

Language = letters → words

/dog/

/god/

→ Importance of serial order processes in lexical knowledge and learning of new words

(Leclercq & Majerus, 2010; Majerus, Poncelet, Greffe et al., 2006;
Majerus et al., 2008; Ordonez Magro, Attout, Majerus, & Szmalec, 2018)

Serial order WM & oral language

Receptive vocabulary

Productive vocabulary

Table 2

Bayesian correlation (Pearson r) between the WM tasks and the different vocabulary measures and Raven's CPM.

	Item WM	Order WM
Receptive vocabulary	.09 ($BF_{10} = 0.18$)	.34 ($BF_{10} = 28.12$)
Productive vocabulary (total)	-.03 ($BF_{10} = 0.14$)	.33 ($BF_{10} = 24.02$)
Productive vocabulary (frequent words)	-.08 ($BF_{10} = 0.18$)	.29 ($BF_{10} = 5.86$)
Productive vocabulary (rare words)	-.01 ($BF_{10} = 0.13$)	.35 ($BF_{10} = 45.45$)
Productive vocabulary (verbs)	.04 ($BF_{10} = 0.14$)	.21 ($BF_{10} = 0.93$)
Raven's CPM	.19 ($BF_{10} = 0.61$)	.18 ($BF_{10} = 0.53$)

Several computational models exist but no one can reproduce the entire behavioral effects usually seen in order WM processing

Order WM models

Chaining models

Can explain only a limited range of behavioral effects

Positional models

Can explain very successfully a large panel of behavioral effects

Order WM models

Positional models

Temporal markers
(oscillatory response)
(Brown et al., 2000)

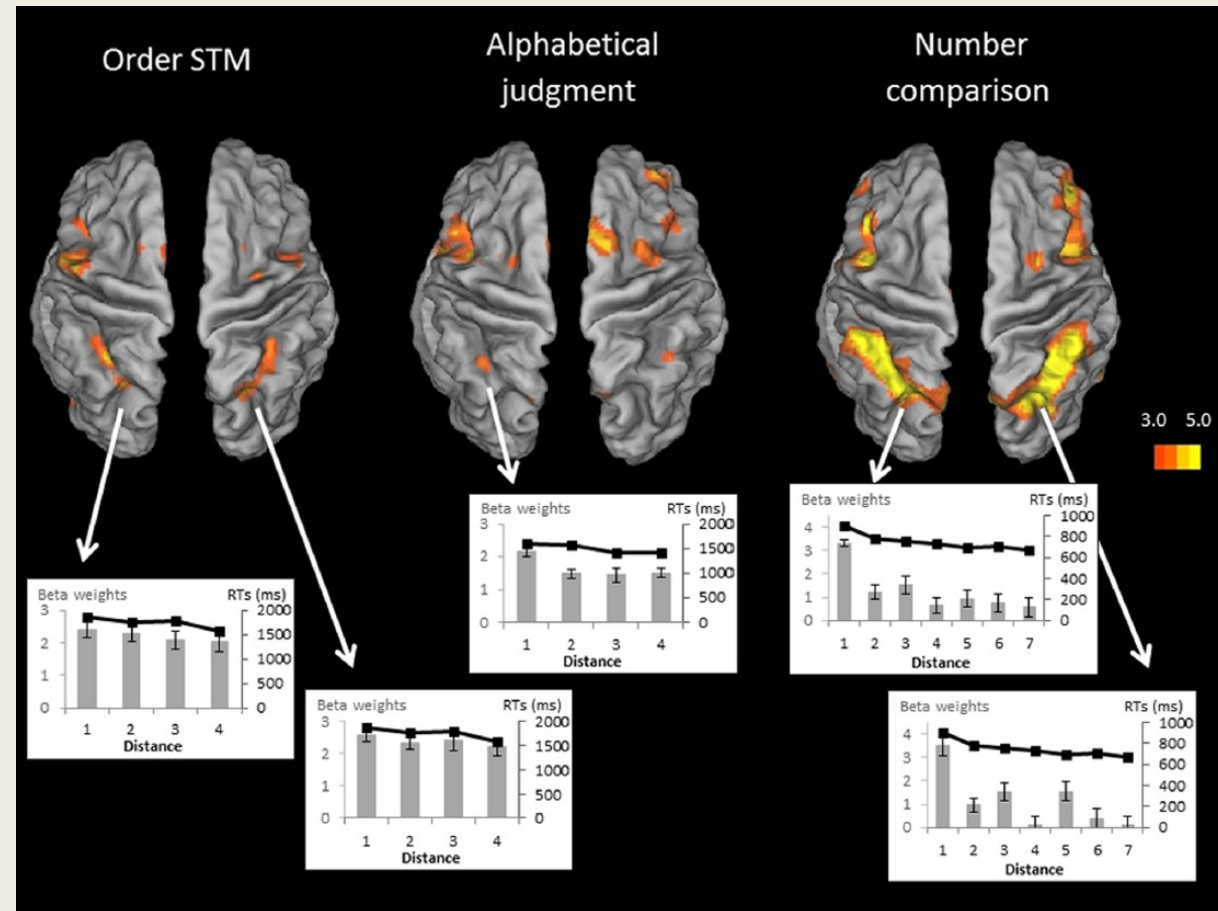

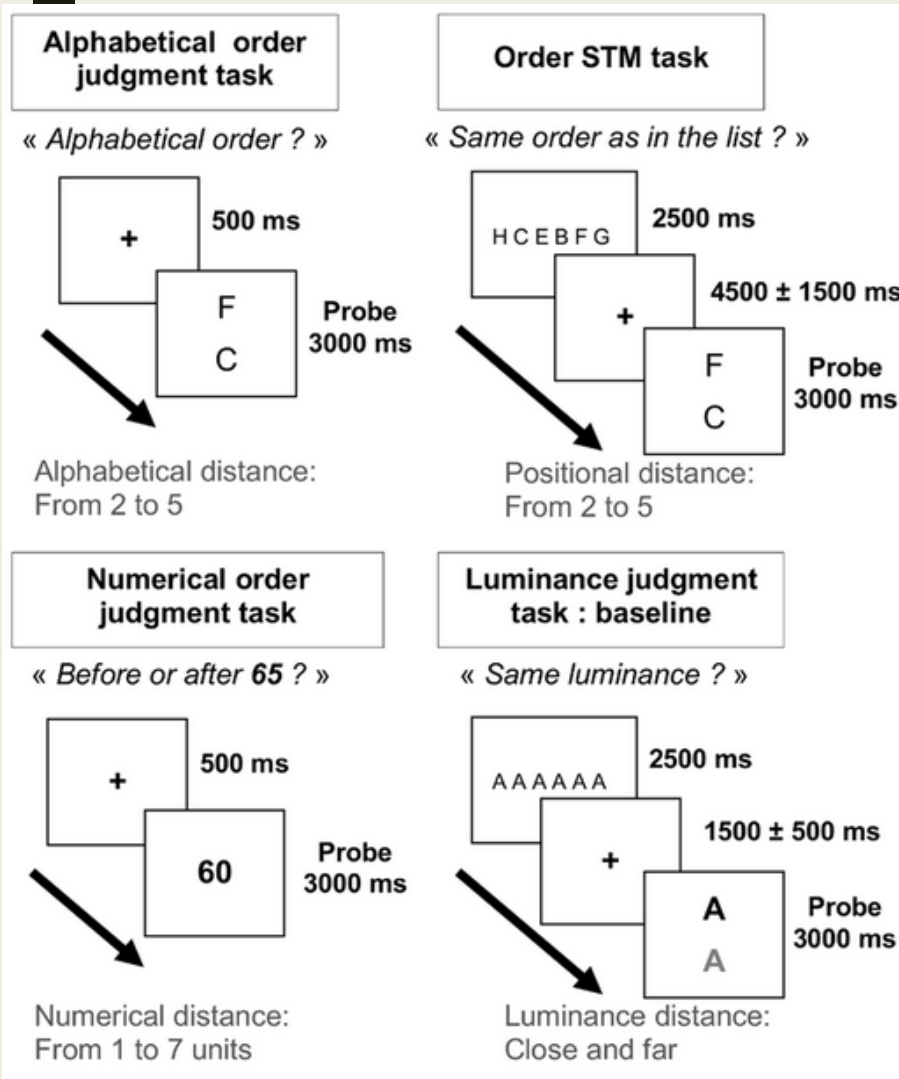

Spatial markers
(Start-end, Henson, 1998; Abrahamse et al., 2014)

Rank markers
(Botvinick & Watanabe, 2007)

Common ordinal representation ?

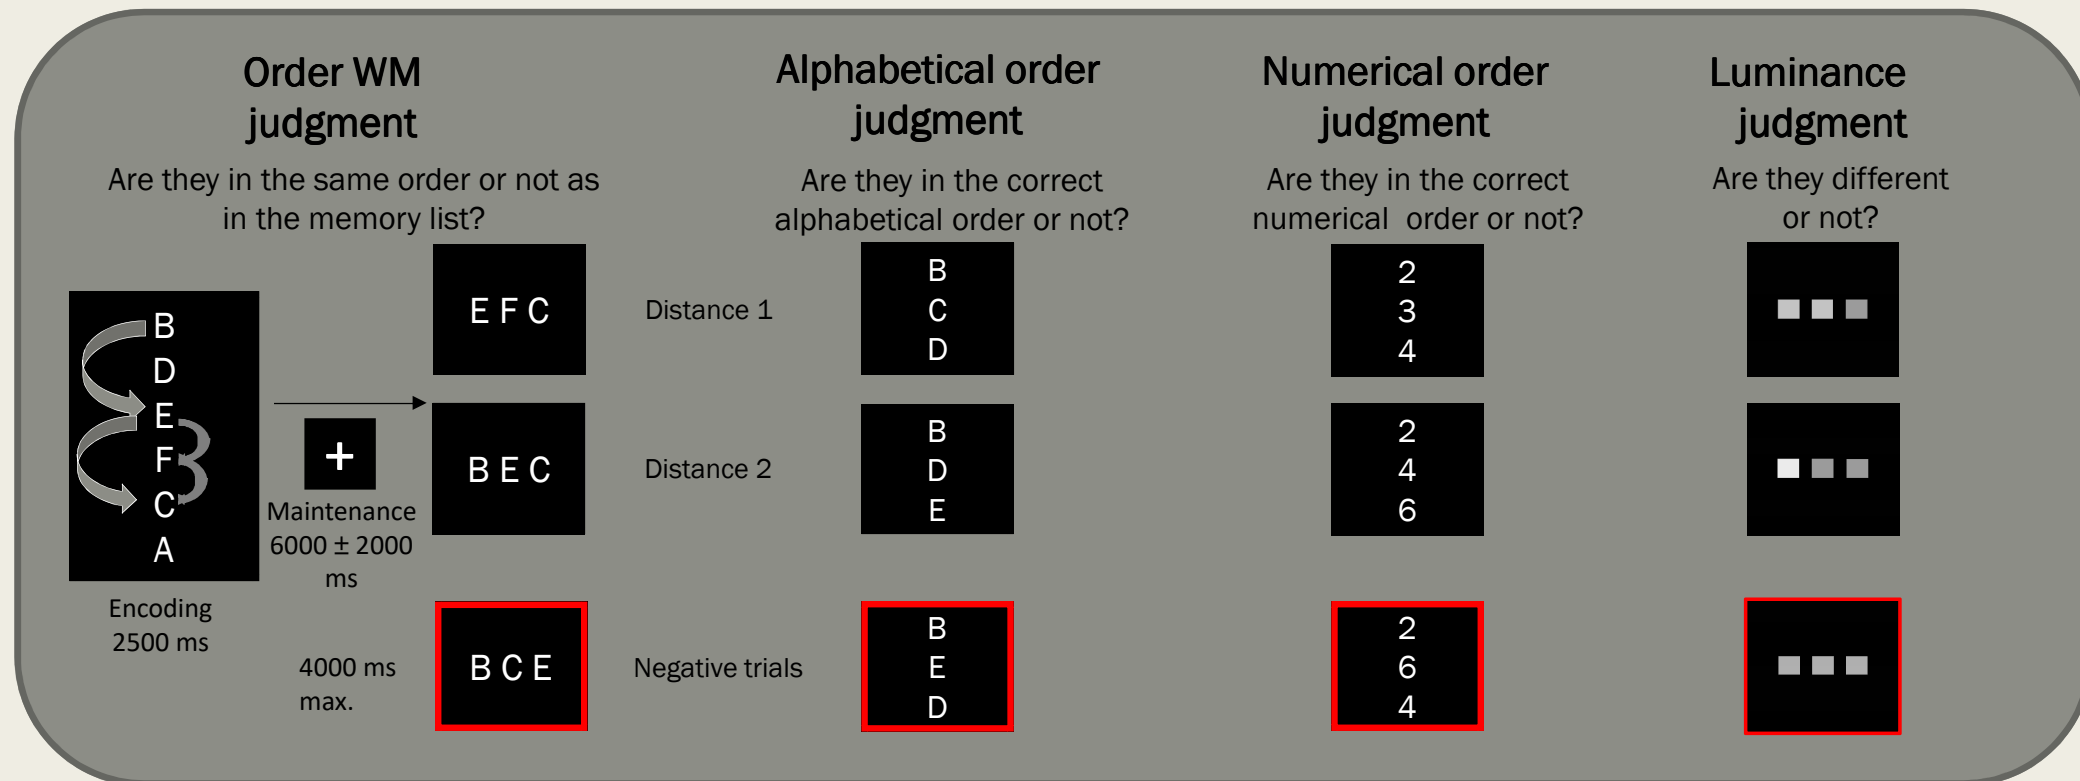

→ a more general, common ordinal representation to code serial order in WM BUT similar brain networks ≠ same information is processed

Common ordinal representation ?

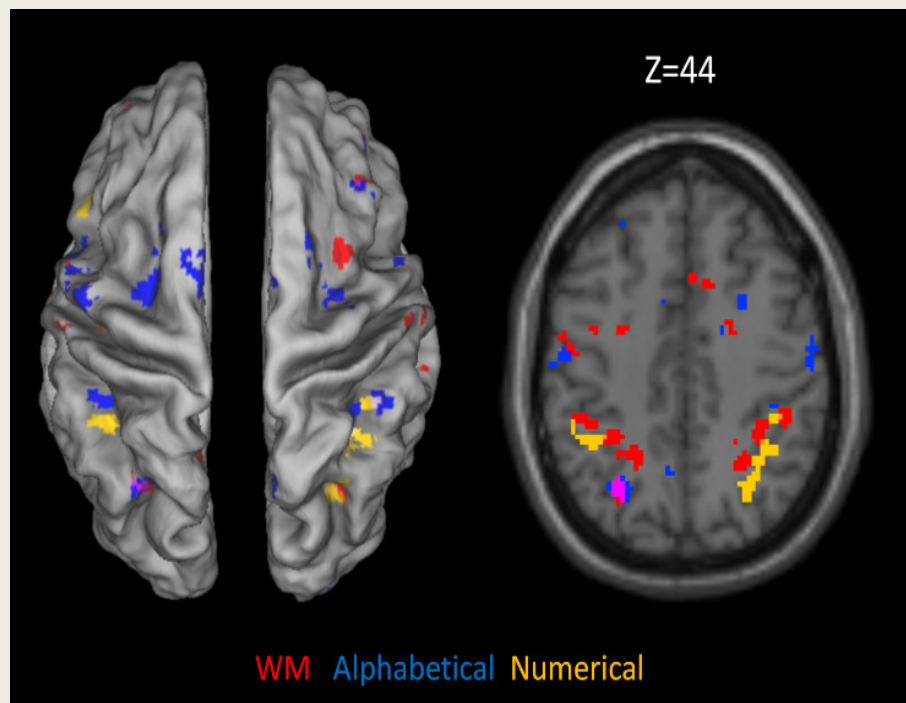

MVPA + triplets

- examining patterns of neural responses, rather than analyzing single voxel or regions
- more robust way to assess distance effect

Common ordinal representation ?

- Univariate

	No. voxels	Left/ right	x	y	z	SPM Z - value
Ordinal distance effect for order WM (D2<D1)						
IPSa	26	L	-30	-44	44	3.79*
	50	R	46	-36	40	4.25*
IPSp	96	L	-28	-64	44	4.26*
Ordinal distance effect for ordinal alphabetical judgment (D2<D1)						
IPSp	43	L	-28	-64	44	4.24*
	11	R	30	-62	38	3.50*
Ordinal distance effect for ordinal numerical judgment (D2<D1)						
IPSa	69	L	-38	-44	40	3.81*
	28	R	38	-38	40	3.73*
IPSp	71	R	32	-60	46	4.00*
MFG	57	L	-48	22	22	3.98*
	18	R	46	40	22	3.89*
IFG	34	L	-36	28	20	4.06*
Standard distance effect for luminance judgment (D1<D2)						
BA17	6	R	16	-94	-4	3.57 ^a

Common ordinal representation ?

MVPA
Prediction
between
tasks

Common ordinal representation ?

Prediction between tasks
With luminance judgment

→ this frontal involvement was not specific to the ordinal processing but more general

Common ordinal representation ?

- Domain-general implication of fronto-parietal cortices BUT do not support the hypothesis of domain-general ordinal codes per se
 - *prediction of ordinal distance only for the order WM and alphabetical tasks, but not for the numerical domain*
 - *prediction not specific to ordinal distance → luminance distance*

'hard-vs-easy' dimension → different levels of attentional control

- More specific role of the posterior IPS for ordinal processing ?
- A spatial-attentional role of the posterior IPS
 - *Differentiated neural signals for leftward versus rightward orientation of attention (Yantis et al. 2002; Silver and Kastner 2009; Vandenberghe and Gillebert 2009; Bressler and Silver 2010; Gillebert et al. 2011).*
 - *Mental whiteboard hypothesis : attentional spatial frame could allow the temporary organisation of memoranda and letters on a horizontal line, ordered from left to right (Abrahamse et al. 2014, 2017)*

Temporal codes

Henson, 2000; Abrahamse et al., 2017; Van Dijck et al., 2011; Guida

Hartley, Hurlstone and Hitch, 2016; Brown et al. 2000

Discussion

- This needs to be reproduce in other context
- Spatial codes more for the serial order LTM processes
- Spatialization is flexible → more like a strategy than a coding per se

Figure 1

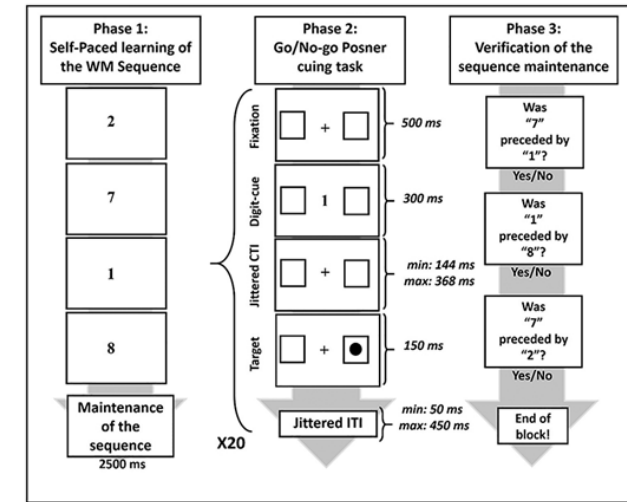

Figure 2. Observed data and regression line representing right-hand reaction times minus left-hand reaction times as a function of position in the sequence that was probed (five positions) and items presentation.

Guida et al., 2020

Interim conclusions

- Serial order WM required **domain-general coding** but not necessarily a more general ordinal representation per se
- This domain-general coding could be **sustained by a temporal coding** engrained in the posterior IPS and the IFG.
- However, to maintain and recall the information, serial order WM could be represented spatially to be manipulated and recalled more easily.

→ Further research needs to be done to understand this specificity of spontaneous vs. strategic coding of information.

Conclusion

- Importance to take into account the serial order level in WM and to understand the nature of this coding
- Important to identify precisely the WM deficits to accurately deal with them
- Required to consider the treatment/training of order WM in children with learning disabilities and brain-damaged patients
