# What we do at the thermodynamics laboratory

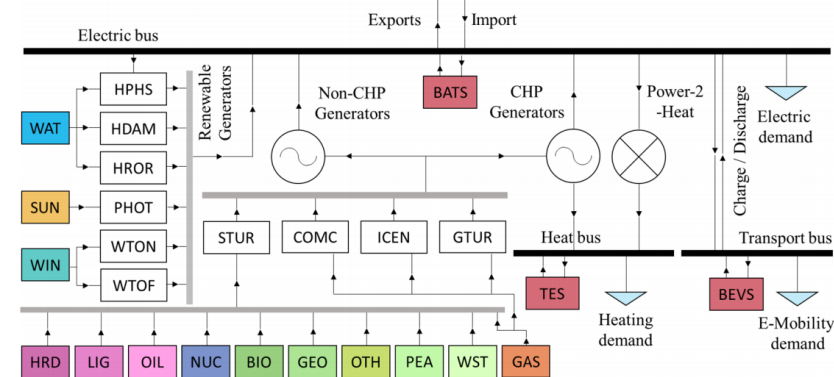

## Component Level:

- Monitoring, Dynamic Modeling, Optimal control

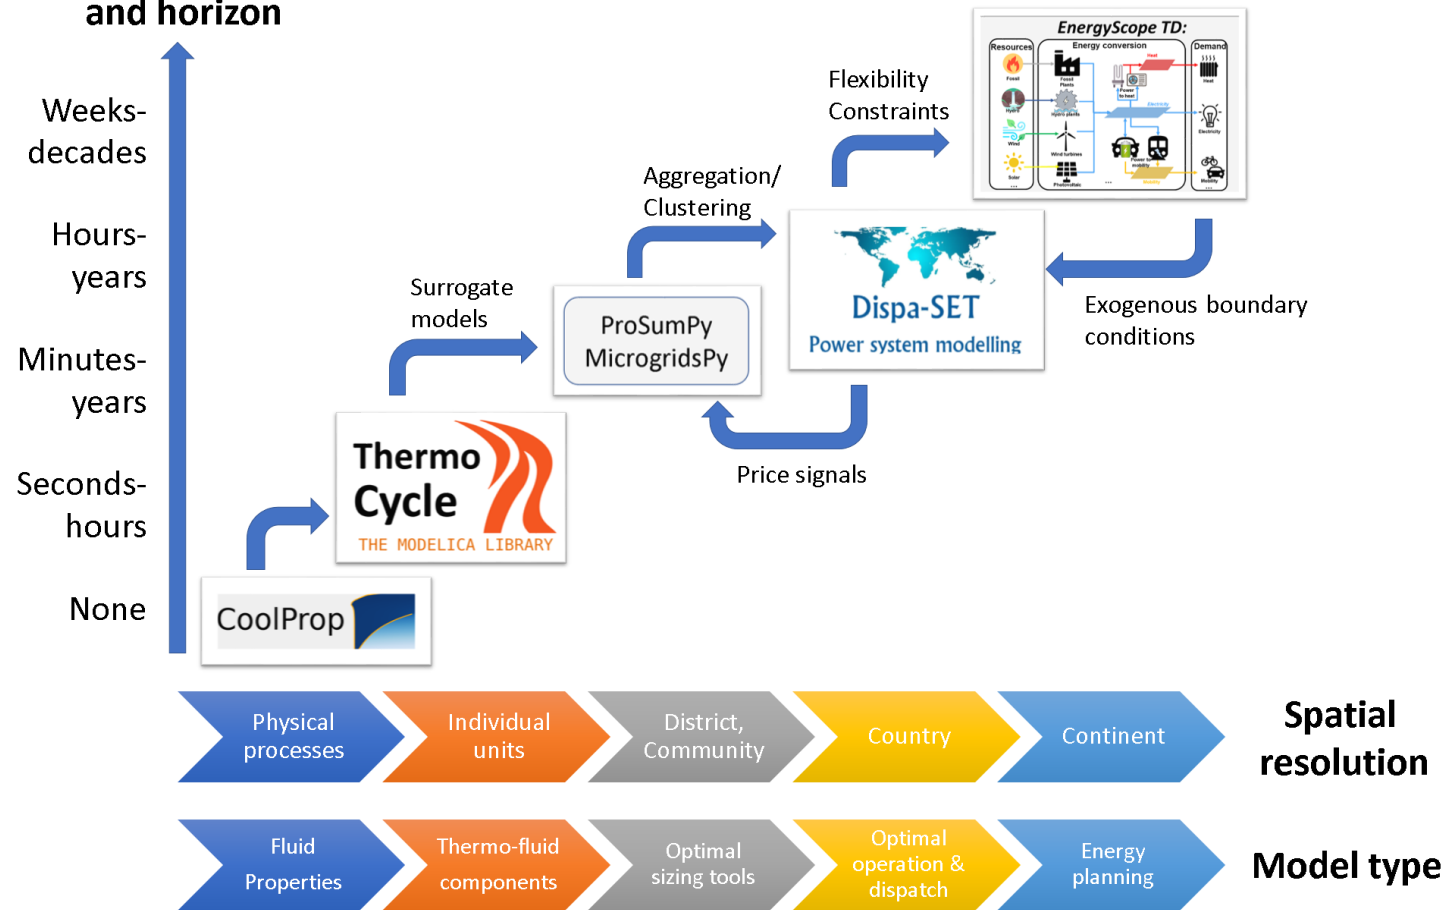

## System level:

- Optimal integration, multi-scale simulations, flexibility provision by thermal systems
- Development and use of open-source models:

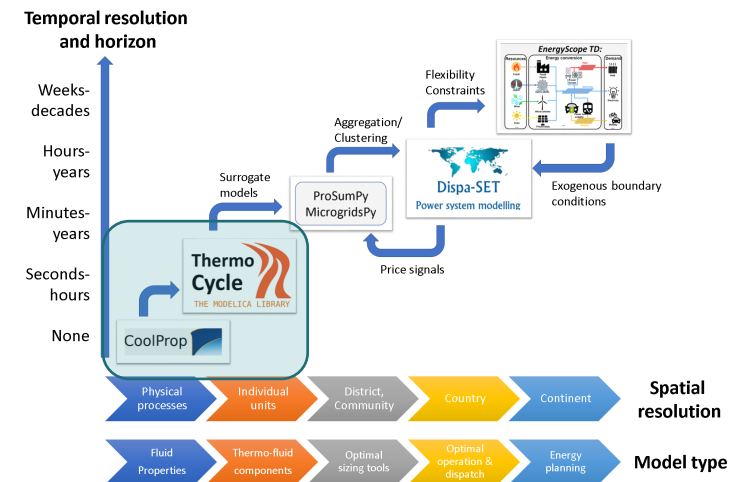

# Models to support the energy transition

Temporal resolution and horizon

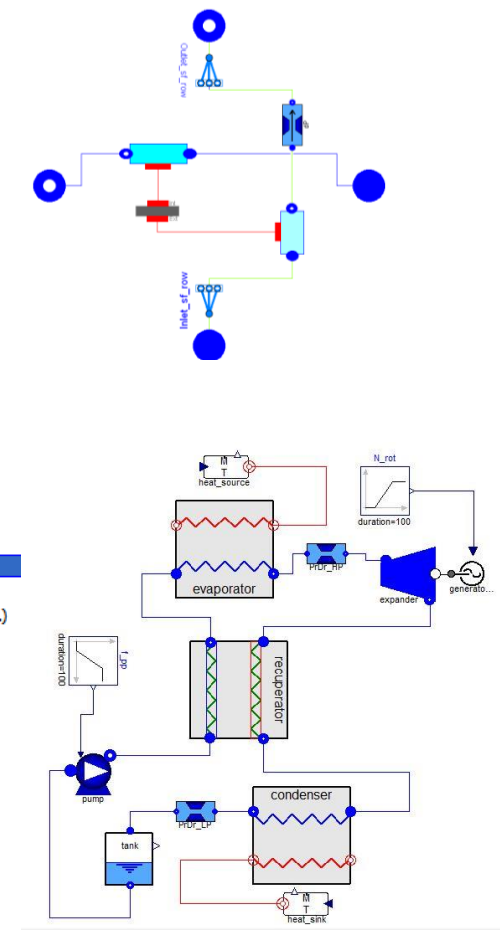

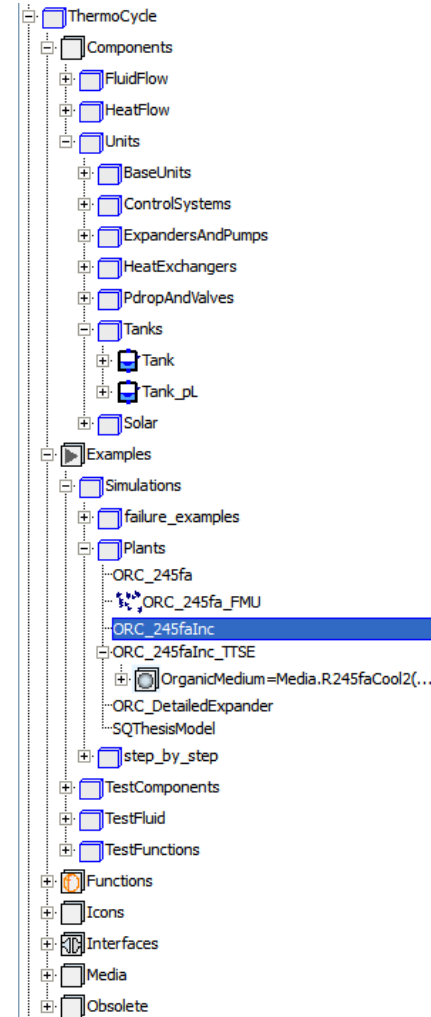

- Multi-scale portfolio of models:
  - **From** the accurate characterization of thermal processes
  - **To** their widespread deployment at country/continental level

# ThermoCycle – CoolProp: dynamic modelling and fluid properties

# The ThermoCycle Library

- Modelica: Open-source language for the modeling of complex multiphysics systems.
- Acausal language
- ThermoCycle => Open-source Library for the modeling of thermal systems
- Cross-Platform
- Special focus on thermodynamic cycles
- Computational efficiency and robustness are key aspects of the library

# Thermo-physical fluid properties: *CoolProp*

## REFPROP:

- Historical, reference software for thermophysical properties for:
  - 151 pure and pseudo-pure fluids
  - Unlimited mixtures
- Written in Fortran
- Non-free

## CoolProp:

- Open-source thermophysical properties for:
  - 125 pure and pseudo-pure fluids
  - 35 mixtures
  - 57 incompressible pure fluids
  - 47 incompressible mixtures
- Written in C++
- MIT license

# Simulation display

# Robustness of dynamic two-phase flows: *Chattering*

Non-physical flow reversals and simulation failures can occur if:

$$V_i \cdot \frac{d\rho_i}{dt} \approx \dot{M}_{su}$$

# Benefits: *Hacking into the code*

- Discontinuities in thermodynamic properties:
  - Multiple numerical issues
  - Simulation failures
- Solution:
  - Smoothing of the thermodynamic properties
  - Implemented directly into Coolprop

# Benefits: *Hacking into the code*

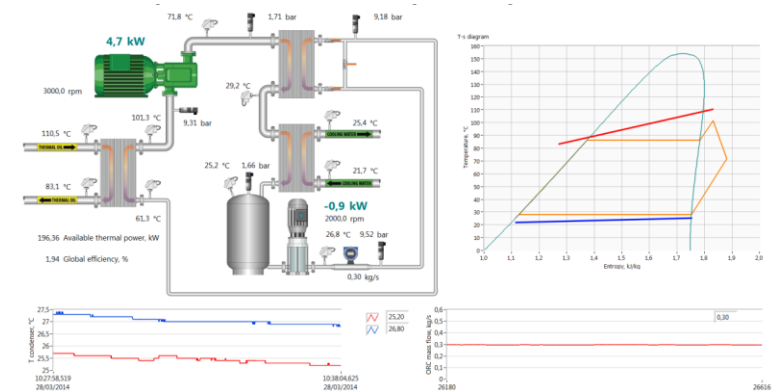

- Discontinuities in thermodynamic properties:
  - Multiple numerical issues
  - Simulation failures
- Solution:
  - Smoothing of the thermodynamic properties
  - Implemented directly into Coolprop

# Benefits: *Software compatibility and portability*

- Interface to multiple engineering softwares
  - Fully-featured wrappers: Python (2.x, 3.x) , Modelica, Octave, C#, VB.net, MathCAD, Java, Android, MATLAB
  - High-level interface only: Labview, EES, Microsoft Excel, LibreOffice, Javascript, PHP, FORTRAN, Maple, Mathematica, Scilab, Delphi & Lazarus, Julia
- Runs in Windows, OSX, Linux, IOS, Android

# Benefits: *Collaborative work*

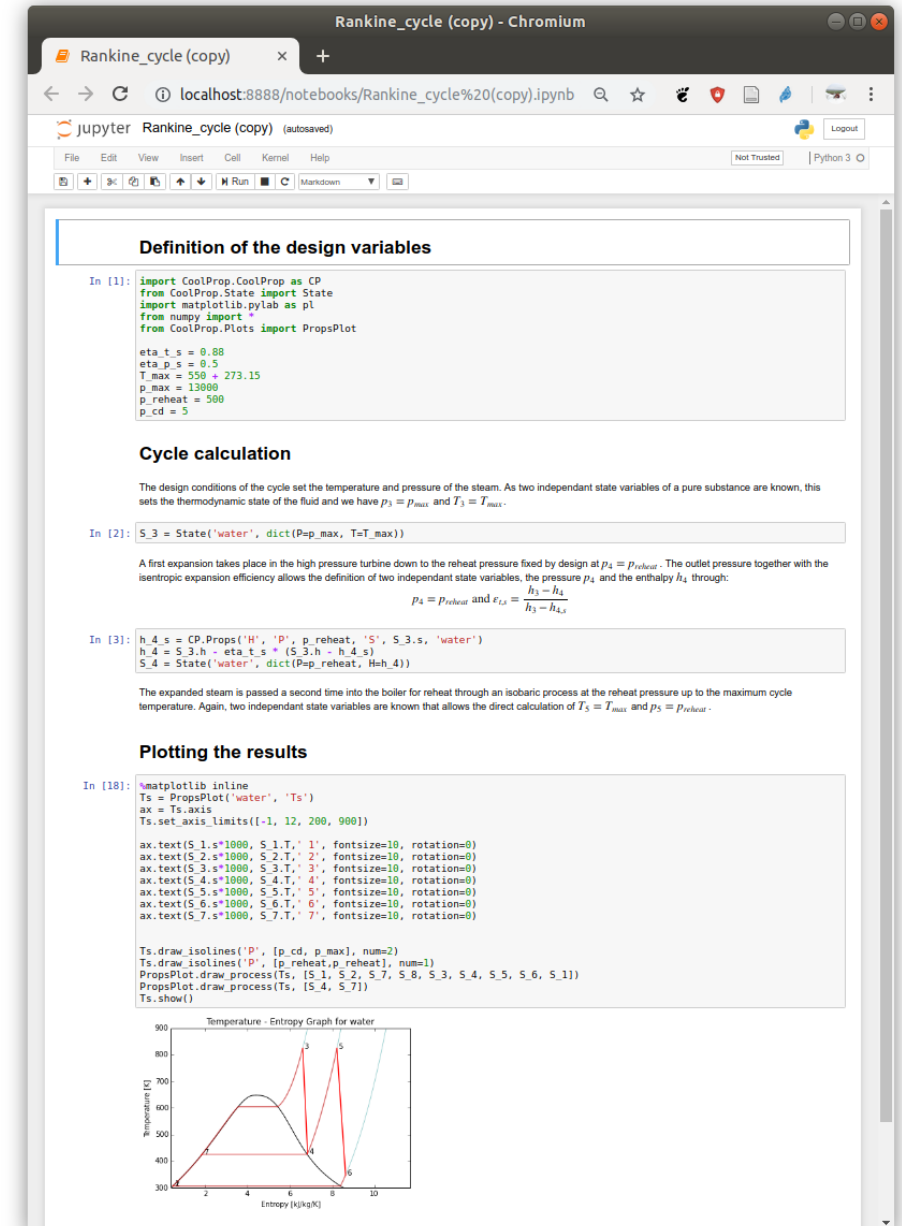

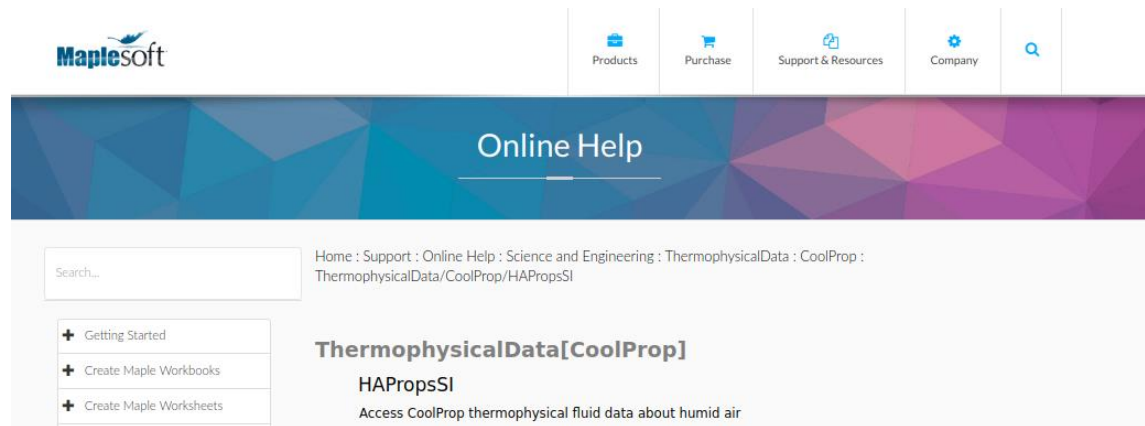

- More than 40 contributors
- However: one main developer
- Github / Sphinx / ReadTheDocs / Travis ecosystem

## Examples:

- Teaching thermodynamics in developing countries
- Private companies

```
In [1]: import CoolProp.CoolProp as CP
from CoolProp.State import State
import matplotlib.pyplot as plt
from numpy import *
from CoolProp.Plots import PropsPlot

eta_t_s = 0.88
eta_p_s = 0.5
T_max = 550 + 273.15
p_max = 13000
p_reheat = 500
p_cd = 5

Cycle calculation

The design conditions of the cycle set the temperature and pressure of the steam. As two independent state variables of a pure substance are known, this sets the thermodynamic state of the fluid and we have  $p_3 = p_{max}$  and  $T_3 = T_{max}$ .

In [2]: S_3 = State('water', dict(P=p_max, T=T_max))

A first expansion takes place in the high pressure turbine down to the reheat pressure fixed by design at  $p_4 = p_{reheat}$ . The outlet pressure together with the isentropic expansion efficiency allows the definition of two independent variables, the pressure  $p_4$  and the enthalpy  $h_4$  through:

$$p_4 = p_{reheat} \text{ and } \epsilon_{t,s} = \frac{h_3 - h_4}{h_3 - h_{4s}}$$

In [3]: h_4_s = CP.Props('H', 'P', p_reheat, 'S', S_3.s, 'water')
h_4 = S_3.h - eta_t_s * (S_3.h - h_4_s)
S_4 = State('water', dict(P=p_reheat, H=h_4))

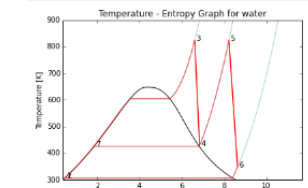

The expanded steam is passed a second time into the boiler for reheat through an isobaric process at the reheat pressure up to the maximum cycle temperature. Again, two independent state variables are known that allows the direct calculation of  $T_5 = T_{max}$  and  $p_5 = p_{reheat}$ .

Plotting the results

In [18]: %matplotlib inline
Ts = PropsPlot('water', 'Ts')
ax = Ts.axis
Ts.set_axis_limits([-1, 12, 200, 900])

ax.text(S_1.s*1000, S_1.T, '1', fontsize=10, rotation=0)
ax.text(S_2.s*1000, S_2.T, '2', fontsize=10, rotation=0)
ax.text(S_3.s*1000, S_3.T, '3', fontsize=10, rotation=0)
ax.text(S_4.s*1000, S_4.T, '4', fontsize=10, rotation=0)
ax.text(S_5.s*1000, S_5.T, '5', fontsize=10, rotation=0)
ax.text(S_6.s*1000, S_6.T, '6', fontsize=10, rotation=0)
ax.text(S_7.s*1000, S_7.T, '7', fontsize=10, rotation=0)

Ts.draw_isolines('P', [p_cd, p_max], num=2)
Ts.draw_isolines('P', [p_reheat, p_reheat], num=1)
PropsPlot.draw_process(Ts, [S_1, S_2, S_7, S_8, S_3, S_4, S_5, S_6, S_1])
PropsPlot.draw_process(Ts, [S_4, S_7])
Ts.show()
```

## Pure and Pseudo-pure Fluid Thermophysical Property Evaluation and the Open-Source Thermophysical Property Library CoolProp

Ian H. Bell,<sup>\*†</sup> Jorrit Wronski,<sup>\*‡</sup> Sylvain Quoilin,<sup>\*†</sup> and Vincent Lemort<sup>\*†</sup>

<sup>†</sup>Energy Systems Research Unit, University of Liège, Liège, Belgium

<sup>‡</sup>Department of Mechanical Engineering, Technical University of Denmark, Kongens Lyngby, Denmark

### Supporting Information

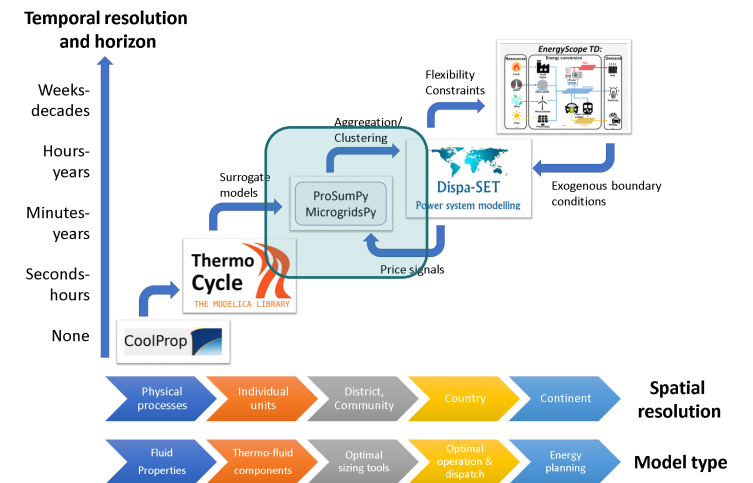

**ABSTRACT:** Over the last few decades, researchers have developed a number of empirical and theoretical models for the correlation and prediction of the thermophysical properties of pure fluids and mixtures treated as pseudo-pure fluids. In this paper, a survey of all the state-of-the-art formulations of thermophysical properties is presented. The most-accurate thermodynamic properties are obtained from multiparameter Helmholtz-energy-explicit-type formulations. For the transport properties, a wider range of methods has been employed, including the extended corresponding states method. All of the thermophysical property correlations described here have been implemented into CoolProp, an open-source thermophysical property library. This library is written in C++, with wrappers available for the majority of programming languages and platforms of technical interest. As of publication, 110 pure and pseudo-pure fluids are included in the library, as well as properties of 40 incompressible fluids and humid air. The source code for the CoolProp library is included as an electronic annex.

OnSSET

- Surveys among Bolivian communities (Both electrified and non-electrified)
- Allows predicting consumption patterns

# RAMP stochastic bottom-up demand model

# MicroGridsPy: Optimal sizing of isolated energy systems

- Objective function:
  - Minimize investment and operational costs

$$Inv + \sum_{s=1}^S \left( \sum_{y=1}^Y \frac{YC_s}{(1+e)^y} \cdot I_s^{occurrence} \right)$$

- Optimization variables:
  - Nominal capacity of generators, battery and renewable sources.
  - Dispatch of generators, battery and renewable sources.
- Optimization characteristics
  - Deterministic or two-stage stochastic
  - LP or MILP.
  - Time period is one year.
  - Time step is one hour.

# MicroGridsPy: Example results

Monitoring of the “El Espino” microgrid:

Re-optimization of the system:

- Smaller diesel generator
- Better battery charging strategy

➔ - 34% diesel consumption

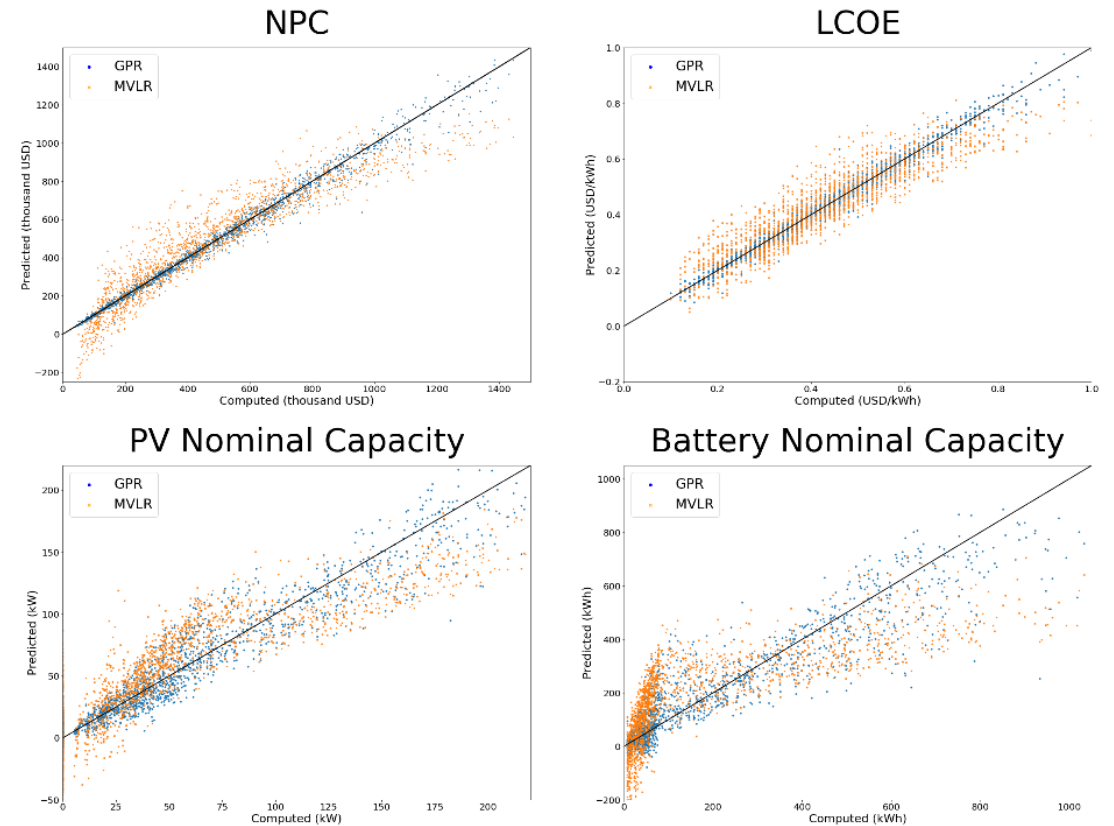

# Surrogate model creation

## Input output parameters

Input parameters	Output parameters
PV investment cost	NPC
Battery investment cost	LCOE
Depth of discharge	PV installed capacity
Battery Cycles	Battery installed capacity
Generator investment cost	
Generator efficiency	
Low heating valuer	
Fuel cost	
Toto demand in the year	
Total PV production from one unit	

## Selected machine learning methods:

- Multi-linear regression.
- Gaussian process regression.

# OnSSET open-source spatial electrification tool

## Electrification algorithm:

1. Calculates LCOE for each each isolated system technology.
2. Calculates the LCOE cost of extending the grid.
3. Compares LCOE grid with isolated systems in each community.
4. If at least 1 community has been electrified with grid, come back to step 2.
5. Calculates all relevant indicators.

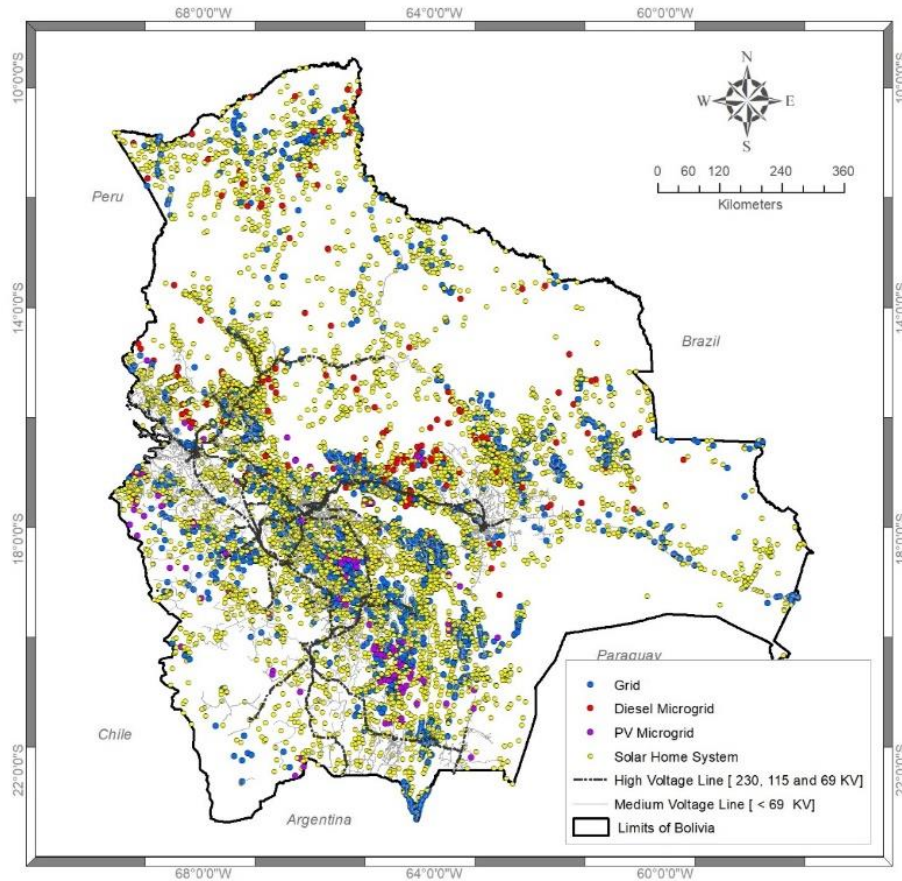

## Legend

- × Grid extension
- Micro-grid hybrid
- Micro-grid hydro
- Mini-grid diesel
- × Standalone diesel
- × Standalone PV
- National limits
- Administrative limits
- International limits
- High Voltage lines

# Results: Universal access in Bolivia

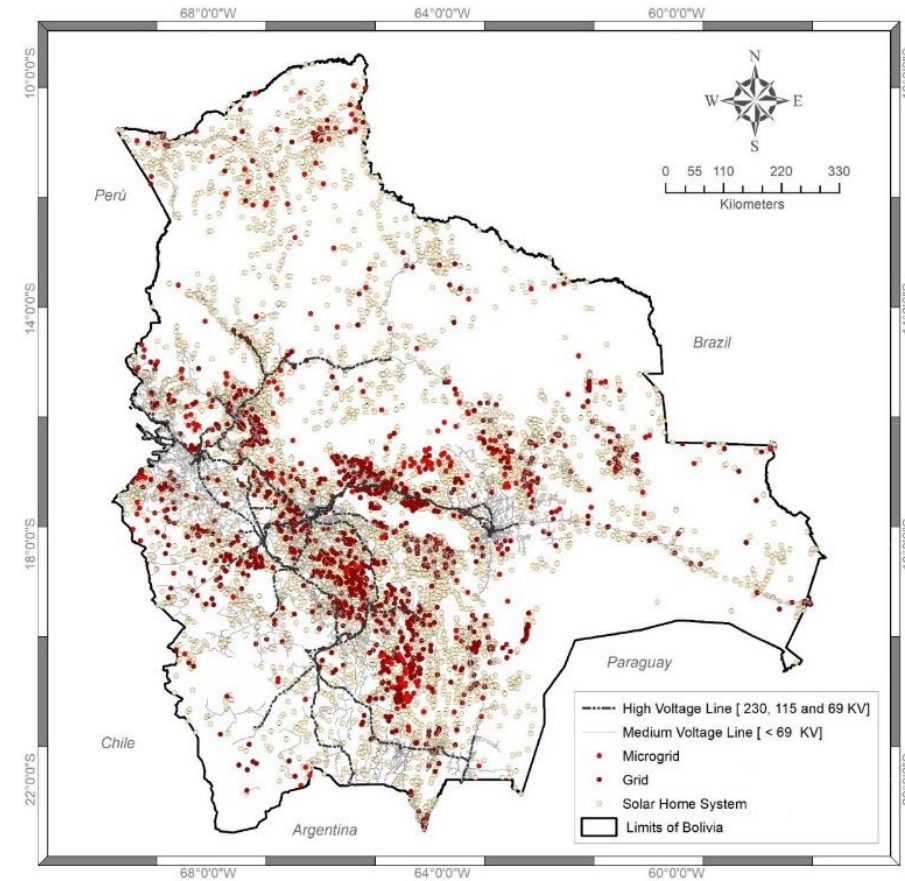

## Naïve formulation

OnSSET only

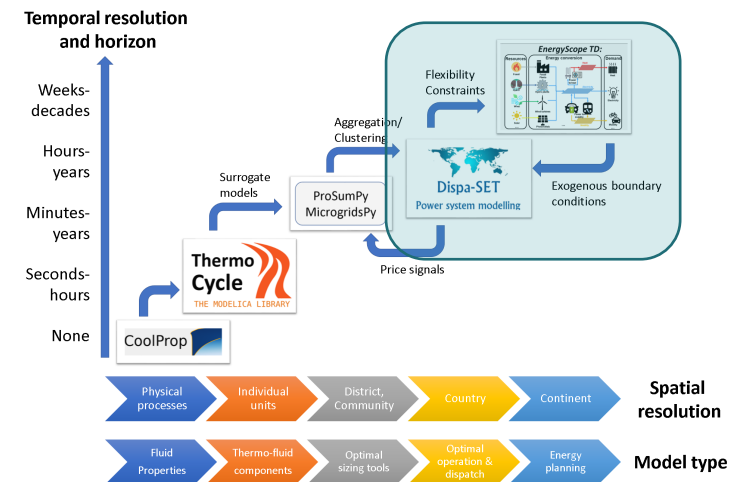

## Interlinked framework

RAMP + MicroGridsPy + OnSSET

# EnergyScope and Dispa-SET: A bi-directional soft-linking

# Dispa-SET in a nutshell

## What Dispa-SET is:

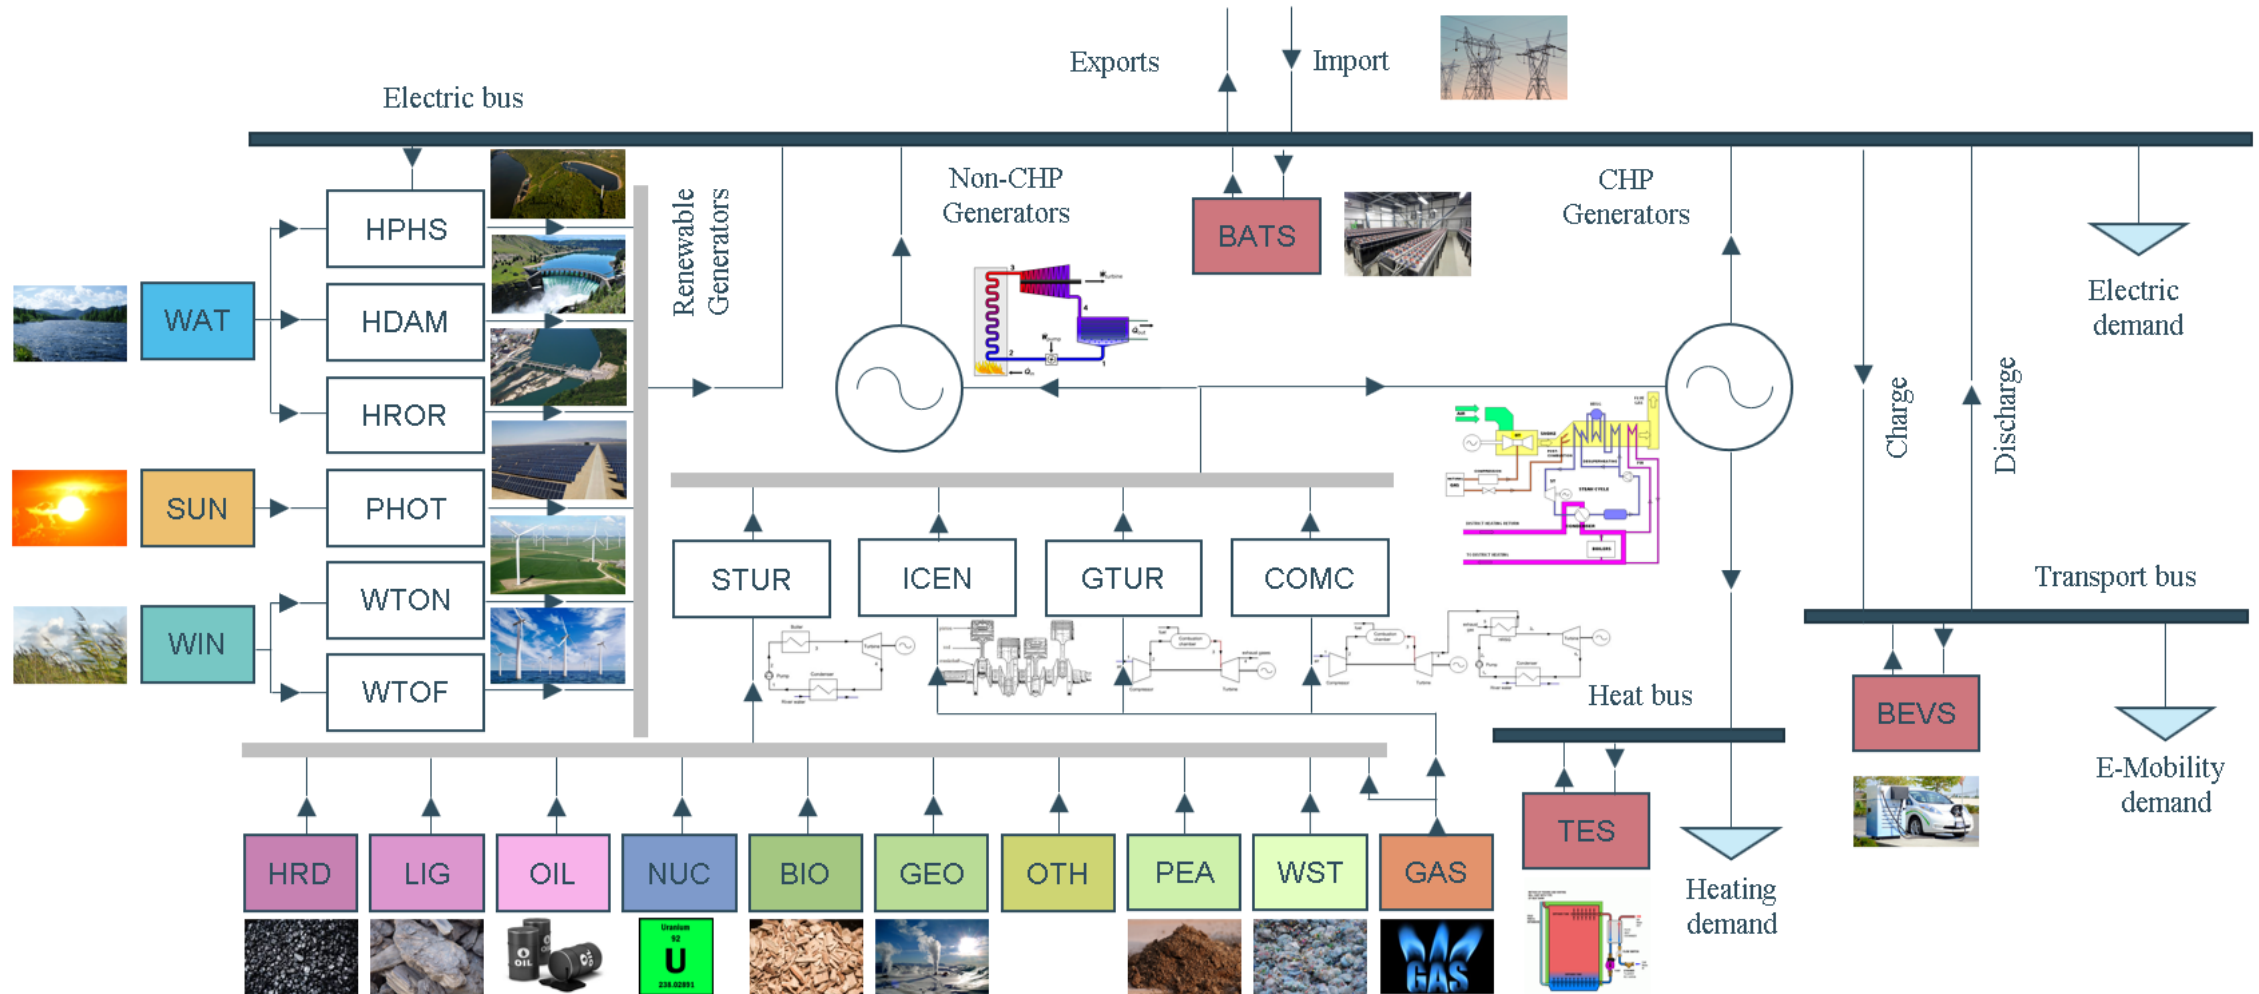

- A unit commitment and dispatch model of the European power system
- Two successive optimizations:
  - Mid-term scheduling of power stations
  - Short-term unit commitment (rolling horizon)
- Probabilistic assessment of system adequacy and flexibility needs of power systems, with growing share of renewable energy generation
- Easily “pluggable” to the outputs of long-term planning models

## What Dispa-SET is not:

- An expansion planning model
  - Only operational costs are optimized
  - No investments

# Dispa-SET 2.3: System structure & technology overview in a single node

- Sector coupling options: P2H, P2V, P2P...

# Dispa-SET 2.1: typical outputs

Country-Specific values (in TWh or in MW):

	Demand	PeakLoad	NetImports	LoadShedding	Curtailment
AT	59.375448	10144.000000	5.144132	NaN	NaN
BE	86.971154	13632.250000	8.911190	NaN	NaN
CH	44.694098	7794.262468	7.199527	NaN	NaN
DE	478.030824	76212.250000	-17.260122	NaN	NaN
FR	470.075612	90588.000000	-51.878128	NaN	NaN
NL	87.925973	16285.500000	5.682672	NaN	NaN

Aggregated statistics for the considered area:  
 Total consumption: 1227.07310992 TWh  
 Peak load: 203182.461067 MW  
 Net importations: -42.20072928 TWh

Number of hours of congestion on each line:

```
{'AT -> CH': 5917,
'AT -> DE': 430,
'BE -> FR': 62,
'BE -> NL': 344,
'CH -> AT': 720,
'CH -> DE': 15,
'CH -> FR': 56,
'DE -> AT': 1522,
'DE -> CH': 4378,
'DE -> NL': 2803,
'FR -> BE': 2689,
'FR -> CH': 7665,
'NL -> BE': 1403,
'NL -> DE': 60}
```

# The EnergyScope model:

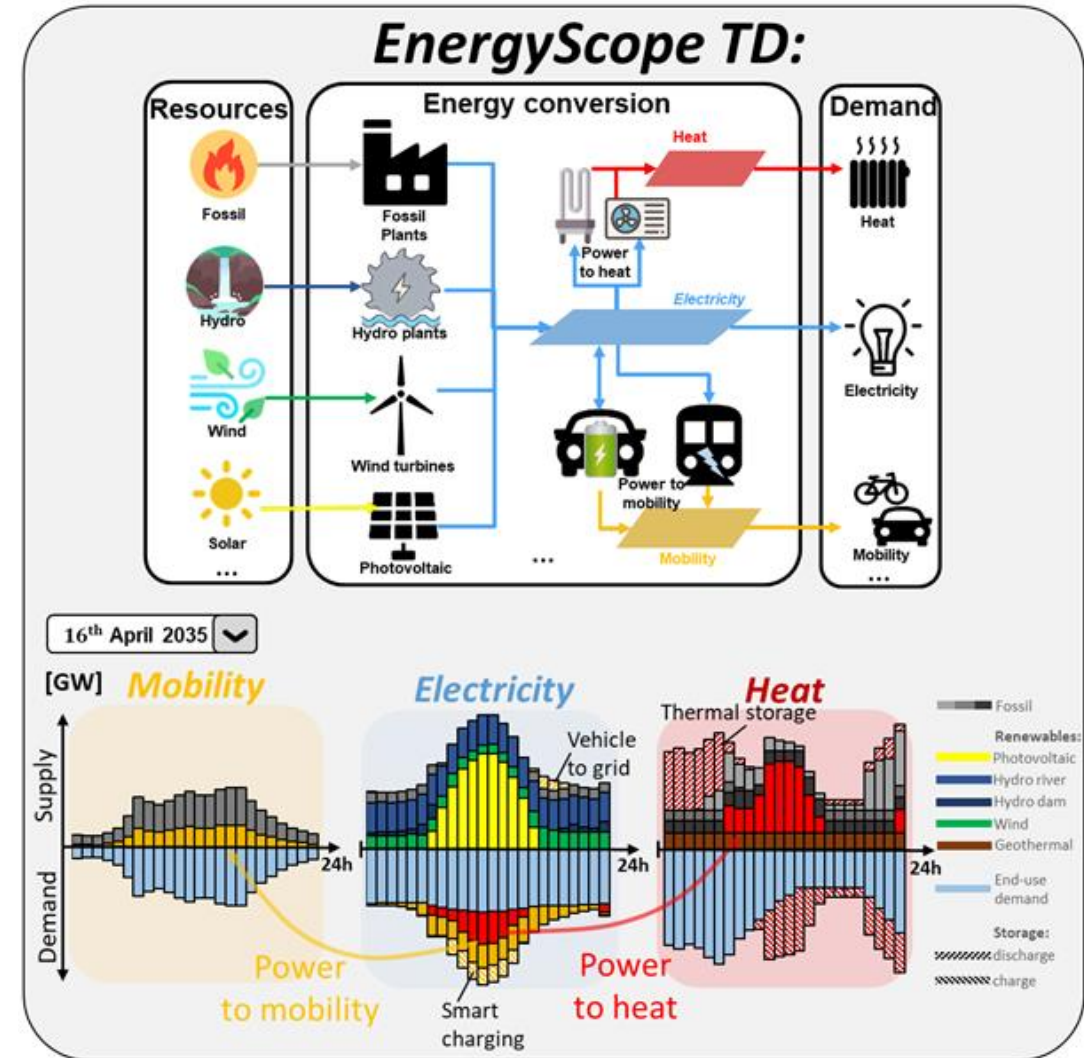

- EnergyScope TD:

- *Advantages:*

- Hourly resolution over a year
    - Whole-energy system: heat, elec. mob...
    - Optimisation of design & operation
    - Open source & documented[1-2]

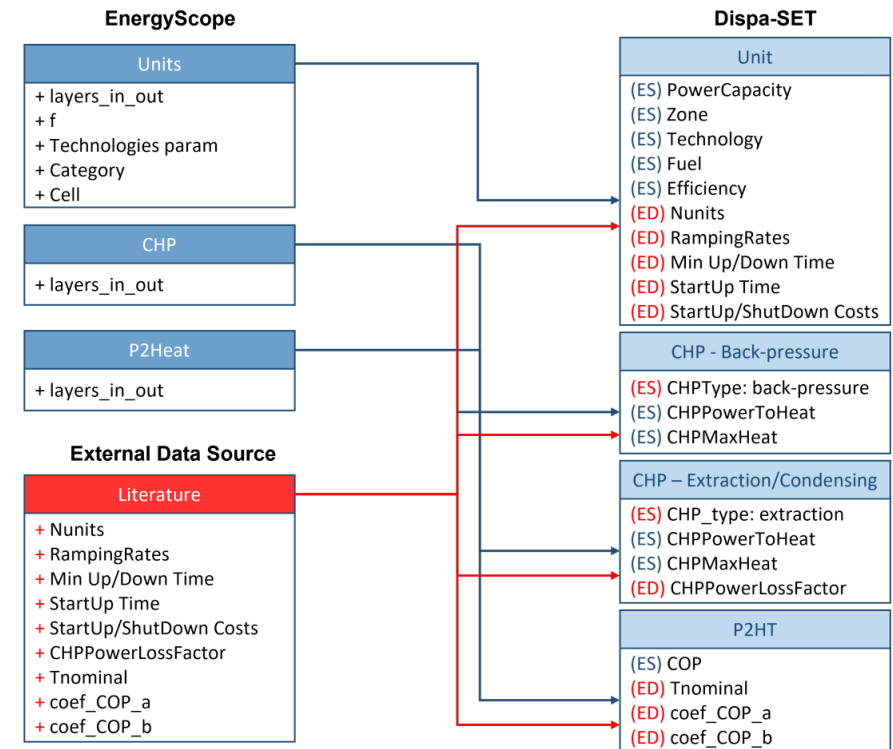

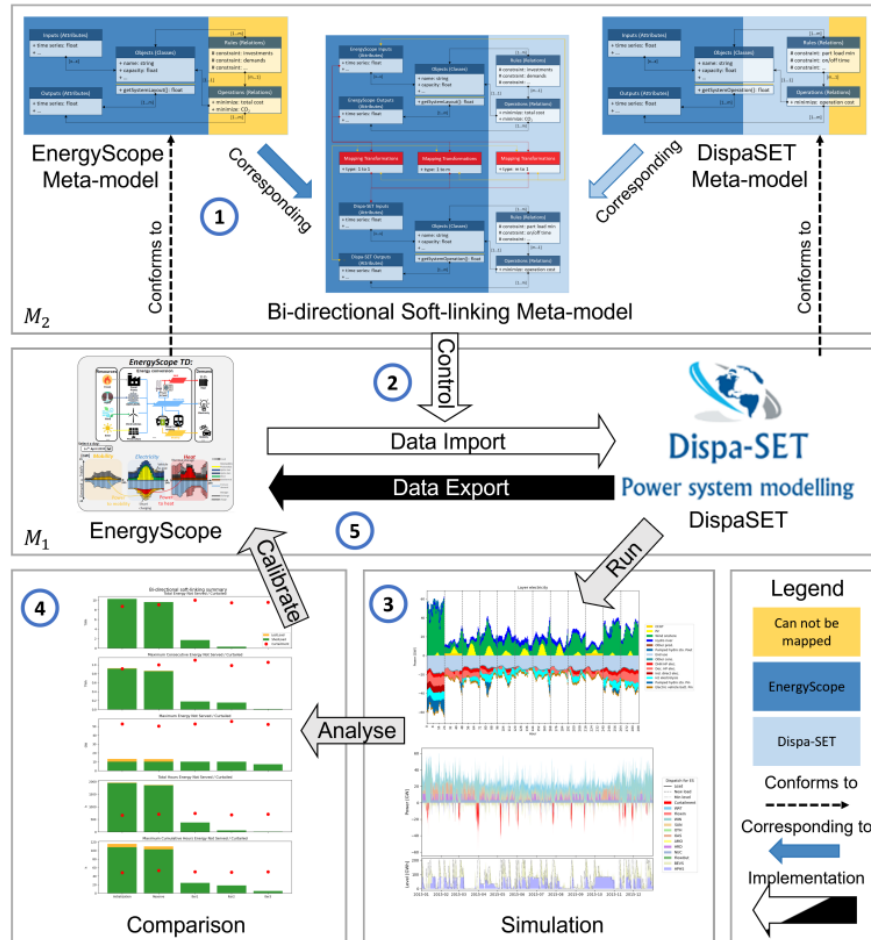

- *Disadvantages:*

- Space resolution: 1 cell
    - Technico-economic: simplified representation of technologies
    - No market equilibrium

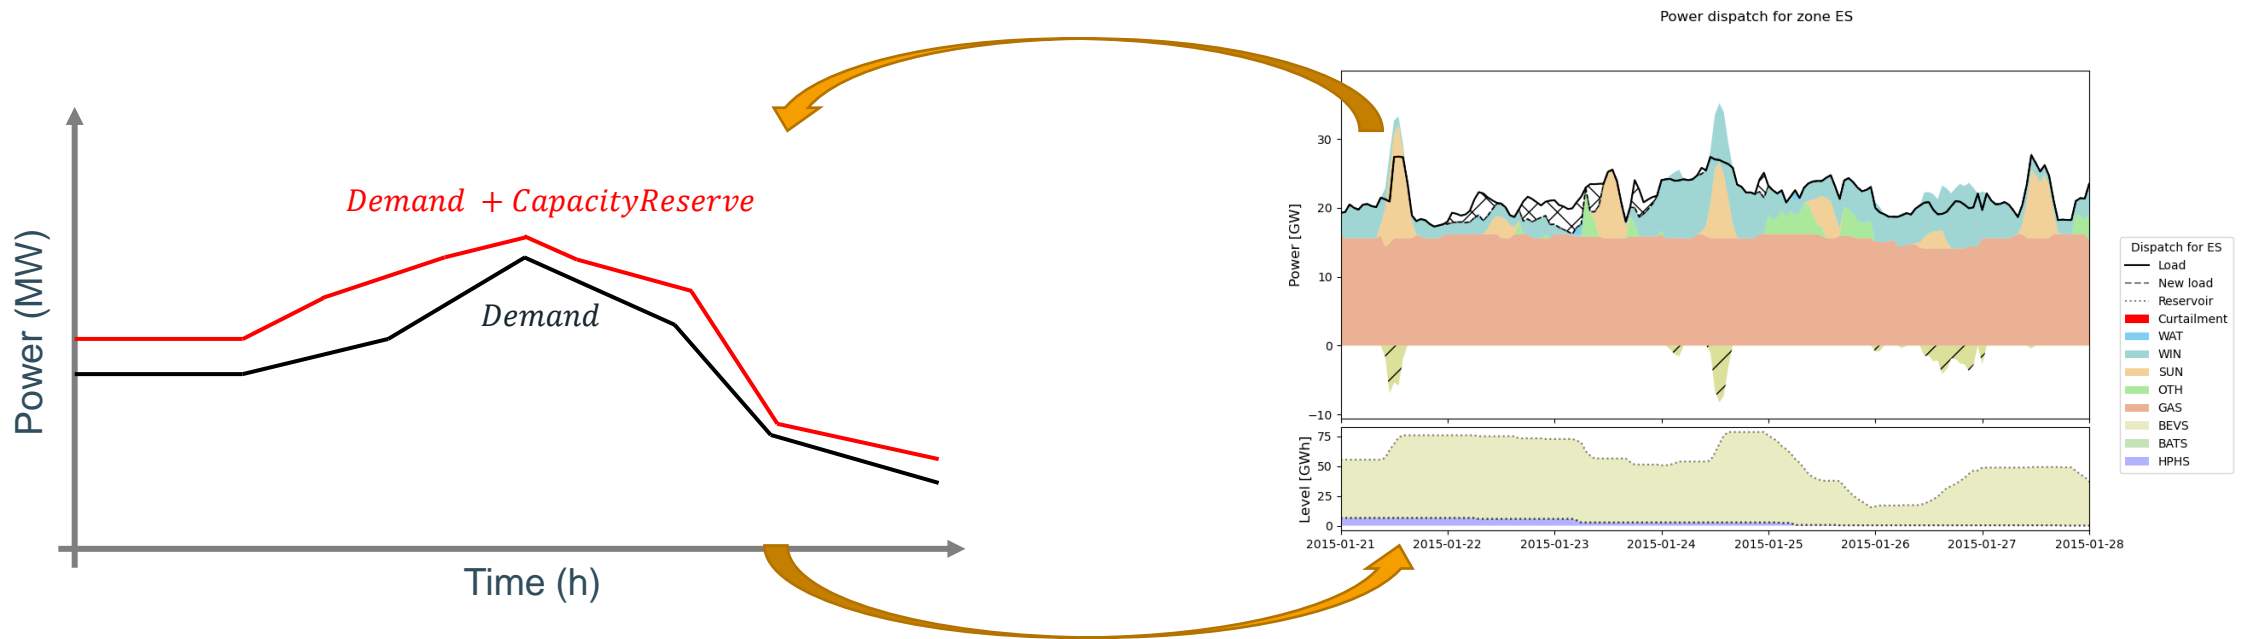

# Mapping variables between both models

# The output of Dispa-SET is fed to EnergyScope as a reserve demand

$$\text{CapacityReserve} += \text{Max}(\text{ShedLoad})$$

- The installed capacity should allow to run with this additional demand
- Operational cost is computed on « actual » operation

# Stop condition

- MILP issue with the solvers **optimality gap**
- Optimization accuracy:

*j* – soft-linking iteration  
*z* – UCED rolling horizon loop  
*i* – UCED time interval

$$Accuracy_z = OptimalityGap \cdot ObjectiveFunction_z$$

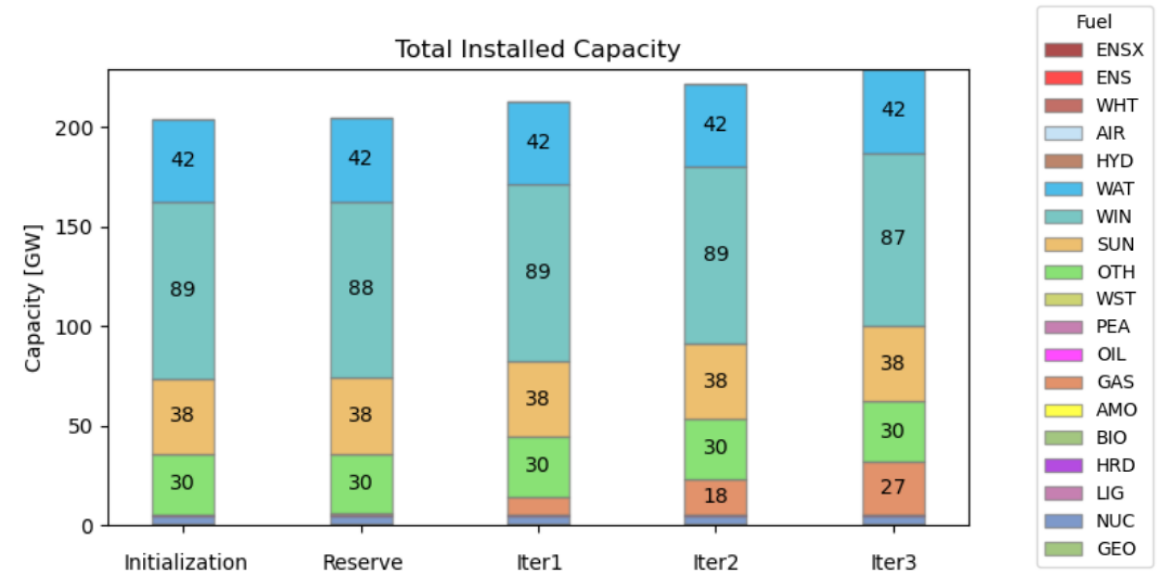

- UCED error:

$$Error_z = \sum_i ShedLoad_i \cdot CostLoadShedding + \sum_i LostLoad_i \cdot CostLostLoad + \sum_i SlackLoad_i \cdot CostSlack$$

- Stop condition:

$$StopCondition = \begin{cases} j + 1: Error_z \geq Accuracy_z \\ stop: otherwise \end{cases}$$

# Over the iterations, the installed flexible capacity increases

Convergence between both models is attained after 3 iterations!

# Final remarks

# Why transparency and reproducibility matter

## Calculation spreadsheet for:

**Growth in a Time of Debt** by Carmen M. Reinhart and Kenneth S. Rogoff. Published in volume 100, issue 2, pages 573-78 of American Economic Review, May 2010

## The Reinhart-Rogoff spreadsheet error arguably skewed the international debate on austerity

### Calculated economic growth (Published version, 2010)

### Corrected calculations (2013):

# Open-science

What does Open Science involve?

- **Open Access:** freely accessible publications for everybody via: gold and green Open Access
- **Open Data** is the practice of opening your data (e.g. measurement data) as unlimited as possible to as many people as possible. The best practice is to commit to the FAIR – principles when it comes to sharing data. Your data should be Findable, Accessible, Interoperable and Reusable.
- **Open Source** (Software) is the practice of sharing the source code of your software freely with everybody. The open-source practice is about releasing your source code under a free license that allows others to use, adapt and redistribute your software freely.
- **Open Methodology:** transparency regarding the uniform laboratory processes e.g., lab work.

Other concepts: FOSS, FAIR principles

# Selecting a license for data

- Creative commons (CC) is well-known
  - Only use version 4.0
- Example: CC BY-NC
  - Others can remix, adapt, and build upon your work
  - their new works must acknowledge you
  - non-commercial use only

- Alternatives include ODbL, ODC-By, PDDL

**CC creative commons**

**MOST OPEN**

**Least Open**

**Licenses**

- CC 0 (ZERO)
- CC BY
- CC BY SA
- CC BY NC
- CC BY ND
- CC BY NC SA
- CC BY NC ND

**Icons**

**Terms of the Licenses**

- Public Domain Dedication (CC0)**  
This is considered a dedication to the public domain, and thus the creator(s) associated with this item have waived all their rights to the work worldwide under copyright law.
- Attribution (BY)**  
Others can copy, distribute, display, perform and remix the work if they credit/cite the creator/author.
- Derivative Works (ND)**  
Others can only copy, distribute, display or perform *verbatim* copies of the work. (No modifications allowed.)
- Share Alike (SA)**  
Others can distribute the work only under a license identical to the one attached to the original work.
- Non-Commercial (NC)**  
Others can copy, distribute, display, perform or remix the work but only for non-commercial purposes.

# Selecting a license for code

- Are you okay with your code becoming part of a closed-source commercial software product?
  - No: GPL
  - Yes: permissive licenses (MIT/BSD/Apache)
- Do you want to force users to publish their improvements to your software, or to software they develop based on your software, under the same license?
  - No: permissive licenses (MIT/BSD/Apache). This makes the code more broadly usable, but also allows people to take the code without sharing their improvements.
  - Yes: GPL. This ensures that any future changes and improvements to the code remain free and open

	Code	Data	Documentation
<b>Copyleft</b>	GPL, (AGPL)	ODbL	CC BY SA
<b>Permissive</b>	ISC, MIT, BSD, Apache <sup>1</sup>	CC BY, ODC-By	CC BY
<b>Public domain</b>	not recommended	PDDL, CC0	CC0

# Why energy models and data should be open

- Quality of science: peer review, reproducibility, traceability
- More effective collaboration between science and policy
  - Transparent social debate
- Collaborative burden sharing (= > increased productivity)
- Research funded by public money should be public

The importance of open data and software: Is energy research lagging behind?

ARTICLE INFO

ABSTRACT

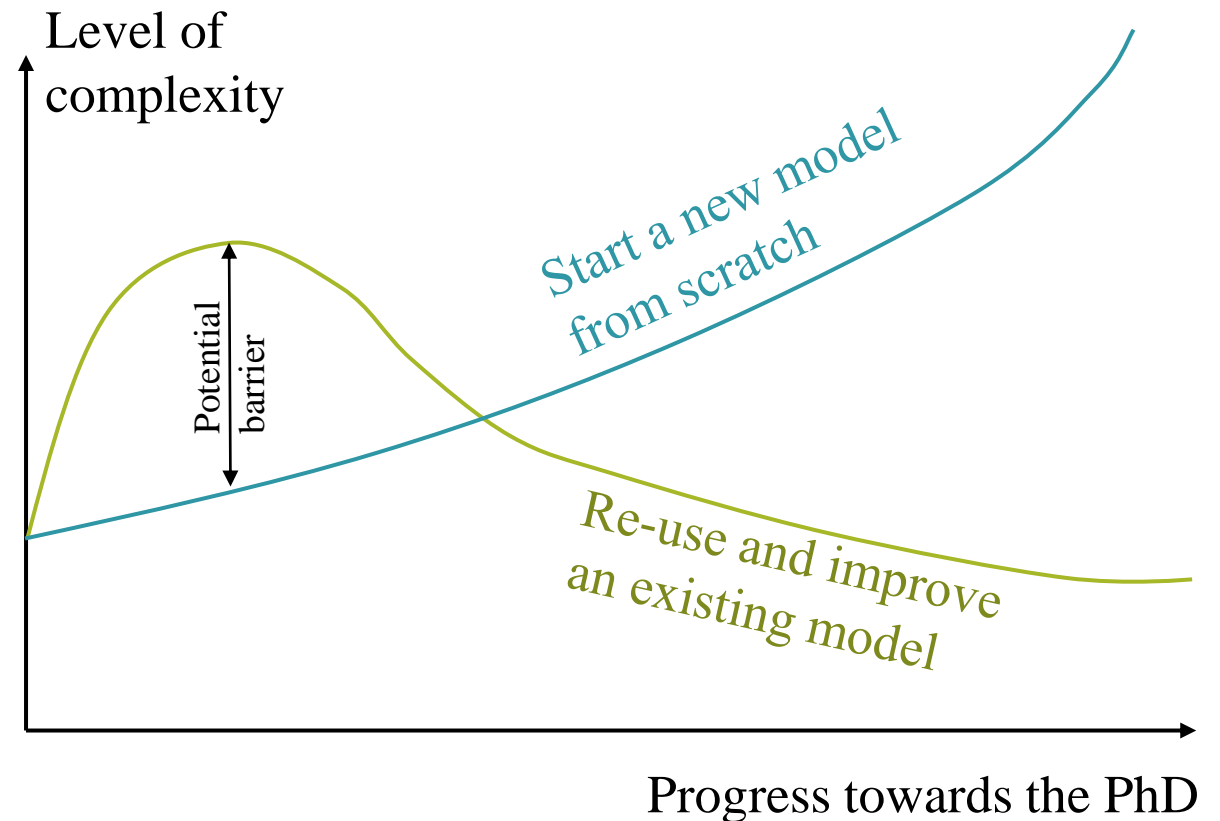

From the H2020 website: *"the European Commission is now moving decisively from Open Access into the broader picture of Open Science"*

# Why energy models and data are not open

- Ethical and security concerns (particularly for data)
  - E.g. Information in household consumption data
- Unwanted exposure and scrutiny
  - *"My code is not good enough to be published"*
  - Reluctance to share data was shown to be associated with weaker evidence
- Fear of the code being stolen
  - *"The code is valuable intellectual property that belongs to my institution"*
- Time-consuming: documenting the code, providing a documentation
  - *"It is too much work to polish the code"*
- Institutional and personal inertia
  - *"It is not common practice to publish code in my institution"*
- License is omitted
  - *"The inputs are proposed as open data and are available upon request"*
  - standard copyright rules apply
  - no re-use or distribution of the code/data is permitted

# Why energy models are proliferating

- Recent years have seen a proliferation of energy system models, open or not
- Reasons include:
  - Limited knowledge of the modeling landscape by young researchers
  - Lack of guidance and inertia of the promotor
  - Willingness to make "something new"
  - The initial potential barrier to get into someone else's model

*Thank you very much for your attention!*
