

# Iron-manganese phosphates with the olivine- and alluaudite-type structures: Crystal chemistry and applications

Frédéric Hatert

MAAMII, Kirovsk, July 21st, 2010

Alluaudite, Buranga pegmatite, Rwanda

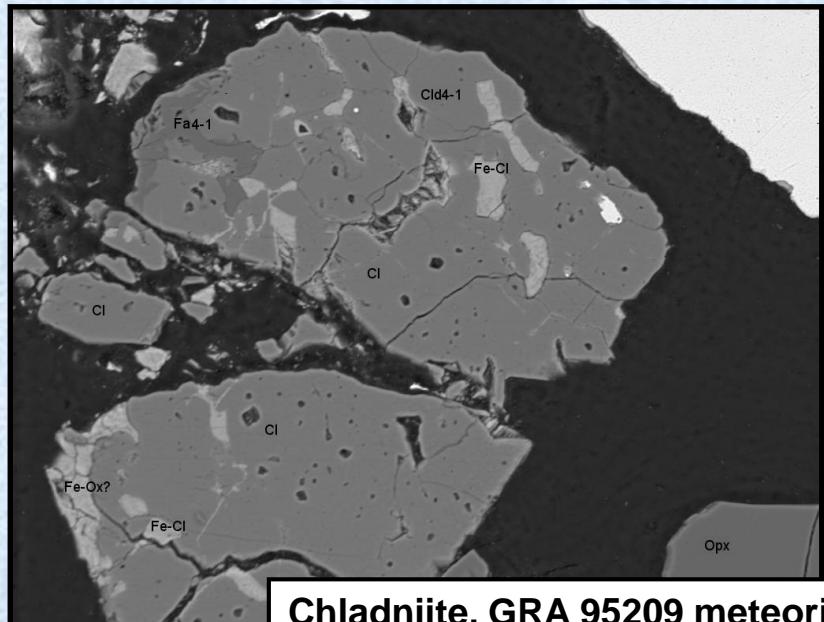

Johnsomervilleite, Loch Quoich, Scotland

## Occurrence

Université  
de Liège

- Granitic pegmatites
- Metamorphic rocks
- Meteorites

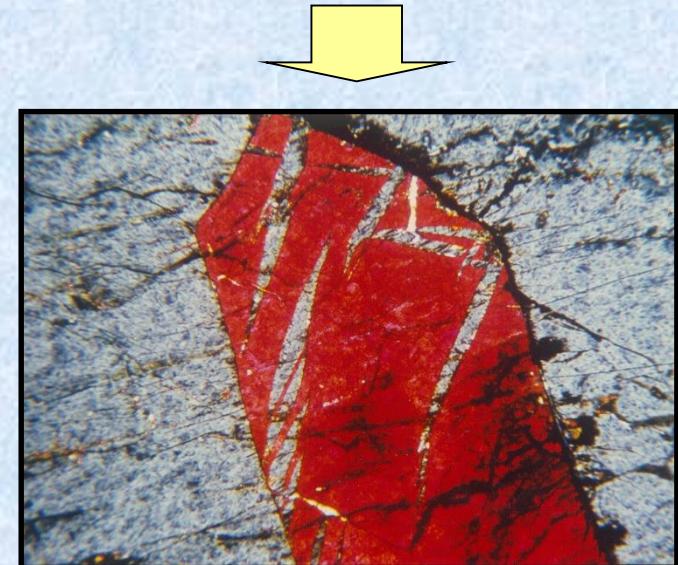

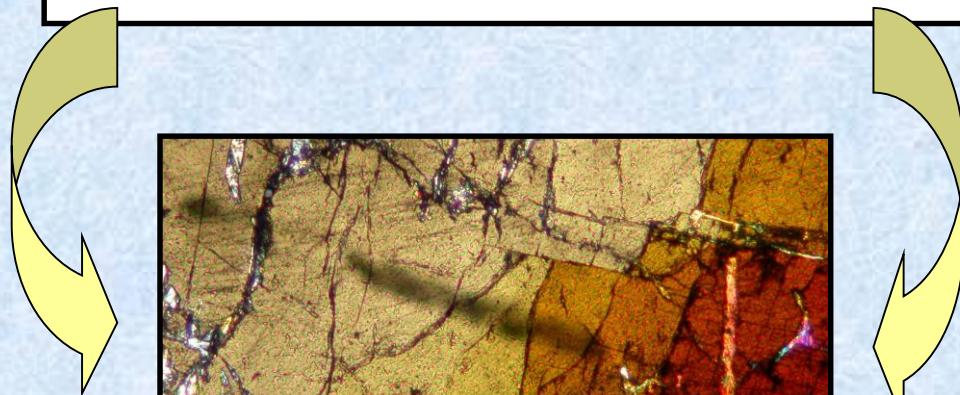

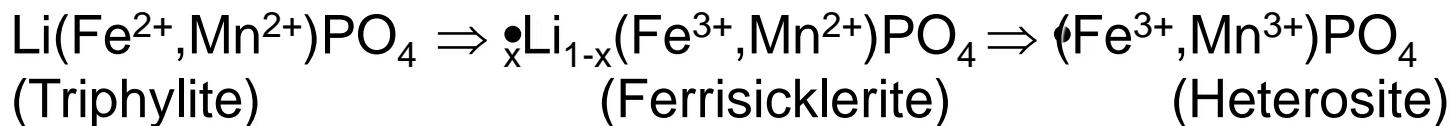

Chladniite, GRA 95209 meteorite

# Fe-Mn phosphates in pegmatites

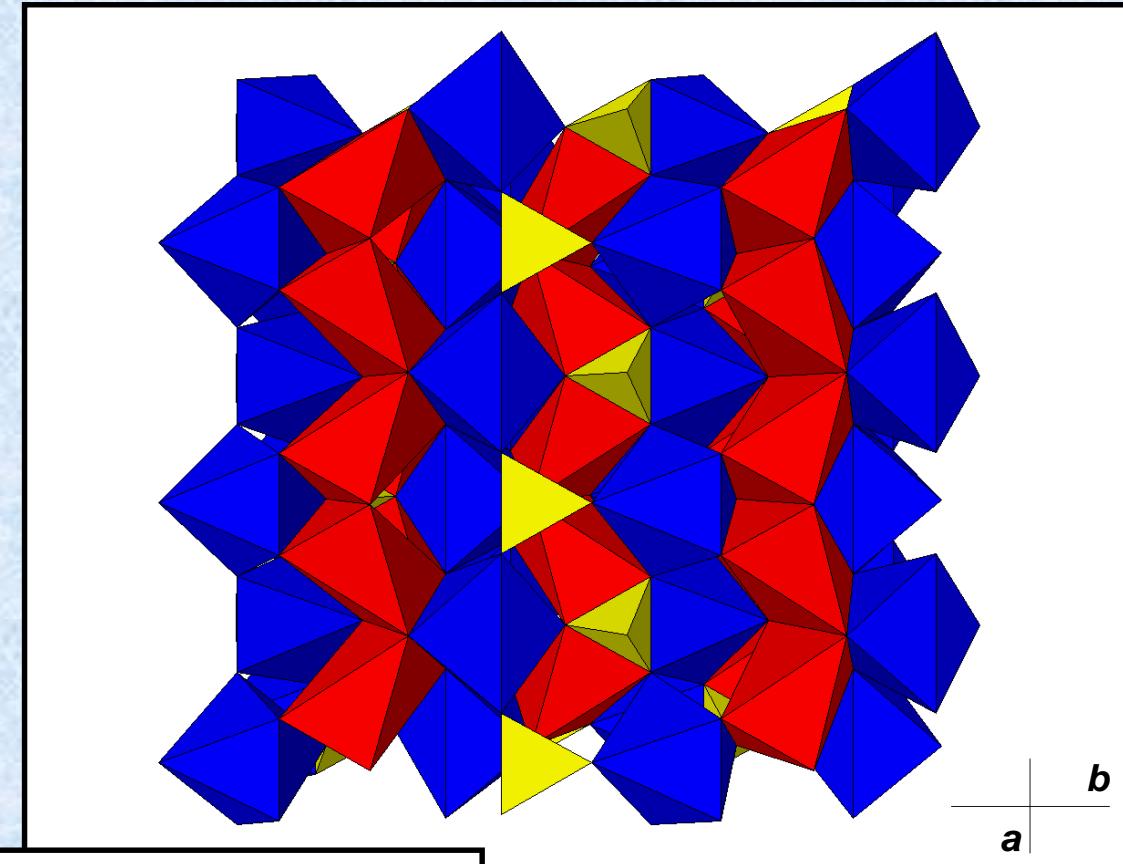

Buranga pegmatite, Rwanda

# Phosphates with the olivine structure: the « Quensel-Mason » sequence

# The triphylite structure

Red octahedra: M1  
Blue octahedra: M2

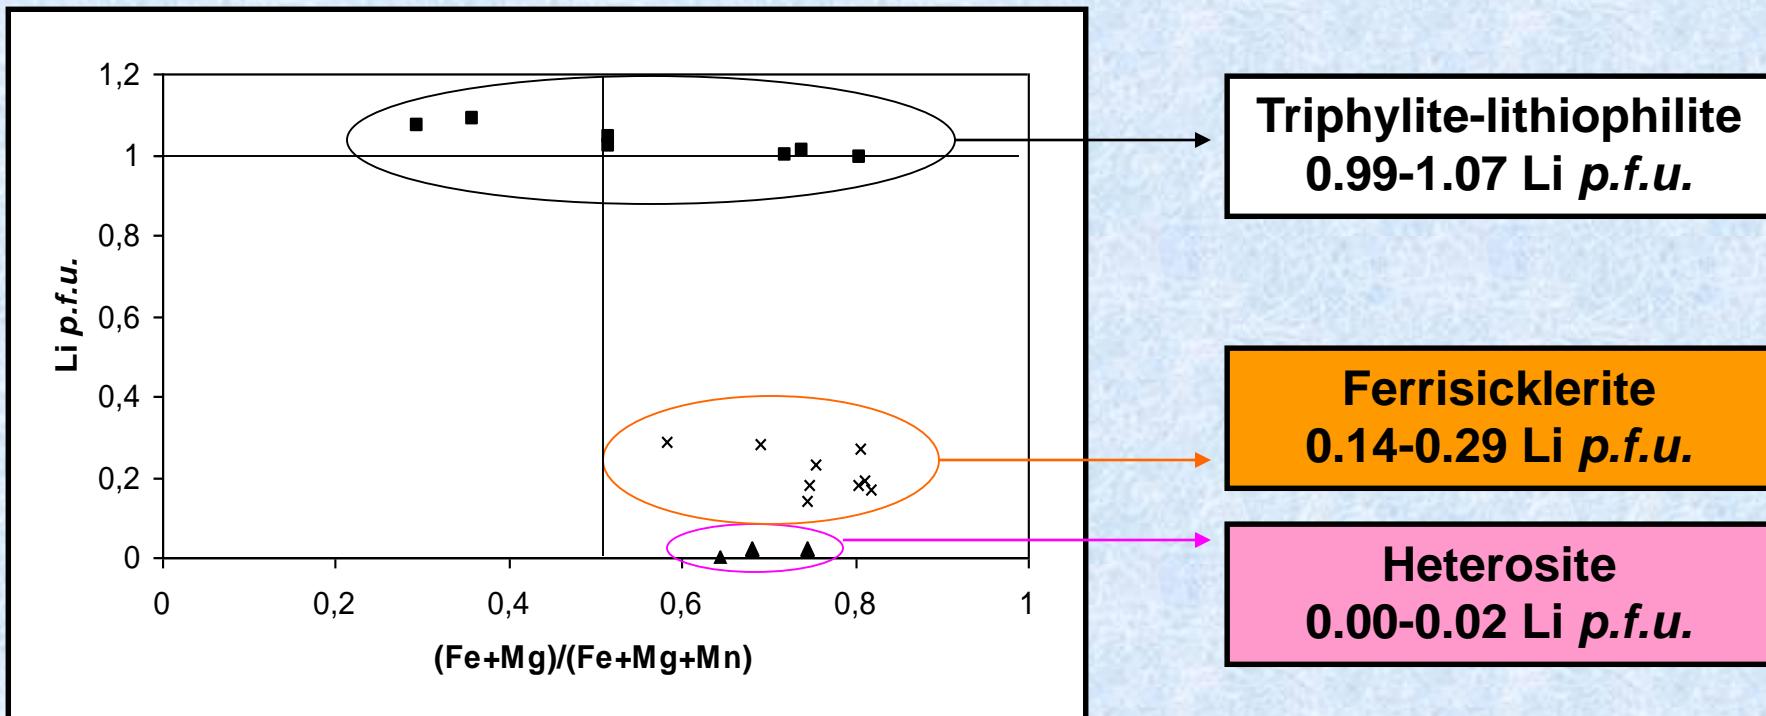

S.G. Pmnb

$a = 6.092$ ,  $b = 10.429$ ,  $c = 4.738 \text{ \AA}$

- M1: Li, []
- M2: Fe<sup>2+</sup>, Mn, Mg

# Crystal chemistry of natural olivine-type phosphates

SIMS and crystal-structure analysis of 19 samples

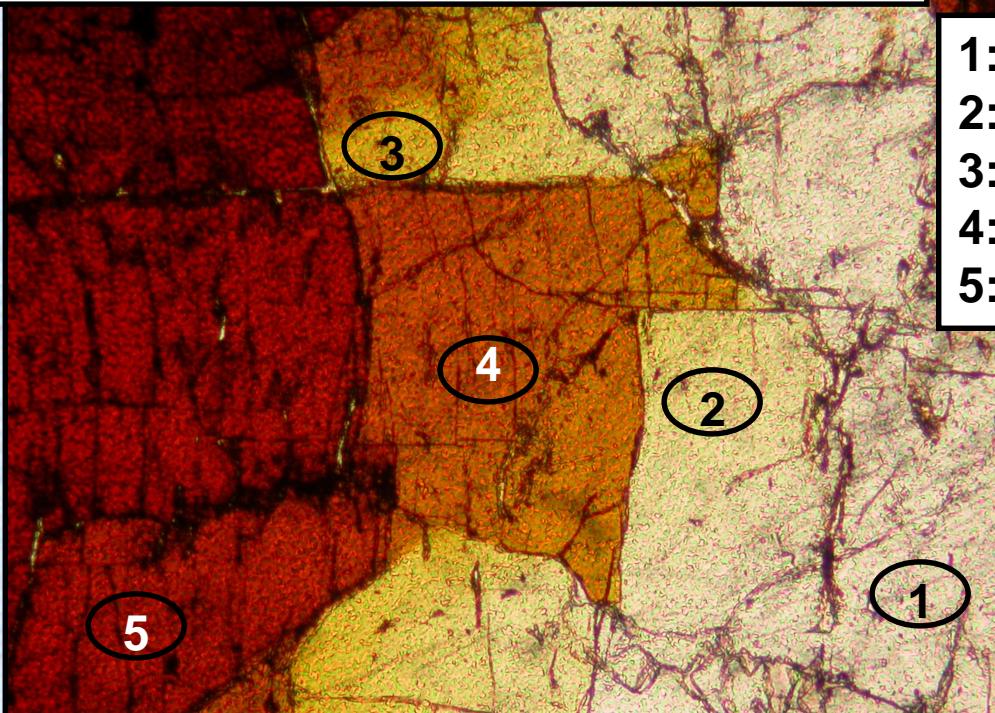

Heterosite may contain up to 0.21 wt. %  $\text{Li}_2\text{O}$ , and ferrisicklerite may show a low Li-content of 1.31 wt. %  $\text{Li}_2\text{O}$

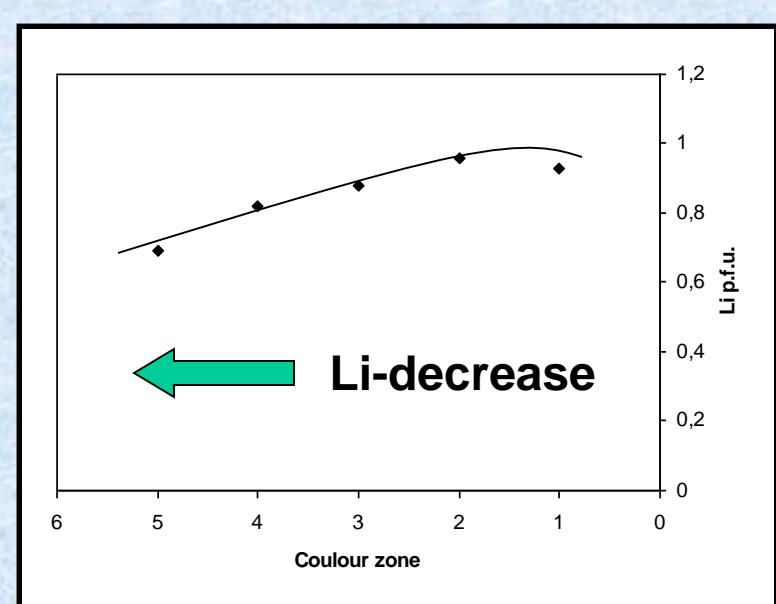

Close Li-contents!

# The progressive transition from lithiophilite to sicklerite

Sample from the Altaï Mountains, China

- 1:  $\text{Li}_{0.93}(\text{Fe}^{2+}_{0.03}\text{Fe}^{3+}_{0.13}\text{Mn}^{2+}_{0.80})(\text{PO}_4)$
- 2:  $\text{Li}_{0.96}(\text{Fe}^{2+}_{0.08}\text{Fe}^{3+}_{0.08}\text{Mn}^{2+}_{0.81})(\text{PO}_4)$
- 3:  $\text{Li}_{0.88}(\text{Fe}^{3+}_{0.16}\text{Mn}^{2+}_{0.80}\text{Mn}^{3+}_{0.01})(\text{PO}_4)$
- 4:  $\text{Li}_{0.82}(\text{Fe}^{3+}_{0.16}\text{Mn}^{2+}_{0.75}\text{Mn}^{3+}_{0.06})(\text{PO}_4)$
- 5:  $\text{Li}_{0.69}(\text{Fe}^{3+}_{0.16}\text{Mn}^{2+}_{0.62}\text{Mn}^{3+}_{0.19})(\text{PO}_4)$

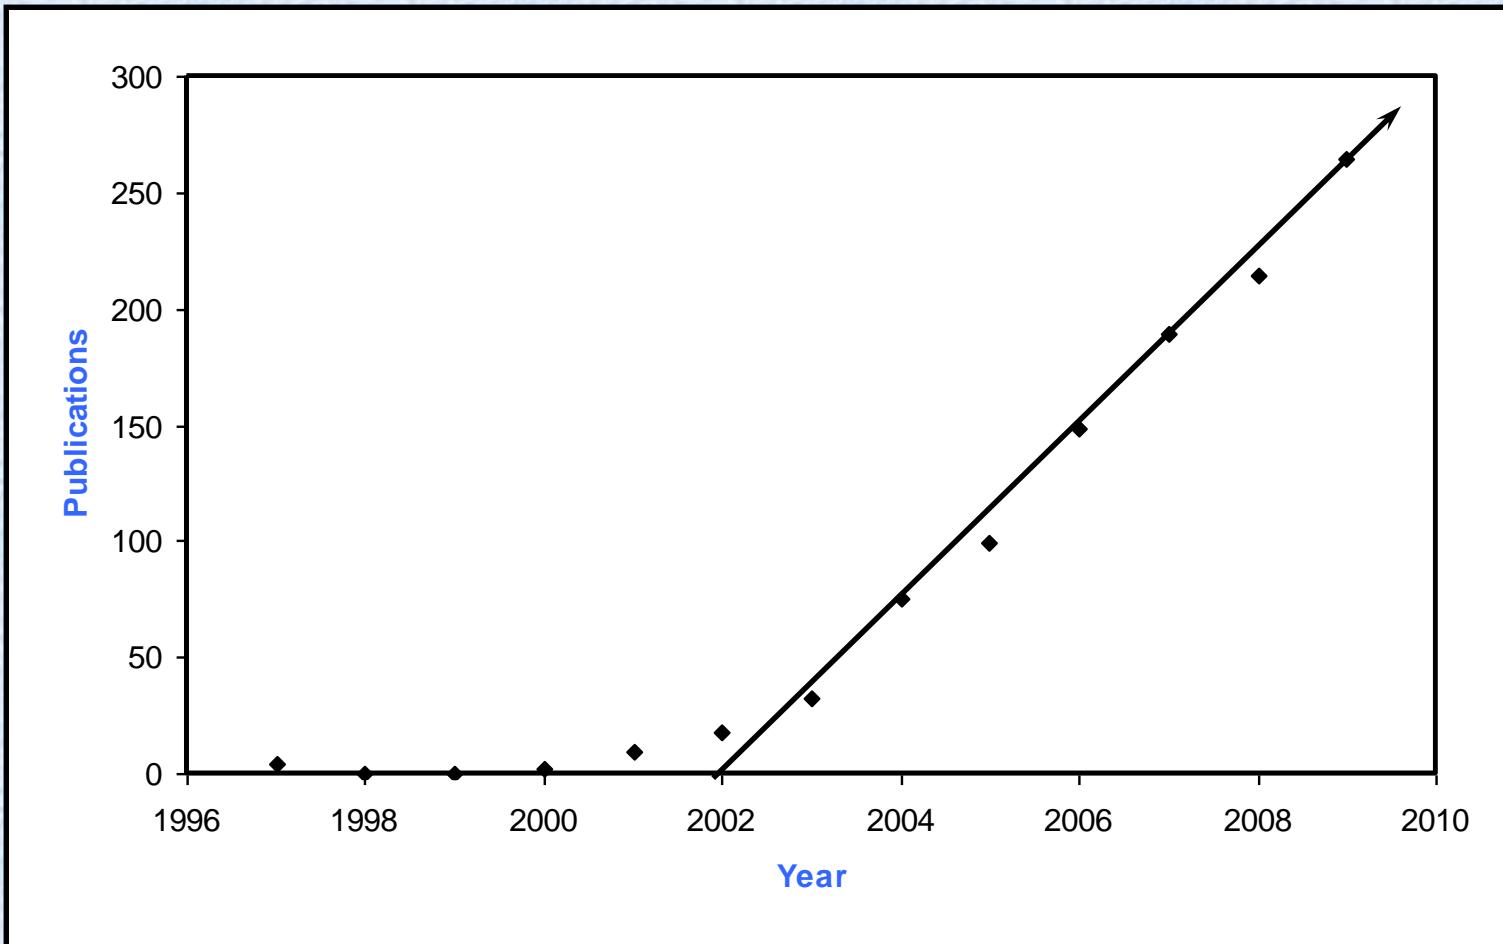

- The transition from lithiophilite to sicklerite is progressive
- The change in colour is due to the presence of  $\text{Mn}^{3+}$

## Battery materials for ultrafast charging and discharging

Byoungwoo Kang<sup>1</sup> & Gerbrand Ceder<sup>1</sup>

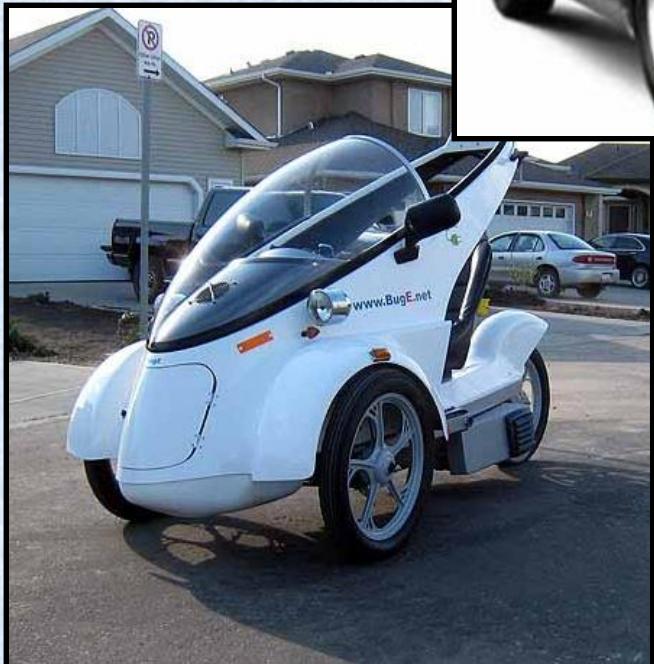

The storage of electrical energy at high charge and discharge rate is an important technology in today's society, and can enable hybrid and plug-in hybrid electric vehicles and provide back-up for wind and solar energy. It is typically believed that in electrochemical systems very high power rates can only be achieved with supercapacitors, which trade high power for low energy density as they only store energy by surface adsorption reactions of charged species on an electrode material<sup>1–3</sup>. Here we show that batteries<sup>4,5</sup> which obtain high energy density by storing charge in the bulk of a material can also achieve ultrahigh discharge rates, comparable to those of supercapacitors. We realize this in LiFePO<sub>4</sub> (ref. 6), a material with high lithium bulk mobility<sup>7,8</sup>, by creating a fast ion-conducting surface phase through controlled off-stoichiometry. A rate capability equivalent to full battery discharge in 10–20 s can be achieved.

# LiFePO<sub>4</sub>-based batteries production

- Phostech Lithium was founded in 2001
- Based on the commercial potential of C-LiFePO<sub>4</sub> and other Phosphate-based cathode materials
- Obtained exclusive rights for the manufacture and sales of LiFePO<sub>4</sub> for Lithium-Ion battery applications with University of Texas and Hydro-Quebec
- Obtained through UDM the access to four improvement patents resulting from UDM's research for Hydro-Québec, including C additive to LiFePO<sub>4</sub> and a new synthesis way from a Fe<sup>+3</sup> precursor

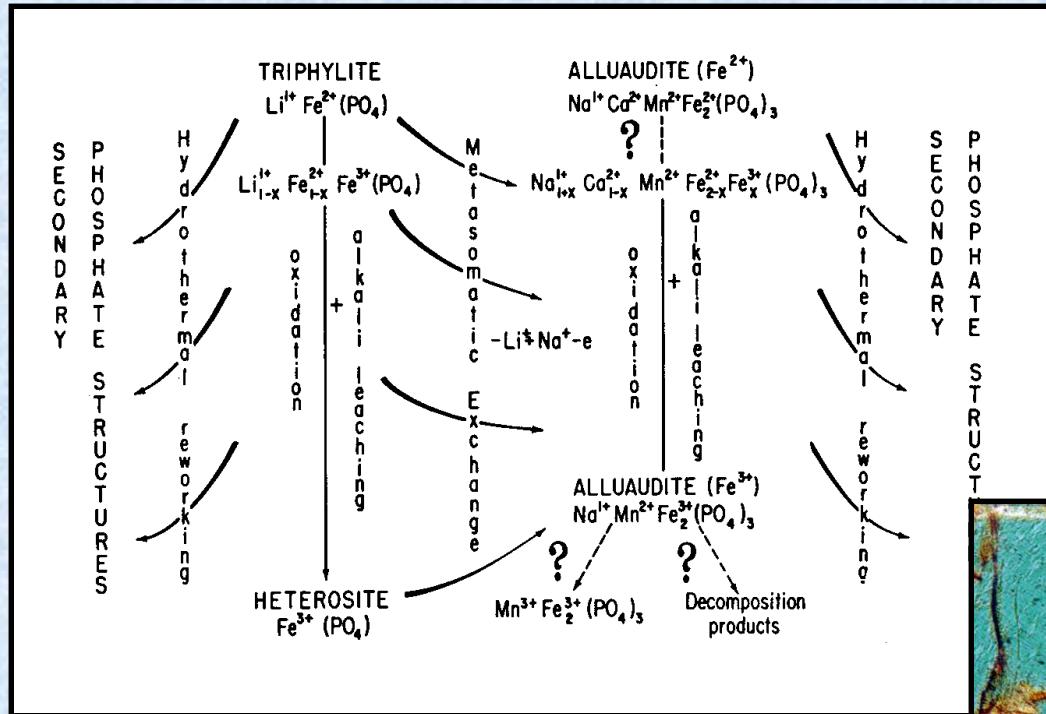

# LiFePO<sub>4</sub>-based batteries applications

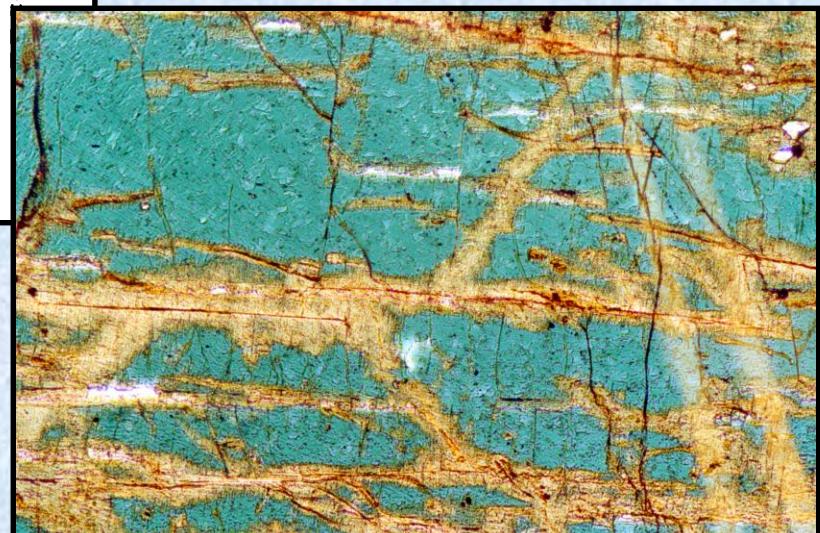

- Cars
- Bicycles
- Motorbikes
- Mobile phones
- Laptops
- Storage of green energy

# Alluaudites as a promising cathode material for Li-ion batteries?

Low performance

Investigation of other  
alluaudite-type  
phosphates necessary

# Conclusions

- Iron-manganese phosphates play a crucial role in the geochemical evolution of granitic pegmatites, and are very sensitive to the variations of physico-chemical parameters
- Investigation of synthetic alluaudites and of natural olivine-type phosphates allowed one to better understand the crystal chemistry of these phosphates.
- Phosphates with the olivine- and alluaudite-type structures show interesting properties, related to the mobility of large cations in their crystal structures. These properties are responsible for the recent use of  $\text{LiFePO}_4$  as electrode material in Li-ion batteries.
