1. Synopsis

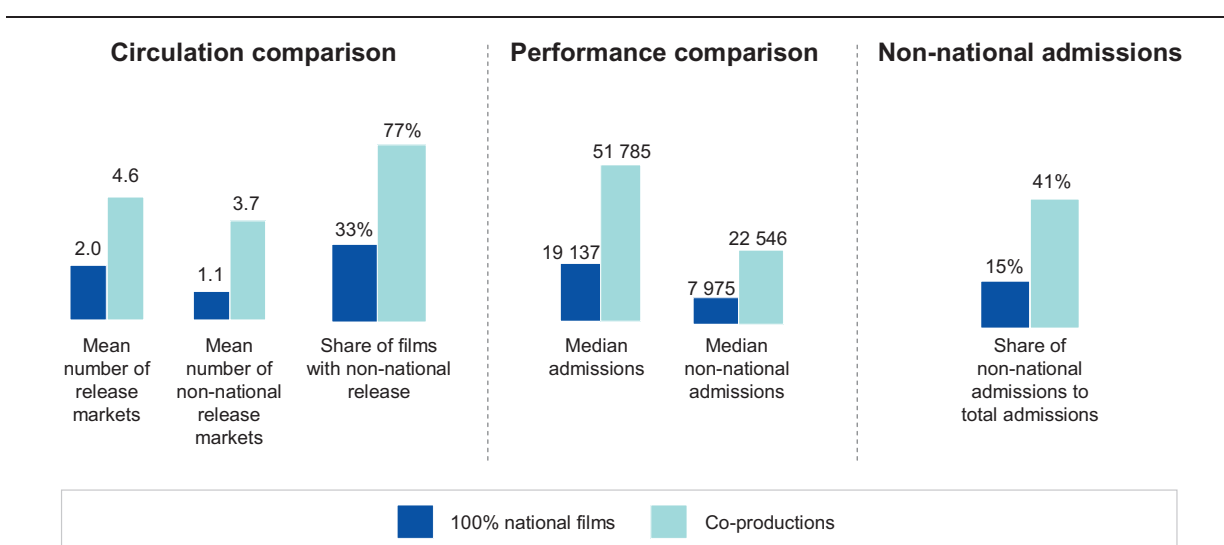

In this study the European Audiovisual Observatory analyses the circulation and performance of European co-productions compared to 100% national European films, both inside and outside their national markets. Circulation is compared in terms of average number of release markets for each of the two types of films as well as in terms of the percentage of films that get released on at least one non-national market. Performance is measured by comparing the respective cumulative average admissions for each type of film, on their national and non-national markets as well as on a total level.

The analysis employs a pragmatic approach by analysing the largest possible data set for which reliable and coherent data are available. The data sample comprises a total of 5 414 films with theatrical release between 2001 and 2007 in 20 selected European markets with comprehensive coverage. The data are drawn from the Observatory's LUMIERE database¹.

Three key conclusions can be drawn from the data analysed:

1. European co-productions travel better than their 100% national counterparts in the sense that on average (mean) co-productions get released in more than twice as many markets as national films. In addition 77% of all co-productions get released on at least one non-national market, compared to 33% of entirely national films;
2. European co-productions attract on average 2.7 times as many admissions as their national peers with co-productions generating on average 51 785 admissions (median value) compared to 19 137 for 100% national films;
3. Non-national markets are more important for co-productions than for entirely national films in terms of admissions, with non-national admissions accounting for 41% of total admissions to co-productions compared to 15% in the case of entirely national films.

2. Preamble and objectives of the analysis

2.1. Preamble

The European Audiovisual Observatory is a partial agreement of the Council of Europe, established by a decision of the Committee of the Ministers of 15 December 1992.

The mission of the Observatory is *“to improve the transfer of information within the audiovisual industry, to promote a clearer view of the market and a greater transparency. In doing so, the Observatory shall pay particular attention to ensuring reliability, compatibility and comparability of information.”*

“Specifically, the task of the Observatory shall be to collect and process information and statistics on the audiovisual sector (namely, legal, economic and programme information) - excluding any standard-setting or regulatory activities - and to place these at the disposal of professionals, of the representatives of the members to the Executive Council of the Observatory (...).”

The European Audiovisual Observatory has, by virtue of its statute, no mandate to contribute to the drafting or evaluation of film policies, either at the national or the European level. Nonetheless to contribute to the improvement of transparency of the audiovisual sector is, *de facto*, to contribute to film policy and its evaluation.

The promotion of co-production is an important element of Council of Europe policy as witnessed by the European Convention on Cinematographic Co-production and the Eurimages fund. During the preparation of the Council of Europe Film Policy Forum and the drafting of the report commissioned for that event it became evident that the status of co-production would be one of the more challenging topics to be debated there. The provision of concrete statistical material analysing the circulation of co-productions was without doubt the most valuable contribution that the Observatory could make to this debate.

The following report draws chiefly on data stored in the European Audiovisual Observatory's LUMIERE database of admissions to films (<http://lumiere.obs.coe.int>). It cannot claim to be a comprehensive report on the importance and effectiveness of co-production, as other factors (legal, financial, professional, aesthetic,...) would need to be taken into account in order to provide an in-depth analysis. As data on most of these aspects are not available on a pan-European level, this analysis chooses to focus on the number of release markets for films and their admissions on national and non-national markets.

In this context, and based on its experience in data collection and analysis, the European Audiovisual Observatory identifies need for greater transparency of information on the costs, financing and revenues related to film production along the entire value chain (theatrical revenues, sales to television, sales to video publishers, international sales, sales to VoD services,...). To date, these data remain largely unavailable on a European level. The Council of Europe, Eurimages and the European Audiovisual Observatory, if specifically mandated, could play a role in the creation of a European “clearing house” for this information crucial to evaluating film policies and increasing transparency.

Finally, various national bodies and professionals have requested an analysis of the impact of the Council of Europe's Convention on Cinematographic Co-production. The European Audiovisual Observatory is ready to participate in such an evaluation, which would certainly enrich significantly the data already collected.

2.2. Objectives of the analysis

The objective of this study is to analyse the circulation and performance of European co-productions compared to 100% national European films both, inside and outside their national markets. The analysis focuses on the following three key questions:

1. How do European co-productions travel in comparison with 100% national European films, i.e. on how many markets does each type of film get released on average? What percentage of films get a non-national release?
2. How do European co-productions perform in comparison with 100% national European films, i.e. how many admissions does each type of film generate on average?
3. What role do non-national markets play for co-productions and 100% national films respectively, i.e. what is the share of non-national admissions to total admissions for each type?

In answering these questions this study uses a pragmatic approach, analysing the largest possible data set for which reliable and coherent data are available. A total of 5 414 films with theatrical release between 2001 and 2007 in 20 selected European markets with comprehensive coverage are analysed on the basis of data drawn from the Observatory's LUMIERE database².

In order to draw valid and unbiased conclusions the data sample ensures identity between the (co-) producing countries and the exploitation markets, i.e. it focuses on films produced within the 20 selected European countries and analyses their theatrical exploitation on the same 20 markets. In doing so the data sample permits the calculation of a representative split between national and non-national admissions, and excludes a bias towards national films, which would be caused by including markets where comprehensive data are e.g. only available for national films.

Please refer to the following chapter for a detailed description of the data sample underlying the analysis and the methodological approach applied.

The Observatory would also like to invite professionals and other experts to provide feedback and comments on this study in order to further enhance the quality and pertinence of its analysis.

² <http://lumiere.obs.coe.int>

3. Methodology and data sample

3.1. Methodological approach

As stated in the introduction the objective of this study is to compare the circulation and performance of European co-productions and 100% national films on their national and non-national markets. In carrying out such a comparison a series of methodological parameters need to be established. To allow the reader to gain a thorough understanding of the nature of the methodology applied and the data population used in the analysis, the major parameters used in designing the study are described in the following paragraphs.

How is a film allocated its 'country of origin'?

In order to avoid double counting of films, each film can only be assigned to one country of origin. The European Audiovisual Observatory allocates a film to the country which provides the majority share of production financing.

What is a '100% national' film?

A 100% or entirely national film is a film that is entirely financed within one single country.

What is a 'co-production'?

A co-production is defined as a film whose production budget is financed by sources stemming from two or more countries. The country providing the majority of the financing, i.e. the majority co-production country, is considered to be the country of origin. In the case of an equal co-production, e.g. Germany 40% / France 40% / Spain 20%, the nationality of the director and subsidiarily the cultural content of the film determine to which country the film is allocated on a case-by-case basis.

This definition of a co-production is not identical with the qualification as an 'official co-production' (which is based on satisfying the requirements set out in the relevant co-production treaties, or those of the European Convention on Cinematographic Co-production) but also includes co-productions that are not necessarily registered by the national film agencies. For instance this can be the case where national broadcasters co-produce feature films with foreign partners.

The European Audiovisual Observatory identifies co-productions on the basis of information provided by various sources. In the case of France, Spain and the United Kingdom co-productions can be identified accurately as official co-production structures are communicated by the CNC, the ICAA and the UK Film Council. Another reliable source of information is Eurimages, the Council of Europe's support fund for cinematographic co-production. Further identification is possible on the basis of information made available by national film agencies and online film databases as well as information provided in the trade press.

As a consequence the qualification of a film as a co-production and its allocation to a specific country of origin by the European Audiovisual Observatory may differ from co-production listings published by other sources.

How is 'circulation' measured?

Circulation in the context of this study is measured on the one hand by the average number of territories a film gets released in and, on the other hand, by its propensity to travel, i.e. the percentage of a certain film type obtaining a release outside of its national market.

How is 'performance' measured?

The performance of co-productions and national films in the context of this study is measured by their respective average admissions, on their national and non-national markets as well as on a total level.

What are 'admissions'?

Admissions are defined as the number of tickets sold.

How is 'average' defined?

In the context of this study an average value can be expressed either as the 'mean' or the 'median' value. It will be pointed out at each occurrence in the text to which of the two terms the word 'average' refers. The 'mean' of a group of values is their arithmetical average, derived by adding the values up and dividing them by their number. The 'median' is another way of expressing an average value, which is defined as the number separating the upper half of a data sample, with the data being arranged in order, from the lower half, i.e. the middle value. In case of an even number of values in the sample, the median is defined as the mean of the two middle values. This method avoids distortions caused by the extreme sample values present in the data sample of admissions analysed here.

How are 'national' and 'non-national' markets defined?

National admissions are defined as admissions in the country of origin. All other markets – including other co-producing countries – are considered as non-national markets. For example Germany is considered the national market for *Perfume: The Story of a Murderer*, a German, Spanish and French co-production. The releases in Spain and France are counted as non-national releases.

To gain an insight into a co-production's propensity to travel outside of its co-producing countries, a third category, counting non-national release markets outside of the co-producing countries is introduced when relevant.

What is the time period covered?

When analysing the circulation of films it is crucial to capture as much of a film's theatrical life cycle as possible. In order to do so the study looks at cumulative admissions for all films on release between 2001 and 2007.

In designing the data sample it is assumed that the following generalized release pattern applies to a significant number of films: national release in the first year of exploitation, followed by a release in major territories in the second year and in smaller markets in the third and following years. However a number of films in the sample, namely those being exploited at the beginning and the end of the reference time period, display different characteristics. The early part of the period includes an above-average number of films with only a non-national release recorded. These films will have had their national release prior to the time period covered. Similarly, for the later part of the period, the sample

shows an above-average number of films with only a national release, as their non-national exploitation falls after the reference period. The cumulative effect is compensatory, thus the data sample as a whole remains representative.

How are the regions defined?

Several indicators are also analysed by regions of origin. In the context of this study the following four regions are defined:

- ... **Big 5:** France, Germany, Italy, Spain and the United Kingdom;
- ... **Western Europe:** Belgium, Ireland, Iceland, the Netherlands, Portugal and Switzerland;
- ... **Scandinavia:** Denmark, Finland, Norway and Sweden;
- ... **Central / Eastern Europe (CES):** Czech Republic, Hungary, Poland, Romania and Turkey.

Where do the data come from?

The analysis in this study is based on a data sample drawn from the Observatory's LUMIERE database. The database includes data on the annual admissions recorded by more than 20 000 films released in 27 European territories since 1996. Due to gaps in data collection in some countries, data quality varies according to the territory in question. The overall rate of coverage for the European Union is estimated at around 86% of the 'real' market.

Data collated in the LUMIERE database comes from a wide variety of sources, including national film agencies and statistics offices, inter-industry bodies, distributors' and exhibitors' associations, the trade press and a small number of private tracking bodies. This is supplemented and completed by data from the European Union's MEDIA Programme, on the basis of declarations made by distributors to its Automatic Distribution Support scheme.

A point to note concerns the data available in the database for the United Kingdom and the Republic of Ireland. Admissions data for these two countries are available to the Observatory only on a cumulative basis, i.e. the admissions for an individual film cover the tickets sold both in the UK and in Ireland. On the other hand, the database does distinguish between films originating in the United Kingdom and films originating in the Republic of Ireland, even if it is not possible to split admissions results for these titles into UK and Irish admissions respectively. This unavoidably dual approach results, for certain calculations, in a minor bias that is without invalidating consequences for the analysis as a whole.

3.2. Data sample

The circulation of European co-productions compared to entirely national films is analysed on the basis of a data sample drawn from the Observatory's LUMIERE database including a total of 5 414 films with cumulative admissions of 1.4 billion tickets sold.

The sample includes cumulative data for

- ... all feature films,
- ... produced since 1999 by one of the 20 European countries covered,
- ... with a theatrical release in any of the 20 European markets covered,
- ... in the time period between 2001 and 2007.

Which films are taken into consideration?

Drawing valid conclusions about the relative circulation levels and performance of European co-productions and entirely national films inside and outside their national markets requires that particular attention is paid to the design of the sample. In particular, a design bias could be introduced by comparing films with significantly differing degrees of data availability with regard to their exploitation markets.

As mentioned earlier, a coherent and unbiased data sample can only be established by ensuring identity between the (co-) producing countries and the exploitation markets. As a result this study focuses on films produced in the 20 European countries for which comprehensive exploitation data are available and takes into consideration only two types of films:

- ... Type 1: **'100% national'** or **'entirely national'** films **produced in one of the 20 sample countries**;
- ... Type 2: **'Co-productions'** that are **co-produced exclusively among the 20 countries** covered, i.e. no co-productions involving countries other than these 20 will be considered in the data sample. This excludes films with US involvement.

In doing so, the study creates a coherent data sample that covers – as a minimum - all the (co-) producing markets for each film in the sample. This sample also permits the calculation of a representative breakdown between national and non-national admissions as data for a film's national release as well as its non-national release in its other co-producing countries and other major European markets are available. This allows a meaningful comparison of circulation and performance of entirely national and co-produced films by ensuring that there is no bias arising from lack of data on a film's performance on national and co-producing markets for which no data are available.

In order to enable the reader to gain a better understanding of the data set analysed here, the overall top 100 films of both categories as well as top 50 lists per region are provided in the appendix to this report.

Which 20 markets are covered?

Though the LUMIERE database attempts to cover all European markets, coverage rates vary across individual territories. To avoid statistical distortion of indicators and to ensure valid conclusions this analysis focuses on the theatrical exploitation of European films in markets with a comprehensive coverage rate for the majority of the reference period. This applies to a total of 20 markets which are listed in Figure 2.

Figure 2: List of 20 countries covered in the data sample

#	ISO code	Country	Region	Number of films in sample	Remark
1	BE	Belgium	Western Europe	76	Data include final declarations for an average of 17 distributors.
2	CH	Switzerland	Western Europe	168	
3	CZ	Czech Republic	CES	153	
4	DE	Germany	Big 5	482	Weak coverage of end-of-runs for some films.
5	DK	Denmark	Scandinavia	243	
6	ES	Spain	Big 5	698	
7	FI	Finland	Scandinavia	107	Comprehensive data only from 2004 onwards; 2001 to 2003 includes comprehensive data on top 100 films and data provided by MEDIA on non-national European films.
8	FR	France	Big 5	1 269	
9	GB	United Kingdom	Big 5	338	GB admissions include IE admissions.
10	HU	Hungary	CES	156	Data cover first releases only.
11	IE	Ireland	Western Europe	55	No separate data for Irish admissions are available. They are reported on a cumulative basis with GB figures.
12	IS	Iceland	Western Europe	30	Data cover first releases only.
13	IT	Italy	Big 5	628	For some years data only cover films with more than 1 000 admissions.
14	NL	Netherlands	Western Europe	169	
15	NO	Norway	Scandinavia	127	Comprehensive data only from second semester 2001 onwards. Data cover first releases only.
16	PL	Poland	CES	138	
17	PT	Portugal	Western Europe	88	First releases only. Comprehensive data only from 2004 onwards; 2001 to 2003 includes comprehensive data on national films and data provided by MEDIA on non-national European films.
18	RO	Romania	CES	63	Comprehensive data for 2002 to 2006. Data for 2007 only include top 20 all and top 20 national films.
19	SE	Sweden	Scandinavia	278	Comprehensive data for 2001 to 2006. Data for 2007 only include top 25 all and top 25 national films.
20	TR	Turkey	CES	148	Data cover first releases only.
Total				5 414	

With regard to the coverage rate over the time period in question, it should be noted that data availability has significantly improved for some countries since 2004. In addition, 2007 data are still provisional as some information, e.g. distributor declarations to the MEDIA programme, are still missing at the time of this analysis, which means that the data for this year are a bit less comprehensive compared to preceding years.

3.3. Understanding the data population

The data sample in the context of the total European market

The data sample comprises a total of 5 414 feature films with cumulative admissions of 1.4 billion tickets sold between 2001 and 2007. How are these figures to be put into perspective with the total European market in the time period covered?

Due to incomplete data availability for several territories the data collected in the LUMIERE database do not reflect 100% of the total admissions generated in the 36 member states of the European Audiovisual Observatory. The Observatory estimates that LUMIERE covers about 86% of the total market in the sample period.

The European market is dominated by US productions which account for roughly 64% of total admissions, followed by European films accounting for about 27%. Films produced in Europe with incoming investment from primarily the US accounted for about 7% and films from third countries represented about 2.5% of the total market volume in terms of admissions.

The European Audiovisual Observatory estimates that the data sample used for this analysis represents about 78% of all admissions generated by European films, sufficient to draw representative conclusions.

Figure 3: The data sample in relation to the total market volume in terms of admissions 2001 - 2007

* Europe refers to the 36 member states of the European Audiovisual Observatory for which data on film markets are collected.

** EUR inc refers to films produced in Europe with incoming investment from the US, e.g. *Harry Potter*.

Source: European Audiovisual Observatory

Split by type and region of origin

The 5 414 films in the sample break down into 1 024 co-productions and 4 390 entirely national films, for total admissions of 1.4 billion tickets sold. Though they accounted for only 19% percent of all films on release, co-productions generated 31% of total admissions. 100% national films accounted for 81% of all films on release and 69% of total admissions.

Figure 4: Number of sample films and admissions by type of film

Source: European Audiovisual Observatory

About 63% of all films originated from one of the Big 5 countries, 14% from Scandinavia, 12% from Central / Eastern Europe while 11% of the films were produced in other Western European countries. The dominance of films from the five major countries is even clearer with respect to admissions, where they capture 81% of the total admissions in the sample, followed by Central / Eastern European films (9%), Scandinavian films (7%) and Western European films (3%).

In the Big 5 countries and Scandinavia films split into approximately 80% entirely national films and 20% co-productions. However in the other two regions this proportion differs. Co-productions are more popular in Western Europe accounting for 31% of films produced, and play a less important role in Central / Eastern Europe, accounting for only 8% of all productions.

Figure 5: Number of sample films and admissions by region

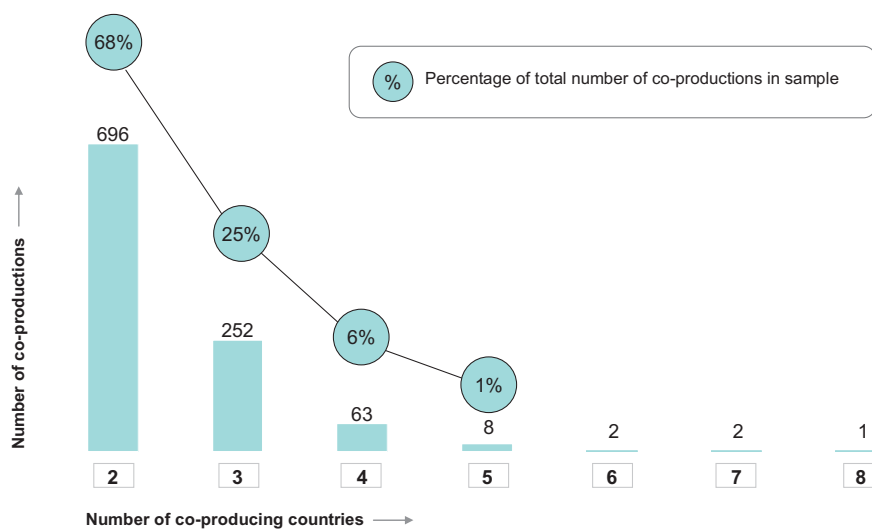

Source: European Audiovisual Observatory

Number of co-productions by number of co-producing countries

As is shown in Figure 6, the majority, i.e. 68%, of all co-productions in the sample were structured as bilateral co-productions. Another 252 co-productions (25%) involved three European co-producing countries, 63 projects (6%) were realised as co-productions between four countries while only 1% of all co-productions involved five or more countries.

Figure 6: Number of sample co-productions by number of co-producing countries

Source: European Audiovisual Observatory

Split by national vs non-national release

In the data sample 1.1 billion (77%) tickets were sold on films' national markets while 323 million (23%) admissions were generated on non-national markets. Out of the total of 5 414 films, 59% were released on their national markets only, whereas 35% were released nationally as well as on non-national markets.

For 331 films (6%) in the data sample LUMIERE registers non-national admissions only. This does not necessarily mean that these films were not released on their home markets. Half of these films were produced in 1999 or 2000 and would have had their national release in these two years which are not covered by the reference period. The lack of national releases for the remaining 168 films produced within the time period covered (accounting for 3% of the total data sample) can be explained by one of the following co-suppositions:

- ... The national release was not registered by LUMIERE due to gaps in data coverage in certain countries, e.g. Belgium or Germany (see Methodology and data sample);
- ... Some of these films are actually compilations of films or short films put together for a very limited number of screenings in a certain non-national market but were not released as such in their national markets or were not registered due to very low number of admissions, e.g. *Night of the Shorts - German Short Pieces*;

- ... Some of the films are co-productions which do have a financial majority in a certain country, e.g. Germany, due to the structuring of the financing but do not actually have any content specific to the registered 'country of origin'. They were thus not released in that country, e.g. *True North* (Steve Hudson, 2006);
- ... Some 2007 productions will only be released nationally in 2008 but have already been released on non-national markets in 2007, e.g. *Angel* (François Ozon, 2007);
- ... Some of the films in question were produced to go direct to TV or DVD on the national market but were given a theatrical release in other markets, e.g. *It's a Free World...* (Ken Loach, 2007).

Figure 7: Releases and admissions split into national and non-national markets

Source: European Audiovisual Observatory

About 75% of the admissions generated uniquely in non-national markets are attributable to films produced in 1999 and 2000. This above average share of non-national admissions partly offsets the above average share of admissions generated on national markets for films produced in 2006 and particularly 2007. The inclusion of films produced up to two years before the sample period, which thus covers only the later stages of the films' theatrical life cycle, compensates the bias towards national admissions introduced by the more recent films which are only at the early stages of their theatrical release cycle.

Split by production year

On average the data sample comprises about 600 productions per year. Figure 8 shows that the number of sample films increases for films produced from 2003 onwards. This reflects the increased coverage of LUMIERE for selected countries since 2003, as mentioned in the previous chapter.

The below average number of productions from 1999 and 2000 is explained by the fact that the data sample only counts films with a theatrical release from 2001 onwards, hence only covering films from these two years which were still shown in cinemas in their second or third year of release. The comparatively low number of 2007 productions in the data sample is due to two facts. On the one hand, the data coverage of LUMIERE for 2007 admissions is not yet as high as in previous years at the time of writing. On the other hand, a certain number of 2007 productions will only be released in 2008.

Figure 8: Number of sample films by production year

Source: European Audiovisual Observatory

Distribution pattern

Figure 9 shows the distribution pattern of films falling into a specific admissions bandwidth. The largest number of films falls into two categories: 29% of all films attracted less than 5 000 admissions in the time period covered, and 22% generated between 10 000 and 50 000 admissions. On a cumulative level, more than half of all films in the data sample, 59%, generated less than 50 000 admissions in the time period covered and the vast majority of 89% did not surpass 500 000 admissions. Only 6% of the films generated over 1 million admissions.

Figure 9: Percentage of sample films by admission bandwidths

Source: European Audiovisual Observatory

A very small number of films accounts for the majority of admissions. The top 100 films, i.e. 1.8% of the total number of films, accounted for 37% of total admissions. 50% of all admissions were generated by the top 137 (2.5%) films and the top 634 films (12%) accounted for 90% of total admissions in the data sample.

Figure 10: Distribution of total admissions in relation to the number of sample films

Source: European Audiovisual Observatory

4. Circulation of European co-productions compared to entirely national films

Circulation in the context of this study is measured by two indicators: the average number of release markets (mean) and the propensity of a film to obtain a non-national release, i.e. the percentage of films in each category that get released in at least one non-national market.

Analysis of the data sample clearly suggests that co-productions are released in a larger number of territories than entirely national films. Figure 11 shows that on average European co-productions are released in a total of 4.6 territories while entirely national films are released in 2.0 markets. While an average 100% national film gets released on only one non-national market, an average co-production gets released on 3.7 non-national markets (including other co-production countries).

It could be argued that, for co-productions, a release in a minority co-producing country constitutes a 'quasi national' release and thus is not directly comparable to non-national releases for entirely national films. However, it is not only the non-national releases in other co-producing countries that contribute to the higher average number of non-national releases for co-productions. An average co-production gets released in almost 3 non-national markets outside of the co-producing countries.

Figure 11: Mean number of release markets by film type and region

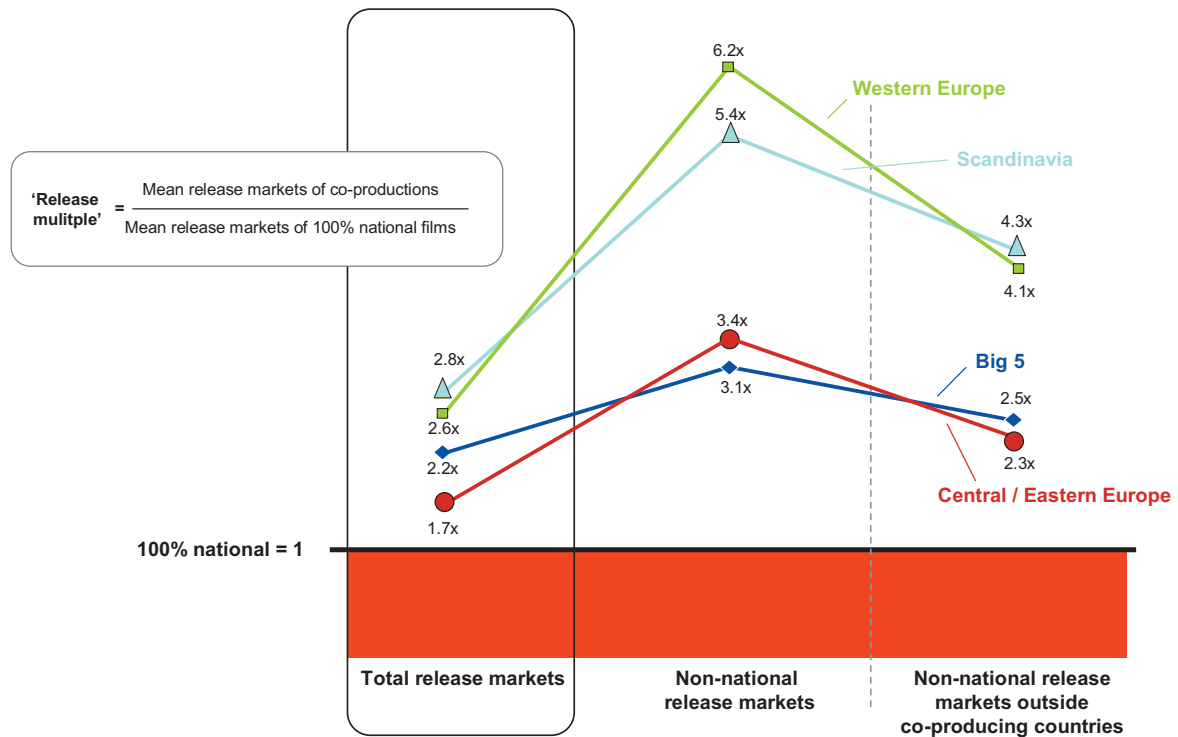

Source: European Audiovisual Observatory

Comparing films from the different regions, the sample data shows that co-productions from all regions get released in more countries than their entirely national counterparts. This is particularly true for co-productions from the Big 5 countries and from Scandinavia which get released on average on 5.1 and 4.6 markets respectively as compared to 2.3 and 1.6 release markets for entirely national films from these regions.

Another way to compare the circulation of co-productions and entirely national films from individual regions is the calculation of a 'release multiple' which is derived by dividing the average number of release markets of a co-production by the average number of release markets of an entirely national film from a specific region. A multiple of 2.8x for Scandinavia indicates for instance that Scandinavian co-productions get released in 2.8x times as many markets as an entirely national Scandinavian film.

Figure 12: Co-production 'release multiples' by region of origin

Source: European Audiovisual Observatory

Figure 12 shows that co-productions from all regions get released on average in 2.8x to 1.7x times as many markets as their entirely national counterparts. The increased circulation is especially evident for releases on non-national markets. This is particularly true for Western European and Scandinavian co-productions which get released in respectively 6.2x and 5.4x times as many non-national countries as their entirely national counterparts. The multiples for the Big 5 countries and Central / Eastern Europe are 3.4x and 3.1x. Multiples for releases outside of co-producing markets range from 2.3x (Central / Eastern Europe) to 4.3x (Scandinavia).

These findings are further underlined by comparing the distribution patterns of co-productions and entirely national films across the number of release markets. Figure 13 shows that a significantly larger percentage (67%) of national films were released in only one market, while this is only true for 28% of co-productions. On the other hand the share of co-productions released in two or more markets is clearly higher for each number of release markets than the respective percentage share for entirely national films.

Figure 13: Percentage of co-productions and 100% national films by number of release markets

Source: European Audiovisual Observatory

Results for the second indicator, the propensity to obtain a non-national release, also support the finding that co-productions circulate better than 100% national films. As is shown in figure 14, 77% of all co-productions get a non-national release, while only 33% of the entirely national films were released outside of their national market. This is also true for co-productions' propensity to obtain release outside of their co-producing countries, with about 59% of all co-productions being released in at least one market other than a co-producing country.

Figure 14: Share of films with non-national release by type

Source: European Audiovisual Observatory

Comparing films originating from different regions, Figure 15 indicates that a significantly higher percentage of co-productions from all regions gets released in at least one non-national market compared to entirely national films from these regions.

Figure 15: Share of films with non-national release by type and region of origin

Source: European Audiovisual Observatory

For 100% national films, the data shows that entirely national films from the Big 5 region circulate comparatively better than entirely national films from Western Europe, Scandinavia and particularly Central / Eastern Europe. While 38% of entirely national Big 5 films get released internationally, only 18% of their Central / Eastern European counterparts find a non-national release.

In comparison, 79% of all Big 5 co-productions get released on at least one non-national market. This share amounts to 81% for Western European co-productions, 71% for Scandinavian and 55% of Central / Eastern European co-productions.

5. Performance of European co-productions compared to entirely national films

As outlined earlier, the performance of co-productions and national films is measured, in the context of this study, by their respective average admissions, on their national and non-national markets as well as on a total level.

As mean admissions values are significantly influenced by films with extremely high or low admissions, the median value gives a clearer view of the ‘average’ admissions a European film actually generates. However, both mean and median values are shown in Figure 16 thus allowing for comparison.

Our analysis of the data sample clearly shows that European co-productions on average, i.e. using the median value, generate significantly higher admissions than their entirely national counterparts. On average a European co-production achieved cumulative admissions of 51 785 tickets sold, while entirely national films earned on average 19 137 admissions. On their national markets, co-productions attracted on average 40 770 admissions, 2.2 times as many as 100% national films. The difference is even more striking when looking at admissions achieved on non-national markets. Here co-productions sold on average 22 546 tickets, 2.8 times as many as entirely national films.

Figure 16: Median and mean admissions by film type

Source: European Audiovisual Observatory

Calculating an ‘admission multiple’ by dividing the median admissions to a co-production by the median admissions to an entirely national film of a specific region provides an interesting way to compare the performance of co-productions and national films from different regions. A multiple of 3.7x for Scandinavia indicates for instance that Scandinavian co-productions generate 3.7x times as many admissions as an entirely national Scandinavian film.

Figure 17 shows that co-productions from Scandinavia, the Big 5 countries and Western Europe achieve on average between 3.7x and 3.1x times as many admissions as their entirely national counterparts. In these three regions, co-productions register higher average admissions than entirely national films both on national as well as non-national markets. However, the attractiveness of co-productions is more pronounced on non-national markets. This is particularly true for Scandinavian co-productions which sell 6.0x times as many tickets on non-national markets as their entirely national productions. The respective multiples for the Big 5 and Western Europe amount to 3.1x and 3.0x. Multiples for co-productions on their national markets range from 2.9x (Big 5) to 2.5x (Western Europe) and 2.0x (Scandinavia).

However films originating from Central / Eastern Europe deviate from this pattern. Co-productions led by a Central / Eastern European country generate fewer admissions than their 100% national counterparts (0.8x times as many).

Figure 17: Co-production ‘admission multiples’ by region of origin

Source: European Audiovisual Observatory

In absolute terms co-productions from the Big 5 and Scandinavia perform particularly well, with median admissions of 74 258 and 74 338 respectively. While Scandinavian co-productions are the strongest films outside of their national markets, attracting on average 30 085 admissions, Big 5 co-productions significantly outperform their national peers on their national markets generating 67 122 admissions on average. This makes them the most successful category of films in terms of median admissions in the data sample.

These findings are underlined by a comparison of the distribution patterns of co-productions and entirely national films along admission bandwidths as shown in Figure 18. A significantly larger percentage (41%) of national films generate less than 10 000 admissions, while this is only true for

25% of the co-productions. 45% of co-productions fall into the bandwidths between 100 000 and 1.5 million admissions, whereas only 34% of entirely national films fall within this bandwidth.

Figure 18: Percentage of co-productions and 100% national films by admission bandwidths

Source: European Audiovisual Observatory

6. The role of non-national markets for European films

To what extent do European co-productions and entirely national films depend on a theatrical release outside of their national markets? The percentage share of each type of film getting a non-national release has already been analysed in the chapter comparing the circulation of films. This chapter will therefore focus on the importance of non-national releases with regard to admissions.

The data analysed clearly shows that admissions on non-national markets are more important to co-productions than they are to entirely national films. While non-national admissions only account for 15% of total admissions to entirely national films, 41% of total admissions to co-productions are generated on non-national markets.

Figure 19: Share of non-national admissions by type

Source: European Audiovisual Observatory

Comparing films from the different regions, it becomes clear that non-national admissions are particularly important to Western European and Scandinavian co-productions, where they contribute 54% of total admissions. While non-national admissions still account for 40% of total admissions to Big 5 co-productions, they contribute significantly less to total admissions to co-productions from Central / Eastern Europe, accounting for only 10% of total admissions.

Entirely national productions depend to a significantly lesser extent on admissions from non-national markets. 100% national films from the Big 5 generate 17% of their total admissions outside their national markets followed by Western European films (15%) and Scandinavian films (13%). Again non-national markets contribute the lowest share to Central / Eastern European productions, accounting for only 6% of total admissions.

7. Conclusions and potential explanations

The study clearly indicates that on average European co-productions get released on more European markets and generate higher admissions than their entirely national counterparts. How are these results to be interpreted and how could they be explained?

Potential explanations for the superior performance of co-productions with respect to circulation and average admissions include the following:

- ... **'Large budget, high production values'**: Co-productions enable producers to raise financing for larger budgets as they can tap into a larger number of financing sources, some of them specifically designed for co-productions, e.g. Eurimages. Generally speaking, a higher budget should result in a higher production values for the film, which in turn should attract a larger number of spectators than a film with a lower production value. Similarly commercially attractive projects will find it easy to attract co-producers and thus may tend to be made as co-productions. Though this might not be the case in each and every specific instance, it may be a general factor contributing to co-productions achieving significantly higher average admissions than entirely national films.
- ... **'Access to international broadcasters and distributors'**: International co-productions will benefit from each co-producers' established relationships not only with national funding bodies but also with local distributors and broadcasters. The involvement of distributors and broadcasters from various countries should significantly improve a film's chances of being released in the respective territories. Involvement may range from distributors and broadcasters simply being aware of the project and having a right of 'first look' to pre-sales or distribution guarantees as part of the financing package. The fact that an official co-production will qualify for 'national' status in most of the co-producing countries can also facilitate access to distribution funding in the various territories.
- ... **'Cross-border appeal'**: Projects that have a cross-border appeal are more likely to be structured as co-productions than content that primarily attracts national audiences in a specific territory. Such projects would naturally tend to find a distributor outside their national markets and generate higher admissions on non-national markets. Cross-border appeal often stems from a common cultural or historical heritage shared among various European countries and may be based on internationally successful literary works (e.g. *Perfume – The Story of a Murder; Pinocchio*), graphic novels (e.g. *Astérix et Obélix*), European history (e.g. *Der Untergang; The Pianist; Elizabeth – the Golden Age*) or European 'celebrities' (e.g. *La Môme; The Queen*).
- ... **'International or multi-local cast'**: The set-up of co-productions provides incentives for a casting which attracts audiences in and outside the film's national markets. This might either be achieved by casting international A-list talent or by mixing 'local stars' from the co-producing countries involved. In both cases, the cast is likely to help the film secure distribution and attract a comparatively large number of spectators in the respective countries, or – in the case of international A-list talent – even beyond.

- ... **'English language'**: Higher budget commercially targeted co-productions will often be shot in English language facilitating access to a high value market traditionally resistant to subtitling, i.e. the United Kingdom. This can also have the effect of lowering subtitling costs which reduces distributors' exposure when releasing the film in other European territories.
- ... **'More release markets, more admissions'**: An obvious and, to a certain degree, mechanical explanation for co-productions to generate higher admissions can be drawn from the fact that co-productions on average do get released on more than twice as many markets as entirely national productions. More release markets tend to result in higher total admissions.

Despite extensive literature on the subject it remains difficult to explain the 'success' or 'failure' of a single film. Most films can be considered as a unique 'product' that needs to establish its own new market. Their success can be influenced by a variety of factors whose true nature and impact might not even be entirely evident to the production or distribution companies themselves, let alone to external observers. Against this background the difficulties and limitations of deducing general explanations for the 'success' of co-productions or entirely national films as such becomes clear.

Nevertheless it is useful to complement the preceding analysis with a brief discussion of the potential explanations for its findings. On the one hand such a discussion contributes to a better understanding of the statistical data as it tries to translate them into the 'real world'. On the other, discussing potential explanations could stimulate discussion with industry professionals who naturally have a better insight into the real benefits and challenges associated with co-productions on the basis of specific practical experiences. The European Audiovisual Observatory would be extremely grateful to receive feedback and comments from professionals on the contents of this study.

8. Appendix

OBSERVATOIRE EUROPÉEN DE L'AUDIOVISUEL
EUROPEAN AUDIOVISUAL OBSERVATORY
EUROPÄISCHE AUDIOVISUELLE INFORMATIONSTELLE

Established in December 1992, the European Audiovisual Observatory is a European public service organisation whose mission is to foster transparency in the European audiovisual sector and provide information services to policy makers and audiovisual professionals.

Its membership consists at present of 36 European states as well as the European Community represented by the European Commission. The Observatory functions within the legal framework of the Council of Europe and operates in collaboration with its information network: partners, correspondents and professional organisations.

The Observatory's principal areas of activity are: film, television, video/DVD, new audiovisual media services and public policy on film and television. It provides information on markets, financing and legal aspects of the audiovisual sector.

Information is made available through print publications, online services, databases and within the framework of conferences and workshops.

Créé en décembre 1992, l'Observatoire européen de l'audiovisuel est un organisme européen de service public dont la mission est d'assurer une plus grande transparence dans le secteur audiovisuel en Europe et de répondre aux besoins en informations des organes gouvernementaux ainsi que des professionnels de l'audiovisuel.

Il regroupe actuellement 36 Etats membres ainsi que la Communauté européenne représentée par la Commission européenne. L'Observatoire s'inscrit dans le cadre juridique du Conseil de l'Europe et travaille en collaboration avec des organismes partenaires, un réseau de correspondants et des organisations professionnelles du secteur.

Ses principaux champs d'activité concernent le cinéma, la télévision, la vidéo/DVD, les services audiovisuels des nouveaux médias et les politiques publiques relatives au cinéma et à la télévision. L'Observatoire fournit des services d'informations sur les marchés, les financements et le cadre juridique du secteur audiovisuel.

Les informations sont disponibles sous forme de publications, de services en ligne, de bases de données ou dans le cadre de conférences ou d'ateliers.

Die im Dezember 1992 gegründete Europäische Audiovisuelle Informationsstelle ist eine europäische Einrichtung des öffentlichen Rechts. Ihr Auftrag besteht in der Schaffung von Transparenz im europäischen audiovisuellen Sektor durch die Bereitstellung von Informationsdienstleistungen für die audiovisuelle Fachwelt.

36 europäische Staaten sowie die Europäische Gemeinschaft vertreten durch die Europäische Kommission sind zur Zeit Mitglieder der Informationsstelle. Die Informationsstelle erfüllt ihre Aufgabe im rechtlichen Rahmen des Europarates und arbeitet in engem Verbund mit Partnerorganisationen, Korrespondenten und Berufsfachverbänden.

Die Informationsstelle hat die Kernarbeitsfelder: Film, Fernsehen, Video/DVD, neue audiovisuelle Mediendienste und staatliche Maßnahmen für Film und Fernsehen. Sie stellt Informationen über Märkte sowie Finanzierung und juristische Aspekte des audiovisuellen Sektors bereit.

Die Arbeitsergebnisse stehen in Form von Printpublikationen, Online-Diensten und Datenbanken zur Verfügung und werden im Rahmen von Konferenzen und Workshops vorgestellt.
