An error was made in the published article in Section 3, where the acceleration was incorrectly stated as $a = 0.154 \pm 0.025\,\mathrm{cm\,s^{-2}}$. The correct acceleration is $a = 0.47 \pm 0.08\,\mathrm{cm\,s^{-2}}$. The error arose because the velocity shift corresponding to a shift of one Sloan Digital Sky Survey (SDSS) pixel in wavelength space, used to determine the acceleration, was given incorrectly. It was stated to be $69\,\mathrm{km\,s^{-1}}$ but $22.5\,\mathrm{km\,s^{-1}}$ in the adopted quasar rest frame of $z = 2.062$. The correct velocity shift is $69\,\mathrm{km\,s^{-1}}$ because the SDSS pixels are logarithmically spaced; therefore, two features separated by $69\,\mathrm{km\,s^{-1}}$ will be one pixel apart at all redshifts.
