# Why IDF-ICAR ExtraMIR Joint Project Plays a Crucial Role in Advancing the Global Adoption of FT-MIR-Based Methane Proxy ?

Prof. Hélène Soyeurt

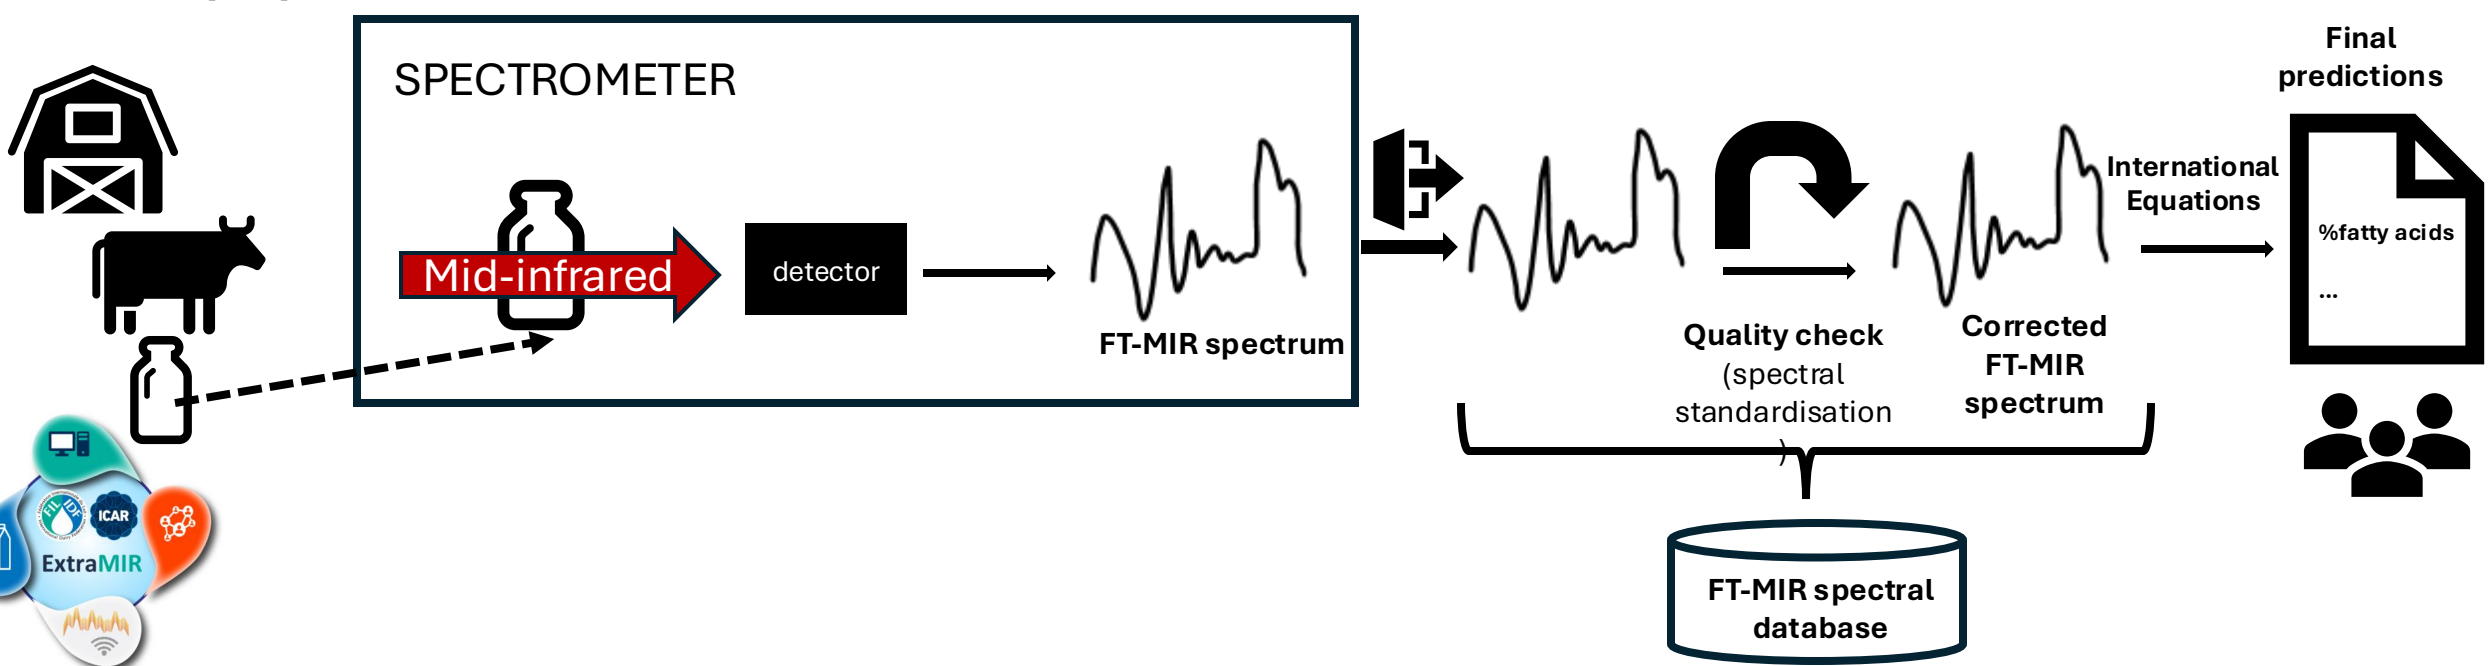

Gembloux Agro-Bio Tech, University of Liège, Belgium

Existing Milk analysis process

ExtraMIR proposal

## Open other possibilities

Consumption  
index, nitrogen  
efficiency ...

Sustainability

Methane, P,  
urea ...

Environment  
al fingerprint

Abnormal milk samples,  
color ...

Nutritional  
quality

Fat, protein,  
lactose, fatty  
acids, Ca,  
lactoferrin,...

Technological  
properties

Cheese yield,  
yoghurt yield,  
butter yield,  
spreadability ...

Animal  
Health

Na, lactoferrin,  
Energy balance,  
body weight, dry  
matter intake,  
acetone, BHB,  
citrate ...

## Open other possibilities

Abnormal milk samples,  
color ...

Go back first to the basics to understand the crucial rule of ExtraMIR for the MIR methane prediction

# MIR Prediction

2 components :

Spectrum

Equation

spec<sub>1</sub>

coeff<sub>1</sub>

spec<sub>2</sub>

coeff<sub>2</sub>

spec<sub>3</sub>

coeff<sub>3</sub>

spec<sub>4</sub>

coeff<sub>4</sub>

spec<sub>5</sub>

coeff<sub>5</sub>

spec<sub>6</sub>

coeff<sub>6</sub>

spec<sub>7</sub>

coeff<sub>7</sub>

.

.

.

.

.

.

.

.

.

.

.

.

.

.

.

.

.

.

spec<sub>n</sub>

coeff<sub>n</sub>

**Prediction = intercept + sum(spec\*coeff)**

# Ultimate Goal

Having the same  
prediction for the same  
spectrum

Not so simple ...

How much the spectral variability is representative of the cow population?

References hard to obtain leading a limited dataset

Spectral variability

Spectral representativity

Equation performances

Every team has its own validation set

Validation performances are not comparable

Sources of variation

Reference used to create the equation

Different teams develop equations using different references (respiration chambers, greenfeed, SF6, laser gun ...)

Calibration dataset used

Spectral standardisation

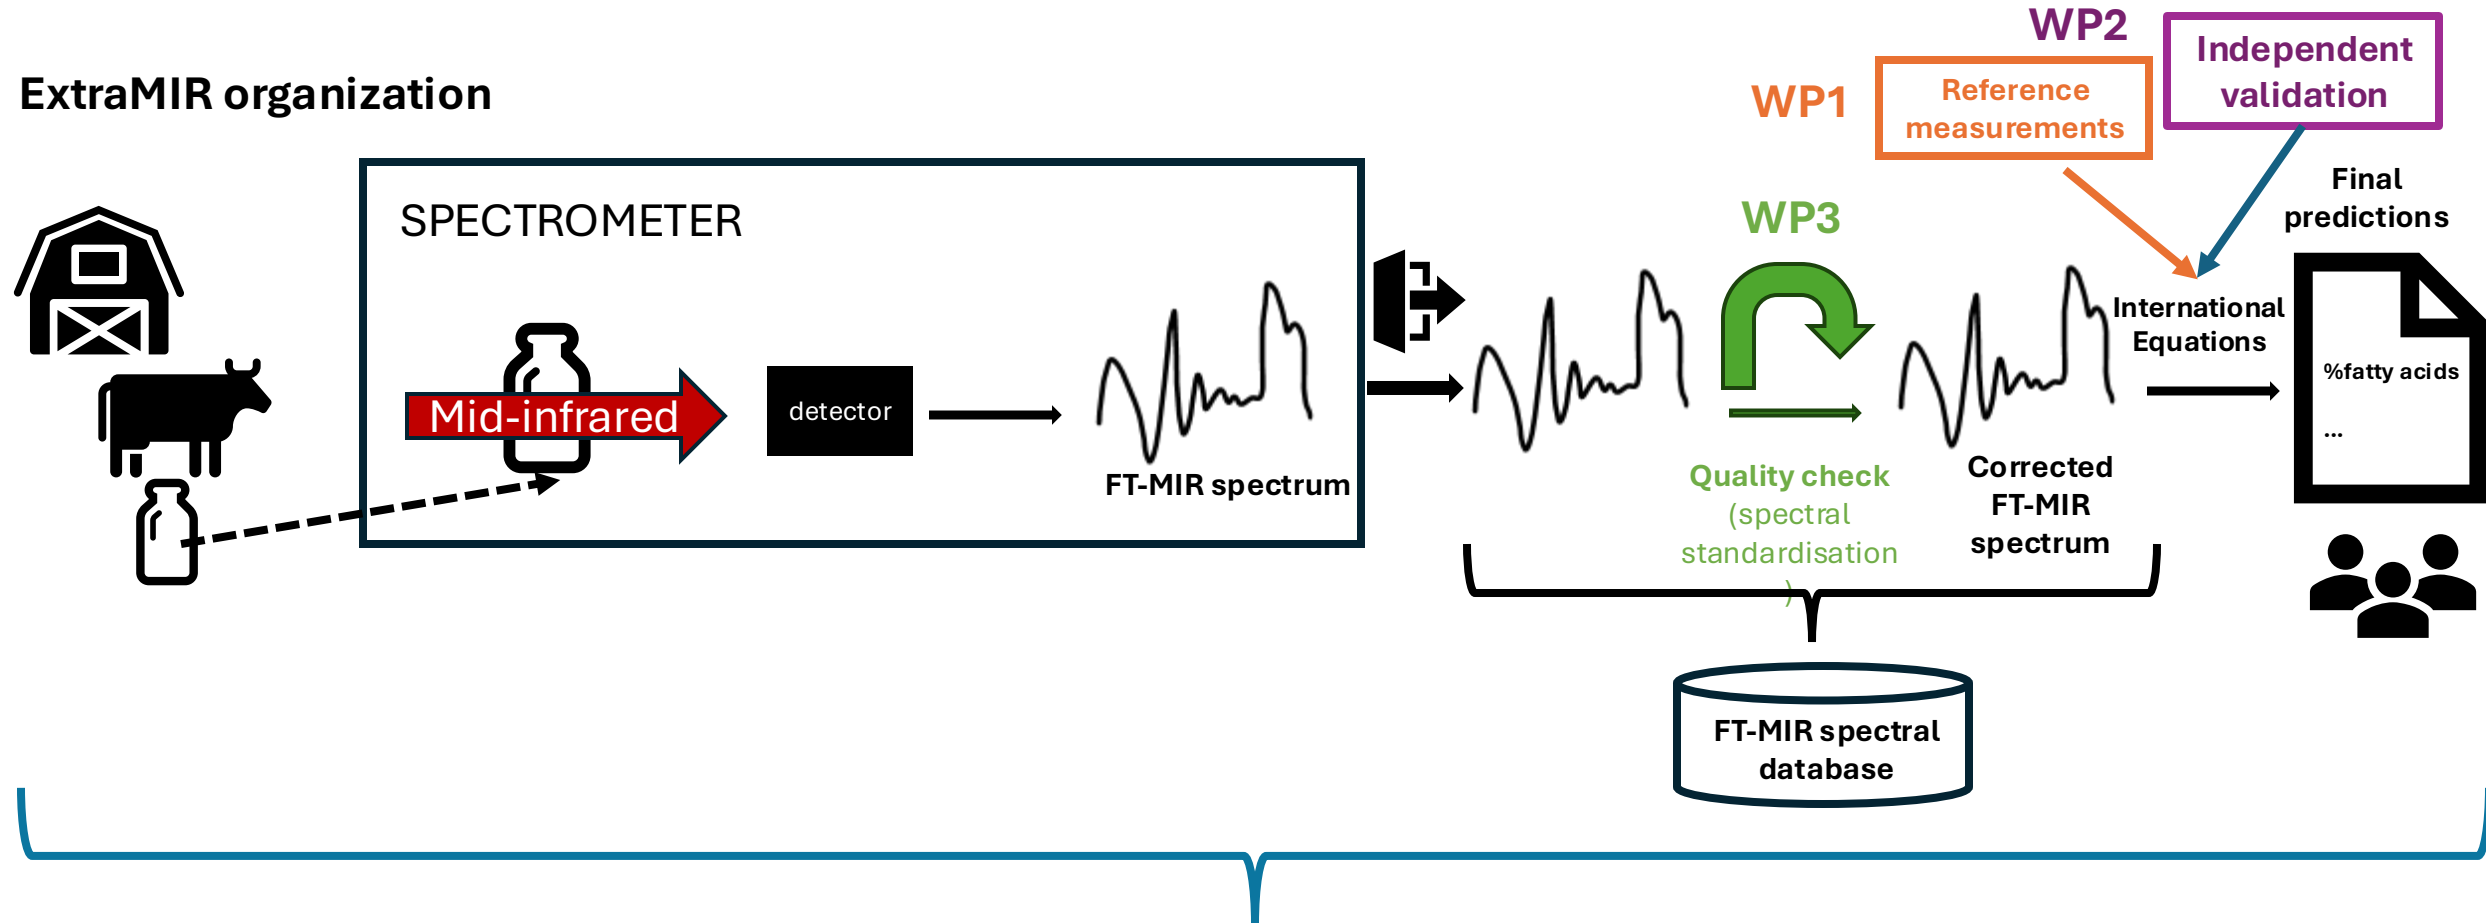

How to standardize the signal ?

Different spectral resolutions

How much are they comparable ?

## ExtraMIR organization

Communication with all stakeholders

WP4

Focussing on Fatty Acids this year but many achievements are interesting for the MIR-based prediction of methane

Equation  
performances

**WP1 :**

Comparison of gold standard  
+ correction factors

## Sources of variation

Reference  
used to create  
the equation

Spectral  
variability

Spectral  
representativity

Different  
instruments

Spectral  
standardisation

**WP3 :**  
Propose spectral  
standardisation  
procedure

WP3 :  
Propose spectral  
standardisation  
procedure

- A group is formed to compare different spectral standardization using samples sent with the ICAR proficiency test
- Results will be communicated soon

Equation  
performances

**WP1 :**

Comparison of gold standard  
+ correction factors

Reference  
used to create  
the equation

**WP3 :**

Propose spectral  
standardisation  
procedure

## Sources of variation

Different  
instruments

Spectral  
standardisation

Spectral  
variability

Spectral  
representativity

**WP3 :**

Check the spectral  
variability covered by  
the calibration set in  
the world  
representative  
spectral database

### WP3 :

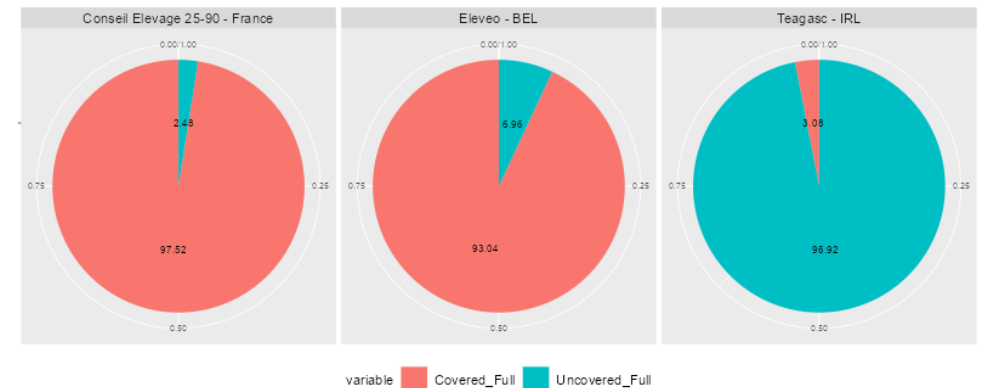

Check the spectral  
variability covered by  
the calibration set in  
the World  
Representative  
Spectral Database  
(WRSD)

- A web application will be available soon
- The idea is to compare the spectral variability of a calibration set with the spectral variability existing in WRSD

Global-H distance per partners - visual view

Equation  
performances

**WP2 :**  
Checking if the prediction of  
methane is the same per  
equations (easiest) + sharing  
samples with known CH<sub>4</sub>  
eructations (harder)

**WP1 :**  
Comparison of gold standard  
+ correction factors

Reference  
used to create  
the equation

## Sources of variation

Different  
instruments

Spectral  
standardisation

**WP3 :**  
Propose spectral  
standardisation  
procedure

Spectral  
variability

Spectral  
representativity

**WP3 :**  
Check the spectral  
variability covered by  
the calibration set in  
the world  
representative  
spectral database

## WP2 :

Checking if the prediction of methane is the same per equations (easiest) + sharing samples with known CH<sub>4</sub> eructations (harder)

Equation performances

### ExtraMIR - Validation tool

[User Identification](#) [Download Validation Spectral Dataset](#) [Upload your Obtained Prediction Dataset](#) [Statistics of your Upoladed Predictions](#) [Validation performances of your equations](#) [Report Download](#)

#### Insert your ID information

Enter the date using the format YYYY-MM-DD

Enter your institution name

Enter your ExtraMIR identification

Enter your password

Confirm ID

#### Information known by the system

- A web application developed in RShiny for Fatty Acids will be available soon.
- We can derive a tool for Methane which compare the predictions performances of equations

# Why IDF-ICAR ExtraMIR Joint Project Plays a Crucial Role in Advancing the Global Adoption of FT-MIR-Based Methane Proxy ?

Outputs from ExtraMIR can help to ensure high quality MIR-based prediction of methane

Next chapter for ExtraMIR ?
