

The background of the slide is a photograph of a snowy mountain landscape. In the foreground, a snow-covered slope leads up to a small, dark, multi-story building with a dome-like structure on top, likely a research station or observatory. The sun is low on the horizon, creating a bright glow and casting long shadows across the snow. The sky is a clear, pale blue.

A new software framework
specifically designed for
remote FTIR observation.

Ch. Servais, O. Flock, Ph Demoulin.

Principal Goals

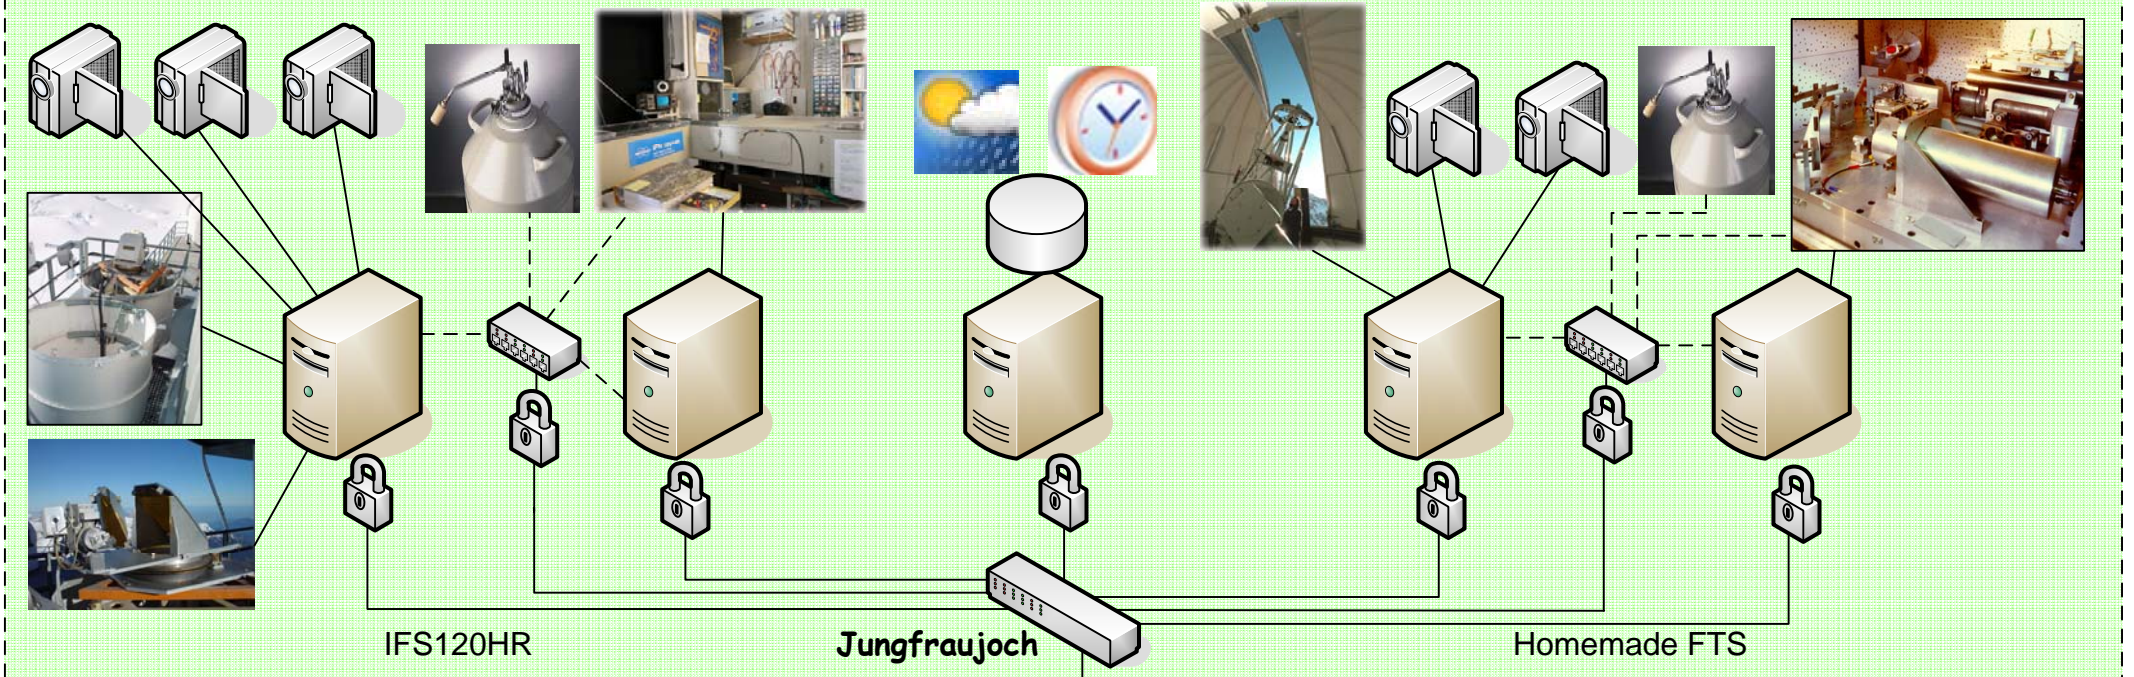

- Provide remote control (local or distant) of experimental data acquisition;
- Control multiple instruments with a single observer;
- Control multiple sites with a single observer;
- Must be optimized for FTIR or other acquisition work requiring close supervision.

Wishlist (1)

- Client-Server open architecture. Must accept new functionalities as plugins.
- Work on very low to high bandwidth internet connections.
- Use limited number of ports to ease administration.
- Accept unlimited number of simultaneous clients with different privileges.
- Administrators must be able to help remotely observers.
- Use XML configuration files, no tricky "regedits".
- Strong protection against attacks. Hardware must be safe.
- Must control an arbitrary number of cameras : rotation, remotely adjustable exposure and orientation, wide range of compressions & frame rates, quick capture of images and movies to keep track of events.
- Optional timestamp can be included in video streams.
- Two cameras must remain visible at all times.
- Provide audio monitoring including capture to help debugging.

Wishlist (2)

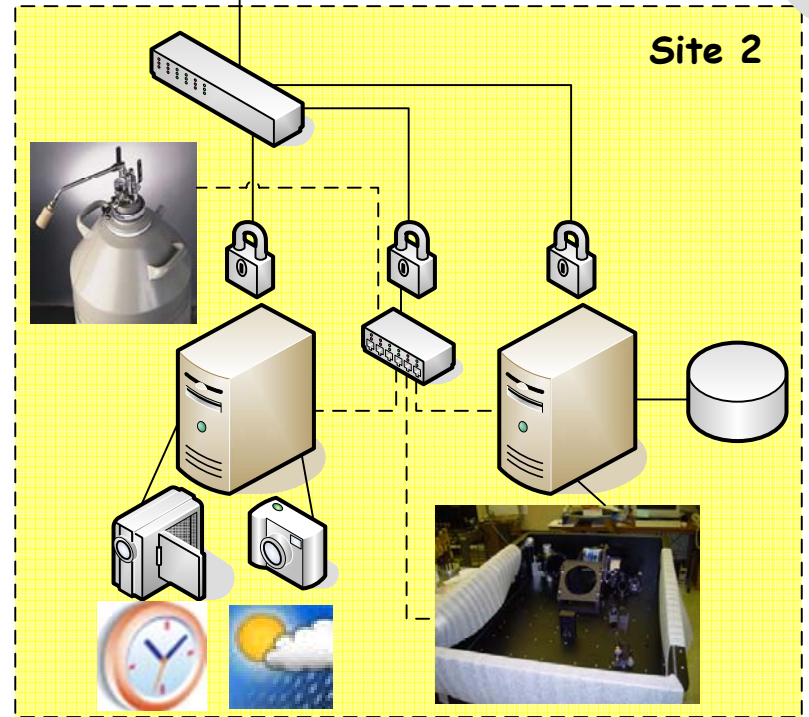

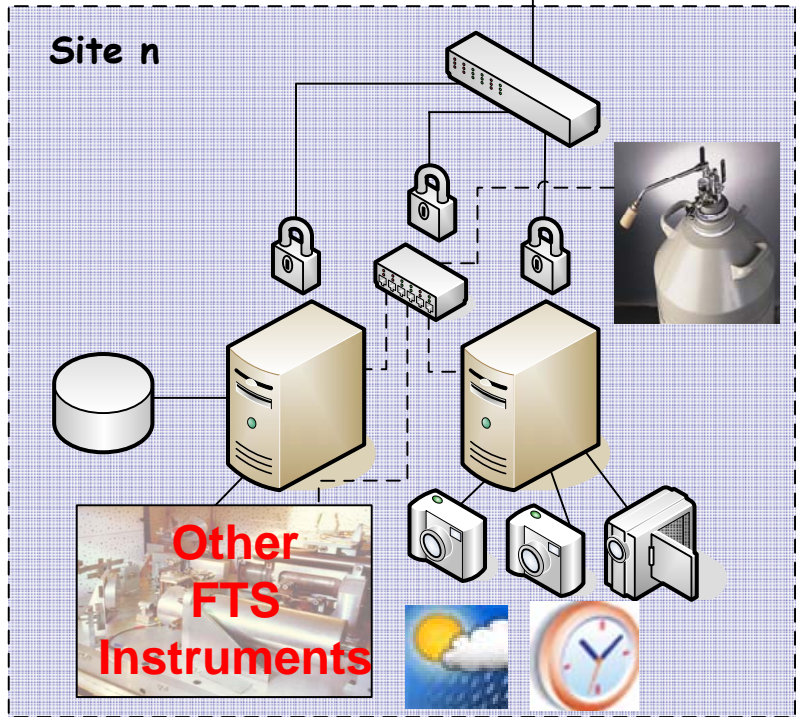

- Client must work on a moderate class laptop with WinXP (may be ported to Linux later).
- Client must accept 1024x768 pixels screens and still leave room for the taskbar.
- Provide communication channels between plugins.
- Servers must be very stable.
- Installation of client application must be easy.
- Keep track of all important events in the servers Windows event log.
- Display events with timestamp in a dialog area always visible on the client application.
- Fast action icons to respond to events requiring prompt action.
- More...

SunTracker SunTrackerLid

28/03/2007 6:15 - SunTrackerLid - Internal unprotection has been requested, system in manual mode.

A high-altitude mountain landscape under a clear blue sky. In the foreground, a rocky peak is partially covered in snow and sparse vegetation. A research station with a glass-enclosed structure and a dome is situated on the peak. The background features a vast, snow-covered mountain range with a valley in the distance. The word "Movie" is overlaid in the center of the image.

Movie

Conclusions

- This framework should greatly ease remote control of multiple FTIR instruments;
- A single observer may simultaneously control multiple instruments located at different sites;
- It is secure;
- It is designed for difficult observation sites;
- It is applicable to future instruments and accepts a heterogeneous instrument farm;
- New plugins and services are in development to control new functionalities.
